Abstract

Forest Management Unit (FMU) Batutegi apply the Social Forestry program, one of which is a scheme of Community Forest (HKM). The high social capital possessed by group of forest farmers will open up the possibility of solving the complexities of problems in implementing HKM programs in the field more easily. Social capital variables namely mutual trust, tolerance, and cooperation will be able to build networks both within community groups and with other community groups. There have been many researches on effect of the entrepreneurial behavior of HKM farmers to community's social capital, but less studies related of the social characteristics HKM's members to their social capital. Under these conditions, this research which was conducted in December 2018 will analyze that effect. The research objective is analyze the effect of social characteristics on the elements forming the social capital of forest farmers managing HKM. Total sample is 86 respondents who are members of the Association of Farmers group (Gapoktan) of Sinar Harapan and Mahardika. Respondents were selected randomly and calculated using the formula Slovin. The data analysis method used is the Non-Parametric Test, namely the Spearman Rank. The results showed that only social characteristics of Mahardika Gapoktan has effect to social norms i.e. networks and the length of stay had an effect on norms, trust and the income had effect to trust.

Keywords: social characteristics, social capital, HKM farmers
