1. Detail Jurnal

Nama Jurnal : International Journal of Advanced Computer Science and Applications (IJACSA)
Publisher : Science and Information Organization
ISSN : 2156-5570 (Online), 2158-107X (Print)
Index Status : Q4
URL : <https://dx.doi.org/10.14569/issn.2156-5570>
Publication : Monthly
Frequency

2. SJR Detail

Country	United Kingdom - SIR Ranking of United Kingdom	9
Subject Area and Category	Computer Science Computer Science (miscellaneous)	
Publisher	Science and Information Organization	H Index
Publication type	Journals	
ISSN	21565570, 2158107X	
Coverage	2017-2020	
Scope	Information not localized	

3. Indexing/Citation

The Science and Information (SAI) Organization is pleased to announce that IJACSA has been accepted for indexing in the Clarivate Emerging Sources Citation Index, a new edition of Web of Science launched in 2015. The quality and depth of content Web of Science offers to researchers, authors, publishers, and institutions sets it apart from other research databases. The inclusion of IJACSA in the Emerging Sources Citation Index demonstrates our dedication to providing the most relevant and influential Computer Science content to our community.

Scopus[®]

Scopus is the largest abstract and citation database of peer-reviewed literature: scientific journals, books and conference proceedings. Scopus is considered the Gold Standard for research assessment and evaluation purposes by 4,500+ universities and 150+ leading research organizations worldwide.

IET InspecDirect

Inspec provides comprehensive coverage of traditional and cutting-edge publications in the specific fields of physics, electrical & electronic engineering, communications, computer science, control engineering and information technology.

An academic search engine that utilizes artificial intelligence methods to provide highly relevant results and novel tools to filter them with ease.

EBSCOhost databases and discovery technologies are the most-used, premium online information resources for tens of thousands of institutions worldwide, representing millions of end-users.

Ex Libris offers data-based solutions and services to more than 4,900 libraries around the world*. A leading provider of library software to academic, research, and national libraries, Ex Libris offers a comprehensive product suite to manage and provide access to electronic, print, and digital materials.

Since 2000, Serials Solutions has been the leading provider of metadata for e-resources. Today, Serials Solutions KnowledgeWorks is the only authoritative knowledgebase to include e-journals, eBooks, and more.

Microsoft Academic Search is a free search engine for academic papers and resources principally in the field of computer science, developed by Microsoft Research Asia, Beijing.

CiteSeerx is a scientific literature digital library and search engine that focuses primarily on the literature in computer and information science.

WorldCat is the world's largest network of library content and services. WorldCat libraries are dedicated to providing access to their resources on the Web, where most people start their search for information.

Ulrichsweb™ is the authoritative source of bibliographic and publisher information on more than 300,000 periodicals of all types—academic and scholarly journals, and more from around the world.

4. Editorial Board

4.1. Editor-in-Chief

4.1.1. *Kohei Arai*

Affiliation : Saga University

Domain of Research : Technology Trends, Computer Vision, Decision Making, Information Retrieval, Networking, Simulation

ShortBio : Dr Kohei Arai, a Scientist, Professor and Author. He is currently Professor at Saga University, Japan and Adjunct Prof. of the University of Arizona, USA since 1998. Dr Arai received PhD degree in Information Science from Nihon University in June 1982 and MS degree in Electronics Engineering from Nihon University in March 1974. His current research concerns are Satellite Remote Sensing, Radiative Transfer Equation, Human-Computer Interaction, Image Recognition and Understanding, Non-Linear Optimization Theory and Wavelet Analysis. Dr Arai holds 42 patents and received numerous awards, including the Patent Award of the Year. Dr Arai has been featured in Japan Times and Italian Newspapers for his work on Eyes only Computer System. He has worked on several global research collaboration projects during his career. He wrote 31 books and published 490 journal papers and 390 of conference papers.

4.2. Associate Editors

4.2.1. *Alaa Sheta*

Affiliation : Southern Connecticut State University

Domain of Research : Intelligent Systems,Artificial Intelligence,Artificial Neural Networks,Autonomous Robots,Computer Vision,Data Mining,Evolutionary Algorithms,Evolutionary Computing,Fuzzy Logic,Genetic Algorithms,Image Processing,Machine Learning,Machine Vision,Medical Diagnosis,Neural Networks,Neuro-Fuzzy Systems,Pattern Recognition,Soft Computing

4.2.2. *Antonio Dourado*

Affiliation : University of Coimbra

Domain of Research : Artificial Intelligence, Computational Intelligence, Data Mining, Intelligent Systems, Signal Processing

4.2.3. *Elena SCUTELNICU*

Affiliation : "Dunarea de Jos" University of Galati

Domain of Research : e-Learning, e-Learning Tools, Simulation

4.2.4. *Krassen Stefanov*

Affiliation : Professor at Sofia University St. Kliment Ohridski

Domain of Research : e-Learning, Agents and Multi-agent Systems, Artificial Intelligence, Big Data, Cloud Computing, Data Retrieval and Data Mining, Distributed Systems, e-Learning Organisational Issues, e-Learning Tools, Educational Systems Design, Human Computer Interaction, Internet Security, Knowledge Engineering and Mining, Knowledge Representation, Ontology

Engineering, Social Computing, Web-based Learning Communities, Wireless/
Mobile Applications

4.2.5. *Liming Chen*

Affiliation : De Montfort University

Domain of Research : Artificial Intelligence, Agents and Multi-agent Systems,
Ambient Assisted Living, Ambient Intelligence, Data Mining, Data Science

4.2.6. *Maria-Angeles Grado-Caffaro*

Affiliation : Scientific Consultant

Domain of Research : Electronics, Sensing and Sensor Networks

4.2.7. *Wichian Sittiprapaporn*

Affiliation : Mahasarakham University

Domain of Research : Intelligent Systems, Neural Networks, Neuro-Fuzzy Systems

4.2.8. *Yaxin Bi*

Affiliation : University of Ulster

Domain of Research : Ensemble Learning/Machine Learning, Multiple Classification System, Evidence Theory, Text Analytics and Sentiment Analysis

Editorial Preface

From the Desk of Managing Editor...

It may be difficult to imagine that almost half a century ago we used computers far less sophisticated than current home desktop computers to put a man on the moon. In that 50 year span, the field of computer science has exploded.

Computer science has opened new avenues for thought and experimentation. What began as a way to simplify the calculation process has given birth to technology once only imagined by the human mind. The ability to communicate and share ideas even though collaborators are half a world away and exploration of not just the stars above but the internal workings of the human genome are some of the ways that this field has moved at an exponential pace.

At the International Journal of Advanced Computer Science and Applications it is our mission to provide an outlet for quality research. We want to promote universal access and opportunities for the international scientific community to share and disseminate scientific and technical information.

We believe in spreading knowledge of computer science and its applications to all classes of audiences. That is why we deliver up-to-date, authoritative coverage and offer open access of all our articles. Our archives have served as a place to provoke philosophical, theoretical, and empirical ideas from some of the finest minds in the field.

We utilize the talents and experience of editor and reviewers working at Universities and Institutions from around the world. We would like to express our gratitude to all authors, whose research results have been published in our journal, as well as our referees for their in-depth evaluations. Our high standards are maintained through a double blind review process.

We hope that this edition of IJACSA inspires and entices you to submit your own contributions in upcoming issues. Thank you for sharing wisdom.

Thank you for Sharing Wisdom!

CONTENTS

- Paper 1: A Proposal for A High Availability Architecture for VoIP Telephone Systems based on Open Source Software**
Authors: Alejandro Martin, Eric Gamess, Dedaniel Uribarri, Jesús Gómez
PAGE 1 – 11
- Paper 2: Aesthetics Versus Readability of Source Code**
Authors: Ron Coleman
PAGE 12 – 18
- Paper 3: User-Defined Financial Functions for MS SQL Server**
Authors: Jolana Gubalova, Petra Medvedova
PAGE 19 – 25
- Paper 4: An Amplitude Modulation of Cerebral Rhythms based Method in a Motor Task BCI Paradigm**
Authors: Oana Diana Eva, Anca Mihaela Lazar
PAGE 26 – 31
- Paper 5: Financial Literacy of SME Managers' on Access to Finance and Performance: The Mediating Role of Financial Service Utilization**
Authors: Juma Buhimila Mabula, Han Dong Ping
PAGE 32 – 41
- Paper 6: Method of Graph Mining based on the Topological Anomaly Matrix and its Application for Discovering the Structural Peculiarities of Complex Networks**
Authors: Artem Potebnia
PAGE 42 – 48
- Paper 7: Comparison of Intelligent Methods of SOC Estimation for Battery of Photovoltaic System**
Authors: Tae-Hyun Cho, Hye-Rin Hwang, Jong-Hyun Lee, In-Soo Lee
PAGE 49 – 56
- Paper 8: Novel Mechanism of Classifying the Brain Tumor for Identifying its Critical State**
Authors: Deepthi Murthy T S, Sadashivappa G, Ravi Shankar D
PAGE 57 – 66
- Paper 9: Quality Flag of GOSAT/FTS Products Taking into Account Estimation Reliability**
Authors: Kohei Arai, Takashi Higuchi, Hiroshi Okumura, Hirofumi Ohyama, Shuji Kawakami, Kei Shiomi
PAGE 67 – 74
- Paper 10: An Ensemble Approach to Big Data Security (Cyber Security)**
Authors: Manzoor Ahmed Hashmani, Syed Muslim Jameel, Aidarus M. Ibrahim, Maryam Zaffar, Kamran Raza
PAGE 75 – 77
- Paper 11: An Interactive Content Development for Depression Awareness among Tertiary Students**
Authors: Sarni Suhaila Rahim, Thum Wei Ching
PAGE 78 – 87
- Paper 12: Model for Predicting Educational Domain Rate based on the Regional Level**
Authors: Arslan Tariq, Iqra Tariq, Aneela Abbas, Muhammad Aadil Butt, Maimoona Shahid, Umair Muneer Butt
PAGE 88 – 92

Paper 13: Crypt-Tag Authentication in NFC Implementation for Medicine Data Management

Authors: Z. Zainal Abidin, N. A. Zakaria, N. Harum, M. R. Baharon, Ee-Song Hong, Z. Abal Abas, Z. Ayop, N. A. Mat Ariff

PAGE 93 – 100

Paper 14: Thinging Machine Applied to Information Leakage

Authors: Sabah S. Al-Fedaghi, Mahmoud BehBehani

PAGE 101 – 110

Paper 15: Statistical-Based Trustful Access Control Framework for Smart Campuses

Authors: AHMAD B. ALKHODRE

PAGE 111 – 117

Paper 16: Singkat: A Keyword-Based URL Shortener and Click Tracker Package for Django Web Application

Authors: Gottfried Prasetyadi, Utomo Tri Hantoro, Achmad Benny Mutiara

PAGE 118 – 122

Paper 17: A Quantum based Evolutionary Algorithm for Stock Index and Bitcoin Price Forecasting

Authors: Usman Amjad, Tahseen Ahmed Jilani, Humera Tariq, Amir Hussain

PAGE 123 – 132

Paper 18: Detection of Railroad Networks in SAR Images

Authors: Şafak Altay Açar, Şafak Bayır

PAGE 133 – 138

Paper 19: Connectivity Restoration Techniques for Wireless Sensor and Actor Network (WSAN), A Review

Authors: Muhammad Kashif Saeed, Mahmood ul Hassan, Ansar Munir Shah, Khalid Mahmood

PAGE 139 – 145

Paper 20: Design of Wearable Patch Antenna for Wireless Body Area Networks

Authors: Saqib Hussain, Saima Hafeez, Sajjad Ali Memon, Nasrullah Pirzada

PAGE 146 – 151

Paper 21: Product Feature Ranking and Popularity Model based on Sentiment Comments

Authors: Siti Rohaidah Ahmad, Azuraliza Abu Bakar, Mohd Ridzwan Yaakub, Nurhafizah Moziyana Mohd Yusop, Muslihah Wook, Arniyati Ahmadr

PAGE 152 – 157

Paper 22: Interest Reduction and PIT Minimization in Content Centric Networks

Authors: Aadil Zia Khan

PAGE 158 – 163

Paper 23: Image Retrieval System based on Color Global and Local Features Combined with GLCM for Texture Features

Authors: Jehad Q. Alnihoud

PAGE 164 – 171

Paper 24: Assessing Trends of Existing Research Contribution Towards Internet-of-Things

Authors: Bhagyashree Ambore, Suresh L

PAGE 172 – 184

Paper 25: Text Clustering using Ensemble Clustering Technique

Authors: Muhammad Mateen, Junhao Wen, Mehdi Hassan, Sun Song

PAGE 185 – 190

Paper 26: Profile-Based Semantic Method using Heuristics for Web Search Personalization

Authors: Hikmat A. M. Abdeljaber

Abstract—Plant disease is one of the reasons that cause the destruction of plant. It affects plant productivity and quality. Most of the farmers made mistake in cope with this problem because of the lack of knowledge. Expert system is a solution that has been widely used for identifying disease. This paper presents an Android-based expert system to help identifying tomato diseases. Data used in this expert system consist of 16 data of tomato diseases, 53 data of symptoms, and 20 variety of rules. This paper implements forward chaining and certainty factor method. Forward chaining is used as a reasoning method to get the result of disease identification. Certainty factor is used as a calculation method to obtain accuracy degree of identification results. Testing has been done through two stages, internal and external. The result from internal testing shows that tomato expert system works properly and fit perfectly in various android devices. External testing is done by giving questionnaire to 44 respondents. The result of questionnaires shows that tomato expert system is categorized as “good” by them.

Keywords—Expert system; forward chaining; certainty factor; tomato diseases; android

I. INTRODUCTION

Tomato is a commodity plant that is being cultivated by many farmers in Indonesia due to its benefit. Tomato can be categorized as vegetable and fruit. Tomato is also used as food ingredient and medicine [1]. Based on statistical data of vegetable productivity in Indonesia in 2016, tomato becomes big seven along with onion, garlic, and chili with 883.233 ton^a. Tomato becomes one of horticulture commodities that has high economic value yet still needs more concern, especially in production and quality enhancement [2]. This matter is showed by statistical data of tomato in Lampung province between 2014 until 2016 in Table I^a. Crop areas increase twice in 2016 yet is not followed by production result. So, the productivity decreases treble with only 4,54 Ton/Ha.

Plant disease is one of the most important reasons that lead to the destruction of plants and crops [3]. Detecting diseases at early stage enable people to overcome and treat them appropriately. This process requires an expert but the number of experts are still far from ideal condition. Moreover, it needs high cost to do consultation. Therefore, expert system helps a great deal in identifying diseases and describing methods of treatment to be carried out.

TABLE I. TABLE OF TOMATO STATISTICAL DATA IN LAMPUNG PROVINCE BETWEEN 2012 - 2016

Year	Crop area (Ha)	Production (Ton)	Productivity (Ton/Ha)
2014	2.366	23.776	10,05
2015	2.143	24.490	11,43
2016	5.211	23.638	4,54

This paper develops an expert system for identifying tomato diseases implementing forward chaining and certainty factor method. These methods are used to get identification results with accuracy degree. This expert system is designed to be android based, so that it can be used by many people anywhere and anytime.

II. LITERATURE REVIEW

A. Artificial Intelligence

Artificial Intelligence (AI) is the area of computer science that focus on creating expert machines that can engage on behaviors that humans consider intelligent [4]. It has many areas in computer science. There are 12 fields in AI, such as Natural Language Processing (NLP), Speech (voice) Understanding, Robotics and Sensory Systems, and Expert Systems [5].

B. Expert System

Expert system is a field in artificial intelligence intended to serve as consultant for decision making. It uses a collection of facts, rules of thumb, and other knowledge about a limited domain to help making inferences in the domain. It is called expert systems because it addresses problems normally thought to require human specialists for solution [6]. Expert systems can be viewed as having two environments: the development environment and the consultation environment. The development environment is used by an expert system builder to build the components and put knowledge into the knowledge base. The consultation environment is used by a non-expert to obtain expert knowledge and advice. The structure of expert system is showed in Fig 1 [5].

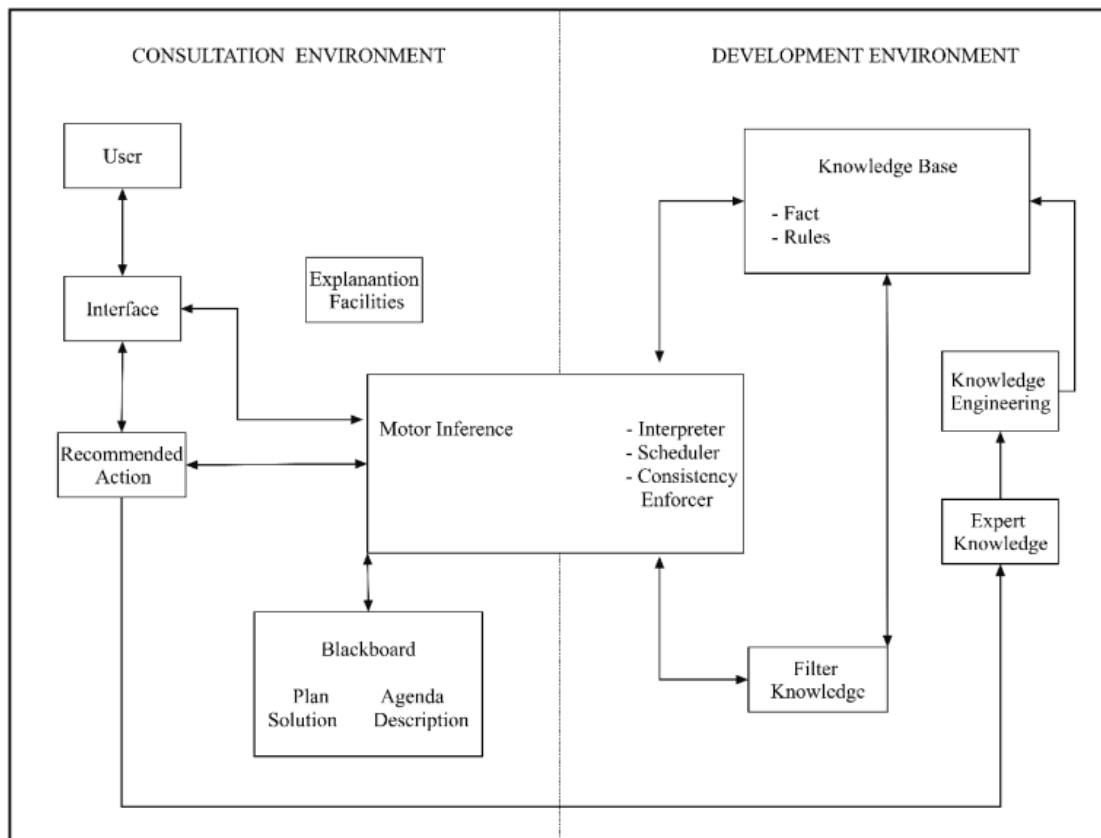

Fig. 1. The Structure of Expert System.

C. Inference Engine

Expert knowledge often can not be represented in single rule. Instead, rules may be chained together dynamically to cover numerous conditions. The process of chaining multiple rules together is called inference. The component conducting inference in an expert system is called the inference engine. Inference engine provides a methodology for reasoning about information in the knowledge base and on the blackboard, and for formulating conclusions. This component provides directions about how to use the system's knowledge by developing the agenda that organizes and controls the steps taken to solve problems whenever consultation takes place. Therefore, inference engine is controller structure or rule interpreter, also is known as brain in expert system. There are two popular approaches for inferencing, such as forward chaining and backward chaining [5].

Forward-chaining is a bottom-up computational model. Forward chaining works with a set of known facts and applies rules to generate new facts whose premises match the known facts, and continues until it reaches a predetermined goal, or until no further facts can be derived whose premises match the known facts. Backward chaining is a reasoning model in expert system that using a goal-driven search. It is a top-down computational design and starts with a goal or hypothesis and then looks for rules to support the hypothesis. It attempts matching the variables that lead to valid facts in the data and indicates that the inference moves backward from the intended goal to determine facts that would satisfy that goal [7].

Forward chaining is appropriate for problems in which most of the data is given in the initial problem statement as how this model works. Forward chaining works forward to find conclusion from facts, starts with the initial facts. Meanwhile, backward chaining starts with hypothesis or goal to know whether the hypothesis accepted or rejected. Backward chaining is appropriate for problem in which goal or hypothesis is given in the problem statement [7]. In Conclusion, forward chaining is used as a reasoning because the system is identifying diseases based on symptoms or facts.

D. Certainty factor

To develop an expert system calculation method is needed to get accuracy degree of the identification results. There are some calculation methods used in expert system, such as heuristic method, classical probability, bayes theorem, and certainty factor.

Heuristic is a method introduced by George Polya in 1945. He defines heuristic as rules for choosing branches in a state space that are most likely to lead to an acceptable problem solution. This method has weakness because it often works based on experience or intuition, so the result maybe inaccurate. Also, it uses limited information and seldom able to predict the exact behavior of the state space farther along in the search [8].

Theory of classical probability was proposed by Pascal and Fermat in 1654. Classical probability considers ideal system that do not become worn out like dice, card, and coin.

Classical probability only considers probability that will be searched, as showed by the following formula:

$$P = W/N \quad (1)$$

Where W is the number of wins and N is the number of equally possible events [9].

Bayes theorem relates cause and effect in such a way that by understanding the effect people can learn the probability of its cause. This theory was proposed by Thomas Bayes in 1763 in his paper *Essay towards Solving a Problem in the Doctrine of Chances* [8]. Bayes theorem and classical probability requires the application of mathematical probability in uncertainty management. Bayes theorem is better than classical probability because it has prior value. Unfortunately, to obtain past data is becoming problem for expert. As a result, if prior data is lacking then it will affect the conclusion, even can give wrong conclusion [10].

One of the most known expert systems attempts to develop representations of uncertainty as an extension of deterministic rule-based expert systems is MYCIN. MYCIN was designed to assist physicians in the diagnosis and treatment of bacterial infections. Shorliffe Buchanan in 1975 introduced certainty factor (CF) method through MYCIN. When a CF-based system recommends a decision (for example, when MYCIN suggests treatment for a suspected infection), it makes use of the CFs assigned to the competing diseases to assess the amount of evidence for each [11]. Here is the formula of CF [12]:

$$CF(H,E) = MB(H,E) - MD(H,E) \quad (2)$$

Description :

$CF(H,E)$: Certainty factor from hypothesis H which is affected by symptom (evidence) E

$MB(H,E)$: Measurement of increased belief on hypothesis H affected by symptom E

$MD(H,E)$: Measurement of increased disbelief on hypothesis H affected by symptom E

1) *Parallel CF*: Parallel CF is a CF obtained by some premises from rule. The value of parallel CF is affected by CF User for each premise and operator used in the premise. Here is the formulas for parallel CF [12]:

$$CF(x \text{ AND } y) = \min(CF(x), CF(y)) \quad (3)$$

$$CF(x \text{ OR } y) = \max(CF(x), CF(y)) \quad (4)$$

$$CF(\text{NOT } x) = \neg CF(x) \quad (5)$$

2) *Sequential CF*: Sequential CF is obtained from calculation result of parallel CF of all premises in a rule with CF from expert. Sequential CF is defined as follows [12]:

$$CF(x,y) = CF(x) \times CF(y) \quad (6)$$

Description :

$CF(x,y)$: Sequential CF

$CF(x)$: Parallel CF from all premises in a rule

$CF(y)$: CF from expert

3) *Combined CF*: Combined CF is final CF from conclusion candidate. This CF is affected by all parallel CF from a rule that will produce conclusion. Combined CF is used when a conclusion obtained from several rules at once. Here is the formula for Combine CF [12]:

$$CF(x,y) = \begin{cases} CF(x)+CF(y)-(CF(x) \times CF(y)), & \text{where } CF(x)>0 \\ & \text{and } CF(y)>0 \end{cases} \quad (7)$$

$$\begin{cases} CF(x)+CF(y)/(1-(\min(|CF(x)|,|CF(y)|))), & \text{where} \\ & \text{one of } (CF(x),CF(y))<0 \end{cases} \quad (8)$$

$$\begin{cases} CF(x)+CF(y) \times (1+CF(x)), & \text{where } CF(x)<0 \text{ and} \\ & CF(y)<0 \end{cases} \quad (9)$$

E. Expert Systems in Agriculture

Expert system has been implemented in many areas, such as medical, finance, automotive, and agriculture. During this five years, many expert systems in agriculture were developed, like tobacco expert system, sugarcane expert system, and red chili peppers expert system. CaneDES is a web-based expert system for disorder diagnosis in sugarcane. This expert system diagnoses disorders in sugarcane which is caused by biotic and abiotic and implements a new classified knowledge representation technique [13]. Another expert system that has been developed is an expert system for tobacco disease management that is applied in web. This tobacco expert system uses two methods for disease diagnosis, such as rule based inference and ontology [14]. Expert system for diagnosing diseases of red chili uses forward chaining and certainty factor method. Based on testing results, this expert system can diagnose red chili plant disease with high accuracy [15].

F. Android

Nowadays web-based systems which can be accessed on the PC or laptop is slowly getting unpopular. People move to palm tools gadget like smartphone which makes activity more comfortable and efficient. So that, every business is developing applications for the mobile devices. One of the most popular operating systems used in mobile device is android [16]. Android is a software stack for mobile device that includes an operating system, middle-ware and key applications. Android is mainly based on Linux operating system which uses java-like languages for running applications [17]. The platform was officially announced in October 2008 [18].

G. Diseases of Tomato

In this research, tomato diseases are divided into two categories, biotic and abiotic. Biotic disease is caused by organism such as fungus, virus, and bacteria. While, abiotic disease is caused by environmental factors like pesticide, less of calcium, and sunshine intensity. There are 12 diseases in biotic category, such as Late Blight (*Phytophthora infestans*), early blight (*Alternaria solani*), leaf mold (*Fulvia fulva*), Fusarium wilt (*Fusarium oxysporum f.sp. lycopersici*), Bacteria wilt (*Ralstonia solanacearum*), Tobacco Mosaic (Tobacco Mosaic Virus/TMV), Cucumber Mosaic (Cucumber

Mosaic Virus/CMV), crinkle (Tobacco Crinkle Virus), Tomato Yellow Leaf Curl (Tomato Yellow Leaf Curl Virus/TYCLV), gray mold (*Cercospora sp.*), powdery mildews (*Oidium sp.*) [19]. There are 4 diseases in abiotic category, such as pesticide poisoning, lack of calcium, high intensity of sunshine, and low intensity of sunshine [20].

III. SYSTEM DESIGN

A. Use Case Diagram

Use case diagram describes interaction between user and system, like what action user can do in this system. This diagram shows that tomato expert system has 5 functions as shown in Fig 2, such as do diagnose, see disease's detail information, access help menu, access about menu, and access instruction menu.

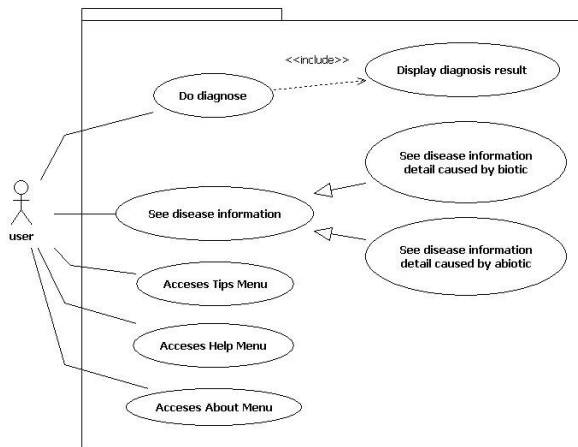

Fig. 2. Use Case Diagram of Tomato Expert System.

B. Calculation of Certainty Factor Method

Calculation method implemented in this expert system is certainty factor. In developing expert system, rule-based is made into two types operator, OR and AND. Operator AND is used for main symptoms. Meanwhile, symptoms using operator OR is displayed in list form. For example, user done a consultation on the tomato leaf with the following symptoms.

- There's spot with diameter 0,5 cm (G22)
- There's gray-brownish ring on the spot (G23)
- There's brown-reddish mold on the spot (G24)

Expert gives CF value 0.79 for the selected symptoms. The rule: **“IF** (There's spot with diameter 0,5 cm (G22) **OR** There's gray-brownish ring on the spot (G23)) **AND** There's brown-reddish mold on the spot (G24) **THEN** *Corynespora* Spot Leaf (B12)”.

Then the calculation is:

$$\begin{aligned}
 \text{Parallel CF} &= CF (G24) \text{ AND } CF (G22 \text{ OR } G23) \\
 &= \min (G24, \max (G22, G23)) \\
 &= \min (0.83, \max (0.79, 0.81)) \\
 &= \min (0.83, 0.81) \\
 &= 0.81
 \end{aligned}$$

$$\begin{aligned}
 \text{Sequential CF} &= CF \text{ from Expert} \times \text{Parallel CF} \\
 &= 0.79 \times 0.81 = 0.6399
 \end{aligned}$$

Percentage of accuracy = 63,99 %

Based on the calculation result, the conclusion for following symptoms chosen by user is *Corynespora* Spot Leaf with the accuracy 63,99%.

IV. TESTING AND RESULTS

The system was developed by using Android Studio, XAMPP on TOSHIBA Satellite L840 and android smartphone OPPO F1s A1601. Two stages of testing, internal and external, is done to see the effectiveness of the system. Internal testing is done by testing system's compatibility and accuracy degree of identification results. To see whether the system is compatible or not, the system is installed in several android devices with different version and screen size. As a result, the system is compatible with Android 4.4 (Kitkat), 5.0 (Lollipop), 6.0 (Marshmallow), and 7.0 (Nougat) version and with android 4,5 inch, 5 inch, and 5,5 inch. The system's function works properly and the interface fits perfectly as shown in Fig 3.

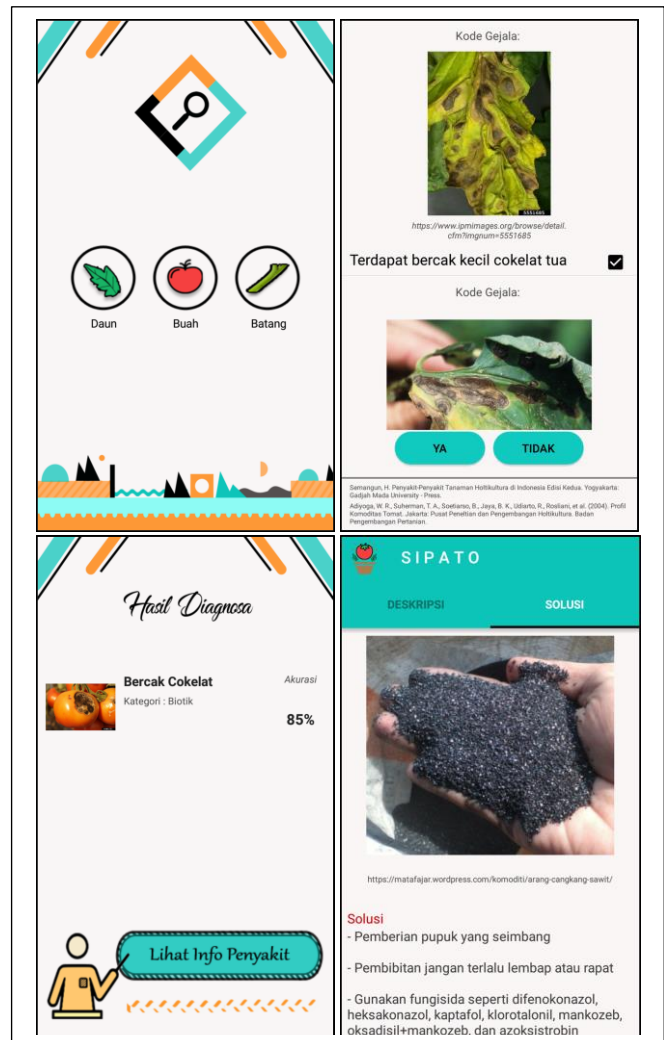

Fig. 3. Interface of Tomato Expert System.

Fig. 4. Facts of Symptom.

This paper provides some facts and compares identification results between the system and expert. It use 33 facts divided into 4 symptom locations, such as leaf, stem, fruit, and crop as shown in Fig 4.

Testing result shows that system gives the accurate identification results. Also, there's degree of accuracy from implementation of certainty factor method. Comparison of identification results is showed in Table II.

TABLE II. TABLE OF COMPARISON IDENTIFICATION RESULTS BETWEEN TOMATO EXPERT SYSTEM AND EXPERT

Facts	Diagnosis	
	System Calculation	Expert Judgement
G02, G21, G03	Late Blight : 66,4%	Late Blight
G02, G01	Powdery Mildews : 61,62%	Powdery Mildews
G25, G27, G36	Pesticide Poisoning : 62,37%	Pesticide Poisoning
G10, G11, G12	Tobacco Mosaic : 63,99%	Tobacco Mosaic
G28, G29	Early Blight : 65,6%	Early Blight
G42, G43, G44	Early Blight : 66,42%	Early Blight
G45, G46	Cucumber Mosaic : 57,75%	Cucumber Mosaic
G51, G48, G49, G50	High intensity of sunshine : 65,57%	High intensity of sunshine
G34, G31, G32	Bacteria Wilt : 71,4%	Bacteria Wilt
G33, G16, G12, G18, G19, G46	Yellow Leaf Curl : 65,57%	Yellow Leaf Curl

External testing is done by giving questionnaire to several respondents. The respondent is divided into 3 groups. Group 1 is experts consist of 4 lecturers from Department of Plant Protection Lampung University. Group 2 is people who are related with this domain consist of 10 farmers and 20 students of Agriculture Faculty of University of Lampung. Group 3 is common people who do not understand about tomato diseases consist of 10 students of Computer Science of University of Lampung.

The respondents were asked to access the system directly and give their assessment by completing the questionnaire. Each statement has 5 answer points with different value, such as Completely Disagree (CD) = 1, Disagree (D) = 2, Slightly Agree (SA) = 3, Agree (A) = 4, and Completely Agree (GA) = 5. Then, those questionnaires being generated into percentage with this following formula [21]:

$$P = \frac{(a \times A)}{(n \times N)} \times 100\% \tag{10}$$

P = Percentage of statement

a = Number of respondents choosing this point

A = Value of statement

n = Number of all respondents

N = Highest value of statement

Next step is deciding interval for each category using this following formula [21]:

$$I = 100\% / k \tag{11}$$

Description :

I = Interval

K = Number of categories

TABLE III. TABLE OF INTERVAL CATEGORY

Percentage	Description
$0\% \geq P \leq 20\%$	Not Good
$20\% > P \leq 40\%$	Less Good
$40\% > P \leq 60\%$	Good Enough
$60\% > P \leq 80\%$	Good
$80\% > P \leq 100\%$	Very Good

REFERENCES

This research uses 5 categories, so interval for each category is 20%. The description for each category is showed in Table III.

Based on the questionnaires result, it shows that this expert system provides useful information for people especially tomato farmers with 87,33%. It helps in identifying diseases well with 79,44%. System works properly and appropriate with 84%. System is easy to understand and to use with 82,77%. Data in the system is complete and clear with 74,44%. It makes people understand about expert system with 79,11%. System provides right solution with 76,11%. Graphic for external testing result is showed in Fig 5.

Fig. 5. Graphic of External Testing Result.

V. CONCLUSIONS

An Android-based tomato expert system implements forward chaining and certainty factor method to identifying tomato diseases has been established. The system which has been installed on various android devices shows the accurate identification result as it is expert. Moreover, all functions work properly and the interface fits perfectly. The result from 44 respondents shows that this tomato expert system is categorized as “good”.

Dear Author(s),

Congratulations, your submitted paper titled "Implementation of Forward Chaining and Certainty Factor Method on Android-based Expert System of Tomato Diseases Identification" has been reviewed and in the International Journal of Advanced Computer Science and Applications (IJACSA) - Volume 9 No 8 August 2018.

accepted for publication

All papers published by International Journal of Advanced Computer Science and Applications are made freely and permanently accessible online immediately upon publication, without any subscription charges.

You may now proceed with the online registration for paper publication at . If you do not have any credit/debit card available or the payment process fails, please get in touch with us.

Registration and Publication Fee Payment

www.thesai.org/Home/FeePayment

Kindly register before for timely publication and indexing of your paper.

20th August 2018

Open Access

Indexing

Upon publication of papers, our next steps will be to submit all published papers in International Indexes and University Libraries. Some of the other indexes include Web of Science, Scopus, Inspec, Ebescos, Microsoft Academic, WorldCat. IJACSA is also indexed in the Thomson Reuters Emerging Sources Citation Index and is also listed in the Thomson Reuters Master Journal List - <http://science.thomsonreuters.com/cgi-bin/jrnlst/jlresults.cgi?PC=MASTER&ISSN=2158-107X>

All submitted manuscripts were subject to a double-blind peer review process. The Editorial Board has decided that the reviewers' feedback will be emailed to the author(s) after successful registration.

Reviewer Feedback

Wishing you all the best and hope to hear from you soon, Regards, EditorIJACSAThe Science and Information (SAI) Organization
