Abstract

The Covid-19 pandemic has caused the global economy to decline. In the second quarter of 2020 Indonesia experienced a contraction of around 3%. Agroforestry farming system is a land management technique that utilizes land optimally by paying attention to environmental sustainability. This research was conducted at KPH Gedong Wani in March 2021. The results of the Gmelina and Amorphophallus muelleri BI (porang) agroforestry model research at FMU Gedong Wani are as follows, The results of the financial analysis of Gmelina is an NPV of Rp. 81.448.441, BCR of 2, IRR of 37%, and annual income of Rp. 7.454.957, (2) The results of the financial analysis of Amorphophallus muelleri BI (porang) is an NPV of Rp. 724.996.300, BCR of 9, IRR of 197%, and annual income 78.649.944. The percentage of income between Gmelina arborea Roxb and Amorphophallus muelleri BI (porang) in both strata is, presumably because porang produces every year, while the results of Gmelina are only enjoyed after harvesting.
