## ABSTRACT

Rapid business development encourages every entrepreneur to create a different service to attract customers. Fast service is its own attraction for customers. Implementation of queuing or scheduling system on chefs can be used to avoid a high stack of ordering food in the chefs, so that serving times can be done quickly. Multilevel Feedback Queue scheduling algorithm is one of the CPU scheduling in the computer operating system. Multilevel feedback queue algorithms allow the process to move the queue. If a process is too time consuming, then the process will be moved to a lower queue. Therefore the interaction process becomes fewer and it reduces CPU time. On this research, we developed a food ordering web application on Android and iOS by applying multilevel feedback queue to create a queue ordering food at the chefs. The time obtained from multilevel feedback queue methods faster 30 minutes 48 seconds from the first come first serve method.

## Keywords

Android, iOS, Restaurant, Queue, Web App.

## 1. INTRODUCTION

Rapid development of business encourage every entrepreneur to create a form that is different from other businesses, one of which is the restaurant business, which is exactly the fast food business, in this case requires an efficient sales system, more attractive, giving priority to the beauty, cleanliness and neatness of service, so that consumers are impressed upon entering the restaurant.

Quality of service is a dynamic state associated with products, services, people, processes, and environments that meet or have expectations with five main dimensions namely reliability, responsiveness, assurance, empathy and tangibles [1]. Quality of services, especially in the restaurant was very influential on customer satisfaction, so customers will not be disappointed or move to another restaurant.

Some of the common problems often experienced by the restaurant's Chef's food reservation buildup and the customer not convenience in ordering food, One of the solutions that can be offered is the provision restaurant tablet PC in the customer tables so that customers can easily order food. Application of queuing or scheduling system on the kitchen / chef can do to avoid the buildup of ordering food in the kitchen / chef [2].

Multilevel Feedback Queue algorithm is one that is used for scheduling the CPU in a computer operating system, multilevel feedback queue algorithms allow the process to move the queue. If a sequester process CPU too long, then the process is moved to a lower queue. This is advantageous because the process of interaction is only wearing a little CPU time. Similarly, if waiting process is too long, this process will be increased levels.

In this research, developed a food ordering web app on Android and iOS platform by applying multilevel feedback queue to create a queue ordering food at the chef, so that the time spent on food preparation faster than the First Come First Serve methods and improve the efficiency of time in the restaurant.

## 2. METHODS

For the model queue that was used in this study is a Multi Channel, Single Phase queue model (M/M/S) and for the development of system application using the prototyping method with the programming language PHP and MySQL.

### 2.1 JQuery Mobile

JQuery Mobile is a touch -optimized web framework (a library of JavaScript or mobile framework). JQuery Mobile is focused on creating a framework that is compatible with a wide range of smartphones and tablet computer, was created for the creation of applications that can run on a smartphone or tablet such as web apps. (JQuery Documentation, 2013) Some of the advantages JQuery Mobile, among others:

1. Compatible with all major mobile platforms as well as all major desktop browsers, including iOS, Android, Blackberry, WebOS, Symbian, Windows Phone, and more.
2. Built on top of jQuery core so it has a minimal learning curve for people already familiar with jQuery syntax.
3. Theming framework that allows creation of custom themes.
4. Limited dependencies and lightweight to optimize speed.
5. The same underlying codebase will automatically scale to any screen.
6. HTML5-driven configuration for laying out pages with minimal scripting.
7. Ajax-powered navigation with animated page transitions that provides ability to clean URLs through pushState.

8. UI widgets those are touch-optimized and platform-agnostic.

## 2.2 Multi Channel, Single Phase (M/M/S)

Multi-Channel Single Phase occurs whenever two or more service facilities fed by a single queue.

Examples of queuing systems can be seen in Figure 1. Meaning of (M / M / S) is the Multi-Channel Model is composed of:

1. The first M is the average arrivals follow a Poisson probability distribution.
2. The second M is the level of service that follows an exponential probability distribution
3. S is the number of system or service facilities in more than one channel.

**Figure 1 Multi Channel, Single Server Queue Model**

M / M / s (Multiple Channel Model) works according Heizer [3] is using the following formula:

$$P_0 = \frac{1}{\left[ \sum_{n=0}^{M-1} \frac{1}{n!} \left( \frac{\lambda}{\mu} \right)^n \right] + \frac{1}{M!} \left( \frac{\lambda}{\mu} \right)^M \frac{M\mu}{M\mu - \lambda}} \quad (1)$$

$$L_s = \frac{\lambda \mu \left( \frac{\lambda}{\mu} \right)^M}{(M-1)!(M\mu - \lambda)^2} P_0 + \frac{\lambda}{\mu} \quad (2)$$

$$W_s = \frac{L_s}{\lambda} \quad (3)$$

$$L_q = L_s - \frac{\lambda}{\mu} \quad (4)$$

$$W_q = \frac{L_q}{\lambda} \quad (5)$$

$$P_n = \frac{\left[ \frac{\lambda}{\mu} \right]^n}{n!} P_0 \quad (6)$$

## 3.1 Multilevel Feedback Queue

Multilevel feedback queue is one algorithm based on the model of Multi-Channel Single server queue. Fundamental advantages possessed by the multilevel feedback queue are the possibility of a process of moving from one queue to another queue, for instance with lower priority or higher [4].

On Multilevel feedback queue there are some important rules:

- If the Priority (A) > Priority (B), then A is executed (not B).
- If the Priority (A) = Priority (B), A & B algorithm running on FSFC (First Come, First Serve).
- If a job is entered into the system, then the work comes into the category highest priority (the topmost queue).

- If the job requires extra time when running, its priority lowered (e.g., displacement of the queue).
- If the work is completed before time, permanent jobs at the same level.

**Figure 2 Multilevel Feedback Queue Examples**

In Figure 2 there is a job (Job A and B) have the highest priority level, and job C and D are at a low priority level. Then the work will be done by the CPU is job A → B → C → D.

## 3.2 Prototyping Methods

With this prototyping method developers and customers can interact with each other during the making of the system. To overcome the inconsistency between the customer and the developer, it must needs good cooperation between the two so that developers will know exactly what the customer wants not rule out technical aspects and customers will know the finishing processes in the desired system, thus will produce a system in accordance with specified completion the time schedule [5]. Summary prototypes in this research are shown in Table 1.

**Table 1 Prototype Module**

Prototype	Generated functions
1	<ol style="list-style-type: none"> <li>1. Function in jQuery to run the program on the iOS and Android platform</li> <li>2. Function for detecting screen resolution and orientation on PC tablet</li> </ol>
2	<ol style="list-style-type: none"> <li>1. Function to connect to the database from the server program.</li> <li>2. Functions to access and display the table of the database server.</li> <li>3. Function to display the tables and images from the database server (Data Food, Price, Image and Category)</li> </ol>
3	<ol style="list-style-type: none"> <li>1. Add, update food quantity and price data into the cart.</li> <li>2. Displays data from client ordering food.</li> <li>3. Reading food ordering function on the Server.</li> </ol>

## 3.3 Queue

Hiller [6] split system queues into three components:

1. Calling Population

According to its size, population to be served can finite or may infinite. Arrival pattern can be regular, it could be random.

2. Queue  
Queue length could be limited or may not be limited.
3. Service Facilities  
Characteristics of service facilities can be seen from the three cases, the layout physically from the system queue, queue discipline, service time.

Such models conventionally are labeled as follows:

### 3.4 Web Applications (Webapps)

Web Applications (Web Apps) is an application that is accessed by users via a network such as the internet or intranet Apers[7]. Web Apps can also be interpreted as software encoded with programming that can be integrated with the browser, usually used programming is combined with HTML JavaScript. A Web Apps basically have 3 layers. In the first layer is on the client side that has the basic browser system. In the second layer contained dynamic content generation tools such as JavaScript and php. In the third layer contained and consists of a data storage back end of the database such as MySQL or Oracle.

## 4. DISCUSSION

### 4.1 Description of Applications

The initial application named "Mejuah - Juah Resto". Application name can be changed based restaurant wants to use the application. Function of this application is the food at the restaurant ordering application on the tablet platform: Android tablets and ipad. This application uses an algorithm Multilevel Feedback Queue (MLFQ) to resolve the problems buildup on the chef. This application was developed with a mobile website application structure. In addition, this application is included on the website for the admin panel to process data of food. To view screenshots of the application shown in Figure 3.

This application consists of a few main menu:

1. Home Menu  
Home function is to provide information to customers latest news in the form of menus and often ordered menu.
2. Ordering Food Menu  
This menu function is ordering food menu that consists of the name of the food, the price of food as well as presentation time. Ordering menu is divided

Nama Makanan	Jumlah	Sub Total
Ramen Noddle 2	1	Rp. 12500
Cocktail	1	Rp. 12000
		Rp. 24500

by food categories, namely: Opening, Main, Extras and Desert.

3. Order Cart  
This orders cart function to accommodate customer orders list that will be sent to the chef.

**Figure 3 Mejuah-juah Resto Screenshot**

### 3.2 Application Development Assumption

Assumption is that the range of conditions specified study / research undefined. The assumptions used in this research are:

1. iPad / tablet used in restaurants can run for working period.
2. Every table in the restaurant had an iPad/tablet. In this study it is assumed the number of the table is 20 and has active status if there are customers as well as inactive if there are no customers.
3. Reservations food queue is using by chefs, so they can serve food quickly so that customers do not wait too long.
4. In the kitchen has a screen to display a list of queues and the number of food ordering food table, where the food was ready the waiters deliver food to the customer table.
5. Application does not set staffing issues and profits earned by the restaurant.
6. Chef considered the server of a queue system that provides reservation service.
7. Number of chefs in assuming there are 4 people and each chef can serve each category of food is opening food, main, dessert and extras.
8. Each - each chef can serve all types of food and all food categories.
9. Server can serve 4 meals ordering process at once.
10. All orders are entered into the server simultaneously.
11. Each chef can only serve a maximum of 10 food items / food.
12. Food presentation with time 00:00:00 will not go into a queue system, but will direct presented by the waitress.
13. The food will be presented in the application has a maximum time is 00:20:00.

## 4.2 Multilevel Feedback Queue

### Algorithm Implementation

MLFQ can change the priority level of the existing queuing system, the changes made to benefit from the services and simultaneously reduce / eliminate the queue (waiting time). For models of Multilevel Feedback Queue can be seen in the flowchart in Figure 4.

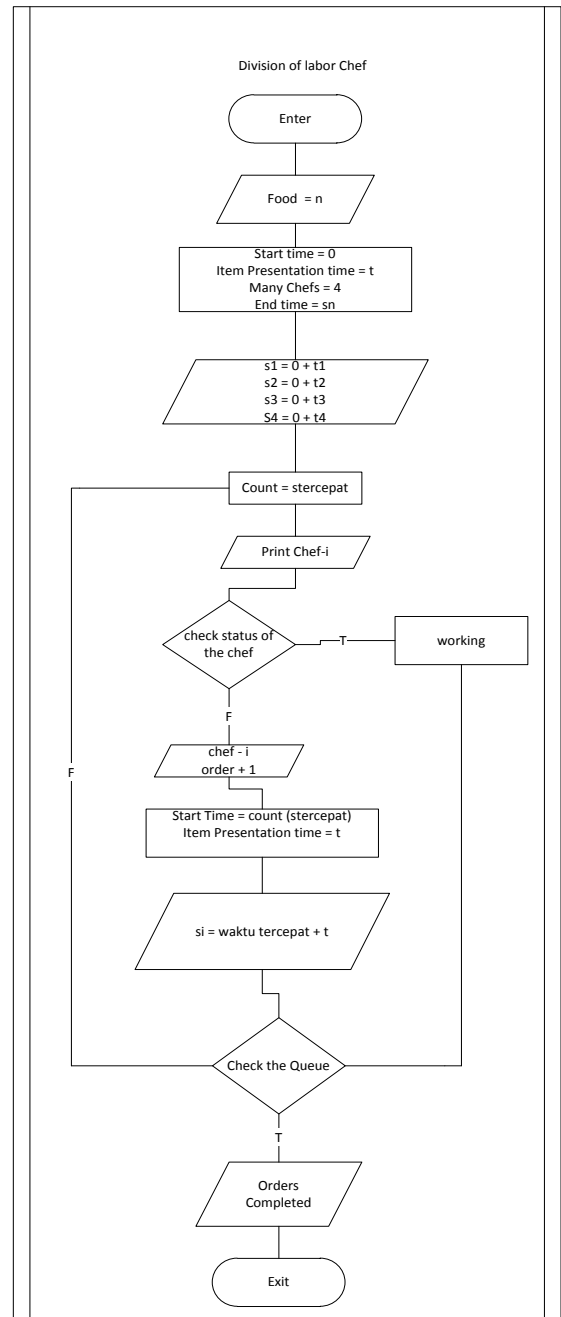

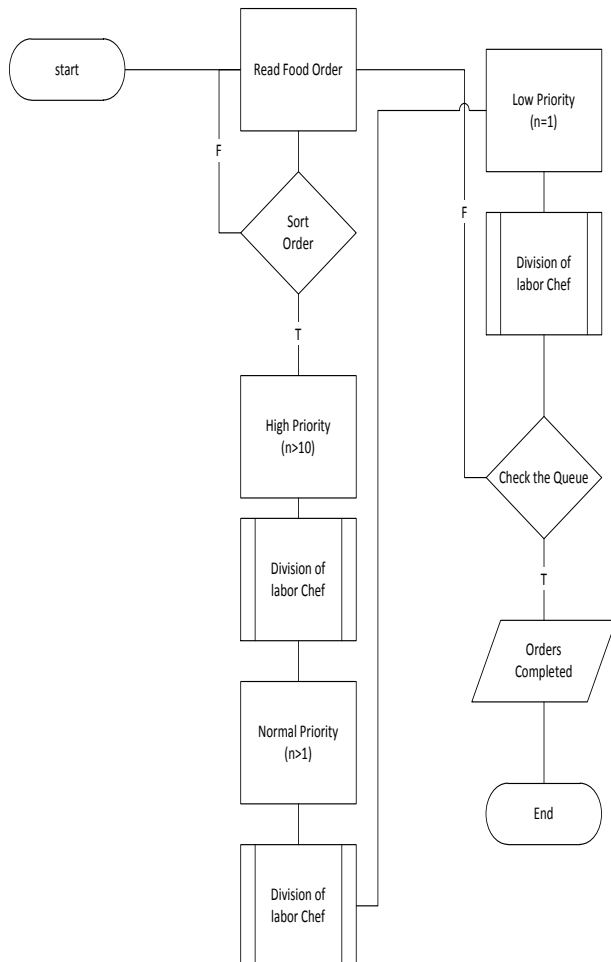

Figure 4 Multilevel Feedback Queue Flowcharts

## 4.3 Analysis of Multi Channel, Single Phase (M/M/S) Queue

If restaurants using chef by 4 people, and available 20 of the table and assumed to rush hour there are 20 order / hour entering the server.

Based on the assumption that has been created, can then be calculated:

**Table 2 Analysis M/M/S Queue**

Notation	Unit	Value
T	1	Hour
$\lambda$	20	Table/Hour
$\mu$	20	Table/Hour
M	4	Unit
$\rho$	0.25	
Po	0.367346939	
L	1,0068	User
Lq	0,0068	User
W	0,05034	Hour
Wq	0.00034	Hour
<b>The probability of the capacity in the system</b>		
n	$P_n$	
0	0.367346939	
1	0.367346939	
2	0.183673469	
3	0.06122449	
4	0.015306122	
5	0.003826531	
6	0.000956633	
7	0.000239158	

#### 4.4 Comparison of Food Serving Time and Channel Distribution FCFS with MLFQ

Comparison of presentation time was calculated to determine the optimal food serving time from manually methods First Come First Serve (FCFS) method and Multilevel Feedback Queue (MLFQ). FCFS method is used for comparison because this method is similar to the conventional method, orders are entered into the system will be done, so the next order must wait the first order completed.

For the division of work (channel) of chef has several processes, namely:

1. 4 queues of incoming orders in the first will be done by each chef.
2. If the chef is still working on the food order status is working.

3. To next food order queue it will be done by a chef who has finished working on the previous order (Status Available).

##### 4.4.1 Execution of Order Food with FCFS Method

Way of working the FCFS method used in this study is any order that comes into the server (kitchen) will be directly done by chefs. For food preparation time with the FCFS method using four chefs can be seen in Table 3. For total work time is calculated based on the total time of each chef cooks and chefs who take the longest time.

**Table 3 Making Food Time With FCFS With Four Chefs**

Order No	Total Time Orders	Working Chef
1	01:08:10	1
2	00:15:41	2
3	00:32:30	3
4	00:22:00	4
5	00:25:30	2
6	00:20:00	4
7	00:12:00	3
8	00:20:11	2
9	00:06:00	4
10	00:14:30	3
11	00:41:48	4
12	00:42:33	3
13	00:00:00	2
14	00:00:00	2
15	00:05:00	2
16	00:05:30	2
17	00:53:00	1
18	00:05:30	2
19	00:15:00	2
20	00:32:00	4
<b>Total Time</b>		<b>02:01:48</b>

#### 4.4.2 Execution of Order Food with MLFQ Method

For the MLFQ methods following process:

1. Each order is entered into the server will be collected and categorized based on the same menu id.
2. Items with the highest number goes into high priority, and the data will be sorted by the amount of food the food.
3. Items with the same amount will be sorted by the time of presentation.
4. Item with the smallest amount goes into a low priority.

For food preparation time with the MLFQ method using four chefs can be seen in Table 4. For total work time is calculated based on the total time of each chef cooks and chefs who take the longest time.

**Table 4 Making Food Time With MLFQ With Four Chefs**

Menu ID	Total	Item	Time Orders	Chef
36	45	10	00:15:00	1
		10	00:15:00	2
		10	00:15:00	3
		10	00:15:00	4
		5	00:15:00	1
18	29	10	00:01:00	2

1	Ramen Noddle	6	20:38:49	00:05:00	20:43:49	Koki ke-4
1	Ramen Noddle	6	20:43:49	00:05:00	20:48:49	Koki ke-1

**Figure 5 MLFQ Working Progress**

## 5. CONCLUSION

For the the model and analysis of queuing systems used is M / M / S, this analysis is used to calculate the optimal time in the making when the queue server. M / M / S queue model will be implemented in the MLFQ the priority order of making food that is high priority and low priority to minimize the time of the presentation of the food.

In the manufacture of queuing systems on the chef, there are worst case when use MLFQ, if the order only contains 3 items, the FCFS method is more optimal from MLFQ because working requires only 3 cooks and does not require a lot of working processes.

This application also has some other shortcomings such as transaction id is created based on a unique time and table number still manually inputting, for further research can be expected to make the transaction id based on IP Address. Hardware support especially tablets and wireless networks are indispensable for the application of the system in real applications restaurant.

## 6. LIST OF SYMBOLS

$\mu$  = Average service rate

$\lambda$  = Average arrival rate

Po = Probability of no individual in the system

Pn = Probability of the capacity in the system

Ls = The average number of customers in the system

Lq = Average number of customers in the queue

Ws = The average time it takes a customer in the system

Wq = Average time it takes a customer in the queue

Ws = The average time it takes a Customer in the system

Wq = Average time it takes a customer in the queue

IJCA Social Web  
Research {LEARN MORE}

Each of the IJCA articles are archived and indexed with prestigious academic indexes including DOAJ, Google Scholar, Informatics, ProQuest CSA Technology Research Database, NASA ADS (Harvard Univ.), ScientificCommons (Univ. of St Gallens), University of Karlsruhe, Germany, Georgetown University Library and Washington University.

The databases provide an ongoing, permanent online archive of International Journal of Computer Applications articles, and migrates content from one file format to another as technology changes and as file formats become obsolete. Even in the event that IJCA ceases operations or is unable to deliver articles worldwide, our archiving partners make certain that IJCA's entire scholarly journal collection is preserved for future scholars, researchers, and students. We will continue to enhance our indexing and archiving systems and stay up to date with evolving industry standards.

International Journal of Computer Applications articles are archived according to leading industry standards. We are pleased to participate in [LOCKSS](#), one of the respected independent archives of scholarly journals. LOCKSS, based at Stanford University Libraries, is an international community initiative that provides libraries with digital preservation tools and support so that they can easily and inexpensively collect and preserve their own copies of authorized e-content. LOCKSS, in its eleventh year, provides libraries with the open-source software and support to preserve today's web-published materials for tomorrow's readers while building their own collections and acquiring a copy of the assets they pay for, instead of simply leasing them. LOCKSS provides 100% post cancellation access.

Google Scholar is a freely accessible web search engine that indexes the full text of scholarly literature across an array of publishing formats and disciplines.

The Astrophysics Data System (usually referred to as ADS), developed by the NASA, USA, is an online database of over eight million papers pertaining to domains including computer science from peer reviewed journals.

Informatics' Open J-Gate is a free database of open access journals, launched in February 2006, hosted by Informatics.

ScientificCommons is a project of the University of St. Gallen Institute for Media and Communications Management. The major aim of the project is to develop the world's largest peer-reviewed archive of scientific knowledge with fulltexts freely accessible to the public.

WorldCat is a union catalog which itemizes the collections of 71,000 libraries in 112 countries which participate in the Online Computer Library Center (OCLC) global cooperative. It is built and maintained collectively by the participating libraries. It is forty years old today.

The collections of the National Library consist of more than 20 million objects, including books, posters, pictures, manuscripts, newspapers and much more. The audio-visual collection consists of more than 7 million hours of recorded material. Being a research library, it also has major collections of literature in other languages.

## Academic Databases

The articles accepted and published with *International Journal of Computer Applications (IJCA)* are indexed with the following academic databases

ProQuest's CSA Illumina database pertains to research and application in the field of computer science, which is updated on a monthly basis.

The print version of Ulrichsweb has been published since 1932. The online version provides web-based and Z39.50 linking to library catalogs.

CiteSeerX is a public academic database, digital library and repository for scientific and academic papers with a focus on computer and information science at the College of Information Sciences and Technology, Pennsylvania State University.

EBSCO Publishing, headquartered in Ipswich, Massachusetts, is an aggregator of full-text content. EBSCO Publishing's core business is providing online databases via EBSCOhost to libraries.

## University Affiliates

*International Journal of Computer Applications (IJCA)* is endorsed and supported by the following universities. The bibliographies of the published articles of *International Journal of Computer Applications (IJCA)* are available with the universities' libraries.

The University of Washington, founded in 1861 in Seattle, Washington, United States, is the largest university in the Northwestern United States and the oldest public university on the West Coast.

University of Karlsruhe is a German academic research and education institution with university status resulting from a merger of the university (Universität Karlsruhe (TH)) and the research center (Forschungszentrum Karlsruhe) of the city of Karlsruhe.

The University of St. Gallen (in German: Universität St. Gallen) is a public research university located in St. Gallen, Switzerland. It is specialized in the fields of business administration and computer science.

The Pennsylvania State University, commonly referred to as Penn State or PSU, is a public research university with campuses and facilities throughout the state of Pennsylvania, United States. Founded in 1855, the university has a threefold mission of teaching, research, and public service. The university lends support to IJCA via CiteSeer academic database.
