Abstract—Diabetes Mellitus (DM) is a metabolic disease characterized by hyperglycemia due to insulin secretion abnormalities and a global health threat. DM has several types, namely type 1, 2, gestational, and other types. Type 2 diabetes patients have the largest number in the world. DM therapy can be done in 2 (two) ways: improving lifestyle and administering drugs. The problems and risks in recommending drugs are essential in the patient's healing process because they are likely to take medicine for life. Approximately 260,000 patients with type 2 diabetes experienced medication errors in 2017. The doctor's mistake in recommending drugs causes a long healing process and costs more. Recommending drugs requires pharmacological knowledge, and not all hospitals have pharmacologists. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of medications used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects. Therefore, this study aims to build an expert system model with a new approach in recommending antidiabetic drugs with more complete parameters and recommend dosage and frequency. The model developed uses the Fuzzy Profile Matching method. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. The dose was calculated using the FIS Tsukamoto for inputting low dosage, and high dosage calculated the weighted average value. Determination of frequency using the IF-Then function. Model evaluation is done by comparing recommendation data from doctors. The results of the evaluation of the model obtained an accuracy of 90%. This system will reduce medical personnel errors in recommending antidiabetic drugs that can positively impact patients' time, the healing process, and costs. This study provides knowledge that antidiabetes drugs' determination requires many parameters, while other studies used only 4 to 8. This study also provides an overview of the dosages of drugs that drug companies can produce. Usually, the company only makes low and high dosage. This study shows that creating multiple drug dosage is more efficient for patients.

Keywords—Model evaluation; diabetic type 2; fuzzy Tsukamoto; profile matching; drugs; dosage; frequency.

I. INTRODUCTION

Diabetic Mellitus (DM) Type 2 is a group of metabolic diseases with hyperglycemia characteristics that occurs because of an abnormality receptor insulin that lasts long also affects its secrecy. DM type is classified into 4 (four) groups, namely Type 1 DM, type 2 DM, gestational DM, and other type DM [1][2]. Blood glucose levels are expressed as diabetic, among others, with a rate of HbA1c > 6.5% (mmol/L) [3]. Until today DM is still one of the global health threats. Epidemiological research indicates the tendency to

increase the incidence rate and prevalence of type 2 Diabetic Mellitus in various parts of the world[4]. The majority of DM is predicted to grow 3 (three) times in 2030. This increase has been expected by the World Health Organization (WHO) that the year 2030 will reach 21.3 million[1], and Predicted from the International Diabetic Federation (IDF) in 2045 will reach 16.7 million [3].

DM can occur in patients accompanied by other diseases. DM therapy can be done 2 (two) to improve the lifestyle and Drug Administration [2]. Treatment of medications using Oral and Insulin types [5]. Commonly used oral drugs are types of Sulfonylurea, Glinide, Biguanide, Tiazolidin, Alpha

Glucose inhibitors, GLP-1, SGLT-2, DPP-4, while for Insulin there are Lispo, Aspart, Glulysine and Faster Aspart [6]. The goal of therapy in DM is to reduce hyperglycemia symptoms, reduce the onset and development of complications, reduce mortality, and improve life quality [6]. Antidiabetic drugs usually pay attention to age, comorbidities, risk of hypoglycemia, and many other factors [7].

Efforts to manage DM still have obstacles in terms of service and health financing [4]. It should be noted that health workers in carrying out their work require high pharmacological accuracy and knowledge [8]. Around 260,000 patients with diabetes experienced medication errors in 2017 [8]. Ignorance and negligence of action to the patient will have an impact on patient safety. One thing that must be considered is the procedure for administering injectable and oral drugs. Giving injection drugs is more at risk of causing hypoglycemic conditions that are dangerous for patients. In addition to economic wastage, irrational drug use patterns can decrease treatment services quality, increase drug side effects, increase treatment failure, and increase insulin resistance [9]. Cases in various health institutions were found to be incorrectly given unnecessary drug combinations. The selection of an appropriate oral hypoglycemic drug is crucial to the success of diabetic therapy, depending on the severity and condition of the patient. Oral hypoglycemic pharmacotherapy can be done using one drug or a combination of two types of drugs [7].

Sub-therapeutic drug administration results in ineffective drug therapy. Drug administration with excessive dosage results in hypoglycemic effects and the possibility of toxicity [10]. Inappropriate use of Insulin often results in hypoglycemia and can lead to weight gain. Unwanted drug effects can occur in long-term use, such as lipodystrophy or loss of fat tissue at the injection site, and allergic reactions can occur, including edema [11]. Treatment must be started as early as possible to prevent or slow the progression of beta-cell failure in people with impaired glucose tolerance [4].

Several researchers have conducted research that discusses antidiabetic drug recommendations. In the study showed Rung-Ching Chen *et al.* [12], the drug recommendations used the SWRL technique with 6 (six) types of antidiabetic drugs Metformin, DPP4, Sulfonylurea, Glinide, Thiazolidinedione, Alpha-Glucosidase (AGI) with 6 (six) parameters of HbA1c, Hypoglycemia, Renal, Heart, BMI, and liver. This research was developed with the Fuzzy method that can display the results of drug recommendations based on the most appropriate level of choice [13]. Drug recommendations are also carried out using Fuzzy-TOPSIS with 7 (seven) types of drugs and 8 (eight) parameters [14]. In 2018 Fuzzy, combined with MULTIMOORA with input data scoring, recommended antidiabetic drugs using 8 (eight) parameters. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of medications used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects such as glucagon secretion (Cell Alpha Pancreas), insulin secretion (Cell Beta), glucose fat, glomerular filtration, muscle glycogen and

contraindications with pregnant or nursing women and infections [15]. Drug recommendations must be adapted to the patient's condition or variables to avoid errors and drug side effects. The number of patient variables has the main and second variables [16]; therefore, the Profile Matching (PM) method is very appropriate because it has a Core Factor and Secondary Factor calculations.

The problem and the risk of recommending drugs are essential in healing patients to maintain health services quality [10]. This research supports this research; this study aims to build an expert system model with a new approach to recommending antidiabetic drugs with more complete parameters and recommend dosage and frequency. The model developed uses the Fuzzy Profile Matching method. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. Model evaluation is done by comparing recommendation data from doctors. A safe treatment system needs to be developed and maintained to ensure that patients receive good drug services due to the increasingly varied drugs and the increasing number of drugs and types of antidiabetic drugs [17]. This study's results can be used as an alternative to help paramedics. Young doctors recommend the right dosage and frequency of medicines to improve the quality of health services, accelerate the healing process, and reduce medical costs.

II. MATERIALS AND METHOD

The application of the suitability of antidiabetic drugs to the patient's health condition was developed by illustrating the proposed model's architecture. The development of the model consists of 2 (two) main parts, namely the development knowledge base and development environment presented in Fig. 1 model was developed from the drug suitability model [16].

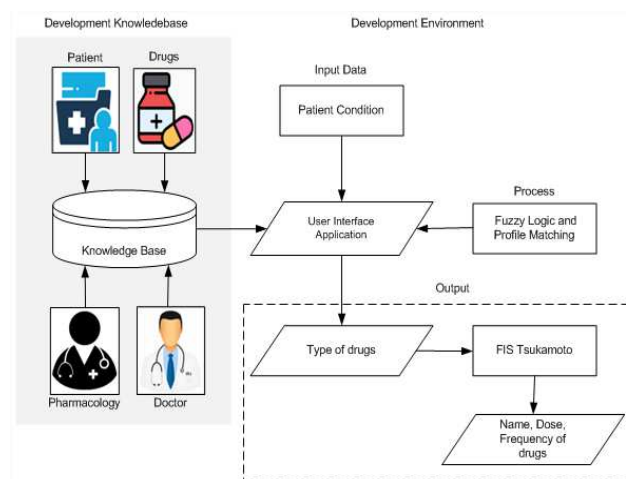

Fig. 1. Model of the suitability of type 2 antidiabetic drugs

A. Development Stages

The first development from the expert consultation stage and the result is presented in Figure. 2. Expert consultation was carried out by specialists in internal medicine, diabetes, and pharmacology to obtain parameters and knowledge base. The next step is the process of matching antidiabetic drugs to the patient's condition using a membership curve. The next

match's result was calculated by the core and secondary factors using the Profile Matching method. In addition to the

type of drug, for determining the dose using Tsukamoto FIS. The stages of development can be seen in Fig. 2.

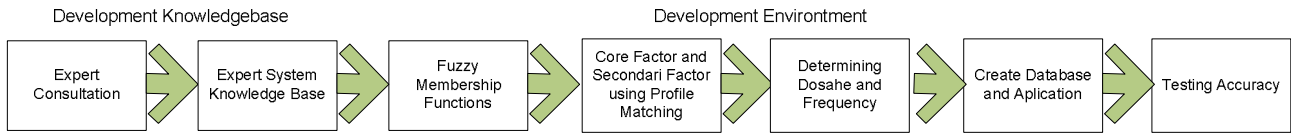

Fig. 2 Stages of model development

B. Expert Consultation

Based on consultations with internists and pharmacologists, as well as a review of several works of literature [5], [18], [19], [4], there are 17 (seventeen) parameters that influence determining the delivery of antidiabetic type 2 drugs. In addition to considering the patient's health parameters, the drug's efficacy and price are presented in Table I.

TABLE I
INPUT PARAMETERS FOR THE DETERMINATION OF ANTIDIABETIC MELLITUS TYPE 2 DRUGS

| P1 | P2 | P3 | P4 | P5 | P6 | P7 | P8 | P9 |
|---------------|-----------------|-------------------|-----------------------|--------------------|-----------|----------------|--------------------------|--------------|
| HbA1c | Age | Body mass index | Renal | Liver | Heart | Blood pressure | Hypoglycemi ^a | Cell of beta |
| % | year | kg/m ² | mg/dl | μ/L | pg/ml | mm/Hg | % | % |
| P10 | P11 | P12 | P13 | P14 | P15 | P16 | P17 | |
| Cell of alpha | Free fatty acid | Muscle glycogen | Filtration glomerulus | Pregnant/lactating | Infection | Efficacy | Cost | |
| % | % | % | ml/min utes | Yes/ No | Yes/ No | High/Mi ddle | Low/H igh | |

Brief description of each patient's health parameters that influences in determining the type 2 antidiabetic drug administration:

- HbA1c (hemoglobin A1c) is a protein containing iron in red blood cells. High or low HbA1c levels will affect drug administration. Intake of HbA1c by pricking a needle in a vein in the arm. Normal levels of HbA1c <6.5% [2]
- Age is taken from the year of birth. Age>60 years old and <60 years old is young. The age of the patient will determine the choice of drug type because not all ages can be given the same drug [1]
- BMI is taken from body weight and height [20]. Kadar normal BMI <25. If someone has a BMI>25, then the drug to be given is different from patients who have a BMI <25kg/m²[20]
- Renal is the level of kidney health obtained based on laboratory tests with the Enzymatic method performed on patients by calculating creatinine levels [21]. Patients with kidney patients need special attention from doctors [18]
- The liver is SGPT (Serum Glutamic Pyruvic Transaminase) level is an abundant enzyme in the liver. Normal levels of 7-56 micro per liter of serum (μ/L) [22].

- Heart health uses the value of B-type natriuretic peptide (BNP) is a hormone produced by the heart. The BNP hormone (NT-proBNP) is a non-active hormone released from the same molecule that has BNP [23]
- Hypoglycemia is a condition when the body's blood sugar levels are too low. Hypoglycemia normal <50% mmol/L [5]. Provision of antidiabetic drugs pay attention to the effects of hypoglycemia [24]
- Beta cells (β cells) are cells found in pancreatic islets that synthesize and secrete Insulin. Beta cells account for about 50-70% of cells in the islet of the pancreas in the human body [25]
- Pancreatic Alpha Cells are cells that function to produce glucagon hormone. This hormone increases blood sugar levels, breaks down the liver reserves in the liver, and then carries it to the blood. Alfa cells account for around 25% of the island of Langerhans [22]
- Free fatty acid (FFA) is the content of free fatty acids in the body that cause cholesterol that can affect drug administration. Normal levels of 30-50 FFA%[4]
- Muscle glycogen is a type of sugar polysaccharide that is stored in liver cells and body muscle cells. Glycogen data is obtained by converting glucose levels obtained from food [22]
- Glomerular filtration is the average rate of blood filtration that occurs in the glomerulus in ml/min units [26]
- Pregnant/lactating is the condition of the patient's history of being pregnant or breastfeeding. Some anti-diabetic drugs have contraindications with this condition [10]
- Infection is the condition of the patient who has a wound or postoperatively. Patients who are experiencing disorders should not be given drugs Sulfonilurena, Glinide, Biguanide, and SGLT-2 [18]
- Efficacy is the level of effectiveness of the drug [18]
- Cost is the cost of purchasing drugs. Determination of the price of medicines taken from the guidelines for the treatment of type 2 diabetes [5]

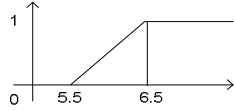

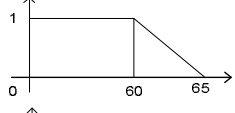

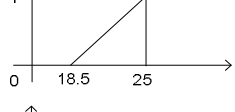

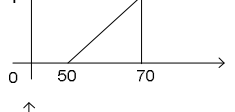

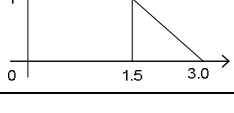

C. Expert System Knowledge Base

The parameters used are made in the form of a knowledge base for each parameter's degree of compatibility with the type of antidiabetic drugs. The knowledge base is presented in Table II. Almost all type 2 diabetic drugs should not be given to DMT2 patients with impaired liver or kidney function, liver, high blood pressure, and severe heart problems. Patients with T2DM aged ≥60 years and overweight (BMI) should be aware of the onset of hypoglycemia. There are types of contraindicated drugs in patients with impaired renal function with LFG ≤ 30 mL/[4]. Also, drug administration needs to be considered for pregnant or breastfeeding patients and have infections [10].

TABLE II
KNOWLEDGEBASE FOR THE SUITABILITY OF ANTI-DIABETIC DRUGS [5], [18], [19], [4]

| Type | HbA1c | Age | BMI | Renal | Liver | Heart | Blood pressure | Hypo glycemia | Cell Beta Pancreas | Cell Alpha | Free Fatty Acid | Muscle Glycogen | Filtrasi Glomerulus | Pregnant /Lactating | Infection | Efficacy | Cost |
|---------------|---------|-------|-------|------------|-------|-------|----------------|---------------|--------------------|------------|-----------------|-----------------|---------------------|---------------------|-----------|----------|------|
| Biguanide | >6.5 | 17-60 | 25-35 | >1.2 | <56 | <100 | >90 | >50 | >50% | <20% | <50% | <1% | >30 | No | No | High | Low |
| Sulfonilurena | >7.0 | <60 | <25 | <1.2 | <56 | >100 | >140 | <50 | <50% | <20% | <50% | >1% | <30 | No | No | High | Low |
| Glinide | >7.5 | >60 | <25 | >0.55 | <56 | >100 | <140 | <50 | <50% | <20% | <50% | >1% | <30 | Yes | No | High | High |
| Thiazolidin | >7.0 | 18-45 | <25 | >0.55 | <56 | <100 | <140 | >50 | >50% | <20% | >50% | <1% | <30 | Yes | Yes | High | Low |
| Alpha Glucose | 7.5 - 9 | <60 | >25 | <1.2 | <56 | >100 | <140 | >50 | >50% | <20% | <50% | >1% | >30 | Yes | Yes | High | Low |
| GLP-1 | 7-9 | >55 | >25 | >1.2 | >56 | >100 | >140 | >50 | <50% | >20% | <50% | >1% | >30 | Yes | Yes | High | High |
| SGLT2 | >9 | >55 | >25 | >1.2 | >56 | >100 | >140 | >50 | >50% | <20% | <50% | >1% | >45 | Yes | No | Middle | High |
| DPP-4 | 7-9 | >55 | >18.5 | >1.2 | <56 | >100 | >140 | >50 | <50% | >20% | <50% | >1% | <30 | Yes | Yes | Middle | High |
| Insulin | >9 | >13 | <25 | 0.55 - 1.2 | >56 | <100 | >140 | <50 | >50% | <20% | <50% | >1% | <30 | Yes | Yes | High | Low |

TABLE III
CURVES AND MEMBERSHIP FUNCTIONS FOR BIGUANIDE DRUGS

| Parameters | Curve | Membership function |
|--------------|--|---|
| HbA1c (%) |  | $\mu(x) = \begin{cases} 0; & x \leq 5.5 \\ \frac{x - 5.5}{5.5 - 6.5}; & 5.5 \leq x \leq 6.5 \\ 1; & x > 6.5 \end{cases}$ |
| Age (years) |  | $\mu(x) = \begin{cases} 1; & x \leq 60 \\ \frac{65 - x}{65 - 60}; & 60 \leq x \leq 65 \\ 0; & x > 65 \end{cases}$ |
| Weight (BMI) |  | $\mu(x) = \begin{cases} 0; & x \leq 18.5 \\ \frac{x - 18.5}{25 - 18.5}; & 18.5 \leq x \leq 25 \\ 1; & x > 25 \end{cases}$ |
| Hypoglycemia |  | $\mu(x) = \begin{cases} 0; & x \leq 50 \\ \frac{x - 50}{70 - 50}; & 50 \leq x \leq 70 \\ 1; & x > 70 \end{cases}$ |
| Renal |  | $\mu(x) = \begin{cases} 1; & x \leq 1.5 \\ \frac{3.0 - x}{3.0 - 1.5}; & 1.5 \leq x \leq 3.0 \\ 0; & x > 3.0 \end{cases}$ |

| | | |
|---------------------|--|--|
| Liver | | $\mu(x) = \begin{cases} 0; & x \leq 40 \\ \frac{x - 145}{150 - 145}; & 40 \leq x \leq 100 \\ 1; & x > 100 \end{cases}$ |
| Heart | | $\mu(x) = \begin{cases} 1; & x \leq 100 \\ \frac{110 - x}{110 - 100}; & 100 \leq x \leq 110 \\ 0; & x > 110 \end{cases}$ |
| Blood pressure | | $\mu(x) = \begin{cases} 0; & x \leq 80 \\ \frac{x - 80}{90 - 80}; & 80 \leq x \leq 90 \\ 1; & x > 90 \end{cases}$ |
| Cell of beta | | $\mu(x) = \begin{cases} 0; & x \leq 45 \\ \frac{x - 145}{150 - 145}; & 45 \leq x \leq 50 \\ 1; & x > 50 \end{cases}$ |
| Cell of alpha | | $\mu(x) = \begin{cases} 1; & x \leq 20 \\ \frac{25 - x}{25 - 20}; & 20 \leq x \leq 25 \\ 0; & x > 25 \end{cases}$ |
| Free Fatty Acid | | $\mu(x) = \begin{cases} 1; & x \leq 50 \\ \frac{55 - x}{55 - 50}; & 50 \leq x \leq 55 \\ 0; & x > 55 \end{cases}$ |
| Muscle Glycogen | | $\mu(x) = \begin{cases} 1; & x \leq 1 \\ \frac{3 - x}{3 - 1}; & 1 \leq x \leq 3 \\ 0; & x > 3 \end{cases}$ |
| Filtration | | $\mu(x) = \begin{cases} 0; & x \leq 25 \\ \frac{x - 25}{30 - 25}; & 25 \leq x \leq 30 \\ 1; & x > 30 \end{cases}$ |
| Pregnant /Lactating | | $\mu(x) = \begin{cases} 0 & \text{Yes} \\ 1 & \text{No} \end{cases}$ |
| Infection | | $\mu(x) = \begin{cases} 0 & \text{Yes} \\ 1 & \text{No} \end{cases}$ |
| Efficacy | | $\mu(x) = \begin{cases} 1 & \text{High} \\ 0 & \text{Middle} \end{cases}$ |
| Cost | | $\mu(x) = \begin{cases} 1 & \text{Low} \\ 0 & \text{High} \end{cases}$ |

D. Fuzzy Membership Functions

Based on the knowledge base in table II, they then made in the form of curves and fuzzy logic membership functions for each parameter with the suitability of the type of antidiabetic drug. Curves and membership functions of the kind of antidiabetic drug Biguanide are shown in Table III.

TABLE IV
CALCULATION VALUE MEMBERSHIP FUNCTIONS

| Id | Parameters | Data | Value of membership |
|----|-----------------------|------|---------------------|
| 1 | HbA1c | 6.9 | 1 |
| 2 | Age | 62 | 0.6 |
| 3 | BMI | 24 | 0.84 |
| 4 | Renal | 2.3 | 1 |
| 5 | Liver | 54 | 1 |
| 6 | Hearts | 98 | 1 |
| 7 | Blood pressure | 138 | 1 |
| 8 | Hypoglycemia | 60 | 1 |
| 9 | Cell of beta | 67 | 1 |
| 10 | Cell of alpha | 19 | 1 |
| 11 | Free fatty acid | 45 | 1 |
| 12 | Muscle glycogen | 2.6 | 0.2 |
| 13 | Filtration glomerulus | 33 | 1 |
| 14 | Pregnant/lactating | No | 1 |
| 15 | Infection | Yes | 0 |
| 16 | Efficacy | High | 1 |
| 17 | Price | Low | 1 |

Membership functions need to be made for the types of antidiabetic drugs Sulfonylurea, Glinid, Thiazolidinedione, Alpha-Glucosidase, GLP-1, SGLT-2, DPP4, and Insulin need to be made. Based on the membership function in Table III, the value of each parameter is then calculated. Table IV displays the membership values for each parameter with the type of antidiabetic drug Biguanide

E. Core Factor and Secondary Factor

Parameter grouping is divided into 2 (two), namely Core Factor (CF) and Secondary Factor (SF). Core Factor is the leading parameter group where the determination of the type of drug given is very dependent on the parameters in this group, whereas a Secondary Factor is a parameter group that does not have a strong influence on the determination of the type of drug given to patients [27]

TABLE V
CLASSIFYING PARAMETERS CF AND SF

| Core Factor (CF) | Secondary Factor (SF) |
|-----------------------------|-----------------------|
| Age (P2) | HbA1c (P1) |
| Renal (P4) | BMI (P3) |
| Liver (P5) | Blood pressure (P7) |
| Heart (P6) | Cell alpha (P10) |
| Hypoglycemia (P8) | Free fatty acid (P11) |
| Cell beta (P9) | Muscle glycogen (P12) |
| Filtration glomerulus (P13) | Efficacy (P16) |
| Pregnant/lactating (P14) | Price (P17) |
| Infection (P15) | |

Calculate the value of CF using a formula:

$$CF = \frac{\sum NC}{\sum IC} \quad (1)$$

CF = The average value of the core factor

NC = Total number of core factor values

IC = Number of items CF value

$$SF = \frac{\sum NS}{\sum IS} \quad (2)$$

SF = The average value of the secondary factor

NS = Total number of secondary factor values

IS = Number of secondary factor items

Based on the grouping of core factors and the subsequent factors calculated the average value:

The value of the average core factor parameters

$$CF = \frac{(0.6+1+1+1+1+1+1+0)}{9} = 0.84$$

The value average secondary factor parameters

$$SF = \frac{(1+0.84+1+1+1+0.2+1+1)}{8} = 0.88$$

The grouping core factor's value average value multiplied the weight of 75%, and the secondary factor bore with a weight of 25%. The result of the core factor and secondary factor weights are then added to get a matching value:

$$Total = (Weight CF * CF) + (Weight SF * SF) \quad (3)$$

$$\begin{aligned} Total &= (0.75 * CF) + (0.25 * SF) \\ &= (0.75 * 0.84) + (0.25 * 0.88) \\ &= 0.63 + 0.22 \\ &= 0.85 \end{aligned}$$

Results calculate of the value 0.85 indicate that the patient "P1" if given the class of antidiabetic medicine Biguanide has suitable $(0.85 / 1) \times 100\% = 85\%$ and for the second medicine 76% that Alpha-glucose, the medications are given can be combined, the show is Table VI.

TABLE VI
DRUG SUITABILITY CALCULATION RESULTS

| Id | Type | Value | Level |
|----|-------------------|-------|-------|
| 1 | Sulfonylurea | 0.56 | 7 |
| 2 | Glinide | 0.55 | 8 |
| 3 | Biguanide | 0.85 | 1 |
| 4 | Thiazolidinedione | 0.71 | 5 |
| 5 | Alpha-Glucosidase | 0.76 | 2 |
| 6 | GLP-1 | 0.73 | 3 |
| 7 | SGLT2 | 0.52 | 9 |
| 8 | DPP-4 | 0.60 | 6 |
| 9 | Insulin | 0.72 | 4 |

This model can evaluate the suitability of the patient's condition with various types of antidiabetic drugs.

F. Dosage and Frequency Drug

The dose and frequency of drug administration are very influential in the therapeutic effect of the drug. Giving excessive dosage, especially for drugs with a narrow range of therapy, will be very at risk of side effects. Conversely, a too small dose will not guarantee the achievement of less than optimal therapeutic levels [17].

TABLE VII
TYPE, DOSAGE, AND FREQUENCY DRUGS [18][4]

| Id | Type | Drugs | Dosage | Frequency (Ones/Day) |
|----|--------------|---------------|---------------|----------------------|
| 1 | Sulfonylurea | Glibenclamide | 2.5 - 20mg/dl | 1-2 |

| | | | | |
|---|--------------------|---------------|-----------------|-----|
| | | Gliclazide | 40 - 320 mg/dl | 1-2 |
| 2 | Glinide | Repaglinide | 1-16 mg/dl | 2-4 |
| | | Nateglinide | 180 - 360 mg/dl | 2-3 |
| | | Metformin | 500 - 3000mg/dl | 1-3 |
| 3 | Biguanide | Buformin | 50 - 100 mg/dl | 1-2 |
| | | Pioglitazone | 15 - 45 mg/dl | 1-2 |
| 4 | Thiazolidine dione | Rosiglitazone | 4 - 8 mg/dl | 1-2 |
| | | Acarbose | 100 - 300 mg/dl | 2-3 |
| 5 | Alpha-Glucose | Miglitol | 25-100 mg/dl | 2-3 |
| | | Liraglutide | 0.6 - 1.8 mg/dl | 1-2 |
| 6 | GLP-1 | Lixisenatide | 10 - 20 mg/dl | 1-2 |
| | | Dapagliflozin | 5 - 10 mg/dl | 1-2 |
| 7 | SGLT2 | Empagliflozin | 10 - 25 mg/dl | 1-2 |
| | | Vildagliptin | 50-100 mg | 1-2 |
| 8 | DPP-4 | Sitagliptin | 25-100 mg | 1-2 |
| | | Lispro | 0.1 - 1 Unit/Kg | 1-2 |
| 9 | Insulin | Aspart | 0.05 - 1Unit/Kg | 1-2 |

G. The domain of Medicine Dosage

Determination of the dose using the parameters in Figure 4 (a). Each parameter becomes an input variable, divided by 2 (two) in linguistic and domain variables. The environment's output is a dose calculated using Tsukamoto's FIS to calculate a more appropriate dosage.

TABLE VIII
DOMAIN PARAMETERS FOR DETERMINES DRUGS DOSAGE

| Id | Parameters | Linguistic Variable | Domain | Output (Dosage) |
|----|--------------|---------------------|---------|-----------------|
| 1 | HbA1c | Normal | 0-9 | |
| | | Abnormal | 6.5-12 | |
| 2 | Age | Young | 0-65 | Low |
| | | Old | 60-100 | |
| 3 | BMI | Low | 0-27 | [0-600] |
| | | High | 24-30 | |
| 4 | Renal | Normal | 0-1.5 | High |
| | | Abnormal | 1.2-3.0 | |
| 5 | Liver | Normal | 0-100 | [500-1000] |
| | | Abnormal | 40-100 | |
| 6 | Hypoglycemia | No | 0-70 | |
| | | Yes | 50-120 | |

TABLE IX
THE DOSAGE DOMAIN OF THE DRUG IS BIGUANIDE

| Type | Drugs | Dosage (mg/dl) | Domain | |
|-----------|-----------|----------------|--------|----------|
| | | | Low | High |
| Biguanide | Metformin | 500 - 1000 | 0-600 | 500-1000 |

Based on Table IX. The next step is to make a curve for each parameter presented in Fig. 3-5, and the output curves for drug dosages are shown in Fig. 6.

Fig. 3 Curve membership function for HbA1c and Age

Fig. 4 Curve membership function for BMI and Renal

Fig. 5 Curve membership function for Liver and Hypoglycemia

Fig. 6 Curve membership function for dosage

Each parameter's membership value is then calculated based on the membership curve and function, as in Table X.

TABLE X
MEMBERSHIP VALUES FOR PARAMETER

| Parameters | Data | Linguistic Variables | |
|--------------|------|----------------------|----------|
| | | Normal | Abnormal |
| HbA1c | 6.9 | 0.84 | 0.16 |
| Age | 62 | 0.8 | 0.2 |
| BMI | 24 | 0 | 1 |
| Renal | 2.3 | 0 | 1 |
| Liver | 54 | 0.76 | 0.23 |
| Hypoglycemia | 60 | 0.50 | 0.50 |

H. Fuzzy Implication Rules for Dosage

Monotonous fuzzy rules are used as a basis for fuzzy implication techniques. The number of practices used is calculated based on the number of criteria and sub-criteria [28]. The parameters used are 6 (six) as HbA1c, Age, BMI, Renal, Liver, Hypoglycemia, and sub-criteria of each criterion are 2 (two), so the number of rules use is $2^6 = 64$ rules. Examples of the use of practices as follows:

“[R13]If HbA1c= Normal and Age=Young and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglycemia=No Then Low dosage;”
 “[R29]If HbA1c= Normal and Age=Old and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglycemia=No Then Low dosage;”
 “[R30]If HbA1c= Abnormal and Age=Young and BMI=Low and Renal=Normal and Liver=Normal and Hypoglycemia=Yes Then High dosage;”
 “[R45]If HbA1c= Abnormal and Age=Young and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglycemia=No Then High dosage;”
 “[R61]If HbA1c= Abnormal and Age=Old and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglycemia=No Then Low dosage;”
 “[R64]If HbA1c= Abnormal and Age=Old and BMI=High and Renal=Abnormal and Liver=Abnormal and Hypoglycemia=Yes Then Low dosage;”

Then value z calculation will be performed to look for output using FIS Tsukamoto from each rule given explicitly (crisp) based on α -predicate (fire strength). In this calculation, not all α and z_{1-64} rules are displayed. The final result is obtained using a weighted average. Examples of the use of practices as follows:

α -predicat₁₃ = $\mu_{\text{HbA1c Normal}} \cap \mu_{\text{Age Young}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
 No Then Low dosage;

$$= \text{Min} (0.84; 0.8; 1; 1; 0.76; 0.5) = 0.5$$

$$Z_{13} = \text{High} - (\alpha_{13} * (\text{High-Low})) = 3000 - (0.5 * (3000-500)) = 1750$$

α -predicat₂₉ = $\mu_{\text{HbA1c Normal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
 Low dosage;

$$= \text{Min} (0.84; 0.2; 1; 1; 0.76; 0.5) = 0.2$$

$$Z_{29} = \text{High} - (\alpha_{29} * (\text{High-Low})) = 3000 - (0.2 * (3000-500)) = 2500$$

α -predicat₃₀ = $\mu_{\text{HbA1c Normal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia Yes}}$
 Low dosage;

$$= \text{Min} (0.84; 0.2; 1; 1; 0.76; 0.5) = 0.2$$

$$Z_{30} = \text{High} - (\alpha_{30} * (\text{High-Low})) = 3000 - (0.2 * (3000-500)) = 2500$$

α -predicat₄₅ = $\mu_{\text{HbA1c Abnormal}} \cap \mu_{\text{Age Young}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
 Then High dosage;

$$= \text{Min} (0.16; 0.8; 1; 1; 0.76; 0.5) = 0.16$$

$$Z_{45} = \alpha_{45} * (\text{High-Low}) + \text{Low} = 0.16 * (3000-500) + 500 = 900$$

α -predicat₆₁ = $\mu_{\text{HbA1c Abnormal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
 Then Low dosage;

$$= \text{Min} (0.16; 0.2; 1; 1; 0.76; 0.5) = 0.16$$

$$Z_{61} = \text{High} - (\alpha_{61} * (\text{High-Low})) = 3000 - (0.16 * (3000-500)) = 2600$$

α -predicat₆₄ = $\mu_{\text{HbA1c Abnormal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Abnormal}} \cap \mu_{\text{Hypoglycemia Yes}}$
 Yes Then Low dosage;

$$= \text{Min} (0.16; 0.2; 1; 1; 0.23; 0.5) = 0.16$$

$$Z_{64} = \text{High} - (\alpha_{64} * (\text{High-Low})) = 3000 - (0.16 * (3000-500)) = 2600$$

TABLE XI
 MEMBERSHIP VALUE FOR ALL A_{1-64} AND Z_{1-64} FROM PARAMETERS

| Id | HbA1c | Age | BMI | Renal | Liver | Hypo | Min (α_{1-64}) | Z_{1-64} |
|----|-------|-----|-----|-------|-------|------|-------------------------|------------|
| 13 | 0.84 | 0.8 | 1 | 1 | 0.76 | 0.5 | 0.5 | 1750 |

| 45 | 0.16 | 0.8 | 1 | 1 | 0.76 | 0.5 | 0.16 | 900 |
| 61 | 0.16 | 0.2 | 1 | 1 | 0.76 | 0.5 | 0.16 | 2600 |
| 64 | 0.16 | 0.2 | 1 | 1 | 0.23 | 0.5 | 0.16 | 2600 |

I. Determining Dosage

After a combination of forming rules, the next step is doing a calculation to get the value of defuzzification by adding the rules to regulations 64 to get the weighted average values (*Weight Average*)

$$z (\text{Dosage}) = \frac{(a1*z1)+(a2*z2)+(a3*z3)+(a4*z4)+\dots+(a64*z64)+}{a1+a2+a3+a4\dots a64} \quad (4)$$

$z (\text{Dosage}) = 2160$ mg/dl. Based on the name of the drug Metformin with the lowest dose of 500 ml/gl and the highest dosage of 3000 ml/dl in Table XI, based on the results of the system recommendations for the correct dosage given by patients as many as 2160 mg/dl.

TABLE XII
 DIFFERENCES IN RECOMMENDED DOSAGES BETWEEN DOCTORS AND THE SYSTEM

| Id | Input | | | | | | Type and drugs | Output | |
|----|-------|-----|-----|-------|-------|---------------|---------------------------------|--|-------------------------------------|
| | HbA1c | Age | BMI | Renal | Liver | Hypo glycemia | | The daily dose recommended by the doctor | Daily dose obtained from the system |
| 1 | 6.5 | 39 | 25 | 0.7 | 78 | 6.5 | Insulin/Lispro | 1 Unit/mL | 6 Unit/mL |
| 2 | 6.9 | 62 | 24 | 2.3 | 54 | 60 | Biguanide/Metformin | 500 mg/dl | 2160 mg/dl |
| 3 | 8.3 | 60 | 20 | 0.8 | 33 | 55 | Biguanide/Metformin | 500 ml/dl | 1703 mg/dl |
| 4 | 6.65 | 40 | 30 | 0.8 | 98 | 65 | Thiazolidinedione/ Pioglitazone | 15 mg/dl | 28 mg/dl |
| 5 | 6.8 | 37 | 27 | 2.1 | 100 | 66 | Biguanide/Metformin | 500 mg/dl | 1571 mg/dl |
| 6 | 11 | 44 | 29 | 0.6 | 140 | 70 | Biguanide/Buformin | 50 mg/dl | 50 mg/dl |
| 7 | 7.9 | 50 | 27 | 3.8 | 130 | 68 | Biguanide/Buformin | 50 mg/dl | 78 mg/dl |
| 8 | 11.6 | 62 | 20 | 2.7 | 130 | 0 | Biguanide/Metformin | 500 mg/dl | 1300 mg/dl |
| 9 | 9.8 | 37 | 27 | 3.8 | 80 | 40 | Insulin/Aspart | 1 Unit/mL | 5 Unit/mL |
| 10 | 6.8 | 65 | 20 | 0.6 | 0 | 55 | Alfa-Glucosidase/ Miglitol | 25 mg/dl | 56 mg/dl |

Fig. 7 The daily dose of medicine recommended by doctor and system

Fig. 7 shows the system recommendations can provide daily dosage according to the patient's severity, while the doctor's recommended dosage begins using a low dosage [29]. Giving too low a dosage can result in suboptimal results [17], and recovery is prolonged for up to 1 year. However, for patients receiving the system's recommended daily dose, recovery duration is shorter to ≤ 3 months [30].

J. Determine Drugs Frequency

The low frequency of use will result in a healing process and have an extended usage interval frequency of drug use that can cause side effects that can worsen the patient's condition. The dose should consider the HbA1c level $< 8\%$ to determine the drug dosage and frequency [18]; we need proper consideration in determining the dosage and frequency. The frequency of administration of antidiabetic drugs using IF-Then about HbA1c levels shown in Table XIII.

TABLE XIII
DETERMINING FREQUENCY BASED ON HBA1C

| HbA1c | Frequency | Value |
|--------|------------------|-------|
| >9 | Frequency high | 3 |
| >7.5 | Frequency middle | 2 |
| >6.5 | Frequency low | 1 |

Algorithm

Input: HbA1c;

Output: Frequency;

Variable

REAL: HbA1c, Frequency;

Begin

If HbA1C >9 Then Frequency = High

Else

If HbA1C >9 Then Frequency = Middle

Else

Frequency = low;

End;

TABLE XIV

K. Expert System Application

This application uses fuzzy-profile matching, which was built using the Pascal programming language with the Delphi IDE. The application interface can be seen in Fig. 8.

Fuzzy logic calculates the value of the match between the patient's condition with the type of drug and profile matching as an inference to display the total amount of each kind of medication. The dose was calculated using the FIS Tsukamoto for inputting low dosage, and high dosage calculated the weighted average value. Determination of frequency using the IF-Then function. Doctors or medics will use this application by inputting several parameters, and the system will display the match values of each antidiabetic drug. Also, the system can communicate as well as the frequency of administration of the appropriate medication

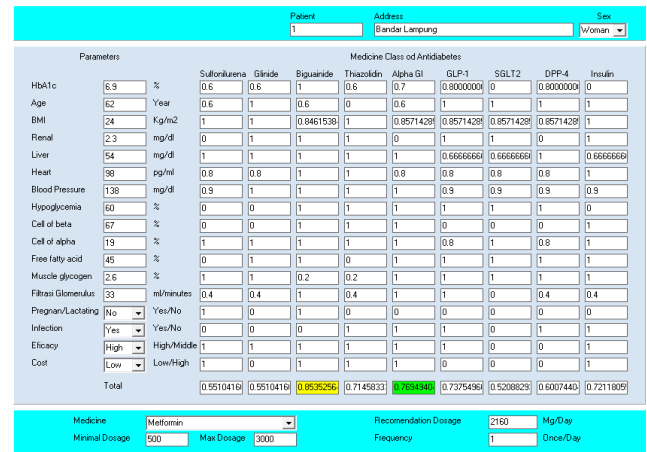

Fig. 8 The developed interface system

L. Comparison with Existing System

Table XIV shows the differences between several studies of antidiabetic drug recommendations with this study. The difference between this study and previous research is that this study uses more complex parameters to recommend the type of drug and its name. Also, being able to calculate the dosage and frequency based on parameters so that the dose and frequency are more precise and consider the price and efficacy of the drug

III. RESULTS AND DISCUSSION

A. Recommendation Doctor with System

The data used were 20 test data taken from patients' medical record data at the Bumi Waras Hospital in Bandar Lampung, Lampung, Indonesia, in 2019. Medical record data were calculated using the ordinal scale 1 and 0, as shown in Figure 9. in mapping the suitability of the patient's condition with antidiabetic drugs. The calculation uses a database query by creating a table; then, the selection is based on each patient's condition stored in the view. Data in the next statement is calculated using a query formula to get the total. The results of the query calculation in Figure 10

Fig. 9. Weight comparison curve using Ordinal scale and Fuzzy

TABLE XV
DATA COMPARISON OF RECOMMENDED SCALE ORDINAL, FUZZY AND DATASET DRUGS

Information: Hb (HbA1C), BP (Blood pressure), Hypo (Hypoglycemia), Cb (Cell of Beta), Ca (Cell of Alpha), Mc (Muscle), FG (Filtrasi Glomerulus), PL (Pregnant/Lactating), If (Infection), Ef (Efficacy), Sul (Sulfonylurea), TZ (Thiazolidine), AG (Alpha Glucose), GL (GLP-1), Ins (Insulin)

B. Evaluation of drugs administration

In Antidiabetic drug recommendations, the accuracy of the system is crucial [33]. The course will display all the results, and the doctor will choose the best based on expertise. Evaluate the suitability of drugs recommendations based on the system, and the doctor, True Positive (TP) is used, which

Calculations using an ordinal scale have weaknesses because they do not produce flexible values to affect the quality of drug recommendations [16]. For example, antidiabetic Sulfonylurea is used for ≤ 60 years. If calculated using an ordinal scale, patients who are 61 years old cannot be given the type of Sulfonylurea drug, even though up to 65 years of age can still be given the medication. Therefore we need a more flexible calculation using Fuzzy logic [16].

Compared with Ordinal scale calculations, the application of fuzzy logic produces drug recommendations that approach the dataset; this is because fuzzy logic can provide flexible values to provide better anti-diabetic drug recommendations. Based on the number of recommended first-line antidiabetic drugs, Biguanide (Metformin), while for the second-line Insulin. This is according to management guidelines for type 2 Diabetes Mellitus [18].

means the doctor approves the recommended drug. The dataset (DS) is the total amount of data, the formula shown in Table XVII. The first stage of testing compares drug recommendations using the Ordinal scale, and the second stage will be carried out to compare drug recommendations using fuzzy logic. The results of drug recommendations using the Ordinal scale can be seen in Table XVI.

TABLE XVI
THE ESTIMATION OF ANTIDIABETIC DRUGS SYSTEM

| Parameter | Definition |
|-------------------------|--|
| True positive rate (TP) | The system recommends, and the doctor agrees |
| Dataset (DS) | The total amount of record |

$$Accuracy = \frac{TP}{DS} \quad (4)$$

$$Accuracy = \frac{\text{Total number of recommend drugs}}{\text{Total Dataset}} \times 100\%$$

TABLE XVII
COMPARISON OF ACCURACY ORDINAL SCALE AND FUZZY

| Scale | First medicine | Second medicine | Average |
|---------|----------------------------------|----------------------------------|---------|
| Ordinal | $\frac{11}{20} * 100\%$ = 50% | $\frac{9}{20} * 100\%$ = 45% | 47.5% |
| Fuzzy | $\frac{18}{20} * 100\%$ = 90% | $\frac{20}{20} * 100\%$ = 90% | 90% |

The recommendation to use Fuzzy does not have much difference with the dataset doctor. The difference lies in the number of Biguanide recommendations that the dataset recommends as many as 14, but the system only recommends 12. Based on the accuracy value calculation, the fuzzy logic application has better accuracy, with an average difference of 43%. The application of fuzzy logic was high-speed and lower cost in recommending reliable drugs [26].

IV. CONCLUSION

Based on the description, explanation, and testing that have been done, we get a few conclusions. This study applied antidiabetic drugs' suitability based on the patient's health condition using the Profile Matching and Fuzzy Logic methods. Based on the evaluations Fuzzy Logic can recommend antidiabetic drugs that are better than using the Ordinal scale. In addition to the recommendation of the type of medicine, the system can also recommend the dosage and frequency of using Tsukamoto's FIS so that it is more precise and reduces the errors of medical staff in recommending drugs and can have a positive impact on patients in terms of time, the healing process, and lower costs. This study provides knowledge that antidiabetic drug determination requires as many as 17 parameters, while other courses only use 4-8 parameters. This study also describes the number of drugs that drug companies can produce. Usually, companies only make low and high dosage. This research shows that creating various dosages of the drug is more efficient for patients. However, this research still needs to be reviewed and continued considering that it still has some weaknesses and shortcomings from the dataset to the number of parameters.

ACKNOWLEDGMENTS

We are grateful to the University of Teknokrat Indonesia for providing support and funding. We also acknowledge Bumi Waras Hospital for the assistance in collecting patient medical record data.

REVIEWER JURNAL**

Amir Husein Commented

Focus

1. Proplems (Object) research
2. Method
3. Evaluation and Solution

Amir Husein Commented

Overall, this section only explains the stages of drug purchase and its impact, and some method explanations, but the subject matter of the research, the state of the art research has no explanation, besides that, it should be noted that the main objectives of this study are presented in this section. some important things as input

1. The impact of drug administration errors is described in a systematic manner supported by the literature,
2. previous research methods and strengths and weaknesses
3. the proposed method and the main contribution of this research, lastly
4. the main purpose of research

Amir Husein Commented

In this section the author has systematically explained the proposed model equipped with a fairly good illustration of pictures and explanations, but as a consideration, it should be presented in a simpler manner where the discussion focuses on the proposed model, the rest can be presented in the supplement.

Amir Husein Commented

It still needs an explanation why it appears in this section, whereas in parts 1 and 2 there is no review of this model, besides that the proposed model is FIS Tsukamoto!

Amir Husein Commented

the proposed model is FIS Tsukamoto, while the application is built using Fuzzy-Profile Matching, maybe need an explanation in this section?

Amir Husein Commented

This study provides the conclusion that the application of anti-diabetes drug suitability based on the patient's health condition using the Profile Matching and Fuzzy Logic methods and the type of drug recommendation model, the system can also use the dosage and frequency of FIS Tsukamoto. both of these models are not explained either in the abstract section, the introduction and appear in section

2. suggestions the authors should provide an explanation of what these two approaches are used for? especially in the abstract and introduction

November 09, 2020

Dear Editor,

First of all, we would like to express our great thanks for giving the opportunity to submit the revised version of our manuscript, **“Fuzzy-Based Application Model and Profile Matching for Recommendation Suitability of Type 2 Diabetic”** for publication in the *International Journal on Advanced Science, Engineering and Information Technology*.

In this revised version, we have made significant improvements to our paper, following all reviewer comments and suggestions. We highlight the changes in the document. We have carefully checked and have proof-reading by a native-speaker on the earliest version of our paper. We also have similarity (Plagiarism) of the manuscript by using **Plagiarism Detector v.1802** by 7% (Seven Percent). We found that your comments and advice have improved and enriched the quality of the paper immensely.

Thank you very much for your assistance, and we are looking forward to hearing any information from you.

Sincerely Yours,

Agus Wantoro, M.Kom. (Assistant Professor)

Admi Syarif, Ph.D. (Associate Professor)

Kurnia Muludi, Ph. D. (Associate Professor)

dr. Khairun Nisa Berawi, Ph. D. (Associate Professor)

Answer to the reviewer comments

Title: Fuzzy-Based Application Model and Profile Matching for Recommendation Suitability of Type 2 Diabetic

Authors: Agus Wantoro, Admi Syarif, Kurnia Muludi, and Khairun Nisa Berawi

Dear reviewer C

First of all, we would like to thank you for giving the opportunity to submit our revised manuscript, " Fuzzy-Based and Profile Matching Application Model for Recommendation Suitability of Type 2 Diabetic" for publication in the *International Journal on Advanced Science, Engineering and Information Technology*. We much appreciate the time and effort that the reviewers dedicated to providing feedback on our manuscript. We found that those comments and advice have improved and enriched the quality of the paper immensely. We have incorporated most of the suggestions made by the reviewers. Those changes are highlighted in the manuscript. Please see below, in blue, for a point-by-point response to the reviewers' comments and concerns. We have also made the proof-reading by native-speaker and similarity check (Plagiarism) of the manuscript using Plagiarism Detector v.1802 by **7% (seven percent)**.

1. Focus problems (Object) research, Method and Evaluation and Solution

1. Thank you very much for the advice given. We strongly agree with the suggestions given and we follow up by making changes to the **abstract** section of our article according to the suggestions given by reviewers. **The problem of this research:** The doctor's mistake in recommending drugs causes a long healing process and costs more. Recommending pills requires pharmacological knowledge, and not all hospitals have pharmacologists. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of medications used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects.
2. **The method we use in our research is :** Fuzzy and Profile Matching method. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. The dose was calculated using the FIS Tsukamoto for inputting low doses, and high doses calculated the weighted average cost.
3. **Solution :** Build an expert system model with a new approach in recommending antidiabetic drugs with more complete parameters and recommend dosage and frequency—determination of frequency using the IF-Then function. Model evaluation is done by comparing recommendation data from doctors using confusion matrix tables. The results of the assessment of the model obtained an accuracy of 90%

2. Overall, this section only explains the stages of drug purchase and its impact and some method explanations. Still, the research's subject matter, the state of the art research, has no description; besides that, it should be noted that the main objectives of this study are presented in this section. Some important things as input

1. The impact of drug administration errors is described in a systematic manner supported by the literature,
2. Previous research methods and strengths and weaknesses
3. The proposed method and the main contribution of this research, lastly
4. The primary purpose of research

1. Thank you very much. We have made some improvements to CHAPTER I according to the reviewer 's suggestion. **Impact of drug administration errors** : Ignorance and negligence of action to the patient will have an impact on patient safety. One thing that must be considered is the procedure for administering injectable and oral drugs. Giving injection drugs is more at risk of causing hypoglycemic conditions that are dangerous for patients. In addition to economic wastage, irrational patterns of drug use can result in a decrease in the quality of treatment services and an increase in drug side effects, increase treatment failure, and increase insulin resistance
2. **Weaknesses of the method in previous research** : Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of medications used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects
3. **Proposed method** : In this study, we propose the Fuzzy-Tsukamoto method and Profile Matching. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. The dose was calculated using the FIS Tsukamoto for inputting low doses, and high doses calculated the weighted average cost. **The contribution of this study is** : that the model we have developed can be used to determine drugs in other diseases. For doctors this application can help in recommending drugs that are in accordance with the patient's condition so that they can reduce the error rate and medical costs
4. **The primary purpose of research** : Aims to build an expert system model with a new approach in recommending antidiabetic drugs with more complete parameters and also able to recommend dosage and frequency

3. In this section, the author has systematically explained the proposed model equipped with a fairly good illustration of pictures and explanations. Still, as a consideration, it should be presented in a more straightforward manner where the discussion focuses on the proposed model; the rest can be shown in the supplement.

Thank you very much for the advice given. We have made some improvements to CHAPTER II according to the reviewer 's suggestion. **We have made several changes regarding** the stages of our research according to the suggestions. The steps that we improve are according to the following picture

4. It still needs an explanation why it appears in this section, whereas in parts 1 and 2 there is no review of this model, besides that the proposed model is FIS Tsukamoto, the proposed model is FIS Tsukamoto, while the application is built using Fuzzy-Profile Matching, maybe need an explanation in this section

- Thank you very much for the advice given. We have made some improvements to the description of the expert application by adjusting reviewer suggestions. **We use three methods** (Fuzzy-Tsukamoto and Profile Matching). Fuzzy logic calculates the value of the match between the patient's condition with the type of drug and Profile Matching as an inference to display the total amount of each kind of medicine.
- **We use Tsukamoto's FIS** : for inputting low doses, and high doses calculated the weighted average value. Determination of frequency using the IF-Then function. Doctors or medics will use this application by inputting several parameters, and the system will display the match values of each antidiabetic drug. Also, the system can communicate as well as the frequency of administration of the appropriate drug

5. This study concludes that the application of anti-diabetes drug suitability based on the patient's health condition using the Profile Matching and Fuzzy Logic methods and the type of drug recommendation model, the system can also use the dosage and frequency of FIS Tsukamoto. Both of these models are not explained either in the abstract section, the introduction, and appear in section 2. Suggestions the authors should explain what these two approaches are used for, especially in the abstract and introduction

- Thank you very much for the advice given. We've covered the abstract and an introduction to our approach. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. The dose was calculated using the FIS Tsukamoto for inputting low doses, and high doses calculated the weighted average value. Determination of frequency using the IF-Then function. Model evaluation is done by comparing recommendation data from doctors using confusion matrix tables

Abstract — Diabetes mellitus Diabetic Mellitus (DM) is a group of metabolic disease characterized by diseases with the characteristics of the tries of the main symptoms, namely polyphagia (lots to eat), polydipsia (lots to drink), and polyuria (lots of urination). The primary marker is derived from blood laboratory results where hyperglycemia due to abnormalities in insulin secretion and a global health threat. DM has several types, namely type 1, 2, gestational, and other types.occurs, where blood glucose levels are above the standard threshold. Type 2 diabetes patients have the largest number in the world.is the most cases due to impaired insulin receptor sensitivity due to unhealthy lifestyles, mainly found in obese individuals. DM therapy can be done in 2 (two) ways, namely by improving lifestyle and administering drugs. The problems drug administration. Problems and risks in recommending drugs are essential become famous in the patient's healing process of healing patients with type 2 DM because they arc it is likely to take the drug consume drugs for life. Approximately 260,000 patients with type 2 diabetes experienced medication errors in 2017. The doctor's mistake in recommending drugs causes a long healing process and costs more. Recommending drugs requires pharmacological knowledge, and not all hospitals have pharmacologists. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of drugs used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects. Therefore, this study aims to build an expert system. This circumstance supports this research to develop a model with a new approach in recommending of antidiabetic drugs with more complete parameters and also able to recommend dosage and frequency. The model developed uses the Fuzzy Profile Matching method. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. The dose was calculated using the FIS Tsukamoto for inputting low doses, and high doses calculated the weighted average value. Determination of frequency using the IF-Then function. Model evaluation is done and application that can help medical staff in recommending the right prescription, right dose, and the right frequency. Evaluation results by comparing recommendation data from the recommendations of doctors and the system using a confusion matrix tables. The results of the evaluation of the model table obtained an accuracy value of 90%. This The existence of this system will is expected to reduce the risk of medical personnel errors mistakes in recommending antidiabetic drugs that, and can positively have a positive impact on patients in terms of time, the healing process, and lower costs. This study research using a different from previous research and provides knowledge that antidiabetes drugs' about different ways of building a drug recommendation system that is suitable for the patient's condition, and also the research shows that the determination of anti-diabetes drugs requires many parameters, while other studies used only use 4 to 8. This study 8 parameters. In also, this study provides an overview of the dosages number of drugs that can be produced by drug companies. Usually, the

Generally, companies only produce low and high doses. This study research shows that producing multiple several doses of a drug doses is can be more efficient effective in the accuracy of therapy for patients.

Keywords — Model; Diabetic type 2; Fuzzy Tsukamoto; Profile Matching; Drugs; Dosage; Frequency.

I. INTRODUCTION

Diabetic Mellitus (DM) Type 2 is a group of metabolic diseases with the characteristics of hyperglycemia that occurs because of an abnormality receptor insulin that lasts long also affects its secrecy. DM type classified into 4 (four) groups, namely Type 1 DM, type 2 DM, gestational DM, and other type DM [1][2]. Blood glucose levels are expressed diabetic, among others, with a rate of HbA1c > 6.5% (mmol/L) [3]. Until today DM is still one of the global health threats. Epidemiological research indicates the tendency to increase the incidence rate and prevalence of type 2 Diabetic Mellitus in various parts of the world[4]. The prevalence of DM is predicted to increase 3 times in 2030. This increase has been predicted by the World Health Organization (WHO) that the year 2030 will reach 21.3 million[1] and Predicted from the International Diabetic Federation (IDF) in 2045 will reach 16.7 million [3]

DM can occur in patients accompanied by other diseases. DM therapy can be done 2 (two) ways with the improvement of lifestyle and Drug Administration [2]. Treatment of medications using Oral and Insulin types [5]. Commonly used oral drugs are types of Sulfonylurea, Glinide, Biguanide, Tiazolidin, Alpha Glucose inhibitors, GLP-1, SGLT-2, DPP-4, while for Insulin there are Lispo, Aspart, Glutysine and Faster Aspart [6]. The goal of therapy in DM is to reduce the symptoms of hyperglycemia, reduce the onset and development of complications, reduce mortality, and improve quality of life [6]. Anti-diabetic drugs usually pay attention to age, comorbidities, risk of hypoglycemia, and many other factors [7].

Efforts to manage DM still have obstacles in terms of service and health financing [4]. It should be noted that health workers in carrying out their work require high pharmacological accuracy and knowledge [8]. Around 260,000 patients with diabetic experienced medication errors in 2017[8]. Ignorance and negligence of action to the patient will have an impact on patient safety. One thing that must be considered is the procedure for administering injectable and oral drugs. Giving injection drugs is more at risk of causing hypoglycemic conditions that are dangerous for patients. In addition to economic wastage, irrational patterns of drug use can result in a decrease in the quality of treatment services and an increase in drug side effects, increase treatment failure, and increase insulin resistance [9]. Cases in various health institutions were found to be incorrectly given unnecessary drug combinations. The selection of an appropriate oral hypoglycemic drug is crucial to the success of diabetic therapy depending on the severity and condition of the patient, Oral hypoglycemic pharmacotherapy can be done using one drug or a combination of two types of drugs [7]

Sub-therapeutic drug administration results in ineffective drug therapy. Drug administration with excessive doses result in hypoglycemic effects and the possibility of toxicity [10]. Inappropriate use of Insulin often results in hypoglycemia and can lead to weight gain. Unwanted drug

effects can occur in long-term use such as lipodystrophy or loss of fat tissue at the injection site, and allergic reactions can occur, including edema [11]. Treatment must be started as early as possible to prevent or slow the progression of beta-cell failure that has occurred in people with impaired glucose tolerance [4].

Several researchers have conducted research that discusses anti-diabetic drug recommendations. The research conducted Rung-Ching Chen *et al.* [12] In previous studies, the drug recommendations used SWRL technique with 6 (six) types of anti-diabetic drugs Metformin, DPP4, Sulfonylurea, Glinide, Thiazolidinedione, Alpha-Glucosidase (AGI) with 6 (six) parameters of HbA1c, Hypoglycemia, Renal, Heart, BMI, and liver. [12]. This research was developed with the Fuzzy method that can display the results of drug recommendations based on the most appropriate level of choice [13]. Drug recommendations are also carried out using Fuzzy-TOPSIS with 7 types of drugs and 8 parameters [14]. In 2018 Fuzzy combined with MULTIMOORA with input data scoring, was able to recommend anti-diabetic drugs using 8 parameters. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of drugs used is 6 to 7, with many parameters 5 to 8. The latest DM endocrinology guidelines for 2020 state explain that in recommending antidiabetic anti-diabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects pay attention to HbA1c, Hypoglycemia, Renal, Heart, BMI, and Liver but there are some things to consider, such as glucagon secretion (Cell Alpha Pancreas), insulin secretion (Cell Beta), glucose fat, glomerular filtration, muscle glycogen and contraindications with pregnant or nursing women and infections [15]. Drug recommendations must be adapted to the patient's condition or variables to avoid errors and drug side effects. The number of patient variables has the main and second variables [16]; therefore, the Profile Matching (PM) method is very appropriate because it has a Core Factor and Secondary Factor calculations. The number of parameters is divided into main and second in considering drugs. Therefore the Profile Matching method is very appropriate to use because it has Core Factor and Secondary Factor calculations.

The problem and the level of risk in recommending drugs are important in the process of healing patients in order to maintain the quality of health services [10]. This situation supports this research this study aims to build develop an expert system model application with a new approach in recommending of antidiabetic drugs with more complete parameters and also able to recommend dosage and frequency. The model Fuzzy logic that has been proven capable of providing drug recommendations that will be developed use to prescribe the Fuzzy Profile Matching method. Fuzzy is used to calculate right drug, the suitability between right dose, and the patient's condition and right

frequency by considering the type quality and price of anti-diabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. Model evaluation is done by comparing recommendation data from doctors using confusion matrix tables drug. A safe treatment system needs to be developed and maintained to ensure that patients receive good drug services. This is due to the increasingly varied drugs and the increasing number of drugs and types of anti-diabetic drugs [17]. This study's results can be used as an alternative to help paramedics and young doctors recommend the right dosage and frequency of drugs to improve the quality of health services, accelerate the healing process, and reduce medical

The application of the suitability of anti-diabetic drugs to the

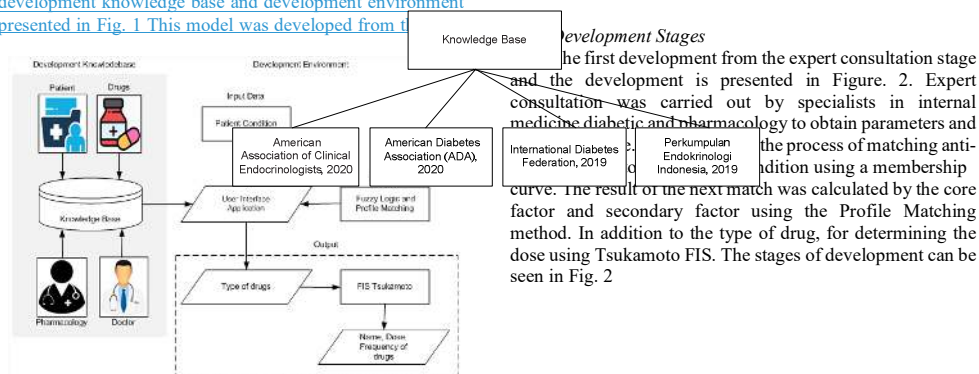

costs [16]

II. MATERIAL AND METHODS

The application of the suitability of anti-diabetic drugs to the patient's health condition was developed by illustrating the architecture of the proposed model. The development of the model consists of 2 (two) main parts, namely the development knowledge base and development environment presented in Fig. 1 This model was developed from the

Commented [a9]: Main Contribution

Commented [AH10]: In this section the author has systematically explained the proposed model equipped with a fairly good illustration of pictures and explanations, but as a consideration, it should be presented in a simpler manner where the discussion focuses on the proposed model, the rest can be presented in the supplement.

Field Code Changed

Commented [a11]: We have adjusted all stages to the model

Fig. 3 Reference for creating a knowledge base

C. Patient Parameters

Based on consultations with internists and pharmacologists as well as a review of several literatures [5], [18], [19], [4], there are 17 (seventeen) parameters that influence in determining the delivery of anti-diabetic type 2 drugs. In addition to considering the patient's health parameters also consider the efficacy and price of the drug presented in TABLE I

TABLE I
INPUT PARAMETERS FOR THE DETERMINATION OF ANTI-DIABETIC MELLITUS TYPE 2 DRUGS

| P1 | P2 | P3 | P4 | P5 | P6 | P7 | P8 | P9 |
|-------|------|-------------------|-------|-------|-------|----------------|--------------|--------------|
| HbA1c | Age | Body mass index | Renal | Liver | Heart | Blood pressure | Hypoglycemia | Cell of beta |
| % | year | kg/m ² | mg/dl | μL | pg/ml | mm/Hg | % | % |

| P10 | P11 | P12 | P13 | P14 | P15 | P16 | P17 |
|---------------|-----------------|-----------------|-----------------------|--------------------|-----------|-------------|----------|
| Cell of alpha | Free fatty acid | Muscle glycogen | Filtration glomerulus | Pregnant/lactating | Infection | Efficacy | Cost |
| % | % | % | ml/minutes | Yes/No | Yes/No | High/Middle | Low/High |

Brief description of each patient's health parameters that influences in determining the type 2 anti-diabetic drug administration:

- HbA1c (hemoglobin A1c) is a protein containing iron in red blood cells. High or low HbA1c levels will affect drug administration. Intake of HbA1c by pricking a needle in a vein in the arm. Normal levels of HbA1c <6.5% [2]
- Age is taken from the year of birth. Age>60 years old and <60 years old is young. Age of the patient will determine the choice of drug type because not all ages can be given the same drug [1]
- BMI is taken from body weight and height [20]. Kadar normal BMI <25. If someone has a BMI>25, then the drug to be given is different from patients who have a BMI <25kg/m²[20]
- Renal is the level of kidney health obtained based on laboratory tests with the Enzymatic method performed on patients by calculating creatinine levels [21]. Patients with kidney patients need special attention from doctors [18]
- The liver is SGPT (Serum Glutamic Pyruvic Transaminase) level is an enzyme that is abundant in the liver. Normal levels of 7-56 micro per liter of serum (μL) [22].
- Heart health uses the value of B-type natriuretic peptide (BNP) is a hormone produced by the heart. The BNP hormone (NT-proBNP) is a non-active hormone released from the same molecule that produces BNP [23]
- Hypoglycemia is a condition when the body's blood sugar levels are too low. Hypoglycemia normal

- <50% mmol/L [5]. Provision of anti-diabetic drugs pay attention to the effects of Hypoglycemia [24]
- Beta cells (β cells) are a type of cells found in pancreatic islets that synthesize and secrete insulin. Beta cells account for about 50-70% of cells in the islet of the pancreas in the human body [25]
 - Pancreatic Alpha Cells are cells that function to produce glucagon hormone. This hormone works to increase blood sugar levels, and break down the reserves of sugar in the liver and then carry it to the blood. Alfa cells account for around 25% of the island of Langerhans [22]
 - Free fatty acid (FFA) is the content of free fatty acids in the body that cause cholesterol that can affect drug administration. Normal levels of 30-50 FFA%[4]
 - Muscle glycogen is a type of sugar polysaccharide that is stored in liver cells and body muscle cells. Glycogen data is obtained by converting glucose levels obtained from food [22]
 - Glomerular filtration is the average rate of blood filtration that occurs in the glomerulus in ml/min units [26]
 - Pregnant/lactating is the condition of the patient's history of being pregnant or breastfeeding. Some anti-diabetic drugs have contraindications with this condition [10]
 - Infection is the condition of the patient who has a wound or postoperatively. Patients who are experiencing infections should not be given drugs Sulfonilurena, Glinide, Biguanide and SGLT-2 [18]
 - Efficacy is the level of efficacy of the drug [18]

16. Cost is the cost of purchasing drugs. Determination of the price of drugs taken from the guidelines for the treatment of type 2 diabetic [5]

D. Knowledgebase Rules

The parameters used are made in the form of a knowledge base for the degree of compatibility of each parameter with the type of anti-diabetic drugs. The knowledge base is presented in Table 2.

D. Expert System Knowledge Base

Formatted: Font: 10 pt, Indonesian

Almost all type 2 diabetic drugs should not be given to DMT2 patients with impaired liver or kidney function, liver, high blood pressure, and severe heart problems. Patients with T2DM aged ≥60 years and overweight (BMI) should be aware of the onset of hypoglycemia. There are types of drugs that

are contraindicated in patients with impaired renal function with LFG ≤ 30 mL/[4]. In addition, drug administration needs to be considered for patients who are pregnant or breastfeeding and have infections [10]

E. Fuzzy Membership Functions

E. Suitable Medicine with Patient Condition

Based on the knowledge base in table 2, then made in the form of curves and fuzzy logic membership functions for Table 3

each parameter with the suitability of the type of anti-diabetic drug. Curves and membership functions for the type of anti-diabetic drug Biguanide are shown in TABLE III.

TABLE III
CURVES AND MEMBERSHIP FUNCTIONS FOR BIGUANIDE DRUGS

| Parameter | Curve | Membership function |
|-------------|-------|--|
| HbA1c (%) | | $\mu(x) = \begin{cases} 0; & x \leq 5.5 \\ \frac{x - 5.5}{5.5 - 6.5}; & 5.5 \leq x \leq 6.5 \\ 1; & x > 6.5 \end{cases}$ |
| Age (years) | | $\mu(x) = \begin{cases} 1; & x \leq 60 \\ \frac{65 - x}{65 - 60}; & 60 \leq x \leq 65 \\ 0; & x > 65 \end{cases}$ |

| 13 | Filtration glomerulus | 33 | 1 |
| 14 | Pregnant/lactating | No | 1 |
| 15 | Infection | Yes | 0 |
| 16 | Efficacy | High | 1 |
| 17 | Price | Low | 1 |

Calculate the value of CF using a formula :

$$CF = \frac{\sum NC}{\sum IC} \quad (1)$$

CF = The average value of the core factor

NC = Total number of core factor values

IC = Number of items CF value

$$SF = \frac{\sum NS}{\sum IS} \quad (2)$$

SF = The average value of the secondary factor

NS = Total number of secondary factor values

IS = Number of secondary factor items

Based on the grouping of core factors and the subsequent factors calculated the average value:

The value of average core factor parameters

$$CF = \frac{(0.6+1+1+1+1+1+1+0)}{9} = 0.84$$

The value average secondary factor parameters

$$SF = \frac{(1+0.84+1+1+1+0.2+1+1)}{8} = 0.88$$

The value average value of the grouping core factor multiplied the weight of 75%, and the secondary factor multiplied with a weight of 25%. The result of the core factor and secondary factor weights are then added to get a matching value:

$$Total = (Weight CF * CF) + (WeightSF * SF) \quad (3)$$

$$\begin{aligned} Total &= (0.75 * CF) + (0.25 * SF) \\ &= (0.75 * 0.84) + (0.25 * 0.88) \\ &= 0.63 + 0.22 \\ &= 0.85 \end{aligned}$$

Results calculate of the value 0.85 indicate that the patient "P1" if given the class of anti-diabetic medicine Biguanide has suitable $(0.85 / 1) \times 100\% = 85\%$ and for the second medicine 76% that Alpha-glucose, the medications are given can be combined, the show is TABLE VI Table 6

F. Determination Core Factor and Secondary Factor

Parameter grouping is divided into 2 (two), namely Core Factor (CF) and Secondary Factor (SF). Core Factor is the main parameter group where the determination of the type of drug given is very dependent on the parameters in this group, whereas a Secondary Factor is a parameter group that does not have a strong influence on the determination of the type of drug given to patients [27]

TABLE V
CLASSIFYING PARAMETERS CF AND SF

| Core Factor (CF) | Secondary Factor (SF) |
|------------------|-----------------------|
|------------------|-----------------------|

TABLE VI
DRUG SUITABILITY CALCULATION RESULTS

| No | Medicine Class | Value | Level |
|----|-------------------|-------|-------|
| 1 | Sulfonylurea | 0.56 | 7 |
| 2 | Glinide | 0.55 | 8 |
| 3 | Biguanide | 0.85 | 1 |
| 4 | Thiazolidinedione | 0.71 | 5 |

| | | | |
|---|-------------------|------|---|
| 5 | Alpha-Glucosidase | 0.76 | 2 |
| 6 | GLP-1 | 0.73 | 3 |
| 7 | SGLT2 | 0.52 | 9 |
| 8 | DPP-4 | 0.60 | 6 |
| 9 | Insulin | 0.72 | 4 |

This model can evaluate the suitability of the patient's condition with various types of anti-diabetic drugs. The calculation results are shown in TABLE VII

Table 7

TABLE VII
PATIENT DATA AND THE TOTAL VALUE OF ANTI-DIABETIC DRUGS

| ID | Parameter Patients | | | | | | | | | | | | | | Type of drug anti-diabetes | | | | | | | | | | | |

G. Determination Drug, Dosage, and Frequency

The parameters used to determine the dose of the drug are HbA1c levels, age, BMI, kidney health, liver, and hypoglycemia. Determine drug frequency based on high or low HbA1c levels. Drug administration based on frequency

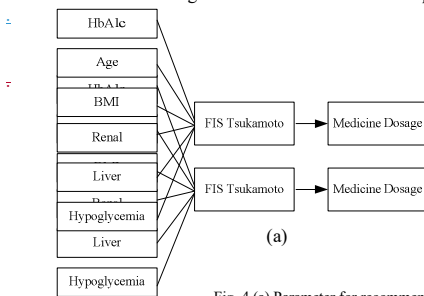

Fig. 4 (a) Parameter for recommendations dosage (b) Parameter for determining a frequency

[16]. The parameters are shown in Fig. 4

H. Dosage and Frequency Drug

The dose and frequency of drug administration are very influential in the therapeutic effect of the drug. Giving

excessive doses, especially for drugs with a narrow range of therapy, will be very at risk of side effects. Conversely, a dose

that is too small will not guarantee the achievement of less than optimal therapeutic levels [17][16]

TABLE VIII
TYPE, DOSAGE, AND FREQUENCY DRUGS[18][4]

| No | Type of drugs | Drugs | Dosage | Frequency (Ones/Day) |
|----|-------------------|---------------|-----------------|----------------------|
| 1 | Sulfonylurea | Glibenclamide | 2.5 - 20mg/dl | 1-2 |
| | | Gliclazide | 40 - 320 mg/dl | 1-2 |
| 2 | Glinide | Repaglinide | 1-16 mg/dl | 2-4 |
| | | Nateglinide | 180 - 360 mg/dl | 2-3 |
| 3 | Biguanide | Metformin | 500 - 3000mg/dl | 1-3 |
| | | Buformin | 50 - 100 mg/dl | 1-2 |
| 4 | Thiazolidinedione | Pioglitazone | 15 - 45 mg/dl | 1-2 |
| | | Rosiglitazone | 4 - 8 mg/dl | 1-2 |
| 5 | Alpha-Glucose | Acarbose | 100 - 300 mg/dl | 2-3 |
| | | Miglitol | 25-100 mg/dl | 2-3 |
| 6 | GLP-1 | Liraglutide | 0.6 - 1.8 mg/dl | 1-2 |
| | | Lixisenatide | 10 - 20 mg/dl | 1-2 |
| 7 | SGLT2 | Dapagliflozin | 5 - 10 mg/dl | 1-2 |
| | | Empagliflozin | 10 - 25 mg/dl | 1-2 |
| 8 | DPP-4 | Vildagliptin | 50-100 mg | 1-2 |
| | | Sitagliptin | 25-100 mg | 1-2 |
| 9 | Insulin | Lispro | 0.1 - 1 Unit/Kg | 1-2 |
| | | Aspart | 0.05 - 1Unit/Kg | 1-2 |

I. The Domain of Medicine Dosage

Determination of the dose using the parameters in Figure 4 (a). Each parameter becomes an input variable,

each divided by 2 (two) in linguistic and domain variables.

The output from the domain is a dose calculated using Tsukamoto's FIS to calculate a more appropriate dosage

TABLE IX
DOMAIN PARAMETERS FOR DETERMINES DRUGS DOSAGE

| No | Variable | Linguistic Variable | Domain | Output (Dosage) | |
|----|--------------|---------------------|---------|-----------------|--------------------|
| 1 | HbA1c | Normal | 0-9 | Low [0-600] | |
| | | Abnormal | 6.5-12 | | |
| 2 | Age | Young | 0-65 | | High [500-1000] |
| | | Old | 60-100 | | |
| 3 | BMI | Low | 0-27 | | |
| | | High | 24-30 | | |
| 4 | Renal | Normal | 0-1.5 | | |
| | | Abnormal | 1.2-3.0 | | |
| 5 | Liver | Normal | 0-100 | | |
| | | Abnormal | 40-100 | | |
| 6 | Hypoglycemia | No | 0-70 | | |
| | | Yes | 50-120 | | |

TABLE X
THE DOSAGE DOMAIN OF THE DRUG IS BIGUANIDE

| Type of drugs | Drugs | Dosage (mg/dl) | Domain | |
|---------------|-----------|----------------|--------|----------|
| | | | Low | High |
| Biguanide | Metformin | 500 - 1000 | 0-600 | 500-1000 |

Based on Table 9. The next step is to make a curve for each parameter presented in Fig. 5-7, and the output curves for drug dosages are shown in Fig. 8

Fig. 5 Curve membership function for HbA1c and Age

Fig. 6 Curve membership function for BMI and Renal

Fig. 7 Curve membership function for Liver and Hypoglycemia

Fig. 8 Curve membership function for dosage

Based on the membership curve and function, the membership value for each parameter is then calculated, as shown in Table 11 – 16.

TABLE XI
MEMBERSHIP VALUES FOR HBA1C

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| HbA1c | 6.9 | 0.84 | 0.16 |

TABLE XII
MEMBERSHIP VALUES FOR AGE

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| Age | 62 | 0.8 | 0.2 |

TABLE XIII
MEMBERSHIP VALUES FOR BMI

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| BMI | 24 | 0 | 1 |

TABLE XIV
MEMBERSHIP VALUES FOR RENAL

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| Renal | 2.3 | 0 | 1 |

TABLE XV
MEMBERSHIP VALUES FOR LIVER

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| Liver | 54 | 0.76 | 0.23 |

TABLE XVI
MEMBERSHIP VALUES FOR HYPOGLYCEMIA

| Parameter | Data | Linguistic Variables | |
|--------------|------|----------------------|----------|
| | | Normal | Abnormal |
| Hypoglycemia | 60 | 0.50 | 0.50 |

J. Fuzzy Implication Rules for Dosage

Monotonous fuzzy rules are used as a basis for fuzzy implication techniques. The used rules for the formula of the criteria number raised by the number of sub-criteria [28]. The parameters used are 6 (six) as HbA1c, Age, BMI, Renal, Liver, Hypoglycemia, and sub-criteria of each criterion are 2 (two), so the number of rules use is $2^6 = 64$ rules. Examples of the use of rules as follows :

- “[R13]If HbA1c= Normal and Age=Young and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then Low dosage;”
- “[R29]If HbA1c= Normal and Age=Old and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then Low dosage;”
- “[R30]If HbA1c= Abnormal and Age=Young and BMI=Low and Renal=Normal and Liver=Normal and Hypoglicemia=Yes Then High dosage;”
- “[R45]If HbA1c= Abnormal and Age=Young and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then High dosage;”
- “[R61] If HbA1c= Abnormal and Age=Old and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then Low dosage;”
- “[R64] If HbA1c= Abnormal and Age=Old and BMI=High and Renal=Abnormal and Liver=Abnormal and Hypoglicemia=Yes Then Low dosage;”

Then value z calculation will be performed to look for output using FIS Tsukamoto from each rule given explicitly (crisp) based on α -predicate (fire strength). In this calculation, not all

α and Z_{1-64} rules are displayed. The final result is obtained using a weighted average. Examples of the use of rules as follows:

α -predicat₁₃ = $\mu_{\text{HbA1c Normal}} \cap \mu_{\text{Age Young}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
Then Low dosage;

$$= \text{Min} (0.84; 0.8; 1; 1; 0.76; 0.5)$$

$$= 0.5$$

$$Z_{13} = \text{High} - (\alpha_{13} * (\text{High-Low}))$$

$$= 3000 - (0.5 * (3000-500))$$

$$= 1750$$

α -predicat₂₉ = $\mu_{\text{HbA1c Normal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
Then Low dosage;

$$= \text{Min} (0.84; 0.2; 1; 1; 0.76; 0.5)$$

$$= 0.2$$

$$Z_{29} = \text{High} - (\alpha_{29} * (\text{High-Low}))$$

$$= 3000 - (0.2 * (3000-500))$$

$$= 2500$$

α -predicat₃₀ = $\mu_{\text{HbA1c Normal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia Yes}}$
Then Low dosage;

$$= \text{Min} (0.84; 0.2; 1; 1; 0.76; 0.5)$$

$$= 0.2$$

$$Z_{30} = \text{High} - (\alpha_{30} * (\text{High-Low}))$$

$$= 3000 - (0.2 * (3000-500))$$

$$= 2500$$

α -predicat₄₅ = $\mu_{\text{HbA1c Abnormal}} \cap \mu_{\text{Age Young}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
Then High dosage;

$$= \text{Min} (0.16; 0.8; 1; 1; 0.76; 0.5)$$

$$= 0.16$$

$$Z_{45} = \alpha_{45} * (\text{High-Low}) + \text{Low}$$

$$= 0.16 * (3000-500) + 500$$

$$= 900$$

α -predicat₆₁ = $\mu_{\text{HbA1c Abnormal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Normal}} \cap \mu_{\text{Hypoglycemia No}}$
Then Low dosage;

$$= \text{Min} (0.16; 0.2; 1; 1; 0.76; 0.5)$$

$$= 0.16$$

$$Z_{61} = \text{High} - (\alpha_{61} * (\text{High-Low}))$$

$$= 3000 - (0.16 * (3000-500))$$

$$= 2600$$

α -predicat₆₄ = $\mu_{\text{HbA1c Abnormal}} \cap \mu_{\text{Age Old}} \cap \mu_{\text{BMI High}} \cap \mu_{\text{Renal Abnormal}} \cap \mu_{\text{Liver Abnormal}} \cap \mu_{\text{Hypoglycemia Yes}}$
Then Low dosage;

$$= \text{Min} (0.16; 0.2; 1; 1; 0.23; 0.5)$$

$$= 0.16$$

$$Z_{64} = \text{High} - (\alpha_{64} * (\text{High-Low}))$$

$$= 3000 - (0.16 * (3000-500))$$

$$= 2600$$

TABLE XVII
MEMBERSHIP VALUE FOR ALL α_{1-64} AND Z_{1-64} FROM PARAMETERS

| ID | HbA1c | Age | BMI | Renal | Liver | Hypo glycemia | Min (α_{1-64}) | Z_{1-64} |

K. Determining Dosage

K. Defuzzification-Weighted Average

After a combination of forming rules, the next step is doing a calculation to get the value of defuzzification by

adding the rules to rules 64 to get the weighted average value (*Weight Average*)

$$z(\text{Dosage}) = \frac{(a1 * z1) + (a2 * z2) + (a3 * z3) + (a4 * z4) + \dots + (a64 * z64)}{a1 + a2 + a3 + a4 \dots a64} \quad (4)$$

$$z(\text{Dosage}) = 2160 \text{ mg/dl}$$

Based on the name of the drug Metformin with the lowest dose of 500 mg/dl and the highest dose of 3000 mg/dl in Table

8, based on the results of the system recommendations for the correct dose given by patients as many as 2160 mg/dl

TABLE XVIII
DIFFERENCES IN RECOMMENDED DOSAGES BETWEEN DOCTORS AND THE SYSTEM

| Patient | Input variable | | | | | | Type and drugs anti-diabetic | Output variable | |
|---------|----------------|-----|-----|-------|-------|----------------|------------------------------------|---|-------------------------------------|
| | HbA1c | Age | BMI | Renal | Liver | Hypo glycaemia | | Daily dose recommended by the physician | Daily dose obtained from the system |
| 1 | 6.5 | 39 | 25 | 0.7 | 78 | 6.5 | Insulin/Lispro | 1 Unit/mL | 6 Unit/mL |
| 2 | 6.9 | 62 | 24 | 2.3 | 54 | 60 | Biguanide/Metformin | 500 mg/dl | 2160 mg/dl |
| 3 | 8.3 | 60 | 20 | 0.8 | 33 | 55 | Biguanide/Metformin | 500 mg/dl | 1703 mg/dl |
| 4 | 6.65 | 40 | 30 | 0.8 | 98 | 65 | Thiazolidinedione/ Pioglitazone | 15 mg/dl | 28 mg/dl |
| 5 | 6.8 | 37 | 27 | 2.1 | 100 | 66 | Biguanide/Metformin | 500 mg/dl | 1571 mg/dl |
| 6 | 11 | 44 | 29 | 0.6 | 140 | 70 | Biguanide/Buformin | 50 mg/dl | 50 mg/dl |
| 7 | 7.9 | 50 | 27 | 3.8 | 130 | 68 | Biguanide/Buformin | 50 mg/dl | 78 mg/dl |
| 8 | 11.6 | 62 | 20 | 2.7 | 130 | 0 | Biguanide/Metformin | 500 mg/dl | 1300 mg/dl |
| 9 | 9.8 | 37 | 27 | 3.8 | 80 | 40 | Insulin/Aspart | 1 Unit/mL | 5 Unit/mL |
| 10 | 6.8 | 65 | 20 | 0.6 | 0 | 55 | Alfa-Glucosidase/ Miglitol | 25 mg/dl | 56 mg/dl |

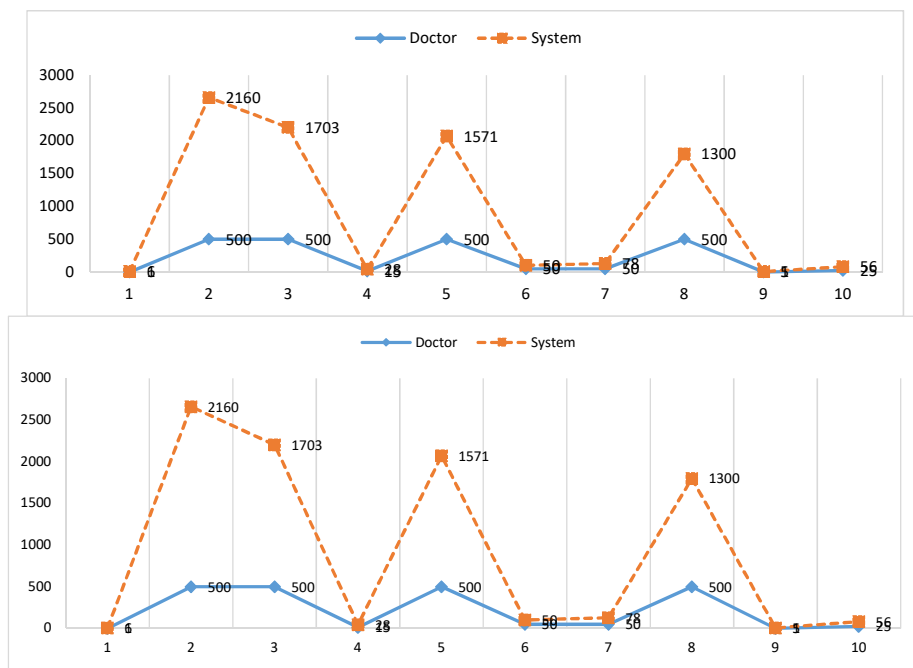

Fig. 7 The daily dose of medicine recommended by doctor and system

Fig. 7 shows the system recommendations are able to provide daily doses according to the severity of the patient, while the doctor's recommended dosage begins using a low dose [29]. Giving too low a dose can result in suboptimal results [17], and recovery is very slow for up to 1 year [16], and recovery is very slow for up to 1 year. However, for patients receiving the system's recommended daily dose, the duration of recovery is shorter to ≤ 3 months [30]

L. Determine Drugs Frequency

The low frequency of use will result in a healing process and have a long usage interval frequency of drug use that can cause side effects that can worsen the patient's condition. The dose should consider the HbA1c level $< 8\%$ to determine the dose and frequency of the drug [18]; for that, we need proper consideration in determining the dose and frequency. The

frequency of administration of anti-diabetic drugs using IF-Then with reference to HbA1c levels shown in Table 19

End;

TABLE VI
DETERMINING FREQUENCY BASED ON HBA1C

| HbA1c | Frequency | Value |
|-------|------------------|-------|
| >9 | Frequency high | 3 |
| >7.5 | Frequency middle | 2 |
| >6.5 | Frequency low | 1 |

Algorithm
Input : HbA1c;
Output : Frequency;
Variable
 REAL : HbA1c, Frequency;
 Begin
 If HbA1c >9 Then Frequency = High
 Else
 If HbA1c >7.5 Then Frequency = Middle
 Else
 Frequency = low;

M. Expert System Application

M. Interface of Applications

This application uses Fuzzy-Profile Matching, which was built using the Pascal programming language with the Delphi IDE and Ms. Access database. Fuzzy logic to calculate the value of the match between the patient's condition with the type of drug and Profile Matching as an inference to display the total value of each type of drug. The dose was calculated using the FIS Tsukamoto for inputting low doses, and high doses calculated the weighted average value. Determination of frequency using the IF-Then function. This application will be used by doctors or medics by inputting a number of parameters, and the system will display the match values of each anti-diabetic drug. In addition, the system can display as well as the frequency of administration of the appropriate drug. The application interface can be seen in Fig. 8

Commented [AH12]: It still needs an explanation why it appears in this section, whereas in parts 1 and 2 there is no review of this model, besides that the proposed model is FIS Tsukamoto!

Formatted: Font color: Red

Commented [a13]: Sir, we will add an explanation regarding Tsukamoto's FIS as suggested

Commented [AH14]: the proposed model is FIS Tsukamoto, while the application is built using Fuzzy-Profile Matching, maybe need an explanation in this section?

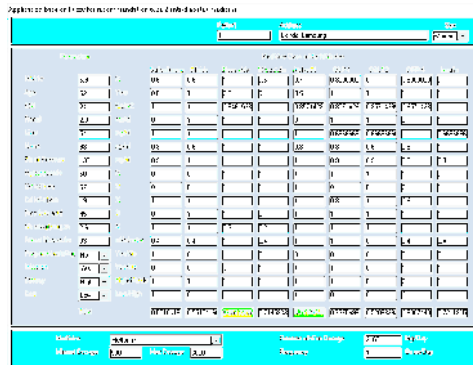

Fig. 8 The developed interface system recommendations type of drugs, drugs, dosage, and frequency

N. Comparison with Existing System

Table 20. Shows the differences between several studies of anti-diabetic drug recommendations with this study. The difference between this study and previous research is that this study uses more complex parameters, able to recommend

the type of drug and the name of the drug. In addition, being able to calculate the dosage and frequency based on parameters so that the dose and frequency are more precise and consider the price and efficacy of the drug

TABLE XX

III. RESULTS AND DISCUSSION

A. Recommendation Doctor with System

The data used were 20 test data taken from the medical record data of patients at the Bumi Waras Hospital in Bandar

Lampung – Lampung, Indonesia in 2019. Based on the type of medical record data, then a table was made in the database used to store the data shown in Table 20

Formatted: Font: Bold

TABLE XX
DATA MEDICAL RECORD PATIENT

Medical record data were calculated using the ordinal scale 1 and 0, as shown in Figure 9, in mapping the suitability of the patients condition with anti-diabetic drugs. The calculation uses a database query by creating a table, then, the selection

is based on each patient's condition stored in the view. Data in the next view is calculated using a query formula to get the total. The results of the query calculation in Figure 10

Figure 9

| Patient | Idolic | Age | BMI | Renal | Liver | Heart | BP | Hbpo | Glucose | Cellulosa | Cellulosa | HbA1c | HbA1c | Filtrates | Pregnan | Infection | Efficacy | Price |
|---------|--------|-----|------|-------|-------|-------|----|------|---------|-----------|-----------|-------|-------|-----------|---------|-----------|----------|-------|

Calculations using an ordinal scale have weaknesses because they do not produce flexible values so that it can affect the quality of drug recommendations [16]. For example, anti-diabetic Sulfonylurea is used for <60 years. If calculated using [17]. For example, anti-diabetic Sulfonylurea is used for <60 years. If calculated using an ordinal scale, patients who are 61 years old cannot be given the type of Sulfonylurea drug, even though up to 65 years of age can still be given the drug. Therefore we need a more flexible calculation using Fuzzy logic [16]

an ordinal scale, patients who are 61 years old cannot be given the type of Sulfonylurea drug, even though up to 65 years of age can still be given the drug. Therefore we need a more flexible calculation using Fuzzy logic [16] though up to 65 years of age can still be given the drug. Therefore we need a more flexible calculation using Fuzzy logic [17]

Fig. 11 Comparison graph of the number of first-line drug recommendations

Fig. 12 Comparison graph of the number of second-line drug recommendations

When compared with Ordinal scale calculations, the application of fuzzy logic produces drug recommendations that approach the dataset this is because fuzzy logic is able to provide flexible values so as to provide better anti-diabetic drug recommendations. Based on the number of recommended first-line anti-diabetic drugs, Biguanide (Metformin), while for the second-line Insulin. This is according to management guidelines for type 2 Diabetes Mellitus [18]

B. Evaluation of drugs administration

In Anti-Diabetic drug recommendations, the accuracy of the system is very important [33]. The system will display all the results, and the doctor will choose the best based on expertise. Evaluate suitability of drugs recommendations based on the system, and the doctor, True Positive (TP) is used, which means the doctor approves the recommended drug. The dataset (DS) is the total amount of data, the formula shown in Table 23.

TABLE XXIII
THE ESTIMATION OF ANTI-DIABETIC DRUGS SYSTEM

| Parameter | Definition |
|-------------------------|--|
| True positive rate (TP) | The system recommends, and the doctor agrees |
| Dataset (DS) | Total amount of record |

$$Accuracy = \frac{TP}{DS} \quad (5)$$

$$Accuracy = \frac{\text{Total number of recommend drugs}}{\text{Total Dataset}} \times 100\% \quad (6)$$

The test results are calculated using a confusion matrix table. The first stage of testing compares the results of drug recommendations using the Ordinal scale, and the second

stage compares drug recommendations using fuzzy logic. The results of drug recommendations using the Ordinal scale can be seen in Table 24

TABLE XXIV
CONFUSION MATRIX RECOMMENDATION DRUG WITH SCALE ORDINAL

| Type of drugs | | Predicted Label | | | | | | | | |
|---------------|-------------------|-----------------|---------|-----------|--------------|---------------|-------|--------|-------|---------|
| | | Sulfonylurea | Glinide | Biguanide | Thiazolidine | Alpha Glucose | GLP-1 | SGLT-2 | DPP-4 | Insulin |
| Actual Label | Sulfonylurea | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Glinide | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Biguanide | 0 | 1 | 7 | 0 | 3 | 1 | 0 | 0 | 2 |
| | Thiazolidinedione | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| | Alpha Glucose | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| | GLP-1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | SGLT-2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | DPP-4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Insulin | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 3 |

The test results using the Ordinal scale; there are some differences in the recommendations for the types of drugs Glinide, Biguanide, Thiazolidine, Alpha-Glucose, and Insulin. The dataset (expert) on the type of drug Biguanide

recommends as many as 14, while calculations using the Ordinal scale only recommend as many as 7 drugs. Furthermore, the results of recommendations using Fuzzy logic can be seen in Table 25.

TABLE XXV
CONFUSION MATRIX RECOMMENDATION DRUG WITH FUZZY

| Type of drugs | | Predicted Label | | | | | | | | |
|---------------|-------------------|-----------------|---------|-----------|--------------|---------------|-------|--------|-------|---------|
| | | Sulfonylurea | Glinide | Biguanide | Thiazolidine | Alpha Glucose | GLP-1 | SGLT-2 | DPP-4 | Insulin |
| Actual Label | Sulfonylurea | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Glinide | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Biguanide | 0 | 0 | 12 | 0 | 0 | 0 | 0 | 0 | 2 |
| | Thiazolidinedione | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| | Alpha Glucose | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| | GLP-1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | SGLT-2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | DPP-4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Insulin | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 3 |

The recommendation to use Fuzzy does not have much difference with the Doctor dataset. The difference lies in the number of Biguanide recommendations that the dataset recommends as many as 14, but the system only recommends

12. The results of the accuracy of the calculation recommendations with Confusion matrix tables 23 and 24 are shown in Table 26

TABLE XXVI
COMPARISON OF ACCURACY ORDINAL SCALE AND FUZZY

| ID | Scale | Accuracy with first medicine | Accuracy with second medicine | Average |
|----|---------|------------------------------|-------------------------------|---------|
| 1 | Ordinal | 55% | 40% | 47.5% |
| 2 | Fuzzy | 90% | 90% | 90% |

Based on the calculation of the accuracy value, the application of Fuzzy logic has better accuracy, with an average difference of 43%. The application of fuzzy logic in recommending

reliable drugs with fast processes and lower costs [26]. The results of comparison of accuracy values in recommending first and second-line drugs are shown in Fig. 12

Fig. 13 Comparison graph of Ordinal and Fuzzy scale accuracy

IV. CONCLUSION

Based on the description, explanation, and testing that have been done, we get a few conclusions. This study resulted in the application of the suitability of anti-diabetic drugs based on the patient's health condition using the Profile Matching and Fuzzy Logic methods. Based on the results of evaluations using confusion testing prove that Fuzzy Logic is able to recommend anti-diabetic drugs that are better than using the Ordinal scale. In addition to the recommendation of the type of drug, the system can also recommend the dosage and frequency of using Tsukamoto's FIS so that it is more precise and reduces the errors of medical staff in recommending drugs and can have a positive impact on patients in terms of time, the healing process and lower costs. This study provides knowledge that the determination of anti-diabetic drugs requires as many as 17 parameters, while other studies only use 4-8 parameters. This study also provides a description of the amount of drug that can be produced by drug companies. Usually, companies only produce low and high doses. This research shows that producing various dosages of the drug is more efficient for patients. However, this research still needs to be reviewed and continued considering that it still has some weaknesses and shortcomings from the dataset to the number of parameters.

ACKNOWLEDGMENTS

Thank you to the University of Teknokrat Indonesia for providing support and funding. We say thank Bumi Waras Hospital for assisting in collecting patient medical record data

Abstract—Diabetes mellitus (DM) is a metabolic disease characterized by hyperglycemia due to insulin secretion abnormalities and a global health threat. DM has several types, namely type 1, 2, gestational, and other types. Type 2 diabetes patients have the largest number in the world. DM therapy can be done in 2 (two) ways: improving lifestyle and administering drugs. The problems and risks in recommending drugs are essential in the patient's healing process because they are likely to take medicine for life. Approximately 260,000 patients with type 2 diabetes experienced medication errors in 2017. The doctor's mistake in recommending drugs causes a long healing process and costs more. Recommending drugs requires pharmacological knowledge, and not all hospitals have pharmacologists. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of medications used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects. Therefore, this study aims to build an expert system model with a new approach in recommending antidiabetic drugs with more complete parameters and recommend dosage and frequency. The model developed uses the Fuzzy Profile Matching method. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. The dose was calculated using the FIS Tsukamoto for inputting low dosage, and high dosage calculated the weighted average value. Determination of frequency using the IF-Then function. Model evaluation is done by comparing recommendation data from doctors using confusion matrix tables. The results of the evaluation of the model obtained an accuracy of 90%. This system will reduce medical personnel errors in recommending antidiabetic drugs that can positively impact patients' time, the healing process, and costs. This study provides knowledge that antidiabetes drugs' determination requires many parameters, while other studies used only 4 to 8. This study also provides an overview of the dosages of drugs that can be produced by drug companies. Usually, the company only makes low and high dosage. This study shows that creating multiple drug dosage is more efficient for patients.

Keywords — Model; Diabetic type 2; Fuzzy Tsukamoto; Profile Matching; Drugs; Dosage; Frequency.

I. INTRODUCTION

Diabetic Mellitus (DM) Type 2 is a group of metabolic diseases with hyperglycemia characteristics that occurs because of an abnormality receptor insulin that lasts long also

affects its secrecy. DM type is classified into 4 (four) groups, namely Type 1 DM, type 2 DM, gestational DM, and other type DM [1][2]. Blood glucose levels are expressed as diabetic, among others, with a rate of HbA1c > 6.5%

20

(mmol/L) [3]. Until today DM is still one of the global health threats. Epidemiological research indicates the tendency to increase the incidence rate and prevalence of type 2 Diabetic Mellitus in various parts of the world [4]. The majority of DM is predicted to grow 3 (three) times in 2030. This increase has been expected by the World Health Organization (WHO) that the year 2030 will reach 21.3 million [1] and Predicted from the International Diabetic Federation (IDF) in 2045 will reach 16.7 million [3]

DM can occur in patients accompanied by other diseases. DM therapy can be done 2 (two) to improve the lifestyle and Drug Administration [2]. Treatment of medications using Oral and Insulin types [5]. Commonly used oral drugs are types of Sulfonylurea, Glinide, Biguanide, Tiazolidin, Alpha Glucose inhibitors, GLP-1, SGLT-2, DPP-4, while for Insulin there are Lispo, Aspart, Glulysine and FASTER Aspart [6]. The goal of therapy in DM is to reduce hyperglycemia symptoms, reduce the onset and development of complications, reduce mortality, and improve life quality [6]. Antidiabetic drugs usually pay attention to age, comorbidities, risk of hypoglycemia, and many other factors [7].

Efforts to manage DM still have obstacles in terms of service and health financing [4]. It should be noted that health workers in carrying out their work require high pharmacological accuracy and knowledge [8]. Around 260,000 patients with diabetes experienced medication errors in 2017 [8]. Ignorance and negligence of action to the patient will have an impact on patient safety. One thing that must be considered is the procedure for administering injectable and oral drugs. Giving injection drugs is more at risk of causing hypoglycemic conditions that are dangerous for patients. In addition to economic wastage, irrational drug use patterns can decrease the quality of treatment services and increase drug side effects, increase treatment failure, and increase insulin resistance [9]. Cases in various health institutions were found to be incorrectly given unnecessary drug combinations. The selection of an appropriate oral hypoglycemic drug is crucial to the success of diabetic therapy, depending on the severity and condition of the patient. Oral hypoglycemic pharmacotherapy can be done using one drug or a combination of two types of drugs [7]

Sub-therapeutic drug administration results in ineffective drug therapy. Drug administration with excessive dosage results in hypoglycemic effects and the possibility of toxicity [10]. Inappropriate use of Insulin often results in hypoglycemia and can lead to weight gain. Unwanted drug effects can occur in long-term use, such as lipodystrophy or loss of fat tissue at the injection site, and allergic reactions can occur, including edema [11]. Treatment must be started as early as possible to prevent or slow the progression of beta-cell failure in people with impaired glucose tolerance [4].

Several researchers have conducted research that discusses antidiabetic drug recommendations. In the study showed Rung-Ching Chen *et al.* [12], the drug recommendations used the SWRL technique with 6 (six) types of antidiabetic drugs Metformin, DPP4, Sulfonylurea, Glinide, Thiazolidinedione, Alpha-Glucosidase (AGI) with 6 (six) parameters of HbA1c, Hypoglycemia, Renal, Heart, BMI, and liver. This research was developed with the Fuzzy method that can display the results of drug recommendations based on the most appropriate level of choice [13]. Drug

recommendations are also carried out using Fuzzy-TOPSIS with 7 (seven) types of drugs and 8 (eight) parameters [14]. In 2018 Fuzzy, combined with MULTIMOORA with input data scoring, recommended antidiabetic drugs using 8 (eight) parameters. Several researchers have researched recommendations for antidiabetic drugs, but no studies have yet been found that discuss recommendations for combination antidiabetic drugs for type two to determine dosage and frequency. The number of medications used is 6 to 7, with many parameters 5 to 8. The latest endocrinology guidelines for 2020 state that in recommending antidiabetic drugs, not only 6 to 7 participants, but still need to maintain other aspects such as glucagon secretion (Cell Alpha Pancreas), insulin secretion (Cell Beta), glucose fat, glomerular filtration, muscle glycogen and contraindications with pregnant or nursing women and infections [15]. Drug recommendations must be adapted to the patient's condition or variables to avoid errors and drug side effects. The number of patient variables has the main and second variables [16]; therefore, the Profile Matching (PM) method is very appropriate because it has a Core Factor and Secondary Factor calculations.

The problem and the risk of recommending drugs are essential in healing patients to maintain health services quality [10]. This research supports this research; this study aims to build an expert system model with a new approach to recommending antidiabetic drugs with more complete parameters and recommend dosage and frequency. The model developed uses the Fuzzy Profile Matching method. Fuzzy is used to calculate the suitability between the patient's condition and the type of antidiabetic drug. Profile Matching is used to calculate the core factor and secondary factor to obtain each drug's total value. Model evaluation is done by comparing recommendation data from doctors using confusion matrix tables. A safe treatment system needs to be developed and maintained to ensure that patients receive good drug services due to the increasingly varied drugs and the increasing number of drugs and types of antidiabetic drugs [17]. This study's results can be used as an alternative to help paramedics. Young doctors recommend the right dosage and frequency of medicines to improve the quality of health services, accelerate the healing process, and reduce medical costs.

II. MATERIAL AND METHODS

The application of the suitability of antidiabetic drugs to the patient's health condition was developed by illustrating the proposed model's architecture. The development of the model consists of 2 (two) main parts, namely the development knowledge base and development environment presented in Fig. 1 model was developed from the drug suitability model [16]

Fig. 1 Model of the suitability of type 2 antidiabetic drugs

A. Development Stages

The first development from the expert consultation stage and the result is presented in Figure. 2. Expert consultation was carried out by specialists in internal medicine diabetes and pharmacology to obtain parameters and knowledge base. The next step is the process of matching antidiabetic drugs to the patient's condition using a membership curve. The next match's result was calculated by the core and secondary factors using the Profile Matching method. In addition to the type of drug, for determining the dose using Tsukamoto FIS. The stages of development can be seen in Fig. 2

Fig. 2 Stages of model development

B. Expert Consultation

Based on consultations with internists and pharmacologists, as well as a review of several works of literature [5], [18], [19], [4], there are 17 (seventeen) parameters that influence determining the delivery of antidiabetic type 2 drugs. In addition to considering the patient's health parameters, also believe the efficacy and price of the drug presented in TABLE 1

TABLE 1
9 INPUT PARAMETERS FOR THE DETERMINATION OF ANTIDIABETIC MELLITUS TYPE 2 DRUGS

| P1 | P2 | P3 | P4 | P5 | P6 | P7 | P8 | P9 |
|-------|------|-------------------|-------|-------|-------|----------------|--------------|--------------|
| HbA1c | Age | Body mass index | Renal | Liver | Heart | Blood pressure | Hypoglycemia | Cell of beta |
| % | year | kg/m ² | mg/dl | μ/L | pg/ml | mm/Hg | % | % |

| P10 | P11 | P12 | P13 | P14 | P15 | P16 | P17 |
|---------------|-----------------|-----------------|-----------------------|--------------------|-----------|-------------|----------|
| Cell of alpha | Free fatty acid | Muscle glycogen | Filtration glomerulus | Pregnant/lactating | Infection | Efficacy | Cost |
| % | % | % | ml/minutes | Yes/No | Yes/No | High/Middle | Low/High |

2 Brief description of each patient's health parameters that influences in determining the type 2 antidiabetic drug administration:

1. HbA1c (hemoglobin A1c) is a protein containing iron in red blood cells. High or low HbA1c levels will affect drug administration. Intake of HbA1c by pricking a needle in a vein in the arm. Normal levels of HbA1c <6.5% [2]
2. Age is taken from the year of birth. Age>60 years old and <60 years old is young. The age of the patient will determine the choice of drug type because not all ages can be given the same drug [1]
3. BMI is taken from body weight and height [20]. Kadar normal BMI <25. If someone has a BMI>25, then the drug to be given is different from patients who have a BMI <25kg/m²[20]
4. Renal is the level of kidney health obtained based on laboratory tests with the Enzymatic method performed on patients by calculating creatinine levels [21]. Patients with kidney patients need special attention from doctors [18]
5. The liver is SGPT (Serum Glutamic Pyruvic Transaminase) level is an abundant enzyme in the liver. Normal levels of 7-56 micro per liter of serum (μ/L) [22].
6. Heart health uses the value of B-type natriuretic peptide (BNP) is a hormone produced by the heart. The BNP hormone (NT-proBNP) is a non-active hormone released from the same molecule that has BNP [23]
7. Hypoglycemia is a condition when the body's blood sugar levels are too low. Hypoglycemia normal <50% mmol/L [5]. Provision of antidiabetic drugs pay attention to the effects of hypoglycemia [24]
8. Beta cells (β cells) are cells found in pancreatic islets that synthesize and secrete Insulin. Beta cells account for about 50-70% of cells in the islet of the pancreas in the human body [25]
9. Pancreatic Alpha Cells are cells that function to produce glucagon hormone. This hormone increases blood sugar levels, breaks down the liver reserves in the liver, and then carries it to the blood. Alfa cells

- account for around 25% of the island of Langerhans [22]
10. Free fatty acid (FFA) is the content of free fatty acids in the body that cause cholesterol that can affect drug administration. Normal levels of 30-50 FFA% [4]
 11. Muscle glycogen is a type of sugar polysaccharide that is stored in liver cells and body muscle cells. Glycogen data is obtained by converting glucose levels obtained from food [22]
 12. Glomerular filtration is the average rate of blood filtration that occurs in the glomerulus in ml/min units [26]
 13. Pregnant/lactating is the condition of the patient's history of being pregnant or breastfeeding. Some anti-diabetic drugs have contraindications with this condition [10]

14. Infection is the condition of the patient who has a wound or postoperatively. Patients who are experiencing disorders should not be given drugs Sulfonilurena, Glinide, Biguanide, and SGLT-2 [18]
15. Efficacy is the level of effectiveness of the drug [18]
16. Cost is the cost of purchasing drugs. Determination of the price of medicines taken from the guidelines for the treatment of type 2 diabetes [5]

D. Expert System Knowledge Base

The parameters used are made in the form of a knowledge base for each parameter's degree of compatibility with the type of antidiabetic drugs. The knowledge base is presented in TABLE II.

TABLE II
KNOWLEDGEBASE FOR THE SUITABILITY OF ANTI-DIABETIC DRUGS [5], [18], [19], [4]

| Medicine Class | HbA1c | Age | BMI | Renal | Liver | Heart | Blood pressure | Hypoglycemia | Cell Beta Pancreas | Cell Alpha | Free Fatty Acid | Muscle Glycogen | Filtrasi Glomerulus | Pregnan /Lactating | Infection | Efficacy | Cost |
|----------------|---------|-------|-------|------------|-------|-------|----------------|--------------|--------------------|------------|-----------------|-----------------|---------------------|--------------------|-----------|----------|------|
| Sulfonilurena | >7.0 | <60 | <25 | <1.2 | <56 | >100 | >140 | <50 | <50% | <20% | <50% | >1% | <30 | No | No | High | Low |
| Glinide | >7.5 | >60 | <25 | >0.55 | <56 | >100 | <140 | <50 | <50% | <20% | <50% | >1% | <30 | Yes | No | High | High |
| Biguanide | >6.5 | 17-60 | 25-35 | >1.2 | <56 | <100 | >90 | >50 | >50% | <20% | <50% | <1% | >30 | No | No | High | Low |
| Thiazolidin | >7.0 | 18-45 | <25 | >0.55 | <56 | <100 | <140 | >50 | >50% | <20% | >50% | <1% | <30 | Yes | Yes | High | Low |
| Alpha Glucose | 7.5 - 9 | <60 | >25 | <1.2 | <56 | >100 | <140 | >50 | >50% | <20% | <50% | >1% | >30 | Yes | Yes | High | Low |
| GLP-1 | 7-9 | >55 | >25 | >1.2 | >56 | >100 | >140 | >50 | <50% | >20% | <50% | >1% | >30 | Yes | Yes | High | High |
| SGLT2 | >9 | >55 | >25 | >1.2 | >56 | >100 | >140 | >50 | >50% | <20% | <50% | >1% | >45 | Yes | No | Middle | High |
| DPP-4 | 7-9 | >55 | >18.5 | >1.2 | <56 | >100 | >140 | >50 | <50% | >20% | <50% | >1% | <30 | Yes | Yes | Middle | High |
| Insulin | >9 | >13 | <25 | 0.55 - 1.2 | >56 | <100 | >140 | <50 | >50% | <20% | <50% | >1% | <30 | Yes | Yes | High | Low |

Almost all type 2 diabetic drugs should not be given to DMT2 patients with impaired liver or kidney function, liver, high blood pressure, and severe heart problems. Patients with T2DM aged ≥60 years and overweight (BMI) should be aware of the onset of hypoglycemia. There are types of

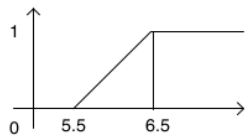

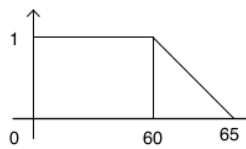

contraindicated drugs in patients with impaired renal function with LFG ≤ 30 mL/[4]. Also, drug administration needs to be considered for patients who are pregnant or breastfeeding and have infections [10]

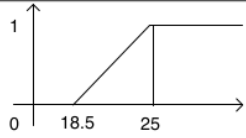

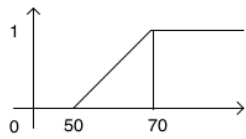

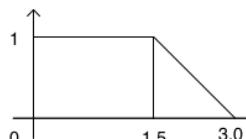

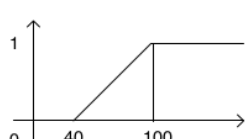

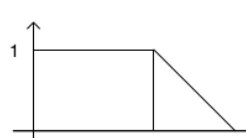

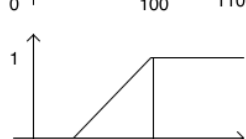

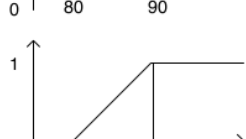

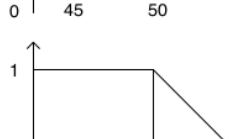

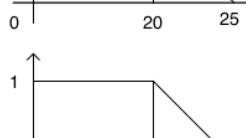

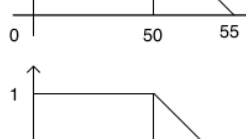

E. Fuzzy Membership Functions

Based on the knowledge base in table 2, they then made in the form of curves and fuzzy logic membership functions

for each parameter with the suitability of the type of antidiabetic drug. Curves and membership functions of the kind of antidiabetic drug Biguanide are shown in TABLE III.

TABLE III
CURVES AND MEMBERSHIP FUNCTIONS FOR BIGUANIDE DRUGS

| Parameter | Curve | Membership function |
|-------------|---|--|
| HbA1c (%) |  | $\mu(x) = \begin{cases} 0; & x \leq 5.5 \\ \frac{x - 5.5}{5.5 - 6.5}; & 5.5 \leq x \leq 6.5 \\ 1; & x > 6.5 \end{cases}$ |
| Age (years) |  | $\mu(x) = \begin{cases} 1; & x \leq 60 \\ \frac{65 - x}{65 - 60}; & 60 \leq x \leq 65 \\ 0; & x > 65 \end{cases}$ |

| | | |
|-----------------|---|---|
| Weight (BMI) |  | $\mu(x) = \begin{cases} 0; & x \leq 18.5 \\ \frac{x - 18.5}{25 - 18.5}; & 18.5 \leq x \leq 25 \\ 1; & x > 25 \end{cases}$ |
| Hypoglycemia |  | $\mu(x) = \begin{cases} 0; & x \leq 50 \\ \frac{x - 50}{70 - 50}; & 50 \leq x \leq 70 \\ 1; & x > 70 \end{cases}$ |
| Renal |  | $\mu(x) = \begin{cases} 1; & x \leq 1.5 \\ \frac{3.0 - x}{3.0 - 1.5}; & 1.5 \leq x \leq 3.0 \\ 0; & x > 3.0 \end{cases}$ |
| Liver |  | $\mu(x) = \begin{cases} 0; & x \leq 40 \\ \frac{x - 40}{100 - 40}; & 40 \leq x \leq 100 \\ 1; & x > 100 \end{cases}$ |
| Heart |  | $\mu(x) = \begin{cases} 1; & x \leq 100 \\ \frac{110 - x}{110 - 100}; & 100 \leq x \leq 110 \\ 0; & x > 110 \end{cases}$ |
| Blood pressure |  | $\mu(x) = \begin{cases} 0; & x \leq 80 \\ \frac{x - 80}{90 - 80}; & 80 \leq x \leq 90 \\ 1; & x > 90 \end{cases}$ |
| Cell of beta |  | $\mu(x) = \begin{cases} 0; & x \leq 45 \\ \frac{x - 45}{50 - 45}; & 45 \leq x \leq 50 \\ 1; & x > 50 \end{cases}$ |
| Cell of alpha |  | $\mu(x) = \begin{cases} 1; & x \leq 20 \\ \frac{25 - x}{25 - 20}; & 20 \leq x \leq 25 \\ 0; & x > 25 \end{cases}$ |
| Free Fatty Acid |  | $\mu(x) = \begin{cases} 1; & x \leq 50 \\ \frac{55 - x}{55 - 50}; & 50 \leq x \leq 55 \\ 0; & x > 55 \end{cases}$ |
| Muscle Glycogen |  | $\mu(x) = \begin{cases} 1; & x \leq 1 \\ \frac{3 - x}{3 - 1}; & 1 \leq x \leq 3 \\ 0; & x > 3 \end{cases}$ |

Membership functions need to be made for the types of antidiabetic drugs Sulfonylurea, Glinid, Thiazolidinedione, Alpha-Glucosidase, GLP-1, SGLT-2, DPP4, and Insulin need to be made. Based on the membership function in Table 3, the value of each parameter is then calculated. Table 4 displays the membership values for each parameter with the type of antidiabetic drug Biguanide

TABLE IV
CALCULATION VALUE MEMBERSHIP FUNCTIONS

| ID | Parameters | Data | Value of membership |
|----|-----------------------|------|---------------------|
| 1 | HbA1c | 6.9 | 1 |
| 2 | Age | 62 | 0.6 |
| 3 | BMI | 24 | 0.84 |
| 4 | Renal | 2.3 | 1 |
| 5 | Liver | 54 | 1 |
| 6 | Hearts | 98 | 1 |
| 7 | Blood pressure | 138 | 1 |
| 8 | Hypoglycemia | 60 | 1 |
| 9 | Cell of beta | 67 | 1 |
| 10 | Cell of alpha | 19 | 1 |
| 11 | Free fatty acid | 45 | 1 |
| 12 | Muscle glycogen | 2.6 | 0.2 |
| 13 | Filtration glomerulus | 33 | 1 |
| 14 | Pregnant/lactating | No | 1 |
| 15 | Infection | Yes | 0 |
| 16 | Efficacy | High | 1 |
| 17 | Price | Low | 1 |

F. Core Factor and Secondary Factor

Parameter grouping is divided into 2 (two), namely Core Factor (CF) and Secondary Factor (SF). Core Factor is the

leading parameter group where the determination of the type of drug given is very dependent on the parameters in this group, whereas a Secondary Factor is a parameter group that does not have a strong influence on the determination of the type of drug given to patients [27]

TABLE V
CLASSIFYING PARAMETERS CF AND SF

| Core Factor (CF) | Secondary Factor (SF) |
|-----------------------------|-----------------------|
| Age (P2) | HbA1c (P1) |
| Renal (P4) | BMI (P3) |
| Liver (P5) | Blood pressure (P7) |
| Heart (P6) | Cell alpha (P10) |
| Hypoglycemia (P8) | Free fatty acid (P11) |
| Cell beta (P9) | Muscle glycogen (P12) |
| Filtration glomerulus (P13) | Efficacy (P16) |
| Pregnant/lactating (P14) | Price (P17) |
| Infection (P15) | |

Calculate the value of CF using a formula :

$$CF = \frac{\sum NC}{\sum IC} \quad (1)$$

CF = The average value of the core factor

NC = Total number of core factor values

IC = Number of items CF value

$$SF = \frac{\sum NS}{\sum IS} \quad (2)$$

SF = The average value of the secondary factor

NS = Total number of secondary factor values

IS = Number of secondary factor items

29

Based on the grouping of core factors and the subsequent factors calculated the average value:

The value of the average core factor parameters
 $CF = \frac{(0.6+1+1+1+1+1+1+0)}{9} = 0.84$

The value average secondary factor parameters
 $SF = \frac{(1+0.84+1+1+1+0.2+1+1)}{8} = 0.88$

The grouping core factor's value average value multiplied the weight of 75%, and the secondary factor bore with a weight of 25%. The result of the core factor and secondary factor weights are then added to get a matching value:

$$Total = (Weight CF * CF) + (Weight SF * SF) \quad (3)$$

$$\begin{aligned} Total &= (0.75 * CF) + (0.25 * SF) \\ &= (0.75 * 0.84) + (0.25 * 0.88) \\ &= 0.63 + 0.22 \\ &= 0.85 \end{aligned}$$

Results calculate of the value 0.85 indicate that the patient "P1" if given the class of antidiabetic medicine Biguanide has suitable $(0.85 / 1) \times 100\% = 85\%$ and for the second medicine

76% that Alpha-glucose, the medications are given can be combined, the show is TABLE VI

TABLE VI
 DRUG SUITABILITY CALCULATION RESULTS

| No | Medicine Class | Value | Level |
|----|--------------------------|-------------|----------|
| 1 | Sulfonylurea | 0.56 | 7 |
| 2 | Glinide | 0.55 | 8 |
| 3 | Biguanide | 0.85 | 1 |
| 4 | Thiazolidinedione | 0.71 | 5 |
| 5 | Alpha-Glucosidase | 0.76 | 2 |
| 6 | GLP-1 | 0.73 | 3 |
| 7 | SGLT2 | 0.52 | 9 |
| 8 | DPP-4 | 0.60 | 6 |
| 9 | Insulin | 0.72 | 4 |

This model can evaluate the suitability of the patient's condition with various types of antidiabetic drugs. The calculation results are shown in TABLE VII

TABLE VII
 PATIENT DATA AND THE TOTAL VALUE OF ANTIDIABETIC DRUGS

| ID | Parameter Patients | | | | | | | | | | | | | | Type of drugs anti-diabetes | | | | | | | | | | | |
|----|--------------------|-----|------|-------|-------|-------|----------------|--------------|--------------|---------------|-----|--------|---------------------|--------------------|-----------------------------|----------|-------|--------------|---------|-----------|--------------|---------------|--------|--------|--------|---------|
| | HbA1c | Age | BMI | Renal | Liver | Heart | Blood Pressure | Hypoglycemia | Cell of Beta | Cell of Alpha | FFA | Muscle | Filtrate Glomerulus | Pregnant Lactating | Infectious | Efficacy | Price | Sulfonylurea | Glinide | Biguanide | Thiazolidine | Alpha Glucose | GLP-1 | SGLT-2 | DPP-4 | Insulin |
| 1 | 6.9 | 62 | 24 | 2.3 | 54 | 98 | 138 | 60 | 67 | 19 | 45 | 2.6 | 33 | No | Yes | High | Low | 0.551 | 0.5510 | 0.8535 | 0.7145 | 0.7694 | 0.7375 | 0.5208 | 0.6007 | 0.7211 |

G. Dosage and Frequency

The parameters used to determine the drug dose are HbA1c levels, age, BMI, kidney health, liver, and hypoglycemia. Determine drug frequency based on high or low HbA1c levels. Drug administration based on frequency

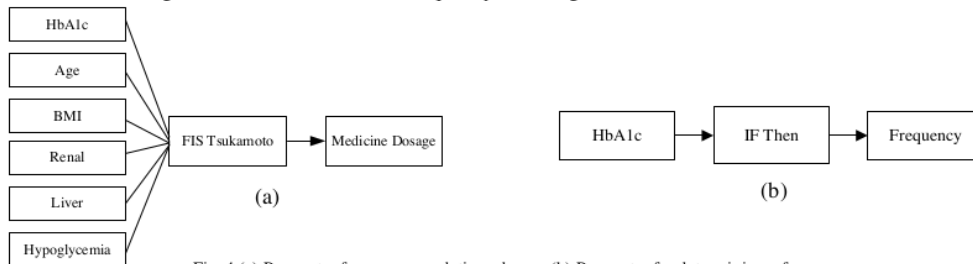

Fig. 4 (a) Parameter for recommendations dosage (b) Parameter for determining a frequency

H. Dosage and Frequency Drug

The dose and frequency of drug administration are very influential in the therapeutic effect of the drug. Giving excessive dosage, especially for drugs with a narrow range of

therapy, will be very at risk of side effects. Conversely, a dose that is too small will not guarantee the achievement of less than optimal therapeutic levels [17]

TABLE VIII
TYPE, DOSAGE, AND FREQUENCY DRUGS[18][4]

| No | Type of drugs | Drugs | Dosage | Frequency (Ones/Day) |
|----|-------------------|---------------|-----------------|----------------------|
| 1 | Sulfonylurea | Glibenclamide | 2.5 - 20mg/dl | 1-2 |
| | | Gliclazide | 40 - 320 mg/dl | 1-2 |
| 2 | Glinide | Repaglinide | 1-16 mg/dl | 2-4 |
| | | Nateglinide | 180 - 360 mg/dl | 2-3 |
| 3 | Biguanide | Metformin | 500 - 3000mg/dl | 1-3 |
| | | Buformin | 50 - 100 mg/dl | 1-2 |
| 4 | Thiazolidinedione | Pioglitazone | 15 - 45 mg/dl | 1-2 |
| | | Rosiglitazone | 4 - 8 mg/dl | 1-2 |
| 5 | Alpha-Glucose | Acarbose | 100 - 300 mg/dl | 2-3 |
| | | Miglitol | 25-100 mg/dl | 2-3 |
| 6 | GLP-1 | Liraglutide | 0.6 - 1.8 mg/dl | 1-2 |
| | | Lixisenatide | 10 - 20 mg/dl | 1-2 |
| 7 | SGLT2 | Dapagliflozin | 5 - 10 mg/dl | 1-2 |
| | | Empagliflozin | 10 - 25 mg/dl | 1-2 |
| 8 | DPP-4 | Vildagliptin | 50-100 mg | 1-2 |
| | | Sitagliptin | 25-100 mg | 1-2 |
| 9 | Insulin | Lispro | 0.1 - 1 Unit/Kg | 1-2 |
| | | Aspart | 0.05 - 1Unit/Kg | 1-2 |

I. The Domain of Medicine Dosage

Determination of the dose using the parameters in Figure 4 (a). Each parameter becomes an input variable,

divided by 2 (two) in linguistic and domain variables. The output from the environment is a dose calculated using Tsukamoto's FIS to calculate a more appropriate dosage

TABLE IX
DOMAIN PARAMETERS FOR DETERMINES DRUGS DOSAGE

| No | Variable | Linguistic Variable | Domain | Output (Dosage) |
|----|--------------|---------------------|---------|--|
| 1 | HbA1c | Normal | 0-9 | Low [0-600] High [500-1000] |
| | | Abnormal | 6.5-12 | |
| 2 | Age | Young | 0-65 | |
| | | Old | 60-100 | |
| 3 | BMI | Low | 0-27 | |
| | | High | 24-30 | |
| 4 | Renal | Normal | 0-1.5 | |
| | | Abnormal | 1.2-3.0 | |
| 5 | Liver | Normal | 0-100 | |
| | | Abnormal | 40-100 | |
| 6 | Hypoglycemia | No | 0-70 | |
| | | Yes | 50-120 | |

TABLE X
THE DOSAGE DOMAIN OF THE DRUG IS BIGUANIDE

| Type of drugs | Drugs | Dosage (mg/dl) | Domain | |
|---------------|-----------|----------------|--------|----------|
| | | | Low | High |
| Biguanide | Metformin | 500 - 1000 | 0-600 | 500-1000 |

Based on Table 9. The next step is to make a curve for each parameter presented in Fig. 5-7, and the output curves for drug dosages are shown in Fig. 8

Fig. 5 Curv membership function for HbA1c and Age

Fig. 6 Curv membership function for BMI and Renal

Fig. 7 Curve membership function for Liver and Hypoglycemia

Fig. 8 Curve membership function for dosage

Each parameter's membership value is then calculated based on the membership curve and function, as shown in Table 11 – 16.

TABLE XI
MEMBERSHIP VALUES FOR HBA1C

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| HbA1c | 6.9 | 0.84 | 0.16 |

TABLE XII
MEMBERSHIP VALUES FOR AGE

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| Age | 62 | 0.8 | 0.2 |

TABLE XIII
MEMBERSHIP VALUES FOR BMI

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| BMI | 24 | 0 | 1 |

| | | | |
|-----|----|---|---|
| BMI | 24 | 0 | 1 |
|-----|----|---|---|

TABLE XIV
MEMBERSHIP VALUES FOR RENAL

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| Renal | 2.3 | 0 | 1 |

TABLE XV
MEMBERSHIP VALUES FOR LIVER

| Parameter | Data | Linguistic Variables | |
|-----------|------|----------------------|----------|
| | | Normal | Abnormal |
| Liver | 54 | 0.76 | 0.23 |

TABLE XVI
MEMBERSHIP VALUES FOR HYPOGLYCEMIA

| Parameter | Data | Linguistic Variables | |
|--------------|------|----------------------|----------|
| | | Normal | Abnormal |
| Hypoglycemia | 60 | 0.50 | 0.50 |

J. Fuzzy Implication Rules for Dosage

Monotonous fuzzy rules are used as a basis for fuzzy implication techniques. The number of practices used is calculated based on the number of criteria and sub-criteria [28]. The parameters used are 6 (six) as HbA1c, Age, BMI, Renal, Liver, Hypoglycemia, and sub-criteria of each criterion are 2 (two), so the number of rules use is $2^6 = 64$ rules. Examples of the use of practices as follows :

“[R13]If HbA1c= Normal and Age=Young and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then Low dosage;”

“[R29]If HbA1c= Normal and Age=Old and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then Low dosage;”

“[R30]If HbA1c= Abnormal and Age=Young and BMI=Low and Renal=Normal and Liver=Normal and Hypoglicemia=Yes Then High dosage;”

“[R45]If HbA1c= Abnormal and Age=Young and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then High dosage;”

“[R61] If HbA1c= Abnormal and Age=Old and BMI=High and Renal=Abnormal and Liver=Normal and Hypoglicemia=No Then Low dosage;”

“[R64] If HbA1c= Abnormal and Age=Old and BMI=High and Renal=Abnormal and Liver=Abnormal and Hypoglicemia=Yes Then Low dosage;”

Then value z calculation will be performed to look for output using FIS Tsukamoto from each rule given explicitly (crisp) based on α -predicate (fire strength). In this calculation, not all

α and z_{1-64} rules are displayed. The final result is obtained using a weighted average. Examples of the use of practices as follows:

α -predicat₁₃ = $\mu_{HbA1c \text{ Normal}} \cap \mu_{Age \text{ Young}} \cap \mu_{BMI \text{ High}} \cap \mu_{Renal \text{ Abnormal}} \cap \mu_{Liver \text{ Normal}} \cap \mu_{Hypoglycemia \text{ No}}$
Then Low dosage;

$$= \text{Min} (0.84; 0.8; 1; 1; 0.76; 0.5)$$

$$= 0.5$$

$$Z_{13} = \text{High} - (\alpha_{13} * (\text{High}-\text{Low}))$$

$$= 3000 - (0.5 * (3000-500))$$

$$= 1750$$

α -predicat₂₉ = $\mu_{HbA1c \text{ Normal}} \cap \mu_{Age \text{ Old}} \cap \mu_{BMI \text{ High}} \cap \mu_{Renal \text{ Abnormal}} \cap \mu_{Liver \text{ Normal}} \cap \mu_{Hypoglycemia \text{ No}}$
Then Low dosage;

$$= \text{Min} (0.84; 0.2; 1; 1; 0.76; 0.5)$$

$$= 0.2$$

$$Z_{29} = \text{High} - (\alpha_{29} * (\text{High}-\text{Low}))$$

$$= 3000 - (0.2 * (3000-500))$$

$$= 2500$$

α -predicat₃₀ = $\mu_{HbA1c \text{ Normal}} \cap \mu_{Age \text{ Old}} \cap \mu_{BMI \text{ High}} \cap \mu_{Renal \text{ Abnormal}} \cap \mu_{Liver \text{ Normal}} \cap \mu_{Hypoglycemia \text{ Yes}}$
Then Low dosage;

$$= \text{Min} (0.84; 0.2; 1; 1; 0.76; 0.5)$$

$$= 0.2$$

$Z_{30} = \text{High} - (\alpha_{30} * (\text{High-Low}))$
 $= 3000 - (0.2 * (3000-500))$
 $= 2500$
 $\alpha\text{-predicat}_{45} = \mu\text{HbA1c Abnormal} \cap \mu\text{Age Young} \cap \mu\text{BMI High} \cap \mu\text{Renal Abnormal} \cap \mu\text{Liver Normal} \cap \mu\text{Hypoglycemia}$
 No Then High dosage;
 $= \text{Min}(0.16; 0.8; 1; 1; 0.76; 0.5)$
 $= 0.16$
 $Z_{45} = \alpha_{45} * (\text{High-Low}) + \text{Low}$
 $= 0.16 * (3000-500) + 500$
 $= 900$
 $\alpha\text{-predicat}_{61} = \mu\text{HbA1c Abnormal} \cap \mu\text{Age Old} \cap \mu\text{BMI High} \cap \mu\text{Renal Abnormal} \cap \mu\text{Liver Normal} \cap \mu\text{Hypoglycemia}$
 No Then Low dosage;
 $= \text{Min}(0.16; 0.2; 1; 1; 0.76; 0.5)$
 $= 0.16$
 $Z_{61} = \text{High} - (\alpha_{61} * (\text{High-Low}))$
 $= 3000 - (0.16 * (3000-500))$
 $= 2600$
 $\alpha\text{-predicat}_{64} = \mu\text{HbA1c Abnormal} \cap \mu\text{Age Old} \cap \mu\text{BMI High} \cap \mu\text{Renal Abnormal} \cap \mu\text{Liver Abnormal} \cap \mu\text{Hypoglycemia}$
 Yes Then Low dosage;
 $= \text{Min}(0.16; 0.2; 1; 1; 0.23; 0.5)$
 $= 0.16$
 $Z_{64} = \text{High} - (\alpha_{64} * (\text{High-Low}))$
 $= 3000 - (0.16 * (3000-500))$
 $= 2600$

TABLE XVII
MEMBERSHIP VALUE FOR ALL A_{1-64} AND Z_{1-64} FROM PARAMETERS

| ID | HbA1c | Age | BMI | Renal | Liver | Hypo glycemia | Min (α_{1-64}) | Z_{1-64} |
|----|-------|-----|-----|-------|-------|------------------|----------------------------|------------|

| 64 | 0.16 | 0.2 | 1 | 1 | 0.23 | 0.5 | 0.16 | 2600 |

K. Determining Dosage

After a combination of forming rules, the next step is doing a calculation to get the value of defuzzification by

adding the rules to regulations 64 to get the weighted average values (*Weight Average*)

$$z(\text{Dosage}) = \frac{(a1 * z1) + (a2 * z2) + (a3 * z3) + (a4 * z4) + \dots + (a64 * z64)}{a1 + a2 + a3 + a4 \dots a64}$$

$$z(\text{Dosage}) = 2160 \text{ mg/dl}$$

Based on the name of the drug Metformin with the lowest dose of 500 ml/gl and the highest dosage of 3000 ml/dl in Table 8, based on the results of the system recommendations

for the correct dosage given by patients as many as 2160 mg/dl

TABLE XVIII
DIFFERENCES IN RECOMMENDED DOSAGES BETWEEN DOCTORS AND THE SYSTEM

| Patient | Input variable | | | | | | Type and drugs antidiabetic | Output variable | |
|---------|----------------|-----|-----|-------|-------|--------------|------------------------------------|--|-------------------------------------|
| | HbA1c | Age | BMI | Renal | Liver | Hypoglycemia | | The daily dose recommend ed by the physician | Daily dose obtained from the system |
| 1 | 6.5 | 39 | 25 | 0.7 | 78 | 6.5 | Insulin/Lispro | 1 Unit/mL | 6 Unit/mL |
| 2 | 6.9 | 62 | 24 | 2.3 | 54 | 60 | Biguanide/Metformin | 500 mg/dl | 2160 mg/dl |
| 3 | 8.3 | 60 | 20 | 0.8 | 33 | 55 | Biguanide/Metformin | 500 ml/dl | 1703 mg/dl |

Fig. 7 The daily dose of medicine recommended by doctor and system

Fig. 7 shows the system recommendations can provide daily dosage according to the patient's severity, while the doctor's recommended dosage begins using a low dosage [29]. Giving too low a dosage can result in suboptimal results [17], and recovery is prolonged for up to 1 year. However, for patients receiving the system's recommended daily dose, the duration of recovery is shorter to ≤ 3 months [30]

```

Variable
REAL : HbA1c, Frequency;
Begin
  If HbA1c >9 Then Frequency = High
Else
  If HbA1c >7.5 Then Frequency = Middle
Else
  Frequency = low;
End;

```

L. Determine Drugs Frequency

The low frequency of use will result in a healing process and have an extended usage interval frequency of drug use that can cause side effects that can worsen the patient's condition. The dose should consider the HbA1c level <8% to determine the drug dosage and frequency [18]; we need proper consideration in determining the dosage and frequency. The frequency of administration of antidiabetic drugs using IF-Then about HbA1c levels shown in Table 19

TABLE XIX
DETERMINING FREQUENCY BASED ON HbA1C

| HbA1c | Frequency | Value |
|-------|------------------|-------|
| >9 | Frequency high | 3 |
| >7.5 | Frequency middle | 2 |
| >6.5 | Frequency low | 1 |

Algorithm
Input : HbA1c;
Output : Frequency;

M. Expert System Application

This application uses Fuzzy-Profile Matching, which was built using the Pascal programming language with the Delphi IDE and Ms. Access database. Fuzzy logic calculates the value of the match between the patient's condition with the type of drug and Profile Matching as an inference to display the total amount of each kind of medication. The dose was calculated using the FIS Tsukamoto for inputting low dosage, and high dosage calculated the weighted average value. Determination of frequency using the IF-Then function. Doctors or medics will use this application by inputting several parameters, and the system will display the match values of each antidiabetic drug. Also, the system can communicate as well as the frequency of administration of the appropriate medication. The application interface can be seen in Fig. 8

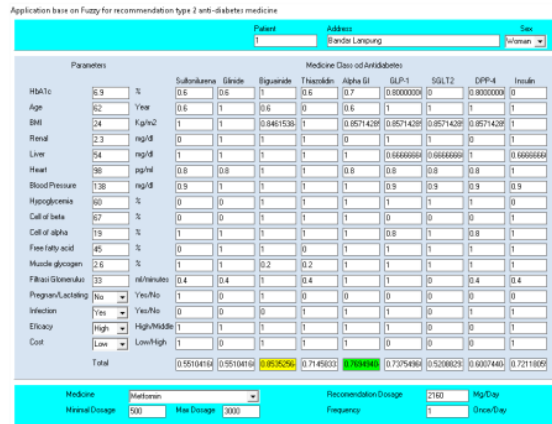

Fig. 8 The developed interface system recommendations type of drugs, drugs, dosage, and frequency

N. Comparison with Existing System

Table 20 shows the differences between several studies of antidiabetic drug recommendations with this study. The difference between this study and previous research is that this study uses more complex parameters to recommend the

type of drug and its name. Also, being able to calculate the dosage and frequency based on parameters so that the dose and frequency are more precise and consider the price and efficacy of the drug

III. RESULTS AND DISCUSSION

A. Recommendation Doctor with System

The data used were 20 test data taken from patients' medical record data at the Bumi Waras Hospital in Bandar Lampung

– Lampung, Indonesia, in 2019. Based on the type of medical record data, then a table was made in the database used to store the data shown in Table 20

TABLE XX
DATA MEDICAL RECORD PATIENT

| Patient | HbA1c | Age | BMI | Renal | Liver | Heart | BP | Hypo | CellBeta | CellAlpa | FFA | Muscle | Filterasi | Pregnan | Infection | Efficacy | Price |
|---------|-------|-----|---------|-------|-------|-------|-----|------|----------|----------|---------|--------|-----------|---------|-----------|----------|-------|
| 1 | 6.9 | | 62.24 | 2.3 | 54 | 98 | 138 | 60 | 67 | 19 | 45.2.6 | | 39 | No | Yes | High | Low |

Medical record data were calculated using the ordinal scale 1 and 0, as shown in Figure 9. in mapping the suitability of the patient's condition with antidiabetic drugs. The calculation uses a database query by creating a table; then, the selection

is based on each patient's condition stored in the view. Data in the next statement is calculated using a query formula to get the total. The results of the query calculation in Figure 10

Figure 9. Weight comparison curve using Ordinal scale (a) with Fuzzy (b)

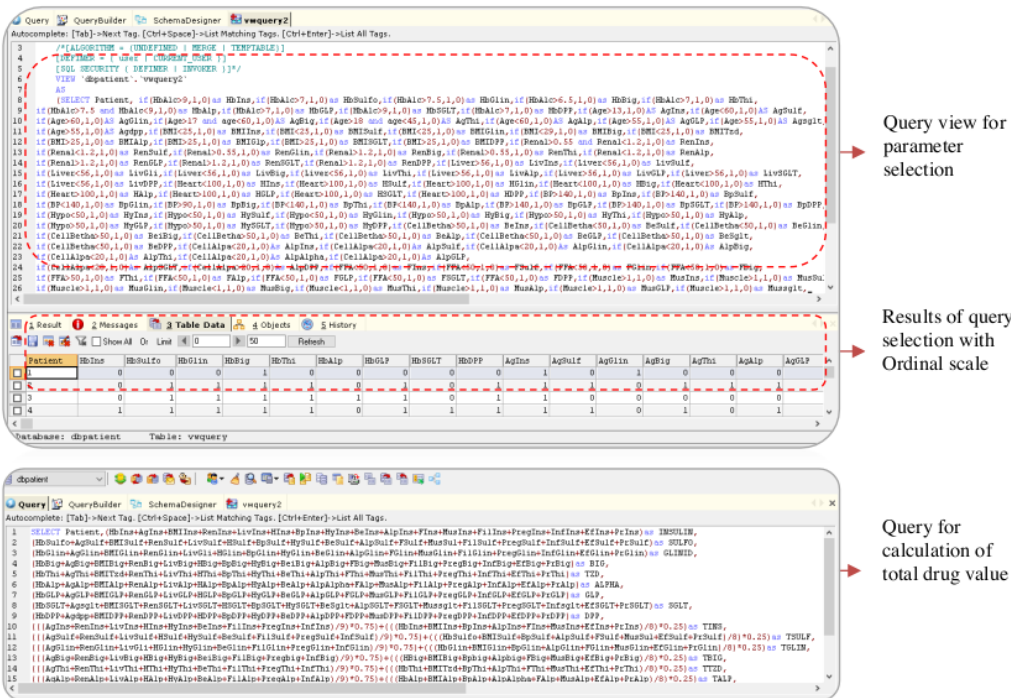

Fig. 10 Query view untuk seleksi parameter dan perhitungan total nilai obat

Calculations using an ordinal scale have weaknesses because they do not produce flexible values to affect the quality of drug recommendations [16]. For example, antidiabetic Sulfonylurea is used for ≤ 60 years. If calculated using an

ordinal scale, patients who are 61 years old cannot be given the type of Sulfonylurea drug, even though up to 65 years of age can still be given the medication. Therefore we need a more flexible calculation using Fuzzy logic [16]

TABLE XXII
DATA COMPARISON OF RECOMMENDED ORDINAL, FUZZY AND DATASET SCALE DRUGS

Fig. 11 Comparison graph of the number of first-line drug recommendations

Fig. 12 Comparison graph of the number of second-line drug recommendations

Compared with Ordinal scale calculations, the application of fuzzy logic produces drug recommendations that approach the dataset; this is because fuzzy logic can provide flexible values to provide better anti-diabetic drug recommendations. Based on the number of recommended first-line antidiabetic drugs,

Biguanide (Metformin), while for the second-line Insulin. This is according to management guidelines for type 2 Diabetes Mellitus [18]

B. Evaluation of drugs administration

In Antidiabetic drug recommendations, the accuracy of the system is crucial [33]. The course will display all the results, and the doctor will choose the best based on expertise.

Evaluate the suitability of drugs recommendations based on the system, and the doctor, True Positive (TP) is used, which means the doctor approves the recommended drug. The dataset (DS) is the total amount of data, the formula shown in Table 23.

TABLE XXIII
THE ESTIMATION OF ANTIDIABETIC DRUGS SYSTEM

| Parameter | Definition |
|-------------------------|--|
| True positive rate (TP) | The system recommends, and the doctor agrees |
| Dataset (DS) | The total amount of record |

$$Accuracy = \frac{TP}{DS} \quad (5)$$

$$Accuracy = \frac{\text{Total number of recommend drugs}}{\text{Total Dataset}} \times 100\% \quad (6)$$

The test results are calculated using a confusion matrix table. The first stage of testing compares drug recommendations using the Ordinal scale, and the second stage will be carried

out to compare drug recommendations using fuzzy logic. The results of drug recommendations using the Ordinal scale can be seen in Table 24

TABLE XXIV
CONFUSION MATRIX RECOMMENDATION DRUG WITH SCALE ORDINAL

| | | Predicted Label | | | | | | | | |
|--------------|-------------------|-----------------|---------|-----------|--------------|---------------|-------|--------|-------|---------|
| | | Sulfonylurea | Glinide | Biguanide | Thiazolidine | Alpha Glucose | GLP-1 | SGLT-2 | DPP-4 | Insulin |
| Actual Label | Sulfonylurea | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Glinide | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Biguanide | 0 | 1 | 7 | 0 | 3 | 1 | 0 | 0 | 2 |
| | Thiazolidinedione | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| | Alpha Glucose | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| | GLP-1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | SGLT-2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | DPP-4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Insulin | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 3 |

The test results using the Ordinal scale; there are some differences in the recommendations for the types of drugs Glinide, Biguanide, Thiazolidine, Alpha-Glucose, and Insulin. The dataset (expert) in the medicine Biguanide

recommends as many as 14, while calculations using the Ordinal scale only recommend as many as 7(seven) drugs. Furthermore, the results of recommendations using Fuzzy logic can be seen in Table 25.

TABLE XXV
CONFUSION MATRIX RECOMMENDATION DRUG WITH FUZZY

| | | Predicted Label | | | | | | | | |
|--------------|-------------------|-----------------|---------|-----------|--------------|---------------|-------|--------|-------|---------|
| | | Sulfonylurea | Glinide | Biguanide | Thiazolidine | Alpha Glucose | GLP-1 | SGLT-2 | DPP-4 | Insulin |
| Actual Label | Sulfonylurea | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Glinide | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Biguanide | 0 | 0 | 12 | 0 | 0 | 0 | 0 | 0 | 2 |
| | Thiazolidinedione | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| | Alpha Glucose | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| | GLP-1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | SGLT-2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | DPP-4 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | Insulin | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 3 |

The recommendation to use Fuzzy does not have much difference with the Doctor dataset. The difference lies in the number of Biguanide recommendations that the dataset recommends as many as 14, but the system only recommends

12. The results of the accuracy of the calculation recommendations with Confusion matrix tables 23 and 24 are shown in Table 26

TABLE XXVI
COMPARISON OF ACCURACY ORDINAL SCALE AND FUZZY

| ID | Scale | Accuracy with first medicine | Accuracy with second medicine | Average |
|----|---------|------------------------------|-------------------------------|---------|
| 1 | Ordinal | 55% | 40% | 47.5% |
| 2 | Fuzzy | 90% | 90 | 90% |

Based on the accuracy value calculation, Fuzzy logic's application has better accuracy, with an average difference of 43%. The application of fuzzy logic in recommending reliable

drugs with fast processes and lower costs [26]. The results of a comparison of accuracy values in recommending first and second-line drugs are shown in Fig. 12

Fig. 13 Comparison graph of Ordinal and Fuzzy scale accuracy

IV. CONCLUSION

Based on the description, explanation, and testing that have been done, we get a few conclusions. This study applied the suitability of antidiabetic drugs based on the patient's health condition using the Profile Matching and Fuzzy Logic methods. Based on the evaluations using confusion testing, Fuzzy Logic can recommend antidiabetic drugs that are better than using the Ordinal scale. In addition to the recommendation of the type of medicine, the system can also recommend the dosage and frequency of using Tsukamoto's FIS so that it is more precise and reduces the errors of medical staff in recommending drugs and can have a positive impact on patients in terms of time, the healing process and lower costs. This study provides knowledge that antidiabetic drug determination requires as many as 17 parameters, while other courses only use 4-8 parameters. This study also describes the amount of drug that can be produced by drug companies. Usually, companies only make low and high dosage. This research shows that creating various dosages of the drug is more efficient for patients. However, this research still needs to be reviewed and continued considering that it still has some weaknesses and shortcomings from the dataset to the number of parameters.

ACKNOWLEDGMENTS

Thank you to the University of Teknokrat Indonesia for providing support and funding. We say thank Bumi Waras Hospital for assisting in collecting patient medical record data

Title and Abstract

Title Fuzzy-Based Application Model and Profile Matching for Recommendation Suitability of Type 2 Diabetic

Abstract **Diabetic Mellitus (DM) is a group of metabolic diseases with the characteristics of the tries of the main symptoms, namely polyphagia (lots to eat), polydipsia (lots to drink), and polyuria (lots of urination). The primary marker is derived from blood laboratory results where hyperglycemia occurs, where blood glucose levels are above the standard threshold. Type 2 diabetes is the most cases due to impaired insulin receptor sensitivity due to unhealthy lifestyles, mainly found in obese individuals. DM therapy can be done 2 (two) ways, namely by improving lifestyle and drug administration. Problems and risks in recommending drugs become famous in the process of healing patients with type 2 DM because it is likely to consume drugs for life. This circumstance supports this research to develop a model and application that can help medical staff in recommending the right prescription, right dose, and the right frequency. Evaluation results by comparing the recommendations of doctors and the system using a confusion matrix table obtained an accuracy value of 90%. The existence of this system is expected to reduce the risk of medical personnel mistakes in recommending drugs, and can have a positive impact on patients in terms of time, the healing process, and lower costs. This research using a different from previous research and provides**

knowledge about different ways of building a drug recommendation system that is suitable for the patient's condition, and also the research shows that the determination of anti-diabetes drugs requires many parameters, while other studies only use 4-8 parameters. In also, this study provides an overview of the number of drugs that can be produced by drug companies. Generally, companies only produce low and high doses. This research shows that producing several doses of a drug can be more effective in the accuracy of therapy for patients

agus Agus Wantoro:

AM We have reached a decision regarding your submission to International Journal on Advanced Science, Engineering and Information Technology, "Fuzzy-Based Application Model and Profile Matching for Recommendation Suitability of Type 2 Diabetic".

Our decision is to: Revision Required

Please submit your revision in 10 days. More than 10 days of paper will be rejected from the system. Re-upload your revision into journal system NOT via email.

Editor

Reviewer C:

Dear Authors,

Thank you for submitting your valuable research findings. However, we still need you to improve the quality of the manuscript according to the reviewer's comments :

Please find an attached file in journal system

We are looking forward to the revision. Good luck!

Kind regards

International Journal on Advanced Science, Engineering and Information Technology

LAMPIRAN TAGIHAN PEMBAYARAN PUBLIKASI ARTIKEL

JOURNAL PROCESSING FEE – 12277

Rahmat Hidayat <mr.rahmat@gmail.com>

12 Des 2020 21.58 (2 hari yang lalu)

Dear Authors,

RE: JOURNAL PROCESSING FEE

We are happy to inform you that since Volume 5 (2015) *International Journal on Advanced Science, Engineering, Information and Technology* (IJASEIT) has been indexed in **Scopus**. The Scientific committees of IJASEIT agree that your manuscript is **ACCEPTED** to be published in **IJASEIT**.

| | |
|---------|--|
| Title | Fuzzy-Based Application Model and Profile Matching for Recommendation Suitability of Type 2 Diabetic |
| Authors | Agus Wantoro |

Journal Processing Fee: USD \$ 255 + Proofread Paper USD \$ 100 + Bank Processing Fee : USD \$ 25, Total USD \$ **380**

Please complete the payment of journal processing fee through wire transfer to:

Account Name : Rahmat Hidayat
BANK Name : Bank Negara Indonesia (BNI)
Account No : 00597 62722

or

Only USD \$ 15 Bank Processing Fee, please make a payment using PAYPAL to (mr.rahmat@gmail.com), Total USD \$ 370

Please reply with copy of Bank transfer to this email or via WhatApps to +62821 71 822448

Best Regards,
Rahmat Hidayat
