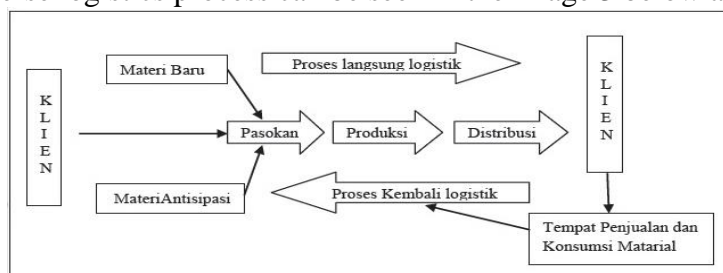
Reverse logistics is a process of planning, implementing, and controlling the efficient and effective flow of goods (raw materials, in-process inventories, or finished goods) and related information, from the consumer point back to the origin (Rogers and Tibben-Lembke, 1999), In this case, the handling of returned goods either salvage and scrap disposal, is part of a process that is closely related to reverse logistics, and is also a component of logistics that need more attention. Reverse logistics also involves the removal and disposal of waste material from the production, distribution and packaging. If the unnecessary waste material that cannot be used to produce other products, the material must be removed. Figure 2 below provides exposure to the key tasks in the flow and reverse logistics.

As stated by Jayaraman et al, (2003) Reverse logistics is the flow in which the product or component coming back after being used for the purpose of repair, recycle or rework. In a world with limited resources and limited disposal facilities, recovery, or improvements made to the product or material is key to supporting the population with rising consumption levels (Georgiadis and Vlachos, 2004). The purpose of reverse logistics is to capture or re-create value or for disposal of goods flows back (Rogers and Tibben-Lembke, 1999). Currently, reverse logistics has a broader concept, as mentioned by Fleischman (1997), this activity seeks to renew the value of goods. Thus, not only of goods withdrawn from the market (distributors, retailers), but also from the end-user even bins and warehouses used in consumer goods. Goods are withdrawn, then processed, either by the original manufacturer or by third parties, for the enhanced value of his or her values returned to normal. The production is also varied; depending on what extent used goods can be processed and value returned. From some literature related to reverse logistics, there are basically four things that considered being the motives of reverse logistics; the economical aspects, environmental aspects, legal aspects, and extended responsibility.

Process of Reverse Logistic

As mentioned before, the process happens in reverse logistics is essentially similar to the activity that occurs in traditional logistics, but there are some differences, some differences are explained by De Britto et. al. (2002) describe such a difference include:

1. On the reverse logistics supply there are many points where the product can be obtained as well as the collection point.
2. It takes a good cooperation and voluntary contributions from suppliers of products, in this case is the consumer, to hand over the goods to the point of collection of the product.
3. Items are collected usually have a low economic value. Unlike traditional logistics came first, logistics to reverse logistics network in various aspects need to be developed.

Reverse logistics are the result of several products that lose their values because of their use as packaging, the loss of function such as a defective product, it is difficult to be sold in the public market, such as excess stock, or must be returned for some reason because of a flaw, everything must be returned or flow backwards from downstream to upstream in the supply chain (Jun-Ji, 2008). Reverse logistics process can be seen in the image 3 below as follows:


Picture 3 Process of *Reverse Logistics*
(Source: Roggers and Tibben Lembke, 1995)

The Purpose of Reverse Logistics

The increasing pressure from various circles on the sustainability of green-production / green company that is happening at the moment, makes the reverse logistics strategy to be one of the main strategies that may be considered by companies to deal with the crisis. As Gungor and Gupta (1999) stated that the company's attention on the environment can be further improved by regulating the production flow in vain, and the handling of the remainder of unused raw materials.

In accordance with the triple bottom line concept that formulates the sustainability and growth of the company depends not only on the operating profit (profit) alone, but also concrete action by the company against the social circumstances (people) and the environment (planet). The three components of the triple bottom line move dynamically depending on the circumstances and the pressure of social, political, economic, environmental, and due to possible conflicts of interest of certain parties (Elkington, 1998). This shows that the concept of social concern in this regard is the concern for the environment is one of the concepts that should be applied to support the company's strategy. However, that does not mean that reverse logistic is similar with the green logistic which is fully focused on the environmental aspects. Manufacturing environmentally conscious is a step further than just manufacturing that implement forward logistics.

Generally speaking, reverse logistics is controlled by several factors such as environmental legislation (Nnorom and Osibanjo, 2008), the extension of the responsibility of the manufacturer (Extended Producer Responsibility) (Khetriwal et al., 2009; Lee et al., 2000), the economy (Liu et al., 2008), and improved customer service (Wu and Cheng, 2006). So basically the reverse logistics strategy can become a competitive force for the company.

Definition of Value Added

Value added is the value of a commodity due to the processing, transportation, and storage or in a production. As argued by Hayami et. al. (1987) in Hidayat et al. (2012), the value added is the difference between the value of the final product by the value of raw materials and other inputs.

Waste

Waste can be defined as any work activities that do not provide added value in the process of transforming inputs into outputs throughout the value stream (Gaspersz, 2011).

Waste can also be defined as a material that is wasted or discarded from the source as the results of human activities and natural processes that do not have economic value (Tchobanoglous et al., 1993). According Tchobanoglous et al. (1993) solid waste is all scrap arising from human activities that are normally solid and discarded when no longer desired or drained. Waste or scrap of waste is the result of human activity that comes from waste generating activities such as market, households, commercial activities such as shops, restaurants and hotels, as well as other activities such as industrial activities that generate waste.

Research method

The approach used in this study is a qualitative approach that is able to provide flexibility and allow researchers to obtain information from primary sources (first-hand information). This research can be categorized as "Qualitative Business Research" which aims to get the desired results in the achievement of business goals.

As described by Zikmund et. al. (2013), through a qualitative approach, researchers can conduct an elaborate interpretation of information to find the substance of a phenomenon without

relying on purely quantitative measurements (numerical measurement), but focused on the discovery of a phenomenon substance and find a new understanding of the perspectives. Design research is using the case study method, which is expected to answer the question "what / how" in a phenomenon / problem that occurs in an organization (Yin, 2014). Such design is done with consideration to get an idea of depth on the design of reverse logistics on the management of waste generated in the form of coffee grounds to create economic value in the supply chain process.

Data Collection Procedures
The data collected in this study using a number of ways that will be stated as follows:
1. Observation, a preliminary study aimed to see, know and understand the problems and the phenomenon of what is happening in some café / coffee shop in Surabaya. Problems and phenomena that occur in the café / coffee shop can be formed into a new strategic framework that is used as a proposed improvement strategy. By observing the production system and supply chain and logistics systems of the café / coffee shop to see the problem.
2. A Literature Study is enabled to view and get information about the phenomenon or problem that occurs in some café / coffee shop in Surabaya with the support of existing theories. Obtained from books, journals about economy and also of the materials that are generally associated with this research as reference material.
3. Interviews, namely excavation or search for data through interviews. This is done in order to find all the information about problems that occur in some café / coffee shop located in Surabaya, and can later be used to obtain data that serves as a support in making the proposed new strategy.
4. Survey the field, observation or research directly to several café / coffee shop located in the Surabaya to obtain the real data and see firsthand process on the spot.
5. Secondary data from the Internet. Data derived from sites containing about things that relate to the theme or subject matter of the study.

Analysis of the data used in the qualitative research done by using words that are always arranged in an expanded text or described (Miles and Hubberman, 1986). In this study, the validity of the data will be tested using the method of triangulation. As stated by Moleong (2004), triangulation is a technique that utilizes data validity checking something else outside these data for purposes of checking the data or as a comparison against the data. Triangulation can be grouped into four types of analytical techniques; the triangulation method, researchers, source, and theory.

Analysis and Result
The research will focus on interviews, surveys and observations conducted on 13 brands café / coffee shop that were selected randomly based on the location / layout of the café / coffee shop itself. Selection of the 13 brand café / coffee shop is based on the geographical location of the café / coffee shop which were scattered in various areas in Surabaya, they are: 2 brands located in North Surabaya, 2 brands in Central Surabaya, 2 brands located in East Surabaya, 2 brands located in West Surabaya, and 2 brands located in South Surabaya, as well as 3 great brands that has a nationwide distribution outlets throughout Indonesia and has the largest number of outlets in Surabaya.

Through Table-1, as follows, can be seen from the informant profile of 13 brands that are used as a reference for researchers in exploring the design of reverse logistics related to the information on coffee grounds waste management in order to create value added in the industrial supply chain processes café / coffee shop in Surabaya:

Table -2 Informant Research Profile

NO	NAMA	LOKASI	JUMLAH OUTLET	JABATAN	KETERANGAN
1	LIBRERIA COFFEE & EATERY	**Surabaya Timur**	1	OWNER	INFORMAN 1
2	COFFEE TOFFEE SPECIALTY	Surabaya Timur, **Selatan**	3	MANAGER	INFORMAN 2
3	KABINET COFFEE	**Surabaya Barat**	1	BARISTA	INFORMAN 3
4	MONOPOLE COFFEE LAB	**Surabaya Barat**	1	BARISTA	INFORMAN 4
5	HISTORICA COFFEE & PASTRY	**Surabaya Pusat**	1	BARISTA	INFORMAN 5
6	STARBUCKS	Surabaya Pusat, Barat, Timur, Selatan	10	SUPERVISOR	INFORMAN 6
7	J.Co DONUTS & COFFEE	Surabaya Pusat, Barat, Timur, Selatan	7	SUPERVISOR	INFORMAN 7
8	THE COFFEE BEAN & TEA LEAF	Surabaya Pusat, Barat, Timur	5	SUPERVISOR	INFORMAN 8
9	CALIBRE COFFEE ROASTERS	**Surabaya Pusat**	1	BARISTA	INFORMAN 9
10	ROLLAAS COFFEE & TEA	**Surabaya Utara**, Pusat, Selatan	3	BARISTA	INFORMAN 10
11	De Mandailing	**Surabaya Selatan**, Timur	2	BARISTA	INFORMAN 11
12	My Kopi O	**Surabaya Utara**, Barat, Selatan	3	BARISTA	INFORMAN 12
13	OOST KOFFIE & THEE	**Surabaya Timur**	1	BARISTA	INFORMAN 13
		TOTAL	**39**		

Based on the data shown in Table-1 above it can be seen that the 13 brands of café / coffee shop that are used as a reference in the study may be representative of the overall total outlet café / coffee shop were recorded in Surabaya as many as 69 outlets. With a total of 39 outlets or outlet amount equivalent to 56.5% of the total number of outlets recorded, the 13 brand also has a high degree of heterogeneity when viewed from the map distribution locations in various areas in Surabaya; Central, North, West, East, and South.

Supply Chain Scheme On The Café / Coffee Shop Industries in Surabaya

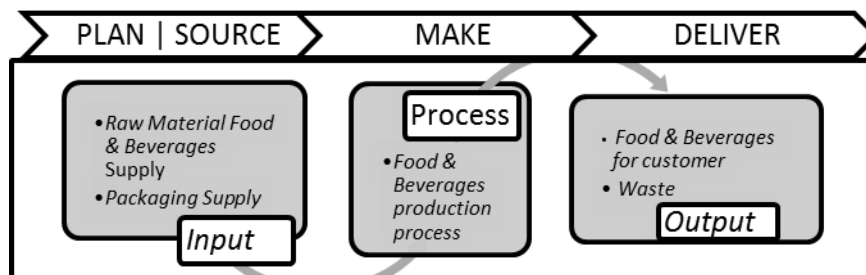
Based on the observation that has been done, it can be obtained information regarding the supply chain process that is based on a system of forward logistic of café / coffee shop as shown in Figure 4 below:


Figure 4. Supply Chain Scheme on Café / Coffee Shop in Surabaya

As shown in Figure 4 above, it can be seen that the picture of the supply chain process in the café / coffee shop in Surabaya still refers to forward logistics system. As described by Srivastava (2008) in the journal written by Lau and Wang (2009), forward logistics is a supply chain system that focuses on activities such as: movement / supply of materials from suppliers, processing of materials in the production, and distribution of the final product to the consumer.

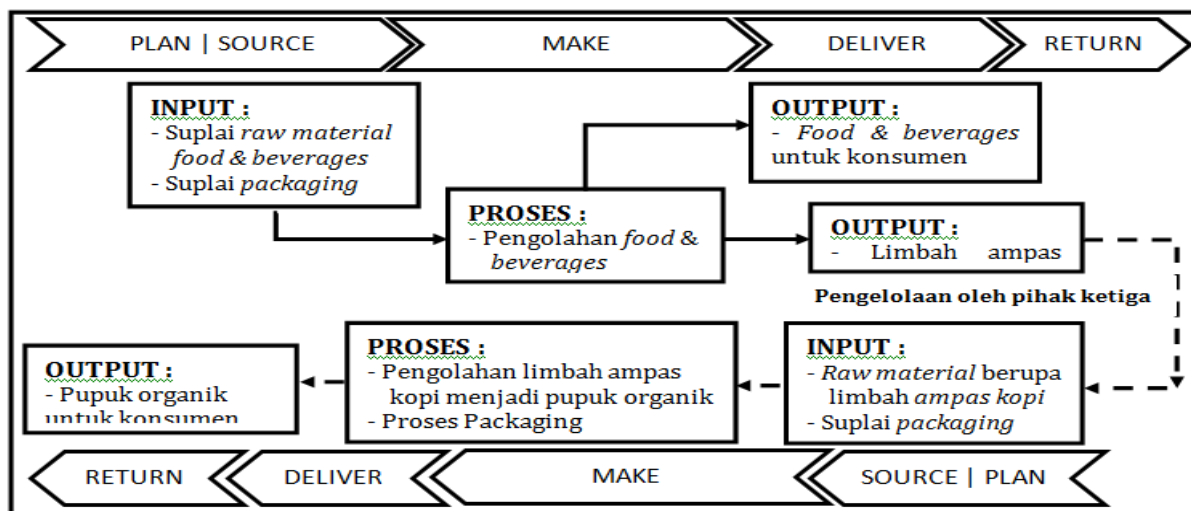
This is consistent with the picture of the supply chain process in the café / coffee shop in Surabaya that is divided into 3 main activities include: input which contains activities reception / supply from suppliers in the form of raw materials of food and beverages (food & beverages) as well as raw material non-food and beverage such as packaging. In the input phase there is also a plan of activity covering the planning process and inventory control as well as the source of activity that includes the supplier selection activities, evaluating the performance of suppliers, scheduling delivery from suppliers, receiving, checking, and make a payment to the supplier. The process of the raw material processing activities / materials (food & beverages) is to be processed into foods and beverages to be consumed by consumers. In the process phase there is also a

make-activity which includes the process of transforming raw material / materials into products that customers wanted. Output of the food and drink that has been generated will be ready for consumption by the final consumer. In the phase of the output is also contained deliver activities that include process to meet the demand for these products in terms of food and beverage customers want. Not only that, the output generated by the production process also includes waste or waste generated during the production process. In this study the waste generated in the form of coffee grounds, because this research focuses on industrial café / coffee shop that has a core product of coffee-based drinks.

Potential Number of Coffee Dregs

Based on the observation of several café / coffee shop in Surabaya it can be obtained some information that there is a potential amount of waste in the form of coffee dregs of 1-2 kg / day / outlet. This amount, if calculated on the period of 1 month assuming 25 working days, can be obtained potential waste coffee grounds of 25-50 kg / month / outlet, in order to obtain information that the total amount of potential waste coffee grounds produced by 69 outlets café / coffee shop were still active in Surabaya amounted to 1725 - 3450 kg / month.

Plan for Waste Management in Reverse Logistics of Coffee Dregs

The number of potential coffee grounds are thrown away in vain by the café / coffee shop in Surabaya for 1725 - 3450 kg / month as well as the availability of several options in conducting the processing of waste in the form of coffee grounds that are not worth to be a new product, making it as the basis of the research in determining design of reverse logistics on the management of waste coffee grounds to be considered as a new business. Later on it will be explained about the proposed design of reverse logistics activities on the management of waste coffee grounds in order to create economic value in the supply chain process industries café / coffee shop in Surabaya as shown in Figure 5 below.


Note: → Forward logistics activities
       ⇢ Reverse logistics activities
Figure 5 The Plan for Waste Management in Reverse Logistics of Coffee Dregs

In the figure-5 it can be seen that the proposed design of reverse logistics activities focuses on the process of managing waste coffee grounds obtained by collecting coffee grounds that have been discarded by the café / coffee shop by a third party, in this case the researchers. The plan of reverse logistics proposal is intended to provide an overview of new business opportunities for

third-party / parties other than the manager of the café / coffee shop that can do the coffee grounds waste management to be processed into a new product which has more value.

The activities of reverse logistics on the management of waste coffee grounds produced by the café / coffee shop in Surabaya begins since the process of making coffee grounds in fact be the final activity (output) in the scheme of supply chain based on forward logistics that has been applied by the managers of the café / coffee shop. In this phase there is also a return activity that is the process of receiving product returns of the generated café / coffee shop that waste coffee grounds itself. This is in contrast with the scheme forward logistics supply chain where the process stopped until the output stage in this case the disposal of waste. Waste in the form of coffee grounds into a major raw material input to the process of reverse logistics activities. Not only the collection of waste in the form of coffee grounds into the main raw material, the input process is also carried out other activities that the supply of goods into raw material support such as packaging used to package new products such as organic fertilizer. In phase of input there is also a plan of activity covering the planning process inventory source coffee grounds and activities that include the distribution process at the time of collection activity coffee grounds. Not only that, the input phase there is also a supplier selection activities, evaluating the performance of suppliers, scheduling delivery from suppliers, receiving, checking, and making payments to suppliers who provide material support.

The management activities of waste is continuing to the next stage which is the processing activity the waste of coffee grounds to be processed becoming organic fertilizer, which at this stage of processing is divided into two main activities namely, the process of drying the coffee grounds and the packaging process is done so that the organic fertilizer to be distributed to the consumer has a special attraction in addition to show the benefits that can be provided from the organic fertilizer for plant growth. In this phase there is also a make-activity which includes the process of transformation of raw materials / materials into new products resulting from such waste coffee grounds.

The final stage of the supply chain process based on reverse logistics is the output process, wherein the organic fertilizer packaged together and ready to be distributed to consumers. In output phase there are also activities that include the delivery process to meet consumer demand for organic fertilizer products itself, and there was activity returns if there are defects in the production process.

Through this study, the researchers also wanted to illustrate the potential market that can serve as a primary target users of organic fertilizer products that are made from the coffee grounds, as will be described in the following sub - chapter.

Economic Value Of Reverse Logistics Activities On Coffee Waste Management and Coffee Utilization Being Organic Fertilizer To Support Urban Farming

Based on the results of the triangulation between researchers, can be obtained information that the coffee ground is an organic fertilizer that is economical and environmentally friendly. Spent coffee grounds contain 2.28% nitrogen, 0.06% phosphorus, and 0.6% potassium. Slightly, the acidic pH of coffee grounds is ranging from 6.2 on the pH scale. In addition, the coffee grounds containing magnesium, sulfur and calcium that is useful for plant growth (Adikasari, 2012). The study uses hydroponic tomato plant through the media as an object of research. Hydroponic planting medium is a way of farming without the use of soil media that is currently prevalent in the area of agricultural that has minimum/limited land, especially in urban areas in Indonesia.

Alongside with the development of science and technology, in urban areas there are many farms and plantations were converted into industrial areas, warehousing, as well as housing. This resulted in an increasingly narrow agricultural land and plantations in Indonesia, whereas when viewed in terms of economics, agriculture and plantations can help people in increasing their income. Moreover, farming is a concrete effort that can be done to prevent global warming.

Through this research also can be obtained information that the city of Surabaya is a city with a population that has considerable enthusiasm in doing farming activities, or better known as the urban farming trend. Urban farming is one of solutions development of agriculture sector due to limited land is being aggressively promoted by the government through the Department of Agriculture Surabaya Surabaya. As revealed by Mr. Djoestamadji, Head of Agriculture of Surabaya in articles on www.antarajatim.com in July 2015 edition, urban farming is one solution that can be applied in view of the limited farmland and plantations located in Surabaya.

One form of implementation of urban farming is to conduct farming activities using hydroponic media. Hydroponic systems are using water main elements and complementary elements in the form of bricks, gravel, or other solid material. One of the pioneers in the development of urban farming in Surabaya is Hydroponics Community Surabaya (SHC). In this study, researchers conducted observations and interviews to explore more about the market potential of the organic fertilizer made from coffee grounds and triangulate the source of that performed on the PR Community Hydroponics Surabaya with an informant named Mrs. Fananah Firdausi located in Green House Puspa Agro Jl Sawunggaling 177-183, Jemundo (Kletek), Taman, Sidoarjo, East Java, Indonesia. Based on observations and interviews, information was obtained that the plants grown using the medium of hydroponics has the advantage of ease of cultivation methods, cheapening the costs involved, and the resulting product is healthier for the body because the plants grown with media hydroponic free of pesticides, fungicides, and insecticide.

Currently, Community Hydroponics Surabaya has a membership of some 19 thousand people and has business potential form the vegetable market that has much in demand at home and abroad. This is consistent with the statement of the Chairman of Farmers' Cooperative Hydroponics East Java, Mr. Yoso Susrianto in an article published in the daily Surya Online edition of March 2015 stating that there is a potential demand of up to 1 ton of vegetables every month to be able to meet demand needs in vegetables both at home and abroad. To perform the calculation of economic value that can be obtained through reverse logistics activities on the management of waste coffee grounds, researchers refer to research conducted by Hidayat et al. (2012). These studies use Hayami method adapted and developed in accordance with the characteristics of agro-industrial supply chain of palm oil, and eliminate the weaknesses that exist in the method. A modification made is the basis for calculating using the value of money, no more weight materials and products. Using the methods detailed Hayami can generate potential economic value and add value for businesses, especially coffee and also create new business models coffee waste utilization, especially for creating useful economic activities like small binsis creative actors. Hayami calculation method provides results in the form of information that the coffee grounds that initially has no value or an added value ratios of 0%, it can be increased until reaching added value ratio of 57%. This represents an added value to be gained if we are able to process the coffee grounds are not worth into a new product that has more benefits.

Conclusion

Based on the analysis through interviews with informants who became manager of the café /coffee shop in Surabaya, literature review on the concept of reverse logistics on the management of waste coffee grounds, as well as the results of triangulation can be concluded that in general, the supply chain process in the café / coffee shop in Surabaya still refers to a forward logistics system that focuses on activities such as: the supply of raw materials by suppliers to the process of providing food and beverages to final consumers and stop the waste disposal activities remainder of production.

Business café / coffee shop in Surabaya do not make the effort management of waste in the form of coffee grounds to be processed into new products that can provide economic value. Obstacles faced by the manager of the café / coffee shop in Surabaya in managing their waste independently among others, is the limited amount of coffee grounds waste generated for each

cafe, limited to time and human resources that willing to conduct utilization of waste coffee grounds. Through the concept of reverse logistics, waste coffee grounds are thrown away in vain by the café / coffee shop in Surabaya which can be utilized as an organic fertilizer that is economical and environmentally friendly, and can act as an enhancer of nutrients for plant growth.

This study provides an overview of the new business opportunities in relation to the management of waste coffee grounds to make a profit by creating a new product that is organic fertilizer that has more value, as well as supporting the creation of the concept of the triple bottom line of a business. This research is only done until the design phase reverse logistics, so it is advisable to be able to proceed with further research, by expanding the scope of the study so that the results can be generalized to create reverse logistics implementation that can later be used properly by operators.

The practical implications for small entrepreneurs should be able to act in a creative and innovative way in creating new business opportunities, especially on the management of waste generated by businesses themselves, given the current business operators should not only focus on the acquisition of profit alone, but also needed cooperation between the various parties to create the concept of environmentally friendly for the companies that support the creation of the concept of the triple bottom line of a business.

MAPPING THE TERRAIN; THE INDONESIAN BUSINESS PERSPECTIVE IN ASEAN ECONOMIC COMMUNITY

Lena Choong Sook Lin, Bina Nusantara University, Indonesia
Marko S. Hermawan, Bina Nusantara University, Indonesia

Abstract

The ASEAN Economic Community (AEC) has been implemented throughout the ten ASEAN members. On one hand, the preparation seems to be an issue of readiness, and on the other hand, many of the practitioners are expecting that changes of business environment will change. This study focusses on related institutions that will be affected by AEC project. By employing institutional logics offered by Thornton, Ocasio, and Lounsbury (2012), the study scrutinise on academics and business practitioners as institutions and the cultural context embedded within. A mixed method of newspaper data analysis and semi-structured interviews were utilised in order to get a comprehensive data from both sources. The finding suggests there is a definite gap of orientation between business practitioner and the academics and that the two institutions have less information and contribution, compared with government and association ones. This study concludes that more participation is needed from both institutions, which are currently being 'victimised' from the project and is less communicated.
Keywords: *ASEAN Economic Community, Institutional Logics, Indonesian Business*

Introduction

December 31st, 2015 marked the implementation ASEAN economic community (AEC); all 10 nations bound together in the ASEAN region will be expected to implement and harmonise their economic and trading regimes. As stipulated in the Bali Concord II blueprint, the economic integration constitute 'a stable, prosperous and highly competitive ASEAN economic region in which there is a free flow of goods, services and investments, a freer flow of capital, equitable economic development and reduced poverty and socio-economics disparities' (ASEAN, 2007). AEC is essentially a process of singularising market and production within the region into larger market place (Soesastro, 2008). The intention is to fulfil regional consumption needs, while offering wider opportunity to market easily within ASEAN countries. One of the attempts is the removal of trading barriers such as customs, taxes, for goods, services and investment. As a consequence, some 591 million people around the region will be effected through an attempt to remove trade barriers and strengthen close cooperation amongst the ASEAN member countries.

The economic integration, that was prepared since its establishment of agreement in 2003, is considered as 'ambitious and sophisticated initiative of its kind' (Jones, 2015; Petri, Plummer, & Zhai, 2012). The initiative began after the ASEAN foreign trade agreement in 1993 was considered a slow progress in terms of implementation and commitments from the members (Ravenhill, 2008). Moreover, Soesastro (2008) also argue that the nature of ASEAN integration has been a voluntarily action. In the past, the regional cooperation between these nations were constituted on a dynamic process, which was left open-ended and slow-progressed. However, the AEC blueprint, which was established on November 2007, is expected to booster the implementation process.

Another obstacle to face the AEC is the clarity of blueprint. Ravenhill (2008) argues that

the blueprint document contains a well- meaning phrase but lacking of specificity regarding realisation of objectives. In other words, there is a wide gap and unclear meanings from the blueprint against what should be done. He suggests that based from McKinsey's report, the ASEAN member should provide a standardisation and harmonisation of barriers removal and taxation systems, competition principles, and product standards. This involves harmonisation of domestic goods, investors and labour standards.

AEC is an initiative that enforces the members to open their markets and allow free-barrier intra- transactions. However, the harmonisation of free-trade area is not an easy task. There are at least two obstacles facing the integration. First, the liberalisation of intra-ASEAN trade has not been of 'sufficient significance to warrant their expending substantial resources to lobby for deeper integration' (Ravenhill, 2008, p. 482). Moreover, the diversity of tariff dispersion rates is high and vary (Plummer, 2006). This hinder the fact that harmonisation can take decades to happen. In this case, it is a matter of how the executives and leaders of each nation committed to the campaign of such integration. The issue of 'political will' has been a classic excuse as to which commitment and execution are addressed to the higher level of authority. Second, trading between ASEAN members are in a relatively small number. Ravenhill (2008) argues that although the trade inflow to ASEAN has been stable throughout 40 years, the proportion of intra- regional trade amongst the member is one quarter of all of ASEAN's trade. Hence, there is a strong refusal to changes as far as business and political interests are concerned. Unfortunately, a number of issue hinders the process of fundamental change in terms of economic, social, and cultural. The issue of infrastructure and business readiness in the Indonesian businesses support this argument, which eventually impact the free flow of goods and services, as well as the freedom to operate across the region (Benny, Yean, & Ramli, 2015). Specifically, the Indonesian businesses fear on the implementation of AEC, where most of the obstacles faced domestically by micro, small and medium enterprises are infrastructure bottlenecks, credit shortages, limited skilled workers and corruption in red tape customs (Rüland, 2016). On the other hand, some countries such as Singapore and Malaysia are on their visible preparations to harmonize economic policies in accordance with what has been agreed in the Bali Concord in 2003.

A number of studies acknowledge the implication of AEC in the region, as well as to overview in a macro-economic level (Hew & Soesastro, 2003; Soesastro, 2003, 2008), but few studies scrutinise micro- level of analysis in a particular nation. Moreover, numerous research in ASEAN integration and regionalisation are done by employing political economic approach (Jones, 2015; Sukma, 2014), while little found in adapting institutional theory as an alternate insight. To some extent, few exposure and preparation on each of the ASEAN nations are prepared, at least from the business point of view. Less information and socialisation is made throughout the campaign, and there is limited action produced by government as regulator to enhance the merging of one- market economy in the region (Perwita, 2015). It is imperative to determine the level of readiness to implement such new policy and to what extent the ASEAN nations provide such formulation and strategic planning towards AEC. Such study reminds us on the fact that rational study of economics must also be understood by a non-rational approach from the sociological point of view. As Granovetter (1985) suggested, the importance of understanding embeddedness of social behaviour is imperative, in conjunction to rational-economic perspective. Hence, this study attempts to investigate current obstacles through scrutinising the three level of institutional analysis, faced by one of the ASEAN country that hinder the readiness to adopt AEC.

An institutional understanding of a society is, thus, imperative to undergo this study. Institutional logics, as proposed by Thornton et al. (2012) is a comprehensive framework to elaborate micro-, meso-, and macro-level of a society in which institutions are comprehended in a structural mannered. By allowing a reconstruction of identities of institutions based on logics and situated practices in Indonesia, it is expected that this study enable to scrutinise the fundamental

setback, both internally and externally. With over 250 million of population and more than 17,000 islands spread across the archipelago, Indonesia has a great potential in the success of the AEC. In addition, following Rüland (2016) argument that the majority of Indonesian businesses have less participation to regional decision making in AEC implementation, this study starts with a question, 'How is the perceived logic of the Indonesian institutions to face AEC?' The following sections are institutional logic framework, followed by research method, findings, and conclusion.

Institutional integration of a region; a comparison between the European Union (EU) and AEC

AEC can be defined as an attempt of economic unification of the region towards a single-market liberalisation. As a consequence, such integration involves integration and reconstruction of social interaction throughout the region. The extent to which cultural, norms, and business environment are materialised and that are affected by such integration. Studies in politics, public policies, and social sciences confirm that institutional changes exist in the integration process, both socially and economically. According to Perkmann (2002), the EU (or his term: Euroregions) has becoming an institution, due to the fact that the post-war history of European process of institution-building within the specific context of the European polity. Secondly, I argue that this institutionalization of the Euroregion can be attributed to the long-term activities of a trans-European policy network. The strategies and actions of the latter can thus be characterized as institutional entrepreneurship.

Plummer (2006, p. 3) describes three primary motivations for economic integration in European continent: (i) to avoid wars of such magnitude, destruction, and loss of life; (ii) to draw markets and resources together for economic and social reconstruction; and (iii) to build a strong, integrated region as a safeguard against the Soviet Union. Consequently, after the establishment of Treaty of Paris in 1951 of the European Coal and Steel Community (ECSC), the European Economic Community (EEC) was formed in 1957 by the Treaty of Rome. The initial aim of this community was to integrate economy, which consist of common market and common union amongst six members: Belgium, France, Luxemburg, Italy, the Netherlands, and West Germany. Hence, these members allow free goods, services, capital, and labour movement.

The development of EU has developed a new social construction within the continent. Risse (2004) argues that there was a degree of dispute and changes of the European identity that affect each nationalism. This also includes cultural variables such as ethnic groups and collective norms of Europe. Nevertheless, national identity and nation's pride remained challenge to integration process, in which some arguably defined 'no European people' and 'no common European history'. It was thus becoming a burden that European Union became a difficult institutional change throughout the region.

However, based on Perkmann (2002) analysis of institutional change, there is one important element to explicate the integration: the theory of policy networks and policy analysis. Political factor has crucial impact to EU, in which policy makers such as Council of Europe and the European Commission promoted supranational policy. Although the two agencies proved to have weak formal position towards the people, the policy networks enable to incorporate policy makers and the freedom of social changes. Furthermore, Perkmann (2002, p. 126) suggests the construction of institutional framework in the EU as follow:

a) the institution: The Euroregion is a blue-print for organizing public cross-border intervention, 'invented' in the fifties in the Dutch-German border area

b) the organizational field: a supranational policy field, EU regional policy, provided the transmission mechanism for the proliferation of Euroregions, that is, their effective institutionalization across the EU and beyond.

c) the institutional entrepreneur: a transnational policy network in the area of Cross-border Cooperation (CBC) has been crucial for advancing the interests of border authorities on both the national and supranational level in Europe over the last decades, thereby contributing to

the institutionalization of the Euroregion as a legitimate model of public agency.

In contrast, the AEC may be interpreted differently as far as the social interaction is concerned. Studies focus on institutionalised regionalism and its impact to social aspects within the ASEAN region. There also has been strong arguments that ASEAN, as one 'micro' institution, is required to restructure its institutional structure in order to strengthen its members to rely on regional institutions and reduce the domination on nation's sovereignty (Sukma, 2014). Another study by Benny et al. (2015), investigate the extent of public attitudes and aspirations towards AEC from three countries: Malaysia, Indonesia and Singapore. The study shows that although there is a positive sign from the public, the aspiration from these countries differ from those of the EU. Most of the respondents reject features offered by EU, such as common currency, the abolition of passports, the establishment of ASEAN parliament, a stronger executive body, and ASEAN Court of Justice (Benny et al., 2015, p. 105). Other studies by Plummer (2006) suggests that the historical and environmental setting of integration is different from the EU. As described above, the spirit toward EU derives from the devastating memory of the WW2 and the emerging cold war tension against the Soviet Union, whereas AEC stems from geographical proximity and cultural similarity. Hence, the macro- institutional factor can also be perceived differently with AEC. Moreover, ASEAN economic development has more diverse in terms of its members income. Another difference is that at the time of its integration, the EU was dominated by developed countries, whereas ASEAN consists of developing ones (only Singapore and Malaysia are considered developed). There is a high possibility that of complex and difficult process in integrating the ASEAN region compared with EU. This is why many argues that the AEC is considered an 'ambitious' effort (Jones, 2015; Petri et al., 2012).

These studies indicate that the both integration of an economic unity produce different social construction and interaction. The extext to which institutional change occur in different direction, as opposed to EU, has led this study to scrutinise the impact of AEC integration to social environment. A preposition of logics would highly be the outcome of this research, and hence, institutional logics determine the reconstruction of social institutions in a specific setting such as Indonesia, and how these institutions impact the business environment.

Institutional Logics as a tool to understand socio-cultural environment.

In a country with multi-ethnic, religion, and islands, analysing an Indonesian society may require thorough investigation from a multiple perspective angle. Studies on contemporary institutions confirm that in order to understand a particular society, one must acknowledge the importance of social construction; the relationship of an actor and his/her surroundings (Jepperson, 1991). Individual, as the smallest institution, enable to perform self-activation in social environment and produce a social pattern is in accordance to the values, norms, and cultural symbols embedded in that society (Thornton et al., 2012). By definition, Institutional logic is a socially constructed, historical pattern of material practices, assumptions, values, beliefs, and rules by which individuals produce and reproduce their material subsistence, organize time and space, and provide meaning to their social reality (Lok, 2010; Thornton & Ocasio, 1999).

In an expected 'AEC institutional environment' faced by the Indonesian business society, institutional logic has recently been a useful framework to elaborate socio-cultural interaction in a specific environment. There is a strong indication that regional integration result institutional changes, in which studies have been scrutinising the development by constructivism (Risse, 2004) and of political and economic approaches (Duina, 2006). Other studies in institutional regionalism (Rattanasevee, 2014) and institutional changes in ASEAN (Sukma, 2014) suggest an institutional constructivism in order to strengthen the role of ASEAN to its members. Scholars have been employing the logics in various disciplines on institutional behaviours, such as sociology, psychology, and management sciences (Thornton et al., 2012), which eventually enrich the holistic view of the Indonesian institution subsequent to AEC. Hence, this study offers

factors influencing business practitioners as 'actor' in meso- and macro institutions (Thornton & Ocasio, 1999), but also other perspectives offered by Associations, Academicians and Government officials. As such, based on Thornton and Ocasio (2008), the mechanism of institutional logics constructions incorporates two principles:

1.   Embedded agency

Institutional logic assumes that interests, identities, values, and assumptions of individuals and organisations are embedded within an institution (Thornton & Ocasio, 2008). An institution is purposed to become the boundary of opportunities and constraints. It is imperative to consider an 'actor' as the individually central expression in order to explicate an inductive construction of symbolic culture and practices (Meyer & Höllerer, 2010; Thornton, 2004).

2.   Society as an inter-institutional system

The involvement of society is one important factor in institutional logic. Derived from Friedland and Alford (1991) concept of society as marketplace, there are numbers of social constructions developed based on the setting of actor. The development of such constructions is made based from different substantive context in the field in which the actor is located (Thornton, 2015). Thornton (2004) suggests six typologies of society: markets, corporations, professions, states, families, and religious, while Meyer and Höllerer (2010) construct eight frames namely market, stakeholders, labor vs capitalgood entrepreneur, valuation method, synthesis, noneconomic values, and ambiguous. These typologies of society represent a unique characterisation of agencies within societies, which represent a different set of social relations and behaviours. The represented logics can be derived from sources of heterogeneity and agency that caused by contradiction of different institutional orders. In addition, the institutional logics approach posits any context that constitutes contradiction from different societal sectors, rather than emphasise on isomorphism and homogeneity in organisational fields (Thornton & Ocasio, 2008). An example of institutional order is shown in table 1.

Institutional logics offers multiple levels of analysis that enable researcher to observe individual behaviour and consciousness based from the level that individual is 'nested' (Friedland & Alford, 1991). These levels can be organisation, markets, industries, inter-organisational networks, geographic communities, and organisational fields (Thornton & Ocasio, 2008). In general, the multiple levels can be classified as three types: Macro, Meso, and Micro levels. The Macro-Societal level consists of the community logic that contributes to the inter-institutional system; the Meso represents the organisational level, and; the micro level emphasises on individual logic. As mentioned earlier the three levels do not individually stand on their own, but rather as an inter-institutional system that correlates closely and generates logics within the organisation. Based on Thornton (2004) interinstitutional system ideal types, this study attempts to construct the institutional orders and the categorical manifestation of individuals and organisations in the Indonesian business context. Provided as a Western-type of institutional, the logics posit a socio-structural composition that consist of Family, Community, Religion, State, Market, Profession, and Corporation. Table 1 defines a complete institutions of an ideal society, which represents categories on how individuals and organisations are likely to understand their sense of self and identity: who they are, their logics of action, how they act, their vocabularies of motive, and what language is salient (Thornton et al., 2012). The category consists of root metaphors, sources of legitimacy, identity, norms, and authority.

In defining institutional legitimacy, Rüland (2016) conducts a study that observe the regional interest representation of the ASEAN regional decision making, namely non-participatory regional organisation, state-corporatist arrangements, liberal-corporatist institution, and liberal pluralism. These categories are based a degree of participatory settings that either state- controlled or functional cooperation. This study, on the other hand, offers

an exploration of context, where the Indonesian behaviours, cultural symbols, and organisational field practices, fall under the level of institutional logics. Although one suggests the that institutions such as government agencies, sectoral bodies, business associations and civil society will emerge the related 'institutional orders' in AEC (Soesastro, 2008), the study allows institutional contradiction and contestation in logics (Thornton, 2015) and transition reconstructed from the data findings. This ensures the current logics experienced by the Indonesian business practitioners, as well as regulators and academicians.

Table 1. Institutional Logics Framework

Y-Axis	X-Axis: Institutional orders						
Categories	Family 1	Community 2	Religion 3	State 4	Market 5	Profession 6	Corporation 7
Root Metaphor 1	Family as firm	Common boundary	Temple as bank	State as redistribution mechanism	Transaction	Profession as relational network	Corporation as hierarchy
Sources of Legitimacy 2	Unconditional loyalty	Unity of will Belief in trust & Reciprocity	Importance of faith & sacredness in economy &	Democratic participation	Share price	Personal expertise	et position of firm
Sources of Authority 3	Patriarchal domination	Commitment to community values & ideology	Priesthood charisma	Bureaucratic domination	Shareholder activism	Professional association	Board of directors Top management
Sources of Identity 4	Family reputation	Emotional connection Ego-satisfaction & reputation	Association with deities	cial & Economy class	Faceless	Association with quality of craft - Personal reputation	Bureaucratic roles
Basis of Norms 5	Membership in household	Group membership	Membership in congregation	Citizenship in nation	Self-interest	embership in guild & association	Employment in firm
Basis of Attention 6	Status in household	onal investment in group	Relation to supernatural	tatus of interest group	Status in market	Status in profession	Status in hierarchy
Basis of Strategy 7	rease family honor	Increase status & honor of members & Practices	Increase religious symbolism of natural events	ease community good	ease proficiency profit	ncrease personal reputation	Increase size & diversification of firm
Informal Control Mechanism 8	Family politics	Visibility of actions	Worship of calling	Backroom politics	Industry analysis	Celebrity professionals	Organisation culture
Economic system 9	Family capitalism	Cooperative capitalism	Occidental capitalism	Welfare capitalism	Market capitalism	Personal capitalism	Managerial capitalism

Methodology

This study complements the use of content analysis and interview analysis in order to construct meanings and sense-making from two different method. The construction of meaning involves interpreting and understanding a set of document and interview transcription, until establishing a concept of thoughts, ideas, and phenomena (Weick, 1995). Following Meyer and Höllerer (2010) the analysis are constructed to explore a "topographic map" of meaning and assisted the making sense of the structured configurations observed.

In a qualitative approach, with interpretivism methodology, the first step is perform document analysis, where the researchers analyse documents originates from online newspapers, magazines, and articles related to AEC and its preparation in Indonesia. There is a growing trend in this method, which enable to capture information generated from people's behaviour and interests through newspaper text mining (Cheney, 2013). Hence, this method is considered appropriate, giving the fact that text mining enable to reveal sense making through meaning that is contested and negotiated amongst sources, which consequently construct a structured 'social space with specific logics and characteristics' (Lok, 2010; Meyer & Höllerer, 2010). In order to present a holistic view of the current issues, the observed documents were taken from three different articles that originates from different languages and domiciles. They are *liputan6.com* (an Indonesian-based news in *bahasa Indonesia*), *the Jakarta Globe* (an Indonesian-based news

in English), and *Channel News Asia* (an international news) from year 2013 – 2016. This method is considered important to the study, in order to gain elicit meaning, gain understanding, and develop empirical knowledge to a particular environment (Corbin & Strauss, 2008). There are reasons of employing document analysis to this study. Firstly, the extent to which AEC phenomenon in Indonesia is relatively new and hence, there is a need to explore further on the new changes of economic integrity. This approach is used by Vaismoradi, Turunen, and Bondas (2013) to identify sensitive phenomena, and to explore unknown phenomenon in a specific setting. Secondly, document analysis is also used to describe missing context, and "possibly finding theme based on frequency of occurrence, division of manifest and latent contents, and non- linear analysis process" (Vaismoradi et al., 2013, p. 399). There is a necessity to explore an in-depth understanding of changes in business process, which will be affected after the implementation of AEC in Indonesia. Thus, document analysis is suitable for this study.

The analysis was based on two framing of interpretation: positive and a negative orientation. Consequently, the documents were analysed sentence by sentence to discover a phenomenon. Similar method of article analysis was performed by Lok (2010) and Meyer and Höllerer (2010) in order to reveal such connotation from the newspaper coverage.

The second step was to undergo interview session, which involves people who are expected to be impacted by AEC. Based from the document analysis from the newspaper coverage, there were for main institutions that were actively commented on the readiness of AEC, namely Business practitioners, Government officials, Associations, and Academics. A semi-structured interview was conducted in order to retrieve a flexible, but related theme to each of the interviewers. The two steps of data collection then were analysed in order to produce coding and to identify the pattern of understanding. It is imperative that these understanding enable to construct prevalent meaning in a particular social field, as well as to capture the sociopolitical environment within the system (Meyer & Höllerer, 2010). Iteration process is needed to gain more understanding, sense-making, and construction of meaning throughout each process. This involves data collection, data reduction, display, and conclusion drawing, which are considered as a cyclical process (Miles & Huberman, 1994). The findings are expected to produce coding and appropriate themes that summoned from the transcription and document analysis.

Findings

The first step of document analysis was conducted from January until May 2016, which involved 174 online newspaper articles. This consists of 103 Indonesian articles in *Bahasa*, 64 of Indonesian-based newspaper in English, and 7 non-Indonesian-based newspapers in English. The reason to have three different types of newspapers is due to obtain fair and balanced information from national and international perspectives, while gaining fruitful information regarding the AEC and its preparation within the nation. The articles were analysed based on the type sources interviewed by the reporter, and the content orientation towards AEC. The first reflects four institutions (shown on table 2), whereas the latter indicates the positive or negative comments from the sources (Table 3). The type of sources was counted based of the persons who were interviewed by the news, despite having more than one coverage in one article.

Table 2. Source of Newspaper coverage

Government/regulator	Association	Practitioner	Academic
106	49	40	6

Based from table 2, the finding shows that the majority of coverage involves government officials, with 106 comments, followed by 49 comments from the association, and 40 comments from the practitioners. Only 6 comments produced by Academics. This analysis shows that the government is imposing the AEC program intensively to the public, while the association supports such promotion. The analysis also business practitioners, with 40 sentences derived

from the business perspective. The regulators and academics seem have less contribution to the AEC perspective.

Table 3. Orientation of comments from Newspapers

Comment towards Advise/Planne d acti vi ties	%	nplemented Action Strategic Program	% &	al Comment or Re vie w	%
Positi ve 136 orientation	35.79%	53	13.95%	109	28.68%
Negative orientation				82	21.58%

Table 3 shows the orientation towards AEC program, which divides into three categories of positive and negative comments: Comment towards advise/planned activities, implemented action & strategic program, and casual comment or review. These categories represent all five sources in table 2. The first category; comment towards advise/planned, means phrases or sentences that supports advisory and suggested content of AEC. The second category reflects phrases of 'real' implementation, executions, and strategic decision for AEC program, while casual comment is for those sentences that do not profound any essential connotation towards AEC.

The finding suggests that the majority of comments favours positive orientation toward AEC program, which consists of 136 sentences of planned activities, 109 casual comments, and 53 on strategic program and actions. On the other hand, only 82 casual comments reflect negative connotation towards AEC, and none from either planned nor action activities. This also suggests that more than 35% of the content are subject to planned activities, while only 13.95% represents program implementation. Hence, the descriptive statistic, as a preliminary finding, shows that the implementation of AEC in Indonesia has not shown a significant implementation towards execution and strategic decision making. Interestingly, only 82 sentences or 21.58% of the overall finding shows negative phrases, such as apathetic, pessimistic, or scepticism on AEC impact to Indonesia. In addition, table 4 provides the six most frequent expression or understanding, both on positive and negative orientation towards AEC.

Table 4. Summary of Orientation Statements

Positi ve orientation	Negative orientation
AEC is an integrated economy in Southeast Asia	Indonesian economic is not ready
Indonesian market has the greatest potential in Southeast Asia	The stability of economy and sociopolitics is questionable
There is an optimistic spirit towards AEC	Local production will be competed
10% of SMEs would fully harness and utilize digital methods in the next 5 years	Incompetent human and natural resource management
Indonesia would likely serve as a 'market' in AEC	Certification is only a discourse
AEC should serve as an opportunity for Indonesia to improve firms' performance and expand beyond Indonesia	Import e xceeds e xports

The second step involves in-depth interviews to executives from business practitioners and academics. Each group discussion was given an introductory short animation film about AEC in order to provide the atmosphere of the content. The next session was to give the above orientation statements to the group, in which they have to comment based on their understanding on each of the statements. Expression of feeling and thoughts on each group are important for this study, in order to grasp the area of interests and ambiance that underpins the group. The ideal types of institutions vary across setting and thus it reflects different material symbols and practices within a society (Friedland & Alford, 1991). Therefore, the study proposes four institutional logics that derive from the finding, shown in Table 5.

Table 5. Proposed Ideal Types Institution

Categories	*Academics*	*Business Practitioners*	*Association*	*Government*
Root Metaphor	Teacher as nurturer	Core Survival	Communicator	Redistribution Mechanism
Sources of Legitimacy	Academic Qualification Research freedom	Consumer needs	Community Trustworthy	Democratic participation
Sources of Authority	University stakeholders	Ministry of trade & Industry	Commitment to Association Va lues	Bureaucratic domination
Sources of Identity	Educator to be educated	Business Plan & Genuine Ideas	Reputation of Association	Social & Economic class
Basis of Norms	Developing People	Self-Driven motivation	Group Membership	Citizenship membership

Under the Academics institution, the role of academics is heavily influenced by the reputation of his/her expertise and the nature of developing people as basis of norms. Moreover, the fundamental of academic logic is derived from the quest for fundamental knowledge, research freedom, rewards in the form of peer recognition, and open disclosure of research results (Sauermann & Stephan, 2013). Based on the table, it is suggested that academics, as institution, has an important role to educate people, and equip themselves with sufficient knowledge and trainings.

The business practitioner's institution, on the other hand, represents a pool of entrepreneurs who is closely related to 'commercial logic' perspective. The construction logic is developed based on the finding and literatures on corporate and commercial behaviours. Such practices relate to bureaucratic control, restrictions on disclosure, private appropriation of financial returns, and orientation towards managerial capitalism (Sauermann & Stephan, 2013; Thornton et al., 2012). As an entrepreneur, the fundamental concept of business relates closely to its metaphor of 'core survival', which inherent almost all profit-oriented business practitioners.

The 'Association' is included in this research due to the fact this institution contributes closely to the successful of the ASEAN integration. It may seem that the association is a medium of institution for a direct access to the government, in terms of communicating a set of group's proposition towards AEC. In this case, association is converted from the function of 'community' in the ideal institutional orders. Moreover, this paper offers a set of institutions that are highly involves in the discussion of AEC from the newspapers.

In relation to academic institution findings, researchers found that there are four main areas that academician's opinion is strongly focusing in its general macro implication/perspective, implementation, and micro perspective of AEC. The finding below shows so me opinions of academics relating to their knowledge in AEC. The notion of an academics is a person who nurtures and develop individuals somehow demonstrates otherwise. Some comments express similar perception in these issues.

Academics as an institution

The finding of the academics started with a general knowledge of Indonesia, where they expressed the demographic advantage of the country. In the AEC, generally Indonesia is one of the largest developing countries that is still growing, as its population of about 250 million people in a country with its rich oil and maritime types in natural resources. One academic shows his perspective.

"So, we are considering as the biggest market not the biggest probably, one of the biggest market in the world and knowing that our market is also very consumptive, therefore it forces other country like it or not to have their good partnership with Indonesia" (Academics, Male)

The academic expressed that Indonesia is one of the largest consumption community and it is attractive to other neighbouring countries like Singapore & Malaysia wanting to be Indonesian business partner in providing products and services. Thus, many SME are leveraging on the population "consumers" as their main business opportunity through online business.

"SME really join fully harness and utilize digital method, this will become the main economic driver. However one or another priority is actually integration from the economic to the global economic. Now the only platform business that can easily connect to global is basically online business"(Academics, Male)

Despite the convenience of global connectivity, Indonesian business growth seems to be flourishing with opportunities, unfortunately, is yet to be equipped with the know-how to be self-sustaining economic community as they are still dependent on some imports such as rice from Thailand.

"Yes, we do have more import than export to other countries but that's the consequences of developing countries like in Indonesia, we are still developing, and we have hundred or millions of people who also need lot of products and services meanwhile we don't have yet the capability to be self-sufficient, we have to import, that is the consequences. But we are going to the direction that probably like our president have mention that in the next 10 years, we are going to the direction to be self-sufficient in term of commodity, [such as] rice, sugar and everything. Yes, basic needs, something like that."

However, it is now believed that with the current president, Indonesia is working towards the self- sustainable community will probably realised in 10 years to come.

In summary, most academics expresses the general AEC implication/perspective in Indonesia rather than its implementation itself as there is no clear academic (as an educator) perspective and positioning. Many of the comment is mainly focusing on economy and its sustainability. The Academics seems to enjoy discussing the general issues of AEC at a more general macro-level. The second issue discussed was the implementation towards AEC. According to this institution, this was not easily demonstrated in this heated discussion amongst fellow academics since the big question is "who is taking charge" of AEC implementation.

"Don't talk about the vision, we kenyang la [an expression of 'fed up'], focus on implementation. What is the gap and how are we going to solve that? [I mean the] Real gap. There is a gap, and the gap will always be the rule game: Procedures, detail procedures. Who is taking in charge of that?" (Academics, Male)

The academics realise that Indonesia is losing out due to the "unknown" rule and the know-how of this project. There is a level of frustrating to witness that the other neighbouring

country such as Malaysia is harvesting the market share by acquiring Indonesian's plantation companies. "Exactly. So okay, there is a pizza, go grab yourself. And people would be like okay, they never taste the pizza before, AEC never been here before. Those smart people from other countries like Malaysia for example they incorporate you see. If you do this then you can go here. That's why for example like the last ten years, they have been buying Indonesia's plantation company. Why are they expecting this? So they already move strategically." (Academics, Male) The academic express their opinion of AEC has no leadership and priorities, a simple metaphor to compare where Indonesia stands in comparatively to developed neighbouring countries such as Malaysia.

"this presidency or this leader of the country, they have like limited like four years or five years turn. So they will focus only for four years or five on the administration and the ASEAN Economic Community. They never become the first priority of this activity, always like number four number five, not that prioritise. If those leaders don't prioritize that also, how can we believe that this will become reality, so more on that from that." (Academics, Male) It does not help with the general presidency within this region usually stays only for four years in their tenure. With that, the president focus is usually within his/her administrative role and few is given in developing AEC project. Academics feel that implementation steps are taken lightly that we have no idea on how the implementation can take place in supporting the growth of AEC.

In terms of micro-perspective, the academics highlights that Indonesia government is protecting its businesses yet there were unclear with their regulations and that creates reluctance from foreign investors.

"Why bother discussing product competitiveness, when Indonesia [only] invites foreign investors with the tight entry requirement. That will deter away the possibilities of investment and development of the country itself." (Academics, Male) Hence, the academic questions the politician priorities in the growth of AEC. This will not create confidence in the nation to follow through.

"Confidence needs to be emphasised if Indonesia want to develop its human resources. And then yes it is also need the human resources also need to have support from the government in terms of the certification. So the competencies need to be standardized. In what area you are good in, it has to be certified. What capability that you are expert in, it needs to be standardizes and certified something like that. And the certification has to be complied with global or international standard by acknowledgement means that we are there, we are equal, we have equal standard of competencies, we have equal standard of ability with other human resources from other country" (Academics, Female) In summary to these quotations, academics briefly mention that there are some micro details that Indonesia government may need to consider developing its nation readiness for example product qualification/certification standards certification in order to commence "trust" in exporting trades implementation. However, on the hind sight, Indonesia does not open to foreign business trades so easily either as there is many barriers to entry requirement. Thus very little SME's plays a role in contributing to the AEC. To some extent, many of the content were discussing on the macro- level perspective and few discusses on the educational part, as well as the implementation towards people's development. Although some academics addressed the pillars of AEC and certification importance, the other fellow academics have little interests in developing such discussion into these areas.

Business Practitioners as institution

The other institution finding was within the business practitioner group. The finding suggests two major theme found in the discussion: Culture and adaptation. The former represents the notion that the Indonesian business practitioners are aware of the resistance to change within the society, whereas the latter constitutes the nature of adaptation towards change

d ue to AEC. In terms of cultural context, the business practitioners argue that cultural mind set is a fundamental perspective towards change, as many of the entrepreneurs have difficulties in changing their mind set to a more flexible manner. One comment expresses this matter:

"I think … the culture is not ready yet, basically, [and] is not about the economy or the quality or the productivity, production. My point of view is the culture because we are so used to be lazy and we are more to collective people. That's why one small restaurant can have 10, if we see at Chinese restaurant in Indonesia, they can have people standing around near the tables and basically is actually not comfortable." (Entrepreneur, Male)

The notion of being 'lazy' may also be interpreted as the way in which the Indonesian are common to have many staff working within the same task, and by working collectively in a company. They prefer to have many people working around him/her, which may also be inefficiency from the company's point of view. On the other hand, the ability to reduce the number of staff is considered 'unnecessary' or taboo to terminate a staff. Moreover, the tendency not to change situation is also supported by another entrepreneur:

"I feel that we won't be able to be ready because we are afraid to change, maybe all of us are scared to change. But overall, we must make our move first, or let say, we just try" (Entrepreneur, Male)

There is a strong tendency that the entrepreneurs have difficulties understanding the situation of change, which results a behaviour of trial and error towards AEC. His expression of 'we just try' perceives as a 'passive' movement of how he has to run the business. An unclear guidance from the authority may have a contribution of such behaviour. Another similar expression supports this notion of uncertainty. "We are all taking about the same thing: mind set. The second is mental [of readiness]. These cultures what we are going to do. But we believe that the Indonesian middle class group is growing in terms of numbers and capital. Many young entrepreneurs are establishing, they were sent overseas to study, and come back with different mind-set. Overall, there no way except to jump in, otherwise we will be left behind. People will adapt." (Entrepreneur, Male)

The word 'adapt' appears as soon as the expression was forced into a stage where the entrepreneur has no option except to change. To his knowledge, adaptation of change requires a great deal of effort, not only for his ability to run the business, but also throughout the entire company and staff.

Overall, the discussion from the business practitioner's perspective, in this case the entrepreneurs, shows a common ground of discussion, in which the micro- level perspective is dominant. Nevertheless, the notion of 'unclear' and 'unsure' connotation remain strong within the topic, which also provide an idea that business practitioners expect of what might happen post-AEC implementation.

'Association' as institution

In general, association can be inferred as a group of society which has collate similar thoughts, goals, and interests. Association is considered as a socially constructed based on people's interaction that underlies the formation of social institutions. In this case, the 'association' is similar to a community, as one institution, to scrutinise the interrelation between institutions which also represent as an interest representation. Moreover, Thornton et al. (2012) argue that the role of community sets out an understanding of local norms and rules that serve as a legitimate model of an organisational- field. There is a high degree of association involvement in terms of communicating messages the AEC project.

Within the Association there are few angles within the various perspectives simultaneously. In view of the economic perspective, should there be a ministry or ministries that can be represented in Jakarta itself in order to derive an angle of navigation keeping in mind on how did the European Union established and founded in Netherlands 1993, worked on incorporating

laws in trades and migration from seven different countries.

"So they would probably give you a better economic perspective. So we are going to be talking with lots of businesses, actually as we speak, I think Alex and Vina maybe finishing their meeting with our donors on this project. So, they will be talking to businesses, they will be talking to different ministries as well as different permanent representatives that are in here Jakarta to talk about, you know how Europeans would be able to navigate this cause this is something that we also try to navigate for our purpose as well, for our knowledge" (Association, Female) Apart from depending on ministries in providing AEC information, the NGO's are feeling some "push" efforts campaigning AEC from the government, and even more when ASEAN Secretariat is located in the central of Jakarta itself.

"But from our standpoint as non-government organization, as NGO, as well as tink tank, we saw that there are so much being push by government but it was a bit, too little too late, meaning, in terms of preparedness and people hyped it up as a jargon meaning oh AEC AEC, but them really, not really putting it out there as to what it entails." (Association, Female) Efforts in trying to gather information from the relevant government/ministries, the researcher finds that in this current society feeling "lost" as we were not provided with any information on AEC, how AEC assist the future economy in these 10 ASEAN countries, has the government prepare our future students with the readiness to enable them to work in a different environment, society/community and is our future generation is ready to take up the challenge.

"So, is very little information as to how AEC affect them? So questions that came to us as a center, whereby we distribute information on ASEAN as basically as a messenger, as often messenger. We were often asked by small medium enterprises by even businesses, how this will affect us. That continues to be the question and even until now, how would this affect us?" (Association, Male) During the researcher interview with the business practitioners, many SME/ Entrepreneurs expressed their similar concerns in trying to grasp the understanding of the how AEC can and should work collaboratively with 10 different Asian countries however there is no right and wrong answer to this discussion as there were no information and confirmation from any regulated association entailing details of "the how".

"To be honest, we also don't know how thus far is affecting any businesses, whether there is anything positive, whether there is negative. But, we know that a lot of people are still asking that question. There is no clear guideline for example as to because you know is still businesses as usual." (Business Practitioner, Male)

With this study researchers concluded even we as a society and economically we are ready for the challenge yet there were no direction, information and collaborative efforts from the government working at the macro- level to link us with business from other Asian countries. Although many SME are as it is working with businesses from other Asian or non-Asian countries in which covers the micro- level of trades and business. As it is there are many foreigners coming into Indonesia just for business purpose and hence that has demonstrated that we are aware of the resources and expertise that each Asian countries are already providing.

Discussion and Conclusion

The purpose of this study is to extend further understanding of the ideal type of institution deriving from Academics, Business practitioners, and Association towards AEC changes. The framework designed by Thornton et al. (2012) describe the Western ideal types of institutional logics, whereas the notion of transforming into specific locus in the Indonesian content is imperative to be discovered. The role of two institutions is expected to provide insights of institutional logics that has emerged from the finding, which provide a new perspective of analysis. As previous study illustrate on the horizontal comparison between ASEAN members (Benny et al., 2015), and the institutional representation by Rüland (2016), this study analyses the impact on the macro and micro- level institutional perspective in a particular country such as Indonesia.

The finding suggests there is a definite gap of orientation between business practitioner and the academics. On one hand, the academics, who are assigned to cater knowledge of AEC, have less involvement to the notion ass to what has been the ideal type of its institution. Their expression towards macro-discussion on politics and economic situation post-AEC often suggest holistic view of the Indonesian perspective, whereas the expectation to incline towards a micro- level conversation and implication are somewhat underdetermined. Specifically, business academics play an important role in designing a framework that bridges the gap between business practitioner and the expected outcome of AEC. However, due to unclear vision from the officials on each of the ASEAN member (Ravenhill, 2008) and uncommitted engagement between government agency members (Jones, 2015), the implementation on the micro- level is far from reality. In this in line to which Indonesian business practitioners are facing fear to the implication of AEC (Rüland, 2016) due to unrepresentative and asymmetric interest representation. There is a strong indication that the level of participation of the four institutions may have difficulties in collaborating the notion of AEC project. The 'passive' participation from the business practitioners also suggest that this institution fails to comprehend what is essential for them as 'core survival' mode, and rather to become 'victimised' of such project in this situation (Rüland, 2016). This argument is in line with Ravenhill (2008) in that business sector has little participation in the AEC project and that institutional process is highly involve government-to- government agreement. Nonetheless, the implementation in the micro-level seems to have been 'neglected' in a way that both institutions require a great deal of assistance in this matter. Moreover, as seen on the newspaper coverage analysis in table 2, the participation of practitioner and academics on this project were far less than those commented from government and association. Compared with the EU development described by Perkmann (2002), there is little contribution given from both parties, which consequently explain the narrow vision of this project within the institutional fields. Only association conducts its role in communicating messages derives from the government. This gives an idea that the two institutions are being 'excluded' from the grand scenario of AEC project. As such, the expression of 'ambitious' project is also confirmed by Petri et al. (2012), in that further cooperation and role-strengthening between these institutions is heavily needed.

In conclusion, the construction of ideal types of institutional logics provides a comprehensive analysis of building an understanding of existing institutional change and an attempt to construct a topographic map of Indonesian business society. The framework shows a detailed category that represent symbolic materials and practices that can identify each of the institution represented by academics, business practitioners, associations, and government. Communication is another problem why the AEC project is less implemented in each institution. The inter- institutional ideal systems mentioned in table 5 are not fully manifested within these institutional orders. Thus, further calibration of roles and responsibility are required. Overall, the cultural context in Indonesia can also be accommodated with this framework, in that specific norms and behaviours represents the characteristics embedded within the institution, which often omitted by Western perspective. Hence, institutional logics enable studies from the Eastern view to emerge and contribute positively to the literature.

This study offers theoretical as well as practical contributions. First, institutional logics perspective serves as a comprehensive lens to scrutinise social and cultural construction that not only to discover societal culture of individuals and organisations, but also to identify and integrate multiple level of analysis. Second, by entangling each of the institutions and their institutional nature, this study aids to align the function of each role in the successful implementation of AEC. Institutional logics help to determine the cause of misalignment role of relevant institutions and its capacity to implement the successful of the project. This study also portrays the four designated institutional in which some categories within inter-institutional order cannot be implemented as it should be. The asymmetric system representation initiated by Rüland (2016) and importance of having solid, sufficient and efficient forms of institutions

(Rattanasevee, 2014) may well be suited within the typology of institutional logics offered in this study.

There are limitations of this study that needs to be described. Firstly, most studies concerning ASEAN integration and regionalisation are within the area of international relation, economics, and policy studies, thus making this study a challenging approach in sociological perspective. However, this study provides an introduction to the use of the qualitative approach for future studies of institutional mapping in Indonesia.

Secondly, due to limitations and difficulty of access to other institutions such as government officials, this study has been cross-sectional in the nature of collecting data. Thirdly, only one researcher was involved in this project and some interviews were conducted and transcribed in Indonesian. As such, there may be a lost- in-translation process that may lose the essence of logics. However, back translation was provided to encounter such problems. Lastly, generalisation issue, as part of qualitative, confirms that this study cannot be compared between academics and/or business practitioners in other settings.

This study suggests avenue of research. First, the application of institutional logics in Indonesia can be extended to the use of ethnic norms and values, which also provide a more Eastern 'flavour' towards understanding in a cultural manner. Indonesia has been acknowledging one of the most various nations of ethnicity, religion, and race, which holds more than three hundreds dialect languages. The utilisation of this framework can enrich the formation and category of the ideal types, dedicated to understand a more comprehensive materials and practices. Second, the additional institutions from the government and association perspectives may enrich the holistic overview of the AEC program within the Indonesia business context. Also, scrutinising other members in ASEAN will acknowledge the variety of issues concerning the changes within each nation.

COMPETITIVENESS OF FURNITURE INDUSTRY: THE CASE OF SUKOHARJO, INDONESIA

Darsono, Universitas Sebelas Maret, Indonesia
Agustono, Universitas Sebelas Maret, Indonesia

Abstract
The purpose of this research is to identify and analyze of rattan furniture industrial competitiveness in Sukoharjo Regency, to analyze factors that affect the amount of rattan furniture industrial competitiveness in Sukoharjo Regency. The method used is analytical descriptive implementation of records techniques. Data analysis methods used are Porter's Diamond, RCA (Revealed Comparative Advantage) and OLS (Ordinary Least Square). The results showed, based on the analysis of Porter's Diamond Theory and the analysis of RCA showed that the Sukoharjo rattan furniture industry has a good condition for the development of rattan furniture industry and classified as having a strong competitiveness. The model function of rattan furniture industrial competitiveness of Sukoharjo is $Y = -42,801 + 5,074X_1 + 1,719.10^{-5}X_2 + 0,003X_3 + 15,850D$. This model has a coefficient of determination (R2) of 0,643 which means that 64,3% of the variation of the dependent variable ie rattan furniture industrial competitiveness of Sukoharjo can be explained by the independent variables. Based on the results obtained by the F test showed that all variables studied jointly significant effect on the rattan furniture industrial competitiveness in Sukoharjo Regency at 95% confidence level. T test results showed that variable the export price of Sukoharjo rattan furniture (X_1), the exchange rate of the U.S. Dollar against the Rupiah (X_3) and the government policy (D) individually significant effect on the rattan furniture industrial competitiveness of Sukoharjo. Based on the standard value of the regression coefficient, variable the exchange rate of the U.S. Dollar against the Rupiah (X_3) provide the greatest influence with a positive relationship.

Key Words : *Competitiveness, Sukoharjo, Rattan, Furniture*

Introduction
Indonesia is one country that has long been engaged in international trade (Rahimah, 2012). one of the international trade activity is exports.

Table 1. Exports value of Indonesian oil and gas and non-oil and in 2007 - 2011 (Million US$)

Year	Oil and Gas	Non Oil and Gas
2007	22.088,5	92.012,3
2008	29.126,3	107.894,2
2009	19.018,3	97.491,7
2010	28.039,6	129.739,5
2011	41.477,0	162.019,6

Source: BPS 2012

Exports in Indonesia are basically divided into two, namely the oil and gas exports and non-oil and gas exports. Based on Table 1 it can be seen that the value of non-oil and gas exports is always greater than the value of oil and gas exports from year to year. The value of non-oil

and gas exports becomes a great potential to be developed. Basri (2001) states that in accumulating foreign exchange through non-oil and gas sector, the agricultural sector has a significant role. One of the considerable agricultural commodities contributing foreign exchange income through exports are rattan commodities.

Rattan is one of the agricultural commodities which are included in non-timber forest products are very often found in Indonesia. Indonesian rattan has a dominant position in the world market, controls 80 percent of the raw materials of rattan world. Indeed Indonesia has a great potential in developing rattan furniture industry. One of the rattan furniture industry, which is still developing is the rattan furniture industry in the district Gatak, Sukoharjo. Rattan industry in there is producing a wide range of rattan furniture products which have world quality. Most of the production of rattan furniture in Sukoharjo was exported to many countries in the world. This makes the rattan furniture industry in Sukoharjo become one of the leading industrial sector compared with other regions that have the same industrial sector in Indonesia. Hence the analysis to determine the extent of the rattan furniture industry's competitiveness in Sukoharjo is needed also the analysis to the factors that influence it, in order to support the competitiveness enhancement of the rattan furniture industry in Sukoharjo.

Research Method

The basic method used in this research is analytical descriptive by using periodic data (time series) (Nazir, 2002). The purposive method was used for the determinating of research location in Sukoharjo Regency. The data used in this research is secondary data, i.e. data derived from several institutions related with the object of research.

1. Analysis of Porter's Diamond Competitiveness

    This method is qualitative methods by analyzing each component in Porter's Diamond, it consists of Condition Factor, Demand Condition, Related and Supporting Industries, Firm Strategy, Structure, and Rivalry. In addition there are other components associated with four main components, namely government roles and chance. The fourth main factors and two supporting factors are interacting. The overall result of interaction between the mutual support components really determined the development which can be a competitive advantage of an industry.

2. Analysis of RCA Competitiveness (Revealed Comparative Advantage)

    RCA method is based on a concept that trade between regions actually shows the comparative advantages possessed by the region. This study did not use the RCA generally comparing the export of a particular country with export commodities in the world countries, but in a smaller coverage ratio of export of rattan furniture Sukoharjo with Indonesian rattan furniture exports. Performance rattan furniture exports to total exports of Sukoharjo outside the area, then compared with the share of export value of rattan furniture in Indonesia to the total value of exports in Indonesia, used the RCA formula:

$$RCAS = \frac{X/X_{total}}{Y/Y_{total}} \quad ....(1)$$

    Where, RCAS is the rattan furniture industry competitiveness of Sukoharjo, X is the exports value of rattan furniture of Sukoharjo, total X is the value of total exports of Sukoharjo, Y is the export value of Indonesian rattan furniture and Y is the total value of the total export of Indonesian products. The competitiveness of the value of a commodity, there are two possibilities, namely if RCA > 1, means the region has a

comparative advantage over the average so that the commodity has strong competitiveness. If RCA < , means that an area has a comparative advantage in the below averages so that the commodity has weak competitiveness. RCA index is the ratio between the value of the current RCA with RCA value of the previous year. RCA index formula is as follows:

$$RCA\ Index = \frac{RCA\ t}{RCA\ t\text{-}1} \quad \text{....................(2)}$$

Where RCA t is the value of current year RCA (t), while the RCA t-1 is the value of RCA in previous years (t-1), the data in the year is periodically data from 1993 to 2012. The RCA indexes value ranging from zero to infinity. RCA index values equal to one means that there is no an increase in the RCA or export performance in the market this year is equal with the market in the previous year. RCA values less than one means a decline in RCA or export performance in the market is now lower than the previous year. RCA indexes value greater than one means an increase RCA or export performance in the market this year is higher than the previous year.

3. Multiple Linear Regression Method

The analytical methods used to analyze the factors affecting the competitiveness of the rattan furniture industry Sukoharjo is multiple linear regression, which can systematically formulated as follows:

$$DS = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + D \quad \text{.........................(3)}$$

Where, DS is the industrial competitiveness of rattan furniture Sukoharjo (RCA), X1 is an export price of rattan furniture industry Sukoharjo (FOB) (US $ / Kg), X2 is an export volume of rattan furniture Sukoharjo (Kg), X3 is the exchange rate of the US dollar against rupiah (Rp / US $) and D is the government policy with a value of 0 to the policy of opening the export of raw rattan and a value of 1 for the policy to restrict the export of raw rattan, while β_0 is the intercept. In the use of regression analysis, some values that need to be considered include test the coefficient of determination (R^2) that is used to determine the size of accuracy or suitability of a regression line which is applied to a group of observational data. R^2 values indicate how large a proportion (%) variance of the dependent variable can be explained by the independent variables included in the regression model (Gujarati, 2010). F tests is used to determine the level of influence of all independent variables together against the dependent variable with confidence level and a certain significance level (α). While the t-test is used to determine whether the independent variables individually significant effect on the dependent variable at a significance level (α) and a certain confidence level. For classical assumption test, use test multicolliniearity namely the detection of the existence of multicollinearity in SPSS that if VIF> 5 (Sarwono, 2012), Heteroskedasticity test is if the dots spread with not clear patterns above and below the 0 number on the Y axis, so there is no heteroskedasticity problems (Nugroho, 2005), and autocorrelation test means if the DW value is 1.5 DW > DW > 2.5 then there is no autocorrelation (Getut, 2011)

Result And Discussion

1. Competitiveness of Rattan Furniture Industrial in Sukoharjo Regency based on the Concept of Porter's Diamond

Rattan furniture industry in Sukoharjo has been basically having a production factor conditions were pretty enough for the development of the rattan furniture industry. It looks at the value of the production of rattan furniture industry Sukoharjo in 2012, which amounted to Rp 285,062,500,000.00. The value of production of the Sukoharjo rattan

furniture industry is affected by sufficient labor resources and sufficient of raw material for the development of the rattan furniture industry there. Recorded in 2012 there were 282 business units of rattan furniture industry in Sukoharjo, with a workforce of 3,105 people, as well as the supply of raw materials of rattan continue to enter the rattan furniture industry, which is the raw material value of Rp 171,637,500,000.00. Rattan furniture industry in Sukoharjo can be categorized have a pretty good production growth in each year, but it is not followed by the development of product design innovation of rattan furniture from the manufacturer. The condition of the domestic demand for rattan furniture products Sukoharjo still quite low when compared with export demands. Where areas of product marketing of rattan furniture Sukoharjo in the country covering two regions, it is in the city and outside the city, for the region in the city covers an area of Solo and the surrounding areas while the outside the city includes Yogyakata, Magelang, Salatiga, Semarang, Pati, Tuban, Madiun, Ponorogo, Malang, Surabaya, Gresik and Jakarta. Demand in some regions in the country is merely a request from several individual customer orders only, which tend not to be on a large scale. Most entrepreneurs in the rattan furniture industry Sukoharjo itself are not too focused on the domestic share. For the conditions of overseas market demand, product of Sukoharjo rattan furniture industry is quite a lot of demand, especially by the United States, Europe and some countries in the Middle East and ASEAN.

When seen further, it can be said that the Sukoharjo rattan furniture industry is more geared to meet the needs of foreign markets than to meet domestic market demand. Relate and supporting industries in terms of production factors in the rattan furniture industry Sukoharjo include rattan preservation industry, distribution, and training services. In the case of rattan preservation industry, are of national scope in Indonesia actually has a pretty good industrial facility located in areas such as rattan gatherers centers Kalimantan and Sulawesi. One thing that becomes the problem, namely in terms of distribution is relatively inefficient, where the distance to go between raw rattan processing industry to industry craftsmen is very far, from regions outside Java to the Sukoharjo area. The inability of the industry to provide a good service in the distribution of raw materials to industry rattan furniture craftsmen will result in a lack of supply of raw materials so that production will decline even ineffectiveness may also impact the industry. Other supporting industries really important are the service industry, especially training in product design training, and this is a problem that quite a lot by the entrepreneurs of the rattan furniture industry in Sukoharjo. Sukoharjo rattan furniture industry itself still has a standards quality design, and still less able to compete with rattan furniture manufacturers from other countries. Several factors can be categorized into the decisive factor of competition is product differentiation, brand identity, and information.

Product differentiation as part of a strategy to win the market seems still not yet considered from the rattan furniture industry in Sukoharjo. This is evident from the lack of attention of employers to the final design was used, and still seem less likely to attract the market attention. Product differentiation can also be added through the different packaging systems.

The existence of specific brands in a packaging will influence the position and competitiveness of a company, and it is still less attention of most entrepreneurs rattan furniture industry in Sukoharjo. In the current era of globalization, who have access to more information then will be able to win the competition. Likewise, market access for industrial products rattan furniture. The possibility that applied to the issues raised in Sukoharjo rattan furniture industry is foreign importers have a wide enough information about the existing market. As a result, importers bolder to bargain for cheaper products

produced by the rattan furniture industry in Sukoharjo. By law the government has issued policies to support the growth of the furniture industry in Indonesia. One is through Decree No. 28 / M-DAG / PER / 10/2011 on November 30, 2011, which states rattan raw, mixed rattan, rattan W / S and semi-finished rattan prohibited to be exported out of the country. Through the implementation of the new policy, should be an opportunity for the rattan furniture industry Sukoharjo in improving the competitiveness of its industry. Entrepreneurs and craftsmen in Sukoharjo rattan furniture industry is expected to further maximize the chances that there is more to spur the production and export of rattan furniture, as well as improvements in the company as well as the infrastructure, so that later will increase competitiveness in the international market competitive.

2. Competitiveness of Rattan Furniture Industrial in Sukoharjo Regency based on the RCA Method (Revealed Comparative Advantage)

RCA in this study was defined that if the share of export of rattan furniture in the total export of commodities from an area larger than the market share of commodity export rattan furniture in the total exports of the commodity in a country, it is expected the region has a comparative advantage in the production and export of commodities rattan furniture , This study did not use the RCA in generally which is comparing the export of a commodity specific State with a commodity export countries of the world, but into a smaller coverage ratio of export of rattan furniture Sukoharjo with Indonesian rattan furniture exports. Performance of rattan furniture exports to exports total of Sukoharjo outside the area, then compared with the share of export value of rattan furniture in Indonesia to the total value of exports in Indonesia.

Table 2. Development of RCA Value and RCA index rattan furniture industrial in Sukoharjo Year 1993-2012

Year	RCA Value	RCA Index
1993	8,10	0,00
1994	7,97	0,98
1995	9,48	1,19
1996	12,18	1,28
1997	24,73	2,03
1998	34,57	1,40
1999	8,23	0,24
2000	10,27	1,25
2001	6,40	0,62
2002	14,61	2,28
2003	15,00	1,03
2004	8,12	0,54
2005	15,46	1,90
2006	19,92	1,29
2007	21,45	1,08
2008	42,69	1,99
2009	42,69	1,00
2010	42,69	1,00
2011	35,31	0,83
2012	38,53	1,90
Total	418,49	23,02
Rata-Rata	29,92	1,15

Source: Processed Research Data, 2015.

Based on Table 2 can be seen that in the period from 1993 to 2012, shows that the ratio of RCA for rattan furniture Sukoharjo commodity has a value above 1, which amounted to 29.92. This means that commodities of rattan furniture in Sukoharjo have a comparative advantage in the international market compared to competitiveness for the same kinds of commodities. Rattan furniture industry Sukoharjo classified has strong competitiveness. Sukoharjo rattan furniture industry can compete on the international market because in Indonesia has imposed protection on the domestic industry, namely by implementing policies relating to restrictions on the export of raw rattan in 1993 to 1998 also in 2004 and 2011. The value of the rattan furniture industry competitiveness in Sukoharjo also quite influenced by the value exports and total exports of rattan furniture, which were both very dependent on changes in the value of the rupiah against the US dollar. This can occur because the value of the existing RCA influenced by export values is calculated in US Dollars, thereby strengthening or weakening of the rupiah against the US dollar is extremely important influence on the competitiveness of the rattan furniture industry in Sukoharjo.

3. Multiple Linear Regression Function

Based on the results of data analysis using SPSS program, the regression equation of rattan furniture industry competitiveness Sukoharjo as follows:

$$Y = -42{,}801 + 5{,}074\, X_1 + 1{,}719 \cdot 10^{-5}\, X_2 + 0{,}003\, X_3 + 15{,}850\, D$$

From the analysis, the value of R^2 is 0.643. This shows that 64.3% of the variation of the dependent variable in this study is the industry's competitiveness of rattan furniture in Sukoharjo can be explained by the independent variables include export price of Sukoharjo rattan furniture (X_1), the export volume of rattan furniture in Sukoharjo (X_2), the exchange rate of the U.S. Dollar against the Rupiah (X_3) and government policy (D), while the other 35.7% is explained by variations in other variables outside the model used.

Table 3. Variant Analysis of Factors that Influence the Rattan Furniture Industrial Competitiveness Sukoharjo

Variant Source	Sum of Square	Free Degrees	Squares Average	Sig.
Regression	2207,914	4	551,979	0,003**
Residual	1226,307	15	81,754	
Total	3434,222	19		

**: Significant where α = 0:05.
Source: Secondary Data Analysis, 2015

F significance is 0.003. The significance value smaller than α = 0.05. This shows that the independent variables are jointly significant effect on the dependent variable is the competitiveness of the rattan furniture industry Sukoharjo with α of 0.05 (5%).

Table 4. Variant Analysis of Factors that Influence the Rattan Furniture Industry Competitiveness Sukoharjo

Model	Regression Coefficients	Sig.
Export Prices of Sukoharjo Rattan Furniture (X_1)	5,074	0,009[**]
Export Volume of Sukoharjo Rattan Furniture (X_2)	$1{,}719 \cdot 10^{-5}$	0,060[ns]
Exchange Rate of the U.S.	0,003	0,006[**]

Dollar Against the Rupiah (X₃)		
Government Policies (D)	15,850	0,006**

The independent variable that has a significance of less than 5%, then individually significant effect on the competitiveness of the rattan furniture industry in Sukoharjo. Independent variables were individually significant effect on the competitiveness of the rattan furniture industry in Sukoharjo variable export prices of Sukoharjo rattan furniture with a significance value of 0.009, the exchange rate of the U.S. Dollar against the Rupiah with a significance value of 0.006 and government policies with a significance value of 0.006. Another variable is the export volume of Sukoharjo rattan furniture has a significance value exceeds the value of α = 0:05 in the amount of 0.06 it can be concluded that the individual has no effect on the competitiveness of the rattan furniture industry Sukoharjo. There are several methods to test the multicollinearity by looking at PC value (Pearson Correlation) and VIF (Variance Inflation factors) Value. Tests using the PC value matrix (Pearson Correlation) have criteria when the PC values < 0.8, then between independent variables is not happening multicollinearity (Soekartawi, 2001). Results from the study showed that the highest value of the PC, which is 0.525 so that it can be concluded multicollinearity regression model did not happen. According Sarwono (2012), another way to test multicollinearity is to look at VIF (Variance Inflation factors) that has criteria if VIF > 5, then the regression models occurred multicollinearity. Based on the analysis using SPSS note that the value of the highest VIF, which is 1,571 so it can be concluded multicollinearity regression model did not happen.
Figure 1. Scatterplot Diagram

Based on Figure 1 shows that the dots do not indicate a pattern that is not clear then there is no problem with heteroskedasticity. According Getut (2011) when the statistic DW

values between 1.5 to 2.5 then there is the symptoms of autocorrelation. Based on Table 3. note that the DW value is 1,516. It shows that there is no autocorrelation in the model, because the condition does not occur the autocorrelation is when the value of the DW statistic lies at 1.5 to 2.5 in accordance with the opinion of the Getut.

4. Most Influential Factors Against the Competitiveness of Rattan Furniture Industry in Sukoharjo

Based on Table 6 it can be seen that the variables that have the greatest regression coefficient standard value is exchange rate of U.S. dollar against the rupiah variable (X4), which amounted to 0.626 with a positive relationship. Where it can be concluded that the amount of competitiveness values of Sukoharjo rattan furniture industry is mainly due to the weak exchange rate of the U.S. dollar least against the Rupiah. Positive association explained that if the exchange rate of the U.S. dollar against the rupiah increased by 1 Rupiah, it will increase the competitiveness of the value of the rattan furniture industry in Sukoharjo amounted to 0.626 and vice versa.

Table 6. Regression Coefficients Standard Value of Independent Variables Affecting the Competitiveness of Rattan Furniture Industry in Sukoharjo

Model	Regression Beta Coefficient	Sig.
Export Prices of Sukoharjo Rattan Furniture (X_1)	0,529	3
Exchange Rate of the U.S. Dollar Against the Rupiah (X_3)	0,626	1
Government Policies (D)	0,605	2

Source: Secondary Data Analysis, 2015

Conclusion

Based on the concept of Porter's Diamond, rattan furniture industry in Sukoharjo has a good conditions for the development. Things that need to be considered are in firm strategy, structure, and rivalry. While based on the concept of calculating the value of RCA (Revealed Comparative Advantage) in research data period 1993 to 2012, rattan furniture industry Sukoharjo has an average value of RCA amounted to 29,92 so classified as having a strong competitiveness and has a specialization in commodities rattan furniture. Factors that significantly affect the competitiveness of the Sukoharjo rattan furniture industry are Sukoharjo rattan furniture export price, the exchange rate of the U.S. Dollar against the Rupiah and government policies. This means that if there is an increase in export prices and the exchange rate of the US Dollar, as well as the implementation of policy restrictions on the export of raw rattan by the government, it will improve the competitiveness of the Sukoharjo rattan furniture industry. The factors that most affect the competitiveness of the rattan furniture industry in Sukoharjo is the exchange rate of the U.S. Dollar against the Rupiah.

The size of the value of industrial competitiveness of Sukoharjo rattan furniture is mainly due to the weak or not the exchange rate of the U.S. dollar against the Rupiah. Advice based on the results of this research that the Government is expected to spur the development of the creativity of the producers in the rattan furniture industry in Sukoharjo, where really need for product design innovation training program for entrepreneurs and craftsmen in Sukoharjo rattan furniture industry.

Rattan furniture industry product of Sukoharjo is much enough in demand by consumers from

abroad, sees the potential development of the market share, hence really need for expansion form of market share through product promotion. One way is by doing exhibitions abroad (importing countries). Given the importance of the availability of raw materials for the continuity and sustainability of the rattan furniture industry of Sukoharjo in the future, it is necessary for consistency of government in implementing policies related to restrictions on raw rattan. Other tasks include the presence of a buffer body that can function as stabilizers availability of the main raw material for the rattan furniture industry in Sukoharjo both in terms of quantity, quality and price.

HOW TO ACCELERATE THE PERFORMANCE OF A RESEARCH CENTER: A CASE STUDY

Darsono, Universitas Sebelas Maret, Indonesia
Muhammad Agung Prabowo, Universitas Sebelas Maret, Indonesia
Irwan Trinugroho, Universitas Sebelas Maret, Indonesia
Doddy Setiawan, Universitas Sebelas Maret, Indonesia
Stefanus A Kristiawan, Universitas Sebelas Maret, Indonesia

Abstract
Scientific publication in reputable journals as an outlet to disseminate research and proposition has been widely considered to be a main measure of individual and institutional reputation. This paper provides an insight on how to accelerate the performance, especially with regard to scientific publication, of a relatively small research group in university located in an emerging country. Our research center in banking and finance which was established in the end of 2013 has performed progressively. We have accelerated the number of scientific publication in reputable international journals. Our strategies are mainly on the collaboration with international scholars, introducing research group members to the international environment, research collaboration with industry and regulator and providing technical assistance and some guidelines especially for our junior researchers and extensive networking with scholars in the same fields from domestic and overseas universities.

Keywords: *Research group, scientific publication, international journals, networking, technical assistance*

Introduction

The fundamental concept of a research center in a research-based university is to serve a research mission, is set apart from the departmental organization and to solve complex interdisciplinary problems (Sabharwal and Hu, 2013; Bozeman and Boardman, 2003). More sophisticated, in some countries especially in Europe and the US, research centers are the main army to bolster the number of scientific publications. They are facilitated by substantial budget and facilities. They may also hire PhD students with scholarships.

In the recent years, the Indonesian government has paid much more attention to accelerate the quantity and quality of scientific publications, especially in the universities, as it could be considered to reflect the competitiveness of a country. However, the importance of research centers in universities has not been revitalized.

Indonesian universities contribution to international research environment especially with regards to scientific publication and innovation is far behind some neighboring countries for example Thailand, Malaysia and Singapore. To bolster the quality of research centers or research groups within a university which is ultimately expected to accelerate the publication in international reputable journals; it needs a strong commitment, budget policy, good governance and strong network. Revitalization and restructuring of research centers/ groups could be an appropriate strategy particularly in the social sciences and humanities.

In this present paper, we provide a case study of managing and accelerating the performance of a research group which is the research group of Governance, Banking and Finance (CGBF). This research group is under the Faculty of Economics and Business, UniversitasSebelasMaret (UNS), Indonesia. UNS is a state (public) university which recently occupies 6th for top Indonesian universities (awarded by the 4International Colleges and Universities/4ICU). UNS has established its vision to become a center for knowledge,

technology, and art which is leading at international level based on noble values of national culture. It is generally known that to be internationally recognized, scientific publications at the international level should be the main priority. UNS has provided a substantial budget to boost the quality of research and scientific publication in international reputable journals.

Although the research group of CGBF is relatively very young, it has performed very well especially in scientific publication compared to many others research center in the same field in Indonesia. Moreover, this group is the best research group in areas of the social sciences and humanities in UNS.

We expect that our success story could be a benchmark for other research groups or research centers in Indonesia particularly with regards to the policy of Indonesian government to accelerate the number of scientific publication in international reputable journals.

Research Group Strategies

Research group of Governance, Banking and Finance (CGBF) which is under the Faculty of Economics and Business of UniversitasSebelasMarethas a long-term goal to be an internationally reputable research center in the areas of governance, banking and finance. The original name was the Center for Corporate Governance (CCG) which was established in 2012. The research group received its first research project from the USAID through the SEADI (Support for Economic Analysis Development in Indonesia) project on a research entitled "Local governance, rent-seeking and regional economies" in the latter half of 2012.

In the end of 2013, following the policy of UNS to establish research groups within the schools (faculties), our research group then renovated and extended its scope to Governance, Banking and Finance. At that time, the group is strengthened by 10 internal members (only 4 members hold PhD degree). Most of them are junior faculty members with limited experiences in research and publication. The members have diversity in their research interests including banking, corporate finance, corporate governance, Islamic finance, accounting, strategic and human resources management.

Our main strategy, to be much more competitive especially in the international environment, isfirst, we continuously strengthen our governance and network particularly with regard to the research collaborations and joint papers with overseas reputable scholars. Research collaboration with reputable scholars can help the members of research group to access to expertise, learning tacit knowledge about a technique and methodology, enhancing productivity, pooling knowledge for tackling large and complex problems, obtaining prestige or visibility and access to data sources (Rijnsoever andHessels, 2011; Bozeman and Corley, 2004).

Taking advantage of the network of some research group members, we have more than 30 partners even though some of them are not actively be optimized. More specifically, this research center is supported by 3 external experts (2 experts from US universities and 1 expert from the Indonesia Deposit Insurance Corporation) and 32 international partners and advisers mostly from reputable overseas universities. By doing such collaborations, we have published 6 joint papers in reputable international journals with scholars from University of Limoges France, Purdue University Calumet USA and UniversitiSains Malaysia. We have also some working joint research projects with University of Twente, University of Limoges, UniversitiSains Malaysia and Purdue University Calumet which will lead to publication in reputable international journals.

Moreover, we also attempt to collaborate with industriesand regulators in policy research especially to access to data sources and to get funding. As explained by Kafouros et al. (2015), research collaboration with industry could facilitate funding as well as could lead to innovation. In addition, research collaboration with regulators could be optimized for scientific publication as well. We have done collaboration with some financial regulators in

Indonesia including the Central Bank of Indonesia, the Indonesia Financial Services Authority and the Indonesia Deposit Insurance Corporation (see table 1 for the details).

The other strategy is to extensively provide technical assistance to our junior members and provide and facilitate them with opportunities to present their working papers in international conference. During two years (2013-2015), 31 papers have been presented by the group members in international conferences. By doing so, it is expected that the members, especially junior members, will be familiar and having more international exposure.

Moreover, we also include those junior faculty members in the joint paper projects which subsequently will bring some benefits for them (getting published in journals, having network with international scholars, familiar with scientific writing and publication…..). In addition to publication, we also continuously organize a working paper forum to facilitate members to present their first draft of papers to get inputs and comments from other colleagues before getting ready to be submitted or presented in international conferences. Trainings on methodology and econometric tools have also been conducted. In 2014, we invited Dr. Yun Zhu from Fordham University USA to deliver technical assistance on STATA for research in finance.

After two years of the establishment of this research group, almost all members have published papers in Scopus-indexed journals.

Outcomes

Performance of Research Group of Governance, Banking and Finance in 2013 - 2015is impressive. 23 papers have been published and accepted to be published in Scopus-indexed Journals; some of them are getting published in higher rank journals. The policy of Indonesian government and UNS is to benchmark Scopus in order to justify the quality of international journals.

Moreover, in 2014 and 2015, this group has received a substantialamount of research funding both research grants from UNS and the Directorate of Higher Education in Indonesia (DIKTI) and research collaboration with regulators and industry. We collaborated with Bank Indonesia, Indonesia Financial Services Authority (OJK) and Indonesia Deposit Insurance Corporation (LPS) in some policy researches including Financial Inclusion and Literacy, Micro Credit and Bank Liquidity.CGBF is also the best (with highest group index/ performance evaluation indicator) and the most active research group at the Faculty of Economics and Business of UNS. Most of publications of this school in Scopus-indexed journals are contributed by this research group.

Moreover, this group has actively organized a number of international and reputable events. In 2013, we held a Conference on Risk, Banking and Financial Stability in collaboration with the Journal of Financial Stability. Furthermore, we organized the 2014 Annual Conference of Asian Finance Association in collaboration with the Asian Finance Association (Asian-FA). In January 2015, we hosted the First Conference and Declaration of Indonesian Finance Association (IFA) in collaboration with Indonesian Finance Association (IFA), two largersIndonesian universities (Universitas Indonesia and UniversitasGadjahMada) and the Indonesia Deposit Insurance Corporation.

Table 1 exhibits the summary of performance of Research Group of Governance, Banking and Finance for the period of 2012-2015.

Conclusion

We have provided a case on managing and accelerating the performance of a research group in the context of Indonesia. During almost three years of this research group, it has performed significantly especially in scientific publication to disseminate the research findings. 23

papers have been published and accepted to be published in Scopus-indexed journals. Almost all of research group members have contributed in writing those papers.

Moreover, this group has successfully granted many research grants from the university, the Directorate of Higher Education in Indonesia (DIKTI) and some international agencies such as the USAID. In addition, research collaboration with industry and regulators have also been done.

However, to be more competitive in the international environment, this research group should accelerate the capabilities and skill of research group members. Extensive international partnership will also be bolstered.

Table 1. Performance Indicators 2013-2015

Abstract

There is still no clarity after the completion of Rural PNPM Mandiri which is ended in 2014. The purpose of this research is to inform to the government about several models that are exist in society.The research was done in Kabupaten Banyumas and employed qualitative approach using primary and secondary data which are collected by in-depth interview, focus group discussion , observation and documentary analysis.The findings indicates that there is still a doubt in managing the program because of the following reasons: 1). There is no certainty of the government rules regarding the management pattern; 2). There is no clarity regarding their employment contracts; 3). The spirit of Rural PNPM management in helping and developing poor society. There are four alternative models of economic activity funds management unit of Rural PNPM identified and each model is discussed in depth.,

Keyword : *program completion, rural PNPM-Mandiri, model, Banyumas, poor society*

Introduction

National Program for People Empowerement which ussually called as Rural PNPM Mandiri (PNPM-MPD) is a program aimed at accelerating poverty reduction and unemployment rate. This program was run since April 30, 2007, at the time of President Susilo Bambang Yudhoyono. In 2014 this program has ended with the issuance of employment contract termination letter to all managers facilitators PNPM-MPD. The success of PNPM-MPD inreducing the poverty is supported by BPS data, rural poverty rate in Indonesia in September 2013 amounted to 14.42%, decrease to 13.76% in September 2014. But in 2015 after the program ended, the poverty rate increased to 14.09%, and the rural poverty rate increased to 14.11%.

In Banyumas Regency,the PNPM program has succeeded in reducing the poverty rate in 2011 amounted to 328 510 people (21.11 percent), the year 2012 amounted to 309 777 people (19.44 percent), the year 2013 amounted to 296 807 people (18.44 percent) and in 2014 amounted to 281 414 people (17.34 percent).However,Central Bureau of Statistics of Banyumas estimates that in 2015 the number of poor increased by 10% compared to 2011. Due to the large percentage of poor people in Banyumas incoming 15 regions that are in the red zone or below the national and provincial poverty percentage, then the existence of poverty alleviation programs are still needed. Data reports on the implementation of PNPM-Mandiri shows that on June 30, 2014, total assets of Banyumas Regency PNPM Mandiri Rp 94.993.439.748, -, while the per-October 2014 total assets of PNPM Urban Rp 15.904.264.300, -. Thus the number of PNPM funding is still running in the community is Rp 110 897 704 048, -. The amount of these funds are in the revolving loan in the community and had to be rescued.

Sustainability program until today is still a source of concern as there is still lack of clarity from the government, and perceived by stakeholders former PNPM in Banyumas and even in the whole of Indonesia. At the end of the program, the public assets in the form of capital

revolving fund in Activity Management Unit (UPK) PNPM Mandiri Rural nationally valued at more than Rp 10,450 trillion (ten trillion four hundred and fifty billion rupiah). Implementation of the revolving funds are still scattered in the 5,300 (five thousand three hundred) districts, 401 (four hundred and one) district, one (1) town, and 33 (thirty-three) provinces (Anom Putra Surya, 2015). The funds of such great danger of being lost if not properly managed. Therefore need assessment as to whether the management of these funds at the present time after the program is completed. For this study important to be implemented.

Research Method
Qualitative approach was employed in investigating the research issue. Research was conducted at Banyumas Regency with the population consist of the officer from Central OJK, OJK Purwokerto office, the regent, PNPM stakeholder from 21 district, and the stakeholder of rural PNPM. The informants is interviewed using snowball technique.

The Findings
Banyumas regency consists of 29 districts with 21 districts are classified rural districts. Alleviation of poverty and unemployment in rural districts is carried out through Rural PNPM (PNPM-MPD), which started from 2007 to 2014. The program administratively shown a huge success, namely through increasing the amount of funds that can be used for revolving loans to the poor in order to ensure their productive economic activities. The amount of money that revolving in Banyumas until October 2014 is amounted to Rp 110.897.704.048, -. The success has encouraged the accumulation of funds for program managers to be able to continue to develop a management model in order to improve the ability of fertilization revolving loan fund. This was done because the poor society are expecting the existence of revolving loan program keep running and even providing a loan in a greater amount greater. Besides, the facilitator program managers feel responsible to save funds since the revolving loan has been able to develop very well.

Therefore, by the end of the PNPM-PMD program and the lack of clarity from the government about the management pattern of the revolving loan fund grants, are associated with people's expectations and the sense of responsibility of the former program managers, they still run activities as usual. Nevertheless they are trying to develop a revolving loan activities through models which they can provide a great benefit to support the increased efforts of the revolving loan to meet the demand for funding needs of the poor.

Based on observation from the 21 PNPM-MPD after the program ends, there are four types of models identified which were implemented in Banyumas Regency, namely:
1. The Multifinance Model or PT LKM such as running by PT LKM Kedungmas from Kedungbanteng district.
2. A model that is the same as Rural PNPM at the time is not over (12 districts).
3. A model as at the time of Rural PNPM is not over yet, but with the existence of the Board of Cooperation Intervillage as the association of legal entitiy (6 districts),
4. A model which is the Activity Management Unit (UPK) entity is transformed into the Board of Cooperation Intervillageas the mandate receiver of the Head of Village Consultative (1 sub-district).

Management model of Rural PNPM Post-completion of the program prepared by transforming the revolving fund UPK PNPM-MP of a program leading to the legislative system in accordance with the Village Law No. 6 of 2014. Under the provisions of Law No. 1 of 2013 every financial institution specialized activity was established to provide business development services and community empowerment, either through a loan or financing for micro enterprises to members and the public, the management of deposits, as well as the provision of consulting services business development that is not solely for profit should be

subject to the Act regulating MFIs. Under this regulation, the legal entity of MFI are limited liability companies or cooperatives. If a Limited Liability Company is a legal entity, the shares are at least 60% (sixty percent) owned by the regency government/village-owned enterprises/, and the rest can be owned by Indonesian citizens and/or cooperative.

In addition of juridical considerations,the transformation of UPK Revolving Fund of rural PNPM into the Unit Usaha Bersama BUM Desa, also considering the provisions of the Guidelines for Planning and Protection Activities Capital of rural PNPM, Ditjen Pembangunan dan Pemberdayaan Masyarakat Desa, dated March 27, 2015 provides that: 1) Revolving funds resulted from rural PNPM is owned by the people represented the government of the village (village head). Revolving Fund, divided by the entire village in the subdistrict (based on assets owned by each group in each village), provided that the division is meant only forrecording purposes as an asset/property of the village. Accordingly, there is no physical distribution of funds, or there is no funds from the account transfer process UPK to the village; 2) Revolving Fund is recorded as an asset Village, shall be transferred to the Inter-Agency Cooperation Village (BKAD) throughjudicial procedure by each village; 3) In order to develop inter-village enterprises, the Revolving Fund can be used as capital for the establishment of BUMDesa and / or inter-village BUM village that belongs Villages in the subdistrict.

Under the provisions of the transformation of UPK Revolving Fund PNPM-MP, set through the stages of grants, which started grants from UPK PNPM-MP to the Agency for Cooperation Between the Village (BKAD) as outlined in the manuscript Grant Agreements, which then BKAD donated back to the Village Government through the mechanism of APB village, according to the provisions set forth in Article 17 and Article 18 of the Regulation of the Minister of Rural, Rural Development and Transmigration No. 4 of 2014 on the Establishment, Management and Management and Dissolution of the village-owned enterprises. Grants were awarded to the village later to investment capital for the establishment of Joint Business Unit BUM village in a limited liability company engaged in Microfinance Institutions. The only institution that village can obtain investment from the village government only village-owned enterprises, so that the transformation UPK PNPM-MP Revolving Fund is more appropriate if turned into a Joint Business Unit BUM Village. Before BUM Village submit capital sourced from Grant Revolving Fund PNPM-MP into the Business Unit bersam BUM village, first was an agreement in the forum of inter-village meetings organized by BKAD to form a Joint Venture BUM village in containers Cooperation Agency, an inter-village in the region Districts.

Based on the above it can be concluded that the UPK PNPM Mandiri in Rural Areas that previously existed will turn into a Joint Venture Unit BUM Village with the legal entity PT. MFI Ek. UPK PNPM-MP. PT MFI's shareholders consist of an inter-village Cooperation Agency (BKAD) the District by 40 percent and BOOM Rural District of Commons by 60 percent. BKAD membership comes from BKD-BKD from each village. Legal Entity Association BKAD shaped and has a unit working together in the areas of social, economic and security. Unit work together in the field of economy including BUM implemented by DESA for PT MFI is a transformation of the UPK PNPM-MP. Stock dividends received from investments BKAD 40% will be used for social activities and security as well as the activities carried out in PNPM-MP program has ended, ie in addition to conducting Revolving Fund also finances social activities and security. However, the first model is facing obstacles with the release of its operational license from the Financial Services Authority PT MFI Kedungmas.Model as usual before the program is finished and an inter-village models Cooperation Agency (BKAD) which is incorporated as a Model The second and third model.

Both the model and the third model is substantially similar to the model implemented at the time of the PNPM program has not been ended yet, while on the model BKAD Interagency

Cooperation Agency incorporated the village incorporated in the form of Legal Entity Association. There are six districts that carry out these activities, including that carried out in the District Somagede.

The fourth model is the model where the Activity Management Unit (UPK) transformed into an inter-village Cooperation Agency (BKAD) which implement the mandate of the inter-village meetings. In this model BKAD different from other models where members BKAD a village representative who comes from members of the Rural Cooperation Agency. In this model, all members of the Inter-Agency Cooperation village comes from all members of UPK. In this model BKAD become executive agency, based on the mandate between the Village Council as outlined in the regulations along with the village head.

In choosing the model that will be applied, the program manager, the village government and community representatives should consider several issues related to the purpose and objective of PNPM-MPD is for the economic activity. Some things thatcouldbe consider are:

    A. In terms of beneficiaries:

       1. That the fund is a grant to the community

       2. Associated with the wishes and expectations of the beneficiaries, the beneficiaries expecting a revolving loan program was continued and even intensified its lending

       3. The public also expects community development activities not only in lending activities but also on training and mentoring of productive economic activities

    B. From the management side:

       1. During the program, the community grant fund management has been able to develop well

       2. Thus, it means that the pattern of management of the programs that run during the program was also very good

       3. The amount of funding is limited, it can not cooperate with financial institutions and other third parties

       4. Lack of certainty of the rules of the government regarding the management pattern of community grants that can still be continuity

    C. From the administrator side activities

       1. The spirit of the management of the PNPM-MPD is very high for sustaining the revolving fund keep running.

       2. The manager is very eager to develop community empowerment through the revolving loan and further development activities.

       3. The manager expects a definite rules of the government regarding the sustainability of the revolving loan fund.

Conclusions

The existence of five models developed in the community after the end of rural PNPM are based on the following matters:

    1. Partially only a few districts that have completed the institutional arrangement BKAD the District are aligned with Act No. 6 of 2014 about the village (some people also have the perception that berbda depending on institutional arrangements BKAD the District are aligned with Law No. 6 of 2014 on the village). Practically in 2015 many districts are still preoccupied with it. Even the delay arrangement that is legitimized by the publication of two times the guide arrangement and the termination of the PNPM program MPd from the related Ministry.

    2. National issues relating to the clarity of the regulation, certainty BKAD as subjects of law and government interventions are done partially institutional (expl: Secretariat of the Central Java held Farum its own, the State Secretary with the "intervention in

Lampung, Ungaran and Sragen, and the last intervention Regency Banyumas in the year 2016).

3. Different interpretation of the former rural PNPM actors which lead to conflicts both horizontally between operators and across districts, as well as vertically with institutions that "feels" has the authority to "regulate".

4. The diverse of perception and the spirit of each rural PNPM in securing and sustaining asset after the program is ended. This may cause procedural and technical constraint in every district.

5. Arrangements BKAD aligned with Law No. 6 of 2014 should be completed by the end of 2014. Hence in 2015 fell 2 guideline for structuring and termination of the program of the ministry for many who have not implemented. Psychological factors, political status and sustainability of the contract of rural facilitators also contributing to the delay. The situation above give impact on BKAD performance and stimulating the five model of post-completion rural PNPM.

6. The government immediately follow up by issuing regulations related to the institutional arrangement of the activity management unit ex-rural PNPM program to meet society's expectations.

THE ACCELERATION OF TRADITIONAL BATIK (CREATION AND COMBINATION) THROUGH INTEGRATED MANAGEMENT TO SUPPORT THE ACCELERATION IN REGIONAL ECONOMIC DEVELOPMENT

Asri Laksmi Riani, Universitas Sebelas Maret, Indonesia
Julianus Johnny Sarungu, Universitas Sebelas Maret, Indonesia
Margana, Universitas Sebelas Maret, Indonesia

Abstract

In the longterm, this study aims to increase the income and welfare of batik craftmen, support the development of creative industry, and support the regional development aimed to the acceleration and the expansion of national economic development.

Specifically, this study aims to: (1) explore the potency of traditional batik (creation and combination) to support the development of creative industry based on local wisdom, (2) identify the contribution of traditional batik, both creation and combination in strengthening the economy in batik community and regional economics development, (3) explore the supportin factors in the acceleration of traditional batik industry, both for creation and combination batik in Sragen district, (4) explore the factors that hinder the acceleration of traditional batik industry in Sragen district, (5) identify the management in traditional batik industry in Sragen district, (6) prepare a model of integrated management to support the acceleration in traditional batik industry, both batik creation and combination. This study is a descriptive study and uses qualitative approach.

The data are gathered using several methods that consist of observation (field observation), interview (Focus Group Discussion), and content analysis method (content or document analysis). The data are analyzed using several tachniques including interactive analysis technique (Miles & Huberman, 1984), internal-external analysis technique (MSG, 2013), and supply-demand analysis technique (Blank & Stigler, 1957).

The result shows that Sragen district has potency in batik that can be developed as local product excellence. Batik industry has contributed in strengthening the local economy. On the one side, there are several factors that support the acceleration of traditional batik industry in Sragen district, which include municipal government policy, banking facilities through capital loan from banks, contribution from NGO (Non-Governmental Organization), and private contribution through foster father system. On the other side, there are several factors that hinder the acceleration, such as the fluctuation of foreign exchange, unhealthy price competition among producers, non-optimal current batik association, limited number of experts, limitation in working capital, difficulties in finding raw materials especially silk, the fluctuation in synthetic color quality, erratic weather that affect the process of batik production using cold wax printing technique, non-optimal role of current batik cooperation, and the lack of training aimed to improve batik quality. Sragen district government has formulate the policy regarding the development of batik industry through micro and medium enterprises (MME) and small and medium enterprises (SME) strengthening program.

The batik SME management in Sragen still employs conventional management in term production management that includes product diversification, production mechanism, quality control, marketing management that covers selecting target market, marketing area, and promotion media; and human resource management that covers productivity improvement, employee turn over, and financial management. Based on the result of analysis on the potency, barriers, supporting factors, and government policy regarding batik industry, we formulate a model to accelerate the traditional batik industry in Sragen through intergrated

management to support the acceleceration of regional economic development. The model is then named IMBE (Integrated Management for Batik Enrichment) model.

Keyword: *traditional batik creation, combination batik, integrated management.*

Introduction

1. Background

Batik is a unique craft that represents the great culture and local wisdom owned by Indonesian. Indonesian batik is widely known in the international level and has received an acknowledgement from UNESCO by includes it in the Representative List of the Intangible Cultural Heritage of Humanity in October 2nd, 2009. This acknowledgement represents international acknowledgement on one of Indonesian cultures, and is expected to motivate and increase batik craftsmen welfare, reduce unemployment, reduce poverty, and support the effort to improve people welfare.

Sragen district is one of the centers for batik business. This can be seen from the number of batik SME in Sragen district. In order to improve regional economy, Sragen government has promoted entrepreneurship program for their resident.

The entrepreneurship in Sragen has developed rapidly; this can be observed from the increasing number of SME from time to time. In 2011, Sragen has 13,418 SMEs (BAPPEDA Sragen district, 2012). These SMEs run in various businesses, including batik. In batik industry, there are 4,702 companies/traditional batik industries in Sragen with total investment of Rp. 169,574,000,000,-. The industries can produce 4,287,405 packs of batik (a pack = 20 sheets) (BAPPEDA Sragen district, 2012).

Batik is art made thoroughly and carefully to produce the combination of style or special motive and colors. Batik style and color has symbolic and philosophical meaning. Batik is also an expression of creativity and cultural and spiritual values of Indonesian people. Thus, all components of the community, together with the government should take coninous steps to protect and conserve batik.

The development of batik should be directed to change the old mindse about batik, which consider batik as old, traditional, and non-modern style. Batik desin should be developed, so that it become more flexible and can be used by all social layers in the community, for all age groups, and for all occasions. That's why batik industry needs an effort to initiate the production of creative batik. The development of traditional batik creation starts from the effort to diversify batik products to fulfill consumer's needs and demand. With the optimum creation, it is expected that batik will attract young people interest to wear batik. This is important to change the image of batik as older generation dresscode to a flexible dresscode for all age group.

The proper and professional development of batik industry, including developing batik creation and combination in Sragen, will contribute in the increase in community income and development of regional economy. However, there are several problems regarding the production and market and marketing context of traditional batik creation business (See Figure 1). In the production context, the problems include the limited creativity and innovation of the craftsmen in developing batik creation and combination; in style or motive, design, or coloring process. In the market context, there is no market research on what consumer actually wants from batik industry. Thus, currently, product development is not fully based on market demand. Similarly, the promotion and marketing for traditional batik creation and combination is very limited. A thourough study is neede to solve the problem and to provide insight in accelerating the traditional batik creation and combination industry, so that they can make a diversification to fulfill market taste by directing batik into creative industry.

2. Problems

   The problems are formulated as follows: what is the potency of traditional batik creation and combination in supporting the development of creative industry based on local wisdom, what contributions does traditional batik creation and combination have in strengthening batik community financial and regional economic development, what are the factors that support and hinder the acceleration of traditional batik creation and combination in Srage district, how Sragen government formulate their policy to support the acceleration of traditional batik industry, both creation and combination, to encourage the acceleration in regional economic development, how is the management of traditional batik industry using creation and combination in Sragen currently, and what does the draft of integrated management model to support the acceleration of traditional batik creation and combination industry.

3. Research Purposes

   This study aims to explore the potency of traditional batik creation and combination industry in supporting the development of creative industry based on local wisdom, to identify the contribution of traditional batik contribution in strengthening batik community economy and regional economic development, to explore the factors that support and hinder the acceleration of traditional batik industry in Sragen district, to study governmental policy in Sragen district in supporting the acceleration of traditional batik industry to encourage the acceleration of regional economic development, to identify the management of traditional batik industry in Sragen district, and to formulate the draft of integrated management model to support the acceleratin of traditional batik industry.

Research Method

This study is a descriptive research that employes qualitative approach and has generated the description about the potencies and problems regarding the development of traditional batik industry as local special product. This study is conducted in Sragen district, Central Java province. The selection of this area is due to the consideration that Sragen district is the center of batik industry.

The source of data analyzed in the first year consist of batik community, including the businessmen in batik or batik craftsmen as well as policy maker in Sragen district, especially Industrial Bureau, Cooperation and SME of Sragen district, Development Planning Agency at Sub-National Level (Badan Perencanaan Pembangunan Daerah-BAPPEDA) Sragen District, Tourism and Culture Bureau of Sragen District, Community Empowerment Bureau of Sragen District, Trade Bureau of Sragen District, and PPKAD Bureau of Sragen District.

The other sources of data are the written documents regarding batik industry in Sragen district and all environments (location and events) in each batik SME in the area. In this study the data are gathered through several methods, including observation, interview, focus group discussion, survey, and content analysis method. While to test the validity of the data, we employ source triangulation technique (Moleong, 2000). Each data from a source will be cross checked with the data from another source.

The techniques used to analyze the data on the acceleration of traditional batik creation and combination through integrated management to support the acceleration of regional economy consist of interactive analysis, internal-external analysis, and supply-demand analysis. Interactive analysis (Miles & Huberman, 1984) underlines three main components, data presentation, data reduction, and verification/drawing conclusion. Thus, this method focuses on the relationship among each research process that starts from data collection, data presentation, data reduction, and verification/drawing conclusion. Data presentation is organizing the information in the classification or categorization that enables us to draw conclusion. Data reduction is the process of selection, focusing, simplification, and

abstraction of raw data from field record that will be transcripted and reduced to avoid overlapping. Inferences is organizing the data gathered so that we can draw the final conclusion from the study, in this case is the study on the acceleration of traditional bati creation and combination through integrated management to support the accelartion of regional economic development.

In this study internal-external analysis focuses on the internal and external factors that affect the acceleration of traditional batik creation and combination in order to support the acceleration of regional economic development. Basically, interna-external analysis supports the effort from a company in MSMEs (micro, small, and medium enterprises) category to achieve the success in their business. In this case, all strengths and weakneses or internal and external factors of a business have to be analyzed thoroughly.

The internal factors include the capability, main competende, and resources owned by an industry or IMKM. On the other side, all variables of an industry or external variables of an industry must be analyzed as well. The external variables of an undustry are the external factors that consist of the opportunities and treats. These external factors are the factors that cannot or hard to be controlled, thus if a company wants to control these variables, they have to perform an anticipation. This is the reason as why an industry needs longterm strategy to anticipate and control the external factors (MSG, 2013).

Supply-demand analysis is a tool to find the components in the production process and in the market. Two main components in this analysis is the supply in the form of production and the demand in the market (Blank & Stigler, 1957). The law of demand mentions that: the number of product demanded is the inverse of price; it means that the increase in price will reduce the number of demand and vice versa. The law of supply mentions that: the product offered will grow in line with the price; it means that the increase in price will increase the number of product offered by company and vice versa. In the context of of this study, supply-demand analysis is used to find the components of supply and demand in the development of traditional batik creation. The market component in SME and traditional batik craftsmen in all over Sragen district supports the development of batik industry in Sragen.

Literature Review

A. Batik

Batik comes from the combination of two words in Javenese language "amba", which means "writing", and "titik" which means "dot". The word batik refers to the fabric with motive made by applying wax on to the fabrics, thus straining the dye from entering the fabric. Make batik means painting complicated pattern (dots) on the fabric using wax and a tool named *canting* (Sariyatun, 2006; Cahyani, 2009).

Batik is an art that has high aesthetic value that has become an important part of cultural life in Indonesia (especially Javanese). In the past, Javanese women use their skill in making batik as a source of income, thus, in the past batik crafters identic with exclusive job for women. Batik as one of cultural art has an ability to become national identity. It has unique cultural values inherited from generation to generation, so that we have to preserve it. We do expect that batik will always exist and become the identity of local or national culture (Rara Sugiarti, 2010).

B. Management

Management is a process to plan, organize, direct, and control the efforts from organization members and the use of other organizational resources to achieve the predetermined organizational objectives (Handoko, 2010). From its character, management has three characters: it is a process of continous activities, it concentrated to achieve organizational objectives, and gaining result from cooperation with several people and utilizing resources owned by an organization. Management has several main pillars: production management,

marketing management, distribution management, financial management, human resource management, and organizational management. In management, we know five tools known as 5M (Man, Money, Machine, Method, and Market) (Umam, 2012: 13). While integrated management is a process to manage production sector and market sector aimed to reach balance and success in organizational performance.

C. Creative Industry

According to Simatupang (2007), creative industry with creativity, expertise, and talent as the main components, has a potency to improve people welfare through the offer of intellectual creation. The basis for creative industry is intellectual capital manifested in arts, cultures, technologies, and businesses (See Figure 5). Creative industry consists of the provision of direct creative product for consumers and the support to create creative value in the other sectors with indirect relationship with customers "*...industries which have their origin in individual creativity, skill & talent, and which have a potential for wealth and job creation through the generation and exploitation of intellectual property* (Indonesia Chamber of Trade, 2008).

According to the Department of Trade of the Republic of Indonesia, crafts is one of the creative industry besides the other 13 kinds of creative industries that consist of advertising, architecture, art and antique items, arts performance, design (graphic, interior, etc.), fashion design, video-film and photography, interactive game, music, publisher-offset, computer service and software, television and radio broadcast, and research and development (Indonesia Chamber of Trade, 2008).

Creative industry has strong relationship with creative economy. The development of creative economy has been stated in Presidential Instruction Number 6 of 2009. Serious commitment from all stakeholders is needed in the development of creative economy. Stakeholder is the main pillar in implementing creatice economy. This group is the main element known as The Triple Helix (See Figure 6) that consistd of intellectuals, business, and government.

Result And Discussion

The analysis result shows that batik has been developed in Sragen since long time ago. Currently, Masaran and Plupuh are the sub-districts that developed into a centre of batik in Sragen district. These two sub-districts has long become the centre of batik. The batik production from these two sub-districts has been distributed to all over Indonesia and even abroad. The distribution of Sragen batik is conducted through various techniques and supported by the existence of brokers. As one of the local potencies owned by Sragen district, batik has become the source of income for large number of people in Sragen.

Various jobs that are included in the primary process of batik production including making the design/pattern, drawing the design/pattern, mencanting (applying wax), coloring, me*lorod* (washing the wax from the fabric), packing, and marketing, has become the source of income for people in Sragen. Beside those primary jobs, there are als secondary jobs that support batik production, such as gawang (fabric holder) production, canting (wax applicator) production, special pan for wax production, stove, and container for lorod, as well as other tools. There are also industries that produce the raw materials, such as fabric/textile, syntethic or natural colors, and wax. On the one side, the various jobs in batik industry have provided large employement opportunities. However, on the other side, eventhough batik industry has a good growth; there are several SMEs or businessmen who experience unfortunate condition. Thus, the condition and growth of batik producers in Sragen are varies. Following is the decription of the current condition of batik SMEs in Sragen.

The supporting factors for the acceleration of traditional batik industry both in creation and combination in Sragen are government policies, private sector contribution, facilities from banking service, and NGO contribution. In order to support the development of batik industry

as unique product, Sragen district government has formulate the policies to strenghten SMEs and IKM in Sragen.

The policy is implemented into related program such as the creation of conducive environment for SMEs. The program is then further duescribed into several activities such as granting working capital for cooperation and SMEs, granting equipments for SMEs, SMEs development facility, and assistance and development program for cooperation. Besides, there is also a program for IKM improvement, industrial technology improvement, and potential industry center improvement. These programs are implemented into several activities, including IKM assistance, equipment grants for IKM, facility and working capital grants for IKM, and the development of potential and local industrial centre. Besides the mentioned factors, there are another factor that support the development of traditional batik industry in Sragen district, such as grants for production equipment, training, comparative study, internship, existing showroom, and exhibition.

To increase batik production, both in quantity and quality, Sragen district through its industrial, cooperation, and UKM bureau has provided feeder machine for batik SMEs. The machine has a function to reduce the risk of ruggedness in the coloring and increase the efficiency in economic and human resource terms. With the feeder machine crafter can produce better color. The machine work with dynamo and should be operated by three people. The machine can be operated as follow: the fabric is tied at each tip with rope, then an operator stand in the other side of the machine. The other operator inside the machine has a duty to make sure that the fabric that will be colored enter the machine straightly, and pass over the coloring tube before it is dischrged from the machine. While the other operator in the outer side of the machine have to pull the tied rope so that the fabric does not stuck inside the machine. The coloring process with this machine usually uses remasol dye mixed with waterglass, so that coloring process with this machine does not need separate color lock process.

Besides the grants of feeder machine, SMES in Sragen also get another production machine, such as canting, press tools, and screen or printing table for printing batik. In order to develop batik industry in Sragen district, local government through industrial, cooperation, and small enterprises bureau provides assistance in technique in the form of training to improve batik quality and marketing network expansion.

The training to improve product quality includes natural dye, diversification of syntethic dye using naphtol, rhemasol, and indigosol. The bureau together with tourism and culture bureau has tried to facilitate SMEs to conduct comparative study to other batik SMEs outside Sragen. This activity wants to facilitate batik SMEs in Sragen to learn from experience and knowledge from other SMEs that also produce batik. With enough experience and knowledge, batik SMEs in Sragen district are expected to produce higher quality of batik.

The facilities provided by Sragen district government to develop batik potency also includes internship program. The internship program is aimed to add more knowledge, experience, and improve skills in other batik SMEs, for example in discipline, health, and work safety. Besides that, intership program also aimed to understand the process of batik production, especially the ones performed by batik SMEs to produce high quality products. Generally, intership program is conducted in relatively longer period than comparative study. The period of intership depends on the types of knowledges and skills that an intern wants to learn about.

Other facility provided by Sragen district government is the existence of showroom located near to the city square. The building is built for batik SMEs in Sragen. The location of this showroom is strategic because it is located in the main street conneting Solo and Surabaya. Batik with various motives, materials, sizes, and colors can be seen in the showroom. These batiks are also sorted based on certain criteria, especially it's price.

To expand the marketing area, Sragen district government facilitates the SMEs to join exhibition. Exhibition is an effort to increase the sales because it is an effective promotion for batik SMEs to intoduce their products. However, besides to increase sales, exhibition has many other benefits.

First, through exhibition, SMEs can gather information from their competitors. The information that can be gathered from competitors are price, new design, materials, and equipments. Second, through exhibition, SMEs can measure their sales success during the exhibition. This also shows whether customers like their product. Short-term sales can become a measure or prior evaluation of long-term sales. Exhibition can be used to reflect SMEs products, and the result of sales during exhibition can be used as an evaluation for future sales. Third, exhibition is a mean to introduce new product. Batik businessmen have to be active and proactive in offering their products in the exhibition to achieve the effective marketing in the exhibition. Fourth, exhibition can provide correction for the products they produced, to evaluate the shortcomings, so that in the future it will become the base for them to make an innovation for their product, and to fulfill consumer's taste. Fifth, exhibition can build and strenghten SME's image, so that people will consider the SMEs as the producer of high quality batik. Sixth, through exhibition, SMEs can gather information about their competitors, including the information about price, equipment/machinery, newest batik, new outlet/branch/agent, superior products, etc. Seventh, exhibition can be used to test teamwork in marketing, quality control, production or even packaging. Eighth, exhibition is a mean of direct selling because exhibition is the only advertising media that touch all senses; eyes, ears, nose, and skin, so that it is more realistic to be used in making purchase decision.

These activities prove that Sragen district government has tried to empower SMEs in order to encourage the development of populist economics, so that it can be integrated into regional and national development. This also aims to protect SMEs so that they are not exploited by larger and modern formal business. In order to develop batik business, SMEs in Sragen received low interest loan from banks. The grant in the form of waste water management installation (Instalasi Pengolahan Air Limbah-IPAL) is also granted by GTZ, an NGO from Germany. IPAL has an important role to reduce pollution in the soil and water as a result of batik production. The high volume of batik production in Sragen will have a negative effect toward the environment if the waste is not handled properly.

The role of private sector is vital in supporting the development of batik SMEs in Sragen. One of the systems employed in this process is foster father system in which large company takes a role as the foster father and the SME takes a role as a foster child. The foster father company is a company that functioned as trustee, while the foster child is the fostered (target). The benefit of this system is the improvement of SMEs quality. All this time, large batik company in Surakarta, such as Danar Hadi and Batik Keris act as foster father for SMEs in Sragen, eventhough this sistem is not implemented officially. Foster father system based on the interest toward the business that has important role because it is a form of cooperation between large or medium industry with small industry.

This system can become a bridge for small companies to utilize the economic facilities such as provision, technology, and marketing, which in turn will be able to preserve small industry, so that they will become tougher and actively participate in the development, especially in the batik development. In the system, foster father provides a direction and assistance for small industry to improve their quality, financially through loan, and non-financially through the provision of raw materials, acts as guarantor for small industry in finding loans, provides hardware or software for training to improve quality and skills, as well as providing aids for marketing.

Despite of the factors that support the development of batik in Sragen, there are also factors that hinder the acceleration of batik industry development in Sragen district. The obstacles are

the fluctuation in foreign exchange, unhealthy price competition or no standard in product price, non-optimal support from batik community, limited working capital, limited experts, difficulty in finding raw materials especially silk, the fluctuation in synthetic dye quality, unpredictable weather in the cold printing batik production, non-optimal role of current cooperation, and the lack of training in order to improve batik quality.

One of the factors that hinder the development of batik industry is the fluctuation of exchange, which has serious impact on the price of raw materials such as textile and syntethic colors that must be imported. In this case, batik SMEs have weak bargaining power and most of the time are forced to giving up with the current situation.

Another obstacle in the development of batik industry is the unhealthy proce competition among batik SMEs in Sragen. In order to sell their products, several SMEs sell their batik with very low price, so that they only receive small amount of profit. Currently, there is no standard for batik price to avoid unhealthy price competition among batik SMEs.

That is why currently each SME makes their own pricing system. Thus, there is an impression that some SMEs sell their product with very high price while other SMEs sell their product with very low price. The other problem is the non-optimal support from existing batik community. Several batik SMEs in Sragen have form a community that is aimed to reach efficiency both in production and marketing sector. However, this community is not functioned optimally.

Another obstacle is the limited experts in batik. Eventhough human rsource in Sragen is overabundance, but it is relatively hard to find labor who has expertise in batik. As an example, the number of people who can create batik motive is very limited. This affects the lack of uniqueness in batik motive, becayse they employ the same person to draw their motive. Similarly, in traditional batik production, the numbers of people who have expertise in applying wax into the fabric keep decreasing from day to day.

Besides the limitedness of experts, batik businessmen also experience the limited working capital. Batik production demands high capital because producers cannot directly sell their products upon completion. They have to wait until there are customers who are interested with their products and bought them. This causes batik businessmen have to have extra capital to produce product stock so that customers have wide variety of choices. Batik industry also experiences difficulties in finding raw materials, especially silk. Recently, due to the low exchange of rupiah, batik industry finds that silk is unaffordable for them. This also causes the increase of silk batik price in the market because silk batik becomes rare. The same case happens to the syntethic dye, which increases during the weak currency exchange. This in turn will force IKM to adjust their product price, or increase their product price.

As an addition to the high price of syntethic dye, the quality of this dye also affects batik quality. As the effect the increase in price, a few producers can only afford the cheap dye, which in the end resulting in dissatisfaction because the color of their product wear off when customer wash it.

Another obstacle for batik industry is the erratic weather which has severe effect on the production of batik using cold wax printing. The erratic weather will affect the quality of batik. From the organizational side, there is an obstacle in the form of non-optimal role of batik cooperation. The SMEs in Sragen has initiated a batik cooperation named Koperasi Batik GIRLI. The word GIRLI is an acronym from pinggir kali (riverside). This name is selected because the centre of batik industry in Sragen located in Masaran and Sragen sub-districts, which both located on the riverside of Bengawan Solo. Eventhough it has long put into realization, this cooperation does not functioned optimally. Another obstacle is the lack of training to improve batik quality. Sragen district government, university, and private sectors have tried to conduct a training to improve the quality of batik Sragen. However, the

training is not intensive and tends to be incidental. The training includes batik production with various techniques and coloring training, both using natural color or syntethic color.

Sragen district government has formulated policy regarding the development of batik industry through SMEs and IKM strengthening program. Batik industry is one of business/small and medium industry in Sragen. The development of SMEs, including batik, has been formulated in Local Government Development Plan (Rencana Kerja Pembangunan Daerah-RKPD) of Sragen district 2015. In Chapter V regarding Program Plan and Priority Activities of Sragen 2015 Table 1 there is Point 1.15 regarding cooperation and SMEs. The priority program in cooperation and SMEs in the creation of conducive environment and the improvement of organizational quality for cooperation. While the priority activities in the plan is providing capital grants for cooperation and SMEs, providing equipment grants for SMEs, SMEs development facility, and supervisory and development of cooperation. Another policy and program including the Point 2.7 regarding industry with priority program to increase IKM, improving industrial technology, and improving potential industrial centre.

The priority activities mentioned in the program including IKM supervision, equipment grants for IKM, facility and capital grants for IKM, and the development of potential and local industrial centre.

Management of an industry/business is one of the keys to achieve success or the business. In this study, management refers to two main sectors, production and marketing.

The production sector includes all activities related with production: production process, human resources, quality control, and financial management. While marketing sector focuses on the market: both the existing market and potential market. The management implemented by SMEs in Sragen is still traditional management. Even these SMEs do not understand the management term, such as integrated management, production management, human resource management, etc. Some of them manage their business based on the experience they get when they worked as employee in another SME. Following we describe each management sector that have been implemented by batik SMEs in Sragen in managing their business.

Production Management

Production management is an activity which aims to organize and coordinate resources utilization, including human resource management, assets management, as well as finance and material management, effectively and efficiently in order to create and increase certain goods utility as well as improving productivity. The SMEs in Sragen Municipality generally have not implementing management in broad term. The management model that is implemented is mainly the traditional and family based management. In term of production management, there are three points that are already managed i.e. product diversification, production mechanism, and quality control. However, such management remains traditional.

A sector that should be considered in production management is product diversification. Batik product diversification is an effort taken by batik SMEs to maintain their product uniqueness and quality. Diversification is needed to give consumers alternative in choosing the product they want to buy. Batik SMEs in Sragen Municipality have managed their product diversification traditionally by creating batik motif manually. There is a batik artisan in Sragen who is excelling at creating batik motif. Thus, there are many SMEs that use the artisan's service in preparing their batik motif in different version, thus the uniqueness is preserved, because they had specified the motif they want when placing the order.

Another important matter is production mechanism. All of the SMEs in Sragen Municipality organize their own production process for all of batik product. The production mechanism varies from one to other SMEs. Some products are produced in main production site which is belonged to certain SME. Some other products is produced in batik artisan's house. When there is a huge order, a SME usually will collaborate with other SMEs based on agreed upon system.

Quality control is another important matter in production management. Several SMEs in Sragen Municipality have conducted a quality control on their product. However, such quality control is conducted traditionally. Several SMEs conducted self-quality control and relying on wholesaler or buyer to do the quality control. Thus, if there is no product is rejected by wholesaler and buyer it would mean that the product has meet market requirement.

Marketing Management

The marketing management in the most of SMEs in Sragen Municipality is not based on the marketing theory. The marketing management is a management process which covers several activities such as analyzing, planning, implementing, and monitoring of marketing activities in a company (in this study a SME). The focus of marketing management is fulfillment of market demand, pricing, communication, and efficient and effective distribution in providing information, encourage, and serving the market. In marketing its product, the SMEs in Sragen Municipality depend on traditional marketing such as putting their product in the intermediaries' outlet. These intermediaries seller are the seller who have outlet in Pasar Klewer, Pusat Grosir Solo (PGS), Beteng Trade Center (BTC) and other place.

An important aspects that should be considered in marketing management is market target. In marketing management, most of the SMEs in Masaran Municipality have not been determine their market target. Market target is a group of consumer that has a same characteristics which make it to be an independent target. Market target gives a good prospect, thus producer could marketing its products to several places or regions. Market target will narrow down the mass market into several segments. With the absence of detailed target market, it seems like the SMEs in Sragen Municipality is competing in the same segment, which is general market segment. Beside target market, a company should also consider marketing area. Most of the SMEs distributing their product to Surakarta (Solo), Malang, Surabaya, and other islands such as Bali, Sumatera, Kalimantan, Sulawesi, and Papua. The focused management activity in term of marketing area is covering several aspects such as implementing competitive pricing and producing high quality product.

Promotion media is a part of marketing management. Most of the SMEs in Sragen have not promoting their product independently. Most of them are promoting their product with assistance from other institution such as governmental institution and universities. The Government of Sragen Municipality encourages the promotion of batik product by organizing exhibition and showroom in Sragen. Meanwhile, some universities are assisting the SMEs in promoting their product through electronic media such as website, which leads to online marketing.

Human Resource Management (HRM)·

The success of batik SME is, one of many aspects, determined by the success in term of human resource management (HRM). HRM is a measure to organize the relation and role of human resource (employees) owned by a company. Thus, through HRM a company can manage its human resource efficiently and effectively and maximizing the advantage to achieve company's objective. HRM involve all management decisions and implementations which will affect human resource activities directly. The role of human resource in a company is in the form of their involvement in a planning, system, process, and establishment of company's objective. There are several aspects that need to be considered in HRM such as improvement in productivity, turnover rate, and employees' incentive.

One of important aspect is productivity improvement. Productivity is a ratio between the output and the cost needed (input) to reach such output. Input includes production cost and equipment cost. While output includes sales, earnings, market share, and defects.

Human resource productivity is a unit of measure to determine company's outcome relatively with its objective set. Productivity has an important role in improving profitability and strengthens competiveness. The productivity in batik SMEs in Sragen can be considered

excellent. SMEs' batik artisan in Sragen is known as one of the most highly productive artisan. This can be viewed from the quality and quantity of batik product in Sragen. Batik SMEs in Sragen can fulfill the demand from several well-known batik companies such as Danar Hadi and Batik Keris and many other batik entrepreneur in Surakarta.

Besides that, employee turnover should be considered as well. This is important especially in traditional batik SMEs which rely on human resource capability. Human resource of employees are one of many factors that determine the success of a company (SME). Therefore, a company is required to maintain its employees to minimize turnover rate. Turnover refers to a condition when an employee resigned from their workplace. There are some factors that affect turnover rate such as labor market condition (external factor), internal factor (workplace condition, wages, skills and supervision), and personal factor (intelligence, attitude, personal experience, gender, interest, age, tenure, and personal reaction to their job). Turnover in batik SMEs in Sragen is relatively low. This is because of the implementation of traditional HRM which is based on kinship. Therefore, human touch is more dominant and creating a strong interaction between owner and employees, which will lead to respect.

Financial Management·

Financial management is a process of organizing company's finance. This process involves planning, finance analysis, and financial control by finance manager. Financial management can be viewed from fund source, fund adequacy, and bookkeeping which also covers cash book.

Based on the analysis on the potential, constraint, supporting factors, and the policy of Sragen Municipality Government, which related to batik, a model is established to accelerate traditional batik growth through integrated management to support regional development acceleration. The model called IMBE (Integrated Management for Batik Enrichment).

IMBE model is a draft because it was established by researchers' team based on the above mentioned factors. The establishment of the model involves all stakeholders of batik SMEs because the model is focused on the findings or result of analysis which is not final.

The establishment of model draft is conducted along with the analysis process during the first year, thus the draft model is developed near the end of the first year. The IMBE model consists of several aspects such as context, integrated management, and enrichment (batik enrichment).

The main foundation of IMBE model is context which include all atmosphere (which related with batik potential), problems (which related with batik development in Sragen Municipality), policies (either in the Sragen Governmental or Central Java Governmental, and Central Government), and a strong networking. Context should be managed by integrated management, which involve the management of production and marketing sectors equally. The outcome of 'context' management is a long term result that should be achieved together and based on synergy and good collaboration of stakeholders. A detailed figure of IMBE model is depicted in Figure 1 as follow. Figure 1: IMBE Model.

Conclusion

The research result shows that Sragen Municipality has a potential in batik, which can be developed as regional featured product. The existence of batik industry has providing a contribution to the local economy strengthening. On one side, there are several factors that supporting the acceleration of traditional batik (creation and combination) in Sragen Municipality such as government policy, banking facilities (capital fund), LSM contribution, and private parties contribution through foster father program.

On the other side, there are several constraints such as fluctuation in currency exchange rate (rupiah on dollar), unhealthy price competition between SMEs, the existence of batik community, which is not optimal yet, lack of experts, lack of capital, the difficulty in finding

the raw material (especially silk) fluctuation of synthetic dye, erratic weather (in the cool wax technique), the role of batik cooperation which is not optimal yet, and lack of training in the development of batik quality. However, Sragen Municipality government has established a policy which is related to the development of batik industry through Micro and Medium batik enterprise, and Small and Medium batik enterprises reinforcement program.

The management of SMEs in Sragen Municipality is conducted conventionally, either in production management (such as product diversification, production mechanism, and quality control), marketing management (such as target market, marketing area, promotion media), HRM (such as improvement in productivity, turnover rate), and financial management. Based on the result of analysis on the potential, constraint, supporting factor, and government policy, a model is established to accelerate traditional batik growth through integrated management to support regional development acceleration. The model called IMBE (Integrated Management for Batik Enrichment).

Iwan Budiyono, Politeknik Negeri Semarang, Indonesia

Abstract

In Indonesia, May Day Celebration is always colored by mass demontration and prosecuetions, that celebration is ofcourse will give negative impact in many ways, such as disturbing the economic and social activities. To reduce it, the author try to provide an alternative solution through National On The Job Training Program (NOJTP). NOJTP is a program that provides training to workers on May Day celebrations in order to improve the quality and competitiveness of Indonesian workers. According to Gomes (2002) providing on the job training will at least contribute 90% of the skill and labor competitiveness. Based on survey on opinion to 40 workers in Central java Province, it is found that 95% need this program. To run NOJTP, there are four steps to implement. First, establishing the regulations of NOJTP program; second, socializing NOJTP; third, running the training provision (such as training on language, technology and entrepreneurship) and social; monitoring is held during the implementation and evaluating the whole of activities is done at the end of the training. Some benefits of running these programs are the increases of the productivity, labor competitiveness, the spirit of entrepreneurship, also promoting the sense of social communities, reducing demonstrations, and minimizing the risk of employment termination.

Keywords: *may day celebration, competitiveness, labour, training*

Introduction

Indonesia is country which is rich in resources, both the natural and human resources. Different with natural resources are limited, human resources are increased over time. Based on data from Statistics Indonesia (BPS) it is found that Indonesian population is incresing significantly from year to year [1], even the International Labour Organization (ILO) predicts the Indonesian population in 2019 reach 131 million [2]. The Indonesian labour growth shown as graph in Figure 1.

In quantity, the number of Indonesian population is more higher than other countries in ASEAN, but the competition in quantity will not win when the quality is still far below. Therefore, the problem of Indonesian labour is low quality. The quantity of qualified labor is still very low in Indonesia. Many Indonesian workers do not have special ability or skill to work [3]. Supports from the government are needed to promote them to compete in AEC (ASEAN Economic Community) in which workers from different countries may fill job opportunities in Indonesia.

Entering the first year in the era of AEC, freedom is wide open for labour coming from any country to fill job opportunities. This threat should be taken seriously, unless we will not be the host in our country. And the impact of this threat is will increase the poverty and decrease in prosperity. In addition, May Day celebration, 1st May, is very often colored by mass demonstrations and prosecutions. That celebration will give the negative impacts in many ways, such as disturbing the economic and social activities. In economic side, it is will disturb the company's productivity, and in social side is distrurb tha traffics.

The exictence of labour compete is still rare, it is because most of Indonesian labour are

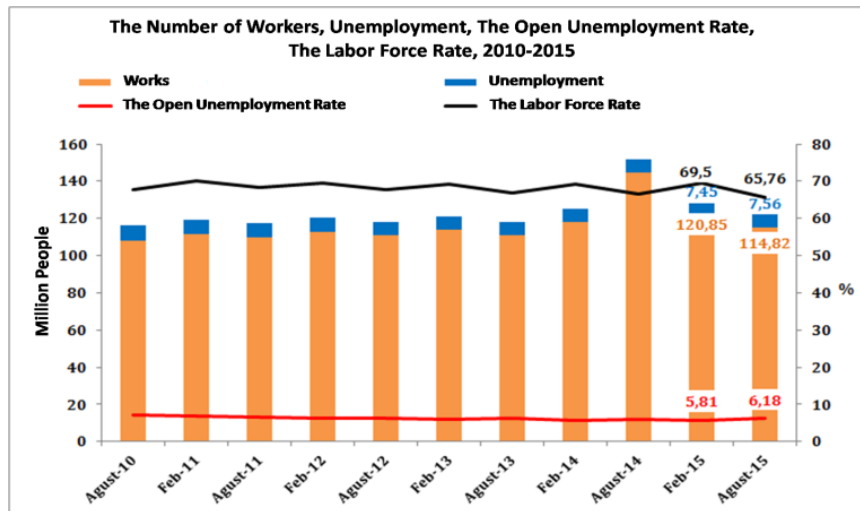
Elemntary School graduate. Beside it, the unemployment of Indonesian population is increasing significantly. Rate of unemployment in Indonesia shown as graph in Figure 1.


Fig. 1. Labour and Rate of Unemployment in Indonesia

Fig. 1 show that the total of Indonesian labour has increased from 2010 to 2015. Where the total of Indonesian labour in 2015 reach 144,82 million, it is because the growing of population in Indonesia. In addition, the unemployment rate in Indonesia is increasing from year 2010-2015, where the total of unemployment in 2015 reach 7,56 million, it is because the lack of employment opportunities and the difficulty of finding work, especially entering the era of AEC, where based on data from Ministry of Manpower of the Republic of Indonesia show that employment opportunities is only 43% of the labour force [1]. Therefore, it is needed the preventive effort to reduce the negative may day celebration and improving the quality and competitiveness of the labour sector, so the author try to provide an alternative solution through "NOJTP" (Natoinal On The Job Training Program).

Material dan Methods

1. Literatur Review Methods

   Study of literature is a literature review focused on a research topic about the condition of Indonesian labour and workers, the competitiveness and may day celebration.

2. Data Collection Techniques

   Data colleque techniques that author use is qualitative study such as study of literatur and library research. Data colleque based from Statistics Indonesia (BPS) and International Labour Organization (ILO). Beside it, the author conducted the interview and observation to Central Java Province's workers in may day celebration. The research method is carried out by observational studies and interviews directly. The technique of direct observation and interviews is done in several stages, including:

   a. Observing the phenomenon and learn the information about labor and concerning about the international may day from various mass media,

   b. Compile a list of questions,

   c. Interview directly. In this step, the author conducted the interviews in person without providing a questionnaire, so we get more detailed information about the condition of the workers.

   The population of workers in Central Java province was more than 11,000 inhabitants, the sample used by the author was 40 workers, it is because it has represented the several cities and companies in Central Java.

References Citation
1. Labour Trands in Indonesia

According to Law No. 13 of 2003 Chapter I Article 1 Paragraph 2 states that labour is any person who is able to work in order to produce goods and services to provision their own needs as well as for society. While in Law No. 21 of years 2000 on the union/labor union defines that labor is any person who works for a wage or remuneration in another form.

Based on result of the projection of the International Labour Organization (ILO) shows that Indonesia's labor market continues to experience growth throughout 2014 and 2015, it is proved by the increasing number of employment and decrease in the number unemployment [2]. Nowedays, the Indonesian labour has increased significantly from year to year, data form Statistics Indonesia show that per August 2015 the total of Indonesian labour reach 114,82 million. If we now look at the economic theory, should Indonesia be a rich country, along with increasing the number of workers are nearly half of the total of Indonesian population.

2. Wage Trends and Level of Education

The existence of wages is the main objective of the labour in Indonesia, however, it had become one of trigger for negative action on May Day celebration, where the first demands is the increase in wages. The high incidence of low wages in Indonesia may be associated with the issue of compliance with minimum wage regulations, where 51.7% of permanent workers earned below the lowest wage required by law in February 2015 [1]. Based data from ILO show that the average of wage in Indoensia is only USD 174, and it is the lowest if compared by the main country in ASEAN (Singapore, Malaysia, Thailand) [2].

One of aspects of the competitiveness is education. In Indonesia, the most of labour are elementary school graduated. The level of education for labour shown in Table 1.

Table 1. Level of Education of Indonesian Labour

No	Level of Education	Total (Labour)
1	Not/Have not been to school	4.387.904
2	Not/Do not complete the Elementary School	14.951.112
3	**Elementary School**	**31.487.578**
4	Junior High School	20.698.644
5	Senior High School	19.813.373
6	Vocational High School	10.837.249
7	Diploma	3.086.444
8	University	9.556.895
	Total	114.819.199

Table 1. shows that the majority of Indonesian workers are an elementary school graduate (45.50%), This certainly will be affect the level of productivity and performance of the workforce.

3.   Review of Training

The existence of the company is highly dependent on the good and the bad performance of companies where in a company, that important is the quality of human resources in the company itself. The training process will be the starting point for the labor in getting an overview will act or work that should they traveled later [4]. Training

is any attempt to improve performance worker to a particular job being be responsible or a specific job to do with their work [5]. Based on the definition above can be concluded that the training is an activity carried by the company as an effort to improve the capabilities, performance and achievements of it is employees.

4.   Review of Labour Competitiveness in Indonesia

Results of research by Ari (2015) showed that the level of competitiveness in terms of labor productivity was ranked 4th (in 2012) of some of the main countries in ASEAN such as Singapore, Malaysia and Thailand [5][24]. The labour competitiveness shown in Table 2.

Table 2. Labour Competitiveness

Country	% of Productiviy	% of Education	% of Wage	Rank
Indonesia	10,003	7,02	31,57	4
Singapore	47,671	26,92	74,37	1
Malaysia	23,603	23,00	74,94	2
Thailand	15,477	16,06	41,73	3

Based on Table 2, it can be seen that the competitiveness of Indonesian workers from three aspects (productivity, education levels and wages) is still far compared with the main countries in ASEAN such as Singapore, Malaysia and Thailand. Therefore, efforts are needed to improve the competitiveness of the workforce, especially workers, is not only on three aspects but in all aspects.

Result and Discussion

The exictence of may day celebration is always colored by mass demontration and prosecuetion, like in Central Java Province, there are more than 11.000 workers were conducted tha may day celebration at Tri Juang Lomba Semarang. Based on survey and inteview on opinion of 40 workers at 1st May 2016, it is found that there are 95% of them need this program. They think that this program is the one of way to improv their skill and competitivenes, because the worker unions (company) only give the induction training. Actually, giving training is the one of company's responsibility. According to Letter No. 13 of 2013 of Training Article 10 Paragraph 3 it is said that the training is conducted in phases.

Based on survey, the responden profile in this case is classified by some group, it is the level of education, ages and gender. The level of education shown in Table 3.

Table 3. Level of Education

No	Level of Education	Total (Labour)
1	Elementary School	10
2	Junior High School	4
3	Senior High School	18
4	Vocational High School	7
5	Diploma	1
Total		**40**

[1]   [24] Ari, Sabilah. M.R. 2015. "Daya Saing Tenaga Kerja Indoenesia dalam Menghadapi Masyarakat Ekonomi ASEAN (MEA)". Jurnal Ilmu Hubungan Internasional. Vol. 3. p. 122-126.

Table 3. above shows that the average level of educational by labour or workers in Central Java province is a high school graduate or equivalent with SMA. It can be seen that graduates high school/high school is not competitive and specialized skills. The results of the interview, average of position or the occupied areas in their work have a lower position, like the packing, labeling, finishing and others. While the profil of responden based on age shown in Table 4.

Table 4. Group of Ages

No	Ages (year)	Total (Labour)
1	≤20	2
2	20 – 30	12
3	31 – 40	20
4	41 – 50	4
5	>51	1
Total		**40**

Table 7. shows that all respondents (employment and labour) are in the productive age. However, in the absence of the provision of education and training that is intensive, this has an impact on the productivity of the companies concerned. The results of the interview, showed that the training received by the workers are only given when the first work or during the training process. This is certainly an impact on quality and performance. If the provision is given intensive training, then predicted to be able to increase the competitiveness of the workers. Therefore, the need for the provision of intensive training through NOJTP. while, the profil of responden based on gender shown in Table 5.

Table 5. Group of Gender

No	Gender	Total (Labour)
1	Male	17
2	Female	23
Total		**40**

Table 5. shows that the average worker is female. This means many companies that did not experience an increase in productivity that may be caused by the existence of counter between the genders and type of work.

For example jobs destined to men actually given to women workers. In addition, if the dominance of female workers contribute to the decline in the productivity of a company, this may be because women workers have more time off than male workers.

The problem of Indonesian labor is not only about number and unemployment, but also the low quality of the workers. Therefore, it is needed preventive efforts in order to improve the competitiveness of Indonesian workers by utilizing May Day celebration. The idea of conducting National On The Job Training Program (NOJTP) may become a viable solution to solve the problem. NOJTP is a program that provides training to workers in utilizing the may day celebrations in order to improve the quality and competitiveness of Indonesian workers. According to Gomes (2002) providing on the job training will at least contribute 90% of the skill and labor competitiveness [6]. NOJTP program will be integrated with Indonesian Presidential Instruction No. 6 of 2014 on Enhancing National Competitiveness in the framework of the Asean Economic Community.

The alternative solution I suggest for the problem is providing intensive basic training on

entrepreneurship to the labor on two days each quarterly. The reason why the author recommend to providing intensive basic training, it is because the company only give the induction training (training when newly entering the workforce) to the workers (this statement is based on interview to the 40 workers), and it certainly very contrary to law number 13 of 2013, article 10, paragraph 3 explains that the job training is given in phases. It is because will affect the labor productivity in Indonesia

The training is designed interestingly and it includes challenging small competitions which involve prizes (such as giving appreciation to the best labour, exemplary labour, and others). So, the workers may have difficulties in deciding whether they want to join the training programs or street demonstrations. The program will be supervised by related parties such as the government (in this case the Ministry of Manpower of the Republic of Indonesia and the Ministry of Industry of the Republic of Indonesia), the employers and the worker union.

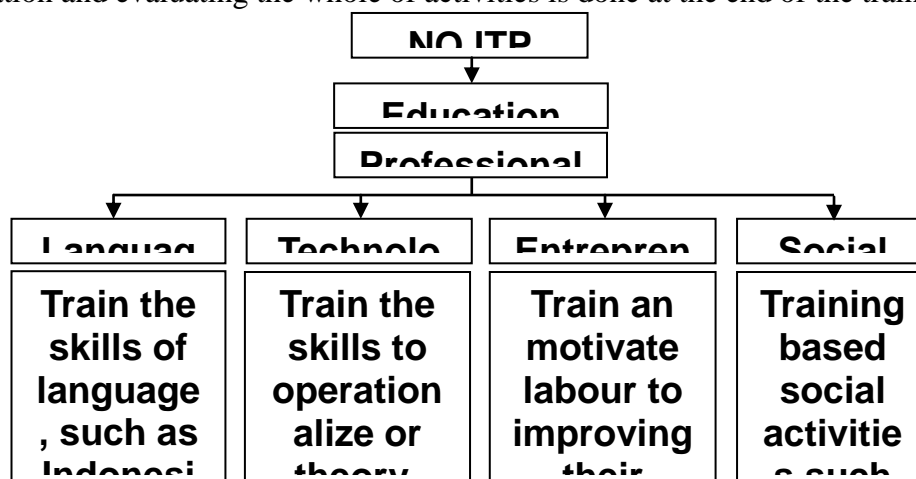
Based on survey on opinon to 40 workers in Central Java Province, it is found that 95% workers need this program. It is because the companies only give the induction training. It is means, this NOJTP program will improve their competitiveness. While 5% did not answer, 5% think that this program will disturbe their times. To run NOJTP, there are four steps to implement. First, establishing the regulations of NOJTP program; second, socializing NOJTP; third, running the training provision (such as training on language, technology and entrepreneurship) and social activities (look Figur 2); monitoring is held during the implementation and evaluating the whole of activities is done at the end of the training.


Fig. 2. Concept of NOJTP

Fig. 2. shows that the concept of this program will provide the usefulness for all parties. The process of training is given directly by the party who professionals and other parties (such as governments and competent parties in the field). The aims of this training provision are to support the professionalism on communication, to improve how to operationalize the machine or technology, improving the worker's creativity not only as labor also as an entrepreneur and to utilize celebrate the May Day celebrations with more meaningful activities. Corporate Social Responsibilities or CSR and the government are responsible for providing the funds. Some benefits of running these programs are the increases of the productivity, labor competitiveness, the spirit of entrepreneurship, also promoting the sense of social communities, reducing demonstrations, and minimizing the risk of employment termination. All seven outputs are predicted to bring Indonesian labors much better. Offering workers beneficial and motivating on the job training programs on the week of May Day celebrations will surely improve the competitiveness of Indonesian labors playing in AEC, which started in 2015.

With the skill improvement through NOJTP program, are expected to increase in average target of company's profit by 10-20%, or more increased significantly compared with the training provided before the NOJTP program.

Conclusion

The exitance of labour compete is still rare in Indonesia, it is because minimal training that given to the labour, beside it, may day celebration is always colored by mass demontration and prosecuetion. Therefore it is need the effort to reduce it. And one of way to reduce it is through NOJTP. NOJTP is a program that provides training to workers on May Day celebrations in order to improve the quality and competitiveness of Indonesian workers. The author suggest that this paper can be implemented in a broad realm, so as to improve the quality and competitiveness of the workforce that impact on increasing Indonesian labor welfare.

Abstract

Todays business environment has become extremely competitive, the ever changing economic tide, other various factors such as globalization, customers' high expectations may lead to uncertainty and unpredictability for business organizations. Business are forced to be more competitive, flexible, and scalable to drive growth and opportunity through the tight competition among other businesses. Tools enablingorganisations to become more competitive is enterprise resource planning (ERP). The benefit resulted from ERP implementation will narrow the choice for companies, from whether they need an ERP into how much will they spent on that particular solution, especialy for Small and Medium Enterprise. ERP systems are basically devided into two types, The Propetiary ERP and the Open Source ERP. The focus of this research is to investigate the flexibility in ADempiere, the Open Source ERP whith hypothesis of wetherADempiere has the flexibility to accomodate the SME needs sample and wetherADempiere can be modified without having a programing skill.

Keywords: *Enterprise Resource Planning, ERP, Flexible, Flexibility, Small and medium enterprise, business applications, information technology*

Introduction

Todaysbusiness environment has become extremely competitive, the ever changing economic tide, other various factors such as globalization, customers' high expectations may lead to uncertainty and unpredictability for business organizations. Business are forced to be more competitive, flexible, and scalable to drive growth and opportunity through the tight competition among other businesses. They need to act quickly and adapt to unexpected changes in order to achieve and maintain sustainable competitive advantages. One of the best way to do so is lying on technology adoption to strengthen the business process to be more efficient and makes decision making a lot easier, even for small and medium size business. The capacity to adapt new technologies is a strategic advantage that acts as an enabler for companies.

There are a wide variety of tools and systems that have been developed to enable organisations to become more competitive, one of these tools is enterprise resource planning (ERP). When successfully implemented ERP will bring about competitive advantages (Maguire, S., Ojiako, U. & Said, A. 2010). (Zeng, Y., Chiang, R.H.L. & Yen, D.C. 2003) andimproving company's business performance(Abdelmoniem, E.M. 2016).ERP becoming one of the most important IT initiatif and it is in its nature to bring in benefit to companies who implemented it solution. (Giovani JC, d.S., Snider, B. &Balakrishnan, J. 2013).

Some of the benefit findings in ERP implementations are, (Velcu, O. 2007)"improved service time in accounting tasks" as an internal efficiency benefit, "faster response to business change" as customer benefits, and financial benefits in terms of other improved efficiencies. Companies that have a business-led motivation perceive "economies of scale" as an internal efficiency benefit, and financial benefits in terms of "lower headcount costs" and "lower selling, general and administrative costs."(Yang, C. & Su, Y. 2009) Operational, tactical, and strategic benefits of ERP for the firm performance of Supply Chain Management in the

internal and external business processes, customer service, and cost management,(Spathis, C. &Ananiadis, J. 2005)increased flexibility in information provision, through effective monitoring and exploitation of assets and revenue-expenditure flow, and improved decision making.

The benefit resulted from ERP implementation will narrow the choice for companies, from whether they need an ERP into how much will they spent on that particular solution,especialy for Small and Medium Enterprise. ERP systems are basically devided into two types, The Propretiary ERP and the Open Source ERP. The Proprietary ERP systems, for example SAP and Oracle have long led the industry ERP and controls about 39% of the ERP software market.

Market Share
Source: Panorama Consulting (2016)

The Propretiary ERP are known to have a pricing structure of a license, annual maintenance and implementation fee. In conterary, almost all of Open Source ERP comes with free license fee, and they are providing source code and license for user to use and modify it. Some of the leading Free Open Source ERP are ADempiere, Adaxa, ERP5 and ERPNext. And there are also an Open Sorce ERP with combined GPL and commercial license, Compiere, Scipio ERP and Odoo (Kowanda, Firdaus and Pasaribu, 2015).

Open Source is a software or program where the source code is available for other developers to use, modified and given enhancements. And the product associated revenue streams is shifted toward the auxiliary products such as support, training, documentation, and others (Kowanda et.al).In this researh we will be focusing on ADempiere free open source working on a specific case on car rental SME/Start-ups

By definition, TheSmall and Medium Enterprise term according toEU definition is: "companies that employ less than 250 persons and which have an annual turnover not exceeding € 50 million euro and / or number of annual balance sheet not exceeding € 43 million". Indonesia's defition of SME, according to UU No. 20/2008 on SMEs are; productive business unit with assets up to a maximum turnover of Rp. 10 billion and Rp 50 billion per year. The next question is the free open source is flexible enough to accomodate SME needs?

Today's rapidly changing business environment means survival of the fittest. Only the most fit are the ones that are most flexible (Newcomer, B. 2004). Flexibility is the keyword that people, companies are looking for besides cost savings and efficiency. Competition had become a major factor forcing them to adjust and finding new way of doing things cheaper and faster to stay in the business.

Information System (IS) flexibility has been regarded as an important indicator of information technology success, encompassing all stages of IS implementation and usage(Chen, R., Sun, C., Helms, M.M. &Jih, W, 2009).IT flexibility have direct impacts oncompetitive advantage

(Tian, J., Wang, K., Chen, Y. & Johansson, B. 2010),and flexibility in information systems has been recognized as an important subset of flexibility in business (Fitzgerald, G. & Siddiqui, F.A. 2002). Flexible software might assist organizations in adapting systems to meet business requirement (Gallagher, K.P. & Worrell, J.L. 2008).

A flexible ERP system brings processes adaptation that support diversification strategy and ensure rapid response to changing business needs. Flexible ERP aims at delivering an open source ERP that's affordable and scalable enough to meet the unique needs of businesses. Companies need a truly adaptable and sustainable IT mechanism, since they compete with a combination of both efficient scale and business agility, and since they need to consistently capture market opportunities and execute business strategy with effectiveness(Dataquest 2013).

Research Objective

The aim of this study was to evaluate the flexibility ofaADempiereFree Open Source ERP system to acomodateCar Rental SMEs needs. The following hypotheses were identified:
1. ADempiere has the flexibility to accomodate the SME needs
2. ADempiere can be modified without having a programing skill

Methodology

This section describes the methodology used to evaluate ADempiere as the free Open Source ERP system chosen. This study is a mix of theoretical and practical hands-on research. The theoretical research focuses on doing a comprehensive review of relevant academic work in order to build a model that will be used as a basis for evaluation criteria usedin the FreeOpen Source ERP systems in the specific case in a Car rental SME.

The model for evaluating Open Source ERP system is built based on the dimension and caractheristicthat have been identified through literature and previous study. The model serves as the guiding principle. The evaluation is done by way of qualitative and self - performed after the download and install using any available guides.

Literature Study

  1. ERP Systems

    By Definition, Enterprise Resource Planning (ERP) is an enterprise level system that integrates all the business processes of an organization into a single database. ERP System enables all the departments of an organization to share and manipulate the data. ERP system has a centralized structure consisting of one single central database which can be accessed by all the departments (Batada, I. & Rahman, A. 2011), Systems integrating product that manages most of the operations in a company(Alshawi, 2004), essential tool enabling organisations to effectively process their business and manage their resources as a result of the unification of business units (Alhirz, H., &Sajeev, A. S. M. (2015), A packaged business software system that lets an organisation automate and integrate the majority of its business processes, share common data and practices across the enterprise and produce and access information in a real-time environment. The ultimate goal of an ERP system is that information must only be entered once (Marnewick, C. &Labuhagne, L. 2005).

    In terms ofERP business model there is a selection to choose from, both open source and proprietary (Klaiss, D. 2008). Proprietary ERP, lead by SAP, Oracle, and Microsoft·usualy had an expensive licenses. A rule of thumb puts them at between one-sixth and one-third of the implementation project costs. And usually need expensive hardware to run(Johansson, B. &Sudzina, F. 2008). On the other hand open source software is proving to be a credible alternative to proprietary software. When

compared to proprietary software, open source software can offer a number of benefits such as stronger customer involvement, lower costs and better quality(Bruce, G., Robson, P. &Spaven, R. 2006).Especialysuperior in meeting ease of customization (i.e., extensibility and adaptability) and cost criteria (i.e., acquisition and maintenance cost)(Benlian, A. 2011). Companies can download a free system, try, evaluate and run the demo; they allow a reduction in the license fee and certain flexibility is more difficult to be found in proprietary ERP (Kowanda et.al, 2015).

2. Advantages of Open Source ERP System

With Open Source ERP we can expect savings associated with license fees and costs are made visible and clear, transparent from the beginning of the process of integration than proprietary ERP (Valyi, 2008). In addition to cost advantages, a white paper released by Smile (a French company that specializes in implementing Open Source solutions) in 2008, Valyi (2008) noted some of the advantages of Open Source ERP:

   a) Flexibility: the source code itself are made available free of charge and thus open to be modified and developed internally.

   b) Quality: Valyi (2008) argues that the Open Source ERP is distinguished by superior quality to technical challenges.

   c) Ability to adapt to the business environment: for the proprietary ERP vendors, clients are directed to adapting business processes with the opinion that the system they have implemented best business practices. Open Source ERP system offers the possibility to adjust to the environment and business practices they do.

   d) Infrastructure Model in accordance with the SME: proprietary ERP system has a model of expensive infrastructure, charging high integration. Although trying to get in on the SME segment with a new lower-cost solutions such as for example SAP Business One. But according to Valyi (2008), the offers are still limited.

   e) There are no hidden costs: many proprietary ERP vendors attract clients by proposing a package at a price that is acceptable but the system limit for example in terms of number of users.

   f) The possibility of certain developments: proprietary ERP vendors maintain the control over the ensemble of functional modules. Specificdevelopment of the system is limited by the system flow

   g) Vendor Independence: by adopting Open Source ERP, client has a strong position to exert pressure on vendor's proactivness and support of the product can be provided by the "community".

   h) Freedom to upgrade: in adopting Open Source ERP client can choose to upgrade, either alone or with the

3. ADempiere ERP

The ADempiere project was created in September 2006 after a long running disagreement between ComPiere Inc., the developers of Compiere™, and the community that formed around that project. The community believed Compiere Inc. placed too much emphasis on the open source lock-in/commercial nature of the project, rather than the community sharing/enriching nature of the project, and after an impassioned discussion decided to split from Compiere™ giving birth to the ADempiere project (Anonim 2016).

ADempiere is licenced under GPL and its source code is widely available so it may be used, copied, modified, and redistributed. It is licensed with certain common restrictions, which generally differ from proprietary software (Anonim 2016).

ADempiere also comes with complete features, from Sales up until varous financial report.

Table 1. ADempiere Features

Features Categorization	Features List
ERP Features	Sales: Quotes to Invoice, Proposals, POS, Sales Orders, Work Orders, Invoicing, Shipment
	Purchasing: Purchase Requisition, RfQ, Purchase Order, Material Reciept, Invoicing
	Manufacturing Management: Product Life Cycle Management, Pool Resource Management, Manufacturing_Workflows, Forecast Management, Planning Management,CRP, MRP, DRP, Discrete Manufacturing,Maintenance Management, Quality Management, Costing Management
	Material Management: Inventory Control, Warehouse Management, Replenishment, Stock Movement, Stock Count, Price List, Bill of Materials
	Finance: General Ledger , Accounts Receivable, Accounts Payable, Financial Reporting, Cash Management Budgeting, VAT/TAX/IVA
	Human Resource: Payroll, Payroll Concepts, Payroll Rule Engine
	Project Management, Manufacturing, Customer Relationship Management (CRM), POS, ecommerce
	Maintenance Management
Features by ADempiere Menu (User Interface)	System Admin, Application Dictionary, Partner Relations, Quote To Invoice, Requisition to Invoice, Returns, Open Items, Material Management, Project Management, Performance Analysis, Assets, Manufacturing Management*, Human resource and Payroll*
OLAP & Reporting	Business Intelligence, Financial Reporting, Extending Reports, Exporting Reports, JasperReports
Other Features	Platform independent, Extendable, Pluggable, Touchable, Callable and Self-Installable
Features by ADempiere Menu (User Interface)	System Admin, Application Dictionary, Partner Relations, Quote To Invoice, Requisition to Invoice, Returns, Open Items, Material Management, Project Management, Performance Analysis, Assets, Manufacturing Management*, Human resource and Payroll*

Source:Anonim(2010)

In Venn and Nuffel (2013), ADempiere poses very complete features compare to other 36 Open Source ERP as stated on the table

Tabel2. Feature comparison between Open Source ERP

Product / Features	Ledger	Financial Reporting	Account Receivable	Account Payable	Multicurrency	Invoicing	Order Processing	Inventory	Purchase Order	Warehouse Management	Manufacturing/Bill of Material	Production Planning	Human Resource Management	Contact Management	Customer Relationship Management	Business Intelligence	Business Process Management	Supplier Relationship Management	Supply chain Management	Procurement	Marketing

Source: VenndanNuffel (2013) (processed)

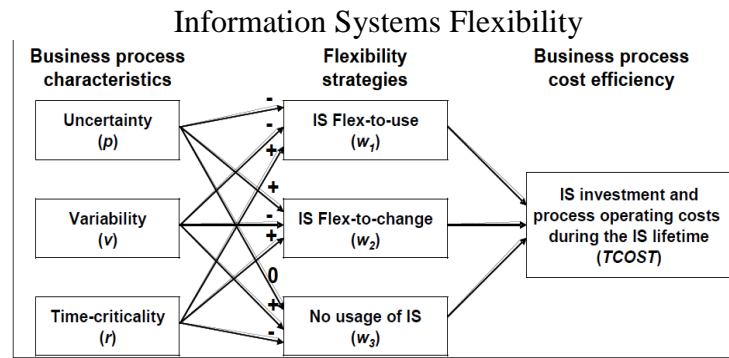
ADempiereprovides a complete framework that can be used to customize the software to suit business needs(Athena Information Solutions, 2015), and it can be used as a framework for rapid application development and its upswing(Ghatrei, S. 2013).

The Flexibility Evaluation Model
In evaluating the flexibility of FreeOpen Source ERP system in this designated case, a model implemented are including evaluation criteria from a comprehensive literature review assessing information systems flexibility
In Al-Mashari, M. (2003), Stedman, (1999) one of the major challenges in ERP adoption is flexibility assurance. The flexibility of ERP systems refers to the extent to which an ERP system may be dynamically reconfigurable to define new business models and processes. According to Jen-Her Wu & Yu-Min, W. (2006), flexibility of the ERP system is measuring ultimateuser satisfaction, and the flexibility in the system comes from the ability to connect applications together with user-defined rules, as well as the type of applications that can be connected together,"(Violino, B. 2008)
Model in evaluating ERP flexibility are using3 flexible parameter principle byNewcomer, B. (2004): First, the parameterization is flexible, meaning that it is user-definable rather than fixed. Second, new parameters can be easily defined and linked to applications or business workflow without the need to perform program modifications. Third, parameters can be set at different organizational levels, down to the lowest level possible.

1. Literature Study

According to Webster's dictionary, the termflexible is defined as'capable of responding or conforming to a changing or new situation'.

There are two types of Information Systems flexibility: (1) ISflexibility for use is the range of possibilities provided by an information system until a major change is required, and (2) Flexibility to change orthe potential adaptability for further changes of a given information systems (Gebauer&Schober, 2006);

Information Systems Flexibility


Source:Gebauer&Schober(2006)

According to Kumar, R.L. &Stylianou, A.C. 2014, based on Research by Fitzgerald (1990) and Land (1982), Techniques used for analyzing system flexibility during systems development are Flexibility Analysis and Future analysis.

Flexibility Analysis techniques

Source:Kumar, R.L. &Stylianou, A.C. 2014

In his research, flexibility is needed to anticipate, respond, or adapt to change, it is important to understand the possible sources of such change. Land (1982), and Fitzgerald (1990) suggested various types of change affecting IS. These changes include: changes in technology (hardware, software, and computing paradigms), laws, the economy, the environment, the organization (structure, policies, and strategies, processes, finances, mergers and acquisitions), the users (attitudes, expectations, tastes, and requirements), interfaces (internal and external systems, customers, suppliers), and IS personnel (skill sets, turnover). Fitzgerald argues that 'a large proportion of major changes to our IS are potentially predictable'. He suggests the use of a technique he termed 'Flexibility Analysis' to analyze the impact of such changes and take necessary action during the systems development process. He emphasizes the need for flexibility analysis despite some practical reasons why such an analysis might be difficult. These reasons, which are in effect challenges to managing IS flexibility, include management commitment, organizational politics, additional time and resource requirements, and lack of analyst/designer experience. Similar to the concept of flexibility analysis, Land (1982) suggests a technique called 'future analysis', which aims to identify 'systems features which are vulnerable to possible changes' and provides guidance in the development of flexible systems able to accommodate such changes. A risk of not

performing such an analysis, according to Land, is having inflexible systems that perform well under the current circumstances but whose performance degrades as those circumstances change. Land also describes the designer's dilemma in deciding the amount of flexibility to build into a system given the cost and development effort necessary. Characteristically, he gives the example of a real case where 'the designer is involved in a trade-off between the extra development and operational cost of designing a system which is adaptable and flexible - a very general system - or of designing a very specific system dedicated to the needs existing at the time of implementation, but which may be incapable of modification, and may have to be replaced if requirements change'. Further in Kumar, R.L. &Stylianou, A.C. (2014) concept of IS flexibility into three major categoriescontaining 10 flexibility types

IS flexibility types and categories

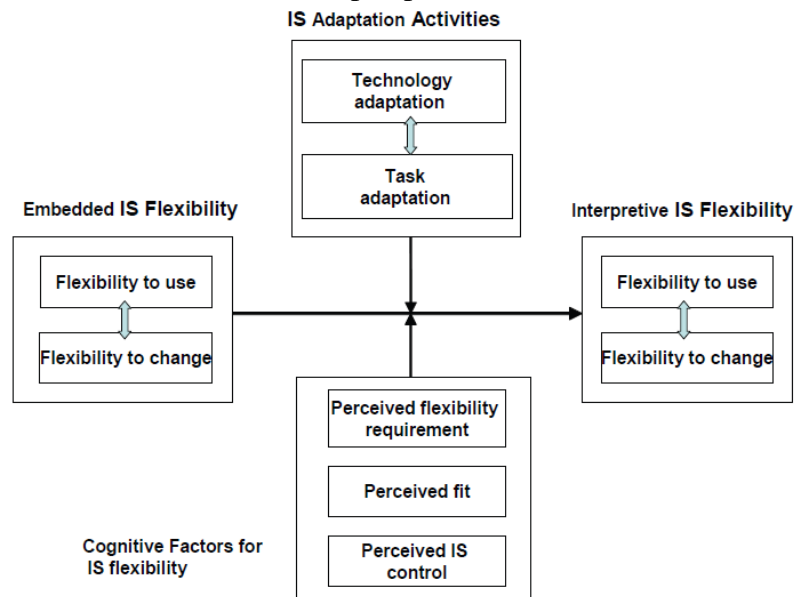
Flexibility categories	Flexibility types
Flexibility in Information Systems Operations	• *Volume flexibility* – Ability to vary the level of support and/or quantity of IS products/services (reports, data, CPU time, bandwidth, transactions, etc.). • *Operating flexibility* – Ability to meet commitments (service levels) by: (a) temporarily maintaining (in spite of negative events), (b) redistributing or (c) changing the focus, mix, role/functionality, location, or workload of IS resources. • *Input/Output flexibility* – Ability to vary the timing, content, format, location, and producers/consumers of system input and/or output. • *Integration flexibility* – Ability to efficiently access and use a variety of data formats and/or applications.
Flexibility in Information Systems & Services Development and Deployment	• *Development flexibility* – Ability to quickly and easily develop, maintain and/or redesign systems and/or services. • *New technology deployment flexibility* – Ability to quickly and effectively evaluate and deploy the appropriate new technology choices.
Flexibility in Information Systems Management	• *Financial flexibility* – Ability to reallocate financial resources among activities of the Information Systems Department. • *Sourcing flexibility* – Ability to obtain necessary IS resources from multiple sources as needed. • *Staffing flexibility* – Ability to meet commitments by maintaining, or varying the mix of existing IS personnel resources, or by hiring new resources.

Source: Kumar, R.L. &Stylianou, A.C. 2014

The roles of an IT organization can be conceptualizedas (a) the operation of existing systems to meet businessrequirements, (b) the development of systems (either newor redesign/maintenance of existing) and deployment ofnew technologies, and (c) the management of financialand human resources.

Information System (IS) flexibility has been regarded as an important indicator of information technology success. This article provides a model of IS flexibility encompassing all stages of IS implementation and usage. The model considers the cognitive factors from IS staff and users as important leveraging IS flexibility with adaptation activities.

In this research we are going to focus on analyzing information systems flexibility in terms of flexibility to change and with focus in the development stage.

A theoretical model of information system flexibility with interpretive flexibility perspective


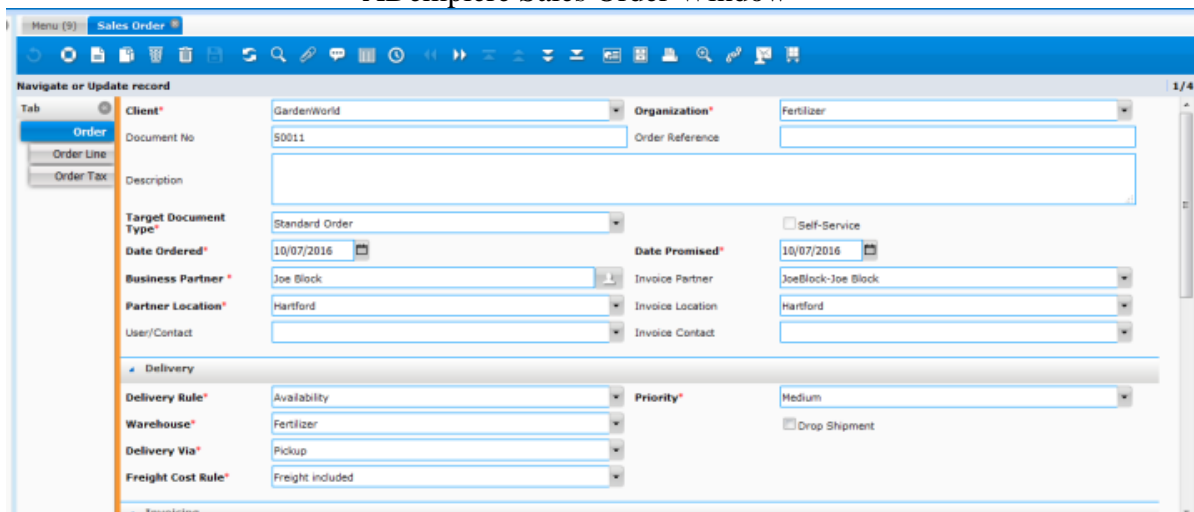
Source:Chen, R., Sun, C., Helms, M.M. &Jih, W (2009).

Results And Discussion

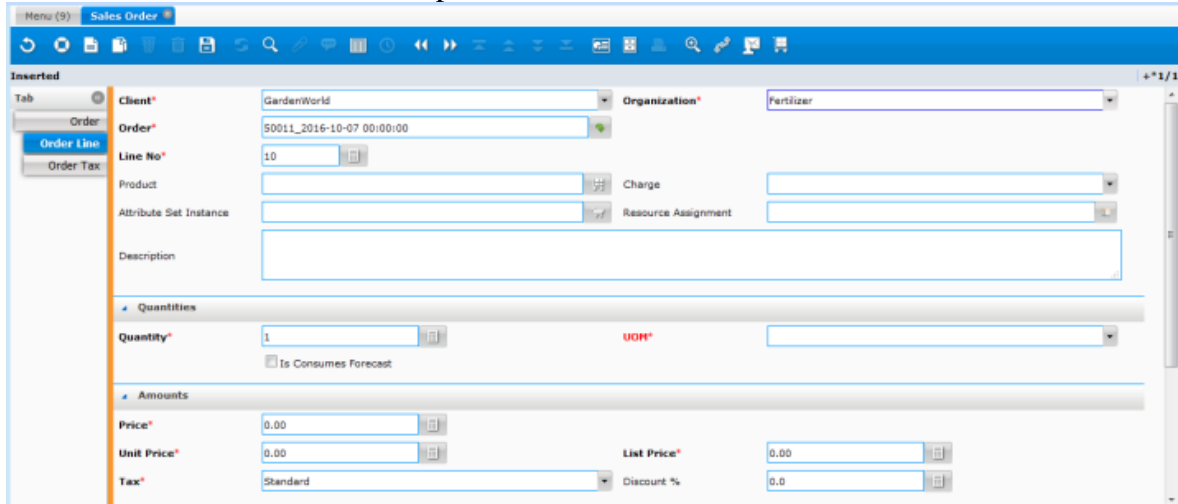
ADempiere as the free open source erpin this research is carefuly installed in an Intel® Core™ i5-2520M processor (dual-core, 2.50GHz, 3MB Cache), with 8GB RAM and 320GB HDD, ntel® Core™ i5-2520M processor (dual-core, 2.50GHz, 3MB Cache), using Windows 7 Pro, with Java 1.7, JBoss and Adempiere 3.8 and Postgress 9.1

Modification case used on this standard ADempiere ERP are on a specific business process as a sample, which is in a case of a Car Rental business Sales Order Process. In generating sales order, the car rental business needs to point out which car (asset) that are rented. The Car itself are registered in the asset module.In the basic Sales Order windows there is no field available to select which car/asset being rented.

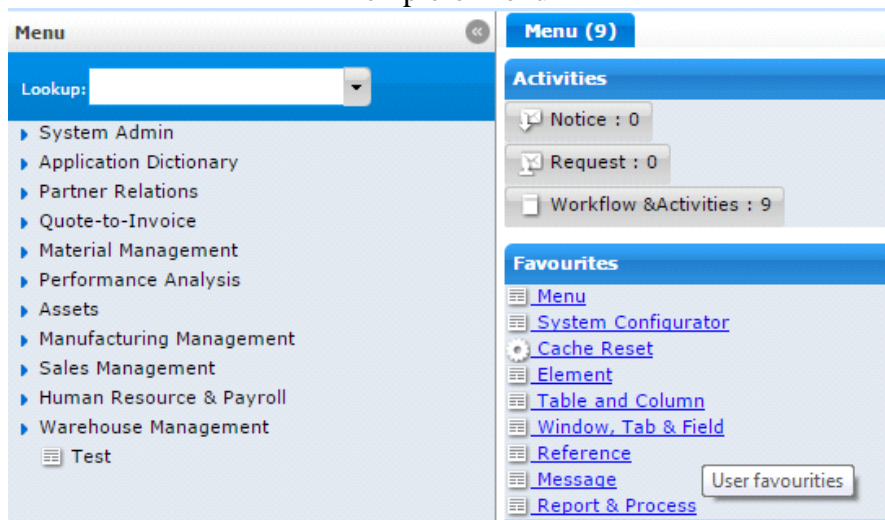
ADempiere Sales Order window is used to registered sales in the business. In the sales order window there are field to register business partner detail, delivery detail and so on.

ADempiere Sales Order Window


In the tab Sales Order Line, there is a selection of product/services used, for example in this Car Rental business it is used to registered hourly, daily, weekly or monthly car rental services. The business model requires to have a car/asset selected in the transaction

ADempiere Sales Order LineWindow


Based on that requirement there is a need to add Car/Asset field in the Sales Order Line Tab. ADempiere as stated by Athena Information Solutions (2015) and Ghatrei, S (2013) provide with a "software development" tools to configure the application.

ADempiere Menu


In the favourite menu there are "Table &Coloum" and "Windoe, Tab & Field" that allow us to configure/modify the application.

Based on the requirement the steps for creating a new "Car Rental – Sales Order" window is creating new field called Asset that integrates with Asset Module. And the steps taken in ADempiere are:

1. Idetifies table used in Asset Module and Sales Order
2. Add new coloum at Sales Order table
3. Add new field/dropdown menu ar Sales Order Window

For starter, we need to log in as system administrator so we can access the tools.

For Table Identification, we just need to acses "menu" on favorite menu and we can zoom in details over details withouth having knowledge of the database structure. We can identify the primary key by looking at a "check" sign on Table and Coloum menu to determind the Table ID that we are going to use to combine in the Sales Order screen.

To add Asset table into Sales Order line window, we can repeat the step as we identify Asset table, which is go to menu, zoom on window, chose the Tab, Chose the window we want to integrate the table with, in this case Sales Order Line, we zoom in table, and we choose Coloum in the following menu.

The process of integration is as simple as pressing add new record on the menu and we just type in the DB Coloum name that we acquired previously, A_Asset_ID, the name, description and the standard settings are already being added into Sales Order Line Window. To confirm the addition we need to press sycronizecoloum to add the created coloum on the window. The last step is create field button on previous Sales Order window that we open previously, we can even modifies the position of the coloum by modifiying the Field sequence.

Modified ADempiere Sales Order LineWindow

With this result the answer for this research hypothesis are 1. ADempiere has the flexibility to accomodate the SME needs and 2. ADempiere can be modified without having a programing skill. Using the given software development framework, the flexibility of the ADempiere is very good. This result is aligned with research by Gao, Y. & Feng, X.Z. (2012), ADempiere development frame work, providing the developer a full play in the software development. Using a framework mode in software development, "flexibility" of software development embedded in the process implementing the method. The application of this software development framework offers the possibility of fast, flexible, and "tailored" business information systems. It is the effective and efficient creation of application systems within a full-fledged strategy (Jain, R. &Chandrasekaran, A. 2009). This Prefabricated framework that can be quickly and easily customized for specific solutions. It increases flexibility by providing the ability to adapt rapidly to change while reducing costs and time to market. (Hewlett-Packard, 1997).

Conclusions, Implications, And Recommendations
Having succesfuly modified (configure) ADempiere as an ERP, without using any software development skill is quite interesting enough to see the horizon beyond that. The possibilities to develop further when goes in to the depth of the source code could be limitless.

Open Source is a software or program where the source code is available for other developers to use, modified and given enhancements. And the product associated revenue streams is

shifted toward the auxiliary products such as support, training, documentation, and others (Kowanda et.al). This result is interestingly prove that open source software, in this case ADempiere couldbe a crediblealternative to proprietary ERPsoftware. Align with research by Benlian, A. (2011), superior in meeting ease of customization (i.e., extensibility and adaptability).ADempiere software development framework also confirm Valyi (2008), which argues the Open Source ERP is distinguished by superior quality to technical challenges. The result also answer Al-Mashari, M. (2003), quoting Stedman, (1999) one of the major challenges in ERP adoption is flexibility assurance, having source code available and embedded software development framework there is a high possibilities to have a flexibility assurance.

Model in evaluating ERP flexibility are using3 flexible parameter principle byNewcomer, B. (2004): First, the parameterization is flexible, meaning that it is user-definable rather than fixed. Second, new parameters can be easily defined and linked to applications or business workflow without the need to perform program modifications. Third, parameters can be set at different organizational levels, down to the lowest level possible. Evaluating ADempiere in this research using ERP flexibility evaluation model by Newcomer, B. (2004), ADempiere have flexible parameterization, new parameters can be easily defined and linked to applications or business workflow without the need to perform program modifications. As for the third criteria as it is not part of the research, is already embedded in the standard matrix authorization menu of ADempiere.

Implications and Suggestions

Open Source ERP in this research represent by ADempiere have a good flexibility in terms of parameterizations and modification of window in the case. The possibilities to develop further more than using embedded software development framework/configuration and touching the source code could be limitless. This study concludes that ADempire could flexibly "modified" to required business needs using embedded tools. Based on the case ADempiere would be able to suit flexibly for SMEs needs. For further research, there is a lot of horizon to look into, it would still make sense to repeat this similar study for different cases and probably in different company scale/business. Another suggestion is to make a comparative study between the leading Open Source ERP and Propretiary ERP.

Abstract

In terms to enter the business in international market, company should prepare strategies that will be implemented and give the chance to strengthen company brand globally. International expansion is further step for any business, but international expansion moves must be slowly considered and well planned. This plan is important for companies that are looking for growth opportunity, acquaint company brand, and generate greater profit in international market.

For oil and gas company, one of the strategy to do their entry market is either upstream or downstream business. In this research, author will be provided analysis to do entry market in downstream business, such as gas station. Asia has numbers of developing country that suitable to be invested. Thailand is one of the developing countries in south east Asia and they provide huge opportunity to do entry market gas station.

Thailand GDP and Total Population is quite high than other Asia countries, following with the total of primary energy consumption per Capita. Apart of their GDP and primary energy consumption per capita, one of the most important variables to know to develop gas station is the number of vehicle growth. The number of vehicles increases each year followed by the growing demand of fuel product. Since there are huge opportunities to expand the international market, the Company can decide to expand its gas station business in Thailand. In order to meet its plan, the companies need to analyse the problem identification that may be occurred. In order to meet the best strategy to develop business in international market, company should be started to analyse the Thailand gas station market with SWOT analysis, IE matrix, tows matrix and Ansoff matrix. Those analysis generate strategies that suitable are market penetration, market development, and product development.

Keywords: *International Expansion, Downstream Business, Ansoff Matrix, Expansion Strategy, Thailand.*

Introduction

Thailand GNI per Capita is quite higher than another countries, include Indonesia. Thailand GNI per capita showed that the ability to buy in Thailand is also high. Supported by the data of vehicle growth in Thailand, this analysis will be completed each other with Thailand GNI per capita. As shown in Figure 1, the growth of vehicle in Thailand increase each year in each type of vehicle. Therefore, this background and opportunity will get the company to take penetrate Gas Station in Thailand.
Source: IHS, 2016

Figure 26 Number of Vehicle Growth

As shown in Figure 2 below, Thailand GDP and Total Population is quite high than other Asia countries, following with the total of primary energy consumption per Capita. Apart of their GDP and primary energy consumption per capita, one of the most important variables to know to develop gas station is the number of vehicle growth.
Source: Pertamina Highlights, 2015

Figure 27 Comparing Factor between Thailand and Indonesia

The number of vehicles increases each year shown by Figure above, followed by the growing demand of oil fuel described by Figure 4 below. Since there are huge opportunity to expand the international market, Company can decide to expand its gas station business in Thailand. In order to meet its plan, Company need to analyze the problem identification that may be occur. In order to meet the best strategy and prepare the financial posture to develop business in international market, company should started to analyze the Thailand gas station market and calculate the feasibility gas station in Thailand.

Figure 28 Demand Gasoline and Diesel

Methods

These research focuse to the strategy formulation that conducted with market analysis of variable that will related to downstream business in Thailand. This research mostly used the secondary data includes study literature as well from Thailand government and also other supporting data such as interview with related company. This research limited to determine the feasibility international expantion downstream business in Thailand.

Results and Discussion

Market Needs, Wants, and Demand is use to determine the market analysis of product. Needs is basic human requirements. Needs become wants when they are indicated to particular objects that might satisfy human needs. Wants can be shaped by society in specific place. Whereas demands are wants for particular products backed by an ability to pay (Kottler and Keller, 2009).

In this analysis, the author will evaluate about the market segment and need of gas station market in Thailand based on sales of vehicles and sales, demand, consumption of fuel using secondary data. This market understanding having purpose to know the market potential changes through macro environment that could influence market segment and market needs of gas station, as well as consumer behavior toward gas station in Thailand. Therefore, the author will be provide about the factors that will impacted toward market segment gas station in Thailand through below explanation. As shown by Figure 2.10 below, describe market share of gas station in Thailand. Those market share will indicate how much Company can grab the opportunity to take the 'others' market share of gas station in Thailand. The strong existing competitor is automatically PTT as the state-owned company in Thailand.
Source: EPPO, 2015

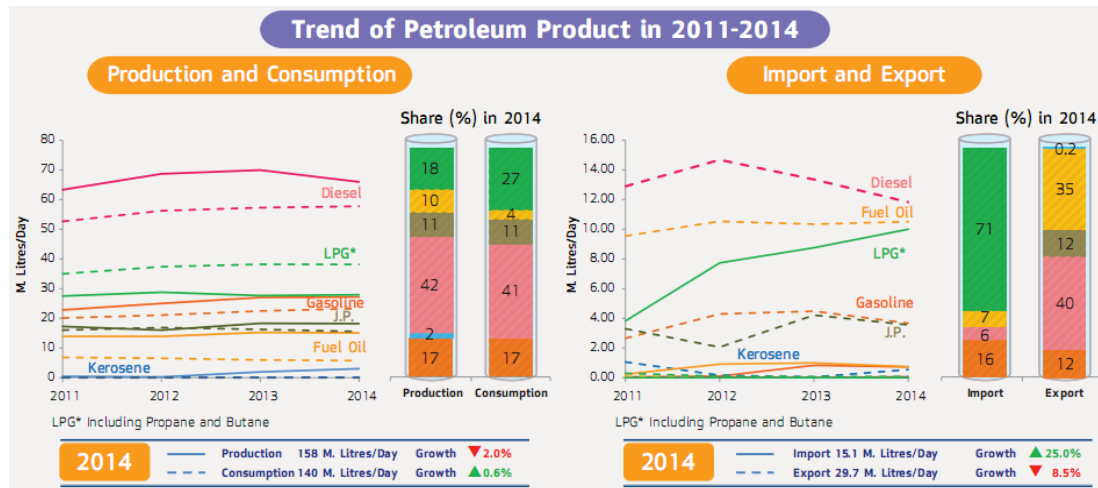
Figure 29 Market Share Gas Station in Thailand

Almost all of the gas station competitor in Thailand sold gasohol as their products, following the government regulacy. Currently, oil traders sold oil, gas, gasohol number nine persons, including the company PTT, Bangchak, Shell, Caltex, Esso, Jet TPI Petronas and Siam United Services by a number of gas stations. In this section, author provide informatin about market size and growth, market trends, and market potential. This information helps company to aware of the market analysis gas station in Thailand.

1. Market Size and Growth

   The total primary energy consumption in 2014 increased by 2.6% from that in 2013, or at a level of 2,053 thousand barrels per day (KBD) of crude oil equivalent. Oil consumption was the second largest, held share of 36%, or an increase of 0.6% shown by Table 2.10. The total primary energy production in 2014 decreased by 0.4% from that in 2013, or at a level of 1,073 thousand barrels per day (KBD) of crude oil equivalent. A total of THB 2,280 billion was spent on energy consumption, an increase of THB 58 billion or 2.6% compared to the previous year. The consumption value of petroleum products, electricity, natural gas and lignite/coal increased when compared with the 2013 level. Those information above indicate that the market growth rate of oil consumption is quite huge and it has opportunity to support company that having plan to develop gas station in Thailand.

2. Market Trends

As shown by Figure 5 below, describe picture about the fuel product consumption and production. Growth of product consumption increase 0,6%, following Diesel and gasoline product. Different from product consumption, the growth production decrease 2,0% in 2014. This figure indicate that the interest and need of fuel product is higher than production.


Source: Energy Statistics of Thailand, 2015

Figure 30 Trend of Petroleum Product in 2011 – 2014

3. Market Potential

The average consumption of gasoline in 2014 was at a level of 23.3 million litres per day or an increase of 3.7% compared with that in 2013. The consumption increased in all type of gasohol because of lower price than gasoline. Diesel consumption in 2014 was at an average of 57.8 million litres per day or an increase of 0.8%. The effect to diesel consumption was not only GDP growth, but also NGV. Since it had become a fuel substitution for diesel, this gave diesel pressure to its growth as shown by Table 2.12 The consumption increase of fuel product both gasoline and diesel support the opportunity to develop gas station.

There are competitors that has been established at Thailand. In order to enter the international market gas station in Thailand, Company should determine the competitive benchmarking analysis and competitor's marketing mix analysis. These analysis provide the analysis that will help Company to determine whether what kind of strategy include product type, price, location that will implement into Company gas station in Thailand. As shown by the Figure 6 below, the leading competitor was PTT, because PTT is the state owned-company of Thailand.

There are nine company listed in EPPO; PTT Co., Ltd, Bangchak Petroleum Public Co., Ltd, Shell, Esso (Thailand) Public Co., Ltd, Chevron Thailand, IRPC Public Co., Ltd, PTG Energy Public Co., Ltd, Siam United Service Public Co., Ltd (SUSCO), and RPCG Public Co., Ltd. Those of companies has much of gas stations spread all over area at Thailand. Each of company has different strategy to service their customer. The main focus on this section will be 4 competitors, such as PTT Co., Ltd, Bangchak Petroleum Public Co., Ltd, Esso (Thailand) Public Co., Ltd and Siam United Service Public Co., Ltd (SUSCO). Each competitor has different value proposition for the customer. Competitor's Marketing Mix Analysis.
Source: IHS, 2016

Figure 31 Competitor's Gas Station

Gas Station in Thailand sell 5 type of fuel, they are Diesel, Gasoline 91, Gasoline 95, Gasohol E20 and Gasohol E85. Company need to determine the price of fuel that will be sold with the competitive price towards another competitor. Meaning of Determination price is to determine the profit margin that will be included into the final price. Therefore, author will analyze the marketing mix of each competitor.

Each competitor has various products especially gasoline and diesel vehicle. Each competitor has differentiation strategy on its product and has specification for specific vehicle in its gas station. Competitor's value proposition is intended to all types of vehicles, specifically on gasoline and diesel vehicle. As shown by Table 1 below describes the product differentiation of gasoline and diesel product in gas station competitor.

Table 25 Competitor's Product Differentiation

Company	Product Differentiation
PTT Thailand Public Co., Ltd. **Bangchak Petroleum Public Co., Ltd.** **ESSO (Thailand) Public Co., Ltd.** **Siam United Service Public Co., Ltd.**	For this product differentiation, almost there is not differentiation among each competitor. This condition occur because of the government regulation about green technology and it cause almost all of the competitor change the products into gasohol product, mixture between gasoline and ethanol

Source: Author Analysis, 2016

As shown by Table 2 below, the competitor doesn't have quite different price among each other. From all of the products, almost all the product has the same price each other. Only the gasoline price that has different price among each other. This condition indicate that the competition among each other competitor was quite high. It also might be indicate that in Thailand, the price structure was conduct by the government. So, this condition occur because of the retail price was the same of each product.

Table 26 Competitor's Product Price

Company	Price		
Bangchak Petroleum	Gasoline 95 : THB 31.36	Gasohol E20 : THB 21.84	Gasohol 95 : THB 24.40
	Gasohol 91 :	Gasohol E85 :	Diesel : THB

	THB 23.98	THB 18.39	24.59
PTT Thailand	Gasoline 95 : THB -	Gasohol E20 : THB 21.84	Gasohol 95 : THB 24.40
	Gasohol 91 : THB 23.98	Gasohol E85 : THB 18.39	Diesel : THB 24.59
ESSO (Thailand)	Gasoline 95 : THB 31.81	Gasohol E20 : THB 21.84	Gasohol 95 : THB 24.40
	Gasohol 91 : THB 23.98	Gasohol E85 : THB -	Diesel : THB 24.59
Siam United Service	Gasoline 95 : THB 31.36	Gasohol E20 : THB 21.84	Gasohol 95 : THB 24.40
	Gasohol 91 : THB 23.98	Gasohol E85 : THB -	Diesel : THB 24.59

Source: EPPO, June 2016

As shown by Table 2.15 below, PTT has the higher number of gas station than other competitor. This condition occurs because PTT was the state-owned company of Thailand. Competitor operated their gas station into two type, they operated their owned gas station and operated by the third parties. They also provide one stop service concept to satisfy lifestyle of modern consumers. Just drop by their gas station, consumer can enjoy any other facilities, i.e. ATM Machine, convenience store, vehicle service and any other facilities.

Table 27 Competitor's Place Strategy

Company	Place Strategy
PTT Thailand Public Co., Ltd.	PTT Retail Marketing distributes refined fuels and lubricating products through PTT network of over 1,180 service stations nationwide (excluding PTT service stations run by PTT Retail Management Co.,Ltd).
Bangchak Petroleum Public Co., Ltd.	Over 76% of finished products from Bangchak's refining processes were sold through the retail network of over 1,072 stations, Of the total number, 457 were standard stations, while 615 were community stations (as of the end of December 2015).
ESSO (Thailand) Public Co., Ltd.	ESSO retail network includes 500 Esso branded retail service stations nationwide – the largest international branded network of retail service stations in Thailand. Network of Esso branded service stations includes stations operated by subsidiary, Thai-C Center Company Limited ("TCC"), and third-party dealers.
Siam United Service Public Co., Ltd.	The Company and its subsidiary companies have total scattering almost 223 petrol stations throughout the country; 72 petrol stations are operated by the Company, 66 petrol stations are leased for operation by SUSCO Retail Co., Ltd., its subsidiary company, and 79 petrol stations are permitted to be operated by dealers.

Source: Competitor Website and Annual Report, 2016

As shown by Table 2.16 below, the competitor provide attractive service to attract and promote their gas station towards their consumer. They provide the latest technology towards its product and provide comfortable service towards their consumer. They want to attract their consumer towards promotion with attractive service and product. This condition occur because they can not compete with price. It cause since government conduct the retail price of product, so that they can not generate diversiferation high margin from its product price. In order to generate more profit from consumer, they create different strategy of each competitor through their strategy promotion towards their product and gas station.

Table 28 Competitor's Promotion Strategy

Company	Promotion Strategy
PTT Thailand Public	To maximize customer satisfaction, PTT has modernized its potential service stations into the complete new look of "PTT Park" with an integration of related services offered such as retail convenient stores located in the same compound of service stations.
Bangchak Petroleum Public	Bangchak stations are positioned for selling fuels from renewable energy, namely Gasohol 91, Gasohol 95, Gasohol E20, Gasohol E85, and Hi-diesel, and are equipped with stores to provide customers with utmost convenience: Baichak Store and Lemon Green Store selling general goods.
ESSO (Thailand) Public	Esso make their promotion with deal towards third parties, i.e Tesco visa card. Esso also actively participate in safety promotion campaigns to support road safety.
Siam United Service Public	In expanding the petrol station network, the Company and its subsidiaries concentrated on the large communities in upcountry and Bangkok Metropolis. The Company and its subsidiaries provided comprehensive services in the large petrol stations in the urban area or on the main roads needing lots of fuel oils, and invested in the medium size petrol stations which gave good return by selecting the form of construction appropriate for each locality and in small petrol stations with small investments and short payback period on feeder roads connecting the districts which did not need so much oils.

Source: Author Analysis, 2016

Conclusion

Related to the market analysis above, Thailand is the suitable country to do company market entry towards its downstream business especially gas station in Thailand. This opportunity supported by the Thailand economic condition, vehicle growth demand and fuel product demand. The competitive situation among competitor should be considered before doing the market entry. Because the existing competitor has been stable and having much of numbers gas station in Thailand. Consumer also more knowing the existing competitor. Based on this condition, company should prepare the suitable and best strategy to do market entry in Thailand.

THE INFLUENCE OF *ENTREPRENEURIAL LEADERSHIP,* MOTIVATION AND DUAL ROLE CONFLICT OF BUSINESS PERFORMANCE AND ITS IMPACT ON THE SUCCESS OF WOMEN ENTREPRENEURS PANGKALPINANG CITY

Reniati, UBB, Indonesia
Khairiyansyah, UBB Indonesia

Abstract

The woman turns to give a significant contribution in moving the economy. The purpose of this research is to know and analyze the influence of *Entrepreneurial Leadership,* motivation and dual role conflict of business performance and its impact on the success of Women Entrepreneurs in the City of Pangkalpinang. This research method using descriptive approach quantitatively with the number of samples as much as 62 women entrepreneurs. Data analysis techniques using the Path Analysis is obtained from questionnaire.

The results of the study showed that the *Entrepreneurial Leadership* and motivation and achievement have positive significant impact on the performance of the business. Dual role conflict significant negative effect on the performance of the business. *Entrepreneurial Leadership ,* motivation and dual role conflict has the role of 88,9% ddalam explain business performance.

Entrepreneurial Leadership have positive significant impact on the success of the business. Now the dual role conflict and negative effect motivation significantly to Business Success. Business Success variables can be explained *Entrepreneurial Leadership ,* motivation, dual role conflict,and business performance of 99.4% . Business Performance have positive significant impact on the success of the business.

Keywords : *Entrepreneurial Leadership, Motivation, Dual Role Conflict, Business Performance and the success of Women Entrepreneurs Business.*

Introduction

a. The Background

Micro Small and Medium Enterprises (MSMES) has become the backbone of the Indonesian economy.History has proven when monetary crisis in 1998 many big business that wind mats because of the crisis. But MSMES exist and sustain the continuation of the Indonesian economy.Recorded 96% MSMES in Indonesia still survive from the shock of the crisis. The same thing also happened in the year 2012-2013, when a crisis comes and resulted in the slowing economic growth, MSMES into the business sector who rescues the Indonesian economy.

In Bangka Belitung Islands Province the number of MSMES also reached 99 percent from the existing business scale, surely this must be a special attention to the Local Government to develop economic business people. The city as the capital of Provinisi Pangkalpinang has 7 (seven) sub-districts each of which has a variety of MSMES that are registered in the district of Industry, Trade Cooperation and SMBS (City Pangkalpinang Disperindagkop). Follows the number of MSMES in the town Pangkalpinang in 2015 served on the table 1.1

As seen in the table 1.1, the number of MSMES unit producers in the city found in the sub-district Rangkui Pangkalpinang which totaled 2.708 units of the number of the next most unit is located in the sub-district Gerunggang with number of 2.168 units, third sequence there are in the sub-district Girimaya, and the sequence of the lowest level there are in the sub-district of Balam with number of 1.315 units number of micro scale business reached

3.744 units, small scale business totaled 1.613 units and the densest populations found on medium scale business as much as 7,406.18 business units.

Table 1.1 the number of MSMES Unit Based on some of the Sub-district of the City of Pangkalpinang 2015

Sub-districts	The Business Micro	The Business Small	The Business Medium-sized businesses	The number of
Bukit Intan	552	127	804	1.483
Gabek	555	146	853	1.554
Gerunggang	530	315	1.323	2.168
Grimaya	517	287	1.109	1.913
The stem Balam	497	113	891	1.315
Rangkui	562	489	1.657	2.708
Taman Sari	531	136	955	1.622
The number of	**3.744**	**1.613**	**7,406.18**	**12.763**

Source: Provincial Industry, Trade cooperatives and SMES, 2015

Research Reniati dkk (2015) shows that businesses MSMES in Bangka Island 65% dominated by women entrepreneurs with their characteristics are dominated by the young age and tingka senior high school education. The woman turns to give a significant contribution in moving the economy. Unfortunately they do not have the entrepreneurial leadership that has not been high and low achievement motivation and conflict between the jurisdiction of domestic and public high so that can impede the performance of the business and business success. Therefore this research attempts to examine the **influence of *Entrepreneurial Leadership,* motivation and dual role conflict of business performance and its impact on the success of Women Entrepreneurs Pangkalpinang City**

b. The aim of the Research

The purpose of this research is to know and analyze :

 a. The influence of entrepreneurial leadership of business performance
 b. The influence of the motivation of business performance
 c. The influence of the conflict of the dual role of business performance
 d. The contribution of the entrepreneurial leadership, motivation achievement and conflict multiple roles to the performance of the business.
 e. The influence of entrepreneurial leadership to business success
 f. The influence of the motivation of business success
 g. The influence of the conflict of the dual role of business success
 h. The influence of entrepreneurial leadership, motivation conflict double role to business success
 i. The influence of business performance to business success

Literature Study

1. Entreprenurial Leadership
 a. The definition of Entrepreneurial Leadership

According to Corbin (2007:61), *Enterpreneurial Leadership* is a leadership style that is able to delegate, able to build employees behave responsible, able to create and assign the decision, and working independently. From this understanding, visible that there is leadership on the people who have positive influence to others who worked with him and also seen in the work of the full which he has been assigned and the decision that he take.

According to Thornberry (2006:24), *Entrepreneurial Leadership* is more as entrepreneurs who usually create change from transact with another company, Because with the change will make the changes are more developed and followed market trends that apply.

According to Goosen (2007:104), *Entrepreneurial Leadership* , both individuals and organizations to create cultural *entrepreneurs* to develop entrepreneurship culture training and the completion of the merger process of *entrepreneurs* , and the new initiatives that brilliant visuals.

So it can be concluded that the *entrepreneurial leadership* is the attitude and ability of the person in the lead an organization and are able to create the changes including the new culture in the organization.

b. An important dimension in the Entrepreneurial Leadership
According to Thornberry (2006:24), there are 5 dimensions of entrepreneurial leadership, namely:

- Able reserves to motivate
  An entrepreneurial leader can motivate people to not only work correctly but also can work together in the best.
- The Visionary
  An entrepreneurial leader must be able to describe and explain about the future of the business.
- Proactiveness
  An entrepreneurial leader have a proactive in order to facing the changes of the business.
- Risk-taking
  An entrepreneur is a brave man in taking the decision.
- Persistent
  An entrepreneurial leader is able to survive in every challenge that exists and is not easy to give up on the circumstances.

2. The motivation
    a. The theory of motivation
- The hierarchy needs (*Hierarchical Theory of Need Thry*)
  The theory of motivation that is very popular is the theory of the needs of advanced by Abraham Maslow. According to Maslow that on every soul of man consists of five needs namely, needs physiologically, safe feeling, social awards, and actualisation of themselves,
- The basic pattern *Content thinking Theory*
  This theory emphasized the importance of understanding the factors that exist in the individual that caused them to behave in particular. This Theory attempts to answer questions such as the needs of what is trying to be satisfied by a person? What causes them to do something?
- The basic pattern of *Process thought Theory*

Process Theory rather than emphasize on the contents of the needs and the nature of encouragement from the needs, but this approach stresses on how and with what purpose each individual motivated to carry out its tasks with the best.

- The basic pattern *Reinforcement Thinking Theory*
  This theory does not use the concept of a motive or the process of motivation. On the contrary this theory explains how the consequences of the behavior in the past affect the actions in the future will come in a cycle of learning process. In view of this theory, individual specific behave because in the past they learn that certain behavior someone will be associated with the result that fun to others, and certain behavior will also produce a result that is not fun.

  b. The motivation dimension
     1. The needs in achieve success (*Need for achievement*)
     2. The needs of the power or the authority of the work (*Need for power*)
     3. The Needs To Affiliate (*Need for affiliation*)

3. Dual Role Conflict
  a. Understanding the Conflict
    The conflict has different meanings according to some experts namely:
- According to Scannell (2010:2), the conflict is a natural and normal that arise because of the different perceptions the purpose or value in a group of individuals.
- According to Muchlas in Sofiyanti (2011:3), the conflict is seen as the behavior of the conflict is an interactive form that occurs on an individual level, interpesonal, groups or on the levels of the organization. This conflict is especially on the individual level is very close relation with stress.
- According to the pace and Faules in Sofiyanti (2011:3), conflict is aksperesi dispute between individuals with other individuals, groups with other groups for a number of reasons. In this view the dispute shows the difference between the two or more individuals who expressed, remembered and experienced.

    So it can be concluded that the conflict is a dynamic process and its existence more regarding the perception of incompatibility purpose and the emergence of various conflict behavior among the parties or more experience and feel that other people as spoilers that potential to achieve their aims.

  b. Understanding the dual role Conflict
    There are various definitions are expressed by the experts about the dual role conflict. Including revealed Grenhouse and Beutell in Ginting (2011:45) stated that the dual role conflict is a conflict that arise as a result of the pressures from the work and family.
    According to Hennessy in Madziatul Churiyah (2005:407) then define the dual role conflict when conflicts that occur as a result from the obligation to work that interfere with the household life.
    Paden and Buchler in Simon (2007:101) define the dual role conflict is a role conflict that appears between the hope of two different role that is owned by a man. Dipekerjaan, a woman that is professional is expected to aggressively competitive, and can run its commitment to the work. In houses, women are often expected to take care of children, mercy and keep her husband.

  c. Types of dual role Conflict

Dual role conflict appears when women feel the tensions between the role of the work with the role of the family. In Triaryati Grenhaus and Beutell (2005:10) There are three kinds of dual role conflicts:

- *Time-based conflict of* time needed to run one of the demands of family or work) can reduce the time to run the demands of others (work or family).
- *Strain-based conflict* occurred under pressure from one of the role of affect the performance of the role of the other.
- *Behavior-based conflict* related to the incompatibility between the pole with the desired behavior by both parts (work or family).

d. The dimensions of the dual role Conflict

Research Reni Yuliviona (2011 : 2) states that the relationship between family and work is a two-way street, therefore the work can influence on the family and vice versa, so that the two components of the dual role conflict can be described as follows:

- FIW (*family interference with work*). Dual role conflict can appear as a result of family affairs interfere with work it means that the shape of the conflict between the role of where the demands that appears in the family interfere with the implementation of the responsibility in the work.
- WIF (*work interference with family*). Dual role conflict can appear as a result of work interferes with family affairs, this means that the form of the conflict between the role of where the demands that appears in the work of the interfere with the implementation of the responsibility in the family.

1. Business Performance

   a. The definition of Business Performance

   According to Torang (2014:74) define protocol performance (*performance*) is the quantity and or quality of the work of the individual or group within the organization in implementing the main tasks and functions are modeled on the norms of standard operating procedures, the criteria and the size of which has been assigned or that occurs in the organization.

   According to Subekhi and Jauhar (2012:19 5) , the performance is the real behavior is displayed each person as the achievements of the work that is produced by a businessman in accordance with entrepreneurs statement.

   b. Assessing Performance

   Assessing performance *(performance appraisal)* is a method of comparing the various work with the use of formal procedures and sitematis to determine a sequence of the level of the work of the work to be able to determine the performance of a person with so provide the basis for a system of fair wages. In the beginning should be held a clear distinction between the assessment of the work and assessment of employees. Assessment of the work is about the work and the task is not about a man. But the assessment of the employees is about the skills and achievements of the holders of office, to distinguish it from the assessment of the level of the level of assessment of the work.

   c. The Benefits of Assessing Performance

   The contribution of the results of the assessment is something that is very useful for the planning policies of the organization.K ebijakan organization policies can be related aspects of individual and organizational aspects. In general the benefits of assessing performance according to Furtwengler (2000) in Sinambela (2012:116) is as follows :

   - The adjustment of the adjustment of compensation

- The performance improvement
- Exercise needs and development
- Decision-making in the case of the placement of the promotion, mutation, dismissal, dismissal and labor planning
- For research interests staffing
- Help the diagnosis of the design error employees.

   d. The purpose of Performance Assessment

According to Sinambela (2012:59) demonstrates its three purposes for assessing performance that influence the rating:

- The purpose of the assessment can directly affect the assessment
- The purpose of the assessment is not directly affect the assessment, through basic cognitive process, including *obsevasi* , *encording* and calling, and
- The purpose of the assessment can affect where appraisers entering the information behavior that was considered when making *judgment* about its performance.

2. Business Success

   a. The definition of Business Success

According to Kadek Agus Suarmawan (2015:3) a successful business in the business when after a certain period of time the business has increased both in the capital expenditure, the scale of business results or spider, business type or management.

According to Hendry Faizal Noor (2007:59) revealed that business success on the fact of the matter is that the success of the business reached tujuanya. Business Success is the home of a company where all the activities that are therein is intended to achieve a success. In the general sense, success shows a better circumstances or unnggul from on the previous period. a successful business when have a advantages compared with the previous period or with the company classmates.

   b. The dimensions of Business Success

According to cashmere feel in Eva and Lia (2013:45) business success can be indicated in the five things, namely : The amount of the sales increase, Results increased production, Benefit or profit increased, Business Growth, The

Development of the fast growing business and satisfying.

In Pickle Suyanto (2010:3) in the research carried out to 97 manager of small businesses produce 5 personality characteristics that contribute to small business success, namely: Drive, Mental ability, Human relations ability, Communications ability and technical knowledge.

According to Algifari in Suyanto (2010:3) business success can be seen from the efficiency of the production process are grouped based on the efficiency of technically and economically efficiency. While Jane in Suyanto (2010:3) said that the assessment of the capacity can be measured using several dimensions namely effectiveness and efficiency equities/fairness price.

Research Method

1. Research approach

The type of research method used researchers in this research is a quantitative descriptive method. Sugiyono (2014: 81), quantitative descriptive research is the

method used to describe or analyze a research results but not used to create a broader conclusion.

Quantitative descriptive method used to explain how the influence of each of the independent variables against the dependent variables namely analyze and investigate the influence of Entrepreneurial Leadership, Motivation Achievement d s dual role Conflict Women Of Business Performance and its impact on the success of *entrepreneurs* women in the City of Pangkalpinang.

2. The population and Samples
   a. The population and Samples
      The population is a region generalisations that consists of the object/subjects that have the quality and certain characteristics specified by the researchers to learn and then drawn conclusion (Sugiono, 2014: 148). The population in this research is 7 sub-districts in the City of Pangkalpinang with number of business as much as 471 MSMES woman . The following are the data MSMES women that were in the cities Pangkalpinang.

The table III.1 Data MSMES women that were in the cities Pangkalpinang 2013

No	Name of sub-districts the	number of MSMES Unit	Number Of Samples
1	Bukit Intan	54	16
2	Gabek	58	8
3	Gerunggang	59	12
4	Taman Sari	107	10
5	Rangkui	83	7
6			4
7	Pangkalbalam Girimaya 26	84	3

Source: data processed, 2016

The sample is part of the number and characteristics which dimilki by populations (Sugiono, 2014: 149). Now the sampling method in this research using the technique is using *purposive sampling probability sampling* . Sugiono, (2013: 151) *purposive sampling* is a technique selection of samples with specific considerations (*judgment sampling*). Criteria used in the consideration of the namely:

- IKM must be owned by a woman and a family.
- IKM must have employees/workers at least 5-40 people.
- IKM must have stood for at least 2 years.

3. The technique of Data Collection
   The method used in the data collection in this research is to use the method questioner, observation, interview and bibliographical studies.

4. Data Analysis Methods
   Analysis of the data used is by using the *Path Analysis* (Analysis of the band) . Analysis of the path is the extension of the double linier regression analysis, analysis of the path is the use of multiple regression analysis to assess the relationship of causation between the variables have been assigned previously based on the theory of the arrow will show the relationship between the variables. To test the influence of the intervening variable and use the path analysis method. Interverning variable is a variable influenced by the exogenous variable and which can also affect the endogenous variable.

The Results And Discussion

1. Model regression analysis

    Multiple regression analysis model 1 (a) used to know the strength of the relationship of the free independent variables against the dependent variable . On multiple regression analysis model 1 (one) its structural equation is :

$$Y_1 = a + b_1 X_1 + b_2 X_2 + b_3 X_3 + e_1$$

Coefficients [a]

The Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	6,460	1,710		3,778	,000
The Cell	,363	,041	,714	8,818	,000
Bce	,087	,036	,195	2,392	,020
SKPG	-,122	,052	-,117	-2,368	,021

A. Dependent Variables: SKU

a. The relationship between the entrepreneurial leadership , motivation , dual role conflict with business performance

    Based on the test results above, SPSS regression equation that reflects the variables in this research is:

    $Y_1 = 6,460 + 0,363 X_1 + X_2 + -0,1220,087X_3 e_1$

    Description :

    Y_1 : Business Performance

    X_1 : *Entrepreneurial Leadership*

    X_2 : The Motivation

    X_3 : Double Role Conflict

    E_1 : A Residual

Based on the test of SPSS individual parameters, obtained the results of individual tests *Entrepreneurial Leadership* shows the value of 0,363 unstandardized beta coefficients and also significant at < 0.05 which means the ***Entrepreneurial Leadership* have positive significant impact on the performance of the business.** The results of the individual testing the motivation show *unstandardized beta coefficients* of 0,087 and also significant at < 0.05 ,which means the **motivation have positive significant impact on Business Performance** . The results of the individual testing dual role conflict shows *unstandardized beta coefficients* of -0,122 and also significant at < 0.05 ,which means the **conflict peranganda significant negative effect on the performance of the business.**

The Model Summary

The Model	R	R Square	It said the R Square	Std. The error of the Estimate
1	A ,943	,889	,883	1,270

A. Predictors: (Constant), SKPG, CELLS BCE

The results of the analysis SPSS *summary model* shows that the greatness of R *Square* is 0,889 or 88,9%. Business Performance variables can be explained by the *Entrepreneurial Leadership* , motivation and conflict multiple roles of 88,9% and 11.1% the rest is explained by other variables outside the model.

2. Multiple regression analysis Model II

   Multiple regression analysis model 2 (two) used to know the strength of the relationship of the free variable (independent) against the variables bound (dependent). On multiple regression analysis model 2 its structural equation is:

   $Y_2 = a + b_1 X_1 + b_2 X_2 + b_3 X_3 + b_4 X_4 + e_2$

Coefficients [a]

The Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	-,541	,937		-,577	,566

SKU	,324	,064	,149	5,029	,000

A. Dependent Variables: SKEP

   a. The relationship between the entrepreneurial leadership , motivation , dual role conflict , business performance d etrieve business success

   Based on the test results above, SPSS regression equation that reflects the variables in this research is: $Y_2 = -0,541 + -0,044 \, 0,985 \, X1 + X_2 + X_3 + 0,324 - 0,008 \, X_4 + e_2$

   Description :
   Y_1 : Business Performance
   Y_2 : Business Success
   X_1 : *Entrepreneurial Leadership*
   X_2 : The Motivation
   X_3 : Double Role Conflict
   E_1 : A Residual

   Based on the test of SPSS individual parameters, obtained the results of individual tests *Entrepreneurial Leadership* shows the value of 0,985 unstandardized beta coefficients and also significant at < 0.05 which means the ***Entrepreneurial Leadership* have positive significant impact on the success of the business. The** results of individual tests shows *unstandardized beta coefficients motivation* of -0,044 and also significant at < 0.05 ,which means **significant negative effect motivation to business success** . The results of the individual testing dual role conflict shows *unstandardized beta coefficients* of -0,008 and not significant on > 0.05 ,which means the **dual role conflict negative effect and not significant for the success of the business.** Test Results of individual business performance shows *unstandardized beta*

coefficients of 0,324 and also significant at < 0.05 ,which means **business performance have positive significant impact on the success of the business.**

The Model Summary

The Model	R	R Square	It said the R Square	Std. The error of the Estimate
1	A ,997	,994	,994	,623

A. Predictors: (Constant), SKU, SKPG, BCE, CELL

The results of the analysis SPSS *summary model* shows that the greatness of R *Square* is 0,994 or 99.4%. Business Success variables can be explained by the *Entrepreneurial Leadership* , motivation, dual role conflict,and business performance of 99.4% and 0.6% the rest is explained by other variables outside the model.

Intepretasi Line Analysis

Based on t tests that appear on the pictures obtained the value:

P1 = 0,363

P2= 0,087

P3=-0,122

P4= 0,985

P5=-0,044

P6=-0,008

P7=0,324

The conclusion and Suggestions

1. Conclusion

   The conclusions from this research are :
   - Entrepreneurial Leadership have positive significant impact on the performance of the business.
   - The motivation have positive significant impact on Business Performance .
   - Konflik peranganda significant negative effect on the performance of the business.
   - Entrepreneurial Leadership , motivation and conflict multiple roles of 88,9% and 11.1% the rest is explained by other variables outside the model.
   - Entrepreneurial Leadership have positive significant impact on the success of the business.

- Significant negative effect motivation to business success .
- The conflict peranganda significant negative effect on the performance of the business.
- Business Success variables can be explained by the Entrepreneurial Leadership , motivation, dual role conflict,and business performance of 99.4% and 0.6% the rest is explained by other variables outside the model.
- Analyze how the influence of business performance to business success business performance have positive significant impact on the success of the business.

2. Suggestions
   - To improve the performance of MSMES in the City Pangkalpinang, then must be improved through increased market share, capital access and central and regional government policy to increase the performance.
   - In order to improve business success MSMES so performance must be improved through entrepreneurial leadership, motivation to achievement in business and reduce the conflicts that occur in running its role as a momtrepreneur.

STRENGTHENING ENTREPRENEURIAL CHARACTER THROUGH FAMILY EDUCATION

Suyahman, Universitas Sebelas Maret, Indonesia
Email: sym_62@yahoo.com

Background

Global development has given opportunity and threat all at once to Indonesian nation. Through global development, this nation has shown its ability of taking opportunity in promoting product trading and tourism in all areas throughout world. On the other hand, through this global development as well, this nation has been exposed to multicomplex virus befalling adolescent such as free sex, individualism, egoism, reduced caring about others, reduced nationalism and patriotism, reduced independency, reduced entrepreneurial spirit, reduced mutual cooperation spirit, and other reduced characters.

Recently, many parties require the improvement of character education implementation in family education institution, in the term of both intensity and quality. Such the requirement is based on social phenomenon developing, including juvenile delinquency, massive quarrel and other moral decadence case. Even, in certain big cities, those phenomena have reached the very worrying level. For that reason, family education institution as the first and primary education institution for children character building is expected to improve its role in establishing the child personality by improving character habituation in daily life.

Education practitioners generally have a consensus on the importance of character education improving attempt in family education channel. However, there are different opinions among them regarding their education approach and mode. Regarding the approach, some practitioners recommend the use of moral education approach developed in western countries such as cognitive model development, value analysis and value clarification approaches. Some others recommend the use of traditional approach such as certain social value impartment into children through habituating it in family life.

In recent context, the implementation of character education is the uncompromising need. The nation's youths have achieved many medals in every international science Olympic competition. They need reward was the part of character education implementation. On the other hand, the cases of moral-deficient students such as those who got married by accident, involved in drug abuse, plagiarism in examination, and the similar illustrate a number of media. Not only students but also education institution and government institution occupied with those with academic degrees are exposed to moral decadence virus.

The striking reality can be analogized to a hard slapping to the nation. Stakeholders and educators formerly expected to be *ing ngarsa sung tulada, ing madya mangun karsa,* and *tut wuri handayani*, (in front gave the modal, in the middle develop the work, and behind gave urging) even cultivate sarcastic slogan: *guru kencing berdiri, murid kencing berlari* (monkey see, monkey do).

It is this environment "unhealthiness" that finally encourages the trend of homeschooling and virtual education to occur. This new education model makes the family education system more marginalized. Many student families switch to homeschooling program to give their children an education because they are worry about the effect of no longer sterile school environment. Additionally, many students experience psychological pressure in non-virtual schools due to too rigid interaction with the authoritarian teachers and inter-student intercourse. Unfortunately, virtual education does not give solution but deprives the students from their social reality contact.

This study focuses on one character value only, entrepreneurial character. This entrepreneurial character is chosen because when every adolescent has entrepreneurial character, precision, criticality, persistence, and independency will grow inside them. Those characters will contribute to dealing with global development currently. Entrepreneurial character should be built earlier not only in school education but also in society and family educations. This research focuses on entrepreneurial character through family education. The problem statement formulated is "How to strengthen the entrepreneurial character value through family education. The objective of research is to describe the strengthening of character value through family education.

Method
This study was a qualitative research departing from data and ending up in a conclusion (Bungin, 2001: 18). The target or object of research was limited to explore as much as possible data in order to prevent the widening of research object, so that the author's credibility determines the quality of research (Bungin, 2001:26). This research also interprets the author's language about the result of research obtained from informant in the field as the discourse to get explanation about the existing condition. This research also employed the descriptive type of research, the one only describing, summarizing a variety of existing condition and situation. The writer tried to explain the concrete condition of research objet and then a description of research object resulted.

This study described how to strengthen character value through family education. For that reason, the data derived from families in Wirogunan village, Kartasura Sub District, Sukoharjo Regency, Central Java Indonesia and data from the children in the same villages. For that reasons, the qualitative analysis was very appropriate for this research. This research was taken place in Wirogunan village, Kartasura Sub District, Sukoharjo Regency, Central Java Indonesia particularly concentrated on RTs (neighborhoods) considered as having the information needed. The instrument of collecting data used was questionnaire (Kountur, 2004, 113). Thus, the only instrument in qualitative was the author himself (Bungin 2001:71) because the author served as data collector affecting the instrument factor.

The informant selecting technique was the one of determining the sample called informant in qualitative research. In the qualitative research, sample was taken purposively so that it should not represent entire population, but the sample should had adequate knowledge to explain the actual condition of research object. If interview was used, the sample would be taken from some events (occurrences), while if observation was used, the sample would be taken from the result of field observation. If documentation technique was sued, the sample could be in the form of documentary material, inscription, legend, and etc (Bungin, 2001:173).

The author selected the informant by deepening the representation of entrepreneurial character education in corresponding family education to be the sample of research. The author also employed certain approaches to child and other family to obtain information that will represent those selected as the sample.

Next, the author explored deeper information to get some persons considered as adequate to be the sample of research. With original information, the author conducted observation through in-depth interviewing those selected as the sample. It was intended to test the validity of information obtained and to obtain sample and categorization certainly using interview technique. From the information and explanation obtained, it can be ensured that some persons can be the sample and their categorization can be made from both other family or children.

In obtaining the necessary data as the material of research report writing, there are some techniques, ways or method the author used corresponding to qualitative research type:

Interview, according to Lexy J. Moleong (1991: 135) is the conversation with certain purposes. In this method, the author and respondent meet face to face to get oral information in the objective of obtaining data that can explain the research problem. The author conducted observation to collect the data corresponding to the research characteristics because he conducted direct or participatory observation in which the author served as research instrument as well. Thus, the author should search for the data himself or observe and search for directly from the informants selected to be data source. In this method, the author becomes a part of any activities existing in the targeted organization. In line with this, Faisol (1990: 78) stated that in this observation method, the author selected participatory observation. Participatory observation is the one involving an individual in certain situation. It facilitates the author to obtain data or information easily and discretionarily. However, in other situations, the author serves as outsider to maintain the objectivity of data needed in solving the existing problem, because the depth of participatory observation result is highly dependent on the author's opportunity or time in the field. In some certain conditions, the author should use straightforward by explaining the purpose and the objective of research first and to facilitate the acquisition of intended data.

The data obtained was then analyzed qualitatively through data classification, data interpretation and data analysis. The descriptive analysis is presented in the form of narrative that will tell about the strengthening of entrepreneurial character value through family education.

Result and Discussion

Thomas W. Zimmerer stated that "Entrepreneurship is a product of a discipline, a systematic process of applying creativity and innovation in meeting the need and market chance. Basically, entrepreneurship is not an innate ability or field experience but it is a discipline taught and learnable. Richard Cantillon (1775) defined entrepreneurship as self-employment. An entrepreneur buys some product currently in certain price and sells it in the future in uncertain price. So this definition emphasizes on how an individual deals with risk or uncertainty. In contrast, Penrose (1963) stated that entrepreneurship activity includes identifying the opportunities in economic system, while Harvey Leibenstein (1968, 1979) argued that entrepreneurship included any activity needed to create or to operate a company when all markets have not been established or identified clearly yet, or its production function component had not been identified completely. The individual undertaking entrepreneurship activity is called entrepreneur. From some concepts above, it can be confirmed that Entrepreneurship has varying definitions among the practitioners or reference source because of different emphasis and focus.

Considering some concepts mentioned above, it can be summarized that there are 6 important essences of entrepreneurship (Suryana, 2003: 13): 1. Entrepreneurship is a value manifested in the behavior becoming the basis of resource, activator, objective, tactic, strategy, process and result (outcome) of business (Acmad Sanusi, 1994). 2. Entrepreneurship is an ability of creating something new and different (Drucker, 1959). 3. Entrepreneurship is the process of applying creativity and innovation in solving problem and finding the solution to make the life better (Zimmerer. 1996). 4. Entrepreneurship is a value needed in start-up phase and venture growth (Soeharto Prawiro, 1997). 5. Entrepreneurship is the process of working on something new (creative) and different (innovative) that is beneficial to give added-value. 6. Entrepreneurship is the attempt of creating added-value by means of combining sources through new and different ways to win the competition. Such added-value can be created by means of developing new technology, finding new knowledge, finding new way of producing

more efficient new product and service, and improving the existing product and service and finding the new way to make the consumers satisfied.

In principle, Entrepreneurship is the process of identifying, developing and bringing vision into life. The vision can be innovative idea, opportunity, and better way of undertaking something. The end product of such the process is the creation of new business established in the risky or uncertain condition. Viewed from its origins, there are there types of entrepreneur (Ir. Ciputra): 1. *Necessity Entrepreneur*, becoming the entrepreneur because of compulsion or urgency of life need.2. *Replicative Entrepreneur*, an entrepreneur tending to imitate the trending business thereby vulnerable to competition and collapse. and 3. *Innovative Entrepreneur*, the entrepreneur keep thinking creatively in seeing opportunity and improving it. Some characteristics of entrepreneurial character are summarized by Vernon a Musselman (1989:155), Wasty Sumanto (1989), and Geoffey Meredith (1989:5) as follows: 1. Strong will to stand alone. 2) Ability of taking risk. 3. Ability of learning from experience. 4. Self Motivation. 5. Competing Spirit. 6. Hard-Work orientation. 7. Self Confidence. 8. Achievement Motivation. 9. High energy level. 10. Firmness and 11. Belief in self-ability.

From some characteristics of entrepreneurial spirit, basically the entrepreneurial spirit can be created and strengthened through family education as well.

The finding of research shows that the adolescents in Wirogunan have high laziness level to be small entrepreneur because most adolescents are dependent on parents in choosing the job. There are some factors affecting it: prestige, will to live well quickly, laziness, and etc. Meanwhile, family gives the adolescents less freedom of determining the type of job they should choose, and family intervenes too deeply with their children in determining the job. It will suppress their creativity and innovativeness, thereby attenuating the entrepreneurial spirit. In such the real condition, the author interviews parents and some adolescents related to entrepreneurial spirit. It is intended to obtain valid information about adolescent entrepreneurship in Wirogunan Village, in order to be reference to find the solution.

The result of interview with parents and adolescent in Wirogunan village can be described in the table 1 below.

Table 1. Result of interview parents and adolescent in Wirogunan village about the entrepreneurial character

No.	Questions	Answers	
		Parents	Adolescents
1.	Do you understand the concept of entrepreneurial character?	Out of 20 parents, 4 answer that they understand and 16 do not understand	Out of 20 adolescents, 8 answer that they understand and 1 understand poorly
2.	If you understand, where do you acquire your knowledge on entrepreneurship?	Out of 4 parents, 4 answer that they acquire it from reading books and 1 from television	Out of 8 adolescents, 6 answer: from lesson in the school and 3 answer from reading books
3.	Do you understand the meaning of entrepreneurial character?	Out of 20 parents, 7 answer that they understand and 13 understand poorly	Out of 20 adolescents, 10 answer that they understand and 10 understand poorly
4.	In your opinion, what is the essence of	Out of 20 parents, 12	Out of 20

	entrepreneurial character?	answer: independency, creativity, innovativeness, persistence, hard work, and readiness to deal with risk and 8 answer: independency	adolescents, 10 answer: independency, creativity, innovativeness, persistence, and sturdiness, and 10 answer: not dependent on others
5.	Do your parents teach you to be an entrepreneur?		Out of 20 adolescents, 3 answer yes and 17 answer: never at all.
6.	As parent, have you ever taught your children to be entrepreneurs?	Out of 20 parents, 5 answer yes, 15 answer no because they want more prestigious job for their children's future	
7.	As parent, how do you impart entrepreneurial spirit to your children	Out of 20 parents, 15 answer: making cakes to be entrusted to stalls, inviting the children to *wedangan/HIK* (Special Kampong Meal), inviting children to go to village cooperation, and 5 answer: yes, by making small business at home	
8.	In your opinion, should the entrepreneurial spirit be strengthened by parents?	Out of 20 parents, 19 answer that it is very desirable and 1 answer: do not know.	

Considering the result of interview, the following explanations can be given:
1. Generally, the parents and the adolescent's understanding of entrepreneurial character concept in Wirogunan village are very limited, so that they do not understand the entrepreneurial character correctly.
2. Because of poor understanding on the entrepreneurial character concept, parents cannot motivate their children to develop entrepreneurial character maximally. Meanwhile, for adolescents, the poor understanding on entrepreneurial character concept makes them unaware of how to develop and to empower their potency maximally.
3. Because of parents' less motivation, the entrepreneurial character of Wirogunan adolescents is weak (poor).
4. Because of limited entrepreneurship opportunity, the entrepreneurial character of Wirogunan adolescents is low.

The result of interview is in lie with some previous studies' findings. Ruba'i (2012) studying on the correlation between parent motivation and entrepreneurial character in MAN (Islamic Senior High School) concluded that parent motivation contributes positively to growing the entrepreneurial spirit in the students of MAN. Similarly, Lena (2013) studying on the role of parents in strengthening the children's entrepreneurial character in Bandung City found that

parents play a very important role in strengthening the children's entrepreneurial character. Joko Mursitho (2015) studying on building children's entrepreneurial character through simple independent business for Senior High School students in metro found that independent business such as canteen, street sellers, vegetable vendor, and *HIK* (Special Kampong Meal) can be the means of building the entrepreneurial character.

Considering the result of research and interview, it can be confirmed that the responsibility of building entrepreneurial character lies on family as well. For that reason, there should be family motivation to grow and to strengthen the entrepreneurial character. The entrepreneurial character can be built with simple and practical models, for example through school canteen, school cooperatives, street sellers, vegetable vendors, product sellers in education exhibition, and HIK (Special Kampong Meal).

Conclusion

Considering the result of research and discussion, it can be concluded that the strengthening of adolescents' entrepreneurial character is very important in Wirogunan Village, Kartasura Sub District plays a very important role and should be strengthened through family education. Strengthening entrepreneurial character can be done through family education in the form of: small business, vegetable vendors, village cooperatives, HIK and etc.

TRAVEL BEHAVIOR AND MOTIVATION OF
EUROPEAN AND INDONESIAN INTERNATIONAL STUDENTS

Supradani Putri Nurina, Universitas Gadjah Mada, Indonesia
Yulia A.Widyaningsih, Universitas Gadjah Mada, Indonesia

Abstract

The international students represent a large and promising market for tourism industry but study on this market is limited. Previous researches found differences in travel behavior based on nationality, most of them studied students from UK, US, Australia, and China.The aim of this study is to identify European and Indonesian international students' travel behavior in the host country where they study as an international student. To achieve that, this study used mixed methods approach with qualitative interview to twenty respondents and quantitative survey to two hundred thirty two respondents. The findings showed the differencies on the importance of travel motivation and the participation of leisure activity between European and Indonesian students. This study provides better understanding on the international student market and gives strategic recommendation to target European and Indonesian students. Collaboration to create innovative initiative in tourism products and development between tourism operators, university, and the policy makers of the host country is suggested.

Keywords: *International students, European, Indonesian, travel behavior, travel motivation, travel preferences, leisure activity*

Introduction

The youth and student travel is a growing market in the travel industry that worth 20% of global international expenditure (IPK International, 2013). In 2024, there will be 3.85 million mobile international students (MacGregor, 2013). In spite of the big opportunity and the significance of this market, little research has been done on international student market. A study on their travel behavior has less attention. The majority of tourism industry in the global world still sees international student travel as a homogenous market and ignoring cultural preferences. Therefore, international student market needs further research.

According to the UNESCO Institute for Statistics' (UIS) Global Education Digest in 2006, an international student is someone who has left his or her country, or territory of origin, and moved to another country or territory with the singular objective of studying but not permanent residents (Clark, 2009). Besides full-time students, exchange student could also be categorized as an international student. Exchange student is someone who studies at an overseas university with transfer credit to the home university, usually for a period of one semester or one year (Llewellyn-Smith and McCabe, 2008).

While the opportunities on student travel market are growing, there is lack of understanding on travel behavior of international student travel market from different nationality. As each individual has unique motivation and preferences, international students display different travel behavior. Previous researches found differences in travel behavior based on nationality, most of them studied students from UK, US, Australia, and China. It showed that every nationality has a unique behavior that requires adapted marketing mix strategies and communication channels.

Indonesia is a potential student source of global student travel in the future and Europe is a potential student source for Indonesian universities and tourism market. They are source of potential present and future income for tourism industry. Thus, an understanding of travel

behavior of the next Indonesian and European generation will benefit tour operators and tourism business on this market. The aim of this research is to identify international student's behavior in the country where they study and the differences between European students in Indonesia and Indonesian students in Europe on travel motivation, preferences, and leisure activity.

Literature Review

1. Travel Motivation

   Motivation is the fundamental starting point in studying travel behavior, why and how individuals make travel decisions to preferred destinations (Kim, Jogaratnam, and Noh., 2006; Heung and Leong, 2006; Hawkins and Mothersbaugh, 2013, p. 352). Since travelers are diverse and have a wide range of motivation which is influenced by many factors and may change over time based on individual's travel experiences, it would be best explained not by only one static models. Concept from Maslow's Theory of Need Hierarchy, Travel Career Ladder (TCL) and Travel Career Patterns (TCP), Push and Pull Factors, Plog's Psychocentric-Allocentric Models, and a categeorization of travel motivations from previous researches were used.

   There are five different levels of motivation from physiological needs, safety, belongingness and love, esteem, to self-actualization by Maslow (Hsu and Huang, 2008). TCL model was developed from Maslow's Need Herarchy Theory then modified into TCP that emphasized the pattern of motivations and its structure by Pearce and Lee (2005). Novelty, escape/relax, relationship, and self-development were mentioned as the core of travel motivation that remain dominant and constant along with the travel experience level. However, as the travel career level develops and the experience increases, travelers' dominant motivation may change.

   Tourist are motivated by a combination of push and pull factors (Klenosky, 2002; Uysal, Lee, and Turk, 2008).The concept describes individuals are pushed by internal motives or forces, into making a travel decisionand how they are pulled or attracted by external forces, which are the destination attributes.The pull factors of destination can be driven by multiple motivations (Klenosky, 2002). Stanley Plog's model of psychocentric/allocentric implies the existing interaction between push and pull factors in travel behavior by classifying tourist based on personality (as cited in Hsu and Huang, 2008).

   Several researchers developed classifications in an attempt to standardize measures of leisure motivation into some dimensions. Beard and Ragheb developed Leisure Motivation Scale (LMS) that classify tourist's intrinsic motivation into four elements which are "intellectual, social, competence-mastery, and stimulus-avoidance" (Ryan and Glendon, 1998). McIntosh, Goeldner and Ritchie divided motivation into four categories, "physical, cultural, interpersonal, status and prestige" motivators (Cooper *et al.,* 2005). Other researchers combined the motive items obtained from the previous tourism and leisure literature and the interview results (Kim and Jogaratnam, 2003; Pearce and Lee, 2005). Even though those results were not identical, they showed common important top main motivation such as "novelty", "escape/relax", "relationship", and "self-development".

   International students' top motivations to travel during study abroad are related to culture, social interaction with locals or friends, relaxation, and increasing knowledge (Field, 1999; Richards and Wilson, 2004; Payne, 2009). Besides similarities, there are differences between different nationalities and cultural background. Most of European students rated high importance on discovering new places, culture (Horak and Weber, 2000; Bicikova, 2014) and adventurous motivation. Chinese and other Asian students rated higher

importance on seeing famous sights (Kim and Jogaratnam, 2002; Xu, Morgan, and Song, 2009) and relaxation motivation (Heung and Leong, 2006).

H1: There is difference on motivation between European students in Indonesia and Indonesian students in Europe.

2. Travel Behavior

Travel behavior shows how tourists behave before, during and after travelling towards the destination and tourism products(Vuuren and Slabbert, 2011). An understanding on travel behavior will benefit tour operators and tourism business on this market in making marketing strategy, product planning, and product development which can increase the number of visitors to the destination.They will get information about what kind of activities tourist wants to undertake, with whom and where those activities are being undertaken, and how tourist makes a decision to buy the product and service.

In the travel decision-making process, travel desire is followed by searching for information then followed by choosing the final destination including other important aspects that determine the potential tourist for future trip decision (Minciu and Moisa, 2009). Analyzing tourist behavior starts with individual's characteristics that lead to understanding travel motivation and perception on destination as the consideration to make a decision. Activity, as one of critical destination attributes to satisfy tourist's needs, connects travel motivation and destination choice (Moscardo *et al*., 1995). In order to create the most suitable product development and campaign programmes, tourism marketers should understand the leisure activity preferences and the actual participation in the destination.

Previous research on student travel behavior found that students not only have similarities but also differences in planning the trip, choosing different attractions, information source, trip features, preferred activities, type of accommodation, mode of transport, and type of meals during leisure trip (Field, 1999; Kim and Jogaratnam, 2003; Payne, 2009; Xu, Morgan, and Moital, 2011). Most of international students enjoyed city and culture-based activity (Shoham *et al.,* 2004) and socially satisfying activity (Richards and Wilson, 2003). European and Asian students showed differences in choosing leisure activity during their trip. Asians put more importance on relaxation activities and seeing famous sights than Europeans who prefer to participate in outdoor and adventurous activities. The nationalities, the study place, and the travel destination influenced the way student travel during their study period.

H2: There is difference on leisure activity between European students in Indonesia and Indonesian students in Europe.

Research Methods

1. Research Design Methods

This study adopted a mixed methods approach, by conducting a qualitative study prior to the quantitative one. The rationale for this approach is to provide a more complete understanding of a research problem. The qualitative phase used semi-structured interview to collect data and aimed to explore emerging themes in travel behavior and motivation using thematic analysis. The result of qualitative interview and literature review were used to develop questionnaire items (Davidson *et al.,* 2010; Gardiner *et al.,* 2013). For interviewee validation, researcher asked two interviewees, one Indonesian and one European, to give feedback on both the preliminary list of themes and interpretations as a reliability check.The quantitative phase using self-administered surveys aimed to measure and tests the differences between European and Indonesian students (You *et al.,* 2000; Kozak, 2002; Xu, Morgan, and Song, 2009; Wang and Walker; 2010).

The interviewee's result showed a link between motivation and activity preferences. Some of interviewee's statements supporting Maslow's theory that one act has multiple motivations. They were motivated by a combination of push and pull factors. Push factor as internal motivation while pull factor as activity in the destination choice.The resultsshowed not only the difference travel motivation between European and Indonesian students but also an explanation that motivation might change because of their travel experience.

In the qualitative phase, the thematic analysis found four emerging themes divided into two stages, which were before travel and during travel. First stage has two themes which were travel motivation divided into 4 main dimensions (novelty, relax/escape, social/relationship, and self-development) and planning on trip features such as travel constraints, travel time, travel companions, expenditures, and destination. Second stage wasthe activity in the destination choice and travel preferences such as mode of transport, accommodation, and food. The interview result was used to develop questionnaire items. The questionnaire used 12 leisure activity items and 14 motivational items derived from interview results and literature review. The items was initially subject to expert opinion to establish validity.

2. Sample

A purposive sample was used by choosing respondents with specific criteria. They are European students who study in Indonesia and Indonesian students who study in European countries in the year between 2013-2014. The quantitative survey with questionnaire was submitted by email which has a link to a web-based survey to European students in Indonesia and Indonesian students in Austria, Germany, Netherlands, Sweden, and UK between December 2014 to February 2015. There were 232usable questionnaires (82 European and 150 Indonesian) which were analyzed using Statistical Package for Social Sciences (SPSS) version 17.

3. Data Analysis Mehods

This study used descriptive analysis using frequency tables and percentage to provide data in European and Indonesian student's profile and travel behavior on trip features.To identify the travel preference between students in the destination choice, this study used mean value. In order to determine if any significant differences between European and Indonesian students related to leisure activity and travel motivation and leisure activity, independent t-test was performed between nationalities as the independent variable and motivation/leisure activity as dependent variable. The p-value was used to test the null hypothesis.

Results And Discussion

1. Sample Profile

From 232 respondents, there were 82 European respondents and 150 Indonesian respondents consisted of 103 male students and 129 female students. Most of them were graduate students and exchange students in a group of age between 20 to 30 years old with main financial source from scholarship and family/parents. Table 1 presents the profile of European and Indonesian students group in frequency and percentage.

Table 1. Profile of Samples

Profile	European (n=82)	Indonesian (n=150)	Total (n=232)	Percentage (%)
Gender				
Male	43	60	103	44.4
Female	39	90	129	55.6
Age				
Less than 20	-	2	2	0.9
20 to 22	25	24	49	21.1
23 to 25	34	39	73	31.5
26 to 30	20	56	76	32.8
Over 30	3	29	32	13.8
Program of Study

Scholarship	23	57	80	34.5
Loan	3	1	4	1.7
Income from working	5	28	33	14.2

2. Travel Behaviors on Trip Features

Almost all the respondents (97.4%) plan to travel during study in the host country. The results supported previous studies (Field, 1999; Kim and Jogaratnam, 2003; Michael *et al.,* 2004; Richards and Wilson, 2004; Heung and Leong, 2006). Students visit important tourist sites while studying abroad to take better advantage of the limited time abroad. The preference to travel in a group with other international students (69.4%) and particularly from the same nationalitysupported previous studies (Horak and Weber, 2000; Shoham *et al.*, 2004; Davidson *et al.*, 2010; Gardiner, King, and Wilkins; 2013).Most respondents traveled during semester break and holidays (66.8%), with travel duration between 1 to 6 nights (72.4%). It showed the need to balance between travel and study in their limited time.

Internet (91.4%), advice from friends and family (65.1%), and guidebooks (31.9%) were their important sources of information. The high use of advice from friends/family as main information sourceindicated that students chose familiar or considerably safe travel destinations. It can be categorized as psychocentric/dependables characteristic in Plog's model.Time (34.1%) and cost (36.2%) as the main travel constraints for students supported previous studies (Field, 1999; Michael, *et al.*, 2004; Ryan & Zhang, 2007; Nyaupane and Andereck, 2008; Payne, 2009).Table 1 presents overall student's travel behavior on trip features in frequency and percentage.

Table 2. Overall Students's Travel Behavior on Trip Features

Travel Behavior on Trip Features	Total (n=232)	Percentage (%)
Plan to travel

3. Travel Motivation

Table 3 shows significant difference between European and Indonesian students in most of the motivation items (with $p<0.05$), except on motivation to discover new things/new places, to learn something new or increase knowledge, to have fun and be entertained, to

experience a new culture and history, and to visit a place recommended by friends (with p>0.05). The high rate on motivation to discover new things/places and to learn something new/increase knowedge supports previous studies (Field, 1999; Richards and Wilson 2004; Payne, 2009) and confirms the importance of the novelty factors (Kim and Jogaratnam 2003; Pearce and Lee, 2005). The positive t-values mean that European students have higher mean scores than Indonesian students.

Table 3. The Differences in the Importance of Travel Motivation

Travel Motivation[a]	Europe Mean (rank), n=82	Indonesia Mean (rank), n=150	t-value	Sig. Level
To discover new things or new places	4.45 (1)	4.21 (1)	1.825	0.069
	4.06 (3)	4.11 (2)	-0.394	0.694
To learn something new or increase knowledge	3.63 (7)	4.10 (3)	-3.116	**0.002**[**]
	3.95 (5)	4.01 (4)	-0.487	0.627
To relax after my studies	4.24 (2)	4.01 (6)	1.691	0.092
To have fun and be entertained	3.52 (8)	4.00 (5)	-3.221	**0.002**[**]
To experience a new culture and history	3.30 (10)	3.69 (7)	-2.405	**0.017**[**]
	3.12 (12)	3.53 (8)	-2.670	[*]
To see famous sights	4.00 (4)	3.30 (9)	4.825	**0.008**[**]
To escape from everyday routines	3.10 (13)	3.14 (10)	-0.299	**0.000**[*]
To do things with my friends relatives or family	3.76 (6)	3.09 (11)	4.270	0.765
	2.70 (14)	3.04 (12)	-2,296	**0.000**[*]
To do things the locals do	3.45 (9)	2.97 (13)	2.995	**0.023**[**]
To visit a place recommended by friends	3.24 (11)	2.49 (14)	4.531	[*]
				0.003[**]
To interact with local residents				**0.000**[*]
To visit my friends, relatives, or family				
To meet new people and the locals				
To do outdoor/sports activity				

[a] Importance of each variable was measured using a five-point Likert scale (1= not important at all, 5= highly important), [*]*p<0.001,* [**]*p<0.01,* [***]*p<0.05*

European students (Mean=4.00, 3.76 respectively) put more importance on motivation to do things the locals do (p= 0.000) and to interact with local residents (p=0.000) as very important motivation compared to Indonesian students (Mean=3.23, and 3.07 respectively). It confirms the importance of self-development dimension in travel motivation. Indonesian students (Mean=4.10, 4.00, 3.69, and 3.53 respectively) put more importance on motivation to relax after study (p=0.002), to see famous sights (p=0.002), to escape from everyday routines (p=0.017), and to do things with friends, relatives, or family (p=0.008) as very important motivation compared to European students (Mean= 3.63, 3.52, 3.30, and 3.12 respectively). It confirms the importance of social/relationship and relax/escape dimension on travel motivation. From these findings, tourism operators can create marketing strategies that emphasize on student's needwith nationality basis.

From result, the first hypothesis (H₁) is supported because there are many statistically significant differences (with p<0.05) on travel motivation between European and Indonesian students. Travel motivations between European and Indonesian students

confirms the motivational theories in the literature review. Travel can be seen as self-actualization needs, to discover new things/places, to experience new culture, gain knowledge, to meet new people, and to interact with the local residents. The motivation to be free and escape from everyday routines can be seen as the esteem needs. The motivation to visit place recommended by friends and to do things with friends/family implies the safety needs in Maslow's hierarchy of needs.

4. Travel Preference and Leisure Activity

Using mean value, there were differences on the type of accommodation, transportation modes, and meals between students (Table 4). In Indonesia, European student used motorcycle and plane frequently (Mean=4.02 and 3.58 respectively) and boat/ship (2.55) sometimes. They preferred to stay in homestay/guesthouse and hostel/dorms (Mean=3.30 and 3.00 respectively). Indonesian students used train frequently (Mean=4.21), bus and plane (Mean= 3.46 and 3.26 respectively) sometimes. In European countries, they preferred to stay in house of friends/relatives and hostel/dorms (Mean=3.17 and 3.15 respectively). Local style food was the most popular type of meals among European students (Mean=4.28) and Indonesian students (Mean=3.27).

Table 4. Travel Preferences of European and Indonesian Students

Travel Preferences	European Mean (rank), n=82	Indonesian Mean (rank), n=150
Transportation Modes		
Motorcycle	4.02 (1)	1.06
Car (rented and private)	2.62 (3)	1.73
Bus	2.56	3.46 (2)
Van	1.61	1.19
Train	2.07	4.15 (1)
Plane	3.58 (2)	3.26 (3)
Boat/Ship	2.55	1.65
Type of Accommodation		
Hotel/Motel	2.78 (3)	2.83 (3)
House of friends/relatives	2.21	3.17 (2)
Hostel/Dorms	3.00 (2)	3.15 (1)
Campground	1.18	1.26
Homestay/Guesthouse	3.30 (1)	1.63
Self-catering accommodation	1.74	1.79
Type of Meals		
Formal restaurant	3.01 (2)	2.30
International fast-food	2.48	3.20 (2)
Local style	4.28 (1)	3.27 (1)
Self-prepared	1.84	2.65
Convenience Stores	2.60 (3)	2.93 (3)
Deli/Supermarket	2.13	2.77

Table 5 shows the preference of leisure activity which was grouped by response mean for frequency of participation by Indonesian students into frequently (3.5 and higher), sometimes (2.5 to 3.49), rarely (1.5 to 2.49), and never (under 1.5). Using independent t-

test, almost all the leisure activities showed statistical significant difference between European and Indonesian students (with p<0.01) except visiting historical monuments and cultural sites and attending festivals and events. Both groups were frequently taking pictures/video (p=0.009) and visiting place with beautiful scenery and landscape (p=0.001) during travel. Indonesian students far more interested in city sightseeing (Mean=4.51), visiting museums/theaters (Mean=3.38), and shopping (Mean=3.22) compared to European students. European far more interested in activities such as trying local foods and drinks (Mean=4.17), hanging out on the beach (3.76), trekking/hiking/climbing (Mean=3.26), doing sports/physical activities (Mean=3.07), doing nightlife and entertainment activities (3.07) compared to Indonesian students. Because there are many differences in the participation of leisure activities, the second hypothesis (H_2) is supported.

Table 5. The Difference on Leisure Activity Preference of European and Indonesian Students

Preference of Leisure Activities[a]	Europe Mean (rank), n=82	Indonesia Mean (rank), n=150	t-value	Sig. level
Frequently				
City Sightseeing	3.94 (3)	4.51 (1)	-4.027	**0.000**[*]

	3.07 (9)	1.07 (12)	6.913	**0.000**[*]
Never				
Doing sport/physical activities				

[a] Frequency of each variable was measured using a five-point Likert scale (1= Never, 5= Almost always), [*]*p<0.001,* [**]*p<0.01*

International students from different nationalities shows similarities and difference in choosing modes of transport, accommodation type, type of meals, and leisure activities during travel in the host country they study. These findings supported previous study on travel preferences (Field, 1999; Kim and Jogaratnam, 2003; Shoham *et al.,* 2004; Payne, 2009; Xu, Morgan, and Song, 2009) and supported the notion that activity connects tourist motivation and destination choice (Moscardo *et al.,* 1995*)*. It is very important for

marketers to focus on strategy to attract international student market with complete information about "what to do" and "what to see" in the country's destination.

Conclusions, Limitations, And Implications

1. Conclusions

    As a young traveler, international students show similar travel behavior in the host country. They are likely to travel with other international students from same or other nationalities. The use of internet as popular information source shows international students are a technology savvy. The most important motivation, "to discover new things or new places", shows that international students are likely more adventurous than general tourist. They are also more likely to be involved socially with local culture and people. The preference in choosing local-style meals shows that students often avoid large chains and, instead, spend their money directly with local business.

    Returning to the initial hypothesis, the results confirm that European and Indonesian students have different motivations and travel preferences in leisure activity. Each nationality should be viewed differently. However, these behaviors may vary because of market conditions and cultural factors. The differences will change as the economical situation of the destination country grows and foreign travel becomes more common. International student's travel career also gives influence on how they travel in the future. The result of this study confirmed previous studies' views that the global student market is not a homogenous group (Richards and Wilson, 2003; Kim and Jogaratnam, 2003). It contributes to the effort in understanding travel preferences and behavior of international student travel market, especially European and Indonesian students market. Tour operators and marketers can use the findings into their strategy because every nationality has a unique behavior that requires adapted marketing strategies and communication channels.

2. Limitations

    There are three main limitations which suggest that the findings should be viewed with caution from the number of sample, the length of study period, and the impact of location. This research only studied two nationalities (European and Indonesian) in two different regions (Europe and Indonesia). The number of sample from European was small (n=82) from 14 countries and did not cover all European student nationalities in Indonesia. The sample for Indonesian respondents was only students from five countries in Europe, which were Austria, Germany, Netherlands, Sweden, and UK. Therefore, the results is not a representative of the population of international students, specifically European students in Indonesia and Indonesian students in Europe but can be treated as further research material. The length of study period in the host country might influence the way students travel. They might travel as a resident, not a visitor anymore. European countries and Indonesia have varied level and qualities in travel mechanism and destinations. They have different topography and cultures so the result cannot be generalized to all international students' population. Further research about international students in same specific region is needed.

3. Implications

    Student travel market is a niche market that needs to be further developed. International students not only gain self-benefit from their experience but also give benefit to the host country. The implication of the findings can be categorized into three important

stakeholders, which are the host university, the host country, and tourism destination. Recommendations for each stakeholder are included.

1. International students affair in host university can create programmes and services to help students adapt easily such as buddy network, orientation program, assistance in sourcing and the availability of accommodation and sporting clubs. A country and university can employ outgoing students as an ambassador for tourism and university promotion.

2. Host country should provide an easy infomation access on student visa, student housing, student transportation information, and student bank account.

3. Tourism operators can create tour packages for international student market to some destinations that suit student's needs.These packages can offer basic or top-up package tours that include accommodation, tasting local meals, transportation and offer reasonable price with wider range of leisure activity arrangements. To minimize the barriers to travel in time, the travel itinerary should be more flexible. To target different market, tourism marketers should provide information that illustrates their preference and most important motivation for the advertising campaigns.The main leisure activity that needs to be included are exploring and experiencing new things. The main motivations need to be emphasized are novelty, social/relationship, relax/escape, and self-development.

   For European student market in Indonesia, tourism marketers should emphasize more on cultural immersion. The activities should be focused more on cultural and outdoor/sports activities (e.g., surfing class and trip, diving course and trip, hop on and hop off islands with snorkeling, bicycle tour to villages, jungle trekking, volcanoes hiking, temple tour). Tour operators could create student package with longer trip period, provide accommodation that involve cultural immersion to local people, such as homestay and public transportation, and offer local guide.

   For Indonesian student market in Europe, tourism marketers should emphasize on famous destinations and learning experiences. Indonesian student shows similar travel behavior like other Asian students that focus more on doing things with friends and family, cultural exploration, and relaxation activities. Tour operators should focus on group travel with shorter period of travel (e.g., multi day or extended tours, day tour, and excursions) and give special deals or discounts. Thematic–based tour packages that may suit with the needs of Indonesian students are shopping experience tour, historical and heritage tour, tour with scenic landscape destinations, and relaxation (e.g., thermal bath and spa tour).

ANALYSIS OF LOCAL COMMUNITY PERCEPTION TOWARDS SUSTAINABLE TOURISM DEVELOPMENT CONCEPT WITH TRIPLE BUTTOM LINE APPROACH AT BUKITTINGGI, WEST SUMATERA

Verinita, Andalas University, Indonesia

Abstract

The research is motivated by the fact that the current tourism industry is one sector that is rapidly growing in the era of the global economy . But tourism that promotes mass tourism will give a negative impact to the environmental balance . Bukittinggi as a destination for major tourist destination in West Sumatra is feared will cause a negative impact as well as Bali when it is not immediately administered to the concept of Sustainable Tourism Development through Triple Buttom Line Approach. Research in order to assess the perception local community towards Sustainable Tourism Development Concept at Bukittinggi. The results showed that among the three aspects were analyzed , namely the economic, environmental and social aspects , then the highest ratings given by respondents to the environmental aspect. But social aspects show the lowest ratings of the three aspects. Therefore, the local government of Bukittinggi should focus on city tourism development to environmental empowerment programs that involve the active participation of the local community in the town of Bukittinggi. This type of research is explanatory research . The research used a questionnaire to 195 local community who stayed in Bukittinggi. The sampling technique is purposive sampling with a cross-sectional coverage that reflects a picture of a situation in Juni-August 2016. The unit of analysis is the local communites of Bukittinggi . The analysis tool is using the frequency distribution .

Key words: *Sustainable Tourism Development Concept, Triple Buttom Line, Local communit*

Introduction
1. Research Background

   The tourism industry is one sector that is rapidly growing in the era of the global economy and become one of the foreign exchange earnings of non oil and gas in Indonesia's third largest. According to the Ministry of Tourism and Creative Economy in October 2015 tourist arrivals reached 6.27 million, this figure has increased by 8.65% from the previous month. In addition to providing foreign exchange contribution to the country's tourism sector which is not vulnerable to the crisis, potentially a seat belt at the time of the national economy of the global economic slowdown due to the global economic crisis. This is because Indonesia has natural resources, human and culture is very rich, so that Indonesia has a unique comparative advantage as a tourist destination.

   When masiv tourism development takes place, do not walk in a focused and comprehensive will encourage the paradox, as happened in Bali. Inability to keep pace with the environment in the physical development of tourism led to a conflict which is sad as overexploitation of the environment where the physical resources. On the other hand, tourism development, economic improvement, increase employment opportunities, the lifestyle changes led to changes in the physical environment and the carrying capacity and occupacy capacity on tourist destinations. Globalization and modernization led to a number of important issues on tourism in Bali such as the degradation of cultural elements and the hybrid culture

Budiarta and Kanca   (2012: 96) states that the mass tourist visit have a negative impact on the physical environment and the social community in Bali. Bali is becoming increasingly congested, causing traffic jams and air pollution, agricultural land is converted into construction of tourism facilities such as hotels, golf courses, restaurants, art shops, villas and other tourism supporting the construction of accommodation. This research was supported by Suandi and Suarna (2007: 7-21) stating mass tourism impact of forest destruction, decreased biodiversity and critical lands. Wijaya (2012: 88) sataes the impact of the construction of a villa in North Kuta result of agricultural land conversion, pollution, coastal erosion, floods and the accumulation of garbage and waste in the region. Not to mention the social and cultural impacts posed, as expressed Budiarta and Kanca (2012: 97) resulting in commoditization and exploitation of tourism culture of Bali, causing degradation of values of Balinese culture. This situation makes the Balinese people become individualistic and materialistic, declining attitude to hospitality among others. The development of mass tourism is also causing a population explosion, live competition, jealousies, economic disparity and social inequality.

Bukittinggi as a major tourist destination and a major tourist destination in West Sumatra is feared in the long term will also experience the same thing if it is not managed in a planned, comprehensive vision and a clear mission. At the time of Bukittinggi vacation to tour the city crowded and congested, with garbage strewn along the landmark Clock Tower surrounded by modern Mall and the unavailability of parking space. Empty land increasingly met by new hotels and inns. Building and population growth are getting solid results in the carrying capacity and occupacy capacity of Bukittinggi heavier. Contour Bukittinggi hilly growing increasingly crowded with buildings accompanied by the emergence of clusters exclusively from the developers . Bukittinggi long-term concern is no longer a comfortable tourist city and a nickname Bukittinggi as the dream land of Sumatra for its natural beauty will be a memory. Because it is necessary to study in order to London remains the leading tourist destination areas that are environmentally friendly, maintained uniqueness, naturalness and a source of pride for future generations.

Based on the background and issues that have been pointed out above, the problem can be formulated as follows: how the local perception of the concept of Sustainable Tourism Development based on Triple Buttom Line approach proposed by Elkington

2. Purpose of Research

This study aimed to: know the local community perception of the concept of Sustainable tourism Development through Triple Buttom Line Approach proposed By Elkington

Literature Review

1. Concept of *Sustainable Tourism Development (STD)*

According to Cortes and Maya (2010: 3075) Sustainable Tourism Development concept is tourism activities that bring together the needs of travelers with local community needs today and in the future. Development of Sustainable Tourism Development based tourism is tourism development that is based on economic, social empowerment and ensure the preservation of the environment.

According to Yoeti (2008: 242) sustainable tourism development brings needs of tourists and tourist destination in the rescue efforts and provide the opportunity to become more attractive again in the future. Daminik and Weber (2006: 26) states tourism development is sustainable resources (attractions, accessibility, amenitas) tourism which aims to provide optimum benefits to stakeholders (stakeholdesr) and the value for the satisfaction rating in the long term. This is consistent with research Rotich et al (2012: 109) states the concept of Sustainable Tourism Development implemented as a policy, planning and activities in the

context of tourism which aims to ensure the development of tourism without damaging the economy, the environment and social welfare.

According to the UNWTO (United Nations World Tourism Organization) in Myra and Olifer (2012: 29) Sustainable tourism is tourism that takes into account the full impact of the economic, social and environmental present and future and answer the needs of visitors to the tourism industry, the environment and the local community. To measure the concept of sustainable tourism can be used several indicators, as shown in the following table.

According to Myra and Oliver (2012: 3) with good planning and effective management, tourism can generate positive benefits in terms of economic, social / cultural and natural environment. Conversely possible leakage of economic value, the extent of the negative impact of social and cultural and environmental degradation. Measures to encourage the tourism industry environmentally sustainable and socially is an important step that would contribute to inclusive social development and preserve the environment of capital, so that the industry can flourish in the medium and long term. The concept of sustainable tourism in Indonesia is already outlined in policy documents and laws, but does not need to be implemented by international minumum standards that have been agreed.

According to the Global Sustainable Tourism Council in Myra and Olifer (2012: 40) that the criteria is an attempt to reach a common understanding on sustainable tourism, which are grouped into four main themes, namely: 1) sustainable planning of effective, 2) maximizing social and economic benefits for local communities , 3) strengthening the cultural heritage, 4) reducing negative impacts on the environment. These criteria can be applied to the entire tourism industry or destinations. To support sustainable pariwista, need a good carrying capacity management, technology, human resources and government policies. For example, the carrying capacity can be ecomanagement with the principles of reduce, reuse, recycle (3R), ekoefiseinsi also be applied in the fields of transport, accommodation, accessibility and amenitas. In the field of technology weapons can implement environmentally-friendly economy adapted to the climate, local culture and the local labor

Table 2.1.
Monitor and Evaluation Indicators for Sustainable Tourism Development

No	Indicator	Special Measurements
1	Location protection	carrying capacity and occupacy capacity, pressure to destination area, destination attractiveness
2	Pressure	Amount of tourists to revisit to destination/ *peak season*
3	Benefit intensity	Intensitas pemanfaatan pada waktu puncak
4	Social Impact	Ratio tourist to local community
5	Pengawasan Pembangunan	Formal procedure to develope
6	Waste management	The percentage of the waste management capability, ratio requirement and the supply of clean water
7	Planning process	Consider regional planning including travel planning (regional)
8	Critical ecosystems	Number of species are still rare and protected
9	Visitor Satisfaction	Level of satisfaction of visitors to Attractions (by questionnaire)
10	Satisfaction local community	The level of satisfaction to the local population (based on questionnaires
11	The contribution of tourism to the economy of local communities	The proportion of total tourism revenue
12	Destination image	Persepsi wisatawan terhdap citra destinasi (kuesioner)

2. Concept of *Triple Bottom Line (TBL)*

Based on the approach of some members who have previously submitted the concept of Sustainable Development Touirism can be concluded in general that the approach they express reference to the concept of the triple bottom line uttered by Elkington. According to Tyrrell et al (2012: 4) The concept of TBL (Triple Bottom Line) is a concept that is consistent with sustainable development (sustainable development) emerged in the 1980s were initiated by Elkington is conducting a comprehensive approach to sustainable development with regard to economic, social and environmental protection.

According Slaper and Hall (2010: 4) TBL is also known as the three P's, namely people, planet and profit as in the picture below.
Figure 2.1.Triple Bottom Line
Source: Slaper dan Hall (2010:4)

Three concepts put forward by Elkington can be measured using indicators as follows.

Table 2.2.
Aspect dan Indicator *Sustainable Tourism Development*

No	Aspect and Indicator
1	*Economic : tangible assets, intangible assets*
2	*Environmental: natural environment (all the resources provided to a firm of raw materials, plants and animals, and including climate)*
3	*Social : firm's relationship with employess customers, the legal system, local community as well as educatuional, government and infrastructure institutions*

Source: Elkington (1998)

In contrast to Elkington, Tyrell et al (2012: 7) grouped into 10 attributes TBL as shown in the table 2.3.

Based on research conducted by Tyrell et al (2012: 7) approach to sustainable tourism helpful to assess perbedan value of groups of different stakeholders (ie tourists, government institutions, industry pelalu tourism services, local residents and the environment). The tourism sector is a sector that is unique to boost sustainable development by incorporating a system of economic, social, environment becomes a community system.

Based on the concepts put forward by Elkington on the concept of sustainable tourism development, it can be combined several indicators to measure the performance of sustainable tourism that will be studied in the city of Bukittinggi.

Table 2.3.
Ten Triple Bottom Line Attribute

No	Dimension	No Attribute	Attribute
1	*Social*	1	*Comunity charity (percentage of gross revenueprovided for local charitable contribution)*
		2	*Community health,safety and security (traffic congestion), security on property, health mensures on prpperty*
		3	*Openness to public and local culture (openness to the nonguest to general public)*
2	*Economic*	4	*Local supplier and customers (good produced and purchased locally)*
		5	*Average hourly wages and benefit (compared to national average)*
		6	*Employment of local residents (employees who maintain a local residence)*
		7	*Local taxes paid (as a percentage of gross revenues)*
3	*Environmental*	8	*Water, energy and material practices (energy conservation, use of environment- friendly product)*
		9	*Green building and infrastructure (environment-friendly management, policies and governace)*
		10	*Waste management and reduction (recycling, wasted reduction)*

3. Framework

To overcome the negative impacts of tourism activities on the town of Bukittinggi in need of comprehensive studies using TBL concept as seen in the research paradigm below:
Figure 2.1.
Research Model

Research Methods

This research conducts to strategic management approach and marketing management Reseach method that used survey method and explorative reseachn types. The sampling

technique is purposive sampling with a cross sectional coverage that reflects a picture of a particular moment. The unit of analysis is the local population living in the town of Bukittinggi. The analysis tool is is kuanlitatif analysis using frequency distribution analysis.

1.   Variable Operationalization
   Operationalization of variables there are on table 3.1. :

Table 3.1.
Variable Operationalization

No	Dimension	Indicators
1	Social	*Comunity charity (percentage of gross revenueprovided for local charitable contribution)*
		Community health,safety and security (traffic congestion), security on property, health mensures on prpperty
		Openness to public and local culture (openness to the nonguest to general public)
2	Economic	*Local supplier and customers (good produced and purchased locally)*
		Average hourly wages and benefit (compared to national average)
		Employment of local residents (employees who maintain a local residence)
		Local taxes paid (as a percentage of gross revenues)
3	Environmen tal	*Water, energy and material practices (energy conservation, use of environment- friendly product)*
		Green building and infrastructure (environment- friendly management, policies and governace)
		Waste management and reduction (recycling, wasted reduction)

2.   Data collection technique
   Primary data was collected by a questionnaire distributed to local residents who live in the city of Bukittinggi is considered capable of providing precise and accurate information

Result
This study analyzed the perceptions of the local population on the concept of tourism development based on sustainable tourism development using a concept put forward by Elkington namely 3P namely: Profit (economics), planet (environment) and People (social). Researchers deploy 195 questionnaires to local people who live in the city of Bukittinggi. The survey was conducted for 3 months starting in June-August 2016. A questionnaire was directly given to respondents selected. The sample in this study was 195 people. Characteristics of the sample was processed using SPSS 16.
The following characteristics of respondent. From of the 195 people sampled in this study, 54% of respondents, or as many as 105 persons of the male and the balance of 46% or 90 persons are female.
The percentage of respondents age is the age range of 17 years to 21 years with a percentage of 41% and was followed by the age of 22 years to 26 years with a percentage of 22%. Respondents have at least 17 years were assumed to have been able to provide precise and accurate information about assessing / their perception of the concept of sustainable tourism.
Based on the characteristics of the type of work, the results obtained from this study that the majority of respondents are students of this type of work by 34% and the percentage of 16%, followed by the type of work as private employees. Based on revenue sharing can be seen that

most respondents had a monthly income of about Rp 500,000, - to Rp 1.000.000, - and samples income above Rp 5.000.000, - the least encountered in this study. This indicates that the people of the city of Bukittinggi has varying income levels.

1.   Response Respondents by Economic Aspects.

Table 4.1.
Response Respondents by Economic Aspects

No	Indicator	Respondents Answer					Total	Mean
		1	2	3	4	5		
P 1	Bukittinggi tourism development attention to the carrying capacity of the city	11	44	53	67	20	195	3,21
P 2	Bukittinggi has a carrying capacity sufficient to accommodate tourist visitors	3	31	70	78	13	195	3,34
P 3	Bukittinggi city government supports the authenticity and naturalness of Attraction	1	4	38	115	37	195	3,94

P10	Tourism development to support the increase regional revenue	0	3	20	85	87	195	4.31
Rata-rata								

Source: questionnaire (2016)

Based on the questions P1, that the city community Buktitnggi give an assessment agree that the development of the city of Bukittinggi attention to the carrying capacity of the city (carrying capacity) which indicates that respondents are aware of the development of sustainable tourism should pay attention to the carrying capacity of the city so there is no damage to the city of London as a destination in a magnet The main in West Sumatra

province. This is in accordance with the question which is the city Bkt P2 has a carrying capacity sufficient to accommodate tourist visitors, the community provides appraisers agree, with an average of 3.34.

This is in line with research Tyrrell et al (2012: 4) that the concept of TBL (Triple Bottom Line) is a comprehensive approach to sustainable development with due respect to the environment as one important indicator in addition to economic and social aspects. Local residents agree that tourism development Bkt raise revenue businesses and communities (P6), tourism development Bkt will reduce the unemployment rate (P7), tourism development, creating new jobs for the community (P8), tourism development Bukittinggi support the emergence of new companies the field of tourism (P), tourism development plan to raise revenue (P10). Statement P 10 memperlihtakan average rate is the highest compared with other statements. It is indicating the that the people of Bukittinggi considered that the concept of tourism sustainbale well-planned development will be able to raise regional revenue through growth in service industries and trade.

2.   Response Respondents by Environment Aspects.

Table 4.2.
Response Respondents by Environment Aspects

No	Indicator	Respondents Answer					Total	Mean
		1	2	3	4	5		
P11	Tourism development support Attraction keasrian	1	0	15	78	101	195	4.24
P 12	Tourism development support municipal waste management Bukittinggi	7	8	34	69	77	195	4.03
P 13	Tourism development to support the quality of natural resources (air, water)	2	4	28	68	93	195	4.26
P14	Tourism development to support the use of saving electric energy sources	10	10	31	60	84	195	4.02
P15	Tourism development support the preservation of the surrounding natural attractions	0	6	53	99	37	195	3.86
P16	Tourism development, improve the function of idle land into productive land	0	1	33	104	57	195	4.11
P17	Tourism development create air pollution	1	5	43	114	32	195	3.88
P18	Tourism development increase temperature and humidity of the city	2	7	42	104	40	195	3.89
P19	Bukittinggi tourism development to support the natural beauty	0	2	38	114	41	195	3.99

Source: questionnaire (2016)

Based on descriptive analysis on environmental aspects, local communities Bukittinggi agreed with the statement that supports the development of tourism attractions keasrian (P11) and the development of tourism support the management of municipal solid waste (P12). Community Bukittinggi provide answers and the highest ratings on the stationing P 13 which supports tourism development quality of natural resources (air, water, etc.) and P16 statement that improve the function of tourism development of idle land into productive land. Tourism development to support the use of saving electric energy sources as well as P15. Tourism development support the preservation of the surrounding natural attractions. This indicates that the urban community Bukttinggi assess Bukittinggi city government has not seriously consider the environmental aspects affecting the sustainability of tourism in the statement Bukittinggi.Sementara P17, P18 and P19 showed a relatively flat at around 3.89 that tourism development creates air pollution, increase tourism temperature and humidity of the city, tourism development Bukittinggi supports natural beauty.

In a statement tourism development, improve the function of idle land into productive land (P16), tourism development creates air pollution (P17), Tourism development raises the temperature and humidity of the city (P18), tourism development Bukittinggi supports natural beauty (P19), most of the tourists leave assessment agrees. The results of this study are supported by Suandi and Suarna (2007: 7-21) stating mass tourism impact of forest destruction, decreased biodiversity and critical lands. It aligned with that expressed by Wijaya (2012: 88) that the impact of the construction of a villa in North Kuta result of agricultural land conversion, pollution, coastal erosion, floods and the accumulation of garbage and waste in the region.

3.   Response Respondents by Social Aspects.

Table 4.3.
Response Respondents by Social Aspects

No	Indicator	Respondents Answer					Total	Mean
		1	**2**	**3**	**4**	**5**		
P 20	Tourism development, increase of crime	11	44	53	67	20	195	3,21
P 21	Tourism development to increase women who work in the tourism sector (selling, sewing embroidery and sells snacks)	3	31	70	78	13	195	3,34
P 22	Tourism development can improve the household economy	1	4	38	115	37	195	3,94
P 23	Tourism development, reducing poverty	1	2	29	94	69	195	4,17

P 24	Tourism development create a good social interaction between individuals	2	8	39	104	43	195	3.94
P25	Tourism development, improve the quality of life	18	47	47	68	15	195	3.08
P26	Tourism development to improve the welfare of society Bukittinggi	1	5	32	79	78	195	4.17
P27	Boost tourism development of education of the city of Bukittinggi	2	7	44	108	34	195	3.92

Sumber : data di olah (2016)

According to the people of Bukittinggi that tourism development increase criminality (P20), and also in accordance with the statement P21 that tourism development Bukittinggi increase women who work in the tourism sector (selling, embroidery and snacks), able to increase pekonomian households (P22) and reducing poverty (P23).

Tourism development create social interactions both among individuals (P24), it is approved by the respondents, as well as tourism development, improve the quality of life (P25) and improve social welfare Bukittinggi (P26), and the development of tourism boost education townspeople Bkt (P27). This indicates that the development of sustainable tourism is able to humanize the man became man more responsible towards themselves, the environment and future generations. This is in line with research Budiarta and Kanca (2012: 97) states that uncontrolled tourism makeover will lead to commoditization of social and cultural exploitation of Bali, causing degradation of values and culture in Bali. This situation makes the Balinese people become individualistic and materialistic, declining attitude to hospitality among others. The development of tourism that does not matter to kulaitas social life also led to a population explosion, live competition, jealousies, economic disparity and social inquality

Based on the above table, the highest ratings given by the people of the town of Bukittinggi in the statement P23 that tourism development to reduce poverty by 4,17dan P26 is a statement of tourism development to improve the welfare of society Bukitinggi. Because berkembanganya tourism sector-based sustainable tourism development will encourage the community to be actively involved in promoting their tourist destinations with an excess of care to the concept of sustainability and will be visible from souvenir products are been created concept of green product in the form of souvenirs and art works. ,This is in line with research Swanson danTimothy (2012: 492) states tourists will make a purchase souvenirs or cenderamta as a sign / evidence that they have done perjalananke a travel destination and has pengalamanistimewa in a privileged spot / special anyway (had a extraordinary experience inextraordinary space). Souvenir reflect on the experience of travel and save a nice memory can be eco-friendly handicraft products (wood waste or waste fabric) can be kerajiana unique hand produced by the local community that describes the integrity of Cultural Studies and the history of the place.

Conclusion

This study analyzed the perceptions of local residents Bukittinggi town tourism development based on the concept of sustainable tourism development using a concept put forward by Elkington namely 3P namely: Profit (economics), planet (environment) and People (social).

Based on research conducted on three aspects: economic, social and environmental, local residents expressed that the economic aspects of tourism concept based kebelanjutan considered able to reduce unemployment, increase of informal employment in industries such as handicrafts / souvenirs and transportation services. The local population is also considered that the concept of sustainable tourism to support the emergence of businesses in the services and trade in Bukittinggi.

In a second aspect, namely planetary aspects (environmental) local residents considered that the development of sustainable tourism can support the beauty of a tourist destination because of the awareness of personnel involved in the tourism industry both active and inactive. This concept can also support the quality of natural resources such as water and electricity which will be saving resource usage tersebut.Pada third aspect which aspects of people (social), local residents considered that the concept of sustainable tourism can reduce the crime rate in Bukittinggi and this concept can improve labor force participation rates of men and women in the various sectors of the economy so that the level of the family also increased.

Based on the analysis using frequency distribution that the concept of Sustainable Tourism Development, which consists of economic, environmental and social can be used to measure the perceptions of local residents against the concept of triple buttom line proposed by Elkington. Of these three aspects reveal that environmental aspects have value and contribute most to the continued development of tourism in the city of Bukittinggi. This means that the local population gives the perception that environmental aspects become important for the assessment of local residents to the development of sustainable tourism that is concerned with the sustainability of future generations. This aspect was rated by locals as an important part to promote sustainable tourism by combining this approach with the local wisdom of local communities. While the economic aspect is the perception of the lowest rated by locals. This means that the economic aspect is the second choice after environmental aspects. This means that people appreciate that the environment adalag important part to promote tourism in Bukittinggi.

IMPROVING THE COMPETITIVENESS OF TRUSMI BATIK-CIREBON THROUGH THE ENTREPRENEURIAL ORIENTATION

Hilmiana, Universitas Padjadjaran, Indonesia
Kartono, Universitas Padjadjaran, Indonesia

Abstract

SMEs (Small and Medium Enterprises) are pillar of the country's economy which can play an important role in the development and growth of a country's economy, followed by the increasing population. As how Trusmi batik industry is trying to face MEA depends on how the industry's actors prepare for it. So Trusmi batik can compete with other companies, which in turn it can maintain the existence of SMEs. It indeed takes a strategy, one of which is by creating competitiveness of Trusmi batik in Cirebon through entrepreneurial orientation, characterized by sustainable innovation, creativity, and risk consideration. Entrepreneurial orientation is an ability owned by a business actor to create something new and different from competitors. In other words, the entrepreneurial orientation is the goal of an entrepreneur to take an opportunity in opening new markets and apply updates from the existing operating with three indicators, namely: being innovative, creative and having risk consideration to improve business competitiveness.

This study explores entrepreneurial orientation on the creation of business competitiveness in the batik industry. In this study, there are 145 respondents surveyed and all of them are the SME owners of Trusmi batik. It is found that the entrepreneurial orientation characterized by innovation, creativity, and risk considerations can increase the competitiveness of the industry to be better. This means that the resilience of batik SMEs is greatly determined by entrepreneurial orientation.

Keywords: *Innovation, creativity, risk considerations and competitiveness*

Introduction

Small and Medium Enterprises (SMEs) are playing an important role in the economy of a country, especially in Indonesia. This is because SMEs can absorb a lot of labors to avoid the emergence of unemployment in each region. SMEs, as which has been proved, are able to save the nation's economy during the economic crisis in 1998, it also proved to have relatively better endurance compared to the bigger business scale. That is why it is not surprising that in times of crisis and recovery period of Indonesia's economic like now, SMEs have a major role which is very strategic in the national economy.

Based on the latest data released by the Central Bureau of Statistics and the Ministry of Cooperatives and Small and Medium Enterprises (BPS and Kemenegkop & SMEs RI) in 2009 there were at least three (3) indicators showing that the existence of Micro, Small and Medium Enterprises in Indonesia has such important position. First, there are a large number of SMEs found in every sector of the economy. The total population of SMEs in 2008 reached 51.2 million units, or 99.99% of the total business units in Indonesia, with the number of their employees reached 90.9 million people, or 97.04% of the entire workforce in Indonesia. Second, it has a great potential in solving unemployment problem which absorb 79.04 million workers, or 99.4% of the total labors. Third, it has a significant contribution to the formation of the Gross Domestic Product (GDP), which contributed up to 55.56% of the total GDP.

Trusmi batik is one of the SMEs coming from the area with the biggest Batik product in West Java, Cirebon. The center of Batik production in Cirebon is located in the village of East Trusmi and West Trusmi, Plered. Batik Cirebon is often referred to Trusmi batik because there is only one center of batik production, which is in Trusmi area. The example of famous batik products are Batik Pesisiran, Batik Mega Mendung, Batik Sawat Panganten, Batik Urang Jejer.

For most of the people in Trusmi, working for batik industry is one of the main livelihood. Trusmi batik itself is classified into a labor-intensive industry because it requires quite a lot of human labors with some special skills. Therefore, Trusmi batik industry also has contributed a lot, especially to the district administration of Cirebon. However, based on the phenomenon that occurred a few years ago (since 2010-2014), there was a decrease in form of the employment absorption and sales. It can be seen from the table below:

Table 1
Export Data of Cirebon Batik in 2008-2010

Year	Job lot	Export Value (US $)
2008	7200	1,008,000.00
2009	7500	1,410,973.50
2010	8500	2830333 , 00

Source: Department of Industrial and Trade of Cirebon regency 2015

The data above shows that the growth of export value of Cirebon Trusmi Batik in 2010 increased significantly compared to the year 2009 that is from 13.3% to 2.8 billion in 2010. the value, however, is still relatively low, if compared to the national export value. In 2010, national batik exports amounted to 22 million USD (www.sinarharapan.co), when assuming the value of the dollar in 2010 was 10 thousand rupiah, the total value of national batik exports in 2010 amounted to 220 billion rupiah. It means that the value of Cirebon batik exports is only 1.27% of the total export value of the national batik. Based on this, it is necessary to have steps to optimize the value of Cirebon batik export to continue its efforts to improve the business competitors, particularly those in Trusmi batik industry. One of the attempts is by seeing the capabilities of SME actors from their entrepreneurial orientation. Since it is through the implementation of the ASEAN Economic Community in 2016 that the opportunity for the nationwide batik industry, especially Trusmi batik industry can enhance its competitiveness so as to increase the value of exports. After the introduction of the MEA, there will be ease in conducting export and import of goods (Agi Syarif , 2015).

However, even in the era of MEA batik industry gets opportunities to continue growing, there are several obstacles faced by the Trusmi batik producers such as economy crisis and globalization that is the agreement of ASEAN - China Free Trade agreement (ACFTA). The next obstacle is the illegal circulation of batik into the Indonesian market in 2008 indicated originating from China smuggled products which is estimated amounted 290 billion rupiah. The spread of those foreign batik can take over the market share of local batik which has become the foundation of income for local batik entrepreneurs, including

Trusmi batik of Cirebon.

The entry of foreign batik from China, which has been widely distributed in Indonesia become the concern of local batik entrepreneurs. It encourages them to compete not only with any similar local but also with foreign competitors. Thus, the local batik entrepreneurs should be able to provide innovation and creativity in order to remain competitive in the market.

The competitiveness of an organization depends highly on the individual, who must have speed, ability of responsiveness, agility, learning ability and competences; which are knowledge, skill and ability related to the job (Uirich, 1998). The managers of the organization must think how to build and maintain a sustainable competitiveness. Barney (1991) states that in order to achieve competitiveness and sustainable profits, the company must seek out and cultivate the special capabilities of all its human resources.

Theory of Competitive Strategy (Porter, 1980) suggests that companies should create a special competitive edge in order to have a strong bargaining position in the competition. Further Porter (1991) states that the company can achieve success if three conditions are met: 1) having the purpose of a strong company in the market; 2) paying attention to the company's strength dynamically by taking into account the opportunities and threats of the external environment; 3) having and digging distinctive competency as the driving force. Meanwhile, according to Mahoney and Pandian (1992), to face the increasingly complex competition and internal crisis, small companies can use the theory of resourced-based strategy. This theory assesses the potential to maintain the company's success in fluctuating external conditions and prioritizes the development of superior internal capabilities. It is not transparent, difficult to be imitated or diverted by competitors, and it also provides long futuristic competitiveness and resistant toward recession.

The competence built from an organization's internal asset utilization through continuous organizational learning ability will produce a sustained competitive advantage and superior business performance. In accordance with the theory of resource-based view (RBV), Barney (1991) stated that resource competency can become a source of sustainable competitive advantage if the Micro, Small and Medium Enterprises provide customers with the valuable competence and resource which are rare, difficult to imitate and difficult to replace. This will be able to maintain a good position in the competition in the industry. The RBV approach also states that high-performance businesses will be more easily achieved if the company has the resources competency and reliable competitiveness (Wernelfelt, 1984; Barney, 1991: Amit *and* Schoemaker, 1993). Coordination of strategic resource as the result of a mix of entrepreneurial orientation, creativity and innovation will support the resource which is non-imitability, non-transferability and non-substitutability as the source of sustained competitive advantage stated by Durand (1999: 45).

In addition to creativity, a factor that is influential in the rise of a business performance is innovation. Innovation of the production process nowadays uses machinery and technology. The previous production process was done manually such as by direct hand- drawing for batik. Then, considering the economic reason, batik was produced on a large scale by means of printing in factories although the patterned fabric of Mega Mendung batik produced with such process cannot actually be called batik. Mega Mendung motif which was previously only known in the form of batik clothe, can now be printed in a variety of goods such as glass painting, interior products such as carved wood and household appliances such as pillowcases, bed sheets, tablecloths and others. Based on the phenomenon and some results of the researches, there are still differences as Barney (1991) stated that competitive advantage belongs to the company which provides the costumers with valuable competence and resource which are rare, difficult to imitate

and to replace. The same thing were mentioned by Wernelfelt, (1984); Barney, (1991), Amit and Schoemaker (1993) that the high operating performance will be more easily achieved if the company has the resources competency and reliable competitiveness. While Durand (1999: 45) stated that entrepreneurial orientation, creativity and innovation will support the creation of resources which are non-imitability, non- transferability and non-substitutability as the source of sustainable competitive advantage. It is different from the findings of Mahoney and Pandian (1992), which explained that to face the increasingly complex competition and internal crisis, small companies can use the theory of resourced-based strategy.

While Ulrich, 1998 mentioned that the company's competitiveness depend on the individuals themselves, who must have speed, responsiveness ability, agility, learning ability and employee competences, namely knowledge, skills and abilities related to the job. Based on the above phenomenon, this study aims to find out whether there is a relationship among innovation, creativity, and risk considerations and to find out whether there is an influence of entrepreneurial orientation (innovation, creativity, and risk considerations) on the competitiveness of SMEs of Cirebon Trusmi Batik either partially or simultaneously.

Literature

1. Entrepreneurial
    Orientation

The consensus in strategic management and the process of entrepreneurial management as studied by Matsuno et al. (2002) and Schindehutte et al. (2008) consists of: Innovativeness, risk-taking and proactive. They studied deeply about the thoughts of Barringer, and Bluedorn 1999; Caruana et al. (1998); Covin and Slevin, 1989; Jennings and Young, 1990; Khandwalla, 1977; Miller, 1983; Miller and Friesen, 1982; Morris et al. (1993). While Matsuno et al. (2002) in his research tended to use the terms of entrepreneurial Proclivity defined as processes, practices and decision-making based on a preference to perform innovativeness, risk-taking and proactive.

According to Slater and Narver (1995) a business can reach its full potential of its market orientation when it is caused by the tendency of the nature of appropriate entrepreneurial orientation in accordance with the design and structure of the organization. Several studies on entrepreneurial orientation show that entrepreneurship is a major attribute to achieve a high performance of a company. The approaches to explain the entrepreneurial orientation can be viewed from several classifications, among others are in the perspective of the individual, organizational and environmental factors. And, the study of entrepreneurship continues to thrive in describing the characteristics of an entrepreneur.

Drucker (1994) suggested that the entrepreneurial orientation as the nature, character or characteristics attached to someone who has a willingness to realize innovative ideas into real business world and can develop it well. Entrepreneurial orientation is the ability to create something new and different.

Scarborough and Zimmerer (1993: 5) proposed a definition of an entrepreneur as someone who creates new business by considering the risks and uncertainties to achieve profit and growth by identifying opportunities and combining them with the resources needed to take the advantages.

From those opinions, the concept of entrepreneurial orientation can be synthesized as a mental attitude, outlook, insights and thought of someone to do his tasks and responsibilities which are always oriented to the customers. In essence, entrepreneurial

orientation is the characteristics and attitudes of the individual who has the willingness to realize innovative ideas creatively into the real world.

Dimension of entrepreneurial orientation by Lumpkin and Dess (1996) in his article stated that there are five (5) dimensions that characterize and distinguish the entrepreneurial orientation, namely: autonomy, innovativeness, risk taking, proactive and competitive aggressiveness. While Miller and Friesen (1982) identified 11 dimensions of the strategy-making process for the entrepreneurial orientation, among of them are adaptiveness, analysis, integration, risk taking and product market innovation. Frederickson (1986) proposed another dimension, namely: proactive, rationality, comprehensiveness, risk-taking and assertiveness. While Hart (1992) developed a framework for integrative in five dimensions: command, symbolic, rational, transitive and generative and Miles and Snow (1978) considered several dimensions covering prospectors, defenders, analyzers and reactors.

Thongvanh Sirivanh et al (2014) mentioned that entrepreneurial orientation is a significant contributor to the success of a business organizations since the success of a business activity is strongly associated with environmental factors both internally and externally. External environmental factors include the economic and social conditions, political and technological factors. Internal factors include entrepreneurial management consisting of an emphasis level on strategic orientation, resource orientation, structure of entrepreneurial culture management, reward philosophy and entrepreneurial orientation related to the personal characteristics of entrepreneurs (Isalam, 2011). Entrepreneurial orientation consists of attitudes toward business innovation, proactiveness in business operations and risk taking (Miller, 1983 ;. Lumpkin & Dess, 1996, p.137 ;. Gurbuz, & Aykol

2009; Kuratko & Hodgetts, 2004, p. 130

).

From those several opinions, it can be said that the entrepreneurial orientation describes the purpose of an entrepreneur to take opportunity in opening new markets and apply updates from the existing operation with three indicators, namely: innovation, creativity and risk considerations.

2. Competitive Advantage

The fundamental concept of competitive advantage can be traced from the concepts revealed by Chamberlin (1939); Selznick (1957); Hofer and Schendel (1978) which describe a competitive advantage as a unique position developed by an organization directly compared to the competitors through its resource usage patterns. Day (1984) and Porter

(1998) revealed the next generation conceptualization which states that a competitive advantage is a goal of the strategy to achieve superior performance.

Bharadwaj *et* al.,(1993, p83-84) explained that the competitive advantage is the result of implementation of the strategy utilizing the various resources of the company. Unique expertise and assets is viewed as a source of competitive advantage. The unique expertise is the company's ability to make its employees as an important part in achieving competitive advantage. The company's ability to develop the skills of its employees properly will make the company become superior, and the implementation of strategies based on human resources will be difficult to be imitated by competitors. While the unique assets or resources are the real resources needed by the company to execute it's competitive strategy. Both of these resources should be directed to support the company's performance which takes low-cost and has difference from other companies.

This is supported by the opinion of Styagraha (1994, p.14) stating that competitive advantage is the ability of an enterprise to provide more value to its products compared to its competitor's, and that value does bring benefits to customers. Some indicators used to measure competitive advantage are: unique, rare, not easily imitated, not easily replaced, and competitively priced. The product uniqueness is the company's unique product combining the art value and customer's taste. Competitive price is the company's ability to adjust product prices to general prices in the market. Not-easily-found product means that its presence is rare in the middle of competition. Not-easily-imitated product means that it can actually be imitated, but imperfect. Hard to replace means there is no similar substitute.

The competitive advantage is the ability of a business to achieve abnormal profit in the competitive industry through strategy of creating value. Competitive advantage will be sustained when the advantage is resistant to eradication from competitors who can do the duplication of benefits from existing strategies (Barney, 1991).

A company should be able to be superior compared to the competitors. The company requires to create competitive strategic by formulating and implementing the strategy of creating value. Competitive advantage is obtained when the company is able to make a lot of different activities carried out by companies incorporated in a chain that can contribute the value which gives maximum margin to the company. Those activities should be carried out strategically with lower cost or better result compared to the competitor's.

Porter (1998) stated that business positional advantage directly achieved by a company represents barriers of competitive mobility in the competition because it may constitute a barrier to new competitors. Porter further differentiated the company's strategic advantage for the first two things because firms have a unique (different from others) seen by customers and because the company has the advantage of relatively low cost position compared to competitors. This strategy should be designed to achieve continuous competitive advantage that the company can dominate both markets and new markets. Competitive advantage basically grows out of the values or benefits created by the company for its customers. They generally prefer to buy products with more value than what they expect. However, that value will also be compared with the price offered. Purchasing will occur if customers consider that the price of the products is appropriate with the value offered.

The purpose of competitive strategy is to obtain sustainable competitive advantage and in turn to increase the business performance. Unique expertise and asset are used as a source of competitive advantage. Porter (1998) stated the competitive advantage is the result of the implementation of value creation, not the simultaneous result of implementation from potential competitor or existing ones, or through the superior execution or strategy application which is similar to competitor's. However, sustainable competitive advantage is obtained when profits can be gained and sustained.

According to Barney (1991) and Baum et al, (2001), the resource-based theory consists of capacity and resources becoming the basis for business organizations to build the rare capacity with high added value. This is a very specific resource for a company so that other companies get difficulties to imitate and find a substitute factor.

The core competence of business is directly related to technical knowledge, reputation, brand awareness, manager's ability, patents and trademarks (Fahy and Smithee 1999). Prahalad and Hamel (1990) stated that the capacity of individual staff is a major determinant of a company's production. It leads to a company's difference (Porter,

1985; Prahalad and Hamel, 1990).

The dimensions of competitive advantage refers to the dimensions adopted from Barney (1991), namely: valuable resource, rare resource, and that which is difficult to imitate and hard to replace.

3. The Influence of Entrepreneurial Orientation on Competitive Advantage

Study by Mohammad Arief et al (2013) analyzed the influence of entrepreneurial orientation on firm performance through flexibility strategies conducted by taking sample of

140 small business owners in Malang. The results showed that there is a direct influence of entrepreneurial orientation on firm performance. However, the influence of entrepreneurial orientation will not be significant through a flexibility strategy so that the variable of the flexibility strategy plays a mediating role in the relationship of entrepreneurial orientation on business performance.

Thongvanh Sirivanh et al (2014) studied the factors influencing the growth of SMEs through sampling as many as 331 entrepreneurs in Laos and using *Structural Equation Modeling* (SEM) analysis. The results showed that there is a positive effect of entrepreneurial orientation on competitive advantage. While competitive advantage and entrepreneurial orientation significantly and positively influence the growth of SMEs.

Li, et al, (2009) analyzed the relationship between entrepreneurial orientation and entrepreneurial performance conducted on 165 companies in Taiwan based on primary data collected through questionnaires. His research found that entrepreneurial orientation is positively related to business growth. Entrepreneurial orientation will initiate changes to continue meeting the customers' desires including how to use either tangible or intangible resources they have. Continuous innovation applied has an effect on the asset. It is then used to form the core competence becoming a source of competitive advantage.

The continuous innovation conducted will form the efficiency of input use and the effectiveness of the business result achievement. The products produced have better quality, customer satisfaction can be met through the product with competitive prices, product demand will increase which ultimately improves competitiveness. The increase of proactive thinking also will improve the ability to capture new business opportunities; the excellence to recognize the customer's expectation and develop the business capacity earlier than the competitors will allow the company to create more superior products.

Entrepreneurial orientation triggers the desire to improve business competitiveness by seeking the resources which are valuable, rare, difficult to imitate and difficult to replace compared to its competitors to gain superiority in business result. It was concluded that entrepreneurial orientation is an antecedent of sustainable competitiveness. The higher the entrepreneurial orientation will be, the higher the competitiveness will be achieved.

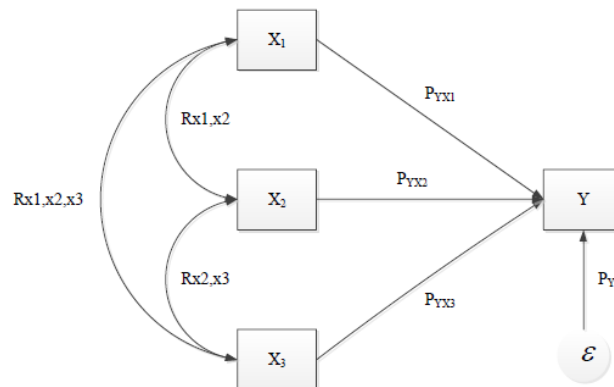
So, the research model can be described as follows:


Figure 1.
Research Model

Methods

This study used a descriptive-analytic method through surveys and the characteristic is *grounded. The s*urvey in data collection is conducted by spreading questionnaires either by sending them or directly visiting the respondents.

The time period used is *cross sectional* which is a moment fact with only one form of data collected in a period of observation in order to answer the research questions (Sekaran, 2009). The unit of analysis in this study is the SMEs of Cirebon Trusmi Batik with 45 respondents as samples using *random sampling,* which means sampling of the population that is done randomly without considering the strata in the population, since members of the population considered homogeneous (Sugiyono 2005).

The type of the relationship between the variables examined in this study is a causal relationship. According to Sugiyono (2004), a causal relationship is cause and result relationship, if X then Y; so that an analytic instrument used in this research is regression with SPSS. Therefore, in this study is expected to clarify whether entrepreneurial orientation as an independent variable has influence on competitiveness as the dependent variable.

Results

1. Descriptive Analysis

Characteristics of respondents based on their latest education are presented in the table below;

Table 2
Respondents by Education Level

No.	Last Education	Frequency	Percentage
1 .	High School	68	46.89
2.	Diploma	28	19.31
3.	Undergraduate	49	33.79
Total		145	100%

Source: Primary data, processed (2016)

From the table it appears that respondents with high school education amounted to 46.89%, followed by 33.79% of undergraduate education. While the smallest number of respondents have diploma level that is 19.31%. Mostly, the businessmen of SME of Cirebon Trusmi Batik with high school education are those who have been running the business for long time. Some of them continue running the business from their parents. That is why, they are mostly self-taught businessmen with no particular experience in education or other schools. In conclusion, the business actors of Cirebon Trusmi Batik should improve their knowledge or get additional education in order to increase capacity and capability in running the business.

This analysis was conducted to obtain an overview of the variables used in this study. This study used two independent variables, namely innovation (X1), creativity (X2), risk consideration (X3) and one that is already bound i.e. business competitiveness (Y). The explanation of categorization used 145 respondents and the scale used is a Likert scale with a score of 1-5. The classification criteria of innovation, creativity, risk consideration and business competitiveness is obtained from:

$$\text{Range Score} = \frac{(145 \times 5) - (145 \times 1)}{5} = 116$$

From the above calculation, the range score is 116. Thus, classification range of each variable can be seen in the following table:

Table 3
Classification
Criteria

Variable	Score		Number of Classifica tion & Interva l Class	Variable score	classification range	
	Highest	Lowest				
Innovation (X1)	30	17	5 (116)	379	Very high High Fair Low Very low	609 – 724 493 – 608 377 – 492 261 - 376 145 – 260
Creativity (X2)	30	14	5 (116)	386	Very high High Fair Low Very low	609 – 724 493 – 608 377 – 492 261 - 376 145 – 260
Risk consideration (X3)	30	11	5 (116)	392	Very high High Fair Low Very low	609 – 724 493 – 608 377 – 492 261 - 376 145 – 260

Business competitiven ess (Y)	25	16	5 (116)	379	Very high	609 – 724
					High	493 – 608
					Fair	377 – 492
					Low	261 - 376
					Very low	145 – 260

Source: research results 2016

The table above shows that some variable such as innovation (X1), creativity (X2), risk consideration (X3) and businesses competitiveness (Y) are in the category is fair. This is important for any organization facing the tightening competition to have the capability of innovation, creativity, and risk considerations (Ulrch, 1998). To obtain a sustainable competitiveness, businesses should be able to grow the capabilities of all of the resources owned by the firm (Barney, 1991). Wernelfelt, (1984); Barney, (1991), Amit and Schoemaker (1993) mentioned that the high operating performance will be more easily achieved if the company has the resources competency and reliable competitiveness. While Durand (1999: 45) stated that entrepreneurship orientation, creativity and innovation will support the creation of non-imitability resources, non-transferability and non-substitutability which are the source of sustainable competitive advantage. Agi Syarif (2015) also stated that business competitiveness of SMEs can be seen from the capabilities of SME businesses like entrepreneurship orientation. It can be used to improve the competitiveness of businesses in the era of MEA as today. SMEs now have greater chance for export market if the they have willingness for innovation, creativity and risk consideration.

2. Test of First Hypothesis: Relationship between Innovation (X1), Creativity (X2) and Risk Consideration (X3)

The test results of the first hypothesis by using program SPSS 19.0 are as follows:

Output of Hypothesis 1
Correlation
s

		Innovation	Creativity	Risk considera tion
Innovation	Pearson Correlation	1	.880**	.910**
	Sig. (2-tailed)		.000	.000
	N	145	145	145
Creativity	Pearson Correlation	.880**	1	.946**
	Sig. (2-tailed)	.000		.000
	N	145		145	145
Risk considerati on	Pearson Correlation	.910**	.946**	1
	Sig. (2-tailed)	.000	.000	
	N	145	145	145

**. Correlation is significant at the 0.01 level (2-tailed).

The test results of correlation between the variable of innovation, creativity and risk consideration indicate that these three variables are significantly correlated. Of the value of correlation coefficient generated, the structural relationship reflected in the first sub structure is as follows:
Figure 2. The first sub structure

Correlation tests among variable X1, X2 and X3 indicate that there is a significant correlation among innovation, creativity and risk consideration. The correlation score of innovation and creativity is 88%, creativity and risk consideration is 94.6%, while innovation and risk consideration is 91%. Based on these results, the first hypothesis stating that there is a relationship among innovation, creativity and risk consideration is acceptable or cannot be rejected.

3. Testing of Hypothesis Two: innovation (X1), creativity (X2) and risk consideration (X3) have simultaneously and partially Influence on competitiveness (Y)

   Simultaneous Hypothesis Testing (Test F-statistics)
   The F-statistic test basically indicates whether all the independent variables included in the model together (simultaneously) do not have a significant effect on the dependent variable. F value is derived from the table ANOVA (analysis of variance).
   The calculation result of the value of F-count for a regression model can be seen in the table below:

**Table of F-test
Result
ANOVA
b**

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	49.430	3	16.477	6.646	.001[a]
	Residual	101.646	141	2.479		
	Total	151.076	144			

a. Predictors: (Constant), X3, X1, X2

b. Dependent Variable: in percentage (%)

Source: attachment of output result of SPSS 19.0

From the data processing shown in the above table, it can be seen that the value of F-count equal to 6.646 with a p-value of 0.001. Therefore, the p-value (0.001) is smaller than a predetermined value α (0.05). It can be concluded that the independent variables (innovation, creativity and risk consideration) have simultaneously significant effect on the dependent variable (competitiveness) on the level 95%.

Partial Hypothesis Testing (Test t-statistic)

To determine whether or not there is a significant influence of the independent variables partially on a dependent variable, statistical t-test was used. Partial hypothesis testing was done by comparing the value t count with t-table value for the error rate of 5% and degrees of freedom (db) = nkl = 145-2-1 = 142 is 1.682.

The calculation result of value t count for each independent variable in the regression model was examined and the decision of partial test is presented in the following table:

Table 3
Partial Hypothesis Testing (t-test)

Variable	t-count	t-table	P-value (sig)	Decision	Note
Innovation (X1)	3,741	1,682	0,000	H0 is rejected	Significant on α = 0,05
Creativity (X2)	1,608	1,682	0,115	H0 is not	Not significant on α = 0,05
Risk Consideration (X3)	-3,331	1,682	0,002	H0 is rejected	Significant on α = 0,05

Source: processed data (2016)

Partial testing result (t-test) to see the significance of each independent variable in the regression model can be described as follows:

1. The significance of innovation on competitiveness
   From the calculation, the value of t-count for innovation variable (X1) is 3.741 with a p- value of 0.001. Therefore, the p-value (0.001) is smaller than a predetermined α (0.05), it can be concluded that partially innovation has a significant effect on the competitiveness with the 95% confidence level. This means that the results of this study manage to reject H0.

2. The significance of creativity on competitiveness
   From the calculation, the value of t-count for creativity variable (X2) is 1,608 with p-value of 0.115. Therefore, the p-value (0.115) is greater than a predetermined α (0.05), it can be concluded that partially, there is no significant impact of creativity on the

competitiveness with the 95% confidence level. This means that the result of this study does not manage to reject H0.

3. The significance of risk consideration on competitiveness
   From the calculation, the value of t-count for the variable risk consideration (X3) is
   3.331 with a p-value of 0.002. Therefore, the p-value (0.002) is smaller than a
   predetermined α (0.05), it can be concluded that partially, risk consideration has a significant effect on the competitiveness with the 95% confidence level. This means that the results of this study manage to reject H0.

To see the influence of innovation (X1), creativity (X2) and risk consideration (X3) on competitiveness (Y), a multiple regression analysis was employed.

Table of Coefficient of Multiple Regression
Coefficients
a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1 (Constant) X1		16.855	1.316		12.803	.000
	X2	.519	.139	1.169	3.741	.001
		.201	.125	.642	1.608	.115
	X3	-.305	.092	-1.526	-3.331	.002

a. Dependent Variable: in percentage (%)
Source : attachment of output of SPSS 19.0

Based on the above calculation, from three independent variables, creativity (X2) is not significant. This can be seen from the probability of significance for creativity (X2) is 0,115 and far above 0.05. While the innovation (X1) and risk consideration (X3) are significant at 0.05. Thus, it can be concluded that the competitiveness variable is influenced by innovation and risk consideration with the following equation:

$$Y = 16{,}855 + 0{,}519\ X1 + 0{,}201\ X2 - 0{,}305\ X3 + \varepsilon$$

Regression coefficient value on the independent variables describes when the independent variable is expected to rise by one unit and the value of other independent variables is estimated constant or equal to zero, then the value of the dependent variable can be expected to rise or fall in accordance with the sign of regression coefficient of the independent variable.

The constant of 16.855 means that the assumption of independent variable is considered constant, then the average competitiveness will be 16.855. The regression coefficient for the variable X1 is positive, indicating the existence of a direct relationship

between innovation (X1) and competitiveness (Y). The regression coefficient for variable X1 is positive implying that each additional value on innovation will improve the competitiveness (Y).

The regression coefficient for the variable X3 is negative, indicating that there is an opposite relationship between risk consideration (X3) and competitiveness (Y). the regression coefficient for the variable X3 indicates that each any reduction in risk consideration performed by a company will reduce competitiveness.

The coefficient of determination (R2)

The influence of innovation, creativity and risk considerations on the competitiveness is shown by the coefficient of determination for the regression model obtained. The calculation of the coefficient of determination (R2) can be seen in the following table:

Table of Coefficient of determination
(R2) Summary Model

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.572ᵃ	.327	.278	1.57454

a. Predictors: (Constant), X3, X1, X2
Source : attachment of output of SPSS 19.0

The table above shows the coefficient of determination (R Square) of 0.327, meaning that 32.7% of competitiveness can be affected by the innovation, creativity and risk consideration. While the remaining amount (100% - 32.7%) = 67.3% can be affected by other variables not examined in this study.

The description of the structural relationship is reflected in the structure of the second sub image which shows the influence of innovation, creativity and risk consideration on the competitiveness, both simultaneously and partially. This is shown as follows:
Figure 3. Output of the second sub structure

From the picture of the substructure, it can be said that the entrepreneurial orientation measured by an indicator of innovation ability and creativity can affect the competitiveness of SMEs of Cirebon Trusmi Batik . This empirical study supports the

previous theories by Hult and Ketchen (2001), Matsuno et al. (2002), Naman and Slevin (1998), Lumpkin and Dess (1996), Miller (1983), Naman and Slevin (1993), Ferrera et al. (2007), Zhou et al. (2005) and Jay and Mort (2001). While Tayebeh Gheydar, et al, (2015) conducted a study on the relationship between entrepreneur's innovative capabilities and competitive advantage with an empirical result showing that the innovative capability may affect the sustainable competitive advantage of a business organization. Li, et al, (2009) in their research found that entrepreneurial orientation is positively related to business growth. Thongvanh Sirivanh et al (2014) showed that the factor of entrepreneurial orientation positively affects competitive advantage. The study by Harper (2003), Griffin et al., (2004), Longenecker et al., (2000) mentioned that entrepreneurship can enhance trade performance.

But, this study shows a different result from the previous studies where the entrepreneurial orientation indicator, i.e. risk consideration does not affect   the competitiveness of SMEs. The risk consideration (X3) is not in line with the competitiveness (Y). This is in accordance with the characteristics possessed by the SMEs of Cirebon Trusmi Batik where in running the business, they often do not use risk factors. So, the efforts to in creating competitiveness still need continuous learning in order the SMEs can make decisions appropriately and carefully. Other factors showing that SMEs of Trusmi Batik have less risk consideration in running the business are, the business is run by family management, business is a legacy in its nature and the managerial competence is not good yet. These factors make them run the business without a wide business target. This is influenced by experience, educational background, capabilities, and competencies. The weakness of batik micro businesses is entrepreneurial orientation, therefore it requires serious attention. Batik micro businesses should proactively deliver their needs of training associated with entrepreneurial orientation in order to improve their business performance.

Conclusion

Based on the results and discussion, the conclusions are drawn as follows:

1. Partially, innovation has significant influence on competitiveness, showing that to acquire business competitiveness, innovation capability is highly needed by the businesses actors. This result is consistent with several studies previously conducted, because basically business innovation is the ability to create something new and different from competitors.
2. Creativity has no significant effect on competitiveness. It is clear that building business competitiveness needs entrepreneurial orientation, in this case is creativity ability. But the business actors of Trusmi batik have a low level of creativity so the business competitiveness has not been seen. It is caused by several factors such as; business of Trusmi batik is a legacy in nature so it is running already and has existing markets. This makes the business actor does not seek extra thought on how to develop the business.
3. Partially, risk consideration significantly influences competitiveness. In this case, SMEs of Trusmi batik need courageous to take decision so they can expand their business and compete with the competitors. This contrasts with the creativity ability that has no effect on competitiveness. In fact, being dare to take decisions has relationship with aspects of business development that will increase profits. So, the businesses try to develop themselves by paying attention to the risks.
4. There significant correlation among innovation, creativity and risk consideration. The correlation between; innovation and creativity is 88%, creativity and risk consideration is

94.6%, innovation and risk consideration is 91%. This means that in order to build

competitiveness on the batik industry, entrepreneurial orientation is needed which is manifested in the capability of innovation, creativity, and risk consideration.

5. Business competitiveness is highly influenced by various factors, among them is entrepreneurial orientation manifested in innovation, creativity and risk consideration.

This is evidenced in the research results simultaneously saying that innovation, creativity and risk consideration influence the level of competitiveness. From this study, it appears

that the effect of entrepreneurial orientation on business competitiveness is still relatively small. This shows that the actors of SMEs of Trusmi batik do not yet use their

entrepreneurial capability to develop their business, so there is a need to provide managerial training so they can run their business in a better and more modern way.

ONLINE MAIL HANDLING PROBLEMS AND SOLUTIONS IN KARANGANYAR REGENCY

C. Dyah Sulistyaningrum Indrawati, Universitas Sebelas Maret, Indonesia
Andre Noev Rahmanto, Universitas Sebelas Maret, Indonesia
Anton Subarno, Universitas Sebelas Maret, Indonesia
Rosihan Ari Yuana, Universitas Sebelas Maret, Indonesia

Abstract

Online administration services are already applied in the information technology era. Officers involved in services of administration no need face to face communication to complete daily works. This research aims to analyze the implementation of online mail handling in Karanganyar Regency and to solve its obstacles based on educational perspective. This research used inductive-deductive approach. The procedure of this research consisted of three phases; disseminate system of online mail handling, focus group discussion (FGD), and discussions and question. Participants of the FGD comprised 33 officers; 28 males and 5 females. The result of this research shows that there are three main problems related to the implementation of online mail handling: local regulation, hardware maintenance, and officers' skill. A periodical leader in the region applies periodical regulation that has different orientations of the government's performance. All problems above will be discussed in this paper.

Keywords: *online mail-handling, government performance, officers' skill*

Introduction

Online administration services are popular in the information technology era. Front officers of public service agile to serve customers using compatible technology. Expert in administration is the most evident in government departments and agencies, then followed by strategic human resource specialist, and strategic business partner (Salleh, Rosline, & Budin, 2015).

Internal procedure of administration for each department can be completed by a system while it does not need different follow up or feedback. The work of the system reduces the workload. Computers are not a novelty for all levels of government officer.

However, system uniformity, officers' competency and completeness of equipment need to be synchronized. Identifying the correct resources leads efficient and quality of performance (Thorwarth, Rashwan, & Arisha, 2016). For instance, an emergency department of hospital needs an accurate action to rescue an incidental patient.

An online procedure of administration service is already proven to support governmental tasks. Not only supporting the paperless program, but also the quick service within the unrestricted range. This kind of workflow needs to be reinforced by regulation or policy which pushes officers to update their skills and competencies. Otherwise, they will lack of skill using technology to support their task.

This research aims to analyze the implementation of online mail handling in Karanganyar Regency and to solve its obstacles based on educational perspective. This paper is organized as follows. In section 2, government and bureaucracy as procedural work is explored. In section 3, the methodology is presented. The result and discussion are also presented in section 4. Finally, our work of this paper is summarized in the last section.

Government And Bureaucracy

Public administration influenced various external   factors   that   influence management action and behavior through different means and channels. External factors are societal value, legal norms, politics, international-global accords, culture, and the state of economy (Jreisat, 2012). Each factor has specific powers to the administration. It depends on the kinds of public   administration   and   country.   Traits of public administration in developing countries are overlapping and heterogeneity, formalism, diffusion, particularism and ascription, imitation rather than development, deficiency of skill, nonproduction-oriented bureaucracy, autonomy, over   staffed   public   organization, underpaid public employee low productivity, centralized decision making, corruption, administration mirrors the political context (Jreisat, 2012).

Innovation is a phenomenon that has happened in public sectors. Hierarchical and long procedural services initiate to support innovation. Borins (2014) categorizes   innovation into five components: a crisis, a problem, political influence, new leadership, and new opportunity. A crisis arises when government's performance fails in service or people are dissatisfied with the government's performance. In this case, problems will appear five times. Slow response because of political influences also leads the government breaks down to visible crisis. Political influences can be categorized: new regulation, lobbying, and an election mandate of the winning candidate's platform (Borins, 2014). New leader applies new regulation.

The features of administrations have common characteristics, namely: a balanced system of power   distribution, a focus on results, technology at the service of management, a profound   concern   for   ethics   and   accountability,   and   redefined   the role of public administration and its linkages with private sectors (Jreisat, 2012). Bureaucracy often follows the political order and turn into either of an overpowering institution.

Government defined success bureaucracy based on outputs and outcomes. Performance of bureaucratic management aims to increase accountability, reducing errors, minimizing customer's complaint, improving officers' skill, and developing management. The performance enables to adapt and to apply appropriate technology that improve services and decision making process. Policies and commitments have been made and dedicated to suitable decision. The policies also enhance ethics accountability of government. Another alternative has been considered in the policy to the possibility of joint public-private services.

Methodology
This   research   used   the   inductive-deductive approach. The procedure of this research consisted of three phases; disseminate system of online   mail   handling,   focus   group discussion (FGD) of officers in Karanganyar regency, and discussion and question phase. Total participants of FGD are 33 respondents who consist of 32 officers and the head of administration division; 28 males and 5 females. The range of age is 24 to 56 years old (mean = 44.1) and their working experience between 1 to 35 years (mean = 18.7). Dissemination session was started with the researcher's presentation and practice of the online mail handling system; then followed up by a question and answer. In presentation and practice session, participants followed the steps of online mail handling instruction using their laptop. Some participants gave suggestions about the system of online mail handling based on their experience. They suggested the maintenance of the system should be done continuously. The result of FGD was analyzed to improve the system of online mail handling and to solve the problems based on educational perspective.

Results And Discussions

The implementation of online mail handling has three phases: practice exercise, real practice, and discussion and question phase. The first phase, practice exercise, is not easy as theoretical review. For instance, when a mail comes, it will be opened and sorted by the incoming mail receiver. Then, to be identified the addressee and recorded in a system. Next an archivist gives a mark and the letter forwarded to the leader to get a disposition. The disposition will be followed up by an executor to give feedback or response. This procedure can work well if all employees have the same knowledge to handle incoming mail. In practice, they have not same background of knowledge. It takes time to explain about the procedure of work and to make sure that they are in the same perception of mail handling. Fortunately, it covered during practice exercise session.

The second phase is the practice of online mail handling. The system of online mail handling has been set up in Indonesian language. It makes them familiar with a command button. However, they are still having problems. Some of them are; internet connection, unfamiliar code, and unsure of the correct procedure. Sometime, they are still awaiting feedback from a partner. All problems are recorded by researcher to improve the system of online mail handling.

The last phase is discussions and questions. In this phase, researchers found three main problems that are local regulations, maintenance schedule of computer, and officers' skill. Local regulation almost changed every five years because a regent in this regency is elected every five years. Each regent cannot be elected more than twice periods. Hardware maintenance relates the local regulation. Of course, it deals with financial department. Budgeting every year depends on the local council and local government decision. Furthermore, officers' skill cannot be improved as fast as technological development. It needs a solution to improve their skill without leaving their office for a long time. The three problems above will be discussed based on educational perspective.

The first problem is local regulation often changed. Inconsistent regulation can be anticipated through project orientation and interest group lobbying. Hellowell & Vecchi (2015) state when the goal of the firm's manager is inconsistent with the firm's owner, manager may prioritize and structure projects, for instance, choose project that offers the most prestigious, most career-enhancing rather than offer the biggest increase in the value. The interest group can influence decision makers to a certain policy. Grossmann (2012) states the changes of federal policy in certain areas, covered by the policy history 1945-2004, is influenced by interest group. Advocacy groups are more influential than business interest, professional associations or unions. The groups use a specific tactic, for example, political action committee (PAC) contribution or lobbying expenditure, to influence policy makers.

The second problem is hardware maintenance. Maintaining hardware of Computers can be done in three ways; maintenance contract, individual service call, and company-operated service (Sutaryadi, Wagimin, Subarno, & Martini, 2007). Maintenance contract means a maintenance machines agreement between buyers and sellers that sellers will be required to maintenance machines for a certain period. This agreement can be done during the payment is processed. Individual service call relates a technician service. He or she will be asked to come when machine is broken. There is no agreement before. Company-operated service refers to the officer's ability. The officer will be sent to join a short course or training program about how to maintain computers or machines. The three kinds of maintenance machines can be chosen one of them or combined. It depends

on institutional needs.

The new trend of maintenance is integrated in planning procurement. Total productive maintenance (TPM) and reliability centered maintenance (RCM) that involves internal and external stakeholder should be mentioned in integrated planning (Al-Turki, Ayar, Yilbas, & Sahin, 2014). This trend results big budget, but it will cover all maintenance cost. TPM and RCM should be checked carefully and clearly to anticipate complaint each other later.

The third problem is the lack of officers' skill. Officers' skill or competency needs to be updated to follow the technological development. As mentioned before, the key point of successful administrators is agile with appropriate technology. Expert in administration is the most evident in government departments and agencies. Officers' skill can be improved in three ways: push human resource development facility, online learning, and informal learning. Push human resource development facility can be done in two models: providing equipments and providing short course programs. Providing equipments means the human resources department has to have facilitated development to develop officers' competency. Providing short course programs mean the human resource department should facilitate the development of personal goals and the company's goals, the need of new competency, competency based benefit, identification of competency need, and method of training (Pandey & Guha, 2014). In this case, human resource development must have full facilities. Morris, Snell, & Bjorkman (2016) state that human capital can be developed from the individual level, the unit level, and the firm level. The individual level means companies hire an individual who has experience about the company's need to develop internally. It relates to the employee engagement of interaction to the local constituencies. The unit level relates to the aggregated knowledge and experience among individuals while they interact each other in the local environment. Strong local human capital may push the local unit to understand their local environment. The firm level refers to the challenges to control and coordinate the employee. Companies emphasize the importance of knowledge as a foundation for the organization. The second solution to improve officers' skill is online learning. Macleod, Haywood, Woodgate, & Alkhatnai (2015) state massive open online courses (MOOCs) is a partnership to develop career enhancement and professions. Learners can learn without leaving their daily activities. They can follow the course synchronous and asynchronous. They also can manage the course according to their own times. The last solution to improve employees' skill is informal learning. The definition of informal learning is a learning process that takes

place outside specifically designed to result in learning outcomes (Allen, 2007). In this situation, learners never feel learning, but they are discovered real-life experience from coworkers, coaches, and mentors. These interactions are effective to improve employees' capability. The three solutions to improve employees' skill is applicable. They have not left their office to study on campus.

Conclusions

Expert in administration is very important to support government's performance. Bureaucracy often follows the political order. It leads slow response of the government's performance that makes government breaks down to visible crisis. Otherwise, government performance can be built through good services of administration.

The working of administration service is influenced by supporting regulation, compatible technology, and officers' skill. Unfortunately, the three factors are obstacles in implementing of online mail handling.

Inconsistent regulation can be anticipated through project orientation and interest group

lobbying. The advocacy group is the most influential local regulation.   The groups use a specific tactic, to influence policy makers. Maintaining hardwares and equipments need to be paid attention.

The four alternative ways to keep equipment in good condition: maintenance contract, individual   service   call,   company-operated service, and integrated planning procurement. An update knowledge of officers is required to comply the Technological development. Officers' skill can be improved in three ways: push human resource development facility, online learning, and informal learning. The best solution to update officers' skill does not refer to certain way, but it depends on the financial support of government, human resource, non-human resource, and other capability.

MANAGEMENT EDUCATION IN INDIA: QUALITY ISSUES AND CONCERNS

Roshan Lal Raina, JK Lakshmipat University, India
Ashwini Sharma, JK Lakshmipat University, India

Abstract

Management education till recent past was one of the most sought after professional streams of education to be pursued by bright young minds of India. Despite the facts that: (i) the nation needs a good number of professionally competent managerial manpower to manage its affairs and (ii) there has been a steady growth in the number of management education institutions set up by the government as well as private bodies in the recent past, the interest level to pursue management education has faded over the years. The paper attempts to illustrate as to how continuous degradation of 'quality' in terms of 'input', 'process' and 'output' at such institutions, particularly at tier two and tier three levels, has been a prime factor responsible for such a down-trend. An attempt has also been made, in the paper, to suggest measures to bring in and build on the element of 'quality' in all these three critical components in a management education institution, so that they live up to the expectations of all the stakeholders by producing, nurturing and grooming industry-ready professionals.

Keywords: *Management Education, Management Institutes, Quality Concerns in Education, Systems Approach*

Introduction

In 700 BCE, the world's first University was established at Takshila in India and in 400 BCE, it was the Nalanda University. Nalanda University hosted 10,000 students and 2,000 teachers (often from foreign lands) exchanging knowledge across countless disciplines, including science, astronomy, medicine, metaphysics, philosophy, Samkhya, Yoga-shastra, the Veda, and the scriptures of Buddhism and foreign philosophy (Ministry of Human Resource Development, Govt. of India, 2016). Indian education system has been influenced by Mughal and British thought. This perhaps marked a declining trend in the standards of quality education as far as Indian wisdom goes. Post-independence, the concern for improving education has always remained as a top priority in the developmental agenda. However, for various reasons, the quality and outcome of the Indian education system, the trust it invokes among stakeholders and its stature globally, have not shown positive signs. In 2016, there are only two Indian institutions that barely make it among the top 300 institutions in the world. In management education, premier Indian institutions feature between 51-100 among 200 institutions of the world (Quacquarelli Symonds Limited, 2016).

Despite starting first, the Indian education system could not sustain as a leader of educational delivery in the world. The Indian education system is ranked 24 among 50 countries of the world (Quacquarelli Symonds Limited, 2016). The argument that modern Indian education system gained autonomy only about 70 years ago to have affected a turnaround is refuted by countries such as South Korea and Finland, which have transformed their education systems within half a century (Choi, 2014) and are ranked higher than India (Quacquarelli Symonds Limited, 2016). Internally as well, among the institutions accredited by National Assessment and Accreditation Council (NAAC), 68 per cent of the Universities and 91 per cent of the colleges are rated average or below average in terms of the quality parameters specified. The quality of education provided in a large number of higher education institutions is a matter of great concern. (Ministry of Human Resource Development, Govt. of India, 2016).

The admissible evidence against higher education quality in India is available in superfluity. In the management education realm, qualitative deficit has set off a negative spiral. Only 7 per cent of the graduates from 5,500 business schools excluding IIMs are employable. This leads to dissatisfaction in the corporate sector which translates into decrease in campus recruitment by 45 per cent YoY. The dwindling placement records discourage students from choosing a post-graduate management program, resulting in a surplus of seats over takers in many colleges, which adversely impacts their sustainability; 220 business schools have shut down within the last two years and another 120 are likely to follow the suit (ASSOCHAM Education Committee, 2016). The aftermath is a downtrend in the popularity of postgraduate management studies in India. Majority of students think that opting for a management course was a wrong decision. Students are dissatisfied with the academic scenario and placement capabilities of their colleges (Raina, Alam, & Siqddiqui, 2014).

It is imperative and urgent to address these quality concerns in business schools. Only then the B-schools can be expected to significantly improve people's lives and at the same time ensure sustainable growth for themselves (Comuel, 2010). In a developing country like India, with huge inequalities in income, institutions providing business education need to meet developmental goals (Gupta & Kamala, 2005). It is only necessary to ensure that such institutions meet the quality standards requisite in as much they discharge their developmental duties whilst satisfying the stakeholders – students, faculty, society, industry, government and global community at large (Shweta & Kumar, 2011).

Since quality in a B-School is multidimensional (Shahaida, Rajshekhar, & Nargundkar, 2007), it is a challenge to measure and remedy the quality deficits in the management education system. This paper assumes the said challenge, and seeks to develop a better understanding of the subject by application of systems theory, and derive possible rectification strategies.

1. Management Education in India
   1. *Timeline*

      Management education in India formally began in 1953 at the Indian Institute of Social Welfare and Business Management (IISWBM) –the first B-School established by Government of West Bengal and Kolkata University. IISWBM experiment of

Chart 29. Data Source: (AICTE, 2016)
offering two-year, full-time MBA program was followed by Delhi University (1955), Madras University (1955), Bombay University (1955) and Andhra University (1957).

The Government of India established Indian Institutes of Management (IIMs) as center of excellence in Management education in early 1960s.

The first Indian Institute of Management was set up in Kolkata in 1961 and the second in Ahmedabad in 1962. Elite club of IIMs added new members in 1973 (Bangalore), 1984 (Lucknow) and 1997-98 (Khozhikode and Indore). By 1980, several state universities across the country started offering MBA programs. Private sector entered the Management education domain after liberalization of economy in 1991. Regulation of Management education began in 1987 when All India Council for Technical Education (AICTE) was formed and management education was taken as part of the technical education. AICTE helped in regulating the B-Schools in terms of governance, accountability, transparency in admission and program administration, infrastructure, students-faculty ratio, curriculum, library, laboratories, grant-in-aid for organizing seminars, conferences, faculty development programs, setting up of entrepreneurship development cell, institute-industry interface cell, etc. (Shweta & Kumar, 2011)

2. *Statistics*

The early years of management education witnessed an incremental growth in the number of management institutes of the nation, until 2009, whence a decreasing growth began, but more were still added (Raina, Alam, & Siqddiqui, 2014). However, in the last five years, India has seen a persistent decline in the number of institutions offering post-graduate management programs. In past four years, the number has reduced by 3.5 per cent every year. On an average, 31 new institutes were approved every year during 2012-16 (as of August 31st 2016) against 56 institutes being shut down on average every year during the same period (AICTE, 2016).

Chart 30. Data Source: (AICTE, 2016)
The total intake (capacity) of postgraduate management programs has drastically declined after 2014-15. The past two years have recorded a negative growth rate of 5 per cent in the number of seats offered in AICTE approved institutions. Similarly, enrolment numbers that showed a steady increment as high as 7 per cent in 2014-15, have fallen by 2 per cent in 2015-16. Number of students successfully graduating has also declined by 1 per cent in 2014-15. Even placements records, which witnessed a steady increase before 2013-14, flat-lined in 2014-15 before finally dwindling with a negative 7 per cent growth rate in 2015-16. The numbers of faculty in approved postgraduate management institutions exhibited vehement growth – as high as 28 per

cent - during 2012-14, after which set upon a decreasing trajectory, falling by 3.5 percent every year up to the current period. (AICTE, 2016). It is evident from the given statistics that postgraduate management education has entered a phase of negative growth after 2014-15.

3. *Issues*

Though, India produces a large number of graduates, perhaps next to U.S., a scholarly debate on curriculum pedagogy and innovation is negligible. Most institutes depend on curricula and materials developed elsewhere and have not developed on intrinsic capacity to respond and evolve to changing needs of various sectors of industry. Many institutions still are unable to fulfill the mandatory changes imposed on them, such as upgrading of the curriculum by the universities or the board of management studies (Saha, 2012). MBA students reported that there were huge gaps between what was promised and what the actual delivery was. They complained that the teaching methodology was poor, with no practical exposure and training. They expressed dissatisfaction over the quality of the faculty too (Bhagwath, 2013). In the backdrop of declining enrolments, Indian management education is also plagued by a lack of student engagement. Higher education institutes suffer from insufficient understanding of student engagement, and therefore face deviant student behavior (Sharma & Awasthi, 2016).

A skills gap analysis was carried out to discover the differences in employers' expectations and the actual performance of MBA graduates. The sample recruiters were of the opinion that on the parameters of knowledge, skills and attitude, there were remarkable differences between the expectations they (recruiters) had and the actual delivery. Majority of the recruiters blamed the colleges - more than 80 per cent stating that the choice of college made a huge difference. Expressing their views on coursework, majority of the respondents felt that barring the Tier 1 institutes, rest all were extremely weak in terms of the knowledge and skills being imparted.

Chart 31. Data Source: (AICTE, 2016)

	Intake	Enrollment	Graduates	Placement	Faculty
2013-14	2%	-1%	4%	6%	28%
2014-15	1%	7%	-1%	0%	16%
2015-16	-5%	-2%		-7%	-4%
2016-17	-5%				-3%
They stressed upon the need to have industry-exposed faculty so that practical knowledge may be imparted to the students. (The Higher Education Forum, 2010) as cited by (Raina, Alam, & Siqddiqui, 2014). The existing teaching pedagogy is responsible for the students' inability to understand the limitations associated with the theories that they are taught in the classrooms. Additionally, they can't practically apply these classroom theories. This happens because they lack the requisite skills and attitudes to apply the theories. (Datar, David, & Cullen, 2010).

Over the past decade, Indian institutes have made huge investments towards increasing their effectiveness. However, in majority of cases, the focus has been on infrastructural development, and not competency building in terms of teaching and research. Students, not getting quality education, have developed aversion towards management courses, and are constrained to go for other conventional courses (Ranjan & Khalil, 2007). Shortage of qualified faculty in Indian B-Schools is also a major concern.

Currently the institutions are facing 30 per cent shortage of faculty and it might rise up to 50 per cent by 2020 if the scenario does not improve (Shweta & Kumar, 2011). Faculty in most B-schools do not have a doctoral degree (Shahaida, Rajshekhar, & Nargundkar, 2007). There is a pronounced lack of research infrastructure (Shukla, 2013). Unfortunately, most of the B-schools have thrived on marketing gimmicks and advertising budget rather than intellectual endeavors (Shweta & Kumar, 2011). Often, critical elements, such as infrastructure, faculty-student ratio, number of PhD faculty in an institute only feature in plans, to get AICTE approval (Shahaida, Rajshekhar, & Nargundkar, 2007).

4. *Systems Approach to Management Education*

A system can be defined as an entity, which is a coherent whole such that a boundary is perceived around it in order to distinguish internal and external elements and to identify input and output relating to and emerging from the entity (Irene & Yip, 2009). Systems theory is hence a theoretical perspective that analyses a phenomenon seen as a whole and not as simply the sum of elementary parts. The focus is on the interactions and on the relationships between parts in order to understand an entity's organization, functioning and outcomes (Mele & Pels, 2010).

The benefits of applying systems theory to management education have been outlined by Gupta and Gupta (2013). It provides a framework for planning, decision-making control and problem solving. It throws light on the dynamic nature of management, provides a unified focus to institutional efforts, and helps to look at institution as a whole instead of parts. It also helps the administrator to identify the critical sub systems and their interaction with each other, and bring efficiency. It aids systematic educational planning and maximum utilization of resources, and helps in improving examination and evaluation system. It also improves the teacher training programs. Applying systems theory to management education administration also helps in improving the overall quality of the system.

5. *Quality in Management Education*

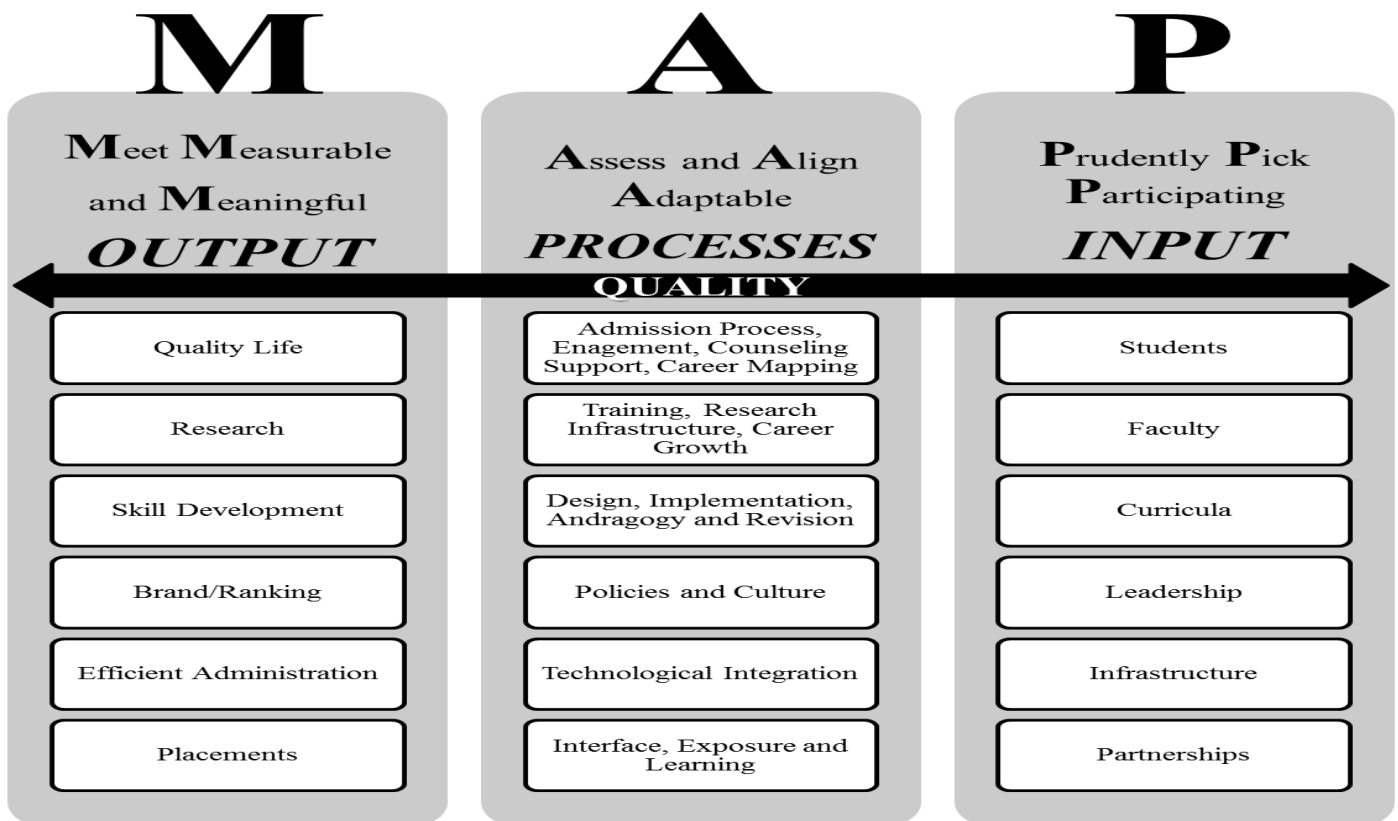
Quality is complex and difficult to measure in service sectors. Quality can be defined as the totality of features and characteristics of a product or service that bear on its ability to satisfy stated or implied need. Applying industry-type quality programs in education may be very difficult, and a holistic perspective for measuring quality of management education is needed, which addresses all aspects including academic, non-academic, admission process, placements, perspectives of parents, faculty,

students, government, external bodies and the like (Shahaida, Rajshekhar, & Nargundkar, 2007).

Abundance of research has been conducted in defining parameters of management education quality. Laha (2002) as cited by (Shahaida, Rajshekhar, & Nargundkar, 2007), has identified academic environment, intellectual capital, physical infrastructure, industry interface, placements, innovation and stakeholder satisfaction as the key indicators of quality. Quality of students and admission process, pedagogy, placements, faculty development and infrastructure, have been collectively proposed as a measure for B-School quality. (Gupta & Gollakota, 2003). Shahaida, Rajshekhar and Nargundkar (2007) have proposed a framework based on systems theory, for measuring quality in B-school through three constructs – quality in inputs, quality in processes and quality in outputs.

The Quality Map

We have built upon the existing research in system science approach to modeling management education to develop a better understanding of stakeholders and processes involved in achieving quality outcomes.

However, we posit a counter-intuitive approach, and suggest a three-step model:


The motivation behind revisiting the systems model in reverse order lies in the evidence that most institutes that focus their efforts on procuring high-quality output, i) do not focus on building processes to attract such input, ii) cannot utilize such output due to absence of effective processes and ambiguity of output definitions and iii) often compromisingly switch to quantity-focused approach at their inability to attract quality-input. We suggest reverse engineering the systems model, to use effective processes that are based on clearly defined outputs to attract desired inputs.

The advantage of MAP model as proposed by us, in addition to the benefits that ply with systems approach, lies in its insight into the implementation of the systems model – Outputs must be meaningful and measureable, processes must be adaptable, and must be assessed and aligned with the multiplicity of outputs, and inputs that can participate in qualitative institutional development must be picked with prudence.

Quality is the soul of the MAP model. Foremost, the MAP framework helps in defining quality standards translated into measureable outputs, which also serve as a yardstick for quality deviations. These outputs can be used to develop an institutional culture replete with processes that inspire, foster and reward high-quality performance. These processes can be leveraged to invite high-quality inputs, which appreciate the value of such processes, are compatible with them and identify with the quality outputs that serve as the rationale behind the process.

"Meet Meaningful and Measureable Outputs
By
Assessing and Aligning Adaptable Processes
&
Prudently Picking Participating Inputs"

1. Outputs

    The MAP model brings the impetus on defining the sought outputs, at first. These outputs can include providing the means to lead a quality life for students, developing skills among students, enabling and empowering faculty to conduct high-quality research, ensuring efficient administration, creating a brand for the institute – supplemented by high rankings in global forums – which beckons integrity and accomplishment, satisfying needs of corporate, parents and other stakeholders by preparing a student to work, earn and contribute to the society.

    The MAP model recommends that quality outputs must be meaningful to the institute and its stakeholders **si**nce satisfaction is the central indicator of quality. Students and faculty often misidentify with the goals set by the institution, or due to the absence of a formal definition of such outputs. The industry has regularly protested the gap between corporate expectations and the academic goals of an educational institute. Such resentment can be addressed and prevented by deriving output standards that are centered on inclusive benefit for all stakeholders involved. Each of these outputs must echo with one or more individual objectives of the stakeholders, which will create a sense of citizenship and encourage synergistic partnership to achieve such output.

    Measurable to analytically reinforce or rectify corresponding processes. The objectives of a plan serve as the benchmark for assessment of performance during plan implementation. Pre-defined output objectives help in assessing compatibility of people and processes with organizational expectations, vivid role-and-task descriptions, scale for measuring deviance and overall, a calm and productive work environment. Measurability of outputs also allows stakeholders to assess the achievements and limitations, which will form the basis of discussions and support towards quality increment. Furthermore, an output that can be measured is an output that can be communicated and compared – output expectations can be used to display competitive advantage over other institutes, as well as assuage the anxiety of students and parents. These measurements can be as simple as a student balancing the amount paid as fees against the packages offered during campus placements, and as complicated as the measurement of institutional contribution to global research and development.

Students regard the ability of an institute to provide them a quality life as the primary purpose behind the educational experience. A stable and positive intellectual, financial, physical and emotional growth through management education carries a lot of meaning for students. These sentiments reverberate with their parents. To that effect, quality of life can be measured in terms of skills possessed, or salary or designation, etc., as per the orientation of the students. These measures themselves serve as outputs desired by a higher education institute. The faculty as well as corporate desire that a graduating student is compatible with the industry. Additionally, both the stakeholders are interested in research – the former needs a research-focused environment to enhance their knowledge, and the latter needs high-quality research to help solve practical problems. The institution regards success in its ability to differentiate itself from the competitors, and establish itself as a preference among elite-quality faculty, students and corporates. This is usually measured by its standing in national and international rankings, which primarily study the qualitative strength of a management institute.

2. Processes

Processes – as per the MAP model – are derived from the desirable output definitions. The MAP framework uses processes to meet two-fold objectives, i) to ensure institutional activities are coherent with desired outputs and, ii) to derive an appreciable filter to assess inputs that will be compatible with the quality standards of such processes.

We have identified an exhaustive list of processes, which include, admission procedures, engagement, counselling support, career mapping, training, research infrastructure, career growth for faculty, curriculum design, implementation, pedagogy and revision, institutional policies and culture, technological integration, industry-academia interface, exposure and learning exchange.

The MAP framework provides two distinct insights into processes for qualitative betterment of management education, which recommend that the processes be:

a. Assessed and Aligned with the academic and non-academic vision of the institution. More often than not, institutional processes are actuated in isolation. In fact, the motivation to actuate institutional processes rests in the need to conform to traditions, rather than to achieve institutional goals. Classroom teaching and curriculum design are seldom aligned with placement objectives. Training and placement efforts are hardly aligned with andragogy. Industry has a limited say in academic experience of the students, which is counter-intuitive because the same academic experience is responsible for developing skills in students, which are required in the industry. Furthermore, the academic experience is often irrelevant or redundant, due to lack of regular assessment of the curriculum. This misalignment is also evident in the low levels of student engagement – engaging students is often seen as a departmental or individual responsibility, rather than an institutional objective. Collectively, ad hoc efforts not only prevent success of quality-effort, they deplete the quality of individual efforts in the institution. Aligning these processes will result in an integrated effort towards quality-deliverance, which will be reinforced with every interaction between stakeholders and institutional departments, as well as within departments.

b. Adaptable to dynamic and often volatile trends in the environment. Management education in India is regularly accused of not updating itself, which also explains the lack of quality. It is imperative for the primary and

support processes of imparting education to be reviewed and revised as per changing requirements of the society, at large. Consequently, the cursory processes must be adaptable to allow for such change. The leadership must put-in-place processes that are flexible – but not casual – to address changes in the future. Adaptability is a measure of process quality, since it determines the system's ability to withstand changes without falling apart. Imbibing adaptability in andragogy, co-curricular development as well as in admission process and placement efforts allows the institution to pursue a multitude of objectives, without compromising the quality. Furthermore, adaptability of processes is essential in aligning the processes with one another, to achieve all-round integration in the scope of quality-deliverance.

It is obvious for admission process to be aligned with the classroom experience, to take into account faculty's teaching abilities and levels of engagement prerequisite to the classroom, to prevent incompatibility between the institutional culture and students enrolled. Similarly, andragogy, placement efforts and industry input must be aligned to ensure minimal deviance in development of skills in students. Internships and projects must be aligned with curriculum to ensure reinforcement of learning. Curriculum must therefore allow room for changes, since professional world's requirements from academic world continuously change. Therefore, agile processes are a priority in quality deliverance in management education.

3. Inputs

"Quality in, quality out" forms the fundamental assumption in the systems model. While, it is congruent in the context of management education, there is often a dilemma in ascertaining the quality of an input. We see students, faculty, curricula, leadership, partnerships and infrastructure as the common inputs in all management institutes. The declining quality of management education is often attributed to the declining quality of input available to these institutes. However, it is irrational to disregard any input as low-quality – it is often the institutions themselves that lack the quality-enhancing infrastructure to optimally harness the potential of available inputs. There are successful institutes which only permit intake of highly-qualified students, but there are also institutes which cater to low-scoring students but are successful is developing a rewarding career. We, thus, posit two categories of input "high-compatibility input" and "low-compatibility input."

Compatibility of input cannot be measured without comparison with processes and desired outputs. The MAP framework aids the choosing inputs, which are compatible, i.e. possess the ability and intention to participate in institutional processes, and identify with institutional objectives. This fact reinforces the need to begin by mapping the desired output first.

We also lay down two assumptions in choosing the inputs:

a. Prudence in selecting inputs. Most institutes aim for high-scoring students in the beginning, but towards the end of admission process enrol low-scoring students due to surplus of seats. Instead, the institutes should assess their processes and outputs, and form a real profile based on compatibility. Prudence also lies in looking beyond scores – the institutes should diversify parameters and include characteristics such as creativity and innovative ability, manners, family background, and aptitude for management education in choosing students, primarily because they collectively govern the success of a student in time spent at the institute. Similar prudence must be applied while selecting faculty – faculty must be compatible with the culture of the institute, as well as with the cadre of

students enrolled. Faculty with research-orientation should be preferred, to create an intelligent culture in the classroom. The curricula and the partnerships with industry must be carefully assessed. Most institutes imitate the curricula and industrial alliances from top management institutes, but end up failing to leverage the benefits offered to a complete extent. It is vital to be prudent in choosing curricula and partnerships that are compatible with institutional processes and desired outputs, to create an ecosystem that benefits all its components.

b. Participating inputs, to foster qualitative growth. Participation herein indicates engagement, which is a crucial parameter in judging input quality and compatibility. Students and faculty must be engaged in institutional building processes, curricula development, infrastructure augmentation, leadership and partnerships reinforcing positive levels of engagement.

Conclusion

Conclusively, it is evident from the review of literature and statistics, that management education needs a quality transformation, lest it loses its popularity and trust among the student audience. Urgent focus must be on quality, and the MAP framework proposed by us, can serve as a wholesome navigation system during the process of improving quality. The MAP framework ensures that quality outputs are achieved through quality processes that invite quality-inputs.

The MAP framework acts as a complete guide to assist a management institution in redefining and re-engineering processes that are aligned with the overall objective of quality-deliverance. The following suggestions can be made, towards the application of the said model:

- Outputs should be well-defined in terms of institutional capabilities. Most institutes pursue outputs set up by top-management institutes but with less than half the resources or the talents, which ends up being a wild goose chase. Stakeholder expectations at different sections in the society are different. Management education should focus on defining outcomes based on stakeholder needs relevant to the section that the institute caters. Similarly, faculty research output from the management schools needs to be more contemporary, localized and solution providing to a country's native problem areas in various domains, rather than being restricted to high impact-factor journal publications.

- Processes must be aligned with objectives, and must be compatible with input quality. Instead of imitating best-practices as is, management institutes must assess the extent to which processes can be replicated and the extent to which they need to change as per context. Partnership with seasoned industry professionals and renowned industry associations in delivery of program can never be overemphasized. This needs to be embedded in the course-delivery itself rather than as a sporadic intervention.

- Inputs' quality is a factor of input compatibility with the institutional processes and desired outputs. Management institutes must segment and target inputs that are compatible with its culture and vision, instead of blindly following general standards of measuring quality. More often than not, general standards such as test scores for students' selection, alma mater for faculty recruitment, foreign case studies for curricula and popular companies for partnerships and placement, do not serve as an appropriate filter for choosing inputs for institutional system. Institutes with humbler processes and low expectations from society lose focus and get demoralized from rejections faced by high-quality input. Such institutes should asses quality input in terms of compatibility with institutional ecosystem.

ATTITUDES OF STUDENTS WHEN USING LEARNING MANAGEMENT SYSTEM (LMS)

P.G. Munasinghe. Rajarata University of Sri Lanka, Sri Lanka
W.P. Wijewardana, Rajarata University of Sri Lanka, Sri Lanka

Abstract

The development of technology has shaped the nature of the education. Learning Management Systems (LMS) of one of the applications in e-learning is widely accepted by undergraduates. The LMS help students and lecturers by facilitating alternative way to learn, communicate and time saving as well as making the learning content easier to be accessed. The users of LMS have reported that the current systems are used mainly as a tool for communication and it was unable to fulfill desired expectations of students. The findings of the previous studies of students' attitudes towards use of LMS are inconclusive. Therefore, the objective of this study is to investigate the students' attitude towards the use of LMS in Sri Lankan Universities. 120 undergraduates of Rajarata University of Sri Lanka was used for the study using purposive sampling. The results reveal that the variables Perceived usefulness and Perceived ease of use have significant effects to the attitude towards use of LMS. Also, the study confirms that the students have positive attitudes towards use of the LMS. Therefore, university should create an e-learning culture through use of LMS by providing useful content with ease of access to the students.

Keywords: *Learning Management System, Attitude, Usefulness, Ease of use, External Factors*

Introduction

The growth of Information and Communication Technology (ICT) has dramatically changed the way people share their knowledge. The Internet is the most popular ICT application is used by students in higher education and it plays a vital role in University Education. One of the most popular ICT applications is available through the web is Learning Management Systems (LMS) and Suorsa and Eskilsson (2014) highlighted that LMS intended to help students by facilitating learning and communication. Also, it provides a lot of functionality including tools for communicating with teachers and other students, assignment management, calendars, file sharing and many more. Adzharuddin and Ling (2013) have strengthen the above idea by expressing LMS is an essential tool for university students as not they can keep updated with their coursework, but get instant notifications pertaining to their daily assignments. In turn, lecturers have an easier time reaching out to their students out of class hours and can instantly update them over the LMS about issues regarding their coursework. More, it mentioned that LMS in the community of higher institutions is an online portal that connects lecturers and students. It provides an avenue for classroom materials or activities to be shared easily. It is also a gateway that enables lecturers and students to interact out of the classroom, having discussions through forums that could otherwise take up too much of the time supposed to be spent learning in the classroom.

Almost all the national universities of Sri Lanka have introduced LMS through MOODLE platform. Yapa et al. (2012) has mentioned that in the Faculty of Medicine, University of Colombo, access is given to all the students from the second year onwards. Rajarata University of Sri Lanka has an e-learning system calling as LMS also called as virtual university. However, there was not a satisfied number of students visited the LMS. Pilot survey was carried out and known to that only a few students get the benefit from the LMS of

the university even most of the students used some kind of e-learning systems but in here some are not known about LMS. Yapa et al. (2012) stated that use of LMS was the weakest method in students' online learning even though they had mentioned that they would have be keen on supplementary learning materials to be made available through the Faculty MOODLE platform. According to the Suorsa and Eskilsson (2014) LMS does not appear to meet the students' needs and expectations because the system was underutilized and in many case ignored by the students. Their attitudes of their LMS are negative and systems were only to use for one purpose; only to handle the communications between the teachers and the students. Therefore, the objectives of this research study is to investigate the students' attitudes towards the use of LMS and to find out the major factors affecting to the students' attitudes toward the use of LMS in Sri Lankan Universities with the special reference to the Rajarata University of Sri Lanka.

The rest of the paper is organized as follows. Next section reviews the literature that relates the present inquiry followed by the methodology used in study together with data collection and analysis procedures. Final section concludes the study along with the implications of the study.

Literature Review

Universities have shown a great interest adoption of new technologies. Many research studies that conducted about adoption of new technologies had used Technology Acceptance Model (TAM) which was developed by Davis et al. in 1989. The web technology (LMS) which was used by many universities to deliver learning and teaching besides the usual face-to-face classroom. The research studies of Trayek and Hassan (2013) and Majdalawi et al. (2014) concerning students attitude towards using of LMS have used the core constructs: perceived ease of use, perceived usefulness of TAM.

The research study of Trayek et al. (2013) defined LMS was a software application enable users or learning manager to disseminate information from systematic planning by adopting appropriate pedagogical approach. It allows users to share information and collaborate online. The attitude toward use of LMS defined as the positive or negative feeling of individuals in performing and how this feeling can affect the particular behavior. Perceived usefulness refers as to how much the user believes that he or she can get help and benefits his or her performance from the use of technology. Perceived ease of use denotes to how easier the user will perceive the using of technology.

In the research study which conducted by Majdalawi et al. (2014) has emphasized how students receive and used LMS in the MOODLE platform. This research used core constructs: perceived ease of use, perceived usefulness of TAM towards attitudes and behavioral intention to use LMS. Davis et al. (1989) reasoned that Perceived usefulness is a major determinant of people's intentions to use computers and Perceived ease of use is a significant secondary determinant of people's intentions to use computers. The research added perceived ease of use as to the degree to which the prospective user expects the target system to be free of effort and perceived usefulness as defined as the prospective user's subjective probability that using a specific application system will increase his or her job performance within an organizational context. Alharbi and Drew (2014) have developed a theoretical framework of Using the TAM for attitudes and Behavioral Intention to Use LMS and argued that the ease of use and usefulness constructs may not be sufficient, and therefore other variables may be needed as cited in the research King and Gribbins (2002). Thus, after reviewing the relevant studies, this study suggests three external variables: LMS usage experience, job relevance, and lack of LMS availability.

Some research studies considered demographic factors of acceptance of LMS. The study of Claar et al. (2014) has said that demographic factors such as age, race, gender, and education levels contribute on student acceptance of LMS. In this study shows the different relationships among variables such as Perceived Ease of Use has a significant positive influence on perceived usefulness of LMS, Perceived usefulness and Perceived Ease of Use has a significant positive influence on attitude toward using LMS, Perceived Usefulness and Attitude toward using has a significant positive influence on behavioral intentions to use, The higher the educational level, the more likely new LMS systems will be accepted and the higher a person's age, the more likely he/she is to perceive a new LMS more negatively.

External factors such as influence from administrative staff, ICT skill and available facilities are important factors to adopt LMS. Macharia and Nyakwende (2010) confirmed this idea by saying that Vice Chancellor of the university influence is significant on ICT development. Furthermore, the study discussed importance of the leadership to adopt to LMS in higher education. In addition to the influence for the LMS the other factors such as organizational variables of Subjective norm, availability of ICTs (infrastructure), Organizational support, Organizational readiness, and top management support were related to behavioral intentions to use LMS in teaching and learning. Liyanagunawardena (2008) also found that some other constructs such as access of the Internet; as there was a significant relationship was found between having internet access away from university and the student perception about the LMS.

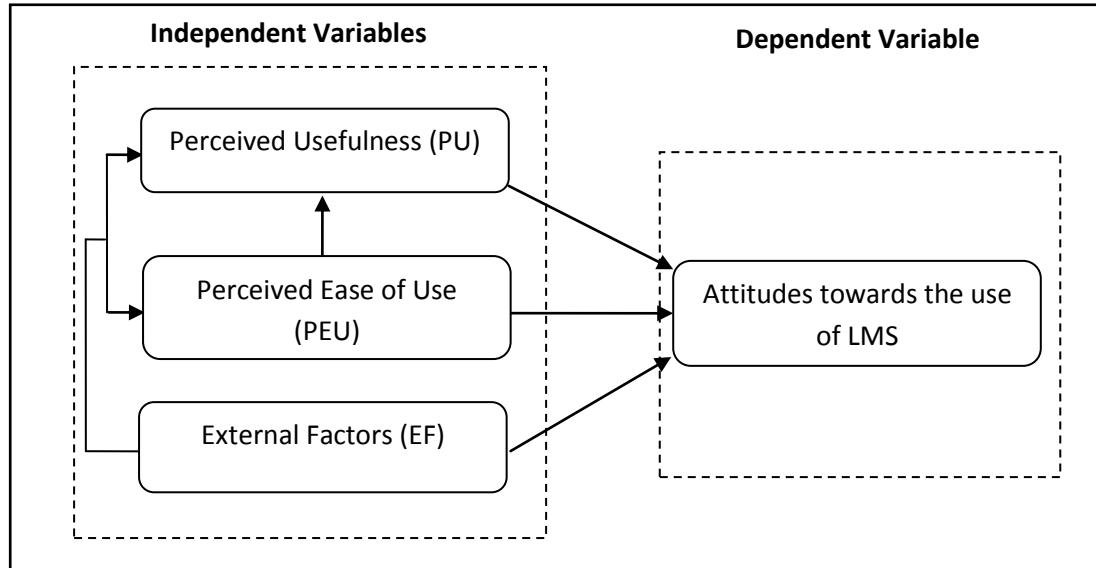
Based on the reviewed literature Perceived usefulness, Perceived ease of use and External factors have been identified as independent variables and Attitudes towards the use of LMS as dependent variable and five hypotheses have been formulated.


Figure 32- Researchers Model/ Conceptual Frame Work

H1: Perceived usefulness has significant positive influence on the attitudes toward use of LMS.

H2: Perceived ease of use has significant positive influence on the attitudes toward use of LMS.

H3: External factors have significant positive influence on the attitudes toward use of LMS.

H4: Perceived ease of use has significant positive influence to the Perceived Usefulness.

H5: External factors have significant influence on the Perceived usefulness and Perceived ease of use of LMS.

Methodology

The study uses a quantitative approach to address the problem of present study. A structured questionnaire was specially designed and employed in data collection. Empirical studies in similar context were employed in identifying key constructs for the research variables and constructing the questionnaire. The questionnaire consists of two major parts out of which the first part is reserved for collecting the demographics of the respondents and the second part for the gathering of data relating to three independent research variables: perceived ease of use, perceived usefulness, and external factors: influence of administrators and teachers, ICT skills of undergraduates and infrastructure facilities in the university and the dependent variable of attitudes towards the use of LMS by undergraduates. All the questions relating to the research variables were set in five-point Likert scale and the demographics data were collected through close ending questions.

The population of the study is the students of Rajarata University of Sri Lanka. Samples of 120 students were selected from the target group using the purposive sampling from considering all the faculties: Agriculture, Applied Sciences, Management Studies, Medical & Allied Sciences and Social Sciences & Humanities. To ensure the reliability and the validity of the research instrument, it was piloted and adjusted accordingly with correct wording and logical ordering of the questions. In the data analysis, descriptive statistics, correlation coefficients and regression analysis were performed.

Results And Discussion

In this study there were 63 (52.5%) male students divided in to five faculties; 12 Management, 20 Applied Sciences, 15 Social Science and Humanities, 9 Medical and 7 Agriculture. There were 57 (47.5%) female students divided in to five faculties; 18 Management, 15 Applied Sciences, 10 Social Science Humanities, 6 Medical and 8 Agriculture. Moreover there were 24 first year students, 36 second year students, 31 third year students and 29 fourth year students. The 100 students (83.3%) out of 120 were using the LMS and 20 students (16.7%) were not using LMS in the university. Usage of computer ours by students is given in table 1 below.

Table 32- Student usage of computer hours per week

Non-educational purpose			Educational purpose		
Hrs	Frequency	Percent	Hrs	Frequency	Percent
1 - 5	31	25.8%	1- 3	9	7.5%
5 - 10	31	25.8%	3- 5	31	25.8%
10 - 15	27	22.5%	5- 7	23	19.2%
15 - 20	21	17.5%	7- 9	22	18.3%
More than 20	10	8.3%	More than 9	33	27.5%

When consider the usage of computers for non-educational purposes in the above table; the 25.8% students from 5 to 10 hours, 25.8% students from 1 to 5 hours, 22.5% students from 10 to 15 hours, 17.5% students from 15 to 20 hours and 8.3% students more than 20 hours use computers for non- educational purposes. According to the table 1, the computer use for the educational purposes shows that 7.5% students are use computers for educational purposes between 1- 3 hours, 25.8% between 3-5 hours, 19.2% between 5-7 hours, 18.3% between 7-9 hours and 27.5% students are use computers for educational purposes more than 9 hours. The outcome of the reliability test carried out is given in table 2 below.

Table 33-Reliability Test of research variables

Variables	Cronbach's Alpha Value	No of Items
Perceived Usefulness	0.872	5
Perceived Ease of Use	0.790	5
External Factors	0.792	13
Attitudes toward the use of LMS	0.878	14
Overall Value	0.908	46

In the study Cronbach's alpha values were used to assess the reliability of variables as it is very important to the researchers to ensure the internal consistency of the questions which was used in the questionnaire. Table 2 presents the result of the each independent and dependent variables reliability test. Theory of research methodology says about reliabilities: less than 0.6 are considered to be poor, those in the above 0.7 ranges are acceptable, and those over 0.8 are good. The table 2 shows that reliability is up to the acceptable level of all constructs.

The final column of the following table (Table 3) indicates that mean and correlation values of the research variables. It may be mentioned that all variables were tapped on a 5-point Likert scale and all the mean values were having above the average. This means that Perceived Usefulness, Perceived Ease of Use, and External Factors have positive affect to use of LMS and finally the respondents have positive attitudes toward the use of LMS in the Rajarata University of Sri Lanka. Correlation data output is given in table 3 below.

Table 34-Correlation Analysis of Research Variables

		PU	PEoU	EF	A	Mean
Perceived Usefulness (PU)		1				3.8240
Perceived Ease of Use (PEoU)	Pearson Correlation Sig.	.675[**] .000	1			3.9520
External Factors (EF)	Pearson Correlation Sig.	.483[**] .000	.586[**] .000	1		3.7031
Attitude (A)	Pearson Correlation Sig.	.624[**] .000	.710[**] .000	.492[**] .000	1	4.0607

**. Correlation is significant at the 0.01 level (1-tailed)

As shown in the above table (table 3) correlation coefficient for the relationship between Perceived Usefulness and Attitude towards use of LMS is 0.624(p<0.01). So, it could conclude that there is a positive and significant relationship between Perceived Usefulness and students attitudes toward the use of LMS. The correlation coefficient of the relationship among Perceived Ease of Use and Attitude towards use of LMS is 0.710(p<0.01). It could indicate that there is a positive and significant relationship between Perceived Ease of Use and Students Attitudes toward the use of LMS. The correlation between External Factors and Attitudes towards use of LMS was 0.492(p<0.01) means there was a positive significant relationship between External Factors and Attitude towards use of LMS. The correlation coefficient between Perceived Ease of Use and Perceived Usefulness is 0.675(p<0.01). It

could conclude that there is a positive and significant relationship between Perceived Ease of Use and Perceived Usefulness. The relationship between External Factors towards Perceived Usefulness and Perceived Ease of Use are 0.483(p<0.01) and 0.586(p<0.01). So, it could conclude that there are positive and significant relationships between External Factors towards Perceived Usefulness & Perceived Ease of Use towards the use of LMS.

Regression analysis was further employed to examine the predictive power of independent variables attitude towards the use of LMS and to validate the results of correlation analysis. The relevant results are reported in table 4 below.

Table 35- Results of the Regression analysis

	Coefficient	Std. Error	t	P
Constant	1.497	0.280	4.828	0.000
Perceived Usefulness(PU)	0.187	0.069	2.395	0.010
Perceived Ease of Use (PEoU)	0.390	0.087	3.556	0.001
External Factors (EF)	0.830	0.088	0.575	0.349
$R^2 =$ 0.569 F = 38.679 Sig F = 0.000				

Dependent variable: Attitudes toward the use of LMS

According to the regression analysis the significance values of the constructs of Perceived Usefulness (PU) and Perceived Ease of Use (PEoU) are less than 0.05. This could conclude that Perceived usefulness and Perceived ease of use were affected towards attitude use of LMS, but External factors were not influenced attitudes towards use of LMS because significant value is greater than 0.05. The coefficient (B) values of Perceived Usefulness (PU):0.187, Perceived Ease of Use (PEoU): 0.390 and External Factors (EF): 0.830. So, this could represent the following equation.

$$Y = 1.497 + 0.187 \text{ PU} + 0.390 \text{ PEoU} + 0.830 \text{ EF}$$

The above equation expresses every unit increase in PU, PEoU and EF are expected to increase attitude towards the use of LMS with the magnitude of 0.187, 0.390 and 0.830 respectively with the constant 1.497 when other two variables (variables which magnitudes are not increased) are unchanged. The F value of 38.679 and p vale of 0.000 indicates that model fit for the data and R^2 is 0.569 which suggests that constructs of the research model PU, PEoU and EF has explained 56.9% of attitudes towards use of LMS of the students in the Rajarata University of Sri Lanka. Based on the above results formulated hypotheses can be evaluated as follows. The summary of hypotheses are given in table 5 below.

Table 36- Summary of hypotheses Testing

	Hypotheses	Mean	Correlation	Regression
H1:	Perceived usefulness has significant positive influence on the attitudes toward use of LMS	Supported	Supported	supported
H2:	Perceived ease of use has significant positive influence on the attitudes toward use of LMS	Supported	Supported	supported
H3:	External factors have significant positive influence on the attitudes toward use of LMS	Supported	Supported	Not supported
H4:	Perceived ease of use has significant positive influence to the Perceived Usefulness	--	Supported	--
H5:	External variable has significant influence on the Perceived usefulness and Perceived ease of use attitude to use of LMS.	--	Supported	--

The above table considered means values of on a 5-point Likert scale, Pearson correlation values and coefficients of regression analysis to check the hypothesis. Correlation values support all the hypotheses. Means of constructs were above the average values of PU, PEoU and EF. Therefore, H1 to H3 were supported by the mean values. Even though correlation result supports three hypotheses (H1, H2, H3) but the regression analysis confirmed only two hypotheses (H1, H2).

Conclusion And Recommendations

The students' attitude towards LMS is inconclusive and the objective of this research study is to investigate the students' attitudes towards the use of LMS in Sri Lankan Universities with the special reference to the Rajarata University of Sri Lanka. The result indicates the students' attitude toward the use of LMS is positive and perceived usefulness and Perceived ease of use will have positive significance attitudes towards the use of LMS of the undergraduates. More, perceived ease of use and external factors positively affects the perceived usefulness of LMS. Furthermore it is necessary to create learning objects of e-learning to improve the attitude towards the use of LMS and separate web accessible computer units should be set up in each faculty with technical support. Students should be trained at the beginning of academic activities. Faculty wise LMS administration such as student registration and account management is needed instead centralized control.

The implication of the results of this study is limited in general context. Thus, future study may validate result of the study in similar and different context. Furthermore, more constructs should be considered to measure the attitudes towards use of LMS by students since the developed model is explained just over the 50% variation by the used constructs: perceived ease of use, perceived usefulness and External factors.

THE EFFECTS OF HRM PRACTICES ON EMPLOYEE SERVICE QUALITY PERFORMANCE IN THAILAND'S CHAINED-BRAND HOTELS

Sorasak Tangthong, King Mongkut's Institute of Technology, Thailand

Abstract

The key objective of this study is to determine the effects of human resource management (HRM) practices on employee service quality performance in Thailand's chained-brand hotels that had been located in Bangkok, Thailand. Eleven theoretically based hypotheses have been developed that point to possible positive and negative relationships between HRM practices, mediating variables and service quality as an employee performance. A total of 450 managers, consisting of top management, HR leader and Line Hotel Operation manager that include Restaurant manager, Engineering manager, Executive Chef were examined and then empirically tested using SPSS AMOS for Path Analysis. The results show that HRM practices have no direct relationship with Employee service quality as an employee performance. But they have an indirect relationship, meaning employee performance cannot be determined solely by the use of HRM practices. Out of the five mediating variables in this study, the one that has the strongest effect on employee performance is employee motivation.

Keywords: *HRM Practices, Employee service quality performance, Thailand's chained-brand hotels*

Introduction

Organizations success depends on the performance of employees. As such, employees need to be managed, which is regarded as an essential function for managers (Gentry et al., 2008, Kraut et al., 1989). Managers are responsible for ensuring that organizations succeed and achieve high-performance levels (Daft, 1988). Amos et al. (2004) further state that performance cannot be left in anticipation that it will develop naturally, despite the employee's natural desire to perform and be rewarded for performance. The desire to achieve needs to be accommodated, facilitated and cultivated. As a result, most organizations have made significant financial commitments, through Human Resources Management (HRM) practices, to manage employees' performance (Chow & Kleiner, 2002). The importance of employee performance to the success of organizations could partly explain why numerous methods for monitoring, managing and improving employee performance have been developed (Schraeder & Jordan, 2011).

Most researchers consider HRM practices to be a very common way to manage employee performance (e.g. Munjuri, 2011). But recently, some researchers have argued that there are other factors besides HRM practices that can have an effect on employee performance. Guest (2002), for instance, explained that the impact that HRM practices have on employee performance will depend on how the practices are perceived by employees. Huselid (1995) found that the effectiveness of employees will depend on the impact of HRM practice on the behavior of employees. Thus literature shows that not only should organizations be equipped with the right HRM practices to increase employee performance, but they should also take into account other factors like employee behavior. While most studies focused on one of these behaviors (e.g. Morrison, 1996), this study will look at five types of behaviors; organizational citizenship, job satisfaction, employee engagement, employee motivation and HR flexibility. These five factors will mediate the relationship between HRM practices and employee performance.

Thailand is destination country for tourists around the world and one of the most famous of city tourism. Hotel industry in Thailand is significantly impact for Thailand economics growth. There are many Thailand's Chained-Brand Hotels. Competition in the Thai hotel industry is very high. Therefore, highly staffs service quality to achieve customer satisfaction, and professional hotel HRM practices are needed.

Theoretical Background

For organizations to succeed, they must have a competitive advantage over their rivals. To understand where this advantage is derived from, it is necessary to look at an organization's resources. Several studies – based on Barney (1991) resource-based view (RBV) – have suggested that HRM is a source of competitive advantage in a company.

  1. Resource-Based View (RBV)

    Barney (1991) RBV theory claims that a company must have valuable, rare, inimitable and non-substitutable resources to have a sustainable competitive advantage and that these resources include everything internal to the firm. Barney (1986) listed all of the assets, capabilities, organizational processes, firm attributes, information, knowledge, and so on, as resources. The application of RBV theory to HRM illustrates the role that people play in building a company's competitive advantage. To explain how RBV theory can be applied to HRM, Wright and McMahan (1992) referred to the following four features that people, as resources, must have for the company to be competitive. First, they must give value to the company's production processes, meaning the level of individual performance must be significant. Second, the skills that the corporation looks for must be rare. According to Wright and McMahan, all human resources should meet these two criteria, since they are evenly distributed. Third, the combined human capital investments of a company's employees cannot be easily imitated. Some argue that other types of resources in a company, such as technology and natural resources, are available to anyone and easy to copy. On the other hand, human resources – particularly HR systems – represent a complex social system (Ulrich and Lake, 1990) and are regarded as intangible assets. Finally, a company's human resources must not be substitutable or replaceable by technological alternatives; however, the high levels of automation in many industries and the continuing shift towards a service economy have made substitution less likely.

    Overall, the resource-based theory provides a useful basis for understanding the value that HRM adds to the performance of the organization. But, beyond RBV, it is important to discuss ideas that involve HRM practices to truly understand the effects that HRM have on organizations.

  2.   Human Resource Management (HRM)

    Guest (1997) and Boselie et al. (2005) have both categorized existing HRM theories. According to Guest (1997), there are three types of theories. The first type is known as Strategic Theories. In the UK, this category means that firms are adhering to good HR practices internally and externally will perform superior to those that do not. In the USA, strategic theories suggest that companies striking a balance among business strategies, structure and HRM policy will have superior performance. The second type is known as Descriptive Theories, which either lists areas of HR policy and outcomes (Beer et al., 1984) or adopts a system-based approach that describes the relationships among levels (Kochan et al., 1986). Descriptive theories are mainly non-prescriptive. The third type is known as Normative Theories, which means that firms establish a norm (or standard pattern) in the form of a prescribed best practice.

According to Boselie et al. (2005), there are three types of HRM theory. The first type is the Contingency Theories, in which HRM is influenced by an organization's environment and circumstances (for example, Legge, 1978). The second group is Resource Based, which states that HRM delivers added value through the strategic development of the organization's rare, hard-to-imitate and hard-to-substitute human resources (for example, Barney, 1991, 1995). The third set is the Ability Motivation Opportunity (AMO) theories, which can be defined by the formula: Performance = Ability + Motivation + Opportunity to Participate. AMO theories provides the basis for developing HR systems that will cater to employees' interests, namely their skill requirements, motivations and the quality of their jobs (for example, Appelbaum et al., 2000; Bailey et al., 2001; Boxall and Purcell, 2003).

3. Models of Human Resource Management

   Numerous models of HRM have been developed to help Human Resources (HR) practitioners effectively manage human resources. Foremost among them is the Harvard Model (Beer et al., 1984), which guides all managers in their relations with employees and concentrates on the human, or soft, aspect of HRM. The Harvard Model focuses on employee commitment, concluding that employees need to be congruent, competent and cost effective. Another prominent model is the Michigan Model (Devanna et al., 1984), which focuses on hard HRM, meaning, people should be managed like any other resource: obtained cheaply, used sparingly, developed and exploited fully. Then, there is the Guest Model (Guest, 1997), which operates on the belief that a set of integrated HRM practices will result in superior individual and organizational performance. Finally, there is the Warwick Model (Hendry and Pettigrew, 1990), which recognizes the impact of personnel on HR strategy content and emphasizes identifying the inner (organizational) and external (environmental) context.

4. Human Resource Management Practices

   To effectively manage human resources, organizations will have to implement innovative HRM practices. However, HRM practices may differ from one organization to another and from one country to another.

5. Types of Human Resource Management Practices

   Researchers have classified HRM practices using various terms; 'best practice,' or 'high-performance' (Huselid, 1995), 'formal' (Aldrich and Langton, 1997; De Kok and Uhlaner, 2001; Heneman and Berkley, 1999), 'sophisticated' (Golhar and Deshpande, 1997; Goss et al., 1994; Hornsby and Kuratko, 1990; Wagner, 1998) and 'professional' (Gnan and Songini, 2003; Matlay, 1999). But Pfeffer (1994, 1998) argued that the most appropriate term is 'Best HRM Practices.' According to Chandler and McEvoy (2000), one question remains in HRM research: is there a single set of policies or practices that represent a 'universally superior approach' to managing people? Theories on best practices or high commitment theories suggest that certain HRM practices, either separately or in combination, are associated with improved organizational performance across the world. Pfeffer (1994) identified seven practices as best practices: employment security, selective hiring, self-managed teams/team working, high compensation contingent on organizational performance, extensive training, reduction in status difference and sharing information. Redman and Matthews (1998) identify an 'HRM bundle' of essential practices, which support service organizations' quality strategies. Saxena and Tiwari (2009) also identified training and development, employer–employee relations, recognition through rewards, culture building, career development, compensation, and benefits as important HRM practices.

Literature Review And Hypotheses
In this section, a review of the literature concerning the relationship between HRM practices and employee performance is presented. Particular focus is on variables such as organizational citizenship behaviors, job satisfaction, employee engagement, employee motivation and HR flexibility. Studies have shown potential hypothetical associations among the selected variables. Altogether, 11 hypotheses were formulated, which are explained below.

1. Human Resource Management System

   To understand the importance of HR and its role in determining the performance outcome of organizations, the HR process must be viewed as a whole. So far, there have been limited research to measure the impact the entire HRM system has on a firm's performance. In measuring the impact, consideration must be made to human resource inputs, processes (and practices) and outputs, leading to sustained competitive advantage (Lado & Wilson, 1994). A model of the HRM system was developed by Ferguson (2006), based on Barney (1991) resource-based view of the firm. Barney's view is explained in the theoretical background section.

2. Employee Performance

   In line with the systems view of HR (Lado & Wilson, 1994), a firm's performance serves as an outcome of an effective HR system. An indicator of a firm's performance is employee performance which can have two meanings. Employee performance is a rating system used by organizations to decide on the abilities and output of an employee, and the record of outcomes achieved per job function during a particular period. Also, employee performance can also mean employee productivity and output as a result of employee development. The performance of employees can be in the form of the quantity or quality or timeliness of output, presence at work and cooperativeness (Güngör, 2011). Macky and Johnson (2000) stated that improved employee performance could also lead to better firm performance.

3. Human Resource Management (HRM) Practices

   This study will examine HR practices (Lado and Wilson, 1994) using the system-based view of HR. HRM practices are a set of distinct yet interrelated activities, functions, and processes aimed at attracting, developing and maintaining a firm's human resources. In most studies, HRM practices are viewed as the independent variable (Becker and Huselid, 1998; Rizov and Croucher, 2008; Sang, 2005). These practices are known to help organizations increase employee performance. For example, Bhatti and Qureshi (2007) found employee participation to have a positive effect on employee productivity. Rewards also have a direct impact on employee performance (Qureshi et al., 2010). Training and development raise performance levels and brings success to organizations by developing the knowledge, skills, ability, competencies and good employee behavior (April, 2010). Singh and Mohanty (2012) also found a positive correlation between training and employee productivity. As employees develop, they become increasingly satisfied with and committed to their jobs (Hameed and Waheed, 2011). As a result, their performance improves, and the organization becomes a more efficient structure (Champathes, 2006). Thus:

   H1: *HRM practices affect employee performance.*

   HRM practices can help organizations raise the level of organizational citizenship behaviors (OCBs) among employees. Employees who participate in decision-making feel that their managers consider them to be important members of the organization. With a

positive outlook towards both management and the organization, the employee would be more willing to take on additional roles, thus increasing the likelihood of OCBs (Bateman and Organ, 1983; Miles et al., 2002; Smith et al., 1983). Organizations may also facilitate citizenship by rewarding OCBs (Babaei et al., 2012). A reward system that directly recognizes good citizenship makes it clear to employees that the organization truly values such behavior (Levering and Moskowitz, 2003; Meet Asda's Happy Family Pack, 2002).

A career planning system is necessary for employees to achieve their specific career goals. With this in mind, Greenhaus and Callahan (1994) developed some career development strategies. They believed that workers needed to go above and beyond the specified requirements of their tasks to realize their career goals. In other words, they had to perform some OCBs. Gong et al. (2010) also show that career planning is positively correlated to OCBs. Employees often view training as organizational support. Such views are positively related with a tendency to help co-workers (Shore and Wayne, 1993). As such employees who reflect positively on the benefits of training exhibit stronger feelings of citizenship to the organization that provided training. Empowered employees have the ability to invent and express OCBs (Morrison, 1996). Independence and the ability to influence outcomes within the scope of their roles encourage employees to go beyond their job requirements (Watt and Schaffer, 2003, Cushman, 2000). Thus:

H2: *HRM practices affect organizational citizenship behaviors.*

Employee participation leads to a sense of satisfaction regarding achievement, closure and work-related interpersonal contact (Sashkin and Burke, 1987). Thus, employee participation is positively correlated with job satisfaction (Bhatti and Qureshi, 2007). Two particular systems, compensation, and benefits and reward have been found to create job satisfaction (Boyt et al., 2001; Khojasteh, 1993; Miller et al., 2001). Rehman et al. (2010) also found job rewards to be a strong determinant of job satisfaction. It is said that the root of job dissatisfaction is an employee's lack of happiness in his/her career; conversely, the primary source of job satisfaction is career happiness, which comes from making a career plan and seeing it out (Henderson, 2000). Organizations that invest in career management are more likely to increase employee job satisfaction (Lee, 2000). Carden (2007) too found a positive relationship between career path and job satisfaction. Providing employee training facilitates the updating of skills, increases professionalism and boosts employee commitment and satisfaction to the organization (Bateman and Strasser, 1984; Bushardt and Fretwell, 1994; Cotton and Tuttle, 1986). Absar et al. (2010) further found training and development to have the greatest and positive influence on job satisfaction. However, some employees require autonomy and a sense of self-actualization to feel satisfied (Khan et al., 2012). Thus there is a relationship between employee empowerment and job satisfaction (Swarnalatha and Sureshkrishna, 2012). Thus:

H3: *HRM practices affect job satisfaction.*

Employees – through participation in decision-making or engagement – will often give back to the organization (Cascio et al., 1997). Employee engagement depends on staff feeling justly rewarded for their skills, knowledge, and contributions (Bhattacharya and Mukherjee, 2009) while the idea of engagement is further supported by Ram and Prabhakar (2011). When managers provide opportunities for training and a level of

support that clearly relates to career development, they help drive employee engagement (Mone and London, 2009). Shafer (2010) is another researcher who found a positive relationship between the professional development training program and employee engagement. Therefore:

H4: *HRM practices affect employee engagement.*

Employees who help to make important decisions feel motivated at work, because it fulfills their basic needs of clarity and social relations (Hussein, 2007). There are numerous ways to boost motivation. Al-Nsour (2011), showed that the participation of employees in strategic decision-making could lead to increased motivation. According to Ali and Ahmed (2009), a reward system helps to motivate employees. So does a career planning system. Employers or supervisors must provide guidance that encourages employees to set their goals; employees feel most motivated to meet the ones they set for themselves (Elrod, 2009), especially if these aims might lead to a promotion or some other kind of advancement. Employees, who perform well in training, feel that they have learned something that will enhance their profile, find themselves motivated at work (Lester, 1999). According to Gawali (2009), there is a positive relationship between employees involved in cross-training and motivation. By the same token, organizational changes that result in skill shortages, time pressures, uncertainties and demanding workloads leave employees feeling powerless and burned out. It is important to empower employees (Kaplan and Norton, 1992, 1996) because empowerment is one of the most efficient intervention programs to increase motivation (Yoon, 2001). Therefore:

H5: *HRM practices affect employee motivation.*

A reward system allows employees to demonstrate their functional flexibility; it provides them with the confidence to take initiative and quickly adapt at work because they know that the organization will recognize them for proposing creative solutions to new problems (Frenkel et al., 1999; Unsworth and Parker, 2003). But greater initiative and flexibility at work can result in an increased workload, which may produce stress and anxiety if employee efforts are not rewarded (Unsworth and Parker, 2003). Training and development are also beneficial in building skill flexibility in the workforce. Employees want to improve their talents to succeed in their careers; when combined with a sturdy educational foundation, proficiency in certain areas will give them the confidence to master and apply new skills (Wright and Snell, 1998). The positive relationship that training has with flexibility is further supported by Beltrán-Martín et al. (2008). A firm's effort to broaden workforce skills and competency grants employees the freedom to pursue alternative methods of carrying out their jobs, which subsequently fosters behavioral flexibility (Frese et al., 1996; Parker and Axtell, 2000). Therefore:

H6: *HRM practices affect HR flexibility.*

4. Organizational Citizenship Behaviors (OCBs)
   OCBs are the extra work-related behaviors of employees which go above and beyond the routine duties prescribed by their job descriptions or measured in formal evaluations. OCBs may also be defined as individual behavior that is discretionary, not directly or

explicitly recognized by the formal reward system, and that in the aggregate promotes the effective functioning of the organization. These behaviors reflect an employee's genuine willingness to be involved in an organization (Chen et al., 1998; Shore et al., 1995). Appelbaum et al. (2005), analysis has shown a correlation between organizational citizenship and productivity. Employees should, therefore, exhibit OCBs to perform better at work (Podsakoff et al., 2009). Thus:

H7: *Organizational citizenship behaviors affect employee performance.*

5. Job Satisfaction
   Job satisfaction is a positive emotional feeling or state-of-mind regarding the nature of work. Satisfaction is a result of one's evaluation towards his job by comparing expectation with actuality. Job satisfaction is also a function of the range of particular satisfactions and dissatisfactions that he/she experiences concerning the various dimensions of work. Positive feelings come from the perception of the individual's job as fulfilling or allowing the fulfillment of their job values, provided these values are compatible with their needs (Dunnette & Locke, 1976). It is generally recognized in the organizational behavior field that job satisfaction is the most important and frequently studied attitude (Islam et al., 2012). There are three critical dimensions to job satisfaction (Locke, 1976): first, job satisfaction is an emotional response to a job situation; second, job satisfaction is usually determined by how well outcomes meet or exceed expectations; and third, job satisfaction represents several related attitudes (Mitchell and Larson, 1987). For organizations to be effective, they must ensure the satisfaction of their employees (Likert, 1961; McGregor, 1960). When employees are satisfied with their jobs, they perform well in the organization (Judge et al., 2001). In Halkos and Bousinakis (2010), findings showed increased satisfaction leads to increased productivity. Hence:

H8: *Job satisfaction affects employee performance.*

6. Employee Engagement
   Employee engagement is the harnessing of an organization members' into their work roles. In an engagement, people employ and express themselves physically, cognitively, and emotionally during role performances. Another definition is employees feel positive emotions toward their work, find their job to be personally meaningful, consider their workload to be manageable, involved enthusiastically at work, and have hope for the future of their work. To become fully engaged is to participate in and be enthusiastic about work (Falcone, 2006). There are two aspects of employee engagement: cognitive engagement and emotional engagement/physical engagement. Cognitive engagement is the extent to which a worker is aware of their mission at work and their role in the organization. Emotional engagement/physical engagement is the degree to which the worker empathizes with others at work and connects in a meaningful way with their co-workers (Kahn, 1990, 1992; Luthans and Peterson, 2002). Engaged employees who maintain positive attitudes have been known to perform better in work environments (Harter et al., 2002; Towers Perrin, 2007). Thus:

H9: *Employee engagement affects employee performance.*

7. Employee Motivation

Employee motivation is one of the policies managers use to increase effective job management amongst employees in organizations. Employee motivation may be defined as identifying needs or desires that give purpose, direction, and the will to accomplish, in a person. Motivation, itself, is described by Hellriegel et al. (1992) as the force acting on or within a person that causes the person to behave in a specific, goal-directed manner. It stimulates people into action and realizes the desired task (Luthans, 1998). A motivated employee is a productive employee who contributes to the effectiveness of the organization (Matthew et al., 2009). When motivation is high, workers are more likely to enjoy working, and as a result, they spend more time and energy on their work tasks and performance improves (Deci and Ryan, 2000, 2002). According to Solomon et al. (2012), a motivational program is considered to be an essential ingredient for enhanced employee productivity. Thus:

H10: *Employee motivation affects employee performance.*

8. HR Flexibility

HR flexibility is a dynamic capability of the firm in a sense that it is focused on adapting employee attributes. For instance knowledge, skills, and behaviors, for adapting to changing environmental conditions as well as the extent to which employees possess skills and behavioral repertoires that can provide a firm with options to pursue strategic alternatives. One of the main features of a flexible workforce is an employee's ability to accomplish a significant number of diverse tasks (Wright and Snell, 1998). Employee functional flexibility, which is a cornerstone of HR flexibility, refers to the extent to which employees can be transferred to different activities and tasks within the organization. It forms the basis for workers to be trained to acquire a range of skills, so that they can do other jobs as well as their own when necessary (Goudswaard and Nanteuil, 2000). Functional flexibility has been advocated as a mechanism to improve efficiency in the organization. It is also associated with superior employee performance (Rosenblatt and Inbal, 1999). Therefore:

H11: *HR flexibility affects employee performance.*

9. Research Framework

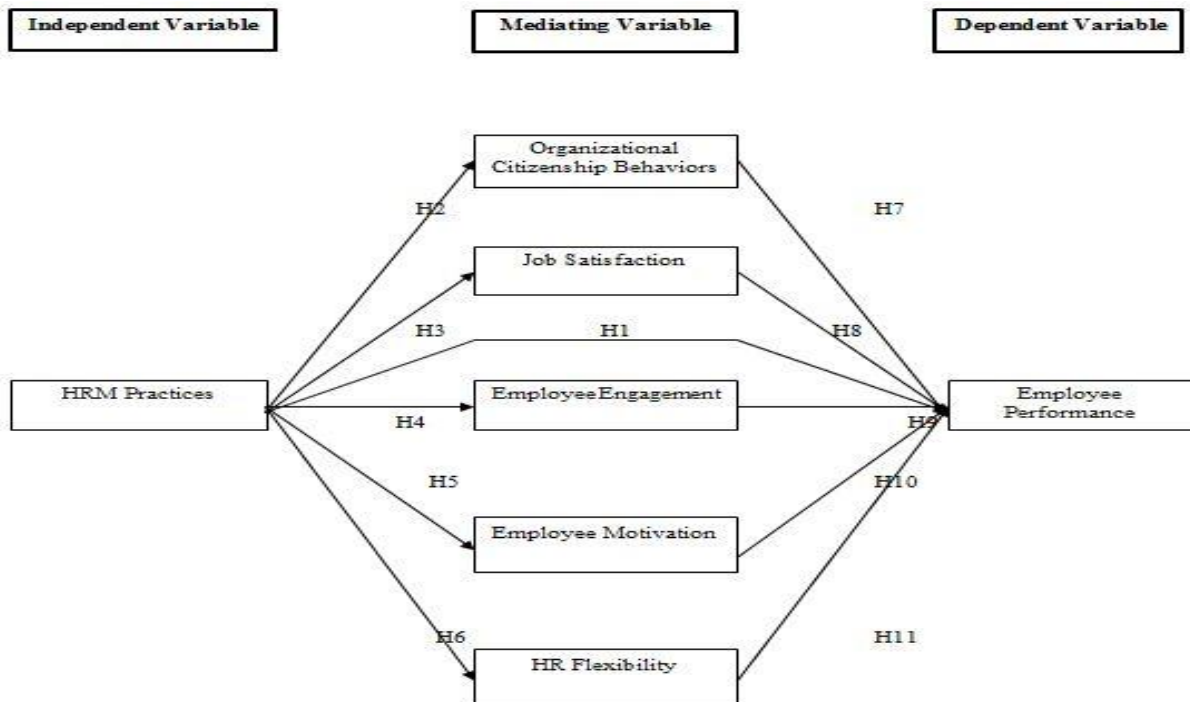
This empirical study will concentrate on the relationship between HRM practices and employee performance. It is possible to develop a comprehensive framework, presented in Figure 1, consisting of HRM practices as the independent variable base of the literature review. The mediating variables include organizational citizenship behaviors, job satisfaction, employee engagement, employee motivation and HR flexibility. Employee performance is the dependent variable.


Figure 33 Conceptual Model

Research Methodology

1. Scope of the Study

    The study focuses on the effects of human resource management (HRM) practices on employee service quality as an employee performance in Thailand's chained-brand hotels that had been located in Bangkok, Thailand. The mediating variables include organizational citizenship behaviors, job satisfaction, employee engagement, employee motivation and HR flexibility.

2. Population and Group Sample

    The population being studied are 238 Thailand's chained-brand hotels in Bangkok where they were members of hotel –chained Thailand. The samples used in this study are all managers in hotel –chained brand in Thailand that were operational in 2016. A total of 450 managers, which comprised of top management, HR leader and Line Hotel Operation manager that include Restaurant manager, Engineering manager, Executive Chef, were randomly selected from the 140 Thailand's chain-brands in Bangkok. For this study, the researcher used the non-probability sampling of purposive sampling, where there would be three types of managers, comprising of Top Management, HR Leader and Line Hotel Operation Manager, in each Hotel. They were chosen in this study because they set and implement policies, including human resource practices, in organizations.

3. Research Variables

    HRM Practices, as the independent variable, have five factors which are 1) Employee Participation 2) Compensation and Benefits Management and Reward System 3) Career Planning System 4) Training and Development and 5) Employee Empowerment. There are five mediating observed variables, which are 1) Organizational Citizenship Behaviors 2) Job Satisfaction 3) Employee Engagement 4) Employee Motivation and 5) HR Flexibility. The dependent variable has one observed variable, which is 1) Employee service quality. This research used Path Analysis to explain the relationships between the Independent Variable, passing through the Mediating Variables, and the Dependent Variable.

4. Research Instrument

   A ten-part self-assessment questionnaire is used to collect quantitative data. Two advisors checked the questionnaire before sending out. Part one contains eight items, asking for information about the organization. These questions are part of the selection process to find out which organizations are relevant in this study. Part two contains six items, concerning personal information of the respondents. Part three has a total of twenty-eight questions, consisting of the five observed variables of HRM practices. These items were developed from Carden (2007), Chew (2004), Cushman (2000), Ferguson (2006), Huselid (1993), Kgomo (2010) and Martin (2011). Part Four to Part Eight involves the mediating variables with a total of thirty-seven items. These were adapted from Bhattacharya (2000), Carden (2007), Cushman (2000), Kgomo (2010), Rose (2012) and Springer (2010). Part Nine has a total of five items that are made up of one dependent variable. These were developed from Rose (2012) and Springer (2010). Lastly, Part Ten allows the respondents to provide any further comments about the questionnaire and whether they intend to use this study, once the data has been analyzed, to manage the human resource in their organizations.

   From Part Three to Part Nine of the questionnaire, the respondents are asked to describe on a 5-point Likert scale with 1 = Strongly Disagree, 2 = Disagree, 3 = Agree, 4 = Moderately Agree, and 5 = Strongly Agree. To reduce the possibility of key information bias, a set of questions in the survey contain some revert questions for some of the variables, such as Job Satisfaction, to ensure that the respondents were confident about answering the questions (Cannon & Perreault, 1999). Reliability was assessed using Cronbach's alpha coefficient. If the value is greater than 0.70, it means that reliability is high. The questionnaire was first written in English and then translated into Thai. For linguistic consistency, it was then translated back into English by an experienced translator, and the necessary corrections were made in the Thai version. The Thai version was then distributed to the respondents.

5. Data Collection

   Two channels were used in distributing the questionnaire. First was a trip to meet the target sample at their workplace, and second electronically via email. In case of incompletes, researcher was directed contact to HR departments—the Departments that most often responded to questions—were contacted by telephone to allow them to coordinate with other manager of respondents for completely. To encourage participation, respondents were promised that they would receive a summary of the findings after the fieldwork was completed. Within 16 weeks, all of the questionnaires were collected and received. A total of 700 questionnaires were distributed, and 532 were returned (76% of response rate), of which 450 were adequately completed.

This research analyzed the data by using Statistical Package for the Social Science (SPSS) for Windows version21 and IBM SPSS AMOS version21. The steps for data analysis are as follows: (1) Examine the questionnaires that were returned from the respondents to check the answers and number them. (2) Enter the responses into the SPSS for Windows.

This research used Path Analysis to study the effects of HRM practices on employee service quality as an employee performance through the five mediating variables, (organizational citizenship behaviors, job satisfaction, employee engagement, employee motivation and HR flexibility). Path Analysis is a flexible, powerful and robust statistical method that is used to examine the relationships among the variables. These variables require a highly flexible and comprehensive statistical methodology thus Path Analysis is considered appropriate to test the conceptual model.

A two-step approach was taken to analyze the data (Anderson and Gerbing, 1988). First, the measurement model was evaluated using confirmatory factor analysis, followed by the estimation of theoretical (structural) models. Confirmatory factor analysis (CFA) was applied in the first part of data analysis to assess the convergent validity and discriminant validity of the multi-item scales measure of constructs. Research analysis results provided CFA measure results, the correlation between construct matrix and square roots of average variance extracted (AVE), as well as the model fit indices.

The evaluation of construct validity and reliability was assessed by confirmatory factor analysis using SPSS AMOS. All the items were then submitted to reliability analysis via Cronbach's alpha coefficient using SPSS 13.0 program. Cronbach's alpha for all constructs are above the recommended value of 0.70 (Nunnally, 1978).

6. Analysis Results

Tables 1 and 2 provide the frequency and percentage of organizational characteristics and personal characteristics of respondents, respectively.

Table 1: Frequency and Percentage of Organizational Characteristics

Variable	Frequency	Percent
Country of Hotel Origin		
Asia Pacific	171	38.00
North America	156	34.67
Europe	112	24.89
Others (e.g. Australia)	11	2.44
Total	450	100.0

Table 2: Frequency and Percentage of Personal Characteristics

Variable	Frequency	Percent
Male	179	39.78
Female	271	60.22
Total	450	100.0
Age		
21-30	35	7.78
31-40	152	33.78
41-50	217	48.22
51 and above	46	10.22
Total	450	100.0
Current Position / Title		
Top Management	48	10.67
HR Leader	98	21.78
Line Operation Hotel Manager	304	67.56
Total	450	100.0
Education Level		
Diploma or below	54	12.00
Bachelor's Degree or equivalent	147	32.67
Above Bachelor's Degree	249	55.33

Total	450	100.0
Work Experience		
0-10 years	67	14.89
11-20 years	231	51.33
21-30 years	125	27.78
31 years and above	27	6.00
Total	450	100.0

a. Confirmatory Factor Analysis (CFA)

This part shows the results of CFA Goodness of Fit statistics, where construct validity is used to check for consistency between the structural components through CFA. Table 3 shows one of the seven components of CFA, namely HRM Practices, Organizational Citizenship Behaviors, Job Satisfaction, Employee Engagement, Employee Motivation, HR Flexibility and Employee Performance.

Table 3: Goodness of Fit Test for Confirmatory Factor Analysis Model in Employee Performance

Goodness – of – Fit Statistics	Levels	Statistics
Chi – Square (χ^2)		1.108
Probability Level (p)	> 0.05	0.293
χ^2 / df	< 2.00	1.108/1= 1.108
RMSEA	< 0.05	0.019
RMR	< 0.05	0.004
GFI	$\geq .90$	0.999
Comparative Fit Index (CFI)	$\geq .90$	1.000

b. Hypotheses Results

Hypotheses are tested by finding the level of relationships between the variables. According to Table 4, correlation results are significant at the 0.01 level (2-tailed). Hypotheses results show the level of relationship between the variables value are not higher than +0.8, since that would mean both variables have the same meaning or use the same measurement.

Table 4: Correlation Results

	HRMP	OCB	JS	EE	EM	HRF	EP
HRMP	1						
OCB	0.530[**]	1					
JS	0.450[**]	0.505[**]	1				
EE	0.565[**]	0.646[**]	0.604[**]	1			

EM	0.341^{**}	0.456^{**}	0.303^{**}	0.578^{**}	1	
HRF	0.520^{**}	0.229^{**}	0.115^{*}	0.243^{**}	0.150^{**}	1
EP	0.380^{**}	0.327^{**}	0.334^{**}	0.383^{**}	0.335^{**}	0.287^{**}	1

N=411. Notes: **
Correlation is significant at the 0.01 level (2-tailed).

Table 5 shows the consistent statistical measure of Path Analysis model in relation to the research hypotheses and the empirical data on Human Resource Practices. The model fit presents statistical values that are within the stated level, as follows: $\chi^2 = 2.631$ with degrees of freedom

(df) of 3, and $\chi^2 / df = 0.877$, which is < 2. This is in accordance with the stated level, and has p-value = 0.452, which should be > 0.05. Values for RMSEA, GFI and CFI are in line with the stated levels.

Table 5: Goodness of Fit Test for Path Analysis Model Hypotheses Tests

Goodness – of – Fit Statistics	Levels	Statistics
Chi – Square (χ^2)		2.631
Probability Level (p)	> 0.05	0.452
χ^2 / df	< 2.00	2.631/3= 0.877
RMSEA	< 0.05	0.000
GFI	$\geq .90$	0.998
Comparative Fit Index (CFI)	$\geq .90$	1.000

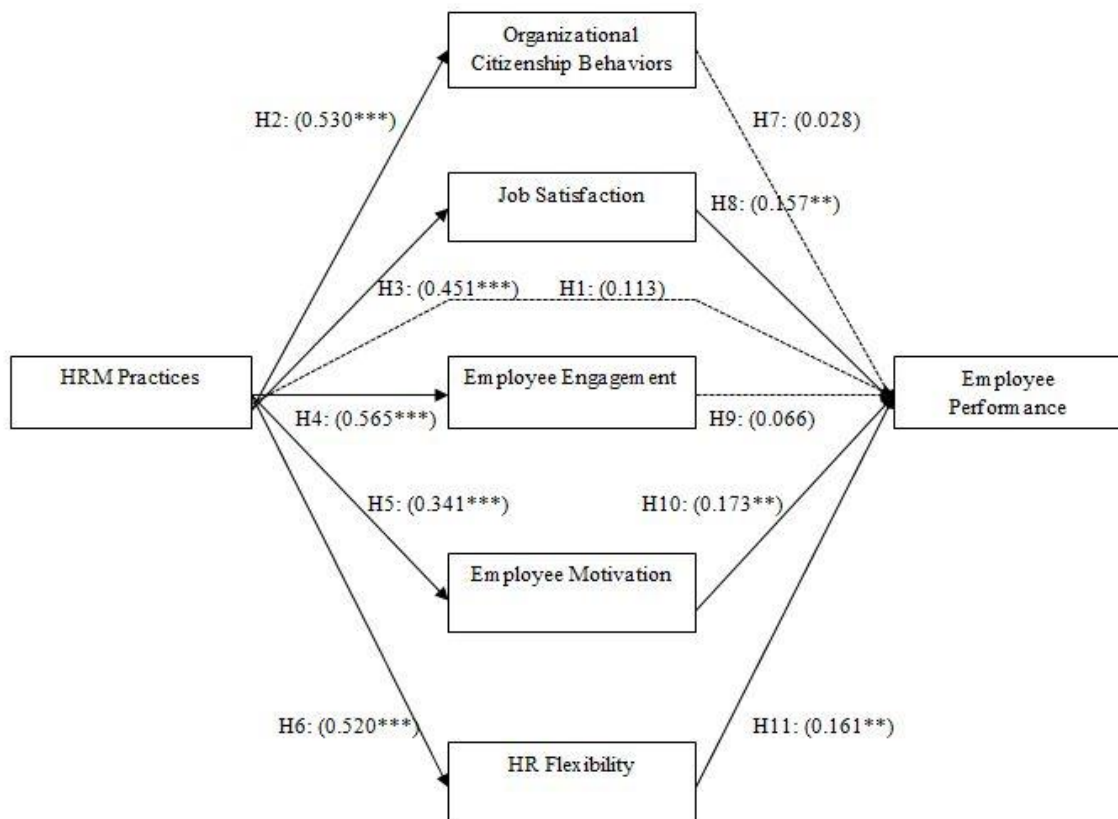
Figure 2 presents the structural model, where the tests results should show not only direct relation between the variables, but also the indirect effect and total effect.


Figure 34 Structural Model

According to the path coefficient, presented below (Table 7), all of the variables in the hypotheses test results have the following relationships.

Table 6: Hypotheses Test Results – Relationship Path Coefficients

Dependent Variables	Independent Variables					
	V3HRMP	V4OCB	V5JS	V6EEG	V7EM	V8HRF
V4OCB	0.530***	-	-	-	-	-
V5JS	0.451***	-	-	-	-	-
V6EEG	0.565***	-	-	-	-	-
V7EM	0.341***	-	-	-	-	-
V8HRF	0.520***	-	-	-	-	-
V9EP	0.113	0.028	0.157**	0.066	0.173**	0.161**

*** $p < .001$, ** $p < .01$

Table 7: Hypotheses Test Results

Hypothesis	Path Coefficients	t value	Result
H1 : V3HRMP → V9EP	0.113	1.856	Not Supported
H2 : V3HRMP → V4OCB	0.530***	12.654	Supported
H3 : V3HRMP → V5JS	0.451***	10.243	Supported
H4 : V3HRMP → V6EEG	0.565***	13.857	Supported
H5 : V3HRMP → V7EM	0.341***	7.354	Supported
H6 : V3HRMP → V8HRF	0.520***	12.336	Supported
H7 : V4OCB → V9EP	0.028	0.466	Not Supported
H8 : V5JS → V9EP	0.157**	2.804	Supported
H9 : V6EEG → V9EP	0.066	0.929	Not Supported
H10 : V7EM → V9EP	0.173**	3.240	Supported
H11 : V8HRF → V9EP	0.161**	3.167	Supported

** $p < 0.01$, t value > 2.576,   *** $p < 0.001$, t value > 3.291

Furthermore, this study is able to show the indirect effect and the total effect, as stated in Table 8.

Table 8: Direct Effect, Indirect Effect, and Total Effect of HRM Practices and Employee Performance

Exogenous Variable	Endogenous Variable		
	V9EP		
	DE	IE	TE
V3HRMP	0.11	0.26	0.37
V4OCB	0.03	-	0.03
V5JS	0.16	-	0.13
V6EEG	0.07	-	0.06
V7EM	0.17	-	0.14
V8HRF	0.16	-	0.12

From Table 8, the direct effect, indirect effect, and total effect of HRM practices and employee service quality can be described as follows:

1) V9EP = 0.16** V5JS + 0.17** V7EM + 0.16** V8HRF
    Employee Performance is the result of the direct effects of Job Satisfaction, Employee Motivation and HR Flexibility, with path coefficients equaling 0.16, 0.17 and 0.16, respectively. These are all statistically significant.

2) V4OCB = 0.53*** V3HRMP
   Organizational Citizenship Behaviors have a direct effect on Human Resource Management Practices with path coefficient equaling 0.53, which is statistically significant.
3) V5JS = 0.45*** V3HRMP
   Job Satisfaction has a direct effect on Human Resource Management Practices, with path coefficient equaling 0.45, which is statistically significant.
4) V6EEG = 0.57*** V3HRMP
   Employee Engagement has a direct effect on Human Resource Management Practices, with path coefficient equaling 0.57, which is statistically significant.
5) V7EM = 0.34*** V3HRMP
   Employee Motivation has a direct effect on Human Resource Management Practices, with path coefficient equaling 0.34, which is statistically significant.
6) V8HRF = 0.52*** V3HRMP
   HR Flexibility has a direct effect on Human Resource Management Practices, with path coefficient equaling 0.52, which is statistically significant.

The model fit using causal Path Analysis model shows consistencies among HRM practices, employee performance, and theories used.

Study Results And Discussion

Results provide new insight into the relationships between the variables. Of eleven hypotheses in this study, eight show positive relationships among the variables and three are unsupported. Included in the unsupported hypotheses, is H1, where there is no relationship between HRM practices and employee performance of employee service quality. The results are contrary to Qureshi et al. (2010), but in that study, data was collected from the cement industry in Pakistan and included low-level employees, and non-hospitality industry. In Bhatti and Qureshi (2007), other study, data was conducted in 34 diverse organizations from the oil and gas, banking and telecommunication sectors in Pakistan. Singh and Mohanty (2012), study was carried out in both the manufacturing and service sector industries in India, whereas this study was done solely in the manufacturing industry in Thailand. Nevertheless, there are also the mediating variables that can affect the relationship between HRM practices and employee performance. From the results, HRM practices are indirectly related to employee performance of service quality through the mediating variables, meaning a relationship still exists between HRM practices and employee service quality.

As for the relationships between HRM practices and the mediating variables, results suggest an overall positive correlation. For H2, HRM practices are positively correlated to OCBs (β=0.530***, $\rho < 0.001$), thus supporting Babaei et al. (2012), Cushman (2000) and Gong et al. (2010). This means that HRM practices should be implemented to build a workforce that is willing to perform more than the standard duties. For H3, HRM practices have a positive relationship with job satisfaction (β=0.451***, $\rho < 0.001$), thus confirming Absar et al. (2010), Bhatti and Qureshi (2007), Carden (2007), Rehman et al. (2010), and Swarnalatha and Sureshkrishna (2012). HRM practices are, therefore, shown to leave employees feeling increasingly satisfied with their jobs. For H4, there is a positive relationship between HRM practices and employee engagement (β=0.565***, $\rho < 0.001$). Results are further supported by Bhattacharya and Mukherjee (2009), Ram and Prabhakar (2011), and Shafer (2010). By using HRM practices will create engaged employees. For H5, HRM practices have a positive correlation with employee motivation (β=0.341***, $\rho < 0.001$). This is confirmed by Al-Nsour (2011), Ali and Ahmed (2009), Gawali (2009) and Yoon (2001), thereby showing how HRM practices can motivate employees to work hard and strive for success. For H6, there is a

positive relationship between HRM practices and HR flexibility (β=0.520***, ρ < 0.001), further supporting Beltrán-Martín et al. (2008) and confirming the view that considered HR practices an appropriate mechanism with which to increase flexibility (Dyer and Shafer, 2002; Sparrow, 1998). Through HR practices, employees were found to be able to perform a variety of tasks effectively.

Results also show a strong positive relationship between the mediating variables and employee service quality. The only exceptions are H7 and H9. H7 indicates that there is no relationship between organizational citizenship behaviors and employee performance of service quality. Regarding H8, results show a strong relationship between job satisfaction and employee service quality (β=0.157**, ρ < 0.01), which is further supported by Halkos and Bousinakis (2010). This suggests that when employees are satisfied with their jobs, they will work harder for the organizations. For H9, there is no relationship between employee engagement and employee performance of service quality. This is in contrast to previous studies like Harter et al. (2002), but that was conducted in just 36 companies outside Thailand. For H10, results indicate a positive relationship between employee motivation and employee performance (β=0.173**, ρ < 0.01). This is confirmed by Solomon et al. (2012), meaning motivated employees will work harder for the organization. For H11, results confirm that HR flexibility has an effect on employee service quality (β=0.161**, ρ < 0.01), thus confirming Rosenblatt and Inbal (1999). This shows that employees with functional flexibility are more productive in the organization.

Implications, Limitations and Recommendations
This study to confirm a model relating HRM practices and employee service quality performance which can help both organizations and academics to understand that employee service quality cannot be determined by HRM practices alone. There are other factors, such as employee behaviors, that can also have an effect on employee performance. In this study, they are the mediating variables that help establish a relationship, albeit indirectly, between HRM practices and employee performance. The importance of HRM practices should, therefore, not be ruled out. Results have confirmed the conceptual model and important aspects of HRM practices in Thailand's chained-brand hotels that can be used in other business.

Many organizations including hotel industry have been trying to create new HRM management tools, which ignore the use of human resource management practices. However, this study can show that HRM practices are still acceptable to all firms and that they should realize the importance of these practices. By employing HRM practices and taking into account employee behaviors, managers can increase the likelihood that their employees will perform better at work and with the quality level expected. But there needs to be full worker participation in the organization, where information concerning policy issues are shared with employees. Employees should also be allowed to make suggestions concerning policies and procedures through a command structure that welcomes employee/employer interaction. Encouraging employees to express their views should be the goal of activities.

Managers in Thailand's chained-brand hotels should construct a system of compensation, benefits, and rewards in which employees are given positive recognition and rewards for good performance. Furthermore, there should be a competitive benchmark that considers the amount and quality of work that employees do. Within this system, the benefits should be equitable.

Chained-brand hotels organizations should institute a career planning system to help employees map out their visions for the future; it should be long-term and focused on individual development. Career planning in organizations must be both vertical and horizontal, allowing employees to not only grow within the scope of their jobs but also to

function and succeed in other roles. It is the duty of the organization to create the opportunity for employees to advance in their careers. Creating opportunities can be done through effective and timely training and development. Once training is complete, organizations should track employee progress both to ensure proper development and to monitor workforce satisfaction. In that sense, organizations must empower employees, giving them autonomy over their jobs.

HRM practices have an effect on these five types of behaviors as mediating variables which, in turn, have a positive impact on employee service quality performance. Out of the five mediating variables, the one that has the strongest effect on employee service quality performance is employee motivation. Managers should develop a program where employees are encouraged to make improvements at work that are acceptable by the organization, and to get ahead, thus allowing them to fulfill their ambitions. Academics should use this new model to create curricula consistent with empirical results by focusing on the HRM practices variables particularly three mediating variables, which are job satisfaction, employee motivation, and HR flexibility.

Although this study is successful in showing that HRM practices have an indirect effect on employee service quality performance, it does have limitations. First, the study was conducted of chained-brand hotels in Thailand and was limited to Bangkok. Thus, conclusions only represent a limited context. Those who intend to do further research on the topic should include other region in Thailand and other countries in South East Asia.

Conclusion
Despite its limitations, this study has given a better understanding of the ways in which HRM practices and employee behaviors, as mediating variables, affect employee service quality as an important performance in chained-brand hotels. Employee service quality performance is a key determinant of a hotel and other hospitality performance, and this study provides in explaining the indirect relationships among these variables. However, these variables are not the only factors that can determine employee service performance in organizations. There are other factors involved besides the five main employee behaviors that have been discussed. Organizations also need to consider other aspects to determine the employee service quality as performance outcome of organizations, such as employee ability & competencies, organizational human resource development programs.

INTERNATIONAL HUMANITARIAN LAW AND CIVILIAN PROTECTION: THE CASE FOR INTERNALLY DISPLACED PERSONS

Nuarrual Hilal Md Dahlan, Universiti Utara Malaysia, Malaysia
Shedrack Ekpa, Universiti Utara Malaysia, Malaysia

Abstract

Current norms for the protection of internally displaced persons is richly influenced by principles entrenched in international humanitarian law as applicable to civilians and non-combatants who are not actively involved in the prosecution of wars. These principles though not specifically directed at this category of persons per se is no doubt of paramount importance to them being victims of armed violence occurring within the borders of their own country. This paper keenly examines legal implications of international humanitarian law rule applicable to non-international armed conflicts to situations of internal displacement with the view to identifying the extent to which the rules and principles can be applied to fan protection for internally displaced persons beyond the parameters set out in the standard setting norms on internal displacement. This conceptual discourse is significant as it contributes to the need to engage in more insightful thoughts on alternate ways of strengthening protection and assistance of internally displaced persons.

Keywords: *Armed conflict; Civilians; Internally displaced persons; Humanitarian*

Introduction

The complementary role of international humanitarian law in setting normative standards for the protection of internally displaced persons is indubitable as current norms on internal displacement are clear restatement of principles of humanitarian law, human rights law and refugee law by analogy (Guistiniani, 2011). This advancement is evidently captured in the Guiding Principles (GP, 2009) and later replicated in the Great Lakes Pact (ICGLR, 2006) and the African Union Convention for the Protection and Assistance of Internally Displaced Persons (Kampala Convention, 2009).

International humanitarian law (IHL) simply refers to rule and principles of international law applicable to war generally. They are also called "law of wars (LOW) or "law of armed conflicts (Solis: 2010). This rule governs armed conflict involving states, civil war groups or secessionists as well as those engaged in any form of state or non-state belligerency (Nagib, 2009). In traditional parlance they are collectively referred to *"jus in bello"* which literally connotes "set of rules of international law relating to the conditions under which a subject of international law is permitted to resort to armed force" (Bugnion, 2003) or law of armed conflicts" (Policastri & Stone) as opposed to *"jus ad bellum"* which on the other hand means "set of rules of international law applicable to the mutual relations of parties to an international armed conflict or the law and customs of war" (Bugnion, 2003; Stahn, 2007).

Broadly speaking, the application of law of armed conflicts or IHL is limited in two category of armed conflicts, namely international armed conflict and non-international armed conflict, with each having distinct rules. It is worthy of note that the extent to which the autonomy grounded in this distinction in terms of legal and practical implications is still shrouded in raging controversies especially having regard to the right of states to quell insurrection and rebellion, and the right of the people to self-determination as derived from the supranational prescriptions in the United Nations Charter (Arts. 1(2) & 55, 1945). Some commentators have described the distinction as arbitrary, unjustifiable and devoid of the humanitarian stance which this branch of international law represents (Warwick & Rowe, 1996).

The protection of internally displaced persons in this paper is examined from the general perspectives of protection of civilian populations in situation of armed conflicts that takes place within the territory of individual states as opposed to extra-territorial (Hickel, 2001). Bearing this in mind, this article critically assesses the role of international humanitarian law in the protection and assistance of internally displaced persons within the context of non-international armed conflicts with a view to identifying interpretative legal issues limiting their wholesale application to situation of internal displacement.

Sources And Progression Of International Humanitarian Law

The sources of international law as set out in the Statute of the International Court of Justice (ICJ) is universally authoritative (Art. 38). It suffices also for international humanitarian law being a subset of the former. These are international treaties/conventions which are formal agreements between states or between states and international organizations or between intergovernmental organizations (Vienna Convention, 1969: Art. 2) ; customary international law which consists of unwritten rules created by the practices of States; general principles as recognized by civilized nations popularly referred to as peremptory norms or *jus cogens;* and judicial decisions of courts such as the International Court of Justice and International Criminal Court and the most highly qualified juristic writings as subsidiary means for the determination of rules of law.

It is apt to state that since 1864 when Dunant called for an international regulation of casualties of battlefields which culminated in the emergence of the first Geneva Convention (American Red Cross, 2011) comprising of only ten articles, international humanitarian law has been in gradual progression (St Petersburg Declaration, 1868).

Two legal current have contributed to further development of international humanitarian law, these are Hague Law which consists of the 1899 and 1907 Conventions and the Geneva Law comprising pre 1949 and 1949 Conventions now merged together by virtue of the two Additional Protocol to the Geneva Convention in 1977. Today as far as issue of humanitarian law treaties are concerned, reference is currently limited to the four Geneva Conventions and the two Additional Protocol on one hand and other Conventions dealing with specific subjects of international humanitarian law such as 1980 Convention on the Use of Conventional Weapons, Convention on Chemical Weapons 1993, Protocol relating to Blinding Laser Weapons 1995, 1996 Revision of the 1980 Convention, Convention on Anti-Personnel Mines (Ottawa Treaty 1997, 1998 Rome of the Statute of the International Criminal Court, Protocol II to the 1954 Convention for the Protection of Cultural Property 1999, 2000 Optional Protocol to the Convention on the Rights of the Child on the Involvement of Children in Armed Conflicts, Protocol on Explosive Remnants of War (Protocol V to the 1980 Convention) 2003, 2005 Protocol III to the 1949 Geneva Conventions, relating to the adoption of an additional distinctive emblem (the "Red Crystal"), and Convention on Cluster Munitions 2008 on the other hand (Bonvier & Langholtz, 2012).

As far this article is concerned, discussion would be limited to the Geneva Conventions (I-IV) of 1949 and the Additional Protocols (I&II) of 1977 because of their distinctiveness and universal acceptance (Wikipedia, 2016).

Scope Of Application Of International Humanitarian Law

IHL rules are invoked only in situations of an 'armed conflict.' Armed conflict is not authoritatively defined in the Geneva Conventions and Additional Protocols despite several references made to the term in international humanitarian law. However, following the decision of International Criminal Tribunal for Former Yugoslavia (ICTY) in *Prosecutor v. Tadic*, in which the accused, a Bosnian Serb politician and former member of a paramilitary

armed forces supporting the attacks on Serb-run concentration camps in Prijedor was alleged of commission of crimes against humanity and grave breaches of the Geneva Conventions, the tribunal held in determining the application of the Geneva Conventions while rejecting the defense argument that there were no hostilities at the relevant time and place that: "…An armed conflict exists whenever there is a resort to armed force between States or protracted armed violence between governmental authorities and organized armed groups…International humanitarian law applies from the initiation of such conflicts…" (ICTY, 1996:70).

It is important to note that before a decision is made on which of the IHL rules that is applicable in any given instance, the nature of armed conflict must be first and foremost determined. Basically, flowing from the combined provisions of the four Geneva Conventions and Additional Protocol I and II, two kind of armed conflicts suffice for the application of international humanitarian law namely; international armed conflicts (IAC) and non-international armed conflicts (NIAC). In other words, rules of IHL apply differently depending on whether the armed conflict in question is international or non-international.

International armed conflicts (IAC) is defined in the common article 2 of the four Geneva Conventions as: "… All cases of declared war or of any other conflict which may arise between two or more of the High Contracting Parties, even if the state of war is not recognized by one of them. The Convention shall also apply to all cases of partial or total occupation of the territory of a High Contracting Party, even if the said occupation meets with no armed resistance."

It therefore follows that for an armed conflict to qualify as international armed conflict, 'parties to the conflict' must be a state within the meaning of the Geneva Conventions and the Additional Protocols, thus acknowledgment of the existence or non-existence of state of war between them is immaterial. State within the purview of the Geneva Conventions is a High Contracting Party who have signed and or ratified the said treaty provisions. It is however submitted that the existence of international armed conflicts should be decided on case by case basis (Jones & Powles, 2003).

In all armed conflicts bearing on above description, all the provisions of the four Geneva Conventions apply in addition to Additional Protocol I for states that have ratified it by virtue of article 1(3) thereof. It is glaring to add here that Additional Protocol I has expanded the definition of international armed conflict (IAC) to also include "armed conflicts in which people are fighting against colonial domination and alien domination and racist regimes" in accordance with article 1(4) of Additional Protocol II to bring them within the protection engendered by the spirit and purport of common article 2 of the Geneva Conventions. This Protocol abandons the concept of protected persons used in article 4 of the fourth Geneva Convention as it opted for an inclusive notion of civilians who are not combatants. It therefore follows that all the provisions of this Protocol aimed at protecting civilians are also applicable to IDPs especially under part IV of the Protocol, for instance under article 50 of Additional Protocol I.

On the other hand, non-international armed conflicts (NIAC) is described by common article 3 of the four Geneva Conventions as "… armed conflicts not of an international character occurring in the territory of one of the High Contracting Parties." Therefore its application is limited to armed conflicts which involves only armed forces of a state armed force of government opponent (belligerents) who are not combatants of another state's armed force occurring within the territory of High Contracting Parties (Solis, 2010). Article 1(2) of the Additional Protocol II clearly excludes internal disturbances such as riot, disorder and banditry from notion of non-international armed conflict and consequently same do not give rise to conflicts known to common article 3 of the Geneva Conventions.

The scope of application of common article 3 of the Geneva Conventions is strictly limited to a lower threshold of armed conflict. In other words, to determine whether a particular armed conflict is a non-international armed conflict or mere internal disturbance/violence two conditions relating to the nature of the conflict must be fully examined to wit: the intensity of the conflict and the organization of the parties to the conflict (ICTY, 1997:352). In other words, where the armed attacks are not 'sufficiently violent and protracted' and the non-state armed groups are not 'sufficiently organized' it is likely to be regarded as internal disturbance which constitute criminal acts punishable in domestic courts and in which case IHL rules of protection as envisaged in the Geneva Conventions and Additional Protocol II in respect of non-international armed conflict would be inapplicable.

It is important to note also that in non- international armed conflicts, common article 3 applies and perhaps Additional Protocol II apply and thus no other portion of the Geneva Conventions is applicable. Common article 3 of the Geneva Conventions is the sole article that deals with several kinds of internal armed conflicts in one single breadth namely- civil wars, insurrections and armed uprisings.

Common article 3 have attained customary international status as it guarantees humane treatment and applies to entire civilian population which also include IDPs (Pictet, 1952-9). It is therefore based on this reason *inter-alia* that it is often referred to as "Geneva Convention in miniature" (ICTR, 2001); Pictet, 1952-9). However to the extent that common article 3 establishes minimum yardstick of the rules of international humanitarian law applicable to internal and international and armed conflicts (ICJ, 1986), it is safe to submit that it applies across the range of armed conflict notwithstanding their characterization.

It is important to add that by reason of the changing nature in the methods of warfare, an internal armed conflict could turn out to an international armed conflict if armed troops intervene 'significantly and continuously' thereby making the provisions of Geneva Conventions regarding international armed conflict to apply to conflicts of non-international character (ICTY, 2006).

Protection Of Internally Displaced Persons In International Humanitarian Law
Owing to the growing number of internal strife, generalized violence and gross human rights violations occurring within the borders of various states around the globe, multitude of people have been forced to leave their place of residence to elsewhere in search of safety and other livelihoods. This vulnerable persons are called internally displaced persons for reasons that their persecution has not taken them outside the territory of their own state. Internally displaced persons is authoritatively defined by the Guiding Principles on Internal Displacement 1998 following the appointment of the then Representative of the UN Secretary General (Francis Mading Deng) by the United Nations Commission on Human Rights. The Principles defines 'internally displaced persons' as "Persons who have been forced or obliged to flee or to leave their homes or places of habitual residence in particular as a result of, or in order to avoid the effects of armed conflict, situations of generalized violence violations of human rights or natural or human-made disasters, and who have not crossed an internationally recognized State border" (GP, 1998: Para 2 & Kampala Convention, 2009:Art. 1k).

The above definition which is merely guiding and descriptive but not binding, incorporates two distinct legal criteria to wit; First, the involuntary nature of their flight and second, the fact that they have not crossed into the territory of another state. Though uprooted by similar causes akin to refugees, it is the internal/external dichotomy that is rightly used in distinguishing refugees from internally displaced persons who as a matter of law must be resident outside the shores of their own country at the material time when protection and assistance is sought (UN Refugee Convention, 1951: Art. 1 (2) A).

However, the extent of deprivations suffered by internally displaced persons is further heightened by the fact that in addition to absence of binding international legal protection, they are not like refugees who are under the direct responsibility of the United Nations High Commissioner for Refugees (UNHCR Statute, 1950, Para 8). Consequently, it becomes obligatory to fan for more concrete scheme of protection for this category of persons whose description failed to confer on them any special status in international law (Ladan, 2015).

Surprisingly internally displaced person (IDP) is not defined in international humanitarian law. However, civilians and non-combatants are clearly described therein as "…Persons taking no active part in the hostilities, including members of armed forces who have laid down their arms and those placed hors de combat by sickness, wounds, detention, or any other cause" (GC I-IV, 1949:Art.3).

The purpose of the definition of civilians in the foregoing provision is meant to generate an extensive meaning that would increase to the maximum extent, the breadth of humanitarian protection granted by the law on armed conflicts (Kolb & Hyde, 2008). Juxtaposing the position of IDPs especially in displacement caused by armed conflicts occurring within the territory of High Contracting Parties which are so described as "conflict of non-international character,' for instance in Nigeria's North East region where government's armed forces are fighting the Boko Haram insurgency in order to suppress and if possible annihilate them (Akinbi, 2015), with the above statutory description, IDPs to the extent that they are not involved in hostilities would rightly qualify as civilians or non-combatants within the meaning of Common article 3 of the four Geneva conventions and article 4 of Additional Protocol II provided the determining criteria of level of intensity of attack and the organization of the non-state armed force (Boko Haram insurgents) suggests the existence of an internal armed conflict and not mere internal disturbances, such as violence, tensions and banditry (Cassese, 2004).

Aside from the foregoing, rules of international humanitarian law may also be applicable to situations of displacement caused by internal disturbances which are clearly outside its province where parties to the conflict agree to apply the same to conflicts beyond and above the formal prescription in accordance with articles 6, 6, 6 and 7 of the first, second, third and fourth of Geneva Conventions respectively.

Rules And Principles Of International Humanitarian Law Applicable To Situations Of Internal Displacement

In the quest for sufficient if not adequate protection for victims of internal disturbances/violence below the threshold of armed conflicts under the Geneva Conventions and the Additional Protocol II and who are technically called 'internally displaced persons' as adumbrated above, states bears national responsibility for their protection and assistance for reasons that they are in the same pedestal with other citizens (Kampala Convention, 2009: Art. 5). This becomes more meaningful when existing norms for the protection for this vulnerable persons are domesticated into national laws and policies taking cue from the principles richly entrenched in international humanitarian law (Kampala Convention, 2009: Art. 7). It is gladdening to note that some of the principles encapsulated in international humanitarian law, which by way of analogy is applicable to internally displaced persons have acquired universal acceptance justifying their replications in the existing norms on internal displacement.

The prevention and prohibition of violations of these extant principles of international humanitarian law would indeed lead to gradual reduction of the depravities associated with situations of internal displacement as a result of violence that takes place within the borders of state in view of the fact that the triggering causes are potentially the same (ICRC, 2010),

notwithstanding the characterization of the conflict in question. Thus this section of the paper will in no particular order examine rules and principles as expressed in the Geneva Conventions and the Additional Protocols, and where necessary cross reference shall be made to both the Guiding Principles and the Africa Union IDP treaty to show extent of their restatements.

In another aspect, rules of international humanitarian law is of immense significance to the realization of protection needs of internally displaced persons insofar as the prevention and protection against unlawful and arbitrary displacements is concerned. Arbitrary displacement is a concept that is aptly employed in a number of norms relevant to internally displaced persons than in any other area of legal discourse, because of its potential as a catch-all-phrase for unlawful treatments which are considered not only to be disparaging but inhumane such as unlawful detention, forceful transfer and disappearance, killings-widespread or systematic, displacement by whatever cause etc. Even though individual branches of international law developed on separate paths, forced displacement in which the notion of arbitrariness resonates has become their common site of convergence (Fitzpatrick, 2000).

The protection of IDPs in non-international armed conflicts occurring within the territory of High Contracting Party against forced displacement in the form of deportation, mass transfers and evacuation is well provided for in article 49 of the fourth Geneva Convention. Civilians in similar circumstances are also protected against forceful displacement or object of attacks under articles 4(3) (e) and 17 (1) and (2) and 13 of Additional Protocol II respectively as replicated in article 7 (3) of the Kampala Convention.

International humanitarian law is greatly underpinned by the philosophical idea that notwithstanding the characterization of conflict, ultimate consideration shall be accorded to the need to protect civilians and non-combatants who are not involved in hostilities based on customary international law which is unequivocally influenced by the principles of humanity and obedience to public conscience derived from unwritten rules inherent in existing treaty law such as Geneva Conventions and Additional Protocols I and II. What is more, the preamble to Protocol I asserts to the effect that the Geneva Conventions of 1949 'are to be fully applied in all circumstances… without any adverse distinction based on the nature of origin of the armed conflict or on the cause s espouse by or attributed to the Parties to the conflict' (Green, 2000). In the erstwhile 1899 Hague Conventions II and 1907 Hague Convention IV, this minimum humanitarian guarantee is called the "Martens Clause."

The International Court of Justice (ICJ) in *Legality of Nuclear Weapons Case* (ICJ, 1996;226) which touches on the legality of threat and use of nuclear weapons reaffirmed the principles of civilian protection "as one of the cardinal principles contained in the texts constituting the fabrics of international law"(Hayashi, 2007).

It is therefore apt to note that based on the notion of civilian protection as evidenced from the provisions of Geneva Conventions, Additional Protocols I and II, Customary International Humanitarian Law rules, internally displaced persons as a result of armed conflict occurring within the territory of a High Contracting State qualify as civilian in this context necessitating their guaranteed right to safe return upon the cessation of hostilities in accordance with articles 49 and 147 of the fourth Geneva Convention, articles 51(7), 78(1) and 84(5) (a) of Additional Protocol, articles 4(3) (e) and 17 & of Additional Protocol II and Rules 129 and 132 of CIHL which are all of utmost relevance in this regard. The obvious problem with international humanitarian law's notion of guarantees against displacement is the fact that it focuses more on involuntary relocation rather than dealing in comprehensive term with situations of forced displacement during armed conflicts (Phoung, 2004).

The foregoing scheme of protection against arbitrary displacement is well restated in Principles 6(1) of the Guiding Principles to the effect that every human being enjoys an

inherent right to be protected against arbitrary displacement from his habitual place of residence. The principles extends the meaning of arbitrary displacement to also include engaging in large scale development projects among other acts listed under paragraph 2 thereof which endanger human lives during displacement. In similar vein, Kampala Convention also frowns at displacement predicated on arbitrary and unlawful grounds.

The Convention under the heading coined 'prohibition and prevention of arbitrary displacement' is in itself a significant innovation as article 4 thereof recognizes the right not to be arbitrarily displaced in a language that is more explicit and elaborative than in any other existing norms regarding internal displacement (Abebe, 2010; Alemayehu, 2010). For instance article 4 (4) (a – h) of this Convention have no equivalence in any other binding norms on internal displacement. In particular, the Convention provides against arbitrary displacement of people whose existence is dependent on land and declare that engaging in such prohibited acts of arbitrary displacement could amount to commission of international crimes (Kampala Convention: 2009, Arts. 4 & 6)⋅ The Convention like the Guiding Principles provides that development projects could lead to arbitrary displacement under article 10 thereof.

It should be added that unlike Principle 9 (c) of the Guiding Principles, the Kampala Convention miss the mark in not providing for kind and purpose of projects envisaged under the Convention. The word "project" in the opinion of this researcher is too wide and thus amenable to multiple deceitful interpretations by those charged with such responsibilities. In the same vein, on question of necessity of the projects in the first place, the Convention similarly failed to employ the phrase '…compelling and overriding public interests' used in the Guiding Principles to curb excesses of state actors and non-state actors. Under articles 2(4) and 3(1) of Great Lakes IDPs Protocol "member states are enjoined to prevent arbitrary displacement and to eliminate all root causes of displacement".

Discrimination is one of the intense triggers of internal armed conflicts which could lead to massive displacement of people from one part of the country to the other when coupled with egregious violations of human rights. At the core of humanitarian law protection is the underpinning idea to treat all persons humanely and the right not to be discriminated against by whatever criteria. This entails the prevention and protection from forcible and involuntary displacement which is highly problematic in situations of internal displacement. In the course of precarious and complex situations, internally displaced persons have been thrown into, they are obligated not to be discriminated against because of their peculiar susceptibilities. The foregoing is richly underpinned also in the provisions of articles 3 and 27, articles 75 of Additional Protocol I, and articles 2(1) and 4(1) of Additional Protocol II, and Rules 1 and 7 of Customary International Humanitarian Law Rules (GP, 1998: Principle 4).

In addition to the foregoing, the general notion of civilian protection and assistance as provided for in the fourth Geneva Convention and Additional Protocols is more apt to IDPs as a result of internal armed conflicts (Kampala Convention, 2009: Art. 7). In particular, IHL rules protects property and possession of civilians during hostilities against direct or indiscriminate attacks or pillage (GC IV, 1949: Art. 33) or from being used as a shield or destruction as a form as of reprisal attack or collective punishment (AP I, 1977: Arts. 51 &52). However, the protection envisaged here is in favor of those civilians who falls into the hands of another state and who are defined as 'protected persons (GC IV, 1949:Art. 4 & Phoung, 2004:46). This is problematic because IDPs as a result of their plight lives within the borders of their own state and are not in the hands of the enemy state as it were and are not to be regarded as nationals of another state.

Conclusion

The continuing rise in internal displacement due to armed conflicts and violence within the territory of states in most part of the world (IDMC/NRC- GRID: 2016) has made the significance of distinction between non-international armed conflicts and internal disturbances or tensions very doubtful as far as application of rules of international humanitarian law as evidenced in the Geneva Conventions and particularly in the Additional Protocol II insofar as it occurs within the territory of a high contracting party is concerned.

Granted that the exclusion of internal disturbances (riots, tensions and banditry) from the application of law of armed conflicts is anchored on the need to protect the integrity and sovereignty of states against interference in its domestic affairs, situation of internal displacement which is characterized as falling below the threshold of a recognizable armed conflict in international humanitarian law also constitutes threat to international and, regional peace and order. That the law of armed conflicts is state centric in view of its unhidden flair for upholding principles of sovereignty and equality of states deserve no further elaboration.

However, there are special procedures under the United Nations Charter dealing with the right of Security Council to intervene under Chapter VII as well as under the African Union's permissive or consensual right of intervention to deal with egregious violations of this nature which are admittedly domestic challenges (AU Constitutive Act, 2000: Art.4h) for reasons that such intervention or interference finds expression in the contemporary understanding that sovereignty also entails protection of subjects (Kuwali, 2010). The exercise of these collective measures in themselves could achieve two ends namely preventing widespread displacement in addition to safeguarding the sovereign integrity of states concerned.

It is no longer surprising to note that cases of disregard for common article 3 of the Geneva Conventions which governs non-international armed conflicts clearly outnumber instances of compliance as majority of states enmeshed in internal armed conflicts are not inclined to acknowledge the existence of common article 3 conflicts in their territory even though such recognition does not affect the legal status of the parties to the conflict as espoused in the final clause of Common Article 3 and also UK Ministry of Defense Manual They would gladly treat such internal violence as a form of rebellion to be dealt with in accordance with domestic penal sanctions. What is more annoying is the fact that High Contracting Parties are blindly vested the ultimate power to decide on when common article 3 conflict exists as well article 1(1) of Additional Protocol II. It is humbly submitted that the self-solicited function or better put, subjective determination of a vital decision of this nature on parties to the conflict is an over-bloated luxury that limits the relevance of IHL rules to internal disturbances or to put more simply violence that takes place within the territory of a High Contracting Party given the absence of mechanisms for international monitoring of states practices in this regard (Cassese, 2004: 33-4).

Strict adherence to the legal complications brought about article 1(1) of Additional Protocol II which introduced formalistic conditions such as intensity of the conflict, effective control of part of a national territory and an organized structure of the parties to the conflict (ICTR, 1998) would definitely renege on the purpose of the law in that it would heighten the threshold far beyond the parameters of internal armed conflict, not to mention of extending the same to internal disturbances which are clearly excluded. The negative delineation of non-international armed conflicts in Additional Protocol II without a corresponding definition of what amounts to internal disturbances and tensions leave much to be desired as its material scope of operation is bedeviled with lack of precision and in most cases the failure provides the cheapest line of defense for unwilling states against the application of international humanitarian law to conflict of low intensity due to attacks from non-state armed groups that

are not structurally organized even when it is glaring that such armed conflicts could present urgent needs for humanitarian intervention.

To this end, this paper concludes that all laws are created for the benefit of all human beings (ICTY, 1995: Para. 97) hence what is evil in international context should be dealt with the same blow at the domestic level. The nature of the parties to the conflict and character of conflict in question is of less practical significance. The interpretation of the threshold of international humanitarian law in the context of non-international armed conflict as applicable to civilian protection should be guided by the understanding of the purpose and object of international humanitarian law which is the provision of highest protection to victims of armed conflicts occurring within the territory of a High Contracting Party in particular (Vienna Convention, 1969: Art. 33) Where internal displacement is as a result of armed conflict, international humanitarian law based on its *raison de'etre (*reasons for its adoption) in common article 3 ought to come in aid of victims so as to assuage their problems without unnecessary distinction.

AN EMPIRICAL STUDY OF THE DETERMINANTS OF THE DEMAND FOR LIFE INSURANCE IN SRI LANKA

S.K. Gamage, Wayamba University of Sri Lanka, Sri Lanka

Abstract

Life insurance plays an important role in managing personal risks of individuals and families and life insurance provides benefits to them when they need financial support at expected or unexpected happening of some events. However, households' demand for life insurance remains very low level in Sri Lanka. The aim of this research is to examine why Sri Lankan households with substantial income have low demand for life insurance plans. In this research, data was collected from a sample of 200 households selected through stratified random sampling technique and the collected data was analyzed using quantitative data analysis techniques. The research revealed that, 31 percent of the households have purchased and 49 percent of the respondents are willing to purchase life insurance products. Majority of the households have no good knowledge about life insurance products. Income of the households is one of the major factors affecting the demand for life insurance. Further, interest rates of the banks, bonus declared by the insurance companies and stability of the company and living costs of the households are the other factors affecting the demand for life insurance. However, households' perception is that, purchasing life insurance plans is a good solution for the economic problems faced in the future.

Keywords*: Personal risk, investment, life insurance, determinants for demand*

Introduction

Life insurance is one of the most important financial instruments used to cover the risk of loss of income or earnings due to death of the life assured and an important saving and investment instrument for the future financial security. Therefore, estimation of life insurance need is essential in financial planning. The most important family needs include, education fund for children, emergency fund for unexpected contingencies, income during the dependency period, income during readjustment period, income to the surviving spouse, and income for the retirement (Rejda, 2008). Personal financial need approach attempts to determine the amount of life insurance that should be purchased based on analysis of needs of those who would suffer financial losses. Life insurance is one of the tools that may be used to meet the gap between the needs and available resources (Emmitt and Therese, 2003).

Life insurance is a legally binding contract between insured and the insurer. In exchange for payment of premium, the insurer agrees to pay specified death benefits to the beneficiary named in the policy if the death of the life assured occurred during the period of insurance (Trieschamann et al 2002). For many people, life insurance is most appropriate for dealing with the exposure of premature death of the life assured. However, many life insurance contracts also have benefits that may be payable due to circumstances other than death. Thus, a life insurance policy with a cash value can be used to save for other concerns, such as retirement, as well as to protect against the financial consequences of premature death.

Insurance Industry in Sri Lanka commenced with the advent of coffee and tea cultivation during the British colonial period. At the beginning, insurance was confined to marine cargo and fire insurance to cover tea and rubber factories. Life insurance was confined to foreigners and affluent people of the country (Wijenaike, 1998). However, the awareness of insurance was spread to the rural arias with the operating of branch offices by foreign insurers and with the entrance of local insurance companies to the market (Kanapathipillai, 1997). Foreign

companies continued their business operation in Sri Lanka even after the gaining its independence in 1948. By 1961, there were 122 foreign and local insurance companies in Sri Lanka and out of which 57 insurance companies transacted life insurance business (Kelagama et al, 1998). However, insurance fund generated by the foreign companies were remitted to their countries and they did not invest these funds in the country. Under these circumstances, the government made a policy decision to nationalize the insurance industry in Si Lanka. Accordingly, Sri Lanka Insurance Corporation (SLCI) was established as the sole insurer to transact life insurance business in the country from 1st of January 1962 (Wickramasinghe, 1997).

Further, government opened the avenues for the private sector to enter into the insurance market from 1986. Accordingly, 3 insurance companies entered into the market in 1987 and subsequently many other private sector companies entered into the insurance market. Further, 80% of the foreign equity participation in insurance companies was permitted by the government in 2000 and the government permitted 100% foreign share holding in insurance companies from April 2002. At present there are 29 insurance companies operating in Sri Lanka and out of which 14 companies are transacting exclusively life insurance business while only the state insurer, Sri Lanka Insurance Corporation Limited is transacting both life insurance and general insurance business in the country.

Research Problem

Although the life insurance is considered as one of the unique and most important financial instrument used in order to cover the risk of individuals, families and the society, life insurance products are not widely used by Sri Lankan households. While the insurance industry has fairly grown during the past few decades, the penetration rate of life insurance remains low at 0.46% of the GDP in 2014 with an average sum assured Rs. 4831. According to the Annual Report of Insurance Board of Sri Lanka (2014), the life insurance penetration as a percentage of total population has increased slowly from 10.7% to 12.6% during 2010 to 2014. The life insurance penetration as a percentage of total labour force has increased only by 2.3% during last 5 years. At present life insurance penetration as a percentage of total labor force in Sri Lanka is 29.6%. These statistical data indicate that, there is a large untapped life insurance market in Sri Lanka.

The penetration of life insurance premium as a percentage of GDP in some of the advanced countries; Switzerland 5.1%, United Kingdom 8%, Denmark 6.7%, Sweden 5%. In South Africa the penetration rate is 11.4%. It is in some of the Asian countries; Taiwan 15.6%, Hong Kong 12.7%, South Korea 7.2%, Japan 8.4%, Singapore 5.0%, Thailand 3.6%, Malaysia 3.1 and India 2.6%. The penetration of life insurance premium as a percentage of GDP in Sri Lanka is only 0.46% in 2014. Out of 88 countries Sri Lanka's rank is 77 in the penetration of total insurance premium as a percentage of GDP in 2014 (Sigma, 2014). Accordingly, it can be observed that the demand for life insurance in Sri Lanka is low compared with life insurance penetration as a percentage of DGP in many other countries in the world. Accordingly, the research problem in this study includes;

Why household in Sri Lanka with sufficient income have low demand for purchasing life insurance policies as an alternative method of long term investment for their financial security in the future?

Objectives of the Research

The main objective of this research study is to examine why Sri Lankan households with sufficient income have low demand for purchasing life insurance policies. Accordingly, the specific objectives of this study include;

1. To examine the households' demand for purchasing life insurance policies.
2. To examine the most preference source of investment of the Sri Lankan households
3. To examine the factors considered by Sri Lanka households when they decide to purchase life insurance policies
4. Suggest some recommendation for the insurance companies to implement for increasing the selling of life insurance policies

Literature Review

According to the Commission of Insurance Terminology of the American Risk and Insurance Association, *"Insurance is the pooling of fortuitous losses by transfer of such risks to insurers, who agree to indemnify insured for such losses, to provide other pecuniary benefits on their occurrence, or to render services connected with the risk"* (Rejda, 2008). This definition indicates that, an insurance arrangement typically includes the characteristics; pooling of losses, payment of fortuitous losses, risk transfer and indemnification. Insurance cannot eliminate or reduce the uncertainty of the individual as to whether the event will occur, nor does it alter the probability of occurrence, however insurance does reduce the probability of financial loss connected with the event (Emmitt & Therese, 2003). Accordingly, insurance is an economic devise where by individuals transfer their risks of large financial losses to the insurers for a small cost that is the premium.

The risks which are directly affected for the individuals are the personal risks. They involve the possibility of loss of earnings or reduction of earned income, extra expenses, and the depletion of financial assets. There are four major personal risks; (1) Risk of premature death, (2) Risk of insufficient income during retirement (3) Risk of poor health and (4) Risk of unemployment (Rejda, 2008). However, Harrington and Niehaus (2003) classify personal risks into six categories such as earning risk, medical expense risk, liability risk, physical assets risk, financial assets risk, and longevity risk. Earning risk refers to the potential fluctuation in a family's earnings, which can occur as a result of a decline in the value of an income earner's productivity due to death, disability, ageing, or change in technology.

The main objective in managing personal risk is to avoid the deprivation of the individual and those dependents on him or her in the event of a loss that causes the termination of income. Achieving this objective generally the income that would be lose as a result of death, retirement, disability or unemployment. Insurance is a common approach to replacing such income (Emmitt & Therese, 2003).

Yaari (1965) was the first to develop a theoretical framework to explain the determinants for the demand for life insurance (Beck & Webb, 2002). He developed the 'life-cycle utility model' to explain the behavior of consumers in optimizing consumption and optimizing long term saving plans. According to Yaari's theoretical framework, the demand for life insurance is a function of wealth, expected income over an individual's life time, the level of interest rate, the cost of life insurance policies (administration cost of life insurers) and to assumed discount rate for current over the future (Kjoseski, 2012). Lewis (1989) has further developed the Yaari's theoretical model extending preferences of beneficiaries and dependents in to the life-cycle utility model. As shown by Lewis (1989), the demand for life insurance depends on the needs of spouse, dependents and beneficiaries. Accordingly, the dependency ratio, family size, age, education level, gender and the marital status etc affect for the demand for life insurance. Beck and Webb (2002) state that, there will be a positive correlation between the education and the demand for any type of life insurance products. Higher level of person's education may cause to understand the benefits of life insurance products and long term savings for managing the risk associated with the person himself. Outreville (1996) states that, individuals with higher level of education are more aware of risks and the significance of

managing the risks. Burnett & Palmer (1991) find that number of children is one of the positive significant variables for the demand for life insurance. However, Anderson & Nevin (1975) fond that there is no significant relationship between family size and the demand for life insurance.

Life cycle hypothesis of Ando & Modigliani (1963) reveals that, income of the individuals varies with the life style and their savings including demand for life insurance differ according to the age level. However, Gandolfi & Miners (1996) find that there is no significant relationship between age and the demand for life insurance product. Gandolfit and Miners (1996) predicts that, demand for life insurance could vary among men and women based on difference in lifetime. Following the assumption that the demand for insurance is increasing with the probability of death and the fact that men live shorter than women, they will demand insurance. Marital status has also been found as an influencing factor for the demand for life insurance from both the individuals and households. Mantis & Farmer (1968) expected that, married men would spend more money on life insurance than single men. But the result of the analysis has indicated negative relationship between marriage and the demand for life insurance.

Redzun (2014) examines that, income is one of the most important determinants for the demand of life insurance consumption. The ability to pay life insurance premium mainly related to the level of income. Life insurance becomes more affordable when income grows. Beck and Webb (2002) state that, an individual's consumption and human capital typically increase along with income, creating a greater demand for life insurance. Hwang and Gao (2003) predict that, the premature death of a breadwinner with a high level of income may be likely to give rise to a greater loss of future income than that of a breadwinner on a lower level. Browne and Kim (1993) and Outreville, (1996) argue that inflation has a dampening effect on the amount of insurance purchased in a country, and erodes the value of life insurance, making it a less desirable good. However, Beenstock et al (1986) state that, rich people do not need insurance protection, and poor people have limited demand because they operate under budget constraints. Accordingly, they predict that, the middle class people have the greatest interest in life insurance products due to having a level of income from which these products become affordable.

Interest rate effects for the demand for life insurance in two different ways. The theory predicts that, a higher level of real interest rates increases life insurer's investment returns and in turn, they can offer improved profitability for potential purchasers of life insurance policies (Beck and Webb, 2002). However, Lenten and Rulli (2006) predict that, rise in interest rates might reduce the purchase of life insurance as higher returns on alternative financial assets may switch consumers from savings in life insurance to another type of investments. Outreville (1996) and Beck and Webb (2002) state that anticipated inflation has a negative impact of the demand for life insurance consumption.

Institutional framework, political and legal stability are most important determinants for vibrant and growing demand for life insurance. Kjosevski (2012) state that when the legal system and political system are stable, the higher will be the willingness of contracting parties to initiate life insurance business. Beck and Webb (2002) suggest that, if fraud is common in claims reporting, then the insurance mechanism will become prohibitively costly for a large part of the population. In Sri Lanka, even after gaining its independence many insurance companies spranged up to mobilized premium through life insurance and frequently disappeared due to lack of insurance legislation in the country to control the activities of insurance companies. This situation was lead to nationalize the insurance industry in Sri Lanka in 1961 (Wijenaike, 1998).

Conceptual Framework

In this research, the conceptual framework is developed based on the factors determining the demand for life insurance. In this case, mainly demographic factors such as age, gender, employment, education (knowledge), and level of income, are taken into consideration. Further, economic factors such as interest rate, cost of living, insurance bonus, benefit receiving period and alternative investment options are taken in to consideration in this research. However, social factors and institutional factors are not taken for the data collection and the analysis. Accordingly, conceptual framework of this study is shown in figure 1.
Figure 1: Conceptual Framework

Development of Hypothesis

In this study hollowing hypothesis were developed to test the relationship between variables.

Hypothesis 1: There is a direct relationship between age and demand for life insurance plans

Hypothesis 2: There is a direct relationship between the income level and the demand for life insurance products

Hypothesis 3: There is a direct relationship between the bonus declared by the insurance companies and the demand for life insurance plans

Hypothesis 4: The urge of the people to purchase life insurance plans decrease when living cost is high

Hypothesis 5: There is a direct relationship between purchasing insurance policy and expectation to receive the insurance benefits while they live than after death

Research Methodology

The research approach adopted in this study was quantitative method which comes under positivism research philosophy. Bryman and Bell (2007) suggest that, positivism advocates the applications of the methods to the study of social reality. The problem of the research and the objectives of this study are directly related a socio economic phenomena, i.e empirical study on the determinants of the demand for life insurance. In this study, a sample of 200 households was selected from Gampaha District. According to the nature of the research problem and objectives, the researcher decided that the participants of this sample should be in the age between 30 -60 years with more than Rs. 10,000 monthly income. The reason for selecting this age group is that the researcher assumed that, adult people in this age group should have a proper plan for how to manage their personal financial risk in the future. According to the information of the Department of Census and Statistics in 2010, Gampaha District consists with 85.4% rural population and 14.6% urban population. Accordingly the sample was selected to represent 85.4% rural population and 14.6% urban population. Further

equal opportunities were given to both male and female to participate in this sample survey. Stratified random sampling technique was adopted to select the sample and the face-to-face interview using interviewer administered questionnaire was used to collect primary data. SPSS was used to analyze the data. Mean and standard deviation used to interpret the result of findings and correlation analysis was adopted to analyze the relationships between variables. Further, t test, chi-square test and Spearman's correlation test were applied to test the hypothesis.

Data Analysis and Presentation

The research problem of this study indicates that, vast majority of the working age population has not covered by life insurance in Sri Lanka. The life insurance penetration as a percentage of total labor force is very low and only a minority of the workforce has obtained life insurance policies. The aim of this section is to analyze the primary data collected from the households to achieve the research objectives. Primary data collected from the sample of 200 households from Gampaha District is analyzed using SPSS software application.

1. Preferred Source of Investment

   In this research, data was collected to examine the households' perception to invest their present money to get benefit in the future. The respondents were asked to state their first preference, second preference and third preference etc; for each source of investment and the result is shown in the Table 1.

Table 1: Preferred source of investment

Preferred investment source	Preference Percentage (%)		
	1st preference	2nd preference	3rd preference
To invest in life insurance	4.0	19.5	31.0
To invest in fixed deposits in banks	66.0	20.0	8.5
To invest in companies' shares	3.0	7.5	13.5
To invest in Government Securities	3.5	12.5	17.0
To invest in lands and buildings	20.0	35.5	18.5
Other	3.0	5.5	4.0

   Table 1 indicates that majority of the respondents (66%) most prefer to invest their additional funds in fixed deposits in banks and 20% of the respondents are willing to invest their extra money in lands and buildings. Respectively, 3% and 4% of the respondents are willing to invest in companies' shares and Government Securities. Only 4% of the sample most prefer to invest in life insurance. However, Table 1 indicates that, 50.5% of the sample has given second or third preference to invest their money in life insurance. These data indicate that, more than 50% of the income earners can be encouraged and promoted to purchase life insurance products.

2. Demand for Life Insurance Products

   The results reveal that, 31 percent households of the sample have purchased life insurance policies. According to the Insurance Board of Sri Lanka (2014), penetration of life insurance as a per cent total labor force is 29.6 percent. Life insurance penetration of the sample indicates that it is consistent with national level of life insurance penetration as a percentage of labor force. Further, the result reveals that, 49 percent of the respondents are willing to purchase any type of life insurance policy.

3. Demographic Factors Affecting the Demand

a. Effect of age

The following hypothesis was developed and it was tested using Chi-square technique to statistically analyze the significance of the relationship between age and the demand for life insurance and the result is indicated in Table 2.

Hypothesis 1: There is a direct relationship between age and the demand for life insurance plans.

Table 2: Relationship between age and demand for life insurance products

	Value	Asymp. Sig. (2-sided)
Pearson Chi-Square	27.056[a]	0.134
Likelihood Ratio	30.772	0.058
Linear-by-Linear Association	1.646	0.199
N of Valid Cases	200	

Because chi-square value is not significant at 5% error level, there is no association between age and the demand for life insurance. Therefore, we can reject the hypothesis 1. Accordingly, it can be concluded that demand for life insurance does not significantly vary with the age between 30 - 60 years.

b. Effect of the gender

Data was analyzed using Cross Tabulations of Descriptive Statistics to examine the effects of gender for the demand for life insurance products from the households and the results are indicate that, 46 percent of the female and 54 percent of the male were willing to purchase life insurance products. Accordingly, it is observed that, the demand for life insurance by male is slightly higher than the female. However, there is no significant difference between the male and female for the demand. Accordingly, it can be concluded that, there is no substantial effect of gender for the demand for life insurance.

c. Effect of employment status of the insured households

Primary data was analyzed using cross tabulation of descriptive statistics to examine the employment status of the households who have purchased life insurance policies. The result of cross tabulation indicates that, out of 200 households, 61 (31 percent) persons have purchased life insurance policies. Out of them, 23 percent of the respondents are public sector and 46 percent private sector employees. Further, 23 percent of them are self-employees and only 8 percent of them are business people. Accordingly, it is observed that, private sector employees are most preferred to purchase life insurance products.

d. Effect of insurance knowledge of the households.

Insurance knowledge of the customers about the product and the making awareness about the product by the marketers are important for promoting the customers to purchase the life insurance. The mean value 3.07 obtained for the statement "*I have a good knowledge about life insurance products*" based on 5 point Likert's scale indicates that, most of the respondents are indifference regarding their knowledge about life insurance plans. It was revealed that 8 percent and 26.5 percent of the respondents respectively strongly agree and agree that they are having good knowledge about life insurance plans. However, the majority of the respondents are not having good knowledge in this regard.

e. Effect of the households' Income

The mean value 4.41 and the std. deviation 0.643 obtained for the statement of *"If I purchase a life insurance plan, I concern about my income"* based on 5 point scale Likert's scale indicate that, vast majority of the respondents is very much concern of their income when they purchase life insurance plans.

The result was revealed that 94.5% of the respondents' perception is their income greatly affects for their demand for life insurance products. Further, following hypothesis was developed to examine the relationship between income of the households and demand for life insurance products.

Hypothesis 2: There is a direct relationship between the income level and the demand for life insurance products

Spearman's Correlation technique was applied to examine the relationship between monthly income of the households and their demand for life insurance. The result of the correlation test is shown in Table 3.

Table 3: Relationship between income and the demand for life insurance

Correlations		If I purchase a life insurance plan, I concern about my income
like to purchase life insurance plans	Pearson Correlation	.136
	Sig. (2-tailed)	.054
	Covariance	.091
	N	200

Because of correlation is significant at the 5% error level, there is an association between income of the respondents and the demand for life insurance plans. Therefore, we cannot reject the hypothesis 2. Accordingly, it can be concluded that, there is a direct relationship between income of the households and the demand for life insurance. It is important to note that, there is no association between monthly income distribution of the households and the demand for life insurance plans. Accordingly, it can be concluded that, life insurance plans should be designed by the insurance companies to match with all the people who belong to different income categories.

4. Economic Factors Affecting the Demand for life insurance
   a. Effect of the interest rates of banks
   The mean value 3.99 and the std. deviation 0.865 of the responses obtained for the statement of *"If I purchase a life insurance plan, I concern about interest rates of the banks"* based on 5 point Likert's scale indicate that, majority of the respondents concern about interest rates of banks when they purchase insurance retirement plans. As a percentage, 81 percent of the respondents strongly agreed or agreed with the statement that banks interest rates affect for their demand for life insurance.
   b. Effect of the insurance bonus
   To examine the relationship between insurance bonus and demand for life insurance plans, following hypothesis was tested applying the Spearman's Correlation technique to examine the relationship between bonus declared by the insurer and the

demand for life insurance plans. The result of the correlation test is shown in Table 4.

Hypothesis 3: There is a direct relationship between the bonus declared by the insurer and the demand for life insurance plans

Table 4: Relationship between declared insurance bonus and the demand

Correlation			If I purchase a life insurance plan, I concern about the bonus declared by the insurers for such plan
Spearman's rho	I like to purchase a life insurance plan	Correlation Coefficient	.123
		Sig. (2-tailed)	.083

Table 4 shows that correlation is significant at the 5% error level. Therefore we cannot reject the hypothesis 3. Accordingly it can be concluded that, there is an association between bonus declared by the insurers and the demand for life insurance.

  c. Effect of the living expenses

To examine the relationship between living expenses and the demand for life insurance plans the following hypothesis was tested applying the Spearman's Correlation technique to examine the relationship between living cost and demand for life insurance plans. The result of the correlation test is shown in the Table 5.

Hypothesis 4: The urge of the people to purchase life insurance plans decrease when living cost is high

Table 5: Relationship between living expenses and the demand for life insurance

Correlation			My urge to purchase a insurance plan will decrease when living cost is high
	I like to purchase life insurance plan	Correlation Coefficient	-.129
		Sig. (2-tailed)	.070

Table 5 shows that, correlation is significant at the 5% error level. Therefore, we cannot reject the hypothesis 4. As a percentage, 98.5 percent of the respondents agreed that, they concern about their living expenses when they purchase life insurance. Accordingly it can be concluded that there is an inverse relationship with the living cost and the demand for life insurance.

5. Benefit receiving period

Benefit receiving period is also one of the factors affecting the demand for life insurance. The mean value 4.04 and the std. deviation 0.974 for the responses to the statement of *"My expectation from insurance is to receive the benefit while on live than after death"* obtained based on the 5 point Likert's scale indicates that majority of the respondents' expectation is to receive the life insurance benefits while they live rather than after their death. Results revealed that, 80.5 percent of the respondents strongly agreed or agreed that, their expectation is to receive insurance benefits while on live than after their death.

To examine the expectation of the respondents to receive the insurance benefits while they live, the hypothesis 5 was tested using Chi-square technique and the result is shown in Table 6.

Hypothesis 5: There is a direct relationship between purchasing insurance policy and expectation to receive the insurance benefits while they live than after death

Table 6: Purchasing insurance policy and expectation to receive the benefits

	Value	Asymp. Sig. (2-sided)
Pearson Chi-Square	30.732[a]	.015
Likelihood Ratio	33.974	.005
Linear-by-Linear Association	.855	.355

Because chi-square value is significant at 5% error level, there is an association between purchasing insurance policy and expectation to receive the insurance benefits while they live rather than after their death. Therefore, we cannot reject the hypothesis 6. Accordingly, it can be concluded that, people most prefer to receive the insurance benefit while they live than after death.

Summary, Recommendation and Conclusion

1. Summary

Life insurance is a legally binding contract between insured and the insurer. In exchange for payment of premium, the insurer agrees to pay specified death benefits to the beneficiary named in the policy if the death of the life assured occurred during the period of insurance. Many life insurance contracts also have benefits that may be payable due to circumstances other than death. Thus, a life insurance policy with a cash value can be used to save for other concerns, such as retirement, as well as to protect against the financial consequences of premature death.

Unforeseen longevity may cause equivalent problems if resources cannot provide an adequate income on retirement. Providing a life time annuity for survivors is one of the important features of life insurance. Therefore, life insurance is suitable for protection of the individuals and his or her dependents against undesirable financial consequences of premature death and superannuation (retirement) of the insured. Personal financial need approach attempts to determine the amount of life insurance that should be purchased based on analysis of needs of those who would suffer financial losses. Life insurance is one of the tools that may be used to meet the gap between the needs and available resources.

Though life insurance is considered as one of the unique and most important financial instrument used in order to cover the risk of individuals, families and the society, life insurance products in Sri Lanka are still not used widely. While the insurance industry has fairly grown during the past few decades, the penetration rate of life insurance remains low. The life insurance penetration as a percentage of total labor force has increased only from 2.3 percent during last 5 years.

The penetration of life insurance premium as a percentage of GDP in some of the advanced countries and, in some of the emerging countries remains substantially higher level. However, the penetration of long term (life) insurance premium as a percentage of GDP in Sri Lanka is remains only as 0.46% in 2014. Out of 95 countries Sri Lanka's rank is 89 in penetration of long term (life) insurance premium as a percentage of GDP in

2013 (Sigma 2014). Accordingly, it can be observed that the demand for life insurance in Sri Lanka is low compared with life insurance penetration as a percentage of DGP in other countries in the world. Accordingly, the research problem in this study includes; "why household in Sri Lanka with sufficient income have low demand for purchasing life insurance policies as an alternative method of long term investment for their financial security in the future"? Accordingly, it is very important to find the reasons for low demand for life insurance in Sri Lanka. This study will be more important for the insurers to identify the determinants of the demand for life insurance products in Sri Lanka and to identify the strategies which can be implemented by the insurers to promote purchasing life insurance products by Sri Lankan households.

The main objective of this research study is to examine why Sri Lanka households with sufficient income have low demand for purchasing life insurance policies. Accordingly, the specific objectives of this study include; examine the households' demand for purchasing life insurance policies, examine the most preference source of investment of the Sri Lankan households, examine the factors considered by Sri Lankan households when they decide to purchase life insurance policies and suggest some recommendation for the insurance companies to implement for increasing the selling of life insurance policies.

One of the important objectives of this study was to examine the demand for life insurance plans. Accordingly, an attempt was made to identify the demand for life insurance. It was revealed that 49 percent of the respondents are willing to purchase life insurance and 51 percent did not like to purchase life insurance.

This research reveals private sector employees and self-employees most prefer to purchase insurance retirement plans, demand from the public sector employees for this product is very low. Gender differences do not affect the demand and age groups 30 -50 years are the most critical age group to purchase this product.

In this research it was revealed that, majority of the respondents are not having a good knowledge about life insurance plans and they have not been made aware of the agents in this regards. However, peoples' perception is that, purchasing life insurance policies is a good solution for the economic problems faced in the future.

Another objective of this research was to examine the factors considered by the people when they purchase life insurance products. It was revealed that, income of the people, interest rates of the banks, bonus declared by the insurance companies and living costs of the people have a major influence on the demand for life insurance. Further, it was revealed that, stability of the insurer is also one of the other important factors considered by people when they decide to purchase the product. In this research it was found that, majority of the respondents prefer to purchase insurance products from public sector insurance companies. Accordingly, it can be concluded that, public sector insurance companies have more opportunities to promote this product.

2. Recommendations

Since there is a very good potential demand for life insurance plans, insurance companies should design their products to match with the customers' requirements and promote the product. For this purpose, the following suggestions are recommended by the researcher to insurance companies.

a. Make aware the general public through advertising using mass media and sales promotional campaigns with field force.

b. Encourage both male and female potential customers as there is a demand for the retirement plans equally from male and female parties.

c. Training of agents and upgrading their knowledge, skills and competencies to understand the product features of life insurance plans, promote and encourage them to sell this product.

d. Rewarding the loyal customers for payment of premium for a longer period of time.

Following suggestions are recommended for the Government to promote life insurance plans as such promotions will be positively affecting to reduce the burden of the government for providing social security.

a. Make awareness programs by the government through Insurance Board of Sri Lanka, to enhance the knowledge of the general public regarding the importance of purchasing life insurance plans for the financial security in the future.

b. Provide tax relief by the government for the life insurance funds of insurance companies and tax relief to the people for payment of premium for the life insurance plans.

3. Research Limitations

In this study it was revealed that, most of the people do not aware about different types of life insurance plans and benefits of such plans. Therefore, the researcher had to make aware some of households before obtaining their views on life insurance plans. Accordingly less knowledge of the respondents about life insurance was one of the limitations in this study.

The budgetary constrain was another main limitation of this research. Though, surveys are useful and powerful in finding the answers for the research questions, due to budgetary constrain, researcher selected the samples of 200 households to collecting data. However, the sample was selected to represent rural, urban, industrial and coastal areas. Time constrain was another limitation of this study. Some times researcher had to spend about one hour to interview one household. Researcher had to collect data, analyze the data and write the project report within six months. Therefore, it was a huge challenge completes this task due to other official commitments.

4. Conclusion

In this research it was revealed that, majority of the respondents are not having a good knowledge about life insurance plans and they have not been made aware by the insurance agents. However, households' perception is that, purchasing life insurance plans is a good solution for the economic problems faced in the future.

Income of the households is one of the major factors affecting the demand for life insurance. However, the income distribution has no significant impact on the demand. Mainly income level of the households has greater effect on the demand. Interest rates of the banks, bonus declared by the insurance companies and living costs of the households are the other factors affecting the demand for life insurance. Stability of the insurer is also one of the other important factors considered by households when they decide to purchase the product. If life insurance plans are purchased, majority of the households most prefer to purchase it from public sector insurance companies.

At present, 31 percent of the households have purchased life insurance policies. However, more than 48.5 percent of the households are willing to purchase life insurance products. Accordingly, there are many potential buyers and untapped market in the field of insurance. Since majority of the households are not having good knowledge about life insurance plans, making more awareness programs by the insurers and the Insurance Board of Sri Lanka will positively effect to enhance the preference of households to purchase this products. Tax concessionary and other supportive actions by the government will also progressively affect the households' demand for life insurance.

CAPITAL STRUCTURE IMMUNIZE OR INFECT VALUE OF THE FIRM

W. P Wijewardana, Rajarata University of Sri Lanka, Sri Lanka
A. A. J. Fernando, University of Sri Jayewardenpura, Sri Lanka

Abstract

The study examines the capital structure that envisages firm immunizes or infects the firm value and tends to prefer risk minimized and higher return structure across the industries. Finance strategy is equated widely with crafting and maintaining a profitable fit between the finance need and the disbursement of firm investment. Capital structure and value of the firm are yet another debatable and famous issues in the field of finance. Therefore, continuous efforts of research can be seen with the main objective of determining optimal capital structure levels for firms to maximize the value. In addition, capital structure decisions play an important role pertaining to firm's stability, profitability and strength in carrying out its operations in the long run. In light of three successive factors, effectiveness and efficiency of capital structure related decisions are critical for mangers to create value for the firm. This study examines the level of optimal capital structure to be maintained by a firm with a view to enhance the value of firm. Study highlights by observing that if external sources of finance are costly to firms than internally generated funds., there will typically be a benefit to investment which adds value to the extent that it helps ensure that a firm has sufficient internal funds available to take advantage of attractive investment opportunities. Study delineates how these financing strategies should depend on such factors as shocks or shift to investment and financing opportunities which leads to maximize the value of the firm.

Keywords: *Value of the firm, Optimal Capital Structure, Stability, profitability, strength*

Introduction

Business unit stakes financing management very seriously, many of authors found that financing management is ranked as one of their most important activities. It helps to contributes prominent value to the economy, deprived of additional value to the economy. Given it real world prominence, one might guess that the topic of capital structure would command a great deal of attention from policy makers, and practitioners would therefore have a well-developed body of wisdom which to deal in setting financing strategy. Unfortunately, finance theory has had much less clear cut guidance to offer on the logically prior questions of financing strategy. What sorts of risk should be financing strategy? Should managers be optimizing financing strategy? What kind of instruments will best accomplish the financing objectives? Finding solution to these questions is difficult because, paradoxically, the same arbitrage logic that helps the refining company decide option relates deltas also implies that there may be no reason for it to engage in financing activity in the first place.

As an ultimate objective of the firm is shareholders wealth maximization, it is most important and necessary activity of the firm managers. In this process, firm effort to maintain maximum return and minimum risk by achieving the wealth maximizations. In the making decisions about the capital structure in the firm, it should consider wealth maximization as well as any other decisions. Any types of firm has own capital structure its entire capital provided his owners, this kind of firm called unlevered in the financial literature. On the other hand, firm entire capital capitalized by debt holders which is called levered firm.

Real business environment there is no pure levered or unlevered firm; it has capitalized proportionately by owners and debt holders.

In order to achieve firm ultimate objective, it is noted that there are number of potential rational to explain why firm might wish to use certain financing strategy. However, it seems fair to report that there is not yet unique, accepted framework which can be used to be guide for setting capital structure strategies. In this paper, researcher illustrates how financing strategy can be designed in a variety to setting towards the optimal capital structure. In order to achieve this study was built on one strand of the past work on financing that examine the implication of ownership, capital structure ant its determinants, product market and capital structure, non-debt tax shield and value of the firm. Extensively speaking, this study argues that if capital market imperfections make externally obtained funds more expensive than those generated internally, they can generate a rationale for financing strategy and it helps to achieve firm stability, profitability and strength.

The basic implication of this argument can be understood as follow. If the firm is unable to select proper financing strategy for capital structure there will be some variability in the cash flows generated by the resources in place. Simple accounting implies that this variability in firm internal cash flow may affect in either; (a) variability in income generated externally or (b) variability in expenses can be identify in generally in term of decreasing return. If the supply of external finance were perfectly elastic, the optimal expected solution of external finance would be to leave external financing plans not affected in the face of variations in internal cash flows, taking up the entire gap by changing of the amount of external finance raised. However this mechanism no longer works well if the marginal cost of funds goes up with the financing externally. On the other hand financing plane may be trade off with some increase in external financing, but some decrease in investment as well. However, available finance influences both investment and financing plan in a way that is costly to the firm. Strategic approach can reduce certain variability in financing; in can impact increasing the value of firm. The model that study develops following section is much in the valued in the above argument. However, it takes the argument several steps rather than direct that there is a role for financing strategy; study is able to show how a firm's optimal financing strategy implement depends on the nature of its investment and financing policies. Further, study illustrates how a well-designed financing strategy can enable a firm to optimally coordinate its investment and financing policies. Ultimate expected results of the financing policy are fulfilling the shareholders objectives.

Acceptable and extremely valid legend of the shareholder is gained maximum benefit to its interest, thus mangers of the firm is to achieve maximum value of the firm as an agent of the owners. Capital structure and value of the firm related decisions are extensive decisions of any kind of company. Thereby all business community should identify that impact of capital structure and value of the firm. Main activity in the managers to the firm is capital structure related decisions. It comprises fund raising and investment. Firm investment capital consists with two main devices which are debt and equity capital. According to Myers (1984), Bowman (1980), and Gupta, (1968) revealed that there is two folders of equity capital divide into retain and public offering.

It depends on firm's preference or capital requirement. The firm capital structure include long term debt, short term debt, common stock, preference stock and debenture etc. Above financial aspects are major of financing plan, which are invested by the various types of investments. An also that return explains to stakeholders about company preference. Therefore these are most important factors to study. Main problem for this study is how much investment both debt and stock should be obtainable? How can govern optimization capital structure by achieving maximum level of value of the firm? Above two researchable issues interest any researcher attention.

Ownership, Capital Structure And Its Determinants

The growth of privatization, deregulation, international businesses, global competition and new information and production technology has changed the world of management accounting. These changes have special implications for transitional and newly industrialized or emerging economies. There are various theories and models regarding to the capital structure and firm value enlighten. Modigliani and Miller (1958) has provided basis for the modern thinking on capital structure and shows the impact of debt-equity ratio on firm value. This made two propositions under prefect capital market condition. As stated before, there has been extensive research and examines the determinants of capital structure and value of the firm both in developed and emerging economics (Modegliani and Miller, 1958; Nasirzade & Mostaghiman, 2010; Banerjee and Bowman, 1980; Bredly, Jarrell, and Kim, 1984; Gupta, 1968; Zhao Bei and Wijewardan 2012). There are various theories and models regarding to the capital structure and firm value enlighten.

This made two propositions under prefect capital market condition. A first proposition is related to the value of firm and capital structure introduced by Modigliani and Miller (1958) that shows value of firm is independent from its capital structure. In the second proposition mentions one thing regarded to cost of capital which is investment cost per capital. It mentions cost of equity plus or debt capital. Indirectly that implies the financial risk. According to Pandey (2004) states that the capital structure decision of a firm influences its shareholders return and risk. Because of it, the market value of its shares may be affected by the capital structure decision (Antoniou, Guney and. Paudyal (2002); Zhao Bei and Wijewardana (2012). The research are expected to do by using with assumption of that capital structure has significant influence on company Market Value Ratios mainly. Normally, Capital Structure consists with debt and equity. Due to debt and equity can influence the value of firm. The determination of capital structure of a company is difficult task. Therefore the selection of capital among the debt and equity can impact to value of the firm. Value of the firm consists with market value of debt capital and market value of equity capital. The return of capital structure can influence to value of the firms.

Product Market And Capital Structure

Theories of Modigliani and miller theory, trade off theory, pecking order theory and agency cost theory have been disused one aspect of capital structure. This models based on the idea that the choice of debt in the first stage of the financing strategy as a commitment to successive output strategies in the second stage, in which product market competition revenue takes place, have traditionally been developed in a input output product level choice quantity competition setting. These models invent the seminal work of Brander and Lewis (1986), moreover as studies by Maksimovic (1988, 1998) and Glazer (1994). In the conceptual concept of Cournot competition model, debt pledges firms' shareholder to be a more cost leader market behavior and equilibrium debt levels are positive, even in the presence of agency costs of debt and in the absence of tax-related and other benefits of debt (Evgeny and Lyandres, 2006). Alternative conceptual model of oligopolistic competition is Bertrand-type product price competition and product capacity cost price competition. Further, show that the alter study cost price competition, company select debt in maximum point of equilibrium level if the uncertainty and risk is product demand related. However, if product costs are uncertain and risky, debt conveys a strategic disadvantage and is not select in equilibrium. On the other hand, the contrary result for the case of product capacity level cost price.

Similar to most pre commitment models the static model developed here has two stages. First, companies operate the market and select their financial structures. The latter are concise by the face values of debt maturing lastly. Each firm's owners set out their firm's debt level with

considering the ultimate objective of maximizing the value of the firm while charming the company's own and its competitors' consequent product output market strategies. Finally, the owners of each firm select company product output market strategy before examine the firm's cash flow. The comprehension of the insufficient, together with the product output market strategies select by the company and by its competitors, determines whether the firm is solvent. If the comprehension of the insufficient above value, the firm is solvent; it repays its debt and distributes the residual cash flow to its shareholders. If the realization of the shock is below the threshold value, the firm's cash flow equals zero, which leads to solvent. The analysis of strategic debt choices is developed in a duopolistic frame. However, varying the contact constraint that is prominently interest rate, which pronounces the amount to which company's selects move their competitor's market value, assists studying the relation between the amount of competitive contact among firms in product output markets and their optimal operating strategies and capital structure choices. All the findings of the model with respect to relations between the contact variables and company's optimal financial and operating leverage continue complete in a more than two company setting.

The model's setup allows examining the effects of the amount of competitive contact on company's financial and operating leverage decisions, as opposed to opinion on one of the probable determinants of the level of contact. The inclined will be settled by finding but perfect equilibrium still unsolved issues. The strategic effect of debt follows in the market from the fact that after the debt levels have been selected. However company's shareholders take only the cash flows stable and sufficient conditions considered if company selects their operating leverage strategies (Harris and Raviv 1991). Thus, debt serves as an assurance device to select a more aggressive operating leverage strategy in the final stage of the strategy.

Non Debt Tax Shield and Value of the Firm
One of complicating issue for today financial managers is relationship between components of capital structure and mixture of loan and stock for financing. Regarding these issues that capital structure effects on investment projects with positive or negative current value by accept particular investment. In this circumstance capital structure models, tax relevancy and its effect is important therefore meaningful and weak relationship between non-debt tax shield and Debt ratio is vital. Although tax has effective role on capital structure decisions relation between business risk and debt ratio. Antoniou et al (2002), conclude their research determinants at company capital structure analysis manage effective factors on capital structure in developing countries. Tax shield effect on capital structure differ from develop and developing countries. On the other hand, Effective factors in ten developing countries capital structure has been analyzed by Booth et al (2001), they revels that their capital structure effected by same variables in developed countries results show that more profitable companies have lower debt ratio. Hence, it is controversial issues exists between develop and developing countries. Jensen and Mackling (1976) conclude their study is to investigate the theoretical factors and reasons for selected model for capital structure from the perspective agency theory and stakeholders interest conflict of economic unit. Jensen and Mackling (1976) argue that it can create a balance between the benefits and costs of debt and achieved an optimal capital structure. In practically there is no optimal capital structure situation and it is proved at the conceptual model and theoretical aspect.

Methodology
In here population considered 367 companies listed in Colombo Security Exchange (CSE) in 2011. The manufacturing sector has 32 listed manufacturing firms. Study was depended on

secondary data collected from audited financial statements. Period of data covers three years from 2012 to 2014 and study period confirmed unusual fluctuation for economy is not reported. In the aspect of quality of the data it is common agreement in the field of finance audited annual reports data is accepted. Research findings of Myers (2001) has reported measurements of capital structure variables hence, this study select well established measurement for this study. There are six variables use as dependent and independent, dependent variables are selected as Market value per share (MVPS) and Price earning (PE) ratio as firm market value measurement. As independent variables Total debt to total equity (TDTE), total debt to total assets (TDTA), Long term debt to assets (LTDA) and short term debt to total assets (SDTA) are capital structure measurement. Mainly three type of analysis have used to employ this study namely; descriptive, correlation and regression model. It is identify two dependent variable therefore two regression models introduce.

$Model\ 1\ MVPS = \alpha_{1.1} + \beta_{1.1}.TDTE + \beta_{1.2}TDTA + \beta_{1.3}\ LTDA + \beta_{1.4}\ STDA + \lambda_1$

$Model\ 2\ PE = \alpha_{2.1} + \beta_{2.1}TDTE + \beta_{2.2}TDTA + \beta_{2.3}\ LTDA + \beta_{2.4}\ STDA + \lambda_2$

Where;

MVPS and PE are dependent variables; TDE, TDTA, LTDA and STDA are independent variables. α int $ercept$, β $coefficent\ of$ var$iables$, λ $error\ term$

Results And Discussion

Table 1 provides descriptive statistics of the study variables. Study sample firms on report average values of MVPS and PE of 67.5219 and 56.0997 respectively as dependent variables in both models. This MVPS values are considerably higher when compared to other gain of the market but compare to standard deviation is high that imply reported degree of volatility and uncertainty of firm value is high. PE ration variation is more than the MVPS.

Table 1: Descriptive Statistics

Variables	**Average**	**Std. Deviation**
Market Value Per Share (MVPS)	67.5219	66.0281
Price Earning (PE)	56.0997	331.8452
Total Debt to Total Equity (TDTE)	0.5163	0.5539
Total Debt to Total Assets (TDTA)	0.2380	0.2112
LTDA (Long Term Debt to Assets)l	0.1196	0.1424
STDA (Short term Debt to Assets)	0.1185	0.1797

Source: Researchers, 2015

However, the value of long-term debt to assets and short term debt to assets ratios represents a notable difference among the samples. These value exhibit manufacturing industry's company assets invested more equity than the debt. However, there is no significant difference between short terms debt to asset investment is less, that implication is practical essence of the field of finance. According to Booth et al. (2001) report a Asian reign long-term debt to assets and short term debt to assets ratios ranging from similar range. In contrast, in Rajan and Zingales (1995), the long-term debt to assets and short term debt to assets ratios of a sample of firms in G-7 countries are higher than Asian reign. The TDTE (51.63%) and TDTA (23.80%) total debt value is higher when compare to the total equity. Invested percentage capital of total asset on total debt is 23.80% which shows higher value. On the other hand, the worsening financial performance, there are three additional reasons for the observed low long-term debt

and short term ratios. First, the long-term debt ratio can be misleadingly low given that many companies use short-term debt on the rolling basis (Antoniou.Guney and.Paudyal , 2002; Xiao et al., 2004). Second, it could reflect that financing institute specially banks are vigilant in issuing long-term debt and short term debt in order to lower credit risk given that the moral hazard of borrowers is severe in Sri Lanka.

Table 2 reports the Pearson correlation coefficients between variables. Except for MVPS and PE, TDTE, and LTDA the correlation coefficients between independent variables are statistically significant. PE and all correlation coefficient are statistically not significant. TDTE and TDTE, LTDA, STDA the correlation coefficients are statistically significant and also coefficient values are high compare to the other values.

Table 2: Correlation Matrix

Variables	MVTB	PE	TDTE	TDTA	LTDA	STDA
MVTB	1					
PE	-0.044	1				
TDTE	-0.172	-0.075	1			
TDTA	**-0.227**[*]	-0.072	**0.758**[**]	1		
LTDA	-0.049	-0.090	**0.742**[**]	**0.542**[**]	1	
STDA	**-0.230**[*]	-0.014	**0.303**[**]	**0.746**[**]	-0.154	1

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

According to the table 3 of model 1and 2 summary adjusted R square Values are 0.08 and 0.009 respectively. It is considerably low; therefore models are not best model. The table 3 of coefficients shows the impact independent variables on dependent variables. Estimation equation of both model are as follows.

Model 1 $MVPS = 82.296 - 15.885.TDTE + 2248.977TDTA - 2234.794\ LTDA - 2316.853STDA$
Model 2 $PE = 88.67 + 7.034TDTE + 110.070TDTA - 351.248\ LTDA - 172.113STDA$

According to above equation MVPS model 1 has negative impact of TDTE, LDTA and SDTA and positive impact on TDTA but statistically insignificant. Model 2 PE has negative impact of LTDA and STDA and TDTE and TDTA positive impact but both values are statistically insignificant.

Table 3: Regression Model Results

Model 1 $MVPS = \alpha_{1.1} + \beta_{1.1}.TDTE + \beta_{1.2}TDTA + \beta_{1.3}\ LTDA + \beta_{1.4}STDA + \lambda_1$

Model 2 $PE = \alpha_{2.1} + \beta_{2.1}TDTE + \beta_{2.2}TDTA + \beta_{2.3}\ LTDA + \beta_{2.4}STDA + \lambda_2$

Variables	*Model 1*		*Model 2*	
	Coefficient	p-Value	Coefficient	p-Value
Constant	82.296	0.000	88.675	0.092
TDTE	-15.885	0.485	7.034	0.953
TDTA	2248.977	0.215	110.070	0.991
LTDA	-2234.794	0.217	-351.248	0.970

STDA	-2316.853	0.201	-172.113	0.985
R^2		0.080		0.009

Conclusion

This study presents two models that demonstrate a mix results among firms' leverage and the extent of competitive contact in their industries. This result is unable to generalization, type of limited gain models that show the conceptual difference between optimal capital structure choices in a duopoly and in a perfectly competitive industry. An important feature of the model is that most subsequent studies of the contact between firms' capital structure and value of the firm decisions. The model demonstrates that, regardless of the value of the firm positively affects their optimal leverage whenever debt carries a strategic advantage. The model's predictions are tested using 3 years of data, while employing two proxies for the extent of contact among firms. The empirical tests demonstrate that the extent of contact among proxies of capital structure and it is an important determinant value of the firm. Statistically and economically this results are not significant relations between the proxies for the degree of contact leverage and value of the firm. Overall, it is found that corporate financing in Sri Lanka PLCs has both some cohesions to, and differences from, that of the firms in traded in CSE. It also show that the various types of debt capita such as long term and short term debt examined in this study do not appear to have significant effects on capital structure choices in Sri Lanka. These results should be of interest to those that are interested in the emerging manufacturing sector. Further research is needed to examine whether the longitude data tested in this study is statistically significant. On the other hand, In the Sri Lankan context, state-owned banks and financing institutes may play vital role issuing debt instruments both short and long term since, the role of CSE with regard of debt instruments does not contribute as expected amount of debt. The capital structure instruments effects are deferent over the deferent situation and the business aspect and therefore study unable to predict the unique conclusion and solution for the issues of capital structure.

BUILDING DYNAMIC CAPABILITIES IN TIME-BOUND NETWORKS

Mousalam Alabdul Razzak, Concerted Solutions, United Arab Emirates

Abstract

Researchers studying the alignment of business resources usually focus on business cases that inherently have a going-concern interaction built on long-term relationships at the firm level, dyadic level, or the broader network level. Resource alignment is usually flexible in terms of the timeline for identifying and aligning resources and resource engagement. This paper describes the theories and empirical studies of resource alignment ranging from resource-based views to more complex network views of social organizational interactions, and their implications to business performance activities. The main challenge comes from time-bound transactions built around the longevity of inter-organizational relations. Thus, the key strategic management problem is how resources and capabilities can be rapidly aligned and managed in a time-bound network to achieve sustainable competitive advantages (SCA) at the network level.

Introduction

According to Van de Ven (1976) organizational theory considers the flow of resources among organizations as a process of creating relationships. These relationships may take the form of simple business transactions such as trading in specific goods, or may be structured into a more concrete alliance such as partnerships. In any case, the outcome of resource interaction is the fulfillment of predetermined business objectives. Such relationships would ideally be created with the notion of longevity. For example, in the case of a one-time trading transaction, the seller would set a target of customer satisfaction to ensure that the buyer will establish a longer-term relationship. At the other extreme, a joint venture alliance would start with the intention to support the prosperity of the relationship as long as it produces competitiveness and profitability. By studying the overlap between transaction cost and organizational theory, Gadde and Hakansson (2008) adopted the IMP approach to highlight the association between a firm's management of its business relationships and its use and control of resources. A firm forms dyadic links with certain members of the supply chain through the strategic decision to make or buy resources. This association then evolves through organizational relationships that may extend beyond the direct interaction to form a network.

Researchers in strategic management (e.g., Penrose, 1959; Barney, 1991), and marketing (e.g., Alderson, 1965), assumed that the heterogeneity of resources were a reason for differentiating firms in terms of their levels of success. Strategy researchers elaborated this assumption into the source of competitive advantage for one firm (e.g., Barney, 1991) or a network of integrated firms (e.g., Ritter et al., 2003). However, not all resources are locked into the firm boundaries; and in many cases the firm does not even readily possess access to resources. Therefore, controlling internal resources or aligning resources with external environments plays an important role in the competitiveness of a firm or even the industry to which the firm belongs, as demonstrated by Dyer's (1996) assessment of the auto industry. On a wider scale, the importance of resource differentiation and management plays a role in cross-country firm competitiveness (e.g., Yang et al., 2009).

Based on the assumption that a firm belongs to an economic exchange system of resources, the focus on a firm's relationship with its external actors has been explored since the middle of the 20th century. Several pioneering researchers have provided a solid foundation to the study of networks. Among them are the theory of firm growth by Penrose (1959) and the

economic perspectives of Alchian and Demsetz (1972) on specialization and cooperation, and the inter-organizational views of Van de Ven (1976). Porter's (1980) strategic management approach to the role of industries in a firm's creation of value also paved the way to understanding networks. These studies agree that resource interactions aim at sustainable advantages driven by strategies based on alliances, knowledge transfer, or other long-term associations.

Most of the theoretical work cited in this introduction addresses firm and network resource alignments that have long-term objectives of sustainability built into their modes of operation. This is suitable for such industries as manufacturing, hospitality, and consumer services. However, some business transactions possess very rigid conditions of execution, especially with respect to the periods of resource engagement. Example sectors that fit into this category are the construction and film industries. A primary feature of these industries is the time-bound nature of resource alignment. Interactions must take place swiftly, resources must be aligned rapidly, and activities or competencies that are integral to competitive advantage may be subcontracted to other members of the network. Therefore, limitations apply to the time allowed for aligning resources, followed by a definite period of engagement. This rigid environment creates complexities that compel each member of the network to focus on completing the project without regard to long-term sustainable competitive advantages that may be created by a more flexible interaction. Subsequently, members of a time-bound network are faced with short-term objectives that are governed by the life of the project.

A construction project is a capital intensive project based transaction (PBT) that involves sequential activities starting from the time of laying the tower foundations. A specialized firm demobilizes from the construction site as soon as its role is completed to allow another firm to start its activity. Other firms have overlapping tasks that also run in parallel. Duboi and Gadde (2002) view this transfer of roles as a source of complexity in the construction industry. This complexity is magnified by the need for a dynamic alignment of resources and capabilities. In their study of time-compression diseconomies, Pacheco-de-Almeida and Zemsky (2007) combine strategic management with microeconomic modeling to assess firm-level resource development. Beginning with the premise that it takes time to develop firm resources, they show that diminishing returns to effort result in a time-cost trade-off. This concept adds another challenge to PBT owners. The natural drive of project dynamics to align resources in relatively shorter period leads to financial burdens.

Practitioners in the construction industry have been criticized for leading the sector into operational inefficiency and sub-optimization at the macro level (Cox & Thompson, 1997; Gann, 1996). This is due to focusing on short-term business objectives. The main effect has been felt in the industry's delayed improvement in technical innovation. Duboi and Gadde (2002) agree with this opinion because the loosely coupled system at industry level causes innovation to suffer. However, they argue that this loose coupling provides the ground to support the tight coupling at the project level. Duboi and Gadde (2002) therefore conclude that the coupling dynamics at the project and industry levels are a convenient match for the inherent complexity in the construction sector. According to this perspective, the project level resembles short-term resource engagement, while the industry level corresponds to longer-term interaction that exceeds a single project.

Literature Review

1. Competitive Advantage

Several researchers from different disciplines have defined the concept of competitive advantage. Baumol et al. (1982) consider a firm's competition to be its existing and potential competition. The consideration of potential competition provides a definition by

default that extends beyond instantaneous competitive advantage to be bound by future market dynamics. Because of the potential for new sources of competition to arise in the future, the concept of sustainable competitive advantage was introduced to the literature. The field of strategic management is rich with research on sustainable competitive advantage (e.g., Rumelt 1984; Porter 1985; Barney 1991). A perspective based on strategic management principles may be attributed to the value chain model first described by Porter (1980). In this perspective, the competitive forces approach considers value creation as the objective of a business transaction. Since then, Porter's approach has identified the role of industry in determining a firm's success (e.g., Passemard & Kleiner, 2000).

Uncertainty and interdependence are among the factors that brand the construction sector as a complex industry. Gidado (1996) attributed this to the complexity of linking and orchestrating the workflow of resources. Such resources extend beyond the dyadic relationship to include an array of interdependences that work together to execute a specific project. With this in mind, this research explored previous literature on creating sustainable competitive advantage through resource management from two dimensions:

- Firm level perspective reviews resource-based literature that focuses on the dynamics of resource alignment at the level of a unit firm, with a distinction between internal and external resources.

- Network level perspective targets the notion of resource management in networks, with a special focus on external resource alignment.

Alchian and Demsetz (1972) presented an economic perspective. They suggested that productivity enhancement might be achieved through "cooperative specialization" that results in "demanding economic organizations which facilitate cooperation" (Alchian & Demsetz, 1972: 777). Economic organization refers to economic methods of measuring productivity. This early demonstration of the benefits of organized coupling of resources evolved through the perspectives of modern economies under inter-firm specializations of the value chain where firms develop limited business links that eventually form a complex network of interactions (Dyer, 1996). Firms can become competitive by developing an integrated production network that demonstrates a high degree of inter-firm specialization. Dyer reached this conclusion by evaluating performance differences between the Japanese and American auto industry supply networks, based on inter-firm specialization of assets such as site, physical and human capital.

2. Resource-Based View (RBV)

Wernerfelt (1984) introduced the RBV concept in his paper, which then diffused to become a seminal concept in business scholarship and practice. Barney (1991) adapted the model to construct a framework for a firm's sustainable competitive advantage. He argued that a firm resource might be a source of sustainable competitive advantage if it possesses four characteristics: valuable, rareness, imperfectly imitable, and lack of a substitute.

Supporters of strategic management criticize the RBV as having difficulty gauging the firm-specific factors that result in high performance and possibly create a competitive advantage (Dyer, 1996). RBV does not consider the time factor. While firm-based resources, especially those that are in some way tangible, are viewed as instantaneous in nature, capabilities are also among such resources. Capabilities could have associations with the time factor. While a resource may be acquired, a capability will require time to be developed. Although a seasoned manager can identify and exploit resources, the actual unique capability may be fully identified only after a certain period. Another aspect

attributed to the RBV perspective is its rigidity in applying it to dynamic environment of a project-based transaction.

3. Dynamic Capabilities Perspective\

A further enhancement of the RBV is the dynamic capability perspective. The term dynamic capability was first defined by Teece et al. (1997: 516) as a "firm's ability to integrate, build and reconfigure internal and external competencies to address rapidly changing environments". The core focus in this definition is managerial and organizational processes, which Helfat (2007) described as means to open new strategic alternatives for a firm.

Eisenhardt and Martin (2000) elaborated on dynamic capabilities. They specified examples of processes characterized as dynamic capabilities including business alliances, resource allocation and knowledge transfer. Eisenhardt and Martin (2000) present the dynamic capabilities perspective as an enhancement of the resource-based view with a focus on long-term competitive advantage, especially in dynamic markets. They view organizational capabilities as common across firms; these capabilities may be labeled as "best practices" that evolve over time through learning. According to Eisenhardt and Martin (2000) the specific sets of organizational strategies that are addressed in the dynamic capabilities perspective include formation of alliances and decision-making strategies that reconfigure resources into value creation. They concluded that dynamic capabilities are not the source of sustainable competitive advantage; it is rather the timing and effective use of these capabilities to configure resources ahead of competition. A key dynamic capability identified by Helfat et al. (2007) is relational capability, which has the potential to provide competitive advantages that provide long-term success through external growth mechanisms, including alliance and acquisition capabilities.

4. Network Competence

Ritter et al. (2003: 745) defined "network competence" as "a company-specific ability to handle, use and exploit inter organizational relationships", which provides competitive advantage. The scope of competence in this definition encompasses owned qualifications and knowledge as well as the skills required to manage the associated resources. The network competence model involves the elements described in Figure 1 as adapted from Ritter et al. (2003).

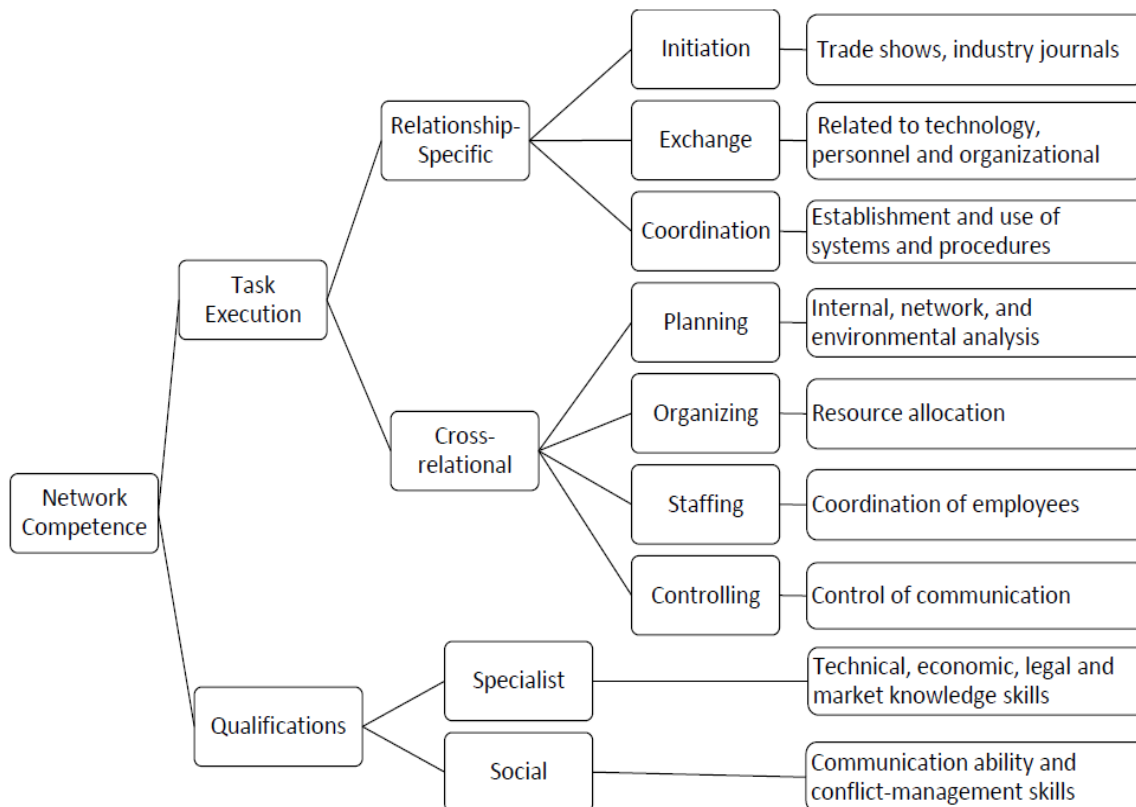
Ritter et al. (2003) presented network competence as a means to develop unique competitive advantages exemplified in enhanced innovativeness in technology-based firms. However, this ability to manage networks has become a resource that can lead to competitive advantages. Considering the unit of analysis to be the dyad or network of firms, they designed a framework for managing a network that led to inter-organizational competitive advantages. The four sources of potential competitiveness include the use of relation-specific assets, knowledge-sharing routines, complementary resources and capabilities, and effective governance mechanisms. Researchers describe these characteristics as alliance capabilities that can be a critical resource for a competitive strategic position (e.g., Anand & Khanna, 2000; Kale et al., 2000).


Figure 1: Parameters of network competence

5. Networks (Organizational Sociology)

The concept of networks dates back to Penrose's (1959) theory of firm growth. The picture of exchange of heterogeneous resources emerged as an interactive process that later developed into interactions of interdependencies between human and physical resources. Alchian and Demsetz (1972) later exemplified a network as the cooperation between firms and across markets through interactions among a lumberman, a lumber mill and a cabinetmaker. Van De Ven (1976) described the inter-organizational relationships among firms as a social action system that facilitates the achievement of goals that would be difficult to achieve had the firms acted independently.

The formation of inter-organizational relationships would be driven by the need to enhance internal or external resources. Van De Ven (1976) supports the idea that gauging the strength of inter-organizational relationship may be achieved by identifying the intensity and direction of resource flow between units. Intensity of resource flow also refers to the frequency of interaction. Van De Ven (1976) used this framework to study how inter-organizational relationships develop and eventually die. His assumptions and hypotheses propose that the strength of inter-organizational relationships is a function of resource dependence on external support, awareness of external resources and internal consensus on the objectives of the relationship. In this context, resource alignment becomes more complex as the number of interacting units increases.

This later evolved into the network perspective, which is also viewed from an organizational sociology perspective (e.g., Galaskiewicz & Zaheer, 1999). A sociological approach to inter-organizational networks is described in Gulati and Gargiulo's (1999)

study of organizational alliances. They explained that organizational alliances are formed to complement firm-specific resources and capabilities in the context of developing the social structure of the network. They elaborated on this concept by describing the formation of a network as an evolving social structure based on a longitudinally dynamic system that links resources. Their model portrayed the social structure as a "macro phenomenon" emerging from micro firm-level decisions seeking to gain access to resources.

The main connection between resource-based view (RBV) and industrial networks comes from the network resources referred to by Gulati (1999) as a similar understanding of the social capital view. Therefore, the RBV perspective may be a source for the creation of inimitable resources within the network. With this capability, a firm's network allows a firm to gain access to key resources that are not possessed internally. Gulati et al. (2000) suggest that the network structure that a firm belongs to is a key resource that may be a crucial source of competitive advantage; accordingly, they label such structures 'strategic networks'.

6. Network Sustainability

Gulati (1999) has discussed network sustainability in the context of resource alignment through networks or alliances, suggesting that alliances and networks enhance the value-creation of firms by providing valuable resources. Zheng et al. (2013: 1208) have elaborated on Gulati's study by defining network resources as "those resources that are owned by their alliance partners but which potentially can be accessed by the focal firm, as well as the valuable routines and arrangements embedded in the ties between the external parties." This view by Zheng et al. (2013) presented network resources as a source of competitive advantage especially in relation to the innovation performance and technological capabilities of firms within a network.

Network resources have created competition among networks rather than just among firms. Firms participating in networks share resources and exchange relationships, thereby creating knowledge acquisition (Inkpen & Tsang 2005). Several researchers have studied the enhancement of a firm's performance through shared network resources in fields such as biotechnology and telecommunication.

7. Role of internationalization

The topic of internationalization is an important complement to this research study. This is why it is important to conduct this kind of studies in rapidly changing economies, such United Arab Emirates (UAE) and Qatar, which rely on the technical contribution of international firms, especially in the construction industry. Given that, the coordination among local and international firms is paramount to the formation of efficient business networks.

A general assessment of the literature on firm internationalization seems to highlight the importance of a firm's resources in determining its ability to internationalize. The disciplines of business literature have produced extensive research on the modes and characteristics of internationalization of firms. Most of the research focuses on growth through internationalization from the firm's perspective. Foundations of these research tracks may have been inspired by Penrose's (1959) theory of firm growth. Hymer (1976) refers to a firm's resources as a critical factor that should be used to penetrate foreign markets. Many researchers follow by focusing on a firm's resources (e.g., Buckley & Casson, 1998) to describe the evolving and dynamic area of internationalization. The resource-based view and dynamic capabilities were also explicitly attributed to internationalization strategies (Peng, 2001).

Barney et al. (2001) highlighted that tacit knowledge developed by a firm through international experience is a competitive capability that is difficult to imitate. When studies on internationalization started focusing on international production into emerging economies or from emerging economies, the perspective of industrial network revealed its important role. Johanson and Mattson (1988) link the strength of an international network to the strength of a company's domestic relationships. Liu and Brookfield (2005) refer to "convoy migration" as a result of the internationalization of other members of a network.

Seggie and Griffith (2008) employ the resource-advantage (R-A) theory to support their argument that internationalization of service-based firms may be enhanced by aligning resources with the globalized domestic market. Standardization of the resource-matching process builds a competitive advantage for the international market. Although Seggie and Griffith (2008) highlight the important role of resource alignment on internationalization, their perspective is more focused on the usually less attended topic of increasing client diversity served domestically. The main proposition they advance is that the alignment of firm resources with the domestic segment's customer needs leads to enhanced performance at the domestic level and in the international market.

Discussion

Based on the literature reviewed in this section, it is evident that scholars have presented two levels of sustainable competitive advantage. The first level is firm-based competitiveness that may be attributed either to tangible sets of resources or intangible capabilities that should possess value-adding characteristics that are unique, inimitable and non-substitutable. The second level is the macro network dimension that takes into account the nature of links among firms as well as the overall industry dynamics with significant attention to social capital fundamentals. While this outlook serves well as a general interpretation of the basic requirements for sustainable competitiveness in a typical business setup, it falls short of addressing the complexities associated with applications that fit within the category of time-bound networks. The reviewed literature has failed to describe the challenges that face individual firms as part of a temporary network where resources are aligned to cater to a certain project with limited long-term potential for continuous interactions. Subsequently, these challenges cascade across the supply chain and affect the competitiveness of the specific network, and the industry itself. Table 1 summarizes the main theories discussed in this section along with a schematic depiction of the expansion from a firm-level view to the network level.

Given the significance of network notions in this study, a sociological approach is the most attractive when addressing social networks. However, to address a broader perspective, including firm-based advantages and resource allocations, the industrial organizational approach was employed. In general, this research evaluated the characteristics of a project-based transaction through the discipline of strategic management, a field that explores the reasons for business success.

In order to conduct this research, the context of an internationally based construction industry can be useful because it provides a unique position to evaluate the features of sustainable competitive advantages in transactions that possess extreme cases pertaining to time, finance, and sequence of activities. While sustainable competitive advantage has been studied in the context of the construction industry, this research is expected to explore the crossroads between firm-level advantages as presented by the resource-based view (Barney, 1991; Wernerfelt, 1984) and the dynamic capabilities view (Eisenhardt & Martin, 2000; Helfat et al., 2007). The dynamic capabilities view serves as a key for alignment with external

resources and social networks that link firms in a single time-bound network. In principle, the resource-based view establishes the firm's advantages, while the relational dynamic capabilities will allow a firm to align its resources with the external environment to become part of the greater network.

Table 1: Theories overview

Resources → Firm → Network →	Sustainable Competitive Advantage

INVESTIGATING THE ISSUES OF USING AGILE METHODS IN OFFSHORE SOFTWARE DEVELOPMENT IN SRI LANKA

V. N. Vithana, Management and Science University, Malaysia
D. Asirvatham, Management and Science University, Malaysia
M. G. M. Johar, Management and Science University, Malaysia

Abstract

Offshore software development (OSD) is the process of developing software by globally distributed teams and it has become increasingly popular due to the many benefits it offers. Reduced costs, access to wide range of skilled people and reduction in application development time are the major attractions to OSD. Agile methods are popular software development methodologies that help companies deliver high quality products rapidly. In order to stay competitive in today's dynamic business environment many software companies are embracing Agile methods. Agile methods require frequent informal communication between all stakeholders of the project. OSD introduces time, cultural and geographical barriers to this requirement. Previous studies in other countries have identified some of the challenges to implementing Agile methods in an offshore environment. However, the impact of the challenges on the project success has not been studied by many. This study uses empirical and theoretical evidences in order to develop a model of challenges and their impact on project success. OSD as the fifth largest export earner of Sri Lanka has an important role in the economy. Thus results of this study will help researchers as well as the ICT industry to obtain an awareness and to alleviate the challenges of OSD.

Key words: *Offshore software development, Agile software development, project success, issues, Global software development*

Introduction

Offshore software development (OSD) is the process of developing software by globally distributed teams. OSD also known as Global software Development (GSD) has become increasingly popular and thus the norm of developing software worldwide (Dingsøyr & Smite, 2014, Vogel & Connolly, 2005). The major benefits of OSD are lower cost, access to abundance of skilled people willing to work for a lower labor cost, improved quality and to reduce development time by developing the product for nearly 24 hours (Agerfalk et al, 2005; Dingsøyr & Smite, 2014; Vogel & Connolly, 2005). Thus many developing countries such as India, Sri Lanka, Philippines, and Bangladesh have become offshore outsourcing destinations. OSD has many barriers due to spatial distance, temporal distance and cultural differences (Jaanu, Paasivaara, & Lasseni, 2012; Agerfalk et al, 2005). Software development methods constantly evolve due to new technologies and demands of the users. Organizations need to continuously adapt new structures, strategies and policies to stay competitive in today's dynamic business environment. Thus, agile software development methods are becoming increasingly popular with the great flexibility they provide organizations to adapt to changing requirements and to market products rapidly. Agile methods were originated by a group of experienced professionals in 2001 based on their years of experience in the industry. According to the agile manifesto there is more value on, Individuals and interactions over processes and tools; Working software over comprehensive documentation; Customer collaboration over contract negotiation; Responding to change over following a plan. (Kent

Beck, Alistaire Cockburn, R Jeffries, & Highsmith, 2001). 'Agile' means being able to deliver quickly. Change quickly. Change often (Higsmith, 2002).

Agile methods are iterative and incremental methods. Agile development methods have been designed to solve the problem of delivering high quality software on time under constantly and rapidly changing requirements and business environment. Agile methods have a proven track record in the software and IT industries. Agile methods were originally developed for projects where all team members are in the same physical proximity where face to face communication is possible. With OSD, close proximity with all team members at all times is impossible. Several past research studies have identified challenges of implementing Agile methods at offshore settings. There are several research studies conducted on success and failure stories of implementing agile offshore. The researcher could not find any studies which have identified all the challenges and their impact on the project success. Further there are very few studies conducted in Sri Lanka on this area. It would be very beneficial for the industry as well as the researchers to obtain a holistic view of the challenges and their impact on the project success.

Thus, this research attempts to answer the following research question: What are the challenges of using Agile methods in offshore software development according to the peer reviewed articles in the literature?

The rest of this paper is organized as follows. Literature review section discusses the identified challenges and issues. In the next section, the theoretical model developed is presented.

Literature Review

This section discusses the challenges in implementing agile methods in an offshore setting. Many of the previous studies are case studies. According to the literature there are 9 challenges namely communication, personal selection, work culture, different time zones, trust, tools and infrastructure, knowledge management, following agile methods and testing.

1. Communication

    Throughout the literature the importance of communication in Agile methods is highly emphasized (Alzoubi & Gill, 2014; Ambler S. W., 2014; Bjarnason, Wnuk, & Regn, 2011; Bose, 2008; Marambe & Jayasundara, 2014; Yaggahavita, 2011). As agile methods were originally designed for small co-located teams, they heavily rely face-to-face communication.

    This is not possible in global teams where the members are geographically distributed and the communication between on-site and offshore teams is possible only through technology mediation. Another limiting factor may be the time difference due to different time zones that hinders synchronous communication even with the usage of telephones or video conferencing systems. The geographical and temporal distance prohibits informal communication (Bose, 2008; Marambe & Jayasundara, 2014; Dorairaj, Noble, & Malik, 2011). According to Fowler, Offshore development brings these two issues which conflict with the principles of agile development (Fowler, 2006). David Parnas states that poor communication among the team members and team members and the customer is the main reason for project failure (Agerfalk et al. 2006). Communication with geographically distributed team members often happen via asynchronous communication methods. Effective communication might be difficult to achieve with asynchronous methods. Email, chat, teleconferencing, video conferencing are the commonly used tools for communication (Bose, 2008). Video conferencing was used only at critical stages of the project as it was the most expensive. Many companies encouraged daily meetings as a successful strategy. Though there are well developed tools used for communication, it is

still a challenge to achieve 100% effective communication as in face to face communication (Korkala e al., 2007).

2. Personal selection

Personal selection in a team is identified as another challenge in GSE (Bose, 2008). Agile development requires cross functional teams with high communication skills (Misra et al., 2008). Members with a mind set for plan driven approach will not be suitable in this environment. Communication would be more effective between members with similar cultural backgrounds and similar mind set. Team members need to be autonomous rather than following the orders of the project manager. Hence selecting the right team members with the correct attitude is a challenge. (Conboy , Coyle, Wang, & Pikkarainen, 2011)

According to the literature different companies used different strategies in selecting the personnel for projects. Many successful scenarios emphasized the importance of having a good team lead who can coordinate the various activities. According to the literature some companies chose to have well experienced, creative people who have worked with each other before to be in the team. Some companies chose to have self-organizing teams who could manage their work responsibilities with minimum supervision (Bose, 2008).

3. Work Culture

As Fowler states another weak spot of offshore development come from culture and distance with the business. Because agile development works best with close communication and an open culture, people working offshore feel the pain much more than those using plan-driven approaches (Fowler, 2006, Bose, 2008). The characteristics of the people involved with the project and the culture plays an important role in the success of an agile project. It is said that offshore teams prefer plan driven development. Hence cross functional teams in an agile environment might not be effective at first. (Yaggahavita, 2011; Lalsing, Kishnah, & Sameerchand , 2012)

4. Different time zones

Having to work in different time zones is identified as another challenge in GSE (Bose, 2008; Conboy , Coyle, Wang, & Pikkarainen, 2011). A globally distributed team has to work in time zones that vary vastly. Agile methods rely on several face to face meetings even within a single iteration. Heavy documentation is not practiced as a way of communication. Thus distributed environment impose barriers for conducting regular meetings that are informed in short notice (Fowler, 2006).

5. Trust

Achieving trust between the team members is identified as another significant challenge in GSE. Since it is difficult to conduct regular meetings with the stake holders as in collocated team, it demotes trust between stakeholders (Bose, 2008; Paasivaara, Durasiewicz, & Lassenius, 2009). Team spirit where the whole team holds responsibility and works towards a common goal is essential in agile development. It is challenge in offshore environment where Sri Lankan and USA team might have a 'us vs them' attitude (Marambe & Jayasundara, 2014)

6. Knowledge Management

Documentation plays an important role in distributed agile more than in the co-located teams. Agile philosophy emphasis on 'just enough documentation'. But with the absence of proper documentation certain knowledge might not be conveyed efficient to all stakeholders (Dingsøyr & Smite, 2014; Bjarnason, Wnuk, & Regn, 2011; Lindvall, et al., 2002). Various tools such as wikis, code repositories are used for knowledge management. It is important that proper strategies and tools are used for efficient

knowledge management in order to effectively utilize tacit knowledge of experienced programmers (Bose, 2008).

7. Following the Agile Development Process
The agile practices are often modified in the distributed environment in order to meet the organizations requirements. Agile philosophy advocates a framework to software development. Details of practices to be used are not elaborated. For an example how to elicit requirements or what kind of documents to produce are not stated. Thus practices are adjusted according to the company's requirements. As Marambe et al. states following the proper techniques are challenged due to lack of knowledge, tight schedules, and distributed nature. These modified techniques might provide short term benefits while introducing unforeseen long term problems. It is identified that following the agile development process has the most significant impact on project success (Marambe & Jayasundara, 2014; Conboy , Coyle, Wang, & Pikkarainen, 2011; Yaggahavita, 2011)

8. Tools and Infrastructure
Usage of correct tools and infrastructure has a huge impact on the project success especially in OSD (Ambler S. W., 2014). Unavailability of the correct tools and infrastructure or improper handling of the tools will impede the project success. Branches of large companies will have all the facilities where as small and medium organizations might not be able to afford the cost (Shrivastava & Rathod, 2014; Alzoubi & Gill, 2014). Schwaber (2004) states the following "Prior to scaling any project, an appropriate infrastructure must be put in place. For instance, if a project will employ multiple collocated teams, a mechanism for frequently synchronizing their work must be devised and implemented." Smite, Moe and Agerfalk (2010) states the following "Although no single tool is strictly mandatory for a successful agile project, the right set of tools greatly facilitate realizing the various agile processes". Prior (2011) in her research observed that on a daily basis developers spend a considerable amount of time dealing with the tools and infrastructure to complete their daily tasks.

9. Testing
Agile philosophy emphasizes early and continuous testing of the product. Unit testing, integration testing, test driven development and test automation are some of the techniques used. Due to time constraints sometimes integration testing might not be possible for all features. This could result in decreased quality of the product. An industry expert opinion was to use test automation as a solution. Then the cost factor would be high. The distributed nature imposes challenges to continuous testing (Marambe & Jayasundara, 2014; Fowler, Using an Agile Software Process with Offshore Development, 2006). Bavani (2009) states that testing is a critical aspect when rolling out agile projects on a distributed scale.

Theoritical Framework
A successful project is should meet the scope, time, cost and quality constraints (Schwalbe, 2011). According to the literature 9 challenges that affect the project success was identified as depicted in Figure 1. Following hypothesis were developed accordingly.
H1 – Effective communication has a positive impact on project success
H2 – Trust between team members has a positive impact on project success
H3 – Differences in time zone have a negative impact on project success
H4 – Personnel selection has a positive impact on project success
H5 – Knowledge management has a positive impact on project success
H6 – Differences in work culture has a negative impact on project success

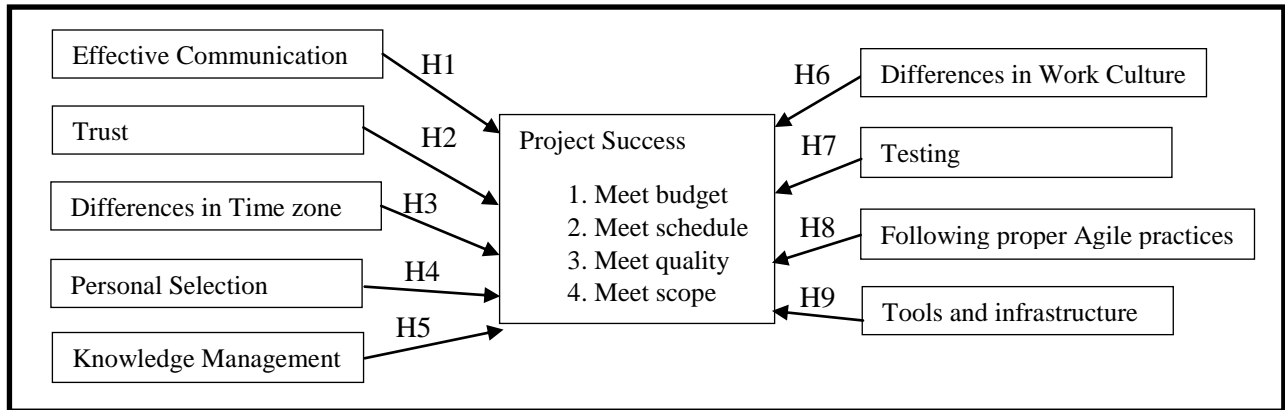
H7 – Testing methods has a positive impact on project success
H8 – Following Proper agile practices has a positive impact on project success
H9 – Having Proper tools and infrastructure has a positive impact on project success


Figure 1-Theoritical Framework

Future Research
In the future we will be testing the proposed theoretical model using quantitative methods. A random sample of software professionals who practice agile methods in an offshore setting in Sri Lanka will be selected. The population will consists of software professionals such as project managers, technical leaders, business analysts, software engineers and quality assurance engineers. It is planned to collect data using a questionnaire. The questionnaire would be personally given and data would be collected. The sampling method would be stratified random sampling and unit of analysis would be a software organization. Using quantitative methods it is planned to identify the most important factors that have an impact on the project success. OSD is currently the fifth large export earner for Sri Lanka. Many software companies are engaged in OSD using agile methods. Hence ICT industry as well as Sri Lanka as a country would greatly benefit from the findings of this study.

ENVIRONMENTAL MANAGEMENT IMPACT FROM ELECTRONIC WASTE: A STRUCTURAL EQUATION MODEL CONCEPTUAL PERSPECTIVE

Thanyaluck Yimyong, King Mongkut's Institute of Technology Ladkrabang, Thailand
Thepparat Phimolsathien, King Mongkut's Institute of Technology Ladkrabang, Thailand
Wanno Fongsuwan, King Mongkut's Institute of Technology Ladkrabang, Thailand

Abstract

This study presents a structural equation model conceptual framework of variables that affect environmental management of discarded electronics, electrical products and appliances manufacturers in Thailand. Waste Electrical and Electronic Equipment or WEEE is different from general waste as there are many diverse and complex parts including heavy metals and hazardous substances such as lead, mercury, and cadmium. Improper handling and disposal can cause significant harm to the environment as well as pose a health hazard to humans. Solid waste management is a complex task which requires the use of advanced technology and specialized process controls. Most e-waste facilities are using aged equipment and techniques which must be upgraded to international standards. Added to this, most consumers do not realize the dangers of e-waste nor does Thailand have adequate and effective legislation and laws governing its disposal. Presently, Thailand relies on an Extended Producer Responsibility, which relies on manufacturers to improve product designs making them more environmentally friendly by reducing the use of hazardous substances that could adversely affect the environment throughout the life cycle of the product. Quantitative data is being obtained from a proposed sample of 240 Thai environmental managers from electronics, electrical products and appliance manufacturers. Qualitative research is being conducted with 10 executives by the use of purposive sampling. Analysis will be conducted using Partial Least Square (PLS-Graph) software to apply Structural Equation Modeling (SEM).

Keywords: *WEEE, e-waste, hazardous substances, environmentally friendly*

Introduction

E-waste is the toxic legacy of our digital age with electronic waste creating 20-50 million tons of e-waste each year around the globe. According to a 2014 report from the ITU (International Telecommunications Union), mobile-cellular subscriptions will reach almost 7 billion at the end of 2014, with 3.6 billion of these in the Asia-Pacific region. The increase is mostly due to growth in the developing world where mobile-cellular subscriptions will account for 78 per cent of the world's total (ITU, 2014), but at some point, most purchase a new phone and discard their old one as 'e-waste'.

E-waste is one of largest known sources of heavy metals and organic pollutants with hazardous or toxic materials like lead, mercury, cadmium, chromium, brominated and chlorinated compounds posing a threat to humans and the environment, if they are improperly disposed of (Deccan Chronicle, 2016). A report from United Nations University (UNU) found that the world produced 41.8 million metric tons of e-waste in 2014 - an amount that would fill 1.15 million 18-wheel trucks. Lined up, those trucks would stretch from New York to Tokyo and back (Baldé, Wang, Kuehr, & Huisman, 2015).

E-waste is a term used to cover all items of electrical and electronic equipment (WEEE) and its parts that have been discarded by its owner as waste without intent of re-use (Baldé et al, 2015). In Asia, the total e-waste generation was 16.0 million tons (Mt) in 2014. China, India,

Japan, Hong Kong, South Korea, Viet Nam, Bhutan, Cyprus and Turkey have national e-waste related laws (Baldé et al, 2015). In China, national e-waste legislation manages the collection and treatment of TVs, refrigerators, washing machines, air conditioners and computers (desktop and laptops). In 2013, China officially collected and treated around 1.3 Mt of these five types of e-waste, which was 28 per cent of the total e-waste generated for all categories (Wang, Kuehr, Ahlquist & Li, 2013).

In Table 1 we can see statistics for ASEAN (plus Timor-Leste) domestic e-waste generated for each country in 2014. ASEAN, the Association of Southeast Asian Nations, is a powerhouse in the production and use of consumer electronics and appliances as well.

Table 1 Domestic E-Waste Generated per Country in 2014

Name	kg/inh.	kt	National Regulation in force till 2013	population (1000)
Brunei Darus-salam	18.1	7	no	411
Cambodia	1.0	16	no	15561
Indonesia	3.0	745	no	251490
Lao People's Democratic Republic	1.2	8	no	6557
Malaysia	7.6	232	no	30467
Myanmar	0.4	29	no	66257
Philippines	1.3	127	no	99434
Singapore	19.6	110	no	5595
Thailand	6.4	419	no	64945
Timor-Leste	4.1	5	no	1172
Viet Nam	1.3	116	yes	92571

In Vietnam alone, in the first six months of 2015, Vietnam produced 107.3 million mobile phones which was a massive 68.8 percent increase compared to the same period in 2014. The export value of cellphones and components in the six-month period topped US$14.7 billion, up 27 percent from the first half of 2014 (Tuoi Tre News, 2015).. Additionally, there were 2.16 million televisions produced, all of which eventually ends of being disposed of somewhere.

Electronic waste isn't just waste, it contains some very toxic substances, such as mercury, lead, cadmium, arsenic, beryllium and brominated flame retardants. When the latter are burned at low temperatures they create additional toxins, such as halogenated dioxins and furans – some of the most toxic substances known to humankind. The toxic materials in electronics can cause cancer, reproductive disorders, endocrine disruption, and many other health problems if this waste stream is not properly managed (Wang, Cai, Jiang, Leuang, Wong, & Wong, 2005).

Yu, Gao, Wu, Zhang, Cheung, and Wong (2006) studied soil contamination from a e-waste recycling center in Southeast China using 'primitive technology' and analyzed the concentration, distribution, profile and possible source of polycyclic aromatic hydrocarbons (PAHs) in the soil. Researched discovered sixteen USEPA priority PAHs in 49 soil samples.

The dominant PAHs were naphthalene, phenanthrene and fluoranthene, which were mainly derived from incomplete combustion of E-waste (e.g. wire insulations and PVC materials), and partly from coal combustion and motorcycle exhausts.

Gullett, Linak, Touati, Wasson, & King (2007), researched air emissions and residual ash samples from experiments of open, uncontrolled combustion of electronic waste (e-waste), simulating practices associated with rudimentary e-waste recycling operations. Circuit boards and insulated wires were handled separately to simulate processes associated with metal recovery. Emissions of polychlorinated dibenzodioxins and dibenzofurans were analyzed as well. It was found that the value for the insulated wire is about 100 times higher than that for backyard barrel burning of domestic waste. The emission concentrations of polybrominated dibenzodioxins and dibenzofurans (PBDD/PBDFs) from the combustion of circuit boards were 100 times higher than for their polychlorinated counterparts. Particulate matter (PM) sampling of the fly ash emissions indicated PM emission factors of approximately 15 and 17 g/kg of the initial mass for the circuit boards and insulated wire, respectively. Fly ash samples from both types of e-waste contained considerable amounts of several metallic elements and halogens; lead concentrations were more than 200 times the United States regulatory limits for municipal waste combustors and 20 times those for secondary lead smelters. Leaching tests of the residual bottom ash showed that lead concentrations exceeded U.S. Environmental Protection Agency landfill limits, designating this ash as a hazardous waste.

Bi et al. (2007) analyzed electronic waste (e-waste) from across the world where in Guiyu, South China, the e-waste is dismantled and discarded. Concentrations of polybrominated diphenyl ethers (PBDEs), polychlorinated biphenyls (PCBs), and organochlorine pesticides (OCPs) were measured in serum from residents of the e-waste dismantling region, where 80% of families work in e-waste recycling, and compared to a matching cohort from a nearby region where the fishing industry dominates (Haojiang). The median BDE-209 concentration in Guiyu was 50-200 times higher than previously reported in occupationally exposed populations.

Zheng et al. (2008) also studied local children under the age of 8 years old in China's e-waste recycling region of Guiyu and stated that from the primitive electronic waste (e-waste) recycling process that the toxic heavy metals may keep on threatening to the health of local children. Children living in Guiyu had significantly higher BLLs (blood lead levels) and BCLs (blood cadmium levels) as compared with those living in Chendian. It was also stated that there was a significant increasing trend in BLLs with increasing age in Guiyu. The risk factors related to children's BLLs and BCLs mainly included father's engagement in the work related to e-waste, children's residence in Guiyu and the amount of time that children played outside near the road every day.

The management of waste electronic and electrical equipment (WEEE) is a major challenge in developing and transition countries (Mmereki, Li, & Li'ao, (2015). Obsolete electrical and electronic equipment (EEE) are a complex waste category containing both hazardous and valuable substances. In developing countries and regions, infrastructure, pre-processing, and end-processing facilities and innovative technologies for end-of-life management of e-waste are noticeably absent due to lack of investment and high costs of its management.

Although it has been established that e-waste is toxic and both dangerous and toxic to the environment and humans, e-waste also contains many valuable, recoverable materials such as aluminum, copper, gold, silver, plastics, and ferrous metals. In order to conserve natural resources and the energy needed to produce new electronic equipment from virgin resources,

electronic equipment can be refurbished, reused, and recycled instead of being landfilled (Kansas Department of Health and Environment, 2015).

In many places however e-waste recycling falls onto the backs of enterprises such as junk dealers who have no knowledge of the toxic nature of their 'junk' nor the technology necessary to extract the precious metals. Most of these firms are unregulated and unregistered as well further complicating the process of regulation and prevention of pollution caused by hazardous substances and heavy metals in the product waste.

In Indonesian as in most places across Asia, there is 2008 law on waste management but a regulation to elaborate on the law has still not been made. The law required that producers handle their own waste (like in Thailand) but in Indonesia that has been interpreted to mean only the packaging (Elyda, 2016). In Thailand there is no specific law or regulation regarding e-waste other than the Hazardous Substance Act B.E. 2535 (1992) and its amendment B.E. 2556 (2013) (Chareonsong, 2014) which covers chemical waste which must require a permit. Used electrical and electronic and appliance enterprises are currently exempted for the need of a permit or to register but importing conditions for used electrical and electronic equipment is required by DIW (Department of Industrial Works) (Chareonsong, 2014).

From Table 2 can be seen an estimation of Thailand's current and projected domestic e-waste generation. In 2016 it is expected that nearly 11 million phones will be discarded along with 2.8 million TVs and over 1.5 million refrigerators and washing machines, which at present times relies solely on a policy of a consumer product manufacture called 'Extended Producer Responsibility or EPR.

Table 2 Estimation of Thai e-waste generation 2014-2021-(Ref: Chareonsong, 2014)

Product type	Waste generation (1,000 units) in year							
	2014	2015	2016	2017	2018	2019	2020	2021
TV	2,587	2,689	2,790	2,889	2,986	3,081	3,174	3,264
Digital camera/VDO camcorder	875	983	1,059	1,065	1,055	1,106	1,192	1,289
Media player	3,476	3,537	3,571	3,588	3,598	3,611	3,630	3,653
Printer	1,520	1,532	1,542	1,546	1,547	1,545	1,543	1,540

Fan	1,916	1,996	2,079	2,164	2,251	2,340	2,431	2,524

Lindhqvist (2000) first formulated the first definition of the extended producer responsibility (EPR) concept around 1990. Today, almost all OECD countries have formulated EPR policies and it is now possible to get a clearer understanding of the way the EPR principle can work under various conditions. In particular, the concept of EPR is as a policy principle to promote environmental improvements of products and product systems, and identifies possible approaches to key concerns in the implementation of EPR which builds on the preventive environmental strategies as promoted by, for instance, UNEP in the Cleaner Production Programme.

From the above, the researchers have developed the following 3 hypotheses for the study (Figure 1 below):

Proposed Research Hypotheses

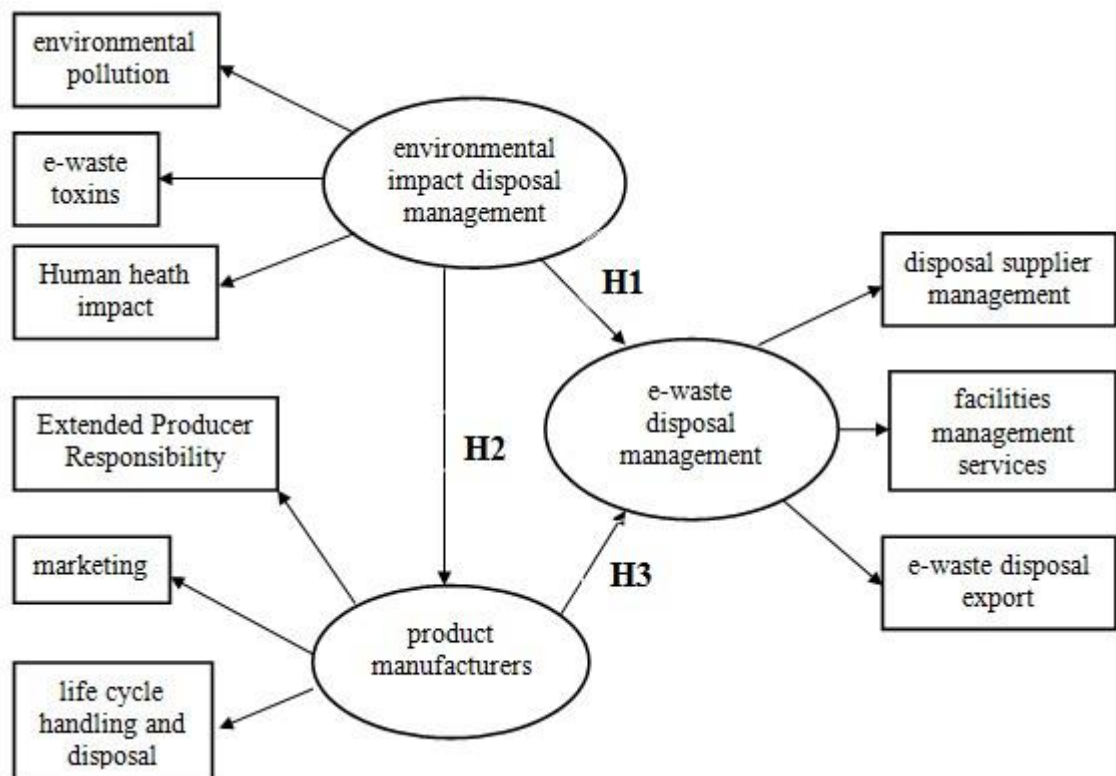
H1: *Environmental impact disposal management* has a direct influence on *e-waste disposal management*.
H2: *Environmental impact disposal management* has a direct influence on *product manufacturers*.
H3: *Product manufacturers* have a direct influence on the *e-waste disposal management*.


Figure 1: Proposed Conceptual Framework

Methodology
This research aims to model the structure of the factors influencing the environmental management of discarded electronics, electrical products and appliances manufacturers in Thailand, so the researchers wish to determine the details and procedures from the methods below:
  1. The approach used in the study
    For this study the researchers used both quantitative and qualitative research from both primary and secondary data. The researchers thus determined the following steps for this study:
    a. Secondary Data Research
      Thus far, research has been comprised of published research, textbooks, internet materials, media reports, and data which has been cleaned, analyzed and collected to

develop a conceptual model for the variables that affect environmental management of discarded electronics, electrical products and appliances manufacturers.

b. Quantitative Research Methods

Quantitative research will be performed from the primary data by collecting a questionnaire from the target sample. The questionnaire to be used to collect data is structured and written in a realistic, easy-to-understand format which is deemed to be reliable and reasonable. Further reliability validation will be undertaken as follows:

- Questionnaire review will be conducted by academic scholars to validate the investigation questions and the use of rhetoric and the simplicity and comprehension of the questions.
- During the questionnaire trial stage, questions and responses will be monitored so better clarity can be achieved. Questions will be updated as needed.
- Perform data collection Statistical analysis

c. Qualitative Research Methods

Qualitative research will involve confirming the model of the quantitative research. It is a collection of interviews with electronics and appliance industry professionals as well as the manufacturers. Qualitative Research is to be undertaken through the use of in-depth interviews with those involved in innovation, including plant managers, production managers and engineering managers. To confirm the model of quantitative research, the sample size for this research will be 10 individuals.

d. Population and sampling

The population in this study is environmental managers of discarded electronics, electrical products and appliances manufacturers.

e. Quantitative research

Schumacker and Lomax (2010) stated that Structural Equation Modeling (SEM) uses a variety of models to show the relationships between observed variables with the same basic goal of providing a quantitative test of a theoretical model hypothesized by a researcher. Meldrum (2010) further stated that a sample size smaller than 100 should not be used in SEM as it is unreliable. This is consistent with other research on the 'Rule of 100' including Gorsuch (1983), Kline (1979), (MacCallum, Widaman, Zhang & Hong, 1999). No sample should be less than 100 even though the number of variables is less than 20 (Gorsuch, 1974; in Arrindell & van der Ende, 1985). Therefore, using a factor of 20 for each of the 12 variables from the research survey, it is anticipated that a total of 240 samples are adequate to assure a reliable sample size (Schumacker & Lomax, 2010).

f. Self-administered questionnaire (SAQ)

For this research, the measurement instrument or questionnaires utilized was prepared from the literature. A self-administered questionnaire (SAQ) is being used as it is exploratory in nature and serves as a starting point for other methodologies.

g. Qualitative Research

Berk (1984) stated that an evaluation of the congruence between items and objectives is the most important assessment during the content validation stage. If there is insufficient evidence that the items are measuring what they are intended to measure, the remaining item analyses are useless. An efficient measure for numerically assessing content experts' evaluations of items is the index of item-objective congruence (Rovinelli & Hambleton, 1977), in which ratings from content specialists are obtained in order to evaluate the match between test items and the table of specifications (Berk, 1984). For this study, 5 experts in their related fields were chosen with items having an IOC index higher than 0.5 being considered acceptable.

Additionally, the index of Item-Objective Congruence (IOC) developed by Rovinelli and Hambleton (1977) will be employed to carry out the screening of questions to a group of 10 initially in the pilot study. The research will then proceed to select items that have an IOC index higher than 0.5, which will be considered acceptable.

h. Research quality inspection tools

The research will be conducted to determine the quality and reliability of the instruments used in the research. Tools used to measure quality include content validity and reliability (Hale & Astolfi, 2014).

Questionnaires are constructed as a tool to measure concept definition and practice using a 5-Point Likert Scale (Likert, 1970). This research will conduct Confirmatory Factor Analysis (CFA) and subsequently reliability analysis to measure Cronbach's alphas (Cronbach, 1951) for this scale items to ensure internal consistency. Multi-item measures were developed based on Cronbach's alpha >0.68. This study will then calculate Cronbach's alphas for each construct. If the value is below 0.50, the research question will be cut off. This is considered highly reliable. The responses to the questions capturing focal constructs will use a five-point Likert scale (rating statements 1-5; 1 = strongly disagree and 5= strongly agree) (Likert, 1970).

There will also be an inspection by 5 experts including:

- Electrical and electronic manufacturers   3 members
- Industrial appliances and electronics academic expert   2 members

Data Collection

1. Primary data

   Primary data is a collection of factors that influence environmental management of discarded electronics, electrical products and appliances manufacturers in Thailand.

2. Secondary data

   Secondary Data consists of studying the theories related to the research from various sources; including books, manuals, tutorials, articles, research papers, etc., to define the concepts and theories used in the study.

Quantitative Data Analysis

Quantitative research is currently envisioned using the partial least squares (PLS) statistical method and hypotheses testing with PLS-Graph software (Chin, 2001), which analyses the display and model structure associated with the observed manifest variables with latent variables.

Analysis of quantitative data

The analysis of quantitative data will be conducted using statistical analysis as follows:

1. An analysis will be conducted by descriptive statistics by characterizing the frequency, percentage, mean, and standard deviation.
2. An analysis will be conducted using structural equation modeling (SEM) to determine the relationship of the factors influencing environmental management of discarded electronics, electrical products and appliances manufacturers in Thailand.

Analysis of qualitative data

To confirm the results of the quantitative analysis are credible and the findings reliable, the researchers will conduct interviews with those involved as environmental managers of discarded electronics, electrical products and appliances manufacturers in Thailand. Afterwards, the researchers will proceed to interpret qualitative information including classified information.

Conclusion

A report from ABI Research predicts that the market for recovering and recycling used electronics will reach $14.7 billion by 2015 (ABI Research, 2010). By 2017, the volume of discarded e-products worldwide is expected to be 33 per cent higher than in 2012 and weigh the equivalent of eight of the Great Pyramids of Egypt. The worldwide smartphone market grew 13.0% year over year in 2015 Q2, with 341.5 million shipments, according to data from the International Data Corporation (IDC, 2015).

No matter where you turn, the numbers are staggering and at some point, it all becomes e-waste. The solution needs to go beyond a policy of EPR which relies on manufacturer participation and cooperation. As was seen in Indonesia, this was watered down to be interrupted as packaging waste only (Elyda, 2016).

Manufacturers need to tackle the root cause of the problem and work on solutions that promote the safe recycling and destruction of their products. Additionally, products need to be designed that are more environmentally friendly without the use of dangerous chemicals and products.

In Thailand the May 19, 2015 draft resolution entitled '*Draft Waste Electrical and Electronics Equipment (WEEE) Management Act, B.E. ....* 'was submitted**.** The Thai cabinet resolved to approve in principle the draft Waste Electrical and Electronics Equipment (WEEE) Management Act, B.E. …. as proposed by Ministry of Natural Resources and Environment. The draft act would then be submitted to the Office of the Council of State for consideration, and later to the coordinating committee of the National Legislative Assembly before proposing to the National Legislative Assembly. Ministry of Natural Resources and Environment would then proceed with the establishment of the waste equipment information center under the Department of Pollution Control (Royal Thai Government, 2015). As can be seen, there are many involved in the regulatory process of e-waste and related consumer product recycling and destruction.

This study therefore is being undertaken to see how these processes are currently working or not working and help with the understanding and dissemination of the information and data so as to help build a cleaner, healthier and sustainable consumer products industry.

BEING GREEN IN THE HOTEL INDUSTRY – AN EMPIRICAL STUDY FROM THAILAND

Thapanaphat Pratyameteetham, King Mongkut's Institute of Technology Ladkrabang, Thailand
Walailak Atthirawong, King Mongkut's Institute of Technology Ladkrabang, Thailand

Abstract

Path analysis is used to evaluate the effects of green drivers, suppliers, service users, and employees' perception of Green Practices, in the Thai hotel industry. The analysis is based on 325 senior industry representatives who responded to a 2015 survey in Thailand. Results show significant positive effects of green drivers, hotel suppliers, service users, and perception of the environment on Green Practices. Additionally, results suggest that drivers, such as international environmental laws, environmental management standards, and competitors, have the effect of hotels adjusting to align with customers' needs and expectations. Furthermore, hotels need to implement processes for selecting suppliers who can provide green products and services to maximize their clients' satisfaction. Customers are increasingly aware of their environmental impact during hotel stays. Awareness of environmental concern by consumers is necessary for all levels within hotels. To strengthen Green Practices, this study suggests that drivers (such as the Thai Hotel Association), suppliers, hotels themselves, and customers continue current trends. A push along the path of Green Practices would help the Thai hotel industry achieve business sustainability. Findings from this study also provide useful information for hotel related firms and those in the hospitality industries on the impact of increase awareness of Green Practices.

Keywords: *Drivers, Hotel Suppliers, Service Users, Environmental Perception, Green Practices*

Introduction

Pollution is occurring on a vast and unprecedented scale globally mainly because the number of industries is increasing (Zhu et al., 2008; Chandraker et al., 2013). Businesses motived to grow revenue and concerns about increased environmental degradation, has triggered the need to integrate environmentally sound changes in supply chain management research and practice. Green and sustainable concepts and practices are increasingly becoming the norm and are issues of strategic importance. Green practices help to reduce environmental risk (Ying & Li-jun, 2012).
The hotel industry worldwide is increasingly more concerned about environmental issues. Bohdanowicz&Martinac (2007) indicated that 75% of environmental pollution caused by the hotel industry was from over-consuming energy, water, and materials. Wastewater, fumes, and materials discharge during operations causes negative impacts on the environment. Thus, without proper design and planning, the environment would be negatively affected. To implement green practices, the hotel industry should follow practices align with environmental supply chain management guidelines. Numerous studies have tried to identify green practices in organizations.
Competition in the Thai hotel industry is very high. To adjust service strategy and achieve customer satisfaction, good management is needed. Hotel management needs to change focus towards ecological issues and the impact of pollution (Robinot & Giannelloni, 2010). Existing hotel operating processes and services results in some problems, such as garbage, polluted water, and wasted energy. Apart from creating problems at tourist destinations, as well as for the surrounding communities, pollution and wastage are partly to blame for global warming. The

Thai hotel industry had 6,085 hotels operating in 2015 (Dept. of Business Development, 2015). A geographical breakdown is shown in Table 1.

Table 1. Thai hotels in 2015 according to administrative regions. Unit: hotel

Region	Bangkok	Central	East	North-East	North	South	West	Total
Amount	1,528	373	939	445	639	1,669	492	6,085
Percentage	26	6	16	7	11	27	8	100

Source: Department of Business Development, 2015

The main objective of this study is to identify the major factors that affect green practices in the hotel industry to develop guidelines for adjustment and self-development of hotel organizations.

Literature Review

1. Green Practice in Hotel Industry in Thailand

Changes in global manufacturing, world climate, environmental and social issues, and concerns affecting client changes are becoming more important in managing any business. Green Supply Chain Management (GSCM) is an approach towards improving the performance of processes, products, and services, according to the requirements of environmental regulations (Hsu & Hu, 2008). Adoption of environmentally friendly GSCM practices includes addressing, internal environmental management, green purchasing, cooperation with customers, and incorporating eco-designs into corporate and operational strategies; aiding the firm's environmental sustainability (Zhu et al., 2008).

Thailand's hotel industry is an important part of the service sector driving Thailand's long-term economic growth. Hotels need to adjust themselves to respond practically to various Green Environmental drivers, considering their other external and internal drivers. It is crucial to become environmentally friendly by creatively taking into consideration the green supply chain.

The green supply chain in the hotel industry is a process concerned with environmental protection related to hotel activities such as green design, green procurement, and suppliers. Management is concern with the environment experienced by service users or customers.
Source: Adapted from Kothari *et al.*, 2005
Figure 1. Green Supply Chain of Hotel Industry

The Green Supply Chain (GSC) in the hotel industry (Fig. 1) shows movement from upstream to downstream. Drivers such as Environmental Law, Environmental regulations, and Competitors affect the GSC in the hotel industry. Relationships among activities and processes have a potential impact on the environment starting from the coordination with hotel suppliers and ending with serving customer demands. The link shows the significance of product suppliers who supplies environmentally friendly goods and services. Currently,

Thailand's hotel industries are adjusting themselves to improve their products and services for a service that are green supply friendly (Kothari et al., 2005).

2. The relationship between Drivers, Hotel Suppliers, Hotel Customers, Environmental Perception, and Green Practices in the hotel industry

Environmental management is considered by business and social sectors as an important part of corporate social responsibility and is being given more attention (Lamond, 2008). Hotel management, also, has to take environmental concerns into account in running the business while balancing business profitability, society, and other sustainable business advantages. The increase in enforcement of environmental law, together with the pressure from stakeholders to be more aware of Green practices, are considerable (DiPietrob et al., 2013; Jones et al., 2014). Creativity in the hotel industry is needed to bring awareness of environment-related issues such as energy management, water consumption, and waste management to save costs and maintain a competitive advantage (Bowe, 2005; Chen et al., 2005).

These factors (Drivers, Hotel Suppliers, and Hotel Customers) are affected by the hotels' business implementation of green practices. In this study, the researchers, therefore, focused on the relationship among all stakeholders in the hotel supply chain by reviewing relevant literature and field research. Some relevant literature is given in Table 2.

Table 2. The study of relevant variables

Considering issues	Items	Researchers	Definitions of terminology
Hotel Drivers	5		
- Adherence to environmental policies (IND)		Awasthi *et al.* (2010)	Domestic environmental laws and regulations,
- Compliance to Government regulations (REG)		Handfield *et al.* (2002)	governmental environmental policies, and international
- Competitors (COM)		Large & Thomsen (2011)	environmental law regulation etc. Institutional pressure promotes organization to adopt the green supply chain practices. (Cui &Jiang, 2012; Zailani *et al.*, 2012; Wong *et al.*, 2009; Wong *et al.*, 2012)

(2010) Buyukozkan&Cifci (2011,2012b)	The enterprise uses green design, green innovation, green manufacturing, green purchasing, and green service practices to increase sustainable performance.(Chien& Shih, 2007; Zhu *et al*., 2008; Shang *et al*., 2010)

3. Theory

In this study, three critical and relevant theories have been reviewed; they are Institutional Theory, Stakeholder Theory, and Ecological Modernization. These theories have been synthesized to be used in the research as follows:

a. Stakeholder Theory
   The theory suggests there are various groups of stakeholders involved in a hotel's operations including government as a regulator, hotel organizations, employees, service users, shareholders, suppliers, competitors, other public/private organizations, and communities. The stakeholder theory is usually used as an explanatory theory for the adoption of various green practices. Stakeholder influences on green purchasing, are supply chain environmental life cycle analysis of reverse logistics are two prime examples of the Theory's use (Sarkis, Zhu, and Lai, 2011).

b. Institutional Theory
   This theory focuses on explaining the imitative behavior of organizations for their survival and societal acceptance (Meyer & Rowan, 1977; Tolbert &Zucker, 1983; Zucker, 1987). The institutional theory could explain the phenomenon of organizations applying for international standardized management techniques and certification such as ISO 14001, ISO 18000, ISO 9000, or TQM social acceptance.
   Institutional theory has become a major research direction to explain environmentally related practices. Normative isomorphic drivers cause enterprises to conform or to be perceived as having legitimate organizational activities. Social normative pressures can explain environmental management practices among enterprises. Mimetic is an isomorphic driver which occur when companies imitate the actions of successful competitors in the industry, in an attempt to replicate the path of their success.

c. Ecological Modernization Theory (EMT)
   EMT has its underpinnings in sociological theories and has been further developed by policy and organizational theories. EMT is geared towards industrial development for environmental protection through innovation and technological development and has been widely adopted in the manufacturing sector. EMT-based green supply chain management (GSCM) studies explain how an environmental policy can promote the adoption of GSCM and demonstrate that GSCM can improve both economic and environmental performances. Due to its 'win-win' nature, governments urge companies to undertake environmental practices voluntarily. However, it is still a question of how EMT and GSCM can give rise to a 'win-win' situation, which is a key to urge suppliers and customers of the companies to have environmentally friendly awareness.

4. Hypotheses
   The researchers have set out the hypotheses of the research in Table 4.

Table 4. Hypotheses of the research

Hypotheses	Relationship link	Content	Selected key literature
H$_1$	Direct Positive to Hotel Suppliers and Green Practice	Suppliers have positive link with Green Practice.	Simpson *et al*.(2007); Nawrocka *et al*.(2009)
H$_2$	Direct Positive to Hotel Customers and Green Practice	Hotel Service Users have positive link with Green Practice.	Simpson *et al*.(2007); Eltayeb&Zailani (2011)

H_3	Direct Positive to Environmental perception and Green Practice	Environmental Perception has positive link with Green Practice	Simpson *et al.*(2007)
H_4	Indirect Positive between joint Drivers, Environmental perception and Green Practice	Drivers contribute more to Environmental Perception of hotel business in creating reliability and trust in Service Users who have environmental awareness.	Eltayeb&Zailani (2011);Diabat&Govindan(2011)
H_5	Indirect Positive between joint Drivers, Hotel Suppliers and Green Practice	Drivers contribute to the adjustment of Suppliers to be more aware of the environment and design when producing products and materials according to the Green Design provided by the hotel and the conditions designated in the agreement made with the hotel.	Large & Thomsen(2011)
H_6	Indirect Positive between joint Drivers, Hotel Customers and Green Practice	Environmental law, environmental, conservation trends, and ISO 14001 help Service Users to realize and be aware more of environmental effects which, then, contributes to the hotel adjustment to respond to Service Users' need.	Zhu *et al.*(2011), Ninlawan *et al.*(2011), Diabat&Govindan (2011), Holt&Ghobadian (2009)
H_7	Indirect Positive between joint Drivers, Hotel Suppliers, Hotel Customers, Environmental perception and Green Practices	The adjustment of Drivers such as environmental rules and regulations raised environmental awareness more among Service Users as well as suppliers. This contributes to the adjustment of the hotel practices as service providers responds to the demands of Service Users.	Diabat&Govindan (2011), Zhu *et al.*(2010), Holt&Ghobadian (2009)

Proposed Model

A Green Supply Chain Performance model of the Hotel Industry in Thailand presented by Pratyameteetham and Atthirawong (2014) has been applied in the conceptual framework of this

research. The model shows that Drivers, Suppliers, and Customers have a direct relationship with Green Practices of hotel organizations. This research focuses on hotels performance in implementing Green Practices using several instigating factors. The conceptual framework is shown in Figure 2.
Source: Adapted from Pratyameteetham and Atthirawong, 2014

Figure 2. Relationship between Drivers, Hotel Suppliers, Hotel Customers, Environmental Perception on Green Practice in the hotel industry to an organization performance

Research Methodology

1. Research Instrument

   A seven-point Likert scale questionnaire was used in this study, where 1 represented strongly disagree, and 7 strongly agree. The survey consisted of 38 questions; 5 questions concerning Drivers, 3 questions concerning Suppliers, 2 questions concerning Service Users, 4 questions concerning Environmental Perception, and 24 questions about Green Practices.

2. Instrument Design Process

   The questionnaire design process was initiated by a pilot interview with five hotel executives to confirm the variables, and then, questions were generated. The drafted questionnaire was validated and analyzed by five experts. Thirty questionnaires were distributed to a non-sample group to find out the questionnaire's reliability using Cronbach's alpha coefficient. After analyzing, the resultant coefficient was 0.976, representing a high-level of reliability thus usable (Kline, 2011).

3. Sample Population and Data Collection

   For this study, the population consisted of hotel managers from 6,085 hotels across the country (Department of Business Development, Ministry of Commerce, 2014). The total sample size determined by the concept of Anderson &Gerbing (1984) was 380 persons from the selected hotels ranging from one-star to five-star hotels.

   All 380 questionnaires were distributed to the sample group by mail, email, and hand. 325 questionnaires were returned (though none from one or two stars hotels) giving an effective response rate of 85.53 percent (Babbie, 2002).

4. Statistical Method

   An analysis was done using descriptive statistics, inferential statistics, and Path analysis. The representative criteria used are provided in Table 5.

Table 5. Relevant Statistics

Statistical Value	Criteria
p-value	< 2.00
χ^2/df	< 2.00

Statistical Value	Criteria
CFI	> 0.9
GFI	> 0.9
AGFI	> 0.9
RMSEA	< 0.05

Source: Hair *et al*. (2006)

Test Results

1. Sample Group Analysis

   The general information of the sample group of 325 hotels in Thailand was analyzed and is classified as shown in Table 6.

Table 6. Descriptive Statistics (n=325)

Gender	Female: (167:51.4%); Male: (158:48.6%)
Age	Below30: 11.1%; 30-39 : 33.8%; 40-49 : 31.1%; 50 and above: 24%
Educational Level	Lower than Bachelor's degree: 11.7%; Bachelor's degree: 67.4%; Master degree or higher: 20.9%
Position	Top executive: 53.8%; Middle level managers: 46.2%
Working experience in the current position	Less than3 years: 23.4%; 3-5 years: 25.2%; 6-10 years: 18.8%;more than10 years: 32.6%
Organization size	Less than60 rooms: 22.5%; 60-149 rooms: 30.8%; 150 rooms or more: 46.8%
Type of Organization	Managed by owners: 72.6%; managed by local chain: 9.2%; managed by international chain: 18.2%
Number of Employees	Less than51employees: 25.2%; 51-99 employees: 19.7%; 100 employees or more: 55.1%
Hotel type	3 - stars: 32.9 %;4 - stars: 50.2 %; 5 - stars: 16.9%

None of the one or two star hotels responded to the questionnaire. Having 55 more data points (14.5 percent of questionnaires) may alter the data especially where the difference is less than 10 percent.

2. Path Analysis

   From the Path Analysis, statistics used to test the model is Chi-squared(χ^2) which is equal to 0.915, degree of freedom (*df*) is equal to 1, *p*-value is equal to 0.339, χ^2/df is equal to 0.915.When the efficiency index is taken into consideration, the Comparative Fit Index (CFI) is equal to 1,000, the Goodness of Fit Index (GFI) is equal to 0.999, the Adjusted Goodness of Fit Index (AGFI) is equal to 0.983, the Root Mean Square Residual (RMR) is equal to 0.007, and the Root Mean Square Error of Approximation (RMSEA) is equal to 0.000. Therefore, it can be concluded that the model conforms to the empirical data as follows:

Table 7. Comparing the Research Results to Statistical Criteria

Statistical Value	Criteria	Research Results
p-value	>0.05	0.339
χ^2/df	< 2.00	0.915
CFI	> 0.9	1.000

GFI	> 0.9	0.999
AGFI	> 0.9	0.983
RMSEA	< 0.05	0.000

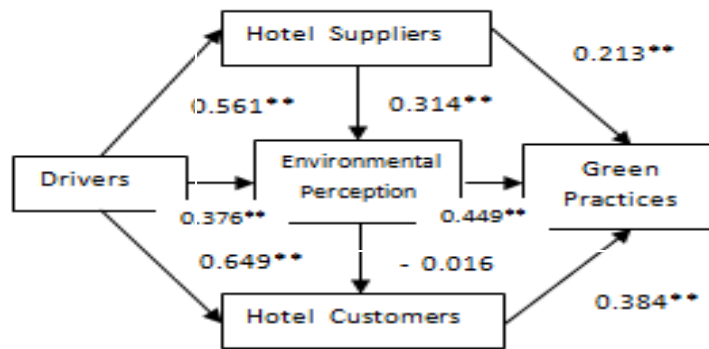
The coherence between the model and the empirical data is presented in Figure 3. The conclusion of the value of direct effect, indirect effect, and total effect of the model is presented in Table 8.


Table 8. Direct Effect, Indirect Effect, and Total Effect of the Model

Cause Variable	Effect Variable											
	Hotel Suppliers			Hotel Customers			Environmental perception			Green Practice		
	TE	DE	IE	TE	DE	IE	TE	DE	IE	TE	DE	IE
Driver	0.561 **	0.561 **	-	0.649 **	0.649 **	-	0.534 **	0.369 **	0.166 **	0.609 **	-	0.609 **

R^2	0.315			0.421			0.353			0.520		

$\chi^2 = 0.915$, df = 1, $\chi^2/df = 0.915$, p-value = 0.339, CFI = 1.000, GFI = 0.999, AGFI = 0.983, RMR= 0.007,
RMSEA = 0.000

Remark: DE = Direct Effect, IE = Indirect Effect, TE = Total Effect
* Refers to statistical significance at the level of .05 ($1.960 \leq t$-value < 2.576),
** Refers to statistical significance at the level of .01 (t-value ≥ 2.576)

From Table 8, the results of the analysis are as follows:
a. Hotel Suppliers have a direct effect on Green Practices with the path coefficient of 0.213 which has statistical significance at the level of .01; supporting H_1.
b. Hotel Customers have a direct effect on Green Practices with the path coefficient of 0.384, which has statistical significance at the level of .01; supporting H_2.
c. Environmental Perception has a direct effect on Green Practices with the path coefficient of 0.449, which has statistical significance at the level of .01; supporting H_3.

d. Drivers have an indirect effect on Green Practices through Environmental perception with the path coefficient of 0.166, which has statistical significance at the level of .01; supporting H_4.

e. Drivers have an indirect effect on Green Practices through Suppliers with the path coefficient of 0.141, which has statistical significance at the level of .01; supporting H_5.

f. Drivers have an indirect effect on Green Practices through Hotel Customers with the path coefficient of -0.007, which has no statistical significance; not supporting H_6.

g. Drivers have an indirect effect on Green Practices through Hotel Suppliers, Hotel Customers, and Environmental perception with the path coefficient of 0.609, which has statistical significance at the level of .01; supporting H_7.

All combined variables in the model explains Hotel Suppliers, Environmental perception, Hotel Customers, and Green Practices at the percentage of 31.5, 42.1, 35.5, and 52.0, respectively.

Table 9. Results

Relation	TE	DE	IE	Hypothesis Decision	Relation
H_1	Hotel Suppliers ➜ Green Practice	0.213**	0.141**	0.354**	Supported

Conclusions And Discussion

The study found that Hotel Suppliers (H1) are critical in providing environmentally friendly products or services. As a result hotel organization are developing an appropriate Hotel Suppliers selection process to find qualified suppliers who can provide green products and services. This finding is consistent with the research result of Bhool&Narwal (2013) suggesting that Suppliers contribute in creating value by offering environmentally friendly products and services. Hotel Service Users or Customers (H2), such as governmental agencies, have significant roles by continuously providing the knowledge and understanding and promoting environmental awareness among hotels. Results align with research result of Bhool&Narwal (2013) who found that environmental awareness of customers is a significant driver for service organizations to understand and develop their services.

Environmental Perception (H3) suggests that the hotel management and personnel shall have knowledge and understanding concerning the steps towards becoming considered a Green Hotel. With a concrete commitment, good motivation, and proper working atmosphere, management can

create a workplace that will have a direct effect on Green Practices. Results conform to the research results of Luo, Qu &Marnburg (2013), who found that justice perceptions, justice-related satisfaction, employee commitment, and turnover intention are several positive or negative factors influencing employee social loafing behavior.

Hypotheses (H4, H5) play the most significant role in raising awareness of hotel organization regarding the environmental importance focusing on reducing pollution. Thus consistent with the research results of Cui & Jiang (2012), who found that drivers have significant effects on the change of organizational practices and that they take into account its stakeholders as well.

Customer demands (H6) have an effect on the behavior of Service Users who expect Green Services from the hotel. There may be some limitations preventing the hotel from improving and developing its service to meet customers' needs. For instance, limitation in the budget for purchasing green products or materials to meet service users' expectations eventually affects the service users' satisfaction. Drivers (H7), environmental law, environmental management standards, etc. have an effect on the practical green path. Suppliers, as well as competitors in the same industry, contribute to Green Practices by adjusting or developing practices to comply with the hotel customers' needs and expectations. This is consistent with the research results of Cui& Jiang (2012), who found that environmental law, regulations, and the policy of the government on the environment lead to adjustments of the business sector towards being a Green Practice organization.

All of the factors mentioned above are in line with Institutional Theory as all of the factors are drivers affecting the operation of the organization. As a result, the hotel organization needs to adjust itself to survive and be competitive. Aligned with Stakeholder theory, all categories of stakeholders such as suppliers, customers, and hotel organizations jointly contribute to the reduction of negative environmental impact and increasing positive effects. For the organization's sustainability, three balancing dimensions of development, economic, social, and environmental development, need to be carried out in parallel with ecological modernization.

Recommendations

As mentioned above, Drivers, Suppliers, and Customers have an effect on the Green Practices of the hotel industry. Considering the Environmental Perception of Suppliers and Service Users the hotel industry can get a better idea of better environmentally friendly practices and develop guidelines to suit. Hotels and their stakeholders can apply the 3Rs (Reuse, Recycle, and Reduce) to reduce the negative environmental impact that may arise from hotel operations as well as to create organization sustainability as shown in Figure 4. To make Green Practice more tangible, each of the stakeholders should carry out the specific roles presented in Table 10.

Table 10. Stakeholders' Roles to make Green Practices more tangible

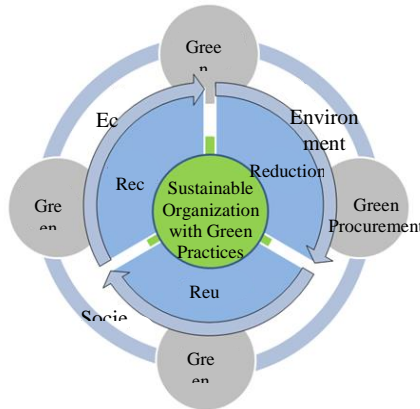
No.	Stakeholders	Green Practice Implication
1	Suppliers	Being aware and paying attention to producing products and services minimizing environmental effects.
2	Hotel organization	Organizing training, providing knowledge, and promoting understanding among the management and personnel in every division concerning Green Practices such as Green Procurement, Waste Management, Energy Saving, and Green Design.
3	Service Users or Customers	Having environmental awareness when using service to reduce environmental effects or reusing products such as using water economically, reusing towel, turning off the lights when they are not needed as well as giving suggestions concerning service quality of the hotel for correction and improvement.
4	Relevant Government Agencies	- Publicizing knowledge of the "Green Hotel" to raise awareness of environmental preservation in the form of leaflets or websites (such as the website of Department of Tourism, Ministry of Tourism and Sports). - Organizing training on environmental management in the hotel such as Green Procurement, Green Design, Energy Saving, and Energy Conservation in Buildings, etc. - Organizing the "Green Hotel Award of Thailand" contest as a campaign for raising environmental awareness of hotel operators to continuously develop their organizations in parallel with paying attention to the environment. - Inspecting hotels to make sure their operations comply with the Hotel Act B.E. 2535 (1992)to reduce environmental impact.
5	Thai Hotel Association	- Organizing meetings of hotel chain members and collectively setting environmental policies and implementing them continuously. - Organizing activities to persuade non-member hotels to become members to have coherent environmental practices in developing the hotel industry in Thailand.


Figure 4. The Proposed Model of a Sustainable Organization with Green Practices

The Model shown in Figure 4 presents the primary objectives of practices for hotels to create environmental balance and operate sustainably. The main idea of the model comprises 3Rs, which would be carried out in every single process of the organization including designing, procurement, service, and logistics to create economic, environmental, and social balance.

AN ANALYSIS OF LEGISLATION AND LAWS AFFECTING THE DISPOSAL OF THAILAND'S E-WASTE

Thanyaluck Yimyong, King Mongkut's Institute of Technology Ladkrabang, Thailand
Thepparat Phimolsathien, King Mongkut's Institute of Technology Ladkrabang, Thailand
Wanno Fongsuwan, King Mongkut's Institute of Technology Ladkrabang, Thailand

Abstract

E-waste is the legacy of digital consumerism with some estimates placing global WEEE (Waste Electrical and Electronic Equipment) at over 20 million tons per year. Growing at a rate of 13 percent per year, this waste includes highly toxic components which are very harmful to the environment and individuals which must be disposed of in a safe and proper manner. Unfortunately, legislation and laws governing this massive problem are limited or non-existent in many countries with Thailand presently relying on an inadequate policy of 'Extended Producer Responsibility' in which manufacturers are tasked to collect and dispose of their respective industry's waste. Stronger legislation in the form of Thailand's WEEE Management Act unfortunately is tied up in a bureaucratic process with many levels of approval necessary before it can be enacted. This research therefore is focused on legislation and laws concerning the management and disposal of discarded consumer products such as electronic, electrical and household appliances products, and the principles related to Thailand's 'Extended Producer Responsibility'. Quantitative data is being obtained from a proposed sample of 240 Thai environmental waste managers from electronics, electrical and appliance products manufacturers. Qualitative research is being conducted with 10 executives by the use of purposive sampling. Analysis will be conducted using Partial Least Square (PLS-Graph) software to apply Structural Equation Modeling (SEM).

Keywords: *EPR, Extended Producer Responsibility, WEEE, recycling*

Introduction

In a special report by the Bangkok Post, the headlines boldly heralded 'Thailand Government Reviews Electronic Waste Management Bill' on December 16, 2014 (Wipatayotin, 2014). In the following year on May 19th, a draft resolution entitled '*Draft Waste Electrical and Electronics Equipment (WEEE) Management Act, B.E. ....* 'was submitted to the Thai cabinet. By the end of the day the government had resolved to approve in principle the draft Waste Electrical and Electronics Equipment (WEEE) Management Act, B.E. …. as proposed by the Ministry of Natural Resources and Environment. The draft act would then be submitted to the Office of the Council of State for consideration, and later to the coordinating committee of the National Legislative Assembly before proposing to the National Legislative Assembly. Ministry of Natural Resources and Environment would then proceed with the establishment of the waste equipment information center under the Department of Pollution Control (Royal Thai Government, 2015). As can be seen, there are many involved in the regulatory process of e-waste and related consumer product recycling and destruction in Thailand.

Thailand's Department of Pollution Control (DPC) has drafted a new law to address electronic waste dumping in public landfills and recycling of hazardous waste throughout the Kingdom which includes "provision for a hazardous waste tax, recycling, and a compulsory take-back scheme where manufacturers have to take back old products when consumers turn up to buy new ones" (Thailand Lawyer Blog, 2014). The WEEE draft law would make dumping electronic or electrical equipment in a public space illegal.

The DPC has also reported that in 2013 Thailand created 368,314 tons of waste from electric and electronic equipment, up from 359,070 tons in 2012. This is consistent with e-waste growth projections which state that by 2017, the volume of discarded e-products worldwide is expected to be 33 percent higher than in 2012 and weigh the equivalent of eight Great Pyramids of Egypt. In an IISD (International Institute for Sustainable Development) conference in 2015 in the Maldives, it was stated that 41.8 million metric tons of e-waste were generated in the world in 2014, 38% of this e-waste was produced in Asia (IISD, 2015). The worldwide smartphone market is also growing 13.0% year over year and in quarter two of 2015, there were 341.5 million shipments of smartphones globally (IDC, 2015). Another report from ABI Research predicts that the market for recovering and recycling used electronics will reach $14.7 billion by 2015 (ABI Research, 2010).

As we can see the problem is massive and is not going away and international bodies, conferences and individual countries and communities are trying to tackle the global problem. An example can be found in the United Nations Environmental Programme (UNEP) through its International Environmental Technology Centre (IETC) which is focusing on WEEE/E-waste management under its waste management program.

Other experts such as Australia's Sunil Herat (IISD, 2015) highlights the business opportunities for recovering valuable materials from e-waste, and recommended a four-step approach for environmentally sound management of e-waste, including to: strengthen collection systems; understand the current financial, policy, and institutional set-up; examine policy measures implemented similar to EPR (extended producer responsibility); and incorporate expertise from an EPR panel on the technological, policy and financing aspects of e-waste management.

The Ministry of Natural Resources and Environment in Thailand, has also introduced an emerging WEEE legal framework based on the EPR principles and a national integrated WEEE management strategy in Thailand at the international Malé, Maldives IISD conference in 2015 (IISD, 2015).

Extended Producer Responsibility (EPR) is increasingly recognized worldwide as an efficient waste management policy to help improve recycling and reduce landfilling of products and materials. The basic feature of EPR is that producers assume responsibility for managing the waste generated by their products put on the market (OECD, 2014). In 2001 OECD defined EPR as "*an environmental policy approach in which a producer's responsibility for a product is extended to the post-consumer stage of a product's life cycle*".

Going back as far as 1990, one can find the origination of Thailand's present EPR strategies as articulated by Lindhqvist (2000) who first formulated the first definition of the extended producer responsibility (EPR) concept. Today, almost all OECD countries have formulated EPR policies and it is now possible to get a clearer understanding of the way the EPR principle can work under various conditions. In particular, the concept of EPR is as a policy principle to promote environmental improvements of products and product systems, and identifies possible approaches to key concerns in the implementation of EPR which builds on the preventive environmental strategies.

The current landscape of EPR in Asia varies significantly across countries and between OECD and non-OECD members. Industrialized OECD economies like Japan and the Republic of Korea have already well-established EPR schemes and regulations in place on the key waste streams, supported by a solid monitoring and enforcement framework. Some rapidly emerging economies, such as the People's Republic of China (PRC), India and Indonesia have started to develop EPR programs even though these are generally not yet fully implemented and functioning. Malaysia and Thailand are also embarking the path towards

EPR for e-waste, although these initiatives generally rely on voluntary participation of producers (OECD, 2014).

In Indonesian as in most places across Asia, there is a 2008 law on waste management but a regulation to elaborate on the law has still not been made. The law required that producers handle their own waste (like in Thailand) but in Indonesia that has been interpreted to mean only the packaging (Elyda, 2016).

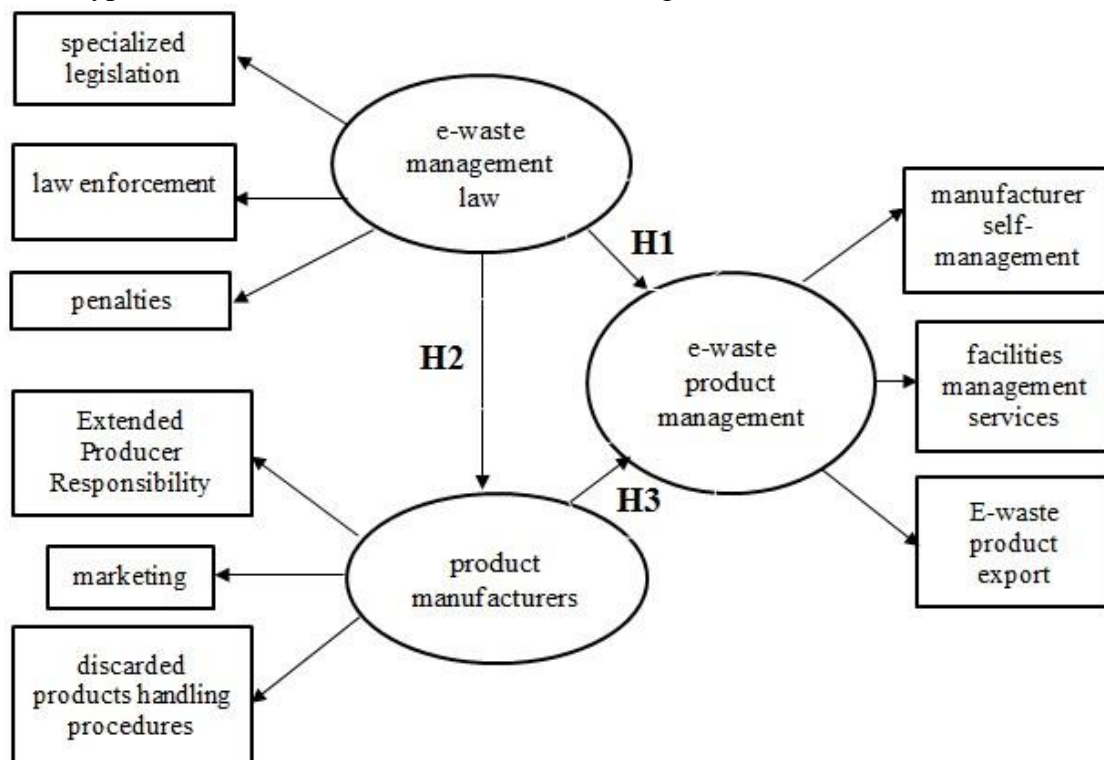
Therefore, as we have seen from the above short discussion, the need for further research and understanding of the variables surrounding the issues, policies, legislation and laws needs to be undertaken in this global problem. The researchers are thus proposing the following three research hypotheses as stated below and modeled in Figure 1:


Figure 1: **Conceptual Framework**

Proposed Research Hypotheses

H1: *Waste management law* of discarded electronic, electrical and appliance products has a direct effect on *waste product management*.

H2: *Waste management law* of discarded electronic, electrical and appliance products has a direct effect *product manufacturers*.

H3: *Product manufacturers* of discarded electronic, electrical and appliance products has a direct effect *waste product management.*

Methodology

This research aims to model the structure of the factors influencing Thailand's legislation and law affecting waste disposal of e-waste from electronics, electrical and consumer appliance products manufacturers in Thailand. Therefore, researchers have determined the following detailed steps of how to carry out the research

1. The approach used in the study

   For this study the researchers used both quantitative and qualitative research from both primary and secondary data. The researchers thus determined the following steps for this study:

a. Study of Secondary Data

The researchers are reviewing the literature related to e-waste legislation and law and the manufacturers' perspectives and policies concerning it. Thus far, research has been comprised of published research, textbooks, internet materials, media reports, and data which have been synthesized to develop a conceptual model for the variables that affect environmental management legislation, law and policies of discarded electronics, electrical, and consumer appliance manufacturers.

b. Quantitative Research Methods

Quantitative research will be performed using the primary data by collecting a questionnaire from the target sample. The questionnaire to be used to collect data is structured and written in a realistic, easy-to-understand format which is deemed to be reliable and reasonable. Further measurement and reliability validation will be undertaken as follows:

- Questionnaire review will be conducted by academic scholars to validate the investigation questions and the use of rhetoric and the simplicity and comprehension of the questions.
- During the questionnaire trial stage, questions and responses will be monitored so better clarity can be achieved. Questions will be updated as needed.
- Perform data collection and statistical analysis

c. Qualitative Research Methods

Qualitative research will involve confirming the model of the quantitative research. It is a collection of interviews with electronics, electrical and appliance industry professionals involved with the manufacture ring of these products.

d. Population and sample

The research population consists of manufacturers of electrical, electronic and consumer products in Thailand.

e. The sample size

Schumacker and Lomax (2010) stated that Structural Equation Modeling (SEM) uses a variety of models to show the relationships between observed variables with the same basic goal of providing a quantitative test of a theoretical model hypothesized by a researcher with Meldrum (2010) further stating that a sample size smaller than 100 should not be used in SEM as it is unreliable. Therefore, using a factor of 20 for each of the 12 variables from the research survey, it is anticipated that a total of 240 samples are adequate to assure a reliable sample size (Schumacker & Lomax, 2010).

To confirm the model of quantitative research, 10 in-depth interviews with those involved in environmental waste disposal management for manufacturers of electrical, electronic and consumer products in Thailand will be undertaken to confirm the model of quantitative research.

f. Tools used in the research

For this research, the measurement instrument or questionnaires utilized was prepared from the literature. A self-administered questionnaire (SAQ) is being used as it is exploratory in nature and serves as a starting point for other methodologies.

g. Quality inspection tools used in the research

Researchers will continue to monitor the quality of the instruments used in the research to be used as a measurement of quality. The entire content validity and reliability is divided into two stages.

- The questionnaire will be created by the research team, and be peer-reviewed and tested by use of the content validity of item objective congruence index (IOC) by five experts in their respective fields. The IOC for each item is the summation of scores given by the experts divided by the number of experts. This ensures the quality of the questionnaire with any IOC score less than 0.05 being eliminated.
- Checked by five experts in their fields including:

Electrical, electronic, and appliance manufacturers	3 members
Industrial appliances and electronics academic experts	2 members

Data Collection

Primary data is a collection of factors that influence environmental waste management legislation, law and policies of discarded electronics, electrical, and consumer appliance manufacturers in Thailand.

Secondary Data consists of studying the theories related to the research from various sources; including books, manuals, tutorials, articles, research papers, etc., to define the concepts and theories used in the study

1. Data analysis and statistics used

   Quantitative data analysis research will be conducted using statistical analysis as follows:

   a. Descriptive statistics including frequency, percentages, means, and standard deviations will be used to demonstrate the profiles as well as rating scores and response rate.

   b. An analysis will be conducted using structural equation modeling (SEM) to determine the relationship of the factors influencing environmental waste management legislation, law and policies of discarded electronics, electrical, and consumer appliance manufacturers in Thailand.

   Qualitative data analysis

   To confirm the results of the quantitative analysis are credible and the findings reliable, the researchers will conduct interviews with those involved in environmental waste management legislation, law and policies of discarded electronics, electrical, and consumer appliance manufacturers in Thailand. Afterwards, the researchers will proceed to interpret qualitative information including classified information. The idea that qualitative data is mainly 'unstructured' is useful, if this is taken not as a definition but rather as an imperative for analysis. Although unstructured data may not be classified, it can be classified and indeed one of the main aims of qualitative analysis is often to do just that (Dey, 1993).

Conclusion

Thailand is in urgent need of a new law to enter the new age of waste management as the amount of electronic waste entering landfills and being dumped on public land threatens public health and the environment. The world is entering a new age of waste management, which requires cooperation from everyone and if waste separation goes ahead successfully, the amount of waste can be cut by half.

Experts concur on the role of the informal e-waste recycling sector; the need for data-driven policy and resources; and the possible costing impact of EPR. It has also been noted the importance of formalizing and incorporating the informal sector into WEEE management systems to create "win-win" situations. The need for occupational safety and health training also must be accessed. It is a known fact that proper and safe e-waste management and

disposal is not an inexpensive proposition so therefore constraints must be overcome for investing in WEEE recovery and recycling facilities. In order to set up a market-based waste management system, data inventory and enabling regulations are needed while being sensitive to the cost of EPR being passed through to end-consumers. Under the concept of "product stewardship," cost increases are inevitable and all stakeholders involved in the electronics market have to become responsible.

DRIVERS OF ENTREPRENEURIAL FIRMS IN HOSTILE EMERGING MARKETS: A SURVIVAL MODEL

Nayana D.P. Dehigama, Asian Institute of Technology, Thailand
Broto Rauth Bhardwaj, Bharati Vidyapeeth University, India

Abstract

Purpose: The purpose of the study was to understand the critical success factors for survival of entrepreneurial firms in hostile markets. Market crises and hostilities challenge the sustainable business ventures and growth of entrepreneurial firms in emerging markets. Success of entrepreneurial firms is important to any nation as the entrepreneurial firms contribute significantly to the stability and well-being of the economy. The purpose of this thesis is to enlighten entrepreneurs what factors that are essential to gain business success in constantly turbulent and hostile emerging economy markets.

Methodology: The research methodology included the empirical research. We collected about 200 data from the respondents, especially entrepreneurs. We requested them to elaborate and rate the entrepreneurial challenges being faced by them during their operations in a particular country. The country in this context is Sri Lanka. This research, conducted in three parts (autobiographic study, case research and questionnaire based survey) using empirical data from entrepreneurs and entrepreneurial firms operating in Sri Lanka provided interesting findings.

Findings: The analyses suggested that in a constantly turbulent and hostile emerging market context, five factors, namely, credibility, creativity, competence, commitment, and connections/relationships (networking) significantly influence entrepreneurial firms' survival and growth in a turbulent economy or market. A model showing the influence of these factors has been proposed too. VMOG MODEL AND PPTCR MODEL would be helpful in developing sustainable enterprises.

Implications: This research also addressed a knowledge gap in the literature by investigating the contribution of factors that are critical and essential for entrepreneurial firms to survive and grow in constantly turbulent and hostile emerging economy markets. The findings offer entrepreneurs in emerging markets important insights into growth strategies for surviving and thriving in often-hostile market conditions. In addition, suggestions for further research to address the possible gaps in the findings of this research have been proposed.

Keywords: *entrepreneurial challenges, key success factors, critical success factors, emerging markets, entrepreneurship*

Introduction

Hostile market conditions make managing business organizations extremely challenging. Especially entrepreneurial start-up firms find it hard to survive in such markets because they lack resilience when facing a crisis and other hostile conditions threatening their survival. An entrepreneur is tested for extraordinary capabilities in driving forward the firm in hostile markets.

In the hostile markets where threats from crises, turbulences, and competition are manifested, sustainable business ventures of entrepreneurial firms has become a great challenge. Many new entrepreneurial firms fail to withstand the pressure generated from these uncontrollable market forces and, finally, may be forced to shut down before long. Enterprise failures cause damage to the economy and loss of credibility of new firms as well as to the entire entrepreneurial community of the country. This unhealthy environment fosters lack of trust in

the entrepreneur's ability to succeed and thus prospective investors become reluctant to invest in new firms, discouraging young entrepreneurs, as they would find it difficult to secure funds and other resources for their new firms.

Companies worldwide have realized the importance of being present and to be operating transnational. That is why many firms tend to expand globally through Mergers & Acquisitions. Furthermore a takeover could be categorized as either friendly or hostile, whereas the latter one is characterized as an acquisition of control of a target company without a contract or a mutual understanding with the management of the target firm (Savela, 1999). Furthermore, if a bid is placed for the shares of the target company without informing its board, the term hostile takeover is also applied (Damodaran, 1997) A target company which faces a hostile bid from an acquiring firm does not stand helpless. The management of the targeted firm may implement certain defense measures, such as various corporate defense strategies, which aims to make the hostile bid less profitable for the acquiring firm as well as protecting the shareholders and the management of the targeted firm. Commonly known is that there are several reactive measurements that can be implemented in the case of a hostile takeover, but one important aspect that we will also look further in to are the proactive measures that can be implemented prior to a hostile bid. The commitment to defend against future takeover attacks is important both because of preventive defenses take time to construct and because they signal that the board and the executives are united in the pursuit of the goal of the companies' independence.

Many researchers confirmed that doing business in hostile markets is not an easy task due to its higher degree of uncertainty and the crisis-rich nature (Herman, 1963; Starbuck and Hedberg, 1977; Turner, 1976; Webb, 1994; as cited in Mishra, 1996). Despite the highly unfavorable conditions for business enterprises as evident from published research, it is encouraging to see some enterprises with similar resources thrive in hostile markets while others go out of business. It is therefore worthwhile to explore the factors behind the survival and growth of new entrepreneurial firms in the face of constant market turbulences and hostilities that affects the whole nation's industries.

Literature Review

1. Characteristics of Emerging Economy Markets

   During difficult times due to hostile market conditions, firms have to face often complex rapid and unexpected changes (Doherty and Delener, 2001; Edgar and Nisbet, 1996; Black and Farias, 2000; Conner, 1998). Lawton (2011), drawing from multiple definitions of natural scientists, described a hostile environment as an environment with unstable external conditions that expose firms to high risks for investments, and making less resources available to operate while demanding more effort to run the business. Researches cite the characteristics of hostility being shortage of resources, rapid inflation, wide swings in the business cycle, changing social values and a multitude of other dynamic forces that radically alter the industry's operating environment (Ward and Lewandowska, 2005). Accordingly, hostile environments ''are characterized by precarious industry settings, intense competition, a harsh, overwhelming business climate, and a relative lack of exploitable opportunities'' (Casillas, Moreno and Barbero, 2011 as cited in Covin and Selvin, 1989). Intimidating offensive characteristics that negatively affect performance is seen to be present in hostile environments (Shin and Kleiner, 2001 as cited in Denenberg, 1999). Therefore, a hostile market can be characterized as a market with adverse, antagonistic, high risk and rapidly changing conditions that negatively affect business performance.

   Recent studies conducted on market crisis situations, its behavior and how firms respond

to turbulent situations have revealed that market hostilities create uncertainties and furthermore push firms towards crisis situations (Ansoff, 2008; Hatiramani, 2008; Harrington et al, 2005). Some scholars have attempted to describe the behavior of market turbulence in which the firms are functioning. Among them, the description of turbulence by Ansoff (2008) is worth an extra attention. There are five distinct levels of turbulences or crises where firms are operating have been described by Ansoff (2008). Repetitive Environment - a placid environment where nothing ever changes even in the free market conditions is the first level of turbulence he identifies. Expanding/Slow Incremental Environment where demand usually exceeds supply and customers' needs are basic and undifferentiated are the second level. Then, the Changing/fast Incremental Environment where customers' needs are differentiated by different buying power and preferences is the third level. Discontinuous (Predictable) environment is the fourth turbulent environment described. This environment exists in emerging markets with influx of foreign competitors, technology substitutions, rapid changes of customer needs, and governmental and social changes. The fifth environment described is the Surpriseful (Unpredictable) Environment where technology leadership plays a key success factor. In this environment, customers are receptive to new technological advancements and are willing to pay for such high technology products. In the first three environments identified, the future can be extrapolated from the past and there are only a few surprises may happen. Firm's existing strengths and successful strategies in the past are likely to remain relevant in winning business. However, in the fourth and fifth level turbulent environments, extrapolation of the past in to the future will be dangerous, as serious frequent market changes tend to happen. In such environments, historical strengths can become weaknesses and the past successful strategies will become obsolete and ineffective (Ansoff, 2008).

Analyzing the hostile and turbulence market behavior critically, James and Wooten (2008) describe five phases that depict organizational crisis situations. They are (i) Signal Detection – where the leadership is getting warning signals that something is wrong, (ii) Preparation/Prevention – where the leadership starts preparing to prevent crisis situation, (iii) Containment / Damage Control – where the leaders execute strategy to control and contain damage, (iv) Business Recovery – where leaders put long term and short term efforts to get back to usual business and (v) Learning – where leaders go through a process of acquiring, interpreting, acting on and disseminating new information throughout the firm. Understanding these phases is very much important in order to develop leadership skills to manage crisis situations successfully (James and Wooten, 2008).

A few interesting definitions for 'crisis' and detailed descriptions of 'crisis behavior' too were proposed by Mishra (1996), Marcus and Goodman (1991) and James and Wooten (2008). The state of crisis has been defined as "a major threat to system survival with a little time to respond involving an ill-structured situation where resources are inadequate to cope with the situation (Mishra, 1996). Looking at a different dimension of crisis situations, James and Wooten (2008) defined business crisis as "any emotionally charged situation that, once it becomes public, invites negative stakeholder reaction and thereby has the potential to threaten the financial well-being, reputation or survival of the firm or some portion thereof". However, few are of the opinion that although a crisis raises questions of survival for a firm, it can lead to either positive or negative organizational outcomes (Marcus, and Goodman, 1991).

Elaborating further on the definition of crisis, two primary types of crisis situations have been identified by James and Wooten (2008): sudden and smoldering. While sudden

crisis are unexpected incidents in which the firms have no control of, smoldering crisis take place due to the problems of firm's leadership. Though there is no 'one way' to curb or manage crisis situations, James and Wooten (2008) reiterated the importance of understanding what differentiate a crisis situation from an unfortunate or unfortunate business challenge. Another similar argument suggested that, during turbulence, change occurs in two dimensions: complexity and turbulence. When complexity increases, turbulence increases (Black and Farias, 2000).

Crisis has been also described in the light of market related instability such as shorter production cycles, product multiplicity and shorter planning horizons. The literature further stated that the crises could be manifested in a commercial confusion caused by global terrorism, localized conflicts, rising oil prices, and the deep rooted uncertainty in the world (Harrington et al, 2005). This definition is highly applicable to a country like Sri Lanka where the national development was hampered for over two and a half decades due to prolonged ethnic conflicts and political turmoil existed in the country.

Literature available suggested that crisis created by market hostilities does not only affect the organizational wellbeing but also to the overall economic stability and development of the country (Hatiramani, 2008). Discussing the long term effects of market turbulence on country's economy in general, researchers stressed that there could be a long-term effect on firm's growth, income and employment sustainability. Trade deficits would be widen and the Government's budgetary management would lead to a higher inflation, and increase in the interest rates while depreciating exchange rates in a turbulent situation (Hatiramani, 2008, as cited in Abeyrtatne, 2008).

2. Case methodology

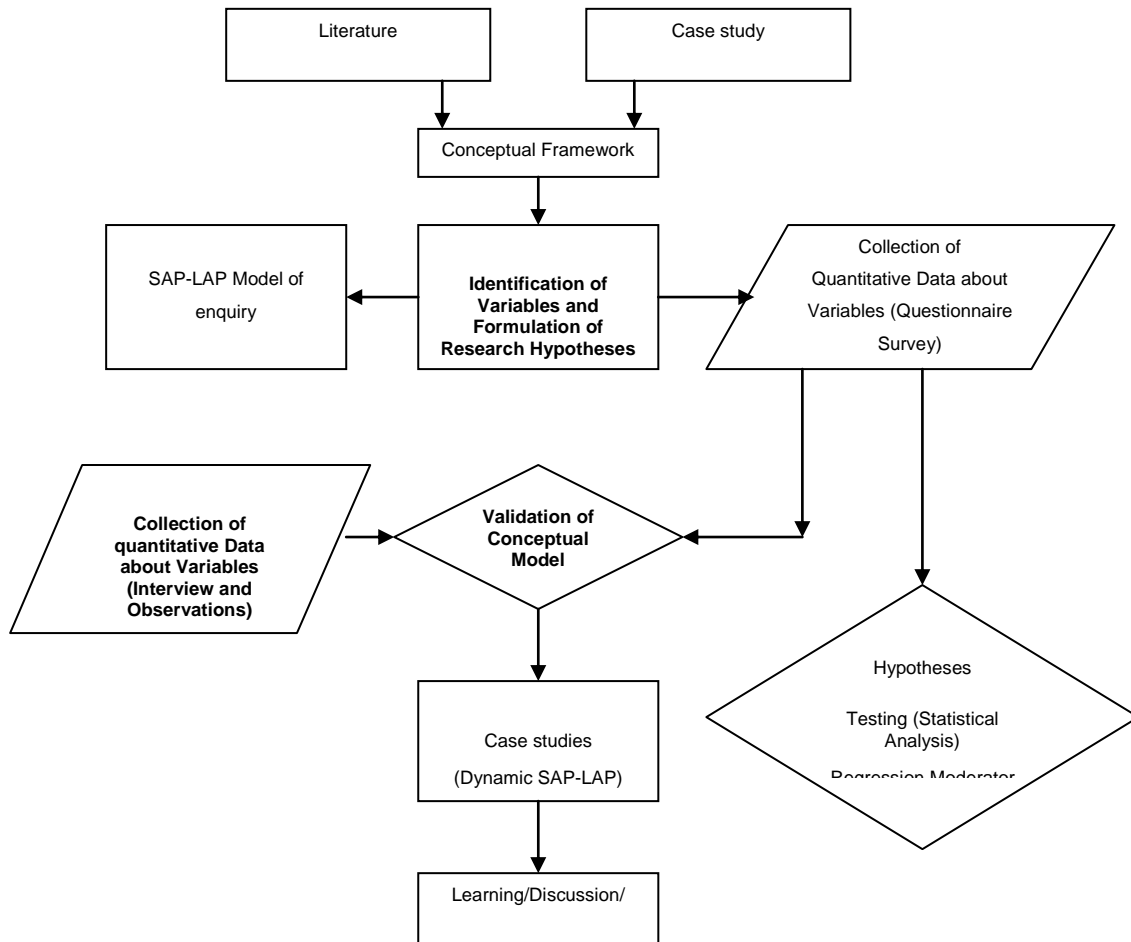
The study was undertaken through case study method (Yin, 1994). Through this method the authors have tried to develop theories based on case study analysis (Eisenhardt, 1999). The study uses SAP-LAP method (Sushil, 2000) and PPTCR model (Bhardwaj, 2016) for developing the theories and proving the drivers of survival factors in hostile markets especially for entrepreneurs. is divided into three phases: (i) the pilot study to identify the organizational antecedents of sustainable business ventures, (ii) questionnaire study to establish relationships among organizational antecedents for sustainable business ventures (iii) case studies to verify and enrich the sustainable business ventures model. The framework of research methodology is given in Figure 1. The framework shows the structural variables and internal environmental variables which help motivate the sustainable concept within the company. The framework also shows the relationship between drivers of sustainable business ventures in hostile markets which are the given characteristics undertaken in the study. The Figure 1 mentioned below describes the methodology in detail. It shows the various steps taken to do the research and also shows the how the conceptual framework was developed.


Figure 1: Framework of Research Methodology

This qualitative research primarily examined the critical factors that helped Epic to survive in a constantly turbulent and hostile market environment that prevailed in Sri Lanka during the decade of 2000. Epic Lanka (Pvt.) Ltd. is one of the most successful companies in Sri Lanka's ICT industry, and has expanded its operations in to neighboring countries. Epic Lanka has recorded continuous business growth and has successfully managed business diversification despite the hostile market conditions during the period 2000 - 2009. In the background study, special attention has been placed on two specific crises in 2000 - 2003 and 2007 – 2009, where the country experienced heightened hostilities due to local and international market turbulences. Epic Lanka recorded a significant growth during the decade amidst many market hostilities.

The findings from the Epic Lanka case (the critical factors for surviving hostilities) were then compared with eleven other cases of entrepreneurial firms that also were successful and have achieved growth during the same period. Comparative cross-case analysis helped identify a set of critical factors that were essential for entrepreneurial case firms to survive in the constantly turbulent and hostile market environment.

The founders of these case firms were interviewed to explore how their organizations have either avoided or withstood crisis situations caused by hostile market conditions in Sri Lanka during the period under review. The strategies adopted by these entrepreneurs and the underling critical factors that helped them in surviving in the hostile market conditions were also investigated. All the 12 companies considered in the sample, including Epic Lanka, have registered steady growth in their revenue and bottom-line profitability amidst hostile market conditions prevail in the country. The respondents were chosen by invitation for empirical data gathering after assessing the credentials of their organizations based on published and market information. The career-stories of these entrepreneurs have been explored through interviews in order to understand what factors have helped them to survive in the hostile markets. The exploratory case research technique used in the interviews yielded in personal, sensitive and confidential information of their entrepreneurial ventures. The genuineness of information ensured through cross-reference of the secondary data relevant to each respondent has improved the quality and reliability of the outcome of comparison and validation.

3. Case study of Sri Lanka

Sri Lanka, being a small developing economy with weak economic fundamentals and markets, has been frequently exposed to turbulence caused by both, domestic and external shocks. Socio-economic indicators reveal that Sri Lanka is generally a hostile market for doing business. The situation aggravated during the decade of 2000 mainly due to the intense civil war and the two global economic crises during the period. Many barriers for entrepreneurial investments and business growth exist in Sri Lanka. Compared to the conditions in a stable economy, Sri Lanka's risk profile is more complex and intense due to its uniqueness of the political and economic environment. This suggests that entrepreneurial start-ups are more vulnerable as they have to operate in a much more uncertain business environment and have to overcome challenges that are much greater than those of more stable and advanced economies.

In Sri Lanka, small and medium enterprises (SMEs), of which majority is entrepreneurial firms, contribute more than seventy percent to the GDP (Central Bank of Sri Lanka, 2013). This indicates the significance of the small and medium firms' contribution towards the domestic economy. It is noteworthy that over seventy five percent of the new established enterprises in Sri Lanka fail to gain momentum of growth and, therefore, ceases to exist after few years of operations. While the failures of this sort have been researched by many scholars (Stinchcombe, 1965; Singh et. al, 1986; Audretsch, 1991; Bruderl et. al., 1992; Holtz-Eakin et. al, 1994; Gimeno, et. al, 1997), it is noticed that lack of resilience in withstanding the challenge caused by market turbulence significantly contributes to business failures in Sri Lanka. Entrepreneurs' incapability to operate under hostile market conditions and to withstand external shocks apparently drives many out of business.

Sap-Lap Method Of Case Study Analysis
Situation: In Sri Lanka, new entrepreneurial firms are exposed to undue risks and threats due to the prevailing hostile market conditions. Entrepreneurs face greater challenges in sustaining their business in such a hostile market filled with many impediments external market forces and uncertainties. Furthermore, hostile markets demand entrepreneurs to adopt unique strategies in their organizations to thwart the impact of hostilities specific to Sri Lanka's economic and market conditions. One of the most commonly debated reasons for the prevailing lower success rate of entrepreneurial start-ups is its inability to survive diverse crises created by the external forces in the unstable, volatile, and hostile market conditions,

which create additional challenges to already existing constraints that every entrepreneurial start-up firm faces. Due to lack of confidence in sustainability and survival of the new firms, skilled professionals express reluctance to join young and new enterprises unless such firms are funded by or are affiliated to larger and well-established corporations. As this tends to restrict hiring the 'best-fit' human resources to young enterprises, they are left in more difficult situations to gain competitive advantage over established large organizations. Until the new enterprise establishes a strong image in the industry, young entrepreneurs face the risk of high employee turnover.

Negative image and low credibility of start-up firms also prevail among the finance institutions such as banks and finance companies due to the frequent failures of start-up enterprises. Due to uncertain sustainability of start-up enterprises in Sri Lanka, financial institutions, in order to avert risks, impose tighter conditions on loans, which include higher interest rates and provision of collaterals up to over 200 percent of the loan. Borrowing from banks has become extremely difficult and application procedures have become very rigid for young entrepreneurs because of the negative image created by frequent business failures.

Actors: It is evident that Sri Lankan entrepreneurs operate in markets characterized by frequent economic and political crises. In this macro environment, understanding the most critical factors that help new entrepreneurial firms to survive is of great importance to entrepreneurs as well as to policy makers. However, the entrepreneurship literature indicates a lack of studies in this regard. This necessitates further research on critical resources and practices that contribute towards the success of entrepreneurs starting new business enterprise in emerging markets. Thus, exploring and understanding the most critical factors that influences entrepreneurial firms' performance and survival will not only benefit entrepreneurs to drive their firms to success amidst hostile market conditions, but also will address a research knowledge gap with regards to influence in the context of different market environments.

Survival and growth of entrepreneurial firms will provide many other benefits too. While establishing a stable local economy, market expansion beyond local boundaries that brings in foreign exchange by way of exports and preventing foreign exchange repatriation through import substitution by manufacturing imported goods locally are key benefits entrepreneurial firms offer. In addition, technology transfer and knowledge assimilation by developing relationships with international industry leaders, engaging in research and development for continuous improvement, innovations, uplifting social and living standards, employment generation, rural economy development and inclusion by bridging rural and urban economies, etc. are also important benefits that could be reaped from sustainable entrepreneurial firms. Therefore, the findings of this research will directly benefit to individual firms for its survival and growth, and to the Governments for developing a stronger national economy, while they will indirectly contribute in improving international relations, knowledge assimilation and transfer, social welfare, etc.

Process of Entrepreneurial Survival In Hostile Markets
Though most of the evidence exist suggests that hostile and turbulent market situations lead to uncertainties for businesses survival (Mishra, 1996) some researchers have described 'crisis' as an 'opportunity' too for innovative entrepreneurs, as crisis situations tend to create pockets of new opportunities for them to grab (Marcus, et al, 1991; James and Wooten, 2008,). A few others too have expressed similar ideas. One research paper quotes that "A crisis is an opportunity riding on a dangerous wind" - the phrase derived from Chinese word for crisis "we iji" which has two ideograms "danger and opportunity". According to the authors, there are two certainties in this chaotic world the businesses are operating in; the rapid change triggers crisis and crisis brings uncertainty and more change. Also, crises can provide

managers opportunities too to learn and change for good amidst threatening repercussions for organizational survival (Mishra, 1996, et. al).

Learnings
The country's GDP growth slowed down to an average of 3.5 percent during the decade of 2000 (Bureau of South and Central Asian Affairs, 2011). Industries suffered due to the credit crunch created in the country as a result of tough policies imposed by the Central Bank. The prime lending rates and bank interest rates reached all-time high figures of 25 to 28 percent, which were rated the highest in the region. Borrowing became almost impossible for industries. The net export of goods and services reported at minus 13.7 percent aggravating the burden on foreign exchange reserves. The trade balance (exports-imports) was recorded at US$ 6 billion. Bad debts in the country during the period accumulated to a staggering amount exceeding Rs. 170 billion, which is almost 5.3 percent of the national average GDP of the decade (Central Bank of Sri Lanka, 2011). Indicating signs of industrial instability, the proportion of non-performing loans was as high as 50 percent of the total loans granted by the banking industry (Daily Mirror, 12 May, 2012). The period prior to 2009 was seen highly hostile for business in Sri Lanka.
On May 19, 2009 the Government of Sri Lanka eradicated terrorism in the country with the end of the long drawn out war. Soon after the victory celebrations, the President of Sri Lanka announced that the country would embark on a new era of economic development. In the years since 2009, the Sri Lankan economy became somewhat stable. Foreign reserves came back to a comfortable footing with an all-time high figure of US$ 8.5 billion, sufficient to support six months of imports and easing the pressure on the current account and the balance of payments (Ceylon Today, 2014). GDP growth increased to seven percent in the post-war period and is estimated to exceed 8 percent in 2015 and beyond. Poverty rates have fallen from 22.7 percent in 2002 to 6.5 percent expected in 2012. As Sri Lanka's economy became strong enough to borrow from international capital markets on its own rather than seeking external assistance from IMF, the new Government started borrowing at commercial rates, which pushing the country into unhealthy debt burdens as the government launched many infrastructure development projects. Critics alleged growing corruption in the guise of development. This situation created political and administrative instability within the country depriving the opportunity of becoming a strong regional economic hub.

Actions
The contribution of entrepreneurs to the economic development is of profound importance to any nation as entrepreneurship fuels the development of the economy by exploitative of opportunities of production and commerce, especially with the onset of globalization. In development economics theory, it is argued that countries that endow effective entrepreneurs in abundance have attained development while effective entrepreneurship is essential for underdeveloped nations to attain development (Desai, 2009; Powel, 2007; Strom, 2011). The economic importance of an entrepreneur can be explained through the fact that the entrepreneur produces goods and services that are essential for life, engages in invention and innovation, creates factor income, contributes to industrialization, generates surplus in the economy, pays taxes to the government and engages in capital market. Thus one could argue that the economic development of a nation is both directly and indirectly attributable to entrepreneurship. Through organizing the factors of production and engaging in innovations that are essential for the society, entrepreneurs play a vital role contributing directly to the enhancement of the gross domestic product (GDP).

Performance

Creating and maintaining a loyal customer base is another strategy for survival during turbulent times as suggested by some of researchers (Ruiz et al, 2008; Mishra, 1996; Abimbola, 2001; Yao, 1997). Companies that recognize the strategic relevance for maintaining a solid base of loyal customers in order to survive grow and financially perform in these competitive markets (Ruiz et al, 2008). Delivering higher customer value has become a key strategy in achieving customer loyalty (Ruiz et al, 2008).

Contrary to the arguments based on consolidation as a strategy, Edgar and Nisbet (1996) states that traditional methods of management techniques such as strategic planning and scenario planning have little impact in coping with the speed, volume and unpredictability of today's hostile markets. Therefore finding new ways of coping with such rapid changes and complexities are essential for firms to survive. In concluding their research, Edgar and Nisbet (1996) present very interesting tactics for firms to be successful in turbulent markets; (i) placing emphasis on new market development, and prepare to aggressively disrupt the market, (ii) leading in adopting market strategy – changing faster than the market does, (iii) aggressive, quick and flexible product management and (iv) aggressive pricing in order to win specific strategic customers (Mason and Staude, 2007 as cited in Edgar & Nisbet, 1996).

Conclusion

Lack of Vision. Lack of vision too was found to be another critical factor for the failures. None of the failed ventures were started with a solid and clear vision. The author had no clear 'dream' of what he wanted to achieve or where he wanted to be in a few years of time. It was revealed that the author has not spent much time in envisaging on, visioning and planning the business. Though he was highly ambitious on the venture, he did not have a clear vision on how to achieve the goals. Every action or decision he took was reactive rather than proactive in most cases. Instead of having long term goals and objectives based on a strong vision, he only had short term objectives looking only a few months ahead with no guidance from a strong vision.

Lack of Passion, Commitment and Focus. Lack of passion, commitment and focus on the core business was appeared to be another factor for failure in most of the failed ventures. The author commenced all his failed entrepreneurial ventures not because he had passion for the core business or domain, but merely for the reason that he would need to commence an entrepreneurial venture to fulfill eager to become an entrepreneur. He has chosen the business domain (or the industry) merely because of influence from outsiders but not for the passion he had on the business/industry, thus the author had minimum commitment and focus on the core-business initiated. Further, it was found that in all the failed attempts, he has not capitalized on the strengths and core-competencies he possessed therefore the companies he founded have failed to gain competitive advantage in the market. As they could not face the competition and market forces successfully, the entrepreneurial ventures could not survive in the hostile market environment. Therefore, using PPTCR model (People, process, technology, culture and resources model) entrepreneurs world over can develop and sustain competitive advantage. Also using VMOG Model (Vision, mission, objective and goals model) entrepreneurs can develop strategic directions for the outcomes and sustainability of the enterprises.

STRATEGIC MANAGEMENT OF SMART CITIES IN THE UAE: PERCEPTIONS OF PRIVATE SECTOR EXECUTIVES

Syed Aziz Anwar, Hamdan Bin Mohammed Smart University, United Arab Emirates
Fahad Al Saadi, Hamdan Bin Mohammed Smart University, United Arab Emirates
Huda Fuad, Hamdan Bin Mohammed Smart University, United Arab Emirates

Abstract
Recent years have witnessed a rising tide of interest in smart cities all over the world. A smart city can be described as an urban area developed to create a sustainable development in all aspects. As smart technologies have emerged with astonishing speed, UAE has taken a strategic decision to transform itself into a smart nation in order to make use of these technologies in all walks of life and compete effectively on the international stage. It would be interesting to examine and analyses how this transformation happens in the UAE through strategic management. Indeed, private sector has a critical role in this transformation process. This study argues that the transformation of the UAE into a smart nation would depend, to a large extent, on the effectiveness of strategic management in both public and private sectors.

Keywords: *smart cities, urban sustainability, strategic management, private sector executives, ICT.*

Introduction
A smart city is described as an urban area where sustainable development in the cultural, social and economic arenas of life is managed to produce excellent performance in a number of specific sectors. These sectors include transport and communications, environment, quality of life, economy, and governance in general. This situation is only achievable through social, financial and human resources, as well as good infrastructure for communications (Jung, 2013).
The world's population will have grown from its 2012 level of 7 billion to over 9 billion in the year 2050. Almost three-quarters of the population is likely to live in urban areas. As more and more people continue to come to cities and the population numbers of cities keep increasing, different types and sizes of cities around the world keep springing up. Cities and towns continue to grow and so do the social and economic aspects of the lives of people. Surely, ICT is one of the factors that have been seen to successfully steer normal cities into smart ones.
Buoyant infrastructure and ICT development are essential in the management of projects meant for the improvement and successful socioeconomic development of cities. The challenges facing cities include increasing population, environmental complications, financial constraints and other challenges. ICT infrastructure is essential for ensuring these challenges do not hinder the development of these cities.

Problem Statement
In the recent past, smart technologies have continued to emerge at an alarming rate. These technologies have great implications for socio-economic development. In other words, if these technologies are not integrated into the entire process of socio-economic change, it would not be possible for cities in the UAE to achieve the avowed objectives of international competitiveness and sustainable development. Therefore, UAE has made a decision to strategically to transform itself into a smart nation so as to be able to use and utilize the

technologies that have continued to develop. The technologies that have already been invented, those that are being developed in real time, and those that will develop in future are being considered by decision makers in the UAE.

Against the backdrop of the UAE's quest to transform itself into a smart nation, this study poses the following research questions.

Research Questions

To what extent does a strategic decision of the Government to transform the UAE into a smart nation have an impact on the strategies of private sector organizations?

This overarching empirical question leads to the following sub-questions.

Research Sub-questions

1. What are the key strategic challenges facing decision makers in the private sector?
2. What are the socio-economic consequences of smart cities?
3. What policies and strategies are going to sustain smart cities?

These research questions pave the way for empirically testable hypotheses as follows.

Hypotheses

   H1: The private sector exhibits weaker levels of smart city dimensions in the UAE.
   H2: Smart cities are invaluable for socio-economic transformation.
   H3:The private sector strategies are enablers of smart cities project in the UAE.

In the light of the research questions and the hypotheses posed above, the main objectives of this research study are as follows.

Objectives

- To demonstrate (through an empirical research exercise) how strategic management is an essential tool in the transformation of any city into a smart city;
- To capture the perceptions of private sector executives about strategic management of the smart cities project in the UAE, and
- To analyze implications of perceptions of private sector executives for managerial decisions.

Significance of Study

The importance of this study is that it can help identify how strategic management can be used to improve the socioeconomic factors of different cities and countries, and even turn the developed cities into smart cities as well. The study will have very appealing implications and lessons on strategic management for improvement of other cities around the world.

The smart city developed using strategic management will provide its citizens with an improved quality of life. It would also encourage business activities and create a well-planned environment for suitable living (Shaban, 2015).

This study anchored in the theoretical framework of strategic management is likely to have implications for policy and literature. It seeks to bridge the gaps in existing literature pertaining to strategic management of smart cities. In a case where the all-inclusive framework of strategic management is non-existent, or has not yet been established, it might be quite challenging for the city to achieve its goals.

Literature Review

Recent years have witnessed a proliferation of studies focusing on smart cities. The main objective of this section is to review literature relating to smart cities to gain conceptual, theoretical and empirical insights, and to identify gaps that this study seeks to fill.

In extant literature, Sanchez L. et al (2011) highlights a new paradigm for smart cities where strategic management of rapid urbanization is vital. Cities are required to increase the efficiency of the infrastructure and other services. Hence, there is a need for taking a step in the direction of change for integrating the management and operations of the infrastructure.

The quality of life experienced by the residents is influenced by the level of smartness of different services. A greater level of this smartness is achieved by smart technology. A smart city transformation is a continuous step to promote advancement. For instance, Dubai has embarked on E-government and developed into an operational smart government. This is a solid base from which a smart Dubai could be achieved. The Dubai government portal was launched and further e-commerce procedures and e-transactions in the city were made possible. In less than a year, innovative possibilities were achieved including the e4all, e-job, e-library, Dubai. (Al-Hader et al., 2009). The UAE's development boom is due to the high ambitions and diverse opportunities.

Washburn, D. et.al (2009) state that smart cities bring up new services and practices which greatly affect policy, coexisting with the urban facilities. A smart city's contribution in the entire urban planning ought to be recognized. As reflected in UAE's development, both urban and regional planning testify to the government's strong support for smart technologies. This study further presents the coexistence of urban space and smart city for mutual benefits.

The smart city concept expounded by Rodzi, (2009) focuses on the smart city infrastructure and reveals that developing a city's infrastructure is an important step in the context of a smart city. The study suggests that the implementation of the system of Enterprise Resource Planning is a basis of creating a smart concept in the city.

Gil-Castineira (2011) observes that the development of the government websites has been a significant enabler of the smart city by establishing customer websites. Anthopoulos, L. et al. (2012) studies the smart value created in the public sector.

Lee (2013) discusses how Dubai has moved closer to being a smart city and states the strategic moves Dubai is making to become a smart city. Harrison, (2011) provides a guide to smart cities' development and explains that providing the relevant solutions to private sector's e-service problems is a strategic step in the development of a smart city. This is because business processes define the ability to provide quality services to customers. The processes influence service delivery, performance and the available administrative support. It is important to outline a framework that improves the existing business processes, thus supporting and developing the e-services. The process model includes some pre-conditions, guidelines, directives and templates. Harrison (2011) emphasizes that it is necessary for the ICT architectures to act as a reference guide for the smart cities. Citizens are required to receive proper e-services that are delivered by an automated business process of an organization and are supported by the information technologies. The UAE has created customer contact centers by promoting businesses that are customer-driven.

Perera, (2014) studies the telecommunication technologies in the UAE. The study argues that Dubai has become a smart city due to the advanced internet access. The Dubai District Design has liaised with du, the official WIFI provider, to offer WIFI services in the d3 region. The existence of the WIFI at d3 is one of the vital steps Dubai has taken that has enabled full access of the internet thus paving a way for a smart city. Citizens are able to access essential government services and information. The robust infrastructure is the basis for development

in every industry (Perera, 2014). Lombardi, (2011) describes Dubai as an innovative smart city that has created specialized skills in various areas of smart city including security, energy, water, environment and communication.

It is thus clear that literature contains a wide range of studies focusing on smart cities and their implications. Certainly, the smart city projects in the UAE appear to be in line with best practice. However, the literature has hardly addressed strategic management dimensions in interaction with private sector decision making processes. This study seeks to fill this gap in the existing literature.

Research Methodology

The study was done in the UAE as policy makers here have been making unfailing efforts to transform it into a smart nation. It was anchored in the strategic management framework (Townsend, 2013).

1. Questionnaire Development

   Following a review of studies relating to questionnaire constructs (Shimp and Sharma, 1987) and in the light of the research questions posed in this study, a questionnaire was developed to capture the perceptions of private sector executives. The questionnaire had 27 items in both sections of the questionnaire. The target population of this study included all private sector executives placed in Dubai, Abu Dhabi, Ajman and Sharjah. Because of difficulties in obtaining probabilistic samples, a convenience sampling technique was used. College students were engaged to collect data. The efforts resulted in obtaining 207 usable responses.

2. *Cronbach's Alpha for Reliability*

   SPSS was used to test the internal consistency of the items in the questionnaire. Cronbach's alpha is a measure of internal consistency. It shows how closely related a set of items are as a group. It is considered to be a measure of scale reliability. The literature suggests that the acceptable values of alpha range from 0.70 to 0.95. The Cronbach's alpha was 0.821 for first section of the variables while it was 0.815 for the second section of the questionnaire.

   Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy was 0.823 for the first section of the study and it was 0.736 for the second section of the variables. Similarly, Bartlett's Test of Sphericity, another indication of strength of the relationship among the variables was found highly significant at 0.000 for both the sections.

Results

The demographic information presented in Table 1 indicates that 70.5 percent of the respondents were male and the remaining 29.5 percent of the respondents were female. The expatriates who responded to the questionnaires were 79.7 percent of the respondents. The maximum responses (55.1%) came from Dubai. The descriptive statistics relating to section 1 is presented in Table 2. The correlations pertaining to section 1 are presented in Table 3.

For the purpose of analyzing data, Principal Component Analysis was applied. Retaining only those variables which had Eigen value more than 1 a total of seven factors emerged from the analysis. These factors put together explained 71.8 percent of total variance (Table 4). After removing the factor loading with less than 0.50, data are presented in Table 5 with the communalities. Tables 6 through 9 present data pertaining to the challenges facing private sector executives in the context of strategic management of smart cities in the UAE.

Table 1: Background information about the respondents

	Percentage
Gender	
Male	70.5
Female	29.5
Nationality	
Emirati	20.3
Expatriates	79.7
Location of the Organization	
Abu Dhabi	27.1
Dubai	55.1
Sharjah	12.6
Ajman	5.3
Total number of respondents	207

Table 2: Relevance and Importance

		Mean	S.D.
	Strategic Planning		
a1	The Smart Cities Project has influenced the vision and mission of my organization	2.71	1.196
a2	The Smart Cities Project has been embedded into the strategic plan of my organization	2.80	1.198
a3	Top management supports smart organization	3.84	1.042
a4	My organization has a shared vision of smart organization	2.71	1.196
a5	Our organization has a central co-ordinator for smart projects	2.68	1.213
a6	Our organization has specific smart goals and objectives	2.76	1.261
	Smart MIS		
a7	Our organization has participated in research relating to smart organizations	3.38	1.263
a8	We collect data on a regular basis	3.48	1.350
a9	We share data on smart systems with our employees	3.22	1.218
a10	We periodically circulate documents relating to smart city projects	2.58	1.235
a11	We regularly disseminate results stemming from smart projects	2.64	1.181
	Smart Performance Indicators		
a12	Our organization has designed smart performance indicators	3.21	1.231
a13	Our organization rewards employees with smart skills	3.35	1.205
a14	Our organization promotes personnel with smart skills to managerial positions	3.92	.997
a15	Smart KPIs exist at all levels of the organization	3.31	1.247
	Competitiveness		
a16	Our organization has enhanced its competitiveness within the UAE due to emphasis on smart processes	4.09	.917
a17	Our organization has enhanced its international competitiveness due to emphasis on smart processes	3.82	.983
a18	Our organization has enhanced its connectivity due to emphasis on	3.93	.973

	smart processes		
a19	Our organization has carved smart brand equity.	3.27	1.129
	Smart Human Capital Development		
a20	We spend considerable budget on smart human capital training and development	3.45	1.104
a21	Our workforce is committed to implementing smart projects	3.72	1.091
a22	Emiratization has got a boost due to smart project	3.67	1.042
a23	We send our employees to smart cities overseas to learn smart best practice	2.90	1.315
	Sustainability		
a24	We design long-term plans	4.05	.787
a25	Smart organizations are invaluable for long-term sustainable development of our country	4.03	.803
a26	We have succession planning in our organization	3.87	.900
a27	We look after vulnerable employees while implementing smart plans	3.44	1.168

Discussion

The hypotheses were validated through the responses, thus suggesting that the government sector is ahead of the private sector in implementing the smart city projects in the UAE. The private sector executives generally appreciated the importance of using strategic

management framework to translate vision, mission, goals and objectives of the smart city project into reality.

There is virtual unanimity in existing literature about the benefits stemming from smart cities. The visionary leadership of UAE realized that the time was ripe for transforming the country into a smart nation to enable it to become more efficient and competitive on the world stage. It is well-known that UAE is an open country. It must be innovative to stay ahead of competitors. Its smart city project is a pioneering project in the Arab World.

The unveiling of smart city project in the UAE has certainly opened up avenues for research. For instance, it would be useful to attempt a coherent definition including all the elements of a smart city. It would be interesting to explore various dimensions of smart city.

The responses to the structured questionnaire and qualitative interviews conclusively suggest that an all-encompassing strategic management framework is quite valuable for successfully implementing the smart city project across public and private sector organizations in the UAE.

This study found support of a cross-section of respondents for the smart city project in the UAE. This is a healthy sign for sustaining the project. Often discussed but rarely empirically substantiated is the strategic management framework for the smart city project in the UAE. Our review of literature suggests that this is the first study on a smart city project anchored in the strategic management framework. The message of this study is loud and clear. Smart cities project in the UAE must include all sectors and sections of society. And, there must be neat integration of ICTs into all aspects of social and economic life in the country to enhance connectivity and convenience.

A review of literature points out that the term, smart city is used to highlight a city's ability to respond as quickly as possible to the needs of the people. The needs of the people include quality of life and welfare. Of course, the core ecosystem of a world-class cities such as Abu Dhabi and Dubai includes transport, government services, education, public safety and healthcare. They must become smart.

The conclusions of this study have managerial implications. Most interestingly, government policy makers and corporate executives can of course co-ordinate their efforts and strategies for the common cause of implementing the smart cities project in the UAE. It is certainly a win-win project for both the sectors.

AN EXAMINATION ON THE SUCCESS OF BILINGUAL SCIENCE TEACHING BY REFERRING TO ITS CONTEXT AT JUNIOR SECONDARY LEVEL IN SRI LANKA

S. J. Jayaweera, Ministry of Education, St. Paul's Girls School, Sri Lanka
A.A. J. Fernando. Department of Accounting, University of Sri Jayewardenepura, Sri Lanka

Abstract

Bilingual Education Policy was introduced in Sri Lanka in 2002 with selected subjects including science. There are serious concerns as to whether intended benefits are being achieved specially in terms of students' performance. This study attempts to examine reasons of introducing bilingual education in science subject and to examine the impact of this change on the teaching learning process, manipulative skills, thinking skills and attitudes.

Data is collected through a survey from five leading schools in the category of 1AB in Colombo. Accordingly, 150 students, 36 teachers of grades 7 and 8 in Bilingual classes and principals of are selected and interviewed. In addition, direct observations are also made on teaching learning process. Qualitative methods and descriptive statistics are used to analyse data.

Study finds that the bilingual program is not successful and major reasons include the use of poor policy framework, nonexistence of proper plans for pre-service or in-service teacher training programs in parallel to introduction of bilingual education, lack of teacher confidence, carrying out of poor and less number of practical sessions. English language competencies of students are also found to be poor. Further, the study reveals that the available training centers and resources are not effectively used thus stressing the need for taking initiatives to streamline training programs. All in all the findings urge policy makers and stakeholders of education system to revisit the bilingual education program in order bring the intended benefits and to enhance the quality of education in Sri Lanka.

KeyWords: *Bilingual Education, Teaching Learning Process, Science, Quality of Education, Education Policy*

Introduction

English medium education was introduced to Sri Lanka during the British Rule but it was changed when famouns Kannagara Reforms that were implemented in 1945. Subsequent changes in political environment of the country in 1956 accelerated in implementing Sinhala as the medium of instruction in parallel to the change of the official language policy.

Throughout the history of public schooling, general profile of education is being argued. Among them the popular idea is that the education system should produce employable citizens. However, many critics argue that education should create someone who is equipped with adequate knowledge, competencies and skills and disciplined with principles and ethics that harmonize with social values. Therefore, the objective should be much more than simply molding students into future workers or citizens. Including pioneers such as Maria Montessori and Rudolf Steiner, among others, all insisted that education should be understood as the art of cultivating the moral, emotional, physical, psychological and spiritual dimensions of developing a child. Science is a very live and practical based environmental related subject which can help achieving above skills to some extent as the core of science follows the basic rationale and nature.

On the other hand, English helps students to improve their communication skills effectively as that is now being widely used. As a result of prolong discussions and suggestions; Bilingual Education Policy was introduced in Sri Lanka in 2002 with selected subjects to be taught in the English medium. However, the situation was more challenging when science subject was introduced mainly due to complexity of the content of the subject and inadequacy of training.   Performance level in science subject is poor even in Sinhala medium and teaching science by existing Sinhala Medium teacher with less training further brought the performance level down. On the other hand students too started facing problems after starting learning science in English medium and this situation should not be ignored without having a proper examination. Therefore, the study raises the following questions with a view to explore the real courses for this from a policy making perspective.

- What were the real reasons for changing the medium of instruction to English?
- What is the impact of the change in the medium of instruction science subject on learning – teaching process and performance
- Whether teaching in English medium improves manipulative skills, thinking skills and attitude

Primary data was collected from 150 students in grade 7 and 8 English medium classes from five leading 1AB schools in Colombo. 1AB School is a one which offers advanced level subjects in all three streams namely Science, Commerce and Arts. Further, 30 teachers who teach science in English medium, 6 class teachers of English medium classes, and five principals of the selected schools were interviewed thus expanding the sample to represent wider perspective. In addition, direct observations were made at all the selected schools.

Both qualitative approach and quantitative techniques were used to assess performance and achievements of English medium students. For data collection purposes at the interviews, structured questionnaire was used. Qualitative methods and descriptive statistics were used to analyse data. Accordingly, the study describes the socio-historical background of English medium education in Sri Lanka, rationale of the study, research methodology, and bilingual education programme in Sri Lanka, teaching-learning process of science at present today, definitions of terms and delimitations of the study.

There are nearly two hundred and fifty thousand candidates of Government Schools face the G.C.E (Ordinary Level) examination, while 10,000 candidates sit the English medium science question paper (according to the Evaluation Report issued by the Sri Lanka examination Department (2009 and 2011), science is a compulsory subject for all students in the curriculum. Therefore from grade 6 – 11 all the students learn science in the class room learning – teaching process in schools. Text book designers and curriculum designers dealing with English medium education should be governed by the theories relating to content based instructions and the objectives of English medium Science education as stated in the National Education Commission (1997).

Literature Review

Theoretical bases formed for science – learning – teaching process for students who are compelled to change their medium were referred along with related researches and further analyzed by referring to Sri Lankan context.

Colonial education policy with a particular reference to the British Education policy in its former colonies exposes one to the attitude of the colonial master to their subjects in the field of education. This is particularly significant because such a discussion traces the circumstances that led to the establishment of English as medium of instruction in education against the local languages (even where such languages could be used in education) in the former British Colonies. Accordingly, the findings from literature was used to investigate, briefly, the factors that hinder the reintroduction and thereby the development of local

languages in education in countries that were subjected to British rule. After this an overview of the causes that led to the temporary relegation of English during the middle of the past century and its subsequent revival afterwards are explored. This is followed by a quick look back on the advent of English in Sri Lanka and its place in science education at present. A presentation of this nature helps to understand the causes that made people, especially, in the countries formerly ruled by Britain, consider English as the superior and the most used language. For certain studies beyond a certain stage in education, it also helps one to critically examine elements that impede more use of local languages in education. It also creates a platform for one to get a good grasp of the percentage of people in a given context that can have access to education in English versus local languages. Furthermore, a presentation of this nature enables one to examine significant questions related to debates on "development" especially in the Sri Lankan context after the instruction of local languages to teach science subjects in the secondary education circle. In order to get a better understanding of the different concept regarding this topic, literature review was grouped into following areas.

- Kannagara Report
- A brief historical overview of Science Education in Sri Lanka
- Nature of Science Education
- The importance of Science Education
- Education Reforms in 2007
- Bilingual Education programme in Sri Lanka
- Second Language Acquisition

Objectives Of The Study
Study tries to achieve following two objectives.
1. To examine the performance level of students in science at secondary level education
2. To examine the bilingual education has been able to improve thinking skills manipulative skills and attitudes of student as planned

Research Methodology
The researcher has already paid direct attention to the methods used in science teaching – learning process in the English medium at junior Secondary Education. Furthermore, it examines the emphasis paid to develop thinking and manipulative skills of students in their learning – teaching process in the class room. Introducing science subject in the medium of English is very needy action and wise decision the government has taken in relation to make an active global citizen. Private sector complains the government sector that school leavers are not trainable, and not employable. Moreover, they are unable to communicate with the modern world as lack of competency of English language. They do not have ability to manage four language skills of English and usage of modern technology. Implementation of English medium science to the curriculum helps to solve the above mentioned issues to some extent. Although, English Medium education promotes competency of using English language of students, it is questionable whether manipulative skills and thinking skills in science are promoted or not. The researcher has already researched the above mentioned issues that should be addressed immediately for the betterment of science English medium learning – teaching process in schools, in relation to produce an active global citizen Qualitative approach and quantitative techniques were used to assess performances and achievements of English medium students. Primary data was gathered through direct observations of learning teaching process, interviews with teachers and students of English medium Science, principals and questionnaires to students of English medium and Teachers

of English medium Science. For the analysis of data qualitative methods and simple statistical methods were used where necessary. Sample of the study consists of 5 – 1AB Colombo schools which conduct Bilingual Education process in Colombo because it has the highest educational performance and also the most sophisticated facilities for learning and teaching process. Accordingly, following constitutes are given as the components of the sample.

- Schools in the Colombo Zone
- Sample schools is limited to 5
- 5 – 1AB Schools.
- Sample number of English medium science teachers is 30
- Sample number of English medium students is 150
- Interview with 2 principals.
- Interview (structured) with 6 English medium science teachers
- Interview with 5 English medium class teachers
- Structured interview with 15 English medium students.

Data Analysis And Discussion

Obtained data at the study were analyzed by using different methods to realize the objectives of the study. This analysis was meant to understand the impact on manipulative skills, thinking skills and attitudes towards science English medium learning - teaching process. Class room observations helped to study the impact of the English medium instructions in the science learning and teaching process. Furthermore, it helped to investigate how the teachers used different methodologies and how teachers used student centered, competency based activity oriented science – learning – teaching process. Findings of interviews and lesson observations were discussed in detail in chapter 4 and significant cross check for the questionnaires were reported accordingly. It was found that there were no proper planed pre-service or in-service English medium science teacher training programs scheduled by the government to conduct the program effectively. The lack of teacher confidence in teaching science in the medium of English and very less practical sessions used in learning - teaching process of science are the major problems identified. Furthermore, lack of English Language skills and lack of manipulative skills in English medium students are other main drawbacks. There are printing mistakes, unclear subject matters in English medium science text books. The text books have to be enriched with colorful illustrations and clear printings. Other major issues recognized are there is no specific framework of bilingual policy and lack of monitoring mechanism in English medium science education at junior secondary level in Sri Lanka. English medium science education in Sri Lanka should be equipped with an on-going and fast evaluation program to have a better future.

The course components of teacher training programs of science teacher trainees at Collage of Education, teacher training center and other relevant training institutions should address all aspects of the science learning – teaching process. Teachers of English medium science, teaching at junior secondary level should be equipped with language competencies and professional skills that are necessary for students, being an active global citizen. In teacher – training programs, special attention should go to attitudinal change of English medium science teachers to promote to grab the maximum use of science laboratories in their learning – teaching process. Furthermore, promoting teachers to use more individual activities with group work is very important in their training programs. Although, the selected schools are well equipped, negative issues related to English medium learning teaching process can be seen.

Conclusion

English medium science education in Sri Lanka should be equipped with an on-going and post evaluation program to have a better future.

The course components of teacher training programs of science teachers trainees at College of Education, teacher training centers, and other relevant training institutions should address all aspects of science learning – teaching process. Teachers of English medium science teaching at Junior Secondary level should be equipped with language competencies and professional skills that are necessary to be an active global citizen. Lack of teacher confidence is one of the major problems identified

In teacher – training programs, special attention should go to attitudinal change of English medium science teachers to promote them to have the maximum use of science laboratories in their learning – teaching process. Furthermore, promoting teacher to use more individual activities with the group work is very important in their training programs.

Text book designers and curriculum designers dealing with English medium education have been governed by theories relating to content based instructions and the objectives of English Medium science Education as stated in the National Education Commission (1997).

Learning instructions can be both in L1 or L2. The language of instructions is also an important aspect in providing clear instructions; (According to the response from students for students' questionnaire)

As mentioned in the literature, the beginning level of English medium students do not have the English language (L2) proficiency in understanding the explanations in English. Therefore, it is advisable to use native English language for strategy instructions.

Another major issue recognized is there was no specific framework of bilingual policy stake holders. They were not aware of the policy. Lack of monitoring mechanism is another significant finding obtained at the interviews with teachers and principals. In any pioneering exercise, monitoring mechanism is inevitable. If the English medium students are proficient enough to understand the explanations, teachers should use L2 only. In most of the schools in Sri Lanka the teachers and students can use mother language in an excellent manner. Therefore, using a combination of both native and target language (English) is very fruitful. It will help English medium students to perform the expected standards. It was proved in this research, researcher provided instructions in both languages.

The above factors should be taken into consideration in order to make the English medium programme at junior secondary level successful in future in Sri Lanka.

EXCESS CASH HOLDINGS AS AN INDICATOR OF AGENCY PROBLEMS

Ernie Hendrawaty, The University of Lampung, Indonesia.

Abstract
The research objective is to examine the implication of excess cash holdings on firm value based on agency theory. This research uses a sample of Indonesian non-financial public firms for the period 2000-2011 whose cash holdings exceed normal cash holdings. By applying panel regression techniques to estimate cash holdings with 1828 observations, 672 of them set cash holdings exceed cash holdings normal, there are some findings. First, excess cash holdings has a negative effect on firm value. Second, the negative effects of excess cash holdings on firm value is stronger for financially unconstrained firms classified by multiple criterions (paying dividends, high cash flow, low MTB and low debt). Third to fifth, the negative effects of excess cash holdings on firm value is stronger for more concentrated ownership, for more dispersed ownership and for more financial distress. Overall, these empirical findings show that excess cash holdings can be a significant indicator of agency problem.

Keywords: excess cash holdings, agency problem, agency theory.

Introduction
Theoretically, the management must allocate cash holdings on a level which could maximize the wealth of the shareholders, that is refer to the cash holdings allocation strategy which balances the costs and marginal benefits of cash holdings (Opler, et al., 1999). The development of the ratio cash holdings of the non financial public companies in Indonesia during the years 2000-2011 fluctuate at a range of
9,8%-13,1%. The important issue is whether those cash holdings are excessive or not.
New chapter research on cash holdings are reflected in the real difference on focus of the cash holding research. According to the old viewpoint, cash holdings do not have a strategic benefit for the company value. Cash holdings are considered only part of the working capital. Cash holdings according to the new viewpoint have a strategic value and are important to the company. The decision of how much cash level should be held could affect the value of the company (Powell and Baker, 2010).
llocating cash holdings exceeding the normal amount of cash holdings like a double-edged sword. On one side, the excess cash holdings allows flexibility to avoid cost of underinvestment. Companies whose flexible financing, when facing a negative shock could avoid financial difficulties and could provide funds for investing purposes when the opportunity to invest arises. Cash holdings are viewed as a form of cash accumulation to anticipate the opportunity to invest in the future so that the cash holdings are valued higher or positively. Research results of Mikkelson and Partch (2003) and Simutin (2012) and research findings of Faulkender and Wang (2006) proves consistently with the hypothesis of financial flexibility. Livdan, et al. (2009) tested the effects of financial constraints to the risk. Their research results indicate that excess cash holdings contain information of effort to reduce financial constraint risks, therefore investors respond more positively. On the other side, excess cash holdings are cash which are not tied to operation and investment, are the biggest candidates to be allocated inefficiently, to be squandered and misused (Fresard and Salva, 2010) because the excess cash holdings are the resources of the company which are easy to misuse which are not align with the interests of the shareholders, so the excess cash holdings have a lot of opportunity to be invested by the controlling shareholders for

projects which decrease the company value to get personal benefits (Jensen, 1986, Stulz, 1990). This argument is in line with Simutin (2010) and Khieu and Phyles (2012) opinion which state that the agency problem is strongly exist in the excess cash holdings.

The potential that the controlling shareholders would exploit the resources of the company by ignoring the interests of the other stakeholders, then the company would be valued lower by the investor. Supporting research that the marginal value of cash holdings are decreasing in line with the increase of cash holdings are Faulkender and Wang (2006), Lee and Powell (2011), Chen, et al (2012). Consistent which the results are the research of Pinkowitz and Williamson (2004) which indicate that the cash of 1 unit of currency significantly contribute to the return of less than 1 unit of currency. The investor argument has the expectation that excess cash could drive the company controlling shareholders to invest to unprofitable projects. The decreasing of market values indicate a problem in agency. The potential that controlling shareholders (insiders) exploiting the company resources, then the company would be valued lower by the investor.

The research goal is testing empirically the implications of excess cash holdings to the value of a company by using a framework of agency theory. This research also adds the variable of financially unconstrained, moderating variable of most concentrated ownership, moderating variable of very dispersed ownership, and moderating variable of most financing difficulties to strengthen the negative effects of cash holdings to the value of the company. The goal is to test the theory of agency as the most appropriate theory to explain the implications of excess cash holdings to the value of the company. This research also uses different methodology to investigate the effect of excess cash holdings to the value of a company. Earlier methodologies commonly use the methodology of Fama and French (1998). This research apply the modern specification model based on the creation of value which originate from the base model which is used by Ramezani, et al (2002) and Bacidore, et al (1997).

Literature Review and Hypothesis Development

The concept of the theory of agency (Jensen and Meckling, 1976, state that the issue of agency could arise due to the occurrence of information asymmetry and the conflict of interests due to inequality of goals. Excess cash holdings are the cash holdings which are so high that they exceed the amount of normal cash holdings. Excess cash holdings are the backup cash allocated over the amount needed for the company to operate daily and to invest (Attig, et al. 2011).

A company should allocate cash holdings to a company at a normal amount, although in reality companies tend to decide to accumulate cash holdings in excess rather than pay off the excess cash holdings to the shareholders, resulting in an excess.

Cash holdings are a kind of liquid asset most favored and the cheapest to convert into another asset which is beneficial individually and is more easily disposed compared to other kinds of assets. From earlier research results, shows that the existence of excess cash holdings indicate an agency problem. Faulkender and Wang (2006) investigated on nonfinancial companies in the United States during the years 1971-2001 and found that the marginal cash value decreased along with the increase of cash holdings. Chen, et al (2012) investigated 8016 companies in the United States and found that the addition of cash on an already large amount of cash will cause an agency problem. Pinkowitz and Williamson (2004) stated that the presence of agency problem while the shareholder view that the insiders will use the funds inefficiently and the debtors

will enjoy profit from the company liquidation, the shareholder lowers the cash holdings value. According to results of research, the first hypothesis argued in this research is:

H1: excess cash holdings negatively effects the value of a company.

Furthermore, when the market is imperfect, then not all companies are able to realize all the investment opportunities because the external costs become disproportionately expensive compared to the internal financial source (Myers and Majluf, 1984). For companies which have financial constrained but have an attractive growth opportunities, the consequence is that the company will invest at suboptimal, thus hindering the growth, performance and value of the company. The benefit of having backup cash to reduce the risk of underinvestment will decrease even more if the company isn't hindered by funding. For companies which are not hindered by funding, cash backup is irrelevant and even causes a higher agency cost because tied to the potential of insiders to squander excess cash holdings even more. Earlier research which support this statement is Faulkender and Wang (2006). According to the companies which do not have financial impediments have a lesser marginal cash value compared to companies with financial impediments. Denis and Sibilkov (2010); Chen, et al (2012) also support the hypothesis.

Therefore, conceptually or logically it can be said that the potential to misuse excess cash holdings for personal benefits will be greater for companies with no financial impediments, which in turn will decrease the value of a company even more than for a company which no financial impediment. The second hypothesis submitted to this research:

H2: the negative effect of excess cash holdings to the value of a company will be stronger in financially unconstrained companies.

This research places emphasis in viewpoint by focusing on the availability of empirical evidence the existence of agency issues caused by excess cash holdings. Entrenchment argument explains that agency conflict type 2 has a higher chance of happening to companies whose shareholding of their main shareholders is very large. This shareholder could use their rights to re-distribute the wealth from others to themselves. Earlier research found that the reduction in performance and company value in companies which have a high shares of insiders (Mitton, 2002; Lemons and Lins, 2003; Suranta and Midiastuty, 2003; Gunarsih, 2003).

Companies in many countries, including Indonesia, have a concentrated ownership structure with the existence of insiders who have a very strong position of control and has the ability to control the company manager (La Porta, et al, 1999). The controlling shareholders have the ability to expropriate minority shareholders, even creditors (Shleifer and Vishny, 1986, Stulz, 1988, and Burkart et al, 1997). Faisal (2013) empirical testing finds the effects of expropriation by insiders on ownership concentration level above 70%. Investors with the expectations that insiders will take their assets, so that they will anticipate this by lowering the value of the company. Therefore, the hypothesis put forth on this research is:

H3: the negative effects of excess cash holdings to the value of the company will be stronger when the ownership of the company is very concentrated.

Conflict of agency also arises from the separation from ownership and control which happens in companies with dispersed ownership, which are companies owned widely by smaller investors (Jensen and Meckling, 1976, Morck et al, 1988). Jani, et al (2004) identified the dispersed ownership using ownership of shares by one shareholder or total block holders less than 30%. These shareholders have low or even none incentive to supervise management because the fee to monitor is so expensive. If one of these shareholders supervise and the performance of the company increases, then the benefits will be reaped by all the shareholders. This expensive monitoring fee ensures that every shareholder will enjoy the free ride in the hopes that another shareholder will do the

monitoring. However the resulting is that there are little or none of the shareholders willing to monitor.

This lack of management supervision by the shareholders cause the incentive by the manager to pursue their own interests by using the costs from the shareholders. An example of this management activity which disadvantages and harms the public company is when the manager determines their high salary with luxurious facility. Managers may invest non beneficially but they can increase their power. Managers may accumulate cash holdings for their own benefits (Jensen, 1986) because cash accumulation can reduce the risk of companies which eventually may save the position of the manager in the company. As result of this free riders problem, the interests of the shareholders are not fulfilled. Therefore, the proposed hypothesis is:

H4: the negative effects of excess cash holdings toward the value of the company is stronger when the ownership of the company is widely dispersed.

Jensen and Meckling (1976) proposed a conflict of agency between the shareholders and the debt holders when the company has debts. On one side the shareholders want excess cash holdings to be invested to high-return investment programs which are risky, however the shareholders believe that when a company has high financial difficulties then shareholders will not receive the benefits of excess cash holdings, the ones who receive the benefit are the debt holders. Therefore, this is the measurement for shareholders in valuing excess cash holdings. As long as the excess cash holdings provide benefit the shareholders, whether shared to the shareholders or held by the company, the value will rise. On the contrary, if the excess cash holdings do not provide benefit, its value will go down (Pinkowitz and Williamson, 2004). The proposed hypothesis in the research is:

H5: the negative effects of excess cash holdings toward the value of the company is stronger when the company is highly financially difficulties.

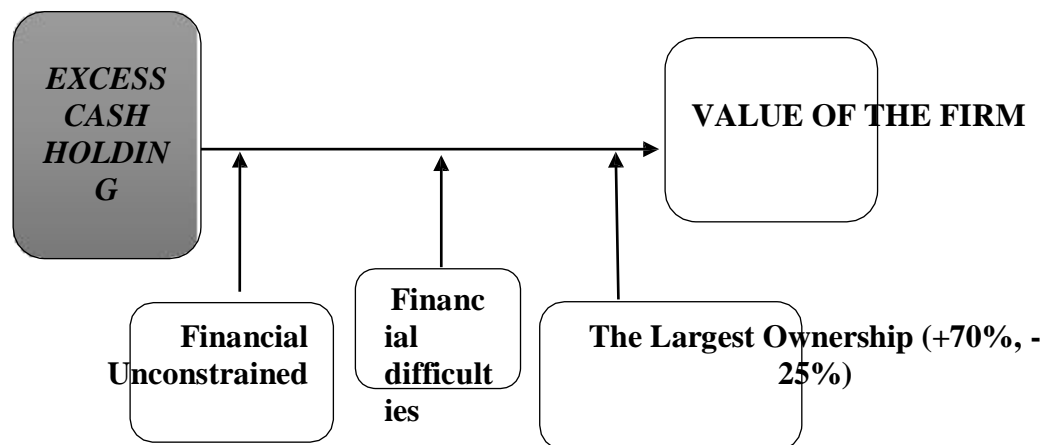
The following is a framework of conceptual research:


Figure 1: Research Framework: The Negative Effects of Excess Cash Holdings on Value of The Firm

Methods

1. Methods To Estimate The Normal Cash Holdings

Excess cash holdings are determined by the residual value of estimated cash holdings. This research will estimate on cash holdings by using a sample of emitens that have data panel structure. Emitens was selected through the method of purposive sampling.

Table 1 Sample Research to Estimate Cash Holdings

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	Obs.
Initial sample	176	263	283	291	305	314	327	351	371	383	406	431	3901
Criteria	54	62	71	76	80	85	88	96	101	105	108	113	1039

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	Obs.

Criteria 3 and 4	49	108	97	84	70	70	75	78	88	90	79	75	963
Available sample	73	93	115	131	155	159	164	177	182	188	196	195	1828

Criteria 1: nonfinancial public companies in Indonesia classified under the classification system of Global Industry Classification (GICS). Criteria 2: nonfinancial public company had Initial Public Offering in 2009. Criteria 3: nonfinancial company has all the related data during the years 2000-2011. Criteria 4: the data are not outlier.

This research will estimate on cash holdings by using three approach on a regressive, estimation model.

A. Static panel data regressive model. Implicitly the estimate of cash holdings of static model assumes there is no need adjustment to the new cash holdings target. The model of static estimation of cash holdings are:

$$CASHHOLDINGS_{i,t} \square \square \square_i X_{i,t} \square \square_i \square \square_t \square u_{i,t} \quad (1)$$

B. Dynamic panel data regression model. Dynamic-model cash holdings admit that there is adjustment process to normal cash holdings, thus resulting in a lag. Autoregressive dynamic regressive statistic model to estimate cash holdings is the following.

$$CASHHOLDINGS_{i,t} \square CASHHOLDINGS_{i,t\square 1} \square \square \square_i X_{i,t} \square \square_i \square \square_t \square u \quad (2)$$

C. Regressive model with the method estimated GLS through the procedure iterative Cochrane Orcut. Autocorrelation is indicated by interdependency of disruption from one regressive model following a structure AR (1). This method is

basically an estimator GLS and is known by the term feasible/estimated GLS. The regressive statistic model of EGLS to estimate cash holdings is:

$$\overline{CASHHOLDINGS)}_{i,t} \square \square \square_i X_{i,t} \square u_{i,t} \quad (3)$$

$$\sum_{i\square 1}^{n}$$

Explanation:

$$\overline{\langle\!\langle\!\langle\rangle\!\rangle\!\rangle} = CASHHOLDINGS_t - \rho CASHHOLDINGS_{t-1}$$

$$\overline{\hat{?}}_{i,} = X_{i,t} - \rho X_{i,t-1}$$

$$\overline{u} = u_t - \rho u_{t-1}$$

Symbol α_i and α_t is *firm-specific effects* and p*eriod-effects*. X is a vector containing independent variables, that is investment opportunity (GROWTH), company size (SIZE_RIIL), financial difficulties (DDISTRESS), cash flow volatility (RV) or (VCF), cash flow(CFLOW), investment (CAPEX), convertibility (CONVERT), leverage (LEV), dividend (DDIV_DPS), cash conversion cycle (CCC), debt maturity (MATURITY), assets tangibility (TANGIBLE).

Industry Dummy	No			No			Yes			No			No			Yes		
N	174			174			174			151			151			151		

The cash holdings estimators are selected based on a criteria of BLUE regression model assumption and the criteria of goodness of fit, which are the value of Adjusted R^2, and the value of SSR (Sum squared Residual). The higher the value of Adjusted R^2, then the better the model. The less the value of SSR, the better the model.

According to those criterion, then the excess cash holdings are calculated based on two of the best specification estimation cash holdings normal model, which are the static estimation cash holdings model with the Cochrane Orcutt iterative correction procedure (Estimated GLS/Feasible GLS) with the cross-section fixed effect modeling and the dynamic estimation cash holdings model using the cross-section fixed effect specifications.

Methods to Test Research Hypothesis

1. **The research sample** is selected from the research sample which in certain years experienced positive excess cash holdings and have a complete data. Excess cash holdings are determined by the value of residual estimation of cash holdings which come from the chosen specification model. Number of selected samples are 672 observations, with the detailed 185 observations from consumer discretionary sector, 143 observations from Materials sector, 110 observations from consumer staples sector, 104 observations from industrial sector. The rest are dispersed out in the remaining 5 sectors.

2. **Research Variables** in term of definition, formula and identification to test the research hypothesis is provided in the table below.

Table 3 Variable Definitions to Test Research Hypothesis

Variable	Definitions and Formulas	Variable Identification
ABNRETURN$_{i,t}$	Abnormal return is aproxy of value of the firm, which excess return from normal return. Normal return is expected return of investor. Formula: $$\propto_{i.t} = R_{i,t} - E(R_{i,t})$$ $\propto_{i.t}$ is abnormal return $R_{i,t}$ is individual return $E(R_{i,t})$ expected return, using market return. Formula:	Dependent Variable
XCASH HOLDINGS$_{i,t}$	Excess Cash Holdings is cash holdings which deviate from normal cash holdings, calculated from residual value of cash holdings with positive sign. Formula: $$XCASHHOLDING_{i,t} = CASH\ HOLDING_{i,t}$$	Independent Variables
DDIV_DPS	is dummy variable, set to one, if the firm paid dividends., and zero otherwise	Moderating Variables to

Variable	Definitions and Formulas	Variable Identification
DMULTIPLE (Dividend, *Cash flow*, *Market to Book* and *Debt)*	is dummy variable, set one if the company paid dividends, had high cash flow, high MTBA and low debt, and zero, otherwise.	Test of Agency Problems
DOWN1	is dummy variable, set one if the largest shareholder has share >70%, and zero, otherwise.	
DOWN2	is dummy variable, set one if the largest shareholder has share <25%, and zero, otherwise.	
DISTRESS	is dummy variable, which measured by TIER ratio. Formula $\text{TIER} = \dfrac{\text{EBIT}_{i,t}}{\text{Biaya Bunga}_{i,t}}$. Dummy variable set one, if TIER<0, and	
EVA $_{i,t}$	*Economic Value Added* is financial performance measure based on shareholders value creation. Formula: $(\text{NOPAT} - (\text{WACC} \times \text{CAPITAL}))/\text{CAPITAL}$ NOPAT = Net Operating Profit After Tax CAPITAL = Book Value of Equity WACC= *Weighted Average Cost of Capital*, from Database	Controlling Variables
RISK $_{i,t}$	is deviation of asset pricing as a proxy of unsystematic risk normalized by asset total t	
SIZE$_{i,t}$	is company size Formula: $\ln(\text{Total Asset}_{i,t})$	

3. **Research Statistics Model** of this research is $Y_{i,t} = \alpha_0 + \beta_1 X_{i,t} + \varepsilon_i$. Coefficient β is estimated by using regression analysis with Moderated Regression Analysis approach, as seen on Table 4.

Table 4 Statistics Test Model and Sign Prediction

Hypothesis	Sign Prediction	Regression Equation
H1	β_1 negative	$ABNRETURN_{t,i} = \alpha_1 + \beta_1 XCASHHHOLDINGS_{i,t} + \Sigma\beta_2 CONTROLS_{it} +\varepsilon$
H2	β_3 negative	$ABNRETURN_{t,i} = \alpha_1 + \beta_1 XCASHHHOLDINGS_{t,1} + \beta_2 DDIV_{i,t} + \beta_3 XCASHHHOLDINGS_{i,t} * DDIV_{i,t} + \Sigma\beta_4 CONTROLS_{it} + \varepsilon$
	β_3 negative	$ABNRETURN_{t,i} = \alpha_1 + \beta_1 XCASHHHOLDINGS_{t,i} + \beta_2 DMULTIPLE_{i,t} +$

Hypothesis	Sign Prediction	Regression Equation
		$\beta 3XCASHHHOLDINGSi,t * DMULTIPLE_{i,t} + \Sigma\beta 4CONTROLS_{it}$
H3	$\beta 3$ negative	$ABNRETURN_{t,i} = \alpha 1 + \beta 1XCASHHHOLDINGS_{i,t} + \beta 2DOWN1_{i,t} +$ $\beta 3_{i,t} * DOWN1_t + \Sigma \beta 4CONTROLS_{it} + \varepsilon_{it}$
H4	$\beta 3$ negative	$ABNRETURN_{t,i} = \alpha 1 + \beta 1XCASHHHOLDINGS_{i,t} + \beta 2DOWN2_{i,t} +$ $\beta 3XCASHHOLDINGS_{i,t} * DOWN2_{i,t} + \Sigma \beta iCONTROLS_{it} + \varepsilon_{it}$
H5	$\beta 3$ negative	$ABNRETURN_{t,i} = \alpha 1 + \beta 1XCASHHHOLDINGS_{i,t} +$ $\beta 2DISTRESS_{i,t} +$

Result and Discussion

Research hypothesis are tested using two models. Model 1 calculates excess cash holdings using the residual value result of estimated model static regression cash holdings, whereupon model 2 calculates excess cash holdings using the residual value of estimated model dynamic regression cash holdings. The summary of the estimation show in Table 5.

Table 5 Summary of Estimated Result

Hyp	Model	β	Direction	Coeff.	t-Stat		Decision
H1	1	β1	negative	-0,767	-2,730	***	H1 Support and robust
	2	β1	negative	-0,579	-2,588	***	
H2	1	β3	negative	-1,674	-2,732	***	H2 Support but not robust
	2	β3	negative	0,130	0,126		
H2	1	β3	negative	-1,671	-1,817	*	H2 Support and robust
	2	β3	negative	-1,053	-1,383		
H3	1	β3	negative	-4,433	-4,012	***	H3 Support and robust
	2	β3	negative	-2,321	-1,769	*	
H4	1	β3	negative	-2,537	-2,492	**	H4 Support and robust
	2	β3	negative	-2,385	-2,644	***	H5 Support and robust

1. **Result of the effect of excess cash holdings toward the company value.** Hypothesis 1 estimates that excess cash holdings negatively affects a company's value. Result of testing show that the variable regression coefficient of excess cash holdings signify negative and significant. The re-estimation results show the sign of negative and significant coefficient. Therefore, hypothesis 1 which states that excess cash holdings affects a company's value negatively is supported and robust. This empirical finding shows that excess cash holdings are a significant pointer to supporting the agency free cash flow hypothesis. The finding of this research supports the agency cost of free cash flow theory, in line with the findings of

Pinkowitz and Williamson (2004), Faulkender and Wang (2006), Lee and Powell (2011), Chen, et al. (2012).

2. **Result of the effects of financially unconstrained in strengthening the negative effects of excess cash holdings toward the value of a company.** Hypothesis 2 states that the unconstrained financial effects strengthen the negative effects of excess cash holdings toward the value of a company.The estimation results show that the interaction coefficient signed negative and significant when the financial unconstrained is classified using a dividend paying criteria. When using a multiple criteria, interaction coefficient is signed as negative and significant. The re-estimation result uses a subsample analysis supporting the hypothesis that the negative effects of excess cash holdings toward the company value is stronger in the subsample of a company which is financial unconstrained using a multiple criteria.

If the data in this research is supported, then the implication of excess cash holdings according to the agency free cash flow hypothesis. The research finds that the effect of unconstrained funding affects return negatively, is consistent to the findings of Pinkowitz and Wiliamson (2004), Denis and Sibilkov (2010) and Tong (2011), which state that unconstrained funding causes cash holdings to hold less value compared to the value of cash holdings when financially constrained. The decline of the value of cash holdings more negatively is the response to the rise of agency cost of free cash flow.

3. **Result of the effect of ownership is very concentrated in strengthening the negative effects of excess cash holdings toward the value of a company.** Hypothesis 3 estimates that the effect of ownership is very concentrated in strengthening the negative effects of excess cash holdings toward the value of a company.

The result of testing shows that the negative effects of excess cash holdings toward the value of a company is stronger when the variable of the main shareholder is over 70%. The same re-estimation shown on model 2 show the same and significant sign of coefficient. Therefore, the hypothesis is supported. The highly concentrated ownership has an effect in strengthening the negative effects of excess cash holdings because in the proportion of shareholding over 70% the act of expropriating is more dominantly acted (Jani, et al. 2004; Faisal, 2013).The expectations in the occurrence of agency problems is reflected in the cutting of company value by outside investors. This test result supports the findings of Liu (2011) and Attig, et al (2011), Kusnadi (2011).

4. **Result the effect of highly dispersed ownership in strengthening the negative effects of excess cash holdings on firm value.** Hypothesis 4 estimates that highly dispersed ownership strengthens the negative effects of excess cash holdings toward the value of a company. The testing result shows the coefficient of interaction show negative sign and significant. Re-estimation to the model 2 also supports the result. Therefore the problem of agency between the shareholders and the supported manager.

The research result is in line with the findings of Kalcheva and Lins (2007), Lee and Lee (2009), and Faisal (2013). In the structure of highly dispersed ownership, allows the entrenchment by company management because of the free-rider problem. Faisal (2013) also finds that the company value decreases when the concentration level of ownership is lower than 30% because of the free rider problem.

5.   **Result of the effects of financial difficulties in moderating the effects of excess cash holdings toward the value of a company.** Financial difficulties is a problem or a hardship caused by the inability of a company to fulfill its obligation. When a company has financial difficulties, then the chosen investments are those with very low risk, causing the shareholders to not have a choice in placing investments in other projects with higher return, causing an agency conflict. The result of estimation and re- estimation shows that the coefficient interaction shows negative sign and significant. Therefore hypothesis 5 is supported in that a company with very serious financial difficulties have an agency problem caused by excess cash holdings. This research result is consistent with the findings of Pinkowitz and Williamson (2004) which state that for outside investors, cash holdings are valued less when the company has financial difficulties, and such are responded negatively by outside investors because investors prefer investments which produce higher return.

6. **Robustness Checks**
    This research tests the robustness model toward the company not experiencing excess cash holdings (UNXCASHHOLDINGS). This testing is done to strengthen the argument that the agency of free cash flow hypothesis happens at a company experiencing excess cash holdings. If the research model is robust, then the company no longer experiencing excess cash holdings will have a better performance compared to those experiencing excess cash holdings. Robustness checks use two measurements of non-excess cash holdings which originate from the residual value of the estimate on the regression of the same cash holdings to test the hypothesis and re-estimate the hypothesis. The result of testing the research model on models 1 and2 using the main variable of non-excess cash holdings show a coefficient of positive-signed UNXCASHHOLDINGS variables ($\beta 1=+1,438$) and ($\beta 1=+0,770$) and significant with the rate of significance as 1%. This result supports the argument of research model. The re-estimation results show that the problem of agency identified using excess cash holdings is supported and robust.

Conclusions, Implications and Recommendations
 1. **Conclusions**
The first finding proves that excess cash holdings affect the value of a company negatively. This empirical finding shows that excess cash holdings are a significant clue in supporting the agency holding hypothesis.
The second finding shows that the effect of the unconstrained strengthens the negative effects of excess cash holdings toward a company's value. Thus empirical finding supports the hypothesis of the agency free cash flow. This research argues that the accumulation of excess cash holdings is motivated by agency reasons, so that the outside investors will respond negatively.
The third finding, the highly concentrated ownership structure is supported by the research data can strengthen negative effects of excess cash holdings toward the company's value. This is consistent with the expropriation hypothesis or the entrenchment hypothesis which state that the act of expropriating excess cash holdings is more dominant when the company ownership is highly concentrated.
The fourth finding, consistent with the managerial entrenchment hypothesis which state that the act of expropriating excess cash holdings by management is more dominantly done when there is the

free rider problem amongst the shareholders as a result of dispersed ownership, resulting in the shareholders not supervising management.

The fifth finding, the agency problem between the insider and the debt holders when the company has severe financial difficulties, so that the safest investment is the most low-risk investment. The difference in risk-taking increases the agency problem between the insiders and the debt holders, which would elicit negative responses from outside investors. Therefore, the hypothesis is supported and robust.

2. Implications

The theoretic implication of this research is able to explain the agency theory using excess cash holdings. To date earlier research uses the proxy of free cash flow or internal cash flow. The other implication of this research is to give additional empirical evidence that the specification of the value model uses a method based on the value creation can competently valuing the effect of excess cash holdings.

The policy implication resulted from this research is giving input to the financial institution to control the cost of external financing, so the companies do not have to face the high cost of cash holdings.

The practical implications of this research that can be given to companies is that the companies allocate strategically the excess cash holdings so as to create a value to the company, for example by returning excess cash holdings to the shareholders in the form of dividend. The practical implications toward investors is that when valuing a company, it is important to consider the resource aspect of the company which is easily misused, the ownership structure of the company and the level of financial difficulty.

The other practical implication is that this research has succeeded in building an estimation model in normal cash holdings which can be used by companies to investigate performance of their level of cash holdings.

3. Recommendations

Related to the limitations of this research, the next research may adds a model which able to measure the marginal value of excess cash holdings. Second, if the managerial decision to invest in short-term in the form of standalone marketable securities, then the determiner will be different from the determiner of cash holdings. This is a limitation in the research because it is assumed that short-term investments are a substitution for cash. Third, researchers give suggestions to test a series of these hypotheses to a sample/subsample group which has a much larger amount of members and balance. The method is to add the period of research to more than 12 years, or to do a research on the sample across ASEAN countries, or JASICA-based sectors so that the observational limitations which are the sample and subsample members can be avoided and the validity of research can be improved.

RETURN STOCKS AFFECTED BY STOCK TRADING SUSPENSION IN INDONESIA STOCK EXCHANGE

Prakarsa Panjinegara, The University of Lampung, Indonesia

Abstract
Suspension is a temporary suspended of shares trading in the Securities Exchange. The termination can be caused due to the request of the Issuer itself or the stock decision in order to provide protection for investors or it may be due to the imposition of sanctions by the Stock Exchange to an Issuer. Information about the suspension is the category of Bad News, in general, will lead to the decline in return stock to the companies that affected by the suspension. Therefore, this study is an event study that refers to an allegedly occurrence h that will affect the decision making of investors whether to buy or not the shares. The results of the study showed the suspension of the company causes fluctuations in the return stock suspension and inflicted the negative abnormal return.

Keywords: Event Study, Suspension, Abnormal return.

Introduction
The Indonesian capital market is a part of the Asia *emerging market* that more increase the capitalization in each year. Along with the development of technology information, more increase the number of market players in Indonesia Stock Exchange so that there is a need for information disclosure for investors to improve the credibility and market efficiency.

The Indonesian capital market will be more efficient when the faster new information available on the market is reflected in the securities price of the capital markets. The information here consists of historical data information, the published data and private data of the company.

Temporary Suspension of stock trading (*suspend*) by Indonesia Stock Exchange (IDX) is one of the information published by the BEI managers for all issuers in the market. Based on the rule, number III-G Kep-00086/BEI/10-2011 about the revocation of the suspension and the Exchange Membership approval by Indonesia Stock Exchange. The suspension is one of the rights owned by the stock exchange to stop suspend stock trading according to the specified time of securities trading. Against trade activities members of a Securities Exchange as the penalty for violations by the Issuer or a member of the securities exchange, or due to demand from the Issuer exchange member, Bapepam-LK or because of the consideration the exchange. Suspend sanctions provided for Issuers is a category of bad news that can affect the value of stock trading for Issuers so that there is a need clarification or improvement effort for errors that have been done.

The following is a list of Issuers companies that affected suspend sanctions in 2014:

Table 1.1. The list of the Companies (Issuer) affected by the Trading Suspension in 2014

No	The Company Code	The Company Name	No	The Company Code	The Company Name

Source: IDX 2014

Normally, all market players did not want the loss at the time of the investment. All forms of information are considered in the decision. This also applies to the transaction related to the capital market activity. It better before investing, investors see information in newspaper and news from the internet to be able to predict the future information that will come due to choosing the secure investment required the careful analysis and accurately supported data.

Overreaction Market hypothesis states that investors systematically perform actions that excessive force against an event by specifying the price too high (low) as a reaction to the information in the value of good/bad, so for a while, the stock price will be shifting from the fundamental value (Fama, 1991).

The Capital Market is the compartment for investors to invest with the hope it will gain the profitability of the capital that has been issued. The desire of investors to invest in the capital market is affected by the information obtained by the investor which is used as the guidelines to determine the policy that will be taken. Good information will react positively to emerging markets while conversely wrong information will react negatively in emerging markets.

Basic Concept of Efficient Market

The first concept of the efficient market has been stated and popularized by Fama (1970). In this context what is meant by the market is the capital market and the money market. A market can say efficient when no one, both individual investors and institutional investors will be able to obtain the abnormal return, after adjusted for risk, using existing trade strategy. This means that the stock prices reflect all available information.

According to Fama (1970) form of the efficient market can be grouped into three, known as the efficient market hypothesis. The three forms of efficient markets are (1) had the weak eyes form of the efficient market hypothesis, (2) semi-strong form of the efficient market hypothesis, and (3) strong form of the efficient market hypothesis. Each of the forms of the efficient market is closely related with as far as where the absorption of information occurred in the market.

The expression of the other mentioned that in an efficient market asset prices or securities quickly and fully reflect the available information about the securities or asset. In studying the concept of the efficient market, our attention will be directed to the extent to which and how quickly the information can affect the market which is reflected in the changes in the price of securities. In this case Haugen, (2001) divided into three information groups, namely (1) information in good past stock prices, (2) all public information, and (3) all available information including inside or private information. Each of the groups of the information reflects the extent of the efficiency of a market. Jones (1998) stated that the price is now share (securities) reflect the two types of information, namely the information that is already known and information that still needs suspicion. The information is already known covers two kinds, namely the past information (e.g. profitability years or the last quarter) and current information as well as Genesis or events that have been announced but still will occur (e.g. the plan of separation share). For example, the information still needs suspicion if many investors believe that interest rates will soon come down, prices will reflect this belief before the actual decline occurs.

Ariani (2010) in the research entitled "The reaction of the Indonesian Capital Market investors to the announcement of bailout Dubai World". The purpose of this research is to know the volatility in the shares of the LQ45 and to test the efficiency of the semi-strong form stock market represented by the shares of the LQ45 recorded in IDX due to the announcement of the bailout Dubai World. The Efficient Capital Market is prices that formed to adjust with the existence information received by investors is the ideal market. In this research, the problem examined how the volatility stocks LQ45 before, during and after the event of the bailout announcement Dubai World and whether there is a significant difference between the average abnormal return before and after the events of the bailout announcement Dubai World which is one of the efficient market indicators. In this research, the method used is the event study method and event date or information that was done by observation is the date of the announcement of the bailout Dubai World which is called as the date event date. The Data used is price index share data and the LQ45

share covering the period August 2009 to January 2010. The results of this research showed that the existence of the bailout announcement Dubai World does not provide a significant impact against the shares return in the LQ45, or there is no abnormal return (excess return), and there is no difference between the volatility stocks LQ45 significantly. From 45 shares including abnormal in the highest return only reach 0,009726 achieved on day 4 after the event date. The positive abnormal return value for 21 days observation totals only 8 days, while the negative value abnormal return amounted to 13 days. Thus this shows that the capital stock market in Indonesia is the half a powerful, efficient capital market because of the bailout announcement information Dubai World are not reflected in the price and return share the LQ45.

Wiyanto (2002) in the research entitled "Weak Form Market Efficiency test on cigarette industry stocks in the Jakarta Stock Exchange covering period 1999-2001 (Divination Box-Jenkins Methods and Runs Test)". This research is a test of weak form market efficiency in the cigarette industry stocks in the Jakarta Stock Exchange period 1999-2001. The results of the analysis identify that cigarette industry stock markets in the BEJ categorized in the market are not efficient in the form of weak. This condition can be used by investors to obtain the abnormal return because the price in the past can be used to predict the price in the future.

Research Methodology
Research Methodology is the steps of research that will be done in writing a scientific paper. The stages of the research determined first in advance so that the research more focused and provided a clear picture about what steps that must be done.

1. Research Period and Place
 A. Research Period
The period observation research was done on these companies before and after the date of suspension cast down by IDX in 2014. Research data used as the Composite Stock Price Index (IHSG) (closing price) and IHSS per issuer 15 days before and after the period of suspension is obtained through the Indonesia Stock Exchange, with the assumption, there is no corporate action.

 B. Research Place
The research was done on all affected suspension shares with the Composite Stock Price Index (IHSG) and sectoral stock price index (IHSS) in Indonesia Stock Exchange.

2. Types of Data
The type of data that is used in this research is secondary data; it is the field research results data obtained by collect data on the company shares that affected suspension on IDX in 2014. According to how collect the data that is needed in this research is in the form of the data time series.

3. Data Collection Method
 A. Literature Research
This literature research was done by collecting and reading from various literature, good financial journals and reference in the form of books and newspapers, magazines or the internet and learn the theories related to this research.

 B. Field Research

Field research was done by visiting the Capital Market Reference Center in Indonesia Stock Exchange. The methods used in this field of research is the documentation method; it performs data collection and recording of data that is required in this writing.

4. Population and Sample Research
A. Population Research
The population in this research is all the shares that listing and suspension in Indonesia Stock Exchange in 2014.
B. Research Samples
The determination of the sample research based on the method purposive sampling with the criteria among others:

TABLE IV. The companies which listing in Indonesia Stock Exchange.

TABLE V. All Companies affected by the suspension in 2014 but revocation sanctions in 2014.

TABLE VI. The suspension companies that are trading actively in 2014 on the outside of the period of suspension.

Based on the criteria specified and there are only 5 samples companies that worthy meet the criteria include:

No	Code	Issuer Name
1	BUMI	Bumi Resources Tbk
2	BWPT	Eagle High Plantations Tbk
3	ITMG	Indo Tambangraya Megah Tbk
4	KREN	Kresna Graha Sekurindo Tbk
5	PKPK	Perdana Karya Perkasa Tbk

Source: IDX 2014

5. Time Range Selection Patterns with Events Study
The amount of time that used in this research is 75 day, 45 days before the information of the suspension by the Indonesia Stock Exchange. The amount of time the estimation period for 45 days, window period during the 15 day before, when suspension and 15 days after taking the sanctions suspension by IDX in 2014.

t_1 H-45 before t_2 H-15 t_0 H +15 t_3

The estimation period | The window period |

6.   Operational Variables Definition

1. Shares return is the rate of return from an investment share. Return on this research is an Issuer return shares.
2. Beta share is returned volatility measurement securities to market return. Beta on this research obtained with how regression (R_i-R_f) as dependent variables and $(R_m -R_f)$ as independent variables during the period of the estimation before the suspension.
3. Expected Return is the rate of return or expected profit by investors, in this research which was the expected return of an Issuer shares. Expected return is calculated by using the estimation model of the Capital Asset Pricing Model (CAPM).
4. Abnormal Return share is the difference that obtained between the realization return and expectation return. Abnormal return that calculated in this research is abnormal return before the suspension and abnormal return after the revocation suspension.
5. The event of contains information in this research is the suspension information which is one of the events and needs to be examined the content information and conducted an event study to know whether an abnormal return or not and how quickly the market will react when an abnormal return.

7.   Analysis Tools

Data analysis method used as follows:

A. Normality Assumption Test

The assumption normality test is to know whether the data is normally spread. The assumption normality test can be seen by *Augmented Dickey Fueller (ADF)* test.

B. Formation CAPM Model and Search for Abnormal Return

1. Calculating Stock Return

Calculating the stock return every day during the period of estimation that calculated by using this formula:

$$R_i = \frac{P_t - (P_{t-1})}{P_{t-1}} + D_t$$

Where :

R_i : *Return* on day t
P_t : Share price (*closing price*) on the day of t (in rupiah)
P_{t-1} : Share price (*closing price*) on the day of t-1 (in rupiah)
D_t : Dividend Share at t period

2.   Calculating Daily Market Return

Calculating the daily market return is calculated with the following equation, with market dividend assumption is not counted or considered as zero.

$$R_m = \frac{IHSG_t - IHSG_{t-1}}{IHSG_{t-1}} + D_t$$

Description:

R_m = Market Return

$IHSG_t$ = The securities market price index in the period to-t

$IHSG_{t-1}$ = The price of securities markets in the period to the previous t

D_t = Market Dividend t period

3. **Regressing (R_i -R_f) and (R_m - R_f) to Form CAPM Model**

   $(R_i - R_f) = \beta (R_M - R_f)$

   Description :

   $E(R_i)$ = Expected Return

   R_F = Risk-free return assets use SBI

   R_M = Market Return

   B = Securities Beta to-i

4. **Calculating Abnormal Return to the Window Period**

   The calculation of Abnormal Return using the formula :

   $AR_{i,t} = R_{i,t} - E(R_{i,t})$

   Description :

   $AR_{i,t}$ = Securities Abnormal Return to-i

   $R_{i,t}$ = The return happens to securities to-i in the period of the event to-t

   $E(R_{i,t})$ = Securities Expected Return to-i in the event period to-t

5. **Calculate the Standardization Abnormal Return**

   $ARS_{i,t} : \dfrac{AR_{i,t}}{KSE_i}$

   Description :

   $ARS_{i,t}$: Standardization Abnormal Return of Securities to-i on the day to-t in the window period

   $AR_{i,t}$: Securities Abnormal Return to-i on the day to-t in the window period

   KSE_i : Estimates Standard Error for securities to-i

6. **Calculate Cumulative Abnormal Return**

   $CAR_t = \sum AR_{t-1} + AR_t$

   Description :

   CAR_t : Cumulatif Abnormal Return securities to-t in the window period

   $\sum AR_{t-1}$: Total number of Abnormal Return securities before t in the window period

   AR_t : The securities Abnormal return to-t

C. Average 2 Varies Test

1. In this study using the average 2 varies test with the paired sample t-test by comparing return between before and after the suspension in IDX.

$$\text{Tcount} = \cfrac{X1 - X2}{\sqrt{\left(\cfrac{(n_1 - n)(SD^2{}_1) + (n_2 - 1)(SD^2{}_2)}{n_1 + n_2 - 2}\right)\left(\cfrac{1}{n_1} + \cfrac{1}{n_2}\right)}}$$

Where:

$\overline{X}1$	= The average abnormal return before Suspension
$\underline{X}2$	= The average abnormal return after Suspension
SD21	= Standard deviation before Suspension
SD22	= Standard deviation of Suspension
N	= Number of samples

2. Determine the region of acceptance and rejection of the zero hypothesis (Ho)
   Ho accepted or Ha rejected if: t count $<$ t table
   Ho rejected or Ha accepted if: t count $>$ t table

3. Compare t count with t table can conclude based on the statisitic test that has done. The author uses the level of trust in 95% or $\alpha = 5\%$.

8. Hypothesis Testing

There are 10 samples of the issuer stocks in this research; the research object is the assumption of the company stocks, and there is historical price data.

The hypothesis testing that used in this research are:

A. Normality Test

H_o: the data normally distributed
H_a: the data are not normally distributed
With the level of confidence 95%, then when
Probability < 0.05: Reject H_o
Probability > 0.05: Do not reject H_o

B. The Average Two Different tests t test

H_o: There is no a significant difference between the average abnormal return on Manufacture stocks between before and after the Suspension.

H_a: There is a significant difference between the average abnormal return on Manufacture stocks between before and after the Suspension.

If Ho was rejected and Ha accepted means, there is a significant difference between the average abnormal return as a result of Manufacture stocks between before and after the suspension.

Result and Discussion
1. Results
A. Stationary Data Test Result
Before analysis the abnormal return stocks test of the companies that are affected by the suspension, the first thing has to do is testing the stationary data. The stationery data test used to test the data behaviour that will be used. Stationary data has the tendency of the data variation is not great and approaching the average value, instead of the data is not stationary have larger variation data with the average value (Insukindro, 1991).

The regression using data not stationary in general has a value R-square which is relatively high, but having the statistic value of the low Durbin Watson. That will affect the regression happens to be spurious or irregular so that the coefficient regression assessor will not efficient, and the regression forecasts will be missed then the result is not valid (Insukindro, 1991).

The research variables used in this research are: The *Return* IHSG value, The Daily SBI Rate, And the return of each company with the code company among others: BUMI, BWPT, ITMG, KREN, PKPK.

The stationery data test using the unit root tests by using the model of the Augmented Dickey Fuller (ADF) using the statistic EVIEWS 8.1 program.

The result of stationery data test summarized in the Table IV.1 among others:

The table IV.1. Test results Stationary

Variable	ADF (Prob.Value)	
	t	Prob.
RIHSG	-6.281056	0.000
SBI	-7.128417	0.000
Return BUMI	-9.594286	0.000
Return BWPT	-7.929213	0.000
Return ITMG	-3.593008	0.000
Return KREN	-5.578658	0.000
Return PKPK	-7.767663	0.000
Test Critical Value		
1%	-3.519050	
5%	-2.900137	
10%	-2587409	

Source: Processed Data

Based on the table IV.1, seen that all variables data that used stationary on the initial level and significant at the alpha level 1%. It shows that the variable data used does not have the unit roots.

B. The formation of Expected Return (E(R))

The formation of the expected return model in this research using CAPM model with fluently time data during 52 days before the suspension. The steps which applied in the formation of each company expected among others:

1. Determine the return of each company using historical data of each company stock price changes in the estimation period 52 days research.
2. Determine the value of the free risk-return using the daily standard value of interest rate in the Certificates Bank Indonesia during estimation period.
3. Determine the return of the market that uses the data changes of Composite Stock Price Index (IHSG) during the estimation of the research period.
4. The formation of CAPM model by forming an equation regression:

$$R-Rf = (Rm-Rf).\beta + a$$

From the equation model be obtained Beta (β) value produced can be used as the former model of CAPM in order to get the Expected Return (E(R)) value with equation:

$$E(R) = Rf + (Rm-Rf).\beta$$

The formation results of each equation regression using EVIEWS 8.1 can be seen on the attachments 1.1 with expected return model of each company as follows:

$$E(R) = Rf + \beta (Rm-Rf)$$
$$E(R_{BUMIt}) = Rf + 0.007742 (Rm - Rf)$$
$$E(R_{BWPT,t}) = Rf + 0.118507801625 (Rm - Rf)$$
$$E(R_{ITMG,t}) = Rf + 0.0788356271004 (Rm - Rf)$$
$$E(R_{KREN,t}) = Rf + 0.000621 (Rm - Rf)$$
$$E(R_{PKPK,t}) = Rf + 0.011955 (Rm - Rf)$$

C. The Calculation Results of the Abnormal Return and Abnormal Cumulative Return

The calculation results of the abnormal return of each company uses the difference between the realization return with the expected return model (R-E(R)) can be seen in the table IV.2.

The table IV.2 Abnormal Return the Companies Affected by the Suspension in 2014

Source: processed data

The calculation results of the abnormal return company can also be seen in the picture IV.1, which shows the movement of abnormal return stocks which fluctuate before and after the suspension on the companies.
Source: processed data

In the picture, IV.1 showed that BWPT share has the movement of abnormal fluctuation return stock greater after the civil suspension revocation compared with the other stocks. This shows the influence of suspension information more has the real impact on investors in BWPT shares that do the transaction stock trading. Based on the calculation results of abnormal return stock of each company can be determined the cumulative value of abnormal return stocks enumerates the value

of abnormal return from 15 days before the suspension and 15 days after suspension revocation as shown in Table IV.3.

The table IV.3. The results of the calculation Cumulative Abnormal Return the companies affected by Suspension on IDX in 2015.

The Period	CAR BUMI	CAR BWPT	CAR ITMG	CAR KREN	CAR PKPK
Before suspension	-0.30461	-0.36648	-0.29966	-0.30328	-0.366
After taking the suspension	-0.6128	-0.08794	-0.68989	-0.26469	-0.32611

Source: The Data processed

The table IV.3 shows that there are two types of emitting companies which have the cumulative impairment of abnormal return stocks after a suspension, specifically the shares of BUMI (Bumi Resources Tbk) and ITMG (Indo Tambang Raya Megah Tbk). While the others three types stocks experiencing the cumulative value abnormal return stock which increased, specifically the shares of BWPT (Eagle High Plantations Tbk), KREN (Kresna Graha Securindo Tbk), and PKPK (Prime Paper Mighty).

The calculation of abnormal return the entire company shares affected by the suspension can also be calculated using the approach the average abnormal return (AAR) and the cumulative average abnormal return (CAAR) all companies affected by the suspension which can be seen in the table IV.4.

Table IV.4 The results of the calculation the *Average Abnormal Return* (AAR) and *Cumulative Average Abnormal Return* (CAAR) The Companies which Affected by Suspension on IDX in 2014.

Source: Processed Data

The table IV.4 shows that there are fluctuations in the value of the average abnormal return in overall stocks before and after the suspension. The cumulative value of the average abnormal return share before and after the suspension event is negative and the more declining showed, in general, the investors have a negative sentiment against the shares of affected suspension companies.

D. Test results vary two average of t Test

Two different tests the average t-test is used to see the difference in the average from the results of abnormal return before and after the suspension event of company shares that affected suspension companies. The results of the vary two the average abnormal return stocks affected by the suspension test can be seen in the Table IV.5.

Table IV.5 Test Results Vary Two the average Abnormal Return Shares affected by Suspension in BEI Year 2014

Test for Equality of Means Between Series

Sample: 1 15
Included observations: 15

Method	df	Value	Probability
t-test	28	0.600183	0.5532
Satterthwaite-Welch t-test*	19.01101	0.600183	0.5555
Anova F-test	(1, 28)	0.360219	0.5532
Welch F-test*	(1, 19.011)	0.360219	0.5555

*Test allows for unequal cell variances

1.	Test results vary 2 average shows the results of t-tests that are not significant with probability 0,5532 greater than significant rank 10% indicates that there is no distinction of significant abnormal return before and after the suspension.
2.	This shows the initial hypothesis (Ho) which indicates there is no difference in the average abnormal return before and after the suspension event received, while the final hypothesis indicates there is a difference of the average abnormal return before and after the suspension event rejected.

2. Discussion

The overall research results using the expectations model of the *Capital Asset Pricing System* (CAPM) with the average two different test methods *sample* t-*test* showed that the value of the probability t-count greater than the probability t-table with the greater significance than 0,10. This result received the initial hypothesis that says there is no difference between the average abnormal return share before and after the suspension event that happened in the company. There is no difference between the average abnormal return shares occurred shows in the information that has been absorbed by the market so the investors do the anticipation on stock price changes.

The results of this research also support the previous research which stated that the capital market in Indonesia Stock Exchange efficient, which means that the price has capital markets reflects the information content that occurs in markets.

Conclusion and Suggestions

1. Conclusion

Based on the results and the discussion of the research done so it can be taken some conclusions among others:

1. Test stationery test results with the ADF test indicates that the overall variable used is stationary with the level of the smaller significance from 0,01, which means the research of data used does not have the roots of the unit which may cause lead to the lancing regression (spurious regression).

2. The results of the abnormal's cumulative return share value before and after the negative value suspension showed negative sentiment market against the suspension information on the companies affected by the suspension.

3. Test results from *2 vary the average sample* t-*test from the Average Abnormal Return* (AAR) shows that there is no difference significant *AAR* between before and after the suspension event indicates that the information has been absorbed by the market and investors have been anticipating the changes of return shares in BEI. The situation supports the previous research which stated that the Indonesian capital market is located on the efficient condition.

2. Suggestions

1. When the perpetrators of the investment take a decision to invest in the capital market preferably first seek clarity regarding the information that is going on related to the type of shares that will be invested in.

2. The suspension event is the event that occurs as a result of an error by the company causing negative sentiment in the market. The company should avoid the suspension by following the rules that have been set by the managers of the capital market.

PERFORMANCE MEASUREMENT INFORMATION, JOB ROTATION, ROLE STRESS AND PERFORMANCE

Fajar Gustiawaty Dewi, The University of Lampung, Indonesia
Abdul Halim, Gadjah Mada University, Indonesia
Slamet Sugiri, Gadjah Mada University, Indonesia
Ertambang Nahartyo, Gadjah Mada University, Indonesia

Abstract

Budgets in the public sector, especially in local government become the starting point for local governments to implement public service. Many strategic decisions relating to the budget that must be taken by public manager for future service improvements.

This study raised the issue that the quality of public manager strategic decisions requires performance measurement information and role stress in local government. Therefore, the performance of public managers associated with budgeting is evaluated in this study.

The study was conducted by using experimental methods to obtain evidence of a causal relationship between performance measurement information, job rotation, role stress, and performance of public managers. This study used a Multivariate Analysis of Variance and path analysis as data analysis.

The results showed that role ambiguity on public manager who received non-financial and financial performance information is lower than public manager who received non-financial performance information only. Public manager performance was significantly higher at the time when experiencing low role ambiguity. These results support the role theory and contingency theory. However, no evidence was obtained that public managers who received non-financial and financial performance measurement information experiencing role conflict is lower than the official who received the non-financial performance measurement information or financial information alone. Similarly, about the job rotation, this study did not obtain evidence that role ambiguity and role conflict were lower in the job rotation with high frequency.

The results also indicate that role ambiguity is fully mediating the effects of performance measurement information on the performance of local government public managers. However, no evidence was obtained that role conflict mediates the influence of performance measurement information on the performance of public managers. Other results showed that role ambiguity and role conflict did not mediate the association with the job rotation and performance.

Keyword: *financial and non-financial performance information,job rotation, performance measurement, role stress.*

Introduction

Questions about the performance of local governments after the reformation are still becoming a hot issue to be discussed. Coste and Tudor (2013) suggested that the performance of services in the public sector is a topic of increasing attention today. The performance of an organization is inseparable from the performance of their leaders, who in the so-called is government public manager. Government public manager plays a very important in driving the performance of government (Moynihan and Pandey, 2010; Melkers and Willoughby, 2005; Cavalluzzo and Ittner, 2004). Stoner (1986) defines performance as the quantity and quality of work completed by an individual, group, or organization. Agency performance is a function of the performance of

programs and activities in it, while the performance of the program/activity is achieved through individual performance in it (LGSP, 2008). In essence, the unit only implements programs and activities that have been decided by public manager in the team budget. Therefore, decisions of official team budget are crucial in creating the performance of local government in the future.

Some previous researchers in the public sector explain that performance measurement is used to improve the quality of decision making (Parker, 1996; Willoughby and Melkers, 2000; Pattison, 2002; Wang, 2002). Acting as an authorized person in the decision-making should desperately need performance measurement information in order to properly carry out its role. The government can use performance measures to improve organizational performance through planning, budgeting, management and better communication (Kreklow, 2005). Conceptually, all system organizations achieve its goals through the allocation of resources generated through the process of managerial decision making (Bodnar and Hopwood, 2010).

However, some studies indicate that the use of performance measurement is still little information in the public sector (Swindell and Kelly, 2000; De Lancer Julnes and Holzer, 2001; Andrews, 2004). De Lancer Julnes and Holzer (2001) suggested that performance measures are not used for decision-making, budget allocation, or monitoring programs. Another study showed that nearly 75% of organizations that collect performance data in the United States do not use it in decision making (Swindell and Kelly, 2000). Most governments can result in performance through performance measurement information, but few governments use performance information (Andrews, 2004). Though the government has devoted tremendous effort in creating performance data in the hope that this performance information will be used to improve performance (Moynihan and Pandey, 2010). Moynihan and Pandey (2010) showed that the antecedent factors that influence the use of performance information by the manager of the local government are public service motivation, the role of the leader, the availability of information, organizational culture and administrative flexibility.

Hall (2008) provided evidence that a comprehensive performance measurement system has positive influence on managerial performance to be mediated by role clarity and psychological empowerment. Research using contingency theory to explain that the performance measurement system, that is part of the management control system needs to be generalized by considering the role of situational factors and psychological empowerment clarity that can be applied effectively. Burney and Widener (2007) showed that strategic performance measurement system (SPMS) positively affects the performance of managers through its relationship with job-relevant information and role ambiguity. The research uses goal setting theory and organizational theory as a basis for research. Goal setting theory predicts that by having a specific purpose in a formalized strategic performance measurement system, the workers become clear about what to do.

The fundamental function of the internal control system is to influence human behavior (Carmichael, 1970). The form of the system of internal control in this study includes the provision of performance measurement information and job rotation. An employee who is too old to work on a part can lead to moral hazard, so job rotation is needed. When an employee is in anticipation of the rotation, the report will be more accurate (Hertzberg et al., 2009).

Chong et al. (2011) provide evidence that the job rotation positively influences the performance of public sector organizations. Phenomenon occurring in local government is that there is a high frequency of rotation so that it becomes a question whether high-frequency job rotation is associated with poor performance. Job rotation done with the correct mechanism will have positive influence on performance (Park, 2010; Giachetti, 2010). However, when the job rotation was short-term, then this can cause problems (Noe et al., 2008).

This research was conducted in the public sector, especially local government, for two reasons. First, the previous studies have not explored conceptual model which shows the antecedent factors of public manager performance in local government. This study proposes Role Theory and Contingency Theory as a relevant perspective to explain the influence of contextual factors on the performance of public manager. Contextual factors refer to changes in the work environment variables, namely: the job rotation, and information technology variables, namely: performance measurement information. Woods (2009) used a contingency theory which the results show that appropriate control depends on the contextual variables of information and communication technology as well as the size of the organization. Woods (2009) tested the contingency theory in the public sector because it argues that the contextual variables in different business sectors are associated with the public sector.

Kahn et al (1964) suggested that role ambiguity and role conflict can be predicted by personal factors, interpersonal, and organizational. Performance measurement information and the job rotation are organizational factors. Rogers and Molnar (1976) explained that as a form of intra-organizational factor is accountability. Performance measurement information is a form of accountability. Parasuraman and Alutto (1981) incorporated contextual variables shift work as antecedents of stress factors in the model study. Displacement refers to the context of changes in the work environment due to different locations within the organization. Testing on the job rotation as antecedent variables in this study uses the arguments developed by Alutto Parasuraman (1981) and Rogers and Molnar (1976).

Second, research on behavioral accounting and managerial accounting has not been done in the public sector. The empirical evidence obtained from studies conducted earlier still showed mixed results. Chong et al (2011) showed the positive effect of job rotation on the performance of public sector organizations. However, Hill (2009) provides evidence that the change of manager is often a negative influence on the performance of individuals and organizations. This suggests that although the job rotation can provide the knowledge, skills and experience on the individual, when carried too fast (high), it will have negative effect on individual behavior.

Research on the performance measures is also not conclusive. In business sector, research from Patelli (2007), Hall (2008) and Lau (2011) showed conflicting results. Patelli research results (2007) are consistent with the Dynamic Role Theory which suggests that diversity measurement of conflicting roles has a negative influence on individual performance. Hall (2008) using contingency theory provided evidence that a comprehensive performance measurement system has positive influence on managerial performance to be mediated by role ambiguity and psychological empowerment. Lau (2011) showed that the non-financial measures influence managerial performance through role ambiguity.

Literature Review and Hypothesis Development

1. Effect of Performance Measurement Information on Role Ambiguity and Role Conflict

Application performance measurement is widely used for management decision making in government who uses a lot of information (Melkers and Willoughby, 2005). Performance information in the public sector is used for management and decision planning, resource allocation decisions, and the incentive scheme (Andrews, 2004). Public managers in local government have some tasks, among others are making decisions and taking budget allocation policies related to the use and implementation of the budget in the area of authority and responsibility.

Performance measurement information provides feedback to the public managers that are expected to improve the quality of decision making. One of the public manager's roles is to make decisions

programs/activities right in the budget. Role ambiguity arises because of lack of information or because there is no information at all or the information is not submitted or is confusing. Factors related to the ambiguity of the role include coordinating the flow of work, a breach in the chain of command, job description, and the adequacy of the flow of communication (Bamber et al, 1989).

Burney and Widener (2007) showed that strategic performance measurement system that contains financial measures and non-financial is closely related to the reduction in role ambiguity. Hall (2008) also showed that a comprehensive performance measurement system (the financial and non-financial) is significantly associated with role clarity both clarity of purpose and process. Kloot (1999) suggested that the single financial performance measures only limited aspects of the performance of an organization. Therefore, non-financial measures are also necessary. Role theory suggests that more complete information received by executive role so that the role executor will understand more the role that should be implemented well. Therefore, the hypotheses in this study are:

H1a: Public managers who receive financial and non-financial performance measurement information will have less role ambiguity than the public managers who received the non-financial performance measurement information only.
H1b: Public managers who receive financial and non-financial performance measurement information will have less role ambiguity than the public managers who received financial performance measurement information only.

The result of Burney and Swanson (2010) research showed that non-financial performance measures are related to job satisfaction manager. Lau (2011) further sought to assess the influence of the financial and non-financial measures alone on role clarity. Research results showed that the non-financial measures affect manager performance significantly through role clarity (ambiguity). The results of the study Lau (2011) also indicated that the effect of a non-financial measure is stronger than financial measures.
H1c: Public managers who receive financial performance measurement information will experience higher role ambiguity than the public managers who received the non-financial performance measurement information.

Simon (2000) suggested that the performance measurement system can communicate organizational priorities and performance information for each individual that can help to increase understanding of their job. Patelli (2007) showed that the diversity of measurement experienced subordinates role conflict. This is consistent with the role dynamic theory. When individuals are given a variety of motivational pressure at the same time, then it can lead to role conflict.

Performance measurement information is a portrait of the organization or unit performance, and it should be used by managers in communicating to management at the top level so that managers can understand the above conditions of the unit underneath. It can alert management to organizational goals thereby decreasing conflict manager role for below. Achievement of government organization objectives uses non-financial performance measures.

Extensive use of performance indicators can create a situation in which an agent can learn aspects of their work that is important for the principal (Thiel and Leeuw, 2002). Financial measures on local government emphasize on the efficiency of an activity, while the non-financial measures emphasize on effectiveness. By the time being given the financial and non-financial measures to a role, it means that a role given is a complex set of roles so that there is a role conflict.

H1d: Public managers who receive financial and non-financial performance measurement information will experience higher role conflict than the public managers who received the information of non-financial performance measures alone.

H1e: Public managers who receive financial and non-financial performance measurement information will experience higher role conflict than the public managers who received financial performance measurement information only.

Several recent studies indicate that non-financial performance measures are closely associated with better managerial performance (Burney and Swanson, 2010; Lau, 2011). The non-financial measures emphasize more on the future and long-term goals, while financial measures considered are outdated, too general, lacking focus, historical and incomplete (Lau and Sholihin, 2005). Therefore, the information of non-financial performance measures is expected to be able to direct the behavior of public managers better.

Person-role conflict occurs when the individual perceives a discrepancy between the needs of the individual needs of his role in running a position (Nelson and Quick, 2003). Information of non-financial performance measurement emphasizes more on achieving long-term goals, which is expected to meet the needs of public managers to take a decision in the budget.

H1f: Public managers who receive financial performance measurement information will experience higher role conflict than the public managers who received the non-financial performance measurement information.

2. Effect of Performance Measurement Information on Performance

Kren (1992) showed a positive relationship between work-related information and managerial performance. Performance measurement information in local government contains of input, output and outcome of a program/activity in the budget that can be classified by financial and non-financial information. Financial and non-financial information is a form of information that is relevant to the job because it describes the results of past work performance achievement that can be used as a reference for making decisions. Burney and Widener (1997) and Kren (1992) suggested that job-relevant information is information used for decision-making.

Performance measurement information contains performance indicators. In the preparation phase of the government budget, it can use performance indicators to show the expected performance level, and at the stage of execution/evaluation of the budget, it can be used to assure the efficiency and effectiveness of a program (Wang, 2000). Role theory assumes that a person will hold the behavioral expectations for himself and others' expectations of him. Performance measurement information is a form of a formal set of expectations. The more complete information obtained, the better a public manager carrying out his role. Single performance measures are not sufficient, because public sector organizations have a variety of stakeholders with different goals and often involve in conflicting (Propper and Wilson, 2003). Criticized financial measures only create short-term perspective as part of the management and the tendency to reject the crucial processes that must be run to ensure the long-term health of the organization (Kaplan and Norton, 1992).

Performance measurement system contains of a variety of measures (at least two measures) that convey information, communicate and clarify strategies (Burney and Widener, 2007). The purpose of this performance measurement system is to motivate managers to act consistent with the organization's strategy (Kaplan and Norton, 1996). Kaplan and Norton introduced the

multidimensional perspectives of performance measures that are expected to address the weaknesses that exist in a single performance measure. Comprehensive performance measurement information is better in improving performance compared to single performance measurement information (Feltham and Xie, 1994; Propper and Wilson, 2003; Ullrich and Tuttle, 2004).

H2a: Performance of public managers who received non-financial and financial performance measurement information is higher than performance of public managers who received only non-financial or financial performance measurement information.

Curristine (2005) explains that the majority of governments of countries that are members of the Organization for Economic Co-operation and Development (OECD) tried to move the emphasis of budget and management from input to the focus on results that are measured in terms of output and/or outcome. This suggests that the current attention on the local government performance measures has shifted to non-financial performance measures. Campbell research (2008) showed that the promotion and demotion are sensitive to non-financial performance measures of quality of service.

Several recent studies show that non-financial information is more powerful in influencing job-outcomes rather than financial information (Burney and Swanson, 2010; Lau, 2011). Burney and Swanson (2010) provide evidence that non-financial performance measures are related to job satisfaction manager. Individual job satisfaction has a strong correlation with the performance of the individual (Petty et al., 1984). Marginson et al (2014) also found that the interactive use of measures of non-financial performance is very important to produce the positive psychological experiences and indirectly improve performance.

H2b: Performance of public managers who received information of non-financial performance measures is higher than the public managers who received financial information only.

3. Effect of Job Rotation on Role Ambiguity and Role Conflict

Kahn et al. (1964) suggested that the role stress predictors are personal factors, interpersonal, and organizational. Job rotation is part of the organizational factors, namely changes in the work environment and the application of the principle of control. In the role theory, it is proposed that different groups demand needs of different roles on the individual (Robbins and Judge, 2011). This means that in the event of job rotation, the role played by a manager will be different too. The results of the study from Morris (1956) showed that individuals who rotated agree that rotation gives them a better understanding of internal and external forces are varied.

Job rotation occurs when an organization deliberately moves employees from one job to another to reduce boredom by giving them varied assignments (Giachetti, 2010). Displacement refers to the context of the work environment changes due to a different location within the organization (Parasuraman and Alutto, 1981). In a company that has a turnover rate (turn-over), it needs lower occurring job rotation as one way to increase the work productivity of employees (Park, 2011).

Cooper et al. (2010) explains that the horizontal rotation of the focal person is sensitive to the role requiring the coordination of a role set. Knowledge of another job gives personal growth, increases self-confidence, and gets people fit and job-oriented. Parasuraman and Alutto (1981) incorporate contextual variables of job transfer (shift work) as antecedents of stress factors in the model study. Job rotation gives knowledge and more experience for individuals in various areas or functions within an organization. Through job rotation program, some knowledge and experience gained

from the previous department has been moved to a new department (Chong et al, 2011). The literature of executive development indicates that the rotation related to career development, improves the experience and learning because it runs a variety of different roles (Champion et al., 1994). Job rotation can clarify the role that can reduce role ambiguity.

H3a: Public managers who have job rotation with high frequency will have less role ambiguity than public managers who have job rotation with low frequency.

Role conflict can occur in three forms, namely person-role conflict, conflict and intra role conflict (Gibson et al., 2003; Nelson and Quick, 2003). Essentially, role conflict occurs when an individual has a condition in congruency or incompatibility with regard to the needs of the individual in their role (Rizzo et al, 1970). Job rotation means redesigning or enriching jobs to develop a number of skills that is varied, task identity, task significance, autonomy and feedback, and allows to improve both motivation and job performance and to reduce the level of stress (Cooper et al., 2010) .
Kaymaz (2010) suggested that work with many people at different periods of time, develops a relationship with humans and support internal and external communication between departments. Rotation gives space for open communication with other people who have the characteristics of different behaviors. Individuals who experience job rotation are perceived to have the ability of adaptability and flexibility (Champion et al, 1994) so it can decrease the role conflict.

H3b: Public managers who have job rotation with high frequency will experience lower role conflict than public managers that experienced job rotation with low frequency.

4. Effect of Job Rotation on Performance

Many companies do the job rotation among them with the aim to prepare lower-level workers for promotion and to reduce the moral hazard problem (Park, 2010). With a job rotation, an individual is expected to gain additional knowledge and experience from other areas so they are able to enhance its capabilities. Job rotation contributes more effective at all levels of managerial decisions with the knowledge and experience gained from diverse assignments in several departments (Kaymaz, 2010). Research results support the theory that the job rotation practices have a positive effect on motivation. Inheritance boring (monotone), increased knowledge, skills and competencies, as well as the development of social relationships in the practice of rotational position have a positive effect on motivation. Brownell and McInnes (1986) showed that the positive effect of motivation on performance.
Sison (2000) explains that the most common development of planning supervisors and executives is job training and job rotation. This policy is to sharpen the executive managerial skills to produce better work performance and enable managers to overcome obsolescence. Training through the job rotation environment will help managers develop more effective utilization and employee relations. Job rotation can be done quickly or slowly depends on the characteristics of the organizational environment. In companies that experience rapid technological change such as in Japan, it is more suitable to apply a faster job rotation to improve employee productivity. At companies that require in-depth expertise in a field such as in America, more effective use of job rotation is slow. As with the existing characteristics of the public sector organizations, public sector organizations, especially local governments, they do not aim for profit and slow adoption of the technology (Zhonghua and Ye, 2012).

Contingency theory explains that there is no management control system design which is universally applicable to all types of organizations. The effectiveness of an organization depends on the control design of the contextual/situational factors. Contextual variables are often found in previous studies such as the external environment (uncertainty, ambiguity and rapid technological development), technology, organizational structure, organizational size, strategy and organizational culture. A good fit means improved performance, while the poor fit implies a decrease in performance (Chenhall, 2003).

H4: Performance of public managers who have job rotation with a high frequency is higher than performance of public managers who have job rotation with a low frequency.

5.   Effect of Role Ambiguity and Role Conflict on Performance

Role stress is often constructed with role ambiguity and role conflict. Role ambiguity relates to the perception of information gap needed to carry out his role with the uncertainty of expectations of different role set members (Saether, 2011).   Role ambiguity is found negatively related to performance (Hamner and Tosi, 1976 in Belkaoui, 1989; Saether, 2011). Role clarity has a positive effect on the achievement of the organization's business plan and the achievement of objectives relating to the provision of services to the community (Greatbanks and Tapp, 2007).

Fisher (2001) provides evidence that the role ambiguity was significantly negative associated with auditor job performance and job satisfaction. High role conflict and role ambiguity give effect to a decrease in job satisfaction resulting in a decrease in performance, which further increases the tendency to leave the organization (Senatra, 1980). Similarly, Fried et al. (1998) provide evidence that the increased role ambiguity and role conflict simultaneously linked to the level of the lower job performance. Role ambiguity caused improper behavior on the job so it affects negatively on performance (Tubre and Colins, 2000). This is consistent with the role theory.

Bamber et al. (1989) found that role conflict arising will increase anxiety in the line of duty. Feelings of anxiety in the work can degrade the performance of the individual. Therefore, it is necessary to create an environment that can reduce role conflict. Abernethy and Stoelwinder (1995) provide strong support that creating an environment that decreases the role conflict affects positively significantly on job satisfaction and performance of individual subunits as a whole. High role conflict leads to a decrease in performance (Senatra, 1980; Fried et al., 1998).

H5a: Role ambiguity experienced by public managers negatively affects the performance of public managers.

H5b: Role conflict experienced by public managers negatively affects the performance of public managers.

6. Role Ambiguity and Role Conflict as Intervening Variable between Performance Measurement Information and Job Rotation to Job Performance

Role theory states that when the expected behaviors of individuals are inconsistent, then the individual will lead to stress, dissatisfaction, and poor performance (Rizzo et al., 1970). Therefore, stress is not expected in the work. Katz and Kahn (1964) and Rizzo et al (1970) suggested that the antecedents of the role stress factors are personal factors, interpersonal, and organizational. Rogers and Molnar (1976) divided it into two organizational variables, namely: intra-organizational and inter-organizational.   One   of   intra-organizational   variable   is   accountability,   while   inter-

organizational variable is resource exchange. Performance measurement information is a form of accountability in local government that contains information of the program/activity achievement program/activity that is expected to clarify how much effort must be made to achieve the goal.

The results of the study from Hall (2008) showed that the role clarity fully mediates the relationship of comprehensive performance measurement systems and managerial performance. Burney and Widener (2007) also found that strategic performance measurement system is significantly associated with the role clarity/ambiguity, and role clarity is an important intervening variable between strategic performance measurement systems and performance manager.

H6a: performance measurement information affects performance through the reduction of role ambiguity.

Patelli research results (2007) indicate that the diversity measurement causes role conflict experienced by subordinates, which then negatively affects the performance of the individual. This is consistent with the role dynamic theory. The dynamics of the role given to individuals through performance measures of financial and non-financial roles can lead to conflict because they allow the occurrence of difficulties in fulfilling both. An activity in local government performance will be measured by the level of efficiency (financial measures) and effectiveness (non-financial measures). In fact, it would be difficult to optimize both in one fiscal year due to the size of the non-financial long-term oriented.

H6b: performance measurement information affects performance through increased role conflict.

Rizzo et al (1970) describe that the position of role ambiguity and role conflict has been explained as an intervening variable that mediates the effect of diverse organizational practices of individual or organization outcome. Exchange of leadership is one of the inter-organizational variables (Rogers and Molnar, 1976). Job rotation is a form of exchange of resources in order to improve the ability of adaptability and flexibility of a person (Champion, et al, 1994).

Adaptability and flexibility of these capabilities could be expected to decrease the role conflict they experienced. Role conflict occurs when a manager is not able to meet the expectations of the job due to incompatible demands (Rizzo et al, 1970; Kren, 1992, Fogarty, 1996). Many previous studies agree that the job rotation is positively related to performance (Champion, et al, 1994; Mourdoukoutas and Roy, 1994; Ortega, 2001; Eriksson and Ortega, 2006; Bei, 2009; Kaymaz 2010, and Chong et al, 2011).

H6c: job rotation affects the public manager performance through a reduction in role ambiguity.
H6d: job rotation affects the public manager performance through a reduction in role conflict.

Research Methods
Data collecting in this study uses laboratory experiments, carried out in two areas: Yogyakarta and Lampung (Way Kanan regency) in Indonesia. Treatments to the subject of two independent variables were investigated, namely performance measurement information and job rotation. Control is done on the inherent variables in the subjects, such as: age, gender, level of education, by using way of random assignment that then it is tested with the chi-square test.

2x3 between variable factorial designs used in this experiment to test whether the performance of public managers (dependent variable) is affected by two (2) independent variables, performance

measurement information and job rotation through a variable intervening: role ambiguity and role conflict. Performance measurement information was manipulated by three (3) levels, namely: non-financial information, financial information, and financial and non-financial information. The job rotation was manipulated with two (2) levels, namely: low frequency and high frequency. Testing of hypotheses 1 and 3 used Manova, while hypotheses 2 and 4 used Anova. Hypothesis 5 used multiple regression, while hypothesis 6 used path analysis.

Table 1. Experimental Design

		Performance Measurement Information		
		Non-Financial	Financial	Financial &Non-financial
Job Rotation	Low Frequency	1	2	3
	High Frequency	4	5	6

Results and Discussion

In experimental studies, randomization is an important thing to do. Tests using the Chi-Square Tests (df = 5, n = 96) showed that there was no significant difference between the experimental conditions for gender (Pearson $\chi 2$ = 2.986, p> 0.702), for the experiments place (Pearson $\chi 2$ = 1.415, p > 0.923), age (Pearson $\chi 2$ = 154.447, p> 0.07), duration of work (Pearson $\chi 2$ = 94.843, p> 0.485), and long-serving (Pearson $\chi 2$ = 48.708, p> 0.525). Testing for normality using the Kolmogorov-Smirnov test showed that the variables age (p> 0.074) and duration of working were (0,138) normally distributed.

Manipulation check was done to convince researchers that the participants have understood and felt the action correctly given. The results of the manipulation check for the variable performance measurement information to the subject in Yogyakarta showed 91% passes, while 92% of Lampung subjects answering correctly.

The results of the manipulation check for the variable rotation of the first questions to the subject position in Yogyakarta and Lampung showed the same figure which is 94% of the subjects answering correctly. The second question to the Yogyakarta region showed 100% of the subjects answering correctly, while for Lampung showed 99% of the subjects answering correctly.

Testing of hypotheses 1 and 3 used Manova, so it is necessary to firstly conduct assumption tests that must be fulfilled, such as: normality test, Homogeneity test of variance and covariance. Normality test is done by Kolmogorov Smirnov resulting that data were normally distributed. Levene's test showed that the variance was homogeneous. Similarly, homogeneity test of covariance showed that there was no difference between cells covariates.

Table2. The mean of Role Ambiguity, Role Conflict and Performance
Panel A. Independent Variable I

Performance Measurement Information	Mean Role Ambiguity	Mean Role Conflict	Mean Performance	N
Non-Financial	4,50	5,03	2,997	30
Financial	3,97	4,73	3,030	30
Financial and Non-Financial	3,42	4,28	3,039	36

Panel B. **Independent Variable** II

Job Rotation	Mean Ambiguity	Role Mean Conflict	Role Mean Performance	N
Low Frequency	3,86	4,90	2,935	49
High Frequency	4,00	4,40	3,115	47

Testing of H1a, H1b, and H1c is done based on the results of Multiple Comparisons Turkey HSD by using the results in Table 3. The result indicates that the lower role ambiguity occurs in the public managers who received financial and non-financial information than the public managers who received the non-financial performance measurement information, which means that H1a is supported. Mean difference between the two was 1.08 (p = 0.036, p <0.05).

Table3. Mean Differences of Role Ambiguity with Turkey

	PMI (I)	PMI (J)	Mean Differences (I-J)	Sig.	Conclusion
Tukey	F & NF	NF	-1,08**	0,036	H1a supported
	F & NF	F	-0,55	0,284	H1b not supported
	F	NF	-0,53	0,316	H1c not supported

PMI= Performance Measurement Information, NF=Non-financial, F=Financial,

F & NF=Financialdan Non-Financial

**) significantat p <0,05

Table 3 also shows that the H1b and H1c are not supported. These results are not in line with Lau (2011) showing that the non-financial measures influence managerial performance through role ambiguity.

Supporting H1a means giving support to role stress theory, at which time a person get a complete and clear information relating to the execution of the tasks that must be delineated and a clearer direction of what to do. Financial information and non-financial together was the message delivered to the individual organization, which may be pressure for the individual. With supporting H1a, it means that role stress theory is also applied to public sector organizations, especially local government.

The mean of role ambiguity in job rotation with a low frequency is 3.90, whereas the mean of role ambiguity in job the rotation with high frequency is greater, which is 4.02. Although there is a mean difference of 0.12 in role ambiguity on the second level of treatment, these results were not statistically different (H3a was not supported). Tests were conducted with Manova produce F count 0,084 with p = 0.772 (p> 0.05), which means that there is no difference in the role ambiguity with low-frequency job rotation and high frequency. Not supporting H3a because the job rotation does not provide additional knowledge and skills related to the job he had to do, so it does not affect the role ambiguity. These results do not support the role stress theory. The results of this study suggest that environmental changes faced by public managers either fast or slow, it does not affect the clarity of work implementation.

Testing for H3b was performed by generating Manova F count 1,815 with p = 0.181 (p> 0.05), which means that there is no difference in the role conflict with the low-frequency job rotation and high frequency, which means H3b is not supported.

Table 4. Mean Differences of Role Conflict with Turkey

	PMI (I)	PMI (J)	Mean Differences (I-J)	Sig.	Conclusion
Tukey	F & NF	NF	-0,77*	0,096	H1d not supported
	F & NF	F	-0,47	0,308	H1e not supported
	F	NF	-0,30	0,532	H1f not supported

*) significantat p <0,10

Test results of H1d, H1e, H1f show that there is no difference in the role conflict in giving three levels of performance measurement information: non-financial, financial, as well as financial and non-financial. Thus, H1d, H1e, H1f are not supported.

In role theory, someone who will be fully informed a job is expected to perform the job better. The results of the ANOVA test resulted F counting of 0.008 with p = 0.992 (p> 0.05). This means that there is no difference in performance from giving the third level of performance measurement information (H2a and H2b are not supported). De Lancer Julnes and Holzer (2001) have suggested that the decision-making process at the stage of adoption and implementation of the information use in the government's performance is influenced by rational and political factors and organizational culture. When political factor is dominant, the public manager then is not rational so that performance measurement information is not considered in the decision process.

The results of this study are consistent with Lau and Sholihin (2005) providing evidence that the use of non-financial performance measures alone or financial measures partially only do not affect the behavior of managers. Kasdin (2010) revealed that the failure of performance measures to motivate public managers in the government is because the performance measures used are numerous and complicated so that it becomes difficult to use. Another factor is the lack of incentive when the program is completed successfully (Kasdin, 2010). These results provide direction for future research to consider the incentive variable as a variable that affects the use of performance measurement information to improve performance.

Testing H4 shows that there is a difference of 0.18, but this result is not statistically significant with a calculated F of 0.328; p = 0.568 (p> 0.05). It means that H4 stating that performance of public managers experiencing high-frequency job rotation is higher than the ones having job rotation with low frequency is not supported. These results do not lend support to the contingency theory and is not in line with previous studies that have been done in the business sector, which indicated that the job rotation practices have a positive effect on employee job outcomes (Kaymaz, 2010). This study suggests that performance measurement information and job rotation are not contextual factors that affect performance in local government.

Testing of H5a stated that role ambiguity experienced public managers negatively affects the performance of public managers. The results showed the coefficient of -0.276; p = 0.01 (p <0.05). It means that H5a is supported. These results are consistent with studies from Yitzhak et al. (1998), Fogarty et al. (2000), Caillier (2010), and Singh and Dubey (2011), and Caillier (2010) conducting

study in government. Table 5 below shows that H5b is not supported. This result is consistent with the results of the research Burney and Widener (2007).

Table 5. Results of Regression Testing

Dependent Variable	Independent Variable	Coefficient	t-value	p-value	Conclusion
Performance	Role Ambiguity	-0,276	-2,627	0,010	H5a supported
	Role Conflict	0,146	1,394	0,167	H5b not supported

The results of path analysis showed that the effect of performance measurement information is not directly on the performance of the work, through role ambiguity. Coefficients resulted from the influence of performance measurement information testtowards the role ambiguity -0.217; p <0.05. Similarly, the coefficients generated from the test of role ambiguity effect on the performance is -0.276; p <0.05. Coefficients having negative mark in the model indicate that more complete measurement of performance information (financial and non-financial) causes lower role ambiguity. Furthermore, a low role ambiguity can improve job performance. However, the direct effect of performance measurement information on job performance coefficient is -0.022; p> 0.05, which is not significant. These results indicate that H6a is supported.

This study supports the contingency theory that the ambiguity of the role as one of the situational factors needs to be considered when choosing the type of performance measurement information that can improve performance. These results also provide support to the role stress theory. By the time a person is given adequate information relating to the task he had to do, so it can reduce role ambiguity that eventually can improve job performance. Table 6 also shows that role conflict does not become intervening between performance measurement information to the performance of the work. This result means that H6b is not supported.

The results of path analysis showed that no evidence obtained that the job rotation affects job performance, either directly or indirectly through role ambiguity and role conflict. These results indicate that H6c and H6d are not supported. It means that the job rotation performed in the local government does not have an impact on the psychological aspects of the work and performance of local government public managers.

Table 6. The Results of *Path Analysis*

Dependent Variable	Independent Variable	Path Coefficient	t-value	p-value	Conclusion
Ambiguity	PMI	-0,217	-2,145	0,035	P<0,05
Performance	PMI	-0,022	-0,212	0,833	p>0,05
Performance	Ambiguity	-0,276	-2,627	0,010	P<0,05
					H6a supported
Conflict	PMI	-0,172	-1,702	0,092	p>0,05
Performance	PMI	-0,022	-0,212	0,833	p>0,05
Performance	Conflict	0,146	1,394	0,167	p>0,05
					H6b not supported
Ambiguity	Job Rotation	0,030	0,292	0,771	p>0,05
Performance	Job Rotation	0,088	0,864	0,390	p>0,05
Performance	Ambiguity	-0,276	-2,627	0,010	P<0,05
					H6c not supported

Conflict	Job Rotation	-0,137	-1,352	0,180	p>0,05
Performance	Job Rotation	0,088	0,864	0,390	p>0,05
Performance	Conflict	0,146	1,394	0,167	p>0,05
					H6d not supported

The results showed that many hypotheses are not supported. Especially for the testing related to the job rotation, literature that can explain it has not been found. Therefore, in-depth interviews are conducted with local government public managers, with the hope of getting answers why this hypothesis is not supported. Interviews were conducted by one of the public managers who had experienced high and low rotation.

Interviewee selected with characteristics of experiencing job rotation with low and high frequency, so that the answer given is not a perception but it is something that is felt. Having attempted to trace the names of officers who rotated through the Regional Employment Agency of Lampung province, the data were not given for confidentiality reasons. Then, another way is used to observe the news in the local newspaper relating to the job rotation for two years. Observations indicate that the public managers who had experienced rapid and slow rotation are only three people, but only one person who is willing to be interviewed by investigators.

A series of questions posed essentially seek for answers on why and how the rotation does not affect the performance of official position. The answers given are as follows:

1. Job rotation does not affect the performance of public managers because basically the pattern of employment in the local government system has been formed, meaning that the work or tasks each employee is already well. Therefore, the change of leadership that can occur at any time does not affect the work to be completed. The work becomes duties (duties and functions) of each employee that must be completed on time. Leaders, in this case, only serve as controller only. Therefore, job rotation experienced public managers also has no effect on role ambiguity and role conflict that are perceived as work to be done by a team working beneath it.

2. After the job rotation, the first thing done is to try to learn the official duties and previous findings related. Especially, at this time, each unit of work has been required to establish an internal government watchdog unit in charge of guarding the implementation of programs and activities in accordance with the plan. The presence of this unit helps public managers to be able to perform the job better.

Conclusion

This study wanted to test the ability of Role Theory and Contingency Theory in explaining the phenomena occurring in public sector organizations, especially local government. Role theory is used in research to explain the relationship of accounting performance measures of financial and non-financial business sector behavior (Lau, 2011; Patelli, 2007), as well as the application of the controlling principles (Burkert et al, 2011), but no studies that tested this theory in the public sector. Paradigm change (into the New Public Management) occurring in government in Indonesia since 2000 is seen to be able to bridge these hypotheses testing.

Specifically, the role theory is divided into three types, namely: the role stress theory, role expansion theory, and the role dynamics theory. In the role dynamics theory, performance measure is a motivational pressure transmitted to individuals in order to influence their role (Patelli, 2007). One result of this study indicates that the use of financial performance measurement information and non-financial more can improve the performance of local public managers through decreasing of role ambiguity, compared to the provision of non-financial information or financial information

alone. These results support the role dynamics theory, which means that it also give theoretical contribution.

In the business sector, research on performance measures has not been conclusive. Researches from Patelli (2007), Hall (2008) and Lau (2011) showed conflicting results. Patelli research results (2007) are consistent with the Role Dynamic Theory which suggests that the diversity of measurement creates role conflict that eventually gives a negative influence on individual performance. Multidimensional performance measures give pressure simultaneously that are sent to a subordinate role, so it creates role conflict. However, Patelli (2007) showed that diversity does not affect the measurement of role ambiguity, contrary to the results of research Hall (2008). Lau (2011) compared the non-financial and financial measures resulting that non-financial measure has a stronger negative effect on role ambiguity than financial measures. The non-financial measures give clarity of role in achieving organizational goals. The difference in study results may be due to differences in methodology and research context. Performance measure used by Patelli (2007) is a measure of organizational performance in the context of establishing incentive plan, while Lau (2011) used individual performance measures to evaluate the performance of the individual. This dissertation contributes subsequent theoretical context of decision-making by public manager relating to the budget.

Contingency theory is used to investigate the effect of contextual variables in the public sector. Contextual variables in the business sector may differ from those in the public sector (Woods, 2009). Contextual factors refer to changes in the work environment variables, namely: the job rotation, and information technology variables, namely: performance measurement information. Performance measurement information and job rotation are parts of the management control system. Testing on the effectiveness of performance measurement information and job rotation practices can contribute to the regulator. The issues raised in this study have not been investigated in public sector organizations.

The findings in this study indicate that the performance measurement information to improve performance through the reduction of role ambiguity. These results may encourage the use of performance measurement information, which is not optimally used in local government. This study implies that role ambiguity may be one factor in contextual variables in local government. Results of other studies indicate that rotation does not affect the performance of public managers either directly or indirectly through role ambiguity and role conflict. These results imply the need to explore other theories that could explain the phenomenon. Franco and Bourne (2003) suggested that the system is applied to the public sector becomes ineffective because of the environment in the public sector and the politics of government agenda that ultimately distort the system.

Limitations and Recommendations for Future Research

This study has limitations, primarily on two things, namely: the use of paper and pencil in the implementation of the experiment, and not allowing job rotation to be done as real experience. First, the implementation of experiments using paper and pencil is chosen because of technical constraints faced by experimental subjects when using the computer. When testing is carried out, most of experimental subjects who are government employees, are not familiar in using computers, so many errors occur on it implementation. It is quite disturbing in the process of implementation of the experiment. However, the use of paper and pencil in this study also raises weakness that is related to the work of most subjects that cannot be processed because the variables measured data is not answered.

Second, laboratory experiments were conducted to have a weakness because it is difficult to create the same situation with regard to the actual rotational position in the field. For example: a new working environment (leadership and subordinates relationship) and the complexity of the actual work to be performed. This can cause the subject's responses less profound.

Future studies are advised to do a different test on the performance of public manager based on job duration duties, between public manager whose main duty and function from previous position is are still related to the duty and function of new job and public manager whose main duty and function from previous position are not related to the duty and function of new position. The results of these tests will be used to enrich and clarify the phenomena that exist in local government.

Specifically, further research is recommended to include variables related to the experience of new position about the kind of the duties. In additional testing done, the variable experience affects performance of public managers significantly. This can methodologically be the basis of these variables that deserve to be tested in future studies. As theoretically, the experience can be one of the personal factors that will certainly psychologically attached to the individual and will have an impact on its performance in the future.

THE ROLE OF TANGIBLE AND INTANGIBLE RESOURCES ON STRATEGIC GROUP CHANGE IN INDONESIAN BANKING INDUSTRY

Ayi Ahadiat, The University of Lampung, Indonesia
Basu Swastha Dharmmesta, Gadjah Mada University, Indonesia
T. Hani Handoko, Gadjah Mada University, Indonesia
B.M. Purwanto, Gadjah Mada University, Indonesia

Abstract

The research assesses the role of tangible and intangible resources whether as a promoter or a blocker of strategic group change. Samples of the research are 126 Indonesian banking firms, which survived from 1999 to 2007, consists of government owned banks, forex and non forex3 private national banks, regional development banks, mixed banks, and foreign banks. K-means cluster analysis is utilized to identify strategic group formation and analysis of strategic group change followed on the clusters identified. Then, the panel data hierarchical logistic regression analysis is done in order to detect the influence of tangible and intangible resources on strategic group change.

Resource based strategic grouping analysis successfully formulated the strategy typology of banking firms in allocating their financial resources: conservatives, opportunistic, speculative, and progressive. The analysis of strategic change has identified the stable strategic time periods (STTPs) and non-STTPs, identified occurrence, extinction, or survival of strategic group, and recognize the strategic group membership composition change as the strategic group change took place.

Regression analysis results indicate that technological capacity, reputation, CEO successions, bank density, and firm age promote the strategic group change, while results suggest that past performance, human capital, and structural complexity block or inhibit the strategic group change. The physical resources, financial resources, and firm size fail to show their roles either as promoter or blocker of strategic group change.

Key words*: Strategic Group Change, Tangible, and Intangible Resources*

Introduction
1. Background

Strategic change has held an important position in the field of strategic management, as a phenomenon to represent on how an organization achieves the co-alignment with its business environment. Organizational fit or alignment with the environment is vital since the changing in competitive, technological, and sociological environment have frequently been threaten the effectiveness and sustainability of company (Farjoun, 2002; Kraatz and Zajac, 2001; Zajac et al., 2000; Ginsberg, 1988; Ginsberg and Venkatraman, 1985; Van de Ven and Drazin, 1985; Venkatraman, 1989; Venkatraman and Camillus, 1984; Rajagopalan and Spreitzers, 1996; Reger and Huff, 1993).

The objective of accomplishing organizational alignment with its environment is to maximize the company performance, so that the survivability and sustainability of business can be maintained (Thomas et al., 1985; Petigrew, 1987b; Smith and Grimm, 1987; Zajac et al., 2000; Zajac and Shortell, 1989; Zajac and Kraatz, 1993; Rajagapolan and Spreitzers, 1996; Kraatz and Zajac, 2001; Ginsberg 1988). The result of alignment process will show either there is similarity or dissimilarity

of performance among organizations. From this evidence, researchers can conclude that similarity and dissimilarity of strategies and implementation exist among companies (Rumelt, 1974; Rumelt et al., 1991; Mehra, 1996).

The strategic group change as a form of organizational alignment is performed through managing tangible and intangible asset, which is by doing so a company can create its competitive advantage (Aaker, 1989). In one hand, some organizations are very dependent to their environment in acquiring the necessary resources (Aldrich, 1979; Pfeffer and Salancik, 1978). In another hand, some organizations are capable to manage their dependence by using the enactment strategy (Thompson, 1967; Hofer and Schendel, 1978). However, because the environment of business has relatively strong influence, therefore, whenever a fundamental change takes place, organizations within the certain environment should change their strategies as well (Thompson, 1967).

In strategic group change study, researchers have difficulties to come up with a consensus on the drivers of strategic change and degree of manageability (Vicente-Lorente and Zuniga-Vicente, 2006). Consequently, the studies in strategic change in the last two decades have resulted in various perspectives, with inconclusive or idiosyncratic findings of researches (Rajagopalan and Spreitzers, 1996). The most dominant approach in strategic change study recently is an environmental resources approach (Dess and Beard, 1984; Campbell, 1969; Aldrich and Pfeffer, 1976; Aldrich and Reiss, 1976; Pfeffer and Salancik, 1978). The main cause of divergence in research findings is differences theoretical perspectives that contribute most of confusion in conceptualization or in defining the strategic change. The condition has triggered to deepen the understanding on strategic change from the the role of tangible and intangible resources perspective in strategic group change.

2. Research Issues

The conceptual issue of the study is to what extent the role of tangible and intangible resource that can act either as promoter of change, or as inhibitor of change. The methodological issue of the study relates research method that used by earlier studies, which most of them utilize cross section data or some of them used single period case study, as shown in study by Chandler (1962, 1977), Mintzberg (1978), Pettigrew (1987a), Johnson (1987, 1992). Due to main theoretical characteristic of strategic change theory as dynamic, path dependent, or link to temporal aspect of study, then if study uses case study should be several period of case (Pettigrew, 1990). With its dynamic characteristics, strategic change theory needs to be tested by longitudinal method (Greve and Goldeng, 2004). Another methodological issue is level of analysis of earlier studies which used level of industry, business, and organization.

3. Research Questions, Motivation, and Research Context

The formulation of research question: First, whether tangible resource functions as promoter or blocker of strategic group change? Second, whether intangible resource functions as promoter or blocker of strategic group change? In line with the addressed questions, the research main motivation is to test the model of the role of tangible and intangible resources in the strategic group change, with the context or setting of Indonesian banking industry or firms.

Theoretical Review and Hypothesis
1. Conceptualization of Strategy

Minztberg has proposed five definitions of strategy as plan, ploy, pattern, position, and perspective (Mintzberg, 1987; Mintzberg et al., 1995; Mintzberg et al., 1998). First, strategy as a plan is defined as the set of intended actions or as a guideline to face the various situations. A plan

normally formulated before the actions are taken or implemented and explicitly formed in a formal document (Mintzberg, 1987). Second, the strategy as a ploy or maneuver, is an intended steps for defeating competitors or opponents (Minztberg, 1987). This view of strategy focuses more toward dynamic aspects of competition. Third, strategy as a pattern is shown by existing strategic behavior or as a realized strategy, which may content emergent change in policy and deliberated initial plan. Fourth, strategy as a position means that the placement of an organization in favorable position, in spite of competitive or uncompetitive condition. In this case the organization situated in special position or has a niche in its business environment (Minztberg, 1987). According to this thought, strategy is viewed as a mean to develop competitive advantage, by focusing certain business unit, industrial structure, and internal competence (Nyamori et al., 2001). Lastly, fifth, strategy as a perspective is understood as a commitment of a strategist to act and responds the environment in certain way.

2. Conceptualization of Strategic Change

The research of strategic change to date is marked by the inconclusive finding. One of the causes of idiosyncrasy is confusion of definitions on strategic change. Table 1 indicates various perspectives and definitions of strategic change.

Table 1. The Variety of Perspectives and Definitions of Strategic Change

No	Perpective	Definition	Researchers
1	Change cube	Strategic change is the change that relate to organizational direction. Change occur start from conceptual level (i.e. vision and culture) to concrete level (i.e. program and people)	Mintzberg and Westley (1992)
2	Revolutionary change/configurational school/ quantum change/ transformational/ turn around/ frame breaking or discontinuous change	Strategic change is the change that takes place in fundamental and comprehensive manner, involving various organizational elements that path-break the organization pattern, in order to respond external environmental and internal organizational pressures.	Mintzberg et al. (1989) Miller and Friesen (1980a, b, 1982, 1984) Tushman et al. (1986) Karim and Mitchel (2000)
3	Evolutionary/Incrementalism / strategic learning/Strategic drift[25]	Strategic change is the change that takes place gradually or incrementally, by dispatching the linkage with the earlier strategies. The change is resulted from a learning process of earlier strategies weaknesses or fail.	Quinn (1980) Nelson and Winter (1982) Carroll and Hannan (1989) Hannan and Freeman (1989) Arnold and Fristrup (1982) Gould and Eldridge (1977) Van de Ven and Poole (1995) Senge (1990a, b)

[25] Perspektif *evolutionary change* tumpang tindih atau *overlap* dengan perspektif *content, context, and process of change,* juga dengan perspektif lensa pembelajaran.

4	Content, context, and process of change	Strategic change that depends on the not only organizational context and process, but also content of strategy.	Pettigrew (1987a)
5	Rational lens, learning lens, and cognitive lens	**Rational perspective:** Strategic change is defined as unitary concept measured by using discrete change in business or corporate strategy **Learning/cognitive perspective:** Strategic change is viewed as an iterative process; manager influences the changes through relatively small steps that designed in order to investigate environment and organization.	Rajagopalan and Spreitzers (1996)
6	Adaptive vs. inertia/ change vs. resistance force/core capability vs. core rigidity[26]	**Adaptive/Core Capability:** Change in strategy whenever fundamental transformation exists within the business highly inert to change due to two main competences: organizational reliability and accountability. Strategy is viewed as fixed since the initial period and will remain stable environment. **Inertia/Resistance:**	Strebel (1994) Hamel and Prahalad (1994) Teece and Pisano (1994) Teece et al. (1990, 1997) Hannan and Freeman (1977) Leonard-Barton (1992)
7	*Strategic group change*	Strategic change takes place when a firm moves from one strategic group strategies which affect performance.	Hunt (1972) Caves and Porter (1977, 1978) Porter (1979) Hatten and Hatten (1987) McGee and Thomas (1986). Smith et al. (1997) Vicente-Lorente and Zuniga- Vicente (2006) Fiegenbaum et al. (1990, 2001)
8	*Resource-based View* (RBV)[27]	Organizational strategic change is driven by or inhibited by the existing resources, either tangible or intangible resources.	Penrose (1959) Wernerfelt (1984) Barney (1991)

3. Research Model and Hypotheses

The strategic change can be as a form of business reconfiguration that forces to change its business resources, either tangible or tangible asset (Karim and Mitchel, 2000; Sanchez et al., 1996; Galan-

---

[26] Perspektif adaptive vs inertia tidak berdiri sendiri tapi menjadi bagian dari perspektif evolutionary, content, context, and process of change, serta strategic group change.

[27] The Resource Based Perspective intersect with perspective of evolutionary, content, context, and process of change, as well as strategic group change. Overlaping among perspective can be seen from explaination each of perspective

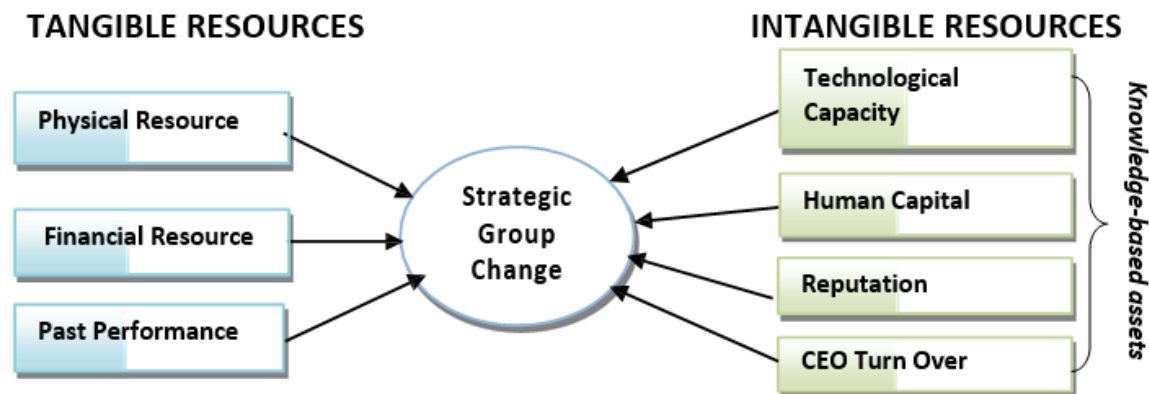
Zazo and Zuniga-Vicente, 2003; Wernerfelt, 1984; Chatterjee and Wernerfelt, 1995; Winter, 2000, 2003; Helfat et al. 2007; Barney and Clark, 2007). Competitive pressures require organization to change its resources mix in order to create or exploit new opportunities (Penrose, 1959; Porter, 1979). Based on its utilization, a resource that possessed by an organization can promote the development of products and services mix. Therefore, resources can be meant as bundles of potential products and services. The possession of certain resources can become source of firm uniqueness (Penrose, 1959). The model of research will assess two type resources, tangible and intangible, as determinants of strategic group change, which is shown in Figure 1.


Figure 1: Research Model

Each of resources, if it is proven by model testing has positive influence on the strategic group change, and then it can be conclude that type of resource functions as driver of strategic group change. However, when it is proven has negative influence on the strategic change, then it can be concluded that type of resource functions as inhibitor of strategic change. Prior to the testing of resource role, whether it is as a driver or as an inhibitor of strategic group change, the determination of stable strategic time periods (SSTPs) must be done. From the SSTPs testing, number of membership of each strategic group in each period can be known. Then, judgment of whether membership change take place as an indicator of strategic group change can be known as well. Each strategic group represents a typology of strategy; therefore the identification of strategic typologies is done after SSTPs are known.

In order to assess the influence of resources role on the strategic change, following hypotheses are formulated:

H1: Physical resource positively influences on strategic group change.
H2: Financial resource positively influences on strategic group change.
H3: Past performance positively influences on strategic group change.
H4: Technological capacity positively influences on strategic group change.
H5: Human capital positively influences on strategic group change.
H6: Reputation positively influences on strategic group change.
H7: CEO turnover positively influences on strategic group change.

Research Method
1. Research Design, Setting, Sample, Level and Unit of Analysis

Design of research is longitudinal analysis that is combining the cross section and time series data in the form of panel data. The utilization of research design is based on the consideration that hypotheses of strategic change have dynamic theory characteristics. Setting or context of research is Indonesian banking industry. Samples are selected from the population of banking firms, in category of state owned banks, foreign exchange national private banks, non foreign exchange national private banks, regional banks, mixed banks, and foreign banks. Periods of data range from 1999 to 2007, with 126 banks are selected out of 129 banks. In this research, strategic changes are assumed to take place in the level of organization with banking firm as unit of analysis.

2. Variables Operationalization
A. Dependent Variable

Dependent variable or criterion variable of the research is strategic group change is also can be called as strategic mobility. Operationalization of strategic change variables draws on three stages procedure (Galan-Zazo and Zuniga- Vicente, 2003; Fiegenbaum et al., 1990). First, strategic variables or strategic dimensions that represent strategies used by banking firms are selected. These dimensions are used to form strategic group in cluster analysis. Second, identification of strategic group resulted from cluster analysis. Third, determination of strategic group change is done by looking at the membership movement among groups to form SSTPs and non SSTPs. This three stages procedure in operationalization is based on earlier studies (Fuente-Sabate et al., 2007; Vicente-Lorente and Zuniga-Vicente, 2006; Fiegenbaum et al., 1990; Fiegenbaum et al., 2001; Fiegenbaum and Thomas, 1990; Dierickx and Cool, 1989).

Strategic dimensions reflect differences in banking products and services for each market segment, and represent bank lending strategy as resources allocation done by banking firms in achieving certain goal for the sake of performance (Barney and Clark, 2007; David, 2009; Thompson et al., 2010). Fund lending done by banks is categorized in intermediation and disintermediation activity (Eisenbeis, 1985; Smith and Walter, 2003; Walter, 2002). Each lending type represents a strategy in creating return from each market segment. The segments are 1) Central bank segment or Bank Indonesia Certificate; 2) Interbank loan or call money segment; 3) Investment segment; and 4) Intermediation segment.

After forming strategic group and identifying SSTPs, the subsequent step is determining the strategies typology in banking firms based on each formed strategic group. The changing of typologies also presented from year to year. Strategy typologies are created by naming each cluster of bank as strategic group using following guideline shown in Table 2.

B. Independent Variables
a. Tangible Resources

  i. **Physical Resource** or PR is the variable to measure the productive capacity of banking firm. This proxy is measured by natural log (Ln) of bank fixed asset.
  ii. **Financial Resource** or FR represents financial ability of banking firm. This proxy is measured by natural log (Ln) of bank debt ratio that calculated by to Ln total debt divided by equity capital of bank.
  iii. **Past Performance** or **ROEt-1** is a variable that represents learning by experience perspective from a prior performance achievement. This proxy is measured by using one year lag ROE of bank firm.

Table 2. Guideline for Strategic Group Labeling

		Fund Lending Segment			
		SBI Segment	**Inter Bank Segment**	**Investment Segment**	**Intermediation Segment**
Fund Lending Intensity	**Very High (VH)**	Conservative Superior	Very Opportunistic	Very Speculative	Progressive Superior
	High (H)	Conservative	Opportunistic	Speculative	Progressive
	Moderate (M)	Relatively Conservative	Relatively Opportunistic	Relatively Speculative	Relatively Progressive
	Low (L)	Conservative Inferior	Less Opportunistic	Less Speculative	Progressive Inferior
	Very Low (VL)	X	Non Opportunistic	Non Speculative	X

b. Intangible Resource

i.   **Technological Capacity** or TC is innovative capability of banking firm as a potential source of competitive advantage. This proxy is measured by squared root of number ATM of each bank. The placement of ATM is viewed not as physical asset placement but rather as technological capability in reaching customer or market coverage.

ii. **Human Capital** or HC is productive capacity of human resource in contributing firm revenue of banking firm. This proxy is measured by dividing earning before tax (EBT) by total employee.

iii. **Reputation** or RP is a variable to measure customer's loyalty as a reflection of bank credibility from the main stakeholders or customers point of view. This proxy is measured by dividing time deposit by total deposit.

iv. **CEO Turnover** or Succession is a variable to measure the role of CEO as initiator strategic change in bank firms. This proxy is measured by coding it 1 when CEO replacement takes place and 0 when there is no change in CEO personnel.

C. Control Variables

a. **Banking Density** or BD is environmental factor that used to detect the rivalry along the study periods, indicated by how dense the strategic group is. This proxy is measured by dividing number of bank in each cluster by total bank, thus total number of density will be similar to number of cluster in every year of observation.

b. **Firm Age** or FA is a measure of establishment or maturity of a firm in relation to its experience. The age of firm is measured by the total year since its founding.

c. **Firm Size** or FS is an indicator of resource possession by a firm, also represents a political insulation and degree of bureaucratization. This proxy is measured by to Ln the total asset of banking firm.

d. **Structural Complexity** or SC is a variable that indicate degree of banking firm organizational complexity. This proxy is measured by Ln of number of branch offices in each banking firm.

3. Testing Model and Analysis Technique

General equation of hierarchical logistic regression that used in the analysis is:

$$SGC_{it} = \alpha + \beta_1 PR_{it} + \beta_2 FR_{it} + \beta_3 PP_{it} + \beta_4 TC_{it} + \beta_5 HC_{it} + \beta_6 RP_{it} + \beta_7 CEO_{it} + \varepsilon_{it}$$
$$(\beta > 0)\ (\beta > 0)\ (\beta > 0)\ (\beta > 0)\ (\beta > 0)\ (\beta > 0)\ (\beta > 0)$$

Where:

SGC Is strategic group change of bank i in period t (value 1 when the firm moves or changes in group membership, and value 0 when the firm does not move or change in group membership). α Is an intercept *β1, β2, β3, β4, β5, β6, and β7* are slope *ε* Is error term

PRit Is physical resource of bank i in period t (*Ln* of total fixed asset) *FRit* Is financial resource of bank i in period t (total debt/total equity) *PPit* Is past performance of bank i in period t (ROEt-1)

TCit Is technological capacity of bank i in period t ($\sqrt{}$ # of ATM)

HCit Is human capital of bank i in period t (EBIT/total employee)

RPit Is reputation of bank i in period t (time deposit /total deposit)

CEOit Is CEO turnover of bank i in period t (value 1 when CEO change, value 0 when CEO not change)

Control variable that are not included in main model to test hypothesis are:

BDit   Is bank density of bank i in period t (number of bank in a cluster/total bank)

FAit   Is firm age of bank i in period t (period t subtracted by year of founding)

FSit   Is firm size of bank i in period t (*Ln* total assets)

SCit   Is structural complexity of bank i in period t (*Ln* number of branch)

Then the whole equation that includes all control variables will be:

$$SGC_{it} = \alpha + \beta_1 PR_{it} + \beta_2 FR_{it} + \beta_3 PP_{it} + \beta_4 TC_{it} + \beta_5 HC_{it} + \beta_6 RP_{it} + \beta_7 CEO_{it} + \beta_8 BD_{it} + \beta_9 FA_{it} + \beta_{10} FS_{it} + \beta_{11} SC_{it} + \varepsilon_{it}$$

Result and Discussion
1. Data and Sample

The research uses data on profile and financial reports of Indonesian banking firms. Data are acquired from the Indonesia Banking Directory published by Bank Indonesia. Data period of research is ranging from 1999 to 2007. Data type consists of financial and non financial data. Financial data extracted from financial reports, while non financial data extracted from banking firm profile.

The research uses banking firm samples that operate from 1999 to 2007. According to dynamic development of Indonesian banking industry, in the year of 2007, total banking firms which operate their business are 129 banks; out of this number 126 banks are eligibly selected as samples of the research. Basis of selection is mainly bank existence in its operations from 1999 to 2007. Samples are consist of 4 or 3% state-owned banks, 33 or26% foreign exchange private national banks, 36 or 29% non foreign exchange private national banks, 26 or 21% regional banks, 17 or 13% mixed banks, and 10 or 8% foreign banks.

2. Strategic Group Analysis and Strategy Typology
A. Cluster Analysis: Determination of Strategic Group
Strategic group is determined by using cluster analysis with K-Means cluster analysis procedure. The result of analysis shows that in 1999 there are 5 strategic groups existed with mean value of F 99.79, in 2000 there are 3 strategic groups existed with mean value of F 127.11, in 2001 there are 6 strategic groups existed with mean value of F 87.09, in 2002 there are 4 strategic groups existed with mean value of F 72.38, in 2003 there are 4 strategic groups existed with mean value of F 72.38, in 2003 there are 4 strategic groups existed with mean value of F 79,82, in 2004 there are 6 strategic groups existed with mean value of F 61,22, in 2005 to 2007 there are 5 strategic groups existed with mean value of F 70,25, 64,69 and 78,68.

B. Strategic Mobility
Strategic mobility is shown by appearances of new strategic group and disappearances of existing strategic group, net change in term of number of strategic group, and number of sustained strategic group. By scrutinizing the mobility of strategic group, stable strategic time periods (SSTPs) can be identified as well. From the determination of strategic change in Indonesia banking industry, two SSTPs are identified: First SSTP in 2002-2003 indicated by 4 clusters each year; and second SSTP in 2005-2007 indicated by 5 clusters each year.

C. Strategic Group Membership Change
Subsequent stage after determination of strategic group and number of strategic group in each year is to see the strategic group change from year to year. The strategic group change is main issue of the research and as dependent variable. In this research, strategic group change is defined as strategic change in banking firm as a result of bank's group membership from year to year. In 1999, the biggest strategic group in term of member number is cluster 3 with 38 banks, while the strategic group with the least member is cluster 5 with only 1 bank. In 2000, strategic group with highest number of member is cluster 2 with 78 banks, while strategic group with least member is cluster 1 with 10 banks. In 2001, strategic group with highest number of member is cluster 5 with

44 banks, while the strategic group with least member is cluster 6 with only 2 banks. The dynamic of membership change also took place from 2002 to 2007.

D. Strategy Typology Based on Strategic Group

Strategic group formation based on strategic dimensions can lead to the identification of strategic dominant in every group. The dominant strategy that implemented by banking firms within a group characterizes certain typology which can be classified as generic strategies in banking firms. From the cluster analysis of Indonesian banking industry, there are four main strategy categories: 1) conservative strategy; 2) progressive strategy; 3) opportunistic strategy; and 4) speculative strategy. In the process of strategy implementation each category interacts and combines with three other strategies with intensity that differ one to another.

The determination of strategic group change as the dependent variable is done by assessing whether a banking firm change its membership of strategic group or not. Value of 1 is assigned to the firm that changed its membership and

0 to the non change. The whole value (change or not change) of all firms will be used as consequences of strategic group change which will be analyzed which resources determine that changes.

E. Strategic Group Change based on The Strategy Typology

Strategic group change that took place between 1999 and 2007 can be seen from clusters that change each year. In 1999, 5 clusters are identified with most them (56%) are fallen into speculative category. In 2000, 3 clusters are identified with most of them (62%) are included in progressive category. In 2001,

6 clusters are identified with 35% are progressive, 33% are opportunistic, and

29% are conservative. In 2002, 4 clusters are identified with 44% are progressive and 35% are conservative. In 2003, 4 clusters are identified with most of them (63%) are progressive. In 2004, 6 clusters are identified with most of the (66%) are progressive. In 2005, 5 cluster are identified with 55% are conservative and 40% are progressive. In 2006, 5 clusters are identified with 57% are conservative and 40% are progressive. In 2007, 5 clusters are identified with 55% are conservative and 43% are progressive.

Strategy choices were changing overtime which are indicated by strategic group change. From the analysis one can see: (1) in 1999 is speculative period due to uncertainty of the macro economy of Indonesia that caused by economic crises, (2) period between 2000-2004 most banks tend to be progressive as the banks enter the recovery period, (3) period between 2005- 2007 most banks tend to be conservative in responding the central banks regulations (establishment of LPS (Indonesian Deposit Insurance Corporation), Single Presence Policy, and CAR).

3. Hypotheses Results Testing

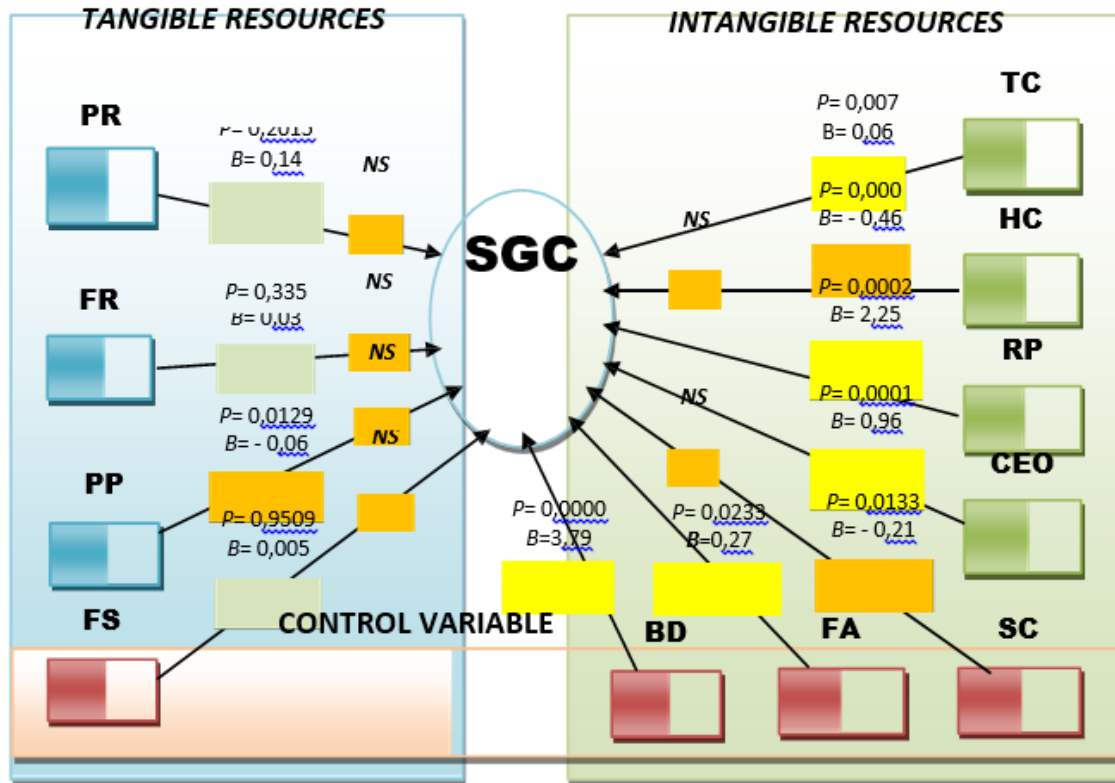
Figure 2 shows those hypotheses testing results which include all variables, significance value, and regression coefficients. Regression analysis results showed that technological capacity, reputation, CEO successions, bank density, and firm age promote the strategic group change. Results suggest that past performance, human capital, and structural complexity block or inhibit the strategic group change. The physical resources, financial resources, and firm size fail to show their roles either as promoter or blocker of strategic group change.


Figure 2. Significances and coefficients of Resources Variables influence on Strategic Group Change

4. Discussions
A. Strategic Group Formation and Changes
Resource based strategic grouping analysis, with strategic dimensions of bank fund allocation segments, successfully formulated the strategy typologies of banking firms: conservative, opportunistic, speculative, and progressive. These typologies are comparable to Miles and Snow (1978) Porter (1980, 1985), McNamara et al. (2003), Reger and Huff (1993), and DeSarbo and Grewal (2008), Ebbes et al. (2010). typologies. The analysis of strategic change has identified the stable strategic time periods (STTPs) and non-STTPs, detected occurrence, disappearance, or survival of strategic group, and detect the strategic group membership composition change as the strategic group change took place.

The SSTPs indicate that within this periods, there is similarity of strategic behavior among firms (Fiegenbaum et al., 1987), and when it turns to instability or to non-STTPs, then when it involves most of the firms within industry strategic path-breaking or revolutionary change or quantum change or turn around or discontinuous change take place (Mintzberg and Westley, 1992; Mintzberg et al., 1989; Miller and Friesen, 1980a, b, 1982, 1984; Tushman et al., 1986; Karim and Mitchel, 2000). However, when change from STTPs to non-STTPs involve few firms and in gradual manner then revolutionary change happen (Van De Ven and Poole, 1995), this concept also known as incrementalism (Quinn, 1980), strategic learning (Hannan and Freeman, 1989; Carroll and Hannan (1989), and strategic drift (Johnson, 1987, 1992).

The analysis implies that the strategic grouping very much depended on the resource allocation policy of banking firms. Banks fund which is allocated to SBI, inter banks loan, securities or capital market, and intermediaries activities (business or commercial loan) can be seen as configuration resource bundles that create the strategic group (Hatten and Hatten, 1987; Dierickxx and Cool, 1989; Mehra, 1996). Similarity and dissimilarity of strategic group resulted from the business level strategies implementation, therefore strategic group analysis is viewed as within industry competition analysis.

B. Resources and Strategic Group Change
a. Influences of Physical Resources, Financial Resources, and Past Performance on Strategic Group Change

Unlike the previous research of Galan-Zazo and Zuniga-Vicente (2003) that showed physical resource as inhibitor, this research indicate that physical resource fail to act either as promoter or as inhibitor of strategic group change or strategic change. Other previous research that found physical resource as inhibitor of strategic change (Wernerfelt, 1989; Boeker, 1989; Dierickx and Cool, 1989; Eaton and Lipsey 1980; Eisenhardt and Martin, 2000; Teece and Pisano, 1994; 2004). Some found physical resources as driver of change (Rumelt, 1974; Pfeffer and Salancik, 1978; Chatterjee and Wernerfelt, 1995).

Similar finding of this research on financial resources that fail to act either as promoter or as inhibitor of strategic group change or strategic change, which is also in line with finding of Galan-Zazo and Zuniga-Vicente (2003). However, contradictory results found in other research, which show that financial resources with its flexible characteristic promote strategic changes (Chatterjee and Wernerfelt, 1995; Teece and Pisano, 1994; Teece et al., 1997; Barney, 1986b; Zajac and Kraatz, 1993; Hoshi et al., 1990; Aoki, 1988).

Past performance is found to have no significant influence on strategic change. However, since it has negative sign in regression result, it suggests that positive past performance can block change, while the negative past performance has potential to induce innovation and learning that can create change in strategic group subsequently. This finding in line with Sitkin (1992), Chandra et al. (2004) and Hom and Haynes (2007) and Galan-Zazo and Zuniga- Vicente (2003), but contradict with Hitt et al. (1998) and Bromiley et al. (2001).

b. Influences of Technological Capacity, Human Capital, Reputation, and CEO Succession on Strategic Group Change

Technological capacity is found to have positive influence on strategic change, or it acts as promoter of strategic group change. This finding contradicted with Galan-Zazo and Zuniga-Vicente (2003), but in line with findings of Bharadwaj et al. (1993) and Roberts and Amit (2003). This research shows that deployment of ATM as technological capacity functions as dynamic capability (Helfat et al., 2007; Foss and Robertson, 2000; Barney and Clark, 2007) in reaching out customer is able to encourage change in terms of market sizes.

Human capital is found to have a negative influence on strategic change, and act as inhibitor of strategic group change. The higher productive capacity of employee the higher resistant to change of the strategic group, this due to competence of human resource can acts as mobility barrier and therefore function as stabilizer of strategic group hegemony.

Reputation is found to have positive influence on strategic change, and acts as promoter of strategic group change. The higher reputation of banking firm the better image it has, and therefore, the

wider opportunities to respond the market and more chance of strategic group change to happen. The finding is in line with Barker III and Duhaime (1997), Kraatz and Zajac (2001), Chatterjee and Wernerfelt (1995), and Zajac and Kraatz (1993). Other research found that reputation acts as a resistant factor of strategic change (Ferguson et al., 2000; Caves and Porter, 1977; Freeman, 1984; Dutton and Dukerich, 1991; Ferguson et al., 2000; Galan-Zazo and Zuniga-Vicente, 2003; Wartick, 1992; Rindova and Fombrun, 1997; Barney, 1986; and Cramer and RuefIi, 1994).

CEO succession is found to have positive influence on strategic change, and acts as promoter of strategic group change. The more frequent of CEO change the more frequent organization to make adjustment to the market requirement and therefore, strategic change is more often to take place due to corporate strategic refocusing by newly assigned CEO (Vicente-Lorente and

Zuniga-Vicente, 2006; Barker and Duhaime, 1997; Goodstein and Boeker, 1991; Lant et al., 1992; Miller, 1993; Westphal and Fredrickson, 2001; Wiersema, 1992; Zuniga-Vicente et al., 2005; Grinyer and McKiernan; 1990; Bigley and Wiersema, 2002)

c. Influences of Bank Density, Firm Age, Firm Size, and Structural Complexity on Strategic Group Change

Bank density is found to have positive influence on strategic change, and acts as promoter of strategic group change. As a measure of rivalry, the higher bank density, the more pressure to the strategic group change. This finding is in line with Vicente-Lorente and Zuniga-Vicente (2006), Zuniga-Vicente and Vicente-Lorente (2004, 2006), Carroll and Hannan (1989), Lee et al. (2002), and Kabanoff and Shane (2008).

Firm age is found to have positive influence on strategic change, and acts as promoter of strategic group change. The finding imply that the older average age of the firms, the more established the firms are, and more tendency to transform themselves through strategic group change, in order to strengthen its legitimacy and to achieve better performance. Boeker (1989) found that age can be either as inertial or as adaptive factor; this finding is confirmed by others (Baum, 1990; Hannan and Freeman, 1984; Kelly and Amburgey, 1991; Ruef,

1997; Galan-Zazo and Zuniga-Vicente, 2003; Sirmon and Hitt, 2009).

Firm size is found to have no influence on strategic change, and its fail to acts either as promoter or as inhibitor of strategic group change. Other researches also show their ambiguous finding (Baum, 1990; Hannan and Freeman, 1984; Haveman, 1993; Kelly and Amburgey, 1991; Haveman, 1993; Ruef, 1997; Zajac and Kraatz, 1993; Zajac et al., 2000, Galan-Zazo and Zuniga- Vicente, 2003). However, Haveman (1993) argue that firm size is political insulation and degree of beauracratization, the bigger is the size of the firms, the more rigid and more inflexible to change. Even though, some organizations are found to be more agile and flexible as the size grows.

S*tructural complexity* is found to have negative influence on strategic change, and acts as inhibitor of strategic group change. The more branches or offices of the firms, the more complex the firms are, and more inert to change. Structural complexity represent the strategy implementation of the firms, the it should support the creation of better performance (Chandler, 1962; Hoskisson et al., 1993; Thompson et al., 2010), because the structural complexity must represent knowledge based integration and dynamic capability (Dagnino et al., 2008). Therefore, structural complexity must facilitate rather than block the strategic group change.

5. Perspective Integration of Resources Influences on Strategic Group Change

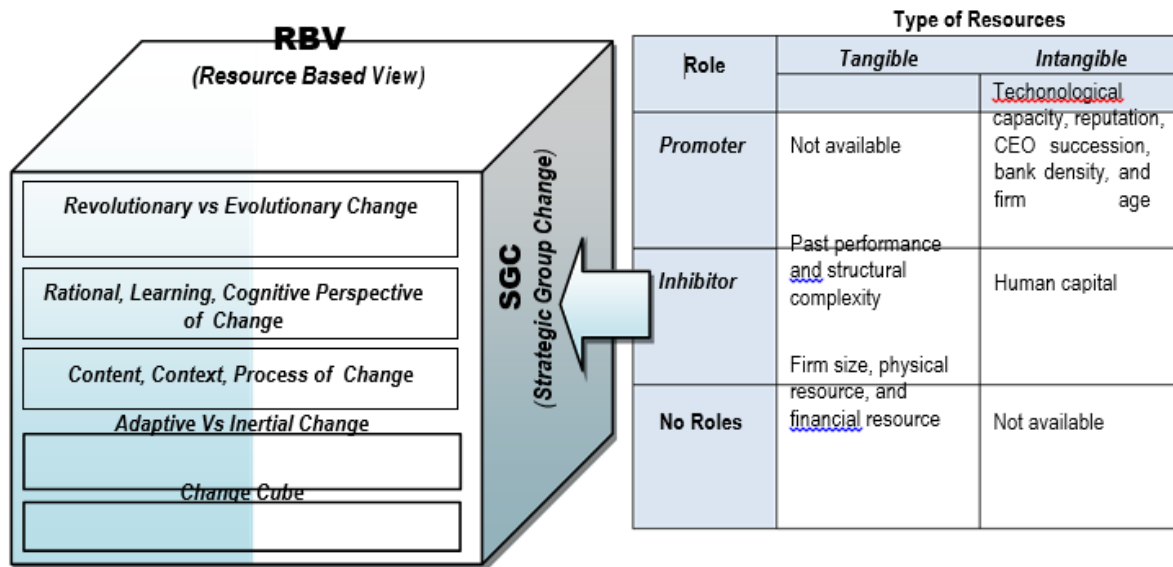
The research utilizes resource based variables can be viewed from two perspectives. First, resources are used as strategic variables or dimensions in formation of strategic group, by considering market segment of each resource bundle. Therefore strategic dimensions of strategic group are the combination of resource based and market based perspectives. Second, resources are determinants of strategic group change, either as promoter or as inhibitor. Various perspectives that involve in explaining how strategic group changes take place are: (1) *resource-based view*; (2) *revolutionary vs. evolutionary change*; (3) *content, context, and process of change*; (4) *rational, learning and cognitive lenses of change*; (5) *adaptive vs. resistance of change*; and (6) *change cube*. Integrative view can be seen in Figure 3.


Figure 3. Various Theoretical Linkages in Strategic Group Change.

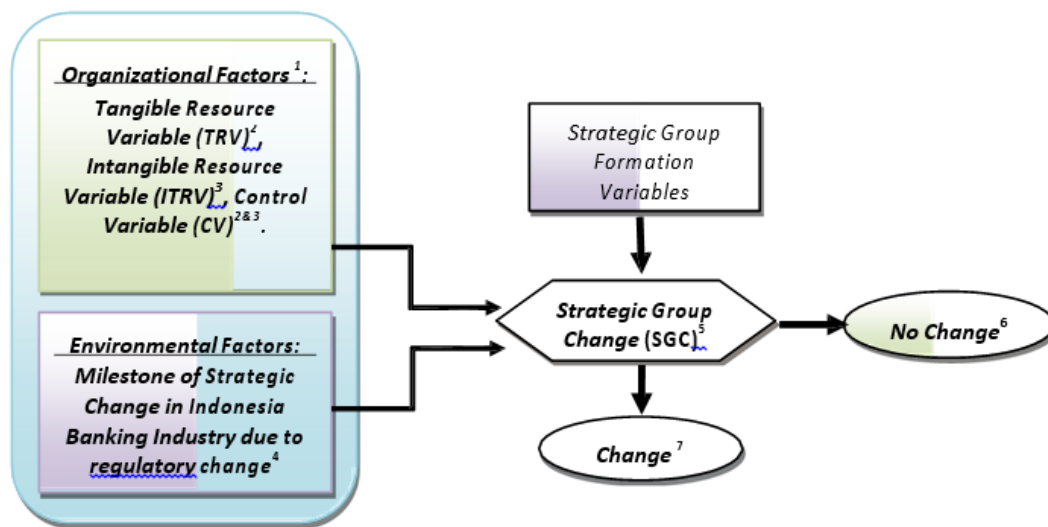
Limitation, Future Research, Contribution, and Implication
1. Limitation and Future Research
Limitations of the research are: (1) The research only determines which resources influence strategic group change whether they promote or inhibit. However subsequent consequences, i.e. regarding direction and magnitude, are not detected, and these can be an future research avenue; (2) Proxies used in this research, like other research which use econometric model, potentially can reduce the true meaning of the constructs. To alleviate this weakness, future research can adopt longitudinal analysis utilizing latent construct with multi dimension variables. Latent growth model (LGM) or longitudinal structural equation modeling can be utilized; (3) The weakness of logistic regression in panel data analysis in Eviews 5.1 cannot determine whether researcher can use fixed effect or random effect, for future research one can use more update version of software.

2. Contribution and Implication
A. Conceptual Contribution
    a.   Strategic group formation in this research use mixed of resource based and market based strategic dimension, which are fund allocations in: (1) Bank Indonesia certificate (SBI

segment); (2) Call money (inter bank loan market segment); (3) Securities (investment in capital market segment), and; (4) commercial loan (intermediation segment).

b. Cluster analysis in this research has successfully identified newly formulated strategy typologies in banking firms: (1) conservative; (2) opportunistic; (3) speculative; and (4) progressive.

c. The research integrate 6 perspectives in strategic management: (1) resource- based view; (2) revolutionary vs. evolutionary change; (3) content, context, and process of change; (4) rational, learning and cognitive lenses of change, (5) adaptive vs. resistance of change, and (6) change cube, in order to explain strategic group change that influenced by tangible and intangible resources (see Figure 4.)


Notes:
Theoretical bases of antecedents and conesquences of strategic group change: 1. Resource Based Perspective, Content of Change, Change Cube Perspective, 2. Rational Lens, 3. Cognitive Lens, 4. Context of Change, 5. Process of Change & Learning Lens, 6. Resistance/Inertia (strategic immobility), 7. Adaptive (strategic mobility): Drastic/ Revolutionary Change or Incremental/ Evolutionary Change

Figure 4. Conceptual contribution of the research

Theoretical bases of antecedents and consequences of strategic group change: 1. *Resource Based Perspective, Content of Change, Change Cube Perspective, 2. Rational Lens, 3. Cognitive Lens, 4. Context of Change, 5. Process of Change & Learning Lens, 6. Resistance/Inertia (strategic immobility), 7. Adaptive (strategic mobility): Drastic/ Revolutionary Change or Incremental/ Evolutionary Change*

B. Methodological Contribution
Methodologically, research have contributions in two folds: (1) K-Means cluster analysis add more alternative in strategic group change study beside Hierarchical Cluster Analysis, Two Step Cluster Analysis, M-Clust Analysis, and Agent Based Cluster Analysis, (2) Longitudinal analysis with panel data analysis in strategic management as test of dynamic theory, with empirical test using secondary data.

C. Managerial Implication

Managerial or policy implication of this research is to help policy or decision maker either in private or public sector (Managers, CEOs, Directors), especially in banking industry, in making assessment of strategic change in relation to tangible or intangible resources of the firms. Reading this research, hopefully, top executive awareness can be enhanced and proactive strategic move can be planned wisely.

CURRICULUM REFORM IN HIGHER EDUCATION
(A CASE STUDY OF CURRICULUM IN THE CONTEXT OF CHANGE IN OFFICE ADMINISTRATION EDUCATION DEPARTMENT, SEBELAS MARET UNIVERSITY)

Ign. Wagimin, Sebelas Maret University Indonesia
Wiedy Murtini, Sebelas Maret University Indonesia
Anton Subarno, Sebelas Maret University Indonesia
Hery Sawiji, Sebelas Maret University Indonesia

Abstract
Curriculum always develops continuously and periodically and can be influenced by policy makers, stakeholders, and teachers' communities. This research aims to analyse the curriculum reform in the context of change based on Indonesian Qualification Framework (IQF). This research used the deductive-inductive approach which consisted of three phases; observe previous curriculum, observe the need of current learning outcome, re-design curriculum. Researchers involved 35 respondents as focused group discussion (FGD) from industry stakeholders and teachers' communities in Solo-Raya. The result of this research shows that curriculum in the department of Office Administration Education should be adapted from stakeholders, policy makers, and teacher communities. Industrial partner as stakeholders, government as policy makers, and vocational high school teachers as teachers' communities, are simultaneously giving critical thinking of curriculum to improve learning outcomes. This research also indicates foreign language, character building, computer skill, and communication skill should be considered in curriculum. All findings above will be discussed in this paper.

Keywords: *curriculum reform, policy maker, Indonesian Qualification Framework (IQF)*

Introduction
Curriculums should adapt international trends and educational research need to be vigilant and active that make researchers have to publish their findings based on quality of education and educational outcomes. It will make easy to access them by policy makers and stakeholders (Brown & Beswick, 2014). Li & Ni (2012) argued the importance of the new curriculum system, real-life, learning methods, and participation to improve curriculum. New concept and terminology in teaching and learning influence theoretical and practical problem in education. It needs teachers review to improve quality of teaching simultaneously and continuously. This will improve the education system.

Ryder (2015) states that stakeholder as external environment in school has a significant implication for policy-maker, teachers and students. Then, local internal environment influence teacher development that can be identified according teachers' beliefs, practices and reflections, teacher communities, and teachers' experience to support curriculum reform. Shay (2015) state that the reasons for the curriculum reforms are based on their own mission.

Wong & Cheung (2015) state if governments play important role in the initiative of curriculum reform it will be a crucial process. Government through presidential decree or ministerial decree can release the guidance of government as policy maker, stakeholders, and teachers' community (Brown & Beswick, 2014). This research aims to analyse the the context of Curriculum reform in the department of Office Administration Education. This paper is organized as follows. In section

2, Indonesian Qualification Framework (IQF) educational management. In section 3, the methodology is presented. The result and discussion are presented in section 4. Finally, our work of this paper is summarized in the last section.

Indonesian Qualification Framework and Educational Management

New paradigm of higher education in Indonesia relates to certain competency for every graduate. Details of competency are released in Indonesian Qualification Framework (IQF). IQF serves as fundamental references for understanding and defining competencies of graduates of academic, vocational, and professional education against the different levels (ACDP, 2015). The learning outcomes level of IQF is (i) value, ethics, moral as basic components; (ii) science, knowledge, or knowhow comprehension; (iii) work competencies; and (iv) level of autonomy and responsibility in work place (DGHE, 2012).

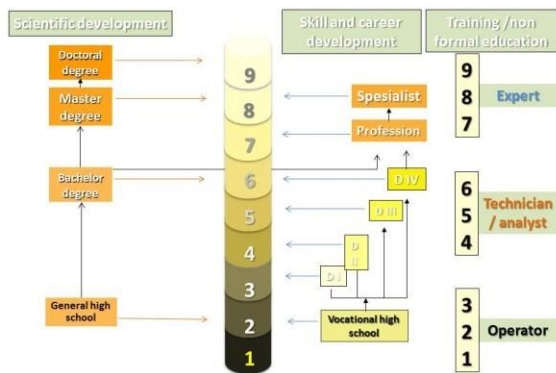
Every graduate of all level education has to have certain competency. The competency which supported by personal characteristic will guide graduates to high performance in the workplace. The characteristic can be identified as talent, skill, and knowledge (Zurnali, 2010). Boyatzis (2008) state that competency is a basic characteristic that guides or support high performance of working. Competency can be defined as an integrated capability to do jobs independently, measurable, and assessable in its field (Presidential decree No. 8/2012).


Figure 1. The Indonesian Qualification Framework (IQF) (DGHE, 2012)

Case, Fraser, Kumar, & Itika (2015) state an institutional autonomy has a strong effect to influence electing courses that make a good use of local opportunities; the state, the industry, and the institution. The state will consider the funding and accreditation. The industry as a partner school for potential employers has a power to supervise students on industrial attachment. The institution requires regular curriculum review to sufficient review for institutional accreditation. The principal, as top manager has power pushing middle and lower manager to implement new curriculum based on international trends. Qian & Walker (2014) argue that principals have an important role promoting teacher to response curriculum reform. Principals considering teachers data, teachers' strategy, teachers' culture, and research to identify the gap of curriculum reform. All of the components have a positive sign to support curriculum reform.

On the contrary, top manager cannot succeed to implement new curriculum if the middle and lower manager against the policy. Park & Sung (2013) explain teachers' role that assumes curriculum reforms were not innovative and create a work overload. They have to learn something

new and then implement it, but no programs are supported. Lin, Chang, Tsai, & Kao (2015) found a gap between teachers and students to implement curriculum. The gap is on the technology curriculum related to its implementation in teaching and learning process. Science and technology should be learned separately.

Methodology
This research used the deductive-inductive approach that aimed to improve learning and teaching process in the Office Administration Education Department. This research consisted of three phases; observe previous curriculum, observe the need of current learning outcome, re-design curriculum. The first and the third phase, researchers observing and re-designing curriculum by themselves. In the second phase, researchers involved stakeholders and teachers' community as focused group discussion (FGD). Total participants of FGD were 35 respondents who consist of 28 vocational high school teachers and seven entrepreneurs in Surakarta; 26 males and 9 females. The range of age is 27 to 50 years old (mean = 40.1) and their working experience between 10 to 35 years (mean = 20.8). FGD was started with the researcher's presentation current curriculum in the department of Office Administration Education, then followed up by curriculum reform in developing countries, and ended with questions and answers session. In presentation session, participants criticize the former curriculum in higher education that it was not match with vocational high school curriculum. Some participants gave suggestions it must be adapted immediately. Yet, it did not start teachers searched a suitable material by themselves. The end of FGD, researcher formulated the prospective curriculum of higher education, then, participants gave some notes about some courses that must be deleted or added. The result of FGD was analyzed to improve the curriculum in the department of Office Administration Education.

Results and Discussions
Curriculum in Office Administration Education department has been developed periodically to improve the learning process and to minimize the gap between higher education curriculum and vocational high school curriculum. The current improvement of higher education curriculum has been developed based on the Indonesian Qualification Framework (IQF). IQF is a platform for the higher education quality system as well as a reference of program standards and criteria (Prasetyo, Suyanto, & Senam, 2014). Based on Presidential Decree No. 08-2012, the definition of IQF has three point that to be emphasized; equalized, qualification, and work experience. Equalized refers to equating and integrating the process of learning outcome through education, training and work experience. Qualification means mastering of learning output that will be grouped based on IQF standard. Work experience means the experience of working in certain skill and certain time intensively resulting a competency.

Develop curriculum needs learning goals, learning methods, and learning process and evaluation to create a good competency of graduates. The structure of curriculum in higher education is developed based on curriculum in senior high school (education and culture (ministerial decree no. 49-2014). The competency of graduates are categorized; learner level development, Indonesian competent qualification, and competence mastery tiered. Higher education curriculum consists of institutional curriculum and core curriculum (Education ministerial decree no 232/U/2000). Institutional curriculum relates to learning materials that show the identity of the university. Core curriculum relates to a group of learning materials in the department through special courses to show its identity. The groups of courses are categorized into: theoretical courses, practical courses, field trips courses. All courses can be grouped based on its

characteristic; required, taken, and optional.

The courses in the department of Office Administration Education consist four groups; personality development (14 credits), behavioral work (27 credits), science and skill (14 credits), special work (73 credits) and social live (14 credits). Total credit courses are 142 credits. The graduates the department of Office Administration Education can work as educators, laboratory assistant, officer, office managers, and entrepreneurs.

Based on FGD results that curriculum in the department of Office Administration Education should be adapted with the current trends, stake holder, and teachers' community. Stakeholders in this case consist of industrial association and teachers association. The first stakeholders, industry association, suggested courses that should be considered by the department of Office Administration Education are foreign language and character building. Foreign language is important because in the globalization era, graduates student required to speak more than one international language. Character building as personal identity should be pushed and applied although it needs time to implement it.

Lavrenteva & Orland-Barak (2015) state that foreign language is important because some reasons; (1) language as a tool which equips individuals to understand people and culture, (2) building a broader vision of the linguistic and cultural diversity and developing students' intercultural communication skill, (3) cultural product and production, (4) guided of awareness culture in which the communication takes place. Valeeva, Baykova, & Kusainov (2016) argue that foreign language should be improved because it equips learners to develop knowledge, skill and ability, to contribute the personal identity, and to increase to scientific communication.

Character building needs to be taught in education and should be listed in the curriculum. It relates to the ability of students to decide a behavior in an appropriate manner, understanding moral value and choose to do the right thing. The benefit of character development in school is to help students in academic achievement and communication skill (Almerico, 2014). In Islamic theology, character building closest meaning to the value of *tauhidullah* that means point of thinking based on the philosophical right (Yapandi, 2015). The value should be trained and practiced in daily life by students, academicians, and people in certain communities.

The second stakeholder, teachers' association, has opinions about courses that should be considered by the department of office administration education are audiovisual editing, visual editing, web, publishing, and public relation skill. The key point of this suggestion are computer skill and communication.

The computer development is never ending, it improves continuously in software and hardware. This condition leads users of the computer to update their skills. Computer skill cannot be separated with information and communication technology (ICT) skill. Using of ICT has high impact to increase in educational motivation, question-making skill, spirit, and curricular score, and educational improvement (Keikha & Yaghoubi, 2010). Higher education students in Office Administration Education Department are prepared to be teachers in vocational senior high school. It means that student need learn computer skills continuously, especially software relates to vocational need. For instance, audiovisual editing, visual editing, web, publishing.

On the other side, teachers should have a good capability in communication. Teaching and learning will not succeed without good communication. Sakiti in Asemanyi (2015) state that communication is a purposeful proses to express, receive, and understand message containing factual information, feeling, idea, and need through symbols. The communication skill can be taught to students started by good perception, good coordination, and good language (Asemanyi, 2015)

Conclusions

High competition of graduate students leads educators and other educational components to prepare students' competency steadily. A good and proper competency involves good curriculum, good learning, and good evaluation. Curriculum in higher education required to cover international trends that can adapt from stakeholders, policy makers, and teacher communities. The three partners gave suggestion to the department of Office Administration Education.

Stakeholder, especially industry, emphasized the foreign language and character building should be considered as a new subject in the curriculum. Policy maker, government, emphasized the certain competency as identity of school or university. Teachers communities emphasized the computer skill and communication skill. Education without computer nonsense to improve student capability. Then, communication is a basic skill of teaching and learning. No communication will no learning.

A PLS-SEM ANALYSIS OF THAI CERAMIC ENTERPRISE INNOVATION, BUSINESS STRATEGIES & PERFORMANCE ON SURVIVAL

Phainphin Kowuttiphong, King Mongkut's Institute of Technology Ladkrabang (KMITL), Thailand
Wanno Fongsuwan, King Mongkut's Institute of Technology Ladkrabang (KMITL), Thailand

Abstract

The world ceramic market is currently estimated at $369 billion, projected to rocket to $705 billion by 2025. Since 1980, large corporations, led by aerospace companies, have amassed over 8,000 patents in structural ceramics. Ceramic is a material made of elements and metals extracted from soil and includes products such as glass, tile, and cement but it is now being spotlighted as a cutting-edge substance used in advanced technologies such as energy, IT, and the bio and medical industries. It is even being 3-D printed. These days, ceramic means much more than pottery, as innovative researchers are making the material wearable and power producing as well. Thailand as a member of a 600 million, 10 nation economic communities with a $2.4 trillion GDP, has risen to become a leading ceramic manufacture. Therefore, the researchers wanted to undertake a study to research how innovation, business strategies and performance affect the Thai ceramic industry's survival. Quantitative data is being obtained from a proposed sample of 220 Thai ceramic industry executives and managers from a population size of 758 firms with qualitative research being conducted with 10 executives by the use of purposive sampling. Analysis will be conducted using Partial Least Square (PLS-Graph) software to apply Structural Equation Modeling (SEM).

Keywords: *AEC, ASEAN, business strategies, organization survival, Thailand*

Introduction

According to Korea's Ministry of Trade, Industry and Energy, the scale of world ceramic market, currently estimated at 440 trillion won ($369 billion), will rocket to 840 trillion won ($705 billion) by 2025. Ceramic is a material made of elements and metals extracted from soil and includes products such as glass, tile, and cement but it is now being spotlighted as a cutting- edge substance used in advanced technologies in energy, IT, and the bio and medical industries (Korea JoongAng Daily, 2015). Since 1980, large corporations, led by aerospace companies, have amassed over 8,000 patents in structural ceramics and consolidated capabilities internally through acquisitions and mergers (Vicari & Schiavo, 2015)

The advanced ceramics market in the Asia-Pacific region is projected to register one of the fastest-growths mainly due to the presence of emerging economies such as China and India as well as emerging activities in the electronics, transportation, energy, and industrial sectors. Asia-Pacific is the biggest market for advanced ceramics, and accounted for a share of around 40% of the global market share in terms of value in 2014 which was majorly contributed by China (MarketsandMarkets, 2014).

The electronics industry is one of the largest end-user industries of advanced ceramics and this trend is projected to continue in the near future. More than 80 percent of up-to-date smartphone parts are ceramic which enables electric current to consistently flow on electronic circuits (Korea JoongAng Daily, 2015).

Asia-Pacific is the biggest market for the electronics industry, and accounted for a share of more

than 40% of the overall market size in the year 2014. It is also estimated that Republic of China followed by Japan, South Korea, and India are the fastest growing markets of advanced ceramics for the electronics industry in the region (MarketsandMarkets, 2014).

The U.S. and China are at the forefront of advanced ceramics consumption, while Germany, France, Japan, and U.K. are other key markets for advanced ceramics consumption. China is the key market in Asia-Pacific, consuming more than half of the demand for the advanced ceramics, followed by Japan, South Korea, and India where consumption is growing at a steady rate. Increase in the consumption of advanced ceramics for monolithic ceramics, ceramic matrix composites and ceramic coatings have been observed in Asia-Pacific due to continued industrialization and rise in the manufacturing sector of the region. Medical industry is projected to be the fastest-growing application segment followed by military & defence between 2015 and 2020 (Markets and Markets, 2014).

The Korean domestic market is expected to expand threefold in a decade. In particular, high-tech ceramic's share of the ceramic market is expected to jump to 70 percent. However, advanced businesses like Kyocera, Murata and TDK in Japan and Corning in the United States with fundamental technologies are far ahead of Korean companies (Korea Joong Ang Daily, 2015).

Ceramics is also used in construction but that too is both rapidly and radically changing. According to Tikul and Srichandr (2010), ceramic tiles are one of the most widely used materials in both commercial and residential buildings in Thailand. Presently the global ceramic tile market is expected to reach over $125 billion by 2020 with Thailand having moved to the number one spot globally in the production of tile.

Ceramic tile dominates the industry, with demand estimated at over 70 million tons in 2014. Growth and development in the construction industry is expected to be the primary growth driver due to urbanization, higher per capita income, population increases and improving economies. Housing and construction are the largest application segments, valued over at $65 billion in 2014. Aesthetic and durability advantages of these products are expected to drive demand in the civil construction sector over the next seven years (CiAdvanced, 2015).

Within the AEC (ASEAN Economic Community), Thailand's SCG Group acquired Vietnam's leading ceramic tile manufacturer, Prime (SCG, 2014) which moved SCG Group into the number one spot worldwide with a ceramic tile production capacity of 225 million square meters per annum (a 50% increase from 2012). This compares to the U.S.A.'s second place Mohawk Industries, with a total capacity of 220 million square meters (ASEAN Ceramics, 2013). Thailand's SCG Group now has expanded to 29 factories within the AEC, including 17 in Thailand, 4 in Indonesia, 1 in the Philippines and 7 in Vietnam with a total workforce of 14,000 people, generating 650 million euros in the tile business alone (Ceramic World Review, 2014).

In Thailand however, the ceramics industry is mostly made up of small to medium sized enterprises dispersed in different provinces across the country. These include the provinces of Saraburi, Nakhon Ratchasima, Lampang, Chiang Mai, Ratchaburi, Samut Sakhon, Nonthaburi, Chon Buri and Rayong. The industrial ceramics industry is one that is important both to Thailand and its economy which is continuously supported and promoted by the government.

From the above data, researchers decided to undertake a study using a structural equation model to develop a greater understanding of the importance of the Thai industrial ceramic industry and the variables effecting its survival. Thailand's large and geographical dispersed ceramics factories are mostly small to medium sized with preliminary data indicated 758 registered businesses nationwide, with a heavy concentration of 172 factories located in the northern, mountainous province of Lampang.

The study will therefore focus on the variables that influence organization survival. There are significant changes underway, heavily influenced by environmental regulations and technological innovation such as 3-D printing. Survival and sustainability in a highly competitive environment is no easy mission, therefore the reason for this research.

Literature Review
1. Innovation

Innovation is defined as adding something new to an existing product or process. Drucker (1985) argued that innovation is the tool of entrepreneurship. In addition, both innovation and entrepreneurship demand creativity. No entrepreneur or enterprise, however successful and big, can continue to hold a place of leadership unless it recognizes that modern business operates in a world of galloping change which creates new problems, risk and opportunities and for which they have to mobilize the enterprise's resources before changes make their impact felt (Okpara, 2007).

Freeman and Soete (1997) elaborated on innovation effects on economics and stated that innovation is an essential condition of economic progress and a critical element in the competitive struggles of enterprises and nation states. Innovation is also critical for those who wish to accelerate or sustain the rate of economic growth in their own and other counties and is critical for the long-term conservation of resources and improvement of the environment. The cutting edge of structural ceramics research is carried out by only a handful of players and they tightly control R&D information, stifling the ability and motivation of outside start-ups to enter the field. Still, innovation bubbles beneath the surface, driven by the need for process disruption.

This is consistent with ceramic research innovation from UCLA engineers which hope to create a ductile ceramic that is hard, able to experience extreme heat and experience low corrosion. While the hardness of steel may withstand pressures of a gigapascal or two, transition- metal carbides can take up to a whopping 20 gigapascals. And they won't melt until they reachover 6,300ºF (3500ºC) — versus steel's melting point around 2,700ºF (1500ºC). (Wasserman S, 2015)

On a more 'down to earth' note, Thailand's SCG Group with 51,000 employees globally and one of the world's largest ceramic product producers is also focusing on research and development (R&D) and has steadily increased its high-value added (HVA) products and services which have an average margin 8% higher than normal products. HVA products now account for 37% of the group's total revenue, up from just 4% a decade ago (Wiriyapong, 2015).. It also acquired technology in United States and Europe to support its innovation drive and since the group projects HVA products to eventually account for half of its products; it's recruiting more PhD-level staff, including those in China, to step up innovation research.

This is consistent with Lemon and Sahota (2004) that states just as 'innovate or die' is one of the mantras of today's economy, knowledge is increasingly recognized as the key underpinning resource and that organizational learning plays an important part in ensuring that knowledge repositories are continually replenished and updated to enable efficient responses to changes in its competitive environment.

According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to innovation. Many scholars have studied these manifest variants or observable variables effects on innovation from which the researchers have synthesized the research to include *product innovation*, *process, innovation* and *marketing innovation* in this study (Dachyar & Fatkhurrohman, 2011; Mutlu & Er, 2003; Seedee, Sulaiman, & Ismail, 2009; Chong, Chan, Ooi, & Sim, 2011).

2. Business Strategies

Business strategy refers to the tools that companies use to judge the competition in the market compared to its competitors (Meskendahl, 2010) which is the competitive strategy. business strategy, or corporate strategy, is the fabric of verbal and non-verbal interactions in organizations setting the behavioural norms for the organizations long-term orientation (Johnson, Whittington, Scholes, & Pyle, 2011). As such strategy should affect daily actions but only or mostly those related to the organizations expectations of its major activities on a more distant horizon (Porter, 1996) and stated that a nation's competitiveness depends on the capacity of its industry to innovate and upgrade.

In Porter's (1985) earlier book on *Competitive Strategy* the concept of generic strategies cost leadership, differentiation, and focus – was introduced which represented the alternative strategic positions in an industry. This is consistent with Tanwar (2013) which discussed 'generic strategies' stated that basically, strategy is about two things: deciding where you want your business to go, and deciding how to get there. It was indicated that generic strategies include 'overall cost leadership', 'differentiation', and 'focus' (Tanwar, 2013) but if firms try to maintain cost leadership as well as differentiation at the same time, they may fail to achieve either.

Lo and Han (2014) discussed the competitive paradigm between globalization and local Chinese development in the ceramic tile industrial cluster, based on the Porter's theory in exploring the factors of the global competitiveness. They concluded that firms have to shape strategic thought and be flexible so that companies can quickly respond to challenges of nearby competitors. According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *business strategies*.

Many scholars have studied these manifest variants or observable variables effects on innovation from which the researchers have synthesized the research to include *cost leadership strategy*, *differentiation strategy* and *focus strategy* in this study (Johnson, Whittington, Scholes, & Pyle, 2011; Lo, & Han, 2014; Meskendahl, 2010; Porter, 1985; Porter, 1990; Porter, 1996)

3. Firm Performance

De Waal (2007) studied the identifying factors that determine the continuous success of a high performance organization (HPO) and identified after an extensive review of the literature some common themes which included: sustained growth; better financial and non-financial performance compared to its peer group; long-term orientation; and finally, better results over a period of at least five years.

Kaplan and Norton (1992) revolutionized conventional thinking about firm performance metrics with the balanced scorecard. When Kaplan and Norton first introduced the concept in 1992, companies were busy transforming themselves to compete in the world of information; their ability to exploit intangible assets was becoming more decisive than their ability to manage physical assets. The scorecard allowed companies to track financial results while monitoring progress in building the capabilities needed for growth. There were 4 main processes of which, the third— *business planning*—enabled companies to integrate their business plans with their financial plans.

This is consistent with research by Škrinjar, Bosilj-Vukšić, and Indihar-Štemberger (2008) which showed that business process orientation leads to better non-financial performance and indirectly to better financial performance.

According to Zuriekat, Salameh, and Alrawashdeh (2011), performance measurement systems are considered information systems that are used to evaluate both individual and organizational

performance. In their study, they investigated the use of a variety of financial and non-financial performance measures identified in the literature to measure performance measurement systems and showed that companies benefit from performance measurement systems that incorporate a wide range of financial and non-financial performance measures.

Hilman and Kaliappen (2014) observed the psychometric properties of the organizational strategies and performance scales which were stated to consist of competitive strategy, market orientation, innovation strategy and organizational performance. It was determined that organizational strategies and performance measures can be useful in examining strategy and performance.

According to the study's research and examination of the literature, it was determined that there were 2 key manifest variants or observable variables related to *firm performance*. Many scholars have studied these manifest variants or observable variables effects on *innovation* from which the researchers have synthesized the research to include *financial performance*, and *non-financial performance* in this study (de Waal, 2007; Kaplan & Norton, 1992; Škrinjar, Bosilj-Vukšić, & Indihar-Štemberger, 2008; Hilman & Kaliappen, 2014; Zuriekat, Salameh, & Alrawashdeh, 2011).

4. Organization Survival

Organizational survival has been argued to be a primary goal or objective every organization should have. In a survey of corporate board member policies and practices by Korn/Ferry International, management succession was stated as the third most important issue on the heels of financial results and strategic planning (Rothwell, 2010).

Bennet and Bennet (2011) proposed a new model for organizations that enables them to react more quickly and fluidly to today's fast-changing, dynamic business environment: the Intelligent Complex Adaptive System (ICAS). ICAS is a new organic model of the firm based on recent research in complexity and neuroscience, and incorporating networking theory and knowledge management, and turns the living system metaphor into a reality for organizations. There are eight characteristics of the ICAS: organizational intelligence, unity and shared purpose, optimum complexity, selectivity, knowledge centricity, flow, permeable boundaries, and multidimensionality. Technology enables connectivity, and the ICAS model takes advantage of that connectivity by fostering the development of dynamic, effective and trusting relationships in a new organizational structure.

Tolulope (2009) discovered in Nigeria that the ceramics industry's spatial distribution of the industries as well as the performance is determined by different factors. Gender lopsidedness was observed among ceramic wares producers with time commitments to production by manufacturers not long enough for firm profitability. Additionally, the production and the management systems of small-scale ceramic industries in South-Western Nigeria are hindered by many other factors.

According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *organization survival*. Many scholars have studied these manifest variants or observable variables effects on innovation from which the researchers have synthesized the research to include *financial management, management* and *succession planning* in this study (Bennet & Bennet, 2011; Rothwell, 2010; Tolulope, 2009).

From the above conceptual review and development, the researchers have developed the following 5 hypotheses for the study (Figure x):

Proposed Research Hypotheses Model

H1: *Innovation* has a direct effect on *Organization Survival*.
H2: *Innovation* has a direct effect on *Firm Performance*.
H3: *Business Strategies* have a direct effect on the *Firm Performance*.
H4: *Business Strategies* have a direct effect on *Organization Survival*.
H5: *Firm Performance* has a direct effect on *Organization Survival*.

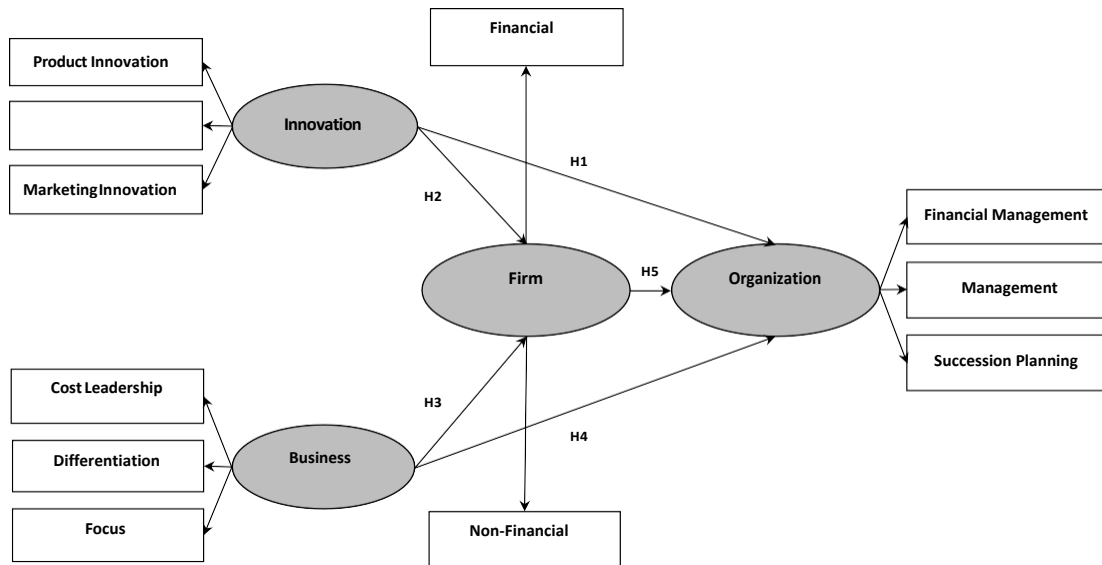
Proposed Conceptual Model (Figure 1)


Figure 1: Conceptual Framework

Methodology
This research aims to model the structure of the factors influencing the survival of the industrial ceramics industry of Thailand, so the researchers wish to determine the details and procedures from the methods below:

1. The Approach Used In The Study
For this study the researchers used both quantitative and qualitative research from both primary and secondary data. The researchers have determined the following steps for this study:

A. Secondary Data Research
This was comprised of published research, internet materials, media reports, and data which has been cleaned, analyzed and collected for a purpose other than the needs assessment, such as academic research or an agency or sector specific monitoring reports (Acaps, 2012).
Therefore, secondly data is a research tool for development of the variables and the structural equation model in understanding the survival determinants of the Thai ceramic industry.

B. The Quantitative Research Study
Quantitative research will be performed from the primary data by collecting a questionnaire from the target sample. The questionnaire to be used to collect data is structured and written and a realistic, easy-to-understand format with are deemed to be reliable and reasonable. Further reliability validation will be undertaken as follows:

C. Review of the questionnaire
This was conducted by academic scholars to validate the investigation questions and the use of rhetoric and the simplicity and comprehension of the questions. During the question trial period, questions undergo a continual rigorous review and inspection for their clarity and ability to the meet the objectives of the research and to carry out data collection and statistical analysis.

D. Quantitative Research
Schumacker and Lomax (2010) stated that Structural Equation Modeling (SEM) uses a variety of models to show the relationships between observed variables with the same basic goal of providing a quantitative test of a theoretical model hypothesized by a researcher. Meldrum (2010) further stated that a sample size smaller than 100 should not be used in SEM as it is unreliable. This is consistent with other research on the 'Rule of 100' including Gorsuch (1983), Kline (1979), (MacCallum, Widaman, Zhang & Hong, 1999). No sample should be less than 100 even though the number of variables is less than 20 (Gorsuch, 1974; in Arrindell & van der Ende, 1985). Therefore, using a factor of 20 for each of the 11 variables from the research survey, it is anticipated that a total of 220 samples from Thai industrial ceramic firms are adequate to assure a reliable sample size (Schumacker & Lomax, 2010).

E. Qualitative Research
Qualitative research will involve confirming the model of the quantitative research. It is a collection of interviews with industry professionals involved in the ceramic industry including entrepreneurs, small and medium sized enterprises (SMEs) and those involved in industry promotion. Qualitative Research is to be

undertaken through the use of in-depth interviews with those involved in innovation, including plant managers, production managers and engineering managers. To confirm the model of quantitative research, the sample size for this research will be 10 individuals.

2. Population and Sampling
The population in this study is 758 operators or managers of ceramic production facilities in

Thailand which have been registered and licensed by the Thai Department of Industrial Works within the Ministry of Industry (DIW, 2011).

3. Self-Administered Questionnaire (SAQ)

For this research, the measurement instrument or questionnaires utilized was prepared from the literature. A self-administered questionnaire (SAQ) is being used as it is exploratory in nature and serves as a starting point for other methodologies.

4. Research Quality Inspection Tools

The research will be conducted to determine the quality and reliability of the instruments used in the research. Tools used to measure quality are divided into 2 phases including content validity and reliability (Hale & Astolfi, 2014). The research is divided into two phases.

Phase I consists of an inspection by 5 experts.

Ceramic plant operators	2 managers
Mid-level SME professionals	2 managers
Ceramic industry academic	1 Professor

Questionnaires are constructed as a tool to measure concept definition and practice using a 5-Point Likert Scale (Likert, 1970). This research will conduct Confirmatory Factor Analysis (CFA) and subsequently reliability analysis to measure Cronbach's alphas (Cronbach, 1951) for this scale items to ensure internal consistency. Multi-item measures were developed based on Cronbach's alpha >0.68. This study will then calculate Cronbach's alphas for each construct. If the value is below 0.50, the research question will be cut off. This is considered highly reliable. The responses to the questions capturing focal constructs will use a five-point Likert scale (rating statements 1-5; 1 = strongly disagree and 5= strongly agree) (Likert, 1970).

Phase II

Phase II consists of measures to ensure the quality of the questionnaire. Berk (1984) stated that an evaluation of the congruence between items and objectives is the most important assessment during the content validation stage. If there is insufficient evidence that the items are measuring what they are intended to measure, the remaining item analyses are useless. An efficient measure for numerically assessing content experts' evaluations of items is the index of item-objective congruence (Rovinelli & Hambleton, 1977), in which ratings from content specialists are obtained in order to evaluate the match between test items and the table of specifications (Berk, 1984). For this study, 5 experts in their related fields were chosen with items having an IOC index higher than 0.5 being considered acceptable. Additionally, the index of Item-Objective Congruence (IOC) developed by Rovinelli and Hambleton (1977) will be employed to carry out the screening of questions to a group of 10 initially in the pilot study. The research will then proceed to select items that have an IOC index higher than 0.5, which will be considered acceptable.

Data Collection
1. Primary Data

Primary data will come from a collection of factors influencing the survival of ceramic industry enterprises within Thailand.

2. Secondary Data

By studying theories and concepts related to the research from various sources, including books, articles, research papers, instruction manuals, etc.

3. Data Analysis and Statistical Methods Used

Quantitative research is currently envisioned using the partial least squares (PLS) statistical method and hypothesis testing with PLS-Graph software (Chin, 2001), which analyses the display and model structure associated with the observed manifest variables with latent variables.

4. Analysis of Quantitative Data

The analysis of quantitative data will be conducted using statistical analysis as follows:

1. An analysis will be conducted by descriptive statistics by characterizing the frequency, percentage, mean and standard deviation.

2. An analysis will be conducted using structural equation modeling (SEM) to determine the relationship of the factors influencing the survival of ceramic industry enterprises in Thailand.

5. Analysis of Qualitative Data

To confirm the results of the quantitative analysis are credible and the findings reliable, the researchers will conduct interviews with those involved as professionals, entrepreneurs and SME managers in ceramic industry enterprises in Thailand.

Conclusion

Ceramics is as old as civilization itself but yet is a craft that is being used in the most advanced disciplines of technology, construction, aerospace, medicine, nanotechnology, etc. In all areas, innovation is a key player in the firm's survival as can be seen from the over 8,000 patents for structural ceramic since 1980, mostly aerospace related. Bringing the products to market using sound strategic decisions with a strong financial sheet are also keys to the firm's survival. From the research thus far and through case studies such as with Thailand's SCG Group, the researchers see the strategic importance of research & development and innovation on group competitiveness and even survival. Big companies 'consume' smaller companies as they become weak and non-competitive. Government policy can hinder or help companies grow and prosper.

Everywhere you look in the world; ceramics is part of our life and what we call 'civilization'. It has been that way since humans settled into villages and started 'homes'. Now it will be part of our move into space and new frontiers. Ceramics is an exciting and extremely interesting industry and the researchers hope to continue their journey in the discovering of the companies and technology in this amazing industry.

In Thailand the research thus far for the industrial ceramics industry has seen the requirement for firms to become more adapt and embrace innovation and long-term business strategy to maintain their both their short-term and long-term competitiveness and industry sustainability.

THE EFFECTS OF BUDGETARY PARTICIPATION, BUDGETARY SLACK, AUTHORITY DELEGATION, AND ORGANIZATIONAL COMMITMENT ON MANAGERIAL PERFORMANCE
AN EMPIRICAL STUDY ON LOCAL GOVERNMENT IN LAMPUNG, INDONESIA

Rindu Rika Gamayuni, Universitas Lampung, Bandar Lampung, Indonesia
Dewi Suryani, Universitas Lampung, Bandar Lampung, Indonesia

Abstract
This paper aims to demonstrate whether budgetary participation, budgetary slack, authority delegation and organizational commitment positively affect managerial performance of local government work unit. This empirical study is conducted with local government work unit in district/city in Lampung Province, uses primary data by distributing questionnaires to 601 respondents, and tested by using Structural Equation Model. The study result proves that participation in budgeting preparation, budgetary slack, authority delegation, and organizational commitment will increase managerial performance of local government work unit in Lampung District/City.
Keywords: *budgetary participation, budgetary slack, authority delegation, organizational commitment, and managerial performance.*

Introduction

To determine a budgeting, in this matter, a process is needed, Mardiasmo (2005) stated that a stage of budgeting is an important thing because ineffective budgeting and it is not oriented to performance will be able to fail the plan that has been set. Budgeting is a managerial plan of action to facilitate the achievement of organization's goal. After the process of organization goal achievement, performance evaluation is needed to be done. The performance evaluation of public sector can be obtained from financial report that can be measured based on the budgeting that has been made. Where it evaluation can be done by analyzing variance between actual performance and the one that is budgeted, where analysis of variance will focus on income variance and spending variance (regular spending variance and investment/capital spending variance) (Mardiasmo 2002:123).

Young (1985) stated budgetary slack as an action estimating lower income and higher cost when agent is given an opportunity to choose work standard to improve performance. It will negatively affect public sector organization, which is when there is mistake on resource allocation and bias in performance evaluation of agent on its responsibility unit (Suartana, 2010). However, in the study from Blanchette et al. (2002), it stated that budgetary slack conducted ethically will be able to improve performance. In Lampung Province, in 2014, determined income budgeting plan had decreased from the previous year, while determined expense budgeting plan had increased. It indicates the existence of budgetary slack in budgeting preparation, especially income budgeting.

Decentralization authority delegation is needed because in decentralized structure of managers/subordinates are given bigger authority and responsibility in decision making. According to Miah and Mia (1996), decentralization is how far higher manager allows lower manager to take decision independently. It is supported by study of Gul, et all. (1995) stating that budgetary participation on performance will positively affect organization that its authority delegation is decentralization. Different from the study of Riyanto (1996), Marani and Supomo (2003) stating that decentralization does not positively affect managerial performance. The responsibility in delegating from top manager to lower manager will bring consequence of bigger responsibility of lower manager toward implementation of decision made. Furthermore, the study of Rachmawati (2009) and Setyarto (2008) proved that organizational commitment positively affects the performance of employees.

Based on the phenomena, theory and previous study results, then, the writer is willing to ensure more whether budgetary participation, budgetary slack, authority delegation, and organizational commitment will positively affect managerial performance of local government work unit (this empirical study is done in districts/cities in Lampung Province). For local government, the result of this study is expected to be able to give information about factors that affect managerial performance, especially in budgeting preparation at the level of local government work unit that manages Local Income.

Literature Review

According to Kennis (1979), budgetary participation is a level of manager participation in making budgeting where budgeting used will be an instrument in defining performance. Brownell (1982) defined participatory budgeting as a level of participation and individual influence in making budgeting. Milani (1975) also argued that the level of participation and the influence of subordinate in budgeting toward decision making in budgeting process is the main factor that differentiates between participatory budgeting (Stedry,1960), so it allows subordinate to negotiate with superior in accordance with their targeted budgeting that can be obtained (Brownell and Melnnes, 1986; Dunk,1993).

According to Anthony and Govindarajan, (2005:85) budgetary slack is the difference of budgeting amount proposed by subordinate with the best estimation amount of organization. Budgetary slack is done by subordinate which is by presenting budgeting with low difficulty level so that it is obtained easily and this discrepancy tends to be done by subordinate because of knowing that their performance is measured by the level of budgeting attainment that has been determined together. According to Dunk (1993) budgetary slack is defined as the express incorporation of budget amounts that make it easier to attain. Budgeting discrepancy can easily occur if information owned by subordinate/MPP (agent) is more than information owned by superior (principal) about a responsibility center.

Authority delegation is authority giving by higher manager to lower manager to conduct a work with authorization explicitly from manager who gives authority at the time the authority is implemented (Marani and Supomo, 2003). According to Bruns and Waterhouse (1975), managers in an organization with high level of decentralization feels that they are the most influencing, participate more in budgeting plan and feel satisfied by activity relating to budgeting. Contrarily, in organization with low decentralization (centralization), managers feel that they are considered less responsible, less involve in budgeting plan and having pressure from superiors.

Mowday et al., (1982) in Pangastuti (2008) defined organizational commitment as: the relative strength of an individual's identification with and involvement in a particular orgaization. This organizational commitment proposed by Mowday has characteristics, which are: (1) strong belief and acceptance toward goal and value of organization; (2) readiness to work hard: (3) strong willingness to stand in organization. Characteristics of organizational commitment among others are: commitment to work, commitment in group, and commitment to organization (Michaels, 1998; Budiharjo (2008).

Government performance cannot be measured by earnings obtained where it is possible for government to have program and activity that can produce bigger income than their cost so that government will have surplus on the program. However, this does not make government performance evaluated good, but service quality is the main goal, whether service given is adequate, so Government Financial Report will be used by groups who are interested in evaluating whether government has done distribution of expense cost fairly (Mardiasmo, 2002:166). Managerial performance is the level of ability, competence of a manager in implementing management activities including planning, coordinating, investigating, arranging, negotiating, representing, supervising, and evaluating. Definition of managerial performance according to Mahoney et al. (1963), managerial performance is performance of individuals of organization members in managerial activities such as; planning, investigating,

coordinating, staff arranging, negotiating, and representing.

1. The Effect of Participation in Budgeting Making on Managerial Performance

Participation in budgeting making gives a feeling of responsibility to lower manager and encourages creativity, because on lower manager who plans or creates budgeting, the objective of budgeting is most likely the personal objective, that causes higher level of objective congruence in this matter is the high job satisfaction. The effect of participation in budgeting making toward managerial performance has been previously studied by Brownell (1982) with instrument of Milani (1975) for budgeting participation, while its managerial performance instrument uses the one from Mahoney et al. (1963). They found that there is positive and significant relationship between participation and managerial performance as well as studies from Bronwel and Melnnes (1986), Agusti (2012), Fernando (2013).
H_1: Participation in budgeting making positively affects managerial performance.

2. The Effect of Budgetary Slack on Managerial Performance

Budgetary slack is created by manager in order to protect self from the risk of budgeting target that cannot be attained (Lukka, 1988; Onsi, 1973; Schiff and Lewin, 1970). When manager participates in budgeting, manager has greater responsibility to subordinate in order to be able to implement budgeting made better, as well as the existence of sanctions giving if it is less than budgeting target and compensation giving if it is able to exceed budgeting target. The existence of intervention possibility from higher management that is faced by managers if they are not able to attain budgeting target, managers will lose resources of organization, lose annual bonus or at the extreme point will lose job (Merchant and Manzoni, 1989). Parker and Nouri (1996) stated that if performance of a manager is evaluated based on running budgeting, then they will ensure their budgeting in the level that easily to be attained, one way is by including slack in their budgeting. According to the result of study from Dunk (1993) and Merchant (1981), budgetary slack will be low if the pressure of budgeting is low. Because manager performance is evaluated by budgeting as the only managerial performance evaluation, but according to Blanchette et al., (2002), budgetary slack done ethically will positively affect managerial performance, the study of Dunk (1995) stated that budgetary slack has positive role in affecting relationship of task difficulty and performance, in line with Wouters (2005) stating that the existence of budgetary slack can reduce budgeting pressure and uncertainty of budgeting target attainment that affects managerial performance. Therefore, the hypothesis that is developed is:
H_2 : budgetary slack positively affects managerial performance

3. The Effect of Authority Delegation on Managerial Performance

Authority delegation is a gift that becomes rights on task and responsibility to conduct something or order others to conduct something. Marani and Supomo (2003) stated that authority delegation is authority giving by higher manager to lower manager to implement an authorization explicitly from manager who gives authority at the time the authority is implemented. Therefore, subordinate or middle manager who is given authority delegation of superior or leader can help top manager in decision making, task, and responsibility with expectation that organization goal can be achieved. A manager who is given authority delegation will give effect of managerial performance, if middle management is given or not in budgeting making authority. According to the result of study from Merchant (1981), it found that budgeting system design will be effective in decentralized organization. Gul *et al.* (1995) in Fernando (2013) found that authority delegation positively affects managerial performance.
H_3:   Authority delegation positively affects managerial performance

4. The Effect of Organizational Commitment on Managerial Performance

Organizational commitment is believed strong and supports value and target expected by organization (Mowday et all. (1982) in Pangastuti, 2009). According to Greenberg and Baron (1993), employee who has high organizational commitment is the employee who is more stable and more productive so eventually also more profitable for organization. Mowday et.al., stated that employee who has high organizational commitment will be more motivated to present in organization and tries to achieve organization goal (Pangastuti, 2008). Meanwhile, Randall et.al, (in Greenberg & Baron, 1993) stated that organizational commitment is related to high desire to share and sacrifice for organization. It is also supported by the study conducted by Fernando (2013) and Wulandari (2013) stating that organizational commitment has positive and significant effect on managerial performance of local government work unit. The formulation on hypothesis is as the following:

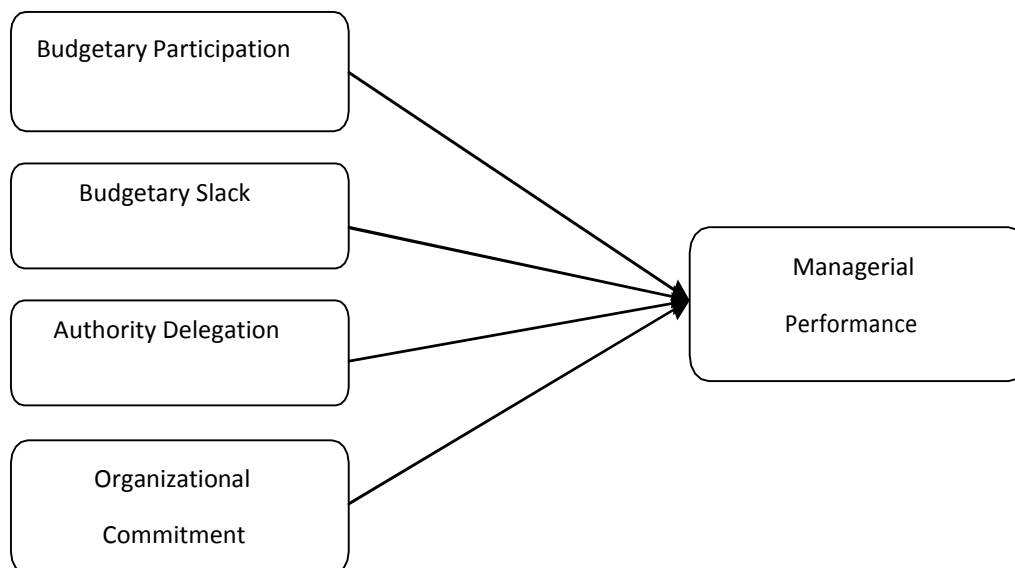
H4:   Organizational commitment positively affects managerial performance


Figure 1. Research Framework

Research Method

1. Data, population, sample, statistic analysis

This paper uses primary data by distribution questionnaires to respondent directly. Population in this study is local government work unit of Districts/Cities in Lampung Province. Sample selecting uses the method of Purposive Sampling, with criteria as the following:

1. Regions that have been established before 2007.
2. Work unit of local government that is Income Center where the responsibility center is that its manager achievement is evaluated based on the income generated.
3. Work unit of local government that has high income target. Local Real Income originated from Local Tax, Local Retribution, separated Local Resources Management and other legal Local Real Income.

Sample in this study is Income Agency, Department of Transportation, Market Department in 10 district/city governments in Lampung. 601 respondents are officials of echelon two, three, and four. Data statistic analysis uses Structural Equation Model (SEM) of Lisrel.

2. Variable, Dimension, and Indicator Measurement

Table 1. Dimension and Indicator of Variable

Variable	Dimension	Indicator
Budgetary Participation (X1) (Milani, 1975)	1. Level of involvement in budgeting planning process 2. Effect felt by Agency leader in budgeting planning process	Participation in budgeting making Satisfaction in budgeting making Needs to give opinion Willingness in giving opinion Magnitude of effect on budgeting determination Frequency of superior in asking opinion
Budgetary Slack (X2) (Dunk, 1993)	1. Budgeting standard, 2. Budgeting achievement, 3. Tight budgeting, 4. Suppression budgeting, 5. Efficiency Budgeting, 6. Budgeting target.	1.1 Determination of budgeting standard for high productivity 2.1 Easiness in target achievement 3.1 Costs used must have limitations 4.1 Few budgeting requirements 5.1 Improvement of budgeting use efficiency 6.1 Target is easily attained
Authority Delegation (X3) Bruns and Waterhouse, 1975)	1. Employee mutation, 2. Budgeting allocation, 3. Task implementation specification, 4. Operational decision, Decision making of leaders.	1.1 Appointment and displacement of employee working relation from leader/head of agency or institution, 2.1 Playing role in budgeting allocation, Suitability of the tasks mandated Task implementation that is in accordance with determined guidance 4.1 Authority to make operational decision
Organizational Commitment (X4) (Mowday et al., 1982)	1. Strong belief and acceptance toward goal and value of organization 2. Readiness to work hard 3. Strong desire to stand in organization	Work evaluating system that is similar to organization A statement of pride working in organization 2.1 Cooperation readiness to achieve organization goal 3.1 Organizational opportunity to improve performance. Stay in organization even though changes occur in organization Selection of right working place that has been considered previously Great concern for the future of organization

Managerial Performance (Y) (Mahoney et al., 1963)	Level of managerial Performance in:
	 1. Planning
	 2. Investigating
	 3. Coordinating
	 4. Evaluating
	 5. Supervising
	 6. Staffing
	 7. Negotiating
	 8. Representing
		1.1 The role of goal and activity plan policy determination
		 2.1 Collecting information in the form of note and report
		 3.1 Report adjustment
		 4.1 Evaluation of working plan
		 5.1 Giving direction to development of subordinate
		 6.1 Placement of employee
		     Plays role in determination of cooperation contract
		     Has role in relating with external party
		 8.1 Performance evaluation and performance overall target

Results and Discussion

1. Result

Based on the result of validity test, all indicators have been valid except indicator KO1 because it has t cal < 1.96. The result of reliability test obtained Composite Reliability value in each variable that is greater than 0.7, then all item of questions in study variables have been reliable.

Based on the measurement of Goodness of Fit Index, it is concluded that most of parameter has fulfilled most of requirements expected which are viewed from value of GFI, AGFI, RMSEA, ECVI, AIC, NFI, NNFI and CFI that have fulfilled the requirement of goodness of fit.

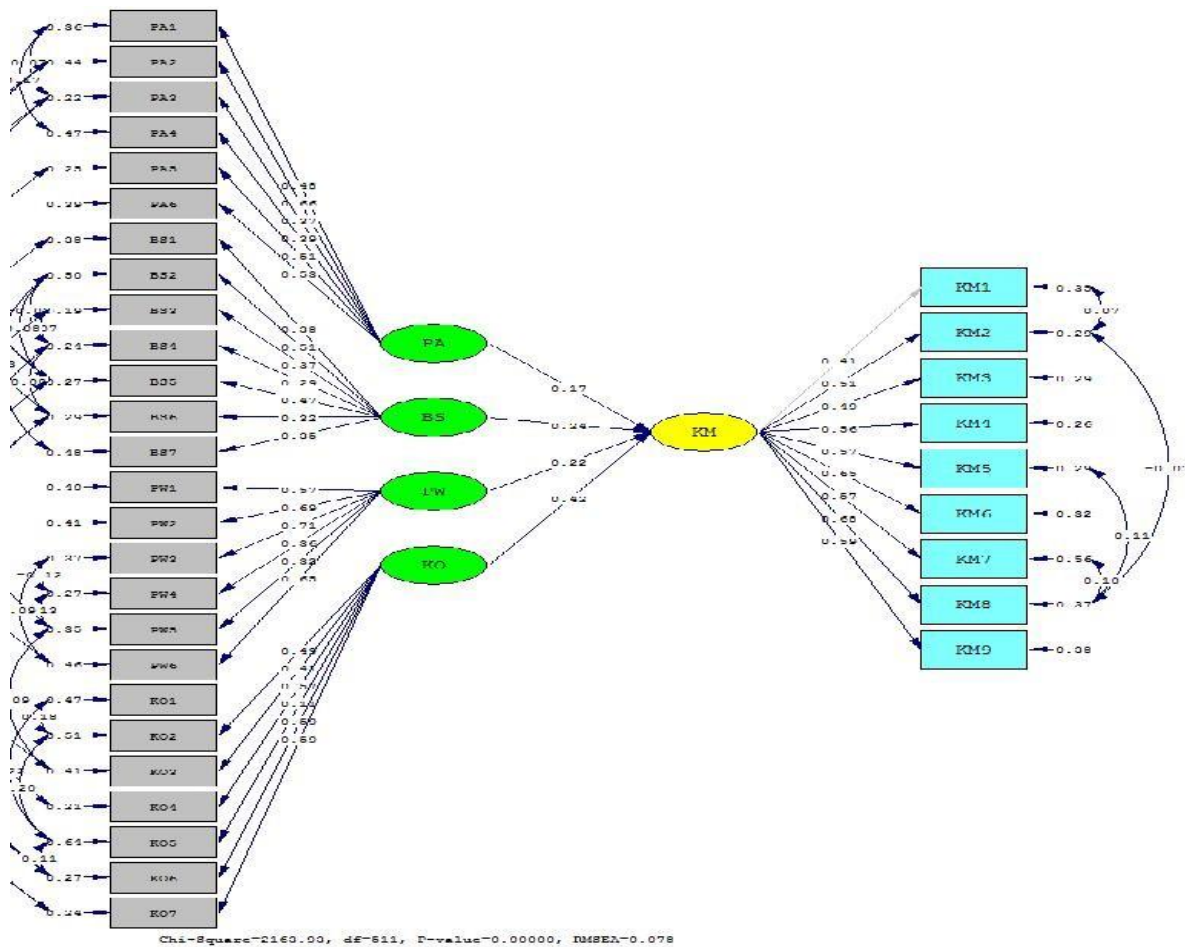
The testing result on study model can be illustrated as the following:


Figure 1. Testing Result of Structural Equation Model
Table 2. Testing Result of Hypothesis and SEM

Relationship Model	Coefficient	Std. Error	T Cal	Information
PA→KM	0.17	0.044	3.83	H1 is supported
BS→KM	0.24	0.051	4.82	H2 is supported
PW→KM	0.22	0.097	2.31	H3 is supported
KO→KM	0.42	0.090	4.69	H4 is supported

Research equation is:
KM = 0.17*PA + 0.24*BS + 0.22*PW + 0.42*KO
Errorvar.= 0.27 , R^2 = 0.73
 Note:
PA   = Budgetary Participation
BS   = Budgetary Slack
PW   = Authority Delegation
KO   = Organizational Commitment
KM   = Managerial Performance

The testing result of hypothesis 1 proves that the effect of participation in budgeting making on managerial performance with path coefficient of 0.17 positively and significantly affects managerial performance of local government. The testing result of second hypothesis proves that Budgetary Slack positively and significantly affects managerial performance of district/city local

government with path coefficient of 0.24. The testing result of third hypothesis proves that authority delegation positively and significantly affects managerial performance of district/city local government with path coefficient of 0.22. The testing result of fourth hypothesis proves that organizational commitment positively and significantly affects managerial performance of local government of district/city in Lampung, with path coefficient of 0.42. R^2 of 0.73 means that dependent variables (budgeting participation, budgetary slack, authority delegation, and organizational commitment) can explain independent variable (managerial performance) as much as 73%.

Discussion

The study result proves that participation in budgeting making positively and significantly affects managerial performance of district/city government work unit in Lampung. Higher participation of in budgeting making of government work unit manager, then, managerial performance is also bigger. Participatory budgeting can be evaluated as managerial approach that can increase performance of each organization member in accordance with target that has been determined previously. Participation in budgeting making gives a feeling of responsibility to lower manager and encourages creativity, because to lower manager who plans or creates budgeting, then, budgeting objective is most likely also personal objective that causes higher level of objective congruence in this matter the high of job satisfaction. The result of this study supports the study of Bronwel and Melnnes (1986), Fernando (2013) and Agusti (2012).

The result of this study also proves that Budgetary Slack positively and significantly affects managerial performance of district/city government work unit in Lampung, but it does not mean that government is suggested to conduct budgetary slack. In this study, budgeting is used as the base to evaluate performance of local government work unit in the following year which is by looking at budgeting realization. In this condition, it allows employees to conduct budgeting discrepancy at the time determining income target, so even though the trend of income target is always increasing, but it is still easy to be realized (budgeting absorption). Budgetary Slack is created by manager in order to be able to protect self from the risk of budgeting target that cannot be attained (Lukka, 1988; Onsi, 1973; Schiff and Lewin, 1970). In line with the arguments from Cyert and March (1963), Merchant (1989) and Belkaoui (1989) in Yuhertiana (2011) stating that the existence of budgetary slack will make manager more creative, more freely to conduct their operational activity, manager is also able to anticipate the existence of uncertainty, so morally they evaluate budgetary slack as something that is positive and ethical. Moreover, budgetary slack also can prevent manager from budgeting pressure, so performance of manager will be more stable. The existence of intervention possibility from higher manager faced by manager if managers are not able to attain budgeting target, then manager will lose resources of organization, lose annual bonus or at the extreme point, will lose job (Merchant and Manzoni, 1989). The study result is in accordance with the study of Blanchette et al., (2002) that found budgetary slack done ethically will positively affect managerial performance, as well as the study of Dunk (1995) stating that budgetary slack has positive role in affecting relationship of task difficulty and performance similarly to Wouters (2005) stating that the existence of budgetary slack can reduce budgeting pressure and uncertainty of budgeting target attainment, so it positively affects managerial

performance.

Based on the result of this study, authority delegation is proven to positively affect managerial performance of district/city government work unit in Lampung. It means that the better authority delegation, the greater managerial performance. Subordinate who is given authority delegation from superior or leader can help top manager in decision making, task and responsibility with expectation that organizational objective can be achieved. The study result supports the study of Gul *et al.* (1995) in Fernando (2013), Marani and Supomo (2003), Merchant (1981), Zulfikar and Supriyanto (2016).

The result of this study also proves that organizational commitment positively affects managerial performance of district/city government in Lampung. The higher organizational commitment, the greater managerial performance. Strong organizational commitment inside individual will cause the individual to try hard in attaining organizational objective in accordance with organization goal and importance, as well as will have positive view and will try their best for organization importance. High commitment makes individual concern with the fate of organization and tries to make organization to be better. The study result supports the study of Mowday et al. (1982) in Pangastuti (2009), Greenberg and Baron (1993), Fernando (2013) and Wulandari (2013).

Conclusions and Implication
1. Conclusion
a. Participation in budgeting making, budgetary slack, authority delegation, and organizational commitment positively and significantly affect managerial performance of local government of district/city in Lampung. It means that higher participation in budgeting making, budgetary slack, authority delegation, and organizational commitment, then, managerial performance will be greater.
b. Budgetary Slack has positively and significantly affects managerial performance of local government of district/city in Lampung. Where Budgetary Slack will be able to keep manager away from budgeting pressure and uncertainty of budgeting target achievement, so it affects on managerial performance improvement. This result is caused by performance evaluation of local government that is measured based on realization of budgeting target so that it needs to redefine evaluation of managerial performance. Budgetary slack is allowed as long as it is ethical. However, budgetary slack that is not ethical is not allowed.

Implication
For local government of Lampung Province, it should give great opportunity for its employees to participate in local budgeting in order to improve managerial performance in the future. Moreover, the existence of budgetary slack in budgeting making will affect performance, so supervision is needed on managerial performance of local government work unit so that income potential in District/City of Lampung Province can be optimized. Local government party also needs to develop working commitment of the employees, so they have high commitment at work. In the matter of authority delegation, for instance its responsibility that is started from planning to implementation object, it is always initiated from staff to superior that can be more optimal.

THE VALUE RELEVANCE OF ENVIRONMENTAL PERFORMANCE: EVIDENCE FROM INDONESIA

Susi Sarumpaet , Universitas Lampung, Indonesia
Melinda Nelwan, Universitas Klabat, Indonesia
Dian Nirmala Dewi, Politeknik Negeri Lampung. Indonesia

Abstract

This study aimed to provide empirical evidence on the value relevance of environmental performance by testing the relationship between share prices of Indonesian listed corporations and their environmental performance ratings, called the PROPER ratings. PROPER (Program for Evaluation of Environmental Performance Ratings) is carried out by Indonesia Ministry of Environment, which annually evaluates and rates environmental performance of selected Indonesian companies and releases the results to the public. 62 listed companies participating in PROPER during 2002-2012 were identified as usable sample, resulting an unbalanced 256 firm-year observations. Following Clarksonet al. (2004) which modifies Ohlson (1995) model, share price is regressed against earnings per share, book value per share, PROPER ratings and other control variables commonly used in value relevance literature. The ersearch findings are that superior environmental performance is associated with higher share price. Specifically, there is evidence that environmental performance information is incremental value relevant on that of the accounting information, and particularly on profitable firms.

Keywords: environmental performance, Indonesia, PROPER ratings, value relevance

Introduction

This study aims to provide empirical evidence on the value relevance of environmental performance by testing the relationship between share prices of Indonesian listed corporation and their environmental performance ratings. Such ratings are annually by The Indonesia Ministry of Environment, through its' program called PROPER (Program for Evaluation of Environmental Performance Ratings). We find that superior environmental performance is associated with higher share price published. Specifically, there is evidence that environmental performance information is incremental value relevant on that of the accounting information, and particularly on profitable firms.

PROPER aims to target selected Indonesian companies whose operational impacts are considered significant to the environment. Initiated in 1995 as a pilot project funded by the World Bank, PROPER restarted in 2002 and fully funded by the state budget. The number of PROPER participants have increased overtime, from 82 in 2002 up to more than 1.000 in 2014.PROPER rates corporate environmental performance using color codes: black, red, blue, green, and gold, indicating the poorest to best environmental performance(Indonesia Ministry of Environment, 2007). One of its purposes is to provide rewards and punishment mechanism for targeted companies based on their environmental performance. By publicly releasing their environmental performance ratings to the stakeholders (2011), the Ministry expects that the PROPER ratings will influence the stakeholders in making investment and related decisions. For example, green investors and creditors may use PROPER ratings in

assessing the risks and return of the rated firms. Meanwhile, green consumers may find PROPER results useful for making purchase decisions.

However, after more than a decade of implementation, there has been little research undertaken to evaluate the effectiveness of the PROPER program, specifically on how different stakeholders value such information as a reward and punishment mechanism, as planned by the ministry. Furthermore, studies on how environmental performance information affects the capital market in an emerging economy, such as Indonesia, is relatively rare, in spite of extensive studies from more developed nations (e.g.,Clarkson, et al. 2004; Goldar, 2003; Konar & Cohen, 2001; Stevens, 1984). This study contributes to the literature by providing empirical evidence on how corporate environmental performance influence their share prices. Using the framework by Ohlson (1995), share prices of Indonesian listed companies are regressed against their PROPER ratings and other control variables.

Previous studies on the relationship between environmental performance and financial performance have been extensive, but are inconclusive (Hughes 2000; Clarkson, et al. 2004; Hassel *et al.* 2005; Moneva & Cuellar 2009).Various measures of financial performance, both accounting and market measures, have been used in these studies and may contribute to the inconclusiveness. Other studies that investigate the relationship between environmental performance and environmental disclosures have also found mixed results (e.g. Hackston & Milne, 1996; Magness, 2003; Neu, et al., 1998; O'Donovan, 2002; Patten, 2002). Environmental performance was also measured using different proxies, such as environmental emissions (e.g., Clarkson, et al., 2004.; Decker & Jalbert, 2003; Johnson, 1995; Konar & Cohen, 2001; Shadbegian & Gray, 2003), companies with hazardous sites (Hutchison, 1997), and firms partially environmental responsible parties by US EPA (Mitchell, 1994).

These studies use only negative environmental performance indicating only poor performers and neglecting good environmental performers in the sample by classifying them into the control sample, i.e. the same category as average performers. We argue that positive environmental performance could also have information content. Therefore, the use of an environmental performance measure that distinguishes poor and good performers, such as PROPER ratings, provides exclusive contribution to the literature. One particular study by Nilsson (2003) uses a five-scaled index of environmental performance of listed Swedish companies provided by a rating firm, named Caring Company. Although such an index includes both poor and superior environmental performance, it may contain of potential validity and reliability problems, because such an index was derived from corporate annual reports, instead of an evaluation by authorized third party. Another study by Endrikat (2015) uses environmental events, i.e., company announcements with regards to managerial decisions, to measure negative and positive environmental performance. Similarly, this measure bears similar issues as compared to third party announcements, because corporate announcements involve much subjectivity of the internal management.

In relation to value relevance literature, prior studies have extensively examined how capital markets combine accounting information with "other information" for firm valuation. For example, Floros(2008) and Oehler, et al. (2013)investigated how political events, such as election, influence capital markets. Barth, et al.(1998) finds that brand value estimates are positively related to prices and returns, incremental to accounting variables. This is consistent with the findings in market valuation literature that find financial information provided by the

historical cost basis of accounting lack of relevance(Scott, 2003).This study also contributes to the empirical findings by testing how environmental performance affects firm value.

The results of this study provide contributions as follows. First, as the Indonesia Ministry of Environment's intention to provide a "stick and carrot" mechanism of the PROPER program, this study gives insight on whether investors, as the primary stakeholders, value corporate environmental performance information in the form of PROPER ratings, which is reflected in the share price. Such an evaluation may help the ministry to understand the effectiveness of PROPER program and how to improve its implementation. This study also provides implications for the managers of Indonesian corporations in developing strategies and managing environmental issues. By understanding how investors respond to environmental performance information, different strategies may be considered in the development of environmental management systems and the handling of their environmental and social reputations. Finally, as mentioned earlier, this study contributes to the literature by providing insight on the information content of environmental information by investigating the value relevance of corporate environmental performance.

Theoretical Framework and Hypothesis Development
1. Theoretical Framework
a. The Concept of Value Relevance

In capital markets research, accounting information is considered to be value relevant because it indicates future profitability, and is thus used by market participants in corporate valuation (Beaver, 2002). While only some economic activities are manifested in current earnings, other information about current economic performance and its implications for future profitability can be assessed by capital market participants (Jiambalvo, et al., 2002). If it has implication for future earnings, then it will be reflected in current share prices.

b. Accounting Information

Companies are competing for limited capital resources; therefore, information about earnings is of a particular interest for investors in relation to their investment decisions. Early studies (e.g., Ball & Brown 1968; Beaver 1968) expound that earnings information contributes to the changes in market value of a company, hence had been used to predict future earnings. Similarly, Nichols and Wahlen (2004) assert current period earnings offers wealth creation information that is useful for predicting future earnings.

Earnings information may be more value relevant to the market than the book value of equity for companies that have a good financial condition(Barth, et al., 1998) and may provide complementary information to book value of equity when abnormal earnings are more persistent (Ohlson, 1995). However, book value of equity (which is the information provided by the balance sheet) is adequate in determining the market value of a normal-growth corporation(Nwaeze, 1998), and is deemed to be more relevant than earnings information where losses are more prevalent and one-time items are substantially impounded in earnings(Barth et al.,1998). Therefore, the complementary value relevance of earnings and book value in various contexts has been a particular interest for extant value relevance studies.

c. Environmental Information

Jiambalvo et al. (2002) argue that sophisticated investors utilize information (i.e. financial and non-financial) to predict future earnings and this is impounded in current share prices. Accordingly, although non-financial information might not be manifested in current

earnings, it may have an impact on future earnings. Therefore, accounting information may not adequately represent future corporate financial performance.

The value relevance of information beyond earnings and book value has been investigated by many studies. For example, Hughes (2000) examines the value relevance of air pollution measures and finds that the market uses this information to estimate future environmental liabilities of the electric utility industry. Moneva and Cuellar (2009) investigate whether financial and non-financial environmental performance information is value relevant to the share market. They find that financial measures of environmental performance (environmental assets/investments, environmental costs, and provisions) are value relevant but non-financial disclosures (environmental policy and environmental management systems) are not. Clarkson et al. (2004) examine the value relevance of environmental capital expenditures of pulp and paper companies and find environmental capital expenditures for low polluting firms are value relevant to the market. Studies in the context of environmental performance information evidently show that environmental information is regarded as value relevant by investors and is useful for equity valuation. This summarizes that non-financial information has implications on the future financial performance of a company and provides additional information to that of earnings and book value of equity.

d. PROPER Ratings and The Value Relevance of Environmental Performance

PROPER is an environmental performance ratings which have been released by the Indonesia Ministry of Environment annually for more than a decade. Such ratings are given to companies whose operating facilities are considered having significant impact to the environment. PROPER has expanded its coverage from 82 in 2002 to more than 1,000 facilities in 2014. It evaluates and rates the participating companies into five color code ratings, black, red, blue, green and gold, from the worst to the best, respectively. Such ratings are given based on the documentation provided by the participating companies and the environmental audit performed by the ministry.

PROPER ratings provide information about corporate environmental performance to the stakeholders, such as equity investors. Companies with superior performance are expected to gain rewards by the increase in share price, and vice versa. In other words, environmental management system and corporate environmental performance are expected to influence corporate performance. A study by Clarkson et al. (2004) reveals that companies with good environmental performance are favored by the share markets as indicated by increased share prices. Management effort to manage company's environmental performance can influence its financial performance and thus companies need to calculate its sacrifice or investment to adopt cleaner production strategies (Porter & Linde, 1995; Russo & Fouts, 1997).

Previous studies support the argument that information about environmental performance is value relevant in particular context(P. Clarkson & Li, 2004; Hamilton, 1995; Hassel, Nilsson, & Nyquist, 2005; Hughes, 2000; Moneva & Cuellar, 2009). (P. M. Clarkson et al.(2004) investigates the value relevance environmental capital expenditure by firms in pulp and paper industry in the US from 1989 to 2000. Categorizing firms of good and poor environmental performance based on their capital expenditure, they reveal incremental economic benefits associated with environmental capital expenditure investment by low-polluting firms but not high-polluting firm.

Hughes (2000) examines the relation between the market value of equity and pollution measures sulfur dioxide emissions. He finds that the levels of sulfur dioxide emissions are

negatively associated with share prices. Hamilton (1995) reported that the higher pollution figures (such as air emissions or offsite shipments of toxic waste) were in a firm's TRI reports, the more likely print journalists were to write about the firm's toxic releases. Stockholders in firms reporting TRI pollution figures experienced negative abnormal returns upon the first release of the information. However, Hassel et al. (2005) finds environmental investments represent only increased costs, resulting in decreased earnings and lower market values. Using a sample of Swedish companies they find that the results of their study support the cost-concerned school, because the results indicate that environmental performance has a negative influence on the market.

Based on these inconsistent results, we believe that a new investigation on the value relevance of environmental performance information will have an important contribution to existing literature. Using a different context and measures of environmental performance, we expect that this particular study will provide empirical finding on how environmental related information influence the share markets. The use of Indonesia as an emerging economy and PROPER ratings are unique in this study and therefore are expected to provide significant contribution to the existing literature which is mainly from developed nations.

Information regarding environmental performance ratings can be value relevant if it provides additional information to the accounting numbers and helps investors access the future financial performance of the firms. As discussed earlier, firms with superior performance may gain benefits from such ratings because they are protected from environmental costs or liabilities. Firms with good PROPER ratings can have higher reputation and legitimacy, which may improve their competitive advantages, and future profitability. Since PROPER ratings indicate future profitability, we predict that PROPER ratings are valued by investors as reflected in share prices:

Hypothesis 1: Environmental performance ratings are value relevant to the market.

Research Method
1. Sample Selection

The population of this study consists of 71 unique listed companies covered under PROPER from the period of 2003 to 2012 (except for 2006 and 2007 when PROPER was suspended). This forms 313 firm-year observations. Since the sampling method is based on the availability of data, companies that do not provide the information needed for this study are excluded from the sample. After cleaning for the unavailable data, the final sample consists of 62 unique companies forming 256 firm-year observations.

2. Data Collection

Two types of data sources used in this study are financial data and environmental performance data. The financial data was mainly collected from electronic database, OSIRIS. Where these database failed to provide such data, corporate financial reports from Indonesia Stock Exchange website and ICMD (Indonesian Capital Market Directory) were used to obtain financial figures. Data regarding environmental ratings (PROPER) was obtained from the website of the Indonesian Ministry of Environment when such ratings were released. Due to its limited economic resources, PROPER only evaluates companies whose environmental impacts are considered significant, but with expanded coverage over time. It includes listed and unlisted companies.

3. Statistical Method

This study uses panel data approach. The sample size of 256 observations formed an unbalanced panel. Based on Hausman test(Wooldridge, 2013) it is found that the preferred model to analyze the panel data is the fixed-effect model.

4. Research Model

The value relevance of environmental ratings in this study is examined using the Ohlson (1995) model modified by including the environmental ratings and control variables, in which we argue that environmental ratings are information incremental to those of accounting information. The model is as follows:

$$SP_{it} =$$
$$\delta_0 + \delta_1 E_{it} + \delta_2 BV_{it} + \delta_3 Environmental\ Ratings_{it} + \delta_4 Control\ Variables_{it} + \varepsilon_1$$

Where,

SP   = Share prices of company i at year t
E   = Earnings per share of company i at year t
BV   = Book value per share of company i at year t
Environmental Ratings = PROPER ratings of company i at year t
Control Variables   = Consists of Growth, Leverage, and Liquidity of company i at year t

5. Dependent Variable

This study uses share prices three months after the end of fiscal year. In this case the share prices used are share prices as of March 31 since the fiscal year end of all the samples at the related years is December 31. Share prices represent firms' expected future cash flows and therefore would provide a more objective measure of firms' financial performance.

- **Independent Variables**
   Earnings

Earnings per share is the first independent variable in this study. It is measured by earnings before interest and taxes divided by number of shares outstanding. According to Ball and Brown (1968), Beaver (1968), and Tucker and Zarowin (2006), earnings which is the product of income statement have a role in determining firms' market value. This is because studies have shown that earnings contain information useful for shareholders to examine firms' value.

   Book Value

Book value per share is the second independent variable which is measured by book value of equity divided by number of shares outstanding. Book value of equity is the product of balance sheet (or statement of financial position) and is deemed value relevant because it provides information that can affect the value of equity. Ohlson (1995) states that current book value can be a factor to determine future earnings, thus provides fair estimation for market value of the firms.

   Environmental Performance (PROPER Ratings)

To operationalize the variable for environmental performance this study uses PROPER ratings. As mentioned earlier, PROPER is a performance evaluation program conducted by the Indonesia Ministry of Environment to selected Indonesian companies' facilities. The results are released to the public using five color-coded instruments; *black, red, blue, green and gold* represent environmental ratings from worst to best. In this study, we define these ratings into an order scale; 1 to 5 for black to gold, respectively.

Since PROPER evaluates and rates companies of their selection based on facilities, companies with more than one facilities will likely to earn more than one ratings and then the researcher averaged the ratings for the purpose of this study. For example, in 2001 PT. Indocement Tunggal Prakasa Tbk. (IDX ticker: INTP) was awarded 2 blues and 1 green for its three facilities located in different areas. The average ratings for INTP is 3,33. Furthermore, we categorized companies with PROPER ratings of larger than 3 as good performers, and poor performers otherwise.

- **Control Variables**
  Growth

Growth is measured by percent of changes in sales. This is one indicator of firms' potential future financial performance because it provides information regarding future investment opportunity (Minnis, 2011). As a result, shareholders may consider that this information is valuable to capture firms' future performance.

Liquidity

Liquidity is measured by total assets divided by total liabilities. Liquidity is one indicator of firms' performance. Firms that are more liquid have more financial resources to conduct environmental related activities as a signal of their capacity in complying with environmental regulation.

Leverage

Leverage is measured by total liabilities divided by total assets. Leverage captures firms' capacity to finance their assets through debt (Clarkson, et al., 2008) . The higher the debts to assets ratio results in a highly leveraged company which makes it riskier to invest in. This means, if a company becomes default, shareholders may lose all their investments.

Results and Discussion

1. Descriptive Statistics

The descriptive statistics of 256 observations are presented on Table 1. On average, the share prices of all companies are around Rp3,500 with the minimum of Rp50 and maximum of Rp55,050. This shows the relative wide range of samples. The earnings per share are approximately Rp164, while the book value per share has an average of Rp1,263. However, it can be seen from the table that there are companies with negative earnings which might influence the examination. The PROPER ratings are around 2.9 in which we categorized the samples as poor environmental performers, on average. The sample companies have PROPER ratings as low as 1 and as high as 4.5. The sales growth of average companies is 13% which is higher than the average inflation rate in Indonesia as presented in www.inflation.eu, thus could be said that the average sample companies have positive growth rate. The liquidity ratio shows that the average companies have total assets which are 2.85 times higher than total liabilities. This indicates that those companies are relatively liquid. The leverage is 0.55, indicating that samples have total liabilities of 55% of the total assets.

Notes: SP: share price; E: earnings per share; BV: book value per share, PROPER: proper ratings, GROWTH:sales growth; LIQ: liquidity; LEV: leverage

.

2. Classical Assumptions

We ran the classical assumptions tests for regression analysis and found some issues of normality, heteroscedasticity, and autocorrelation. We use STATA package which is able to address these issues, which are common in panel data. The Saphiro-Wilk test(Gujarati, 2004) of normality shows that all the variables are not distributed normally (p-value < 0.05). In addition, when predicting the cook's distance, 21 of 256 observations are found to be influential outliers. Therefore, at first those observations are retained with the consideration that the additional hypothesis testing would be conducted by excluding the influential outliers to test for robustness of the results. Testing for heteroscedasticity problem by using Breusch-Pagan/Cook-Weisberg test(Gujarati, 2004), we found the p-value of less than 0.05, which indicates the existence of heteroscedasticity problem in the model. We use robust standard errors to correct for heteroscedasticity.

To test for multicollinearity problem we conduct variance inflation factor (VIF) test. The results show that none of the VIF is larger than 10, thus indicate that collinearity problem does not exist among the independent variables(Gujarati, 2004). Autocorrelation problem is tested using Wooldridge test (Wooldridge, 2013)for autocorrelation in panel data. It is found that the p-value of the test is less than 0.05, indicates autocorrelation problem in the samples. This problem is controlled by clustering the observation(Wooldridge, 2013).

3. Regression Results

To test the hypothesis the first regression is conducted on the pooled samples. Table 2 presents the results. It is found that the model is not significant at all (p-value $= 0.3198$), indicates that the independent variables cannot explain the changes in share prices. However, reflecting on the descriptive statistics where on average the samples are comprised of poor performers, it would be problematic to draw an early conclusion about the results. Therefore, additional testing is conducted to refine the results.

Table 38Regression Results for Pooled Data

Variable	Coefficients	P>t
E	0.747	0.165
BV	0.919	0.134

PROPER	1,327.39	0.097
GROWTH	128.952	0.45
LIQ	36.101	0.382
LEV	2,325.12	0.542
_cons	-3062.585	0.371
Dependent Variable	SP

F	1.198	
Prob>F	0.3198	
N	256	

legend: *p<0.05; ** p<0.01; *** p<0.001

Given that on the descriptive statistics it is shown that there are firms with negative earnings and book value, we argue that this negative accounting information might bias the results. Therefore, we exclude the negative earnings and book value and rerun the test. The results are available on Table 3 below.

Table 39 Regression Results for Positive Earnings and Book Value Firms

Variable	Coefficients	P>t
E	7.486***	0.000
BV	-0.191	0.817
PROPER	1,783.091*	0.035
GROWTH	3.152	0.987

_cons	-3945.546	0.199
Dependent Variable	SP	
R-squared	0.415	
Adj. R-squared	0.397	
F	6.596	
Prob>F	0.0000	
N	206	

legend: *p<0.05; ** p<0.01; *** p<0.001

After excluding negative earnings and book value, 206 observations remained. The results on Table 3 shows that the model is significant at 0.001 level (p-value = 0.000), suggests that the independent variables are able to explain the changes in dependent variable. The adjusted R^2 is 0.397 which means that 39.7% of the changes in dependent variable can be explained by the independent variables.

Among the accounting information, it can be seen that only earnings is positive and significant (p-value = 0.000). However, the significant influence of book value to the share prices does not exist. This shows that the market values information of accounting earnings

rather than that of book value, meaning that earnings are more value relevant to the market. PROPER is significantly positive at 0.05 level (p-value = 0.035). There is evidence that environmental ratings would be value relevant on companies that have better financial performance. This is parallel to the argument that better financial performance is indicative of firms' capacity to better perform environmentally (Al-Tuwaijri, Christensen, & II, 2004; Bosworth & Clemens, 2011).

A study by Clarkson et al. (2004) finds that the market favors information about capital expenditure investment of low polluter firms but not that of high polluters. This indicates that the market could potentially value PROPER ratings of good and poor performers differently. Therefore, the third regression analysis is conducted over the split samples to compare to examine whether the findings are consistent with the notion. The results are shown in Table 4.

Table 40Regression Results for Split Samples

Variable	Good Performers		Poor Performers	
	Coefficients	P>t	Coefficients	P>t
E	13.849**	0.002	0.563	0.203
BV	1.311	0.152	0.709	0.282
PROPER	1,677.690*	0.030	442.732	0.262
GROWTH	-50.906	0.928	255.674	0.295
LIQ	77.310*	0.017	25.406	0.322
LEV	8,407.412*	0.015	1,230.39	0.521
_cons	-1.18e+04**	0.003	85.82	0.968
Dependent Variable	SP		SP	
R-squared	0.763		0.193	
Adj. R-squared	0.735		0.168	
F	31.70		0.686	
Prob>F	0.0000		0.6616	
N	57		199	

legend: *p<0.05; ** p<0.01; *** p<0.001

When conducting the regressions among the split samples, it is found that compared to poor performers that comprised of 199 observations, the number of observations for good performers is reduced remarkably to57 observations. This means that most of the observations have PROPER ratings equal to or less than 3. Although the poor performers outnumbered the good performers, the regression model for good performers is significant at 0.001 level (p-value = 0.000) and gives the highest explanatory power compared to other regressions (adjusted R^2 = 73.5%).

Table 4 shows that, for good performers, earnings are positive and significant at 0.01 level (p-value = 0.002), meaning that information about earnings is still regarded as value relevant to the market, consistent with previous results. It is also found that PROPER is positive and significant at 0.05 level for good performers (p-value = 0.030) relative to poor performers. This confirms that the market values environmental performance of good and poor

performers differently. Two of the control variables, i.e. liquidity and leverage are both positively significant at 0.05 level (*p*-value = 0.017 and 0.015 respectively). The findings show that financial condition of good performers is valuable to the market compared to that of their counterparts. These significant results are absence in the regression of poor performers.

To test the robustness of the results, additional tests are conducted after excluding the influential outliers. This exclusion reduced the sample size to 235 observations. The results on Table 5 are fairly consistent for earnings across all the regressions, although not for PROPER. In fact, the significant result of PROPER that exists in the previous regression on the positive earnings and book value observations is now absent. Nevertheless, all the results from previous regressions hold when the test is conducted among good performers. This shows that besides accounting information, information about environmental ratings is value relevant to the market. Specifically, the market values the environmental performance of good performers more than that of their poor counterparts.

Conclusion, implication, and limitation

This study investigates whether corporate information of environmental performance is value relevant. Using environmental performance ratings by Indonesia Ministry of Environment, called the PROPER ratings, we test whether such information influences share prices in Indonesian capital market. Prior studies from different contexts using various measures of environmental performance have resulted in mixed findings. The use of Indonesia as an emerging economy and PROPER ratings, which indicate both negative and positive environmental performance, are unique to this study. Such uniqueness provides significant contribution the existing literature that reveals how financial and non-financial information are both value relevant (Jiambalvo et al., 2002; Clarkson et al., 2004).

We use a sample of 62 firms during 2003-2012 and resulted in 256 firm-year observations as our final sample. Following Clarkson et al. (2004) that modified Ohlson (1995) model to find the value relevance of environmental performance, we regressed share price with earnings(EPS) and book value (BVS), adding PROPER ratings and other control variables commonly used in the literature, namely growth, liquidity, and leverage.

We did not get significant result for the overall model using the pooled data. However, after excluding firms with negative EPS and BVS, we find that PROPER, as well as earnings, are positively associated with share price, whereas book value of equity and other financial information are not. This finding is consistent with prior studies which find that firm's financial performance is indicative of its capacity to better perform environmentally(e.g., Clarkson et al., 2004;Al-Tuwaijri et al., 2004). When we split the sample into good and poor performers, we find that such positive relationship between PROPER and share price only exists among good performers. This confirms that the market values environmental performance of superior and inferior performers differently.

Furthermore, we conduct four additional tests for robustness by repeating the procedures, but excluding outliers. Similar to the prior procedure, the results show consistency in the association of earnings and share price. However, PROPER was only significant when poor performers were excluded from the sample, which indicates that good news regarding environmental performance are better valued by investors that its bad news. Overall, this study confirms that "other information" does have information content.

We emphasize some limitations of this study. First, due to limited funding, PROPER only rates small portion of listed companies, mostly those who are large and sensitive to the environment. This selection creates potential issue in sample selection bias, because stock market could value environmental performance of smaller and less environmentally sensitive firms. Second, we did not observe different types of corporate environmental performance other than PROPER. Environmental events involving corporations which are reported by the press and environmental information reported by management in the annual reports and company websites may also contain information for investors in assessing firm value. These limitation not control for in our tests potentially confounds inferences.

Extensive research in this topics employed archival method using secondary data. This opens opportunities for further investigations in this issue. The use financial analysts in an experimental or survey setting will advance the research methodology and improving the understanding of how stock market values environmental information. Finally, this study also offers practical implications for management and regulators, such as the Indonesian Ministry of Environment, on the effectiveness of PROPER program. Our finding shows that Indonesian capital market values positive rather than negative environmental ratings, implying that the rewards mechanism seems to function better than the punishment.

ANALYSIS OF EFFECT OF JOB SATISFACTION, ORGANIZATIONAL SUPPORT AND LEADERSHIP STYLE ON THE WORK MOTIVATION AND PERFORMANCE OF EMPLOYEES
(Case Study at PT. Bank Mandiri Tbk. South Sulawesi)

Irwan Usman, Universitas Hasanuddin, Indonesia
Haris Maupa, Universitas Hasanuddin, Indonesia

Abstract

Banking Business is a business of trust, so that the safety factor for customers who save their money in the Bank is the main thing in the business,   and this factor becomes the mainstay for bank Mandiri, in this case, in particular PT.Bank Mandiri Tbk throughout South Sulawesi, in competition with privately owned banks , In order to achieve an excellent quality of service, is determined by the work outcome of each individual employee. Therefore, this research is directed to investigate the effect of job satisfaction, organizational support, and leadership style on job motivation in improving employee performance.

To answer the objectives that have been set in this study, the questionnaire used as a tool to collect data relating to the variables of job satisfaction, organizational support, leadership style, employee motivation, and employee performance which distributed to 110 respondents employees of PT. Bank Mandiri Tbk throughout South Sulawesi.

Based on the analysis by using SEM (Structural Equation Modeling), it can be concluded that in order to improve employee motivation, so that the employee's performance can be increased, it can be pursued by improving leadership style that already exists, improves employee job satisfaction, and increasing the organizational support of the employees.

Keywords: Job satisfaction, leadership style, employee motivation, employee performance

Introduction
Background

Banking Business is a business of trust, so that the safety factor for customers who save their money in the Bank is the main thing in the business,   and this factor becomes the mainstay for bank Mandiri, in this case, in particular PT.Bank Mandiri Tbk throughout South Sulawesi, in competition with private banks,

Susskind et al., (2000) found that support of organizations can be used to increase the motivation of workers whose jobs description are directly related to the customer, so we can say that organization supports variable positively affected the work motivation of workers. An important factor that determines the performance of the employees pursuant to Yammarino et al (1993) is the leadership (leadership). The Leadership describes the relationship between the leader (leader) with a led (follower) and how a leader directing his followers, and will determine how far the follower able to achieve the objectives or expectations of the leader. (Locander et al 2002; Yammarino et al 1993).

Each leader has a leadership style that is different, leadership style has a meaning that

is how leaders influence subordinates to be able to do something or to be able to pursue something, in order to achieve organizational goals. This conclusion was supported by Chen (2004) which states that the high level of support demonstrated by the leadership of the company capable of providing high motivation of employees to work better and achieve the target, The research by Chen (2004) showed that the leadership style positively significant effect on job satisfaction and employee performance, The problems that occurred in PT.Bank Mandiri Tbk is the leader usually only give a command to employees, regardless of function or meaning of the true leader, the leaders were oriented to the achievement of the target, resulting in less attention to the vision and mission of the Bank Mandiri which is "Serving with heart, towards the best.

Related matters and affects the performance of employees is job satisfaction. As defined, job satisfaction is a situation where there is a fulfillment or non-fulfillment of the desire for a job (Timmreck, 2001). Employee satisfaction associated with employee expectations from a supervisor, co-workers, and dealing with the expectations of the work. When in the work environment, employees are not getting what is expected, such as a fair promotion opportunity, good income, good coworkers and a fun manager, and satisfaction with the work that they live day-to-day, then the employee's performance will be reduced.

A discussion of employee satisfaction can not be separated from the fact that employee satisfaction can be achieved when all employee expectations can be met in performing job duties. Job satisfaction is a reflection of the feelings and attitudes of individuals towards work, which is the interaction between the concerned with the work environment. Luthan (1997) stated that there are five factors that influence job satisfaction, namely: income, work colleagues, growth opportunities, employment, and supervisor.

Kartikandari (2002) states that the employee's performance is that the work or the level of success of an employee in carrying out the work, was influenced by internal and external factors. The internal factors eg motivations, goals, expectations, while external factors examples are company's physical and non-physical environment.

Problem Formulation

Employee motivation provides the positive behavior of the perpetrator organization in improving employee performance. Intrinsic and extrinsic motivation as a basic way of viewing the responses that describe appreciation to individuals within the organization. Intrinsic motivation refers to the appreciation of the performance of a task coming from the individual who run the task. Extrinsic motivation refers to the performance of an activity caused by activity leading to some external rewards (rewards given by others rather than implementers of assignments) as well as wages, status, friendship, recognition. Employee motivation is strongly influenced by the organizational support of job satisfaction.

Based on the above matters, the problem in this research is: "how organization supports provided by PT. Bank Mandiri Tbk, leadership style and job satisfaction levels of employees, thereby increasing employee motivation, which affects the employee's performance that is strong and able to work in accordance with the company's expectations, by deploying all the capabilities they have for the advancement of PT. Bank Mandiri Tbk. "Thus the question in this study can be formulated as follows:

1. Does the job satisfaction, influence the work motivation?
2. Does the organization support influence the work motivation?
3. Does leadership style can affect motivation for work?
4. Does the work motivation influence the employee performance?

5. Does the job satisfaction influence the employee performance?
6. Does the leadership style influence the performance of employees?

Research Objectives and Benefits
Objective
1. To examine and analyze the effects of the job satisfaction on work motivation.
2. To examine and analyze the effects of organizational support on work motivation.
3. To examine and analyze the effect of leadership style on the work motivation.
4. To examine and analyze the effect of the work motivation on employee performance.
5. To examine and analyze the effects of the job satisfaction on employee performance.
6. To examine and analyze the effect of leadership style on employee performance.

Benefits of research
1. The results of this study are expected to enrich the concept or theory that supports the development of human resources, particularly with regard to the effect of motivation on employee performance.
2. The results of this study are expected to be used as consideration or input to the company in managing the company's performance through employee motivation.

LITERATURE REVIEW
Theory basis
Employee Performance

According to Stolovic and Keeps (1992) in the Casio (1992) is a set of performance results achieved and refers to the act of accomplishment and execution of any work requested. Bernadin and Russel (1993) defines performance as a "record of comes produced on a specified job function or activating during a specified time period" (record of success generated from a particular job function / activity over a specified period). Meanwhile, according to Casio (1992) the performance refers to the employee achievement on a given task.

From the above notions of performance, then performance can be interpreted as a record of success of a job / task that has achieved through evaluating / assessing the performance of employees by the organization over a specified period and the performance is the result of qualitative and quantitative.

Mc. Kenna and Beach (1995) concluded that the performance factors are most commonly used as an indicator of research are knowledge, abilities, skills, attitude towards work (enthusiasm, commitment, and motivation), quality of work, volume of production and interaction (communication, relationships in the group).

Dessler (1997) provide examples of employee performance assessment criteria includes quality, productivity (quality and efficiency), employment by using a measured science of knowledge.

According to Mannheim Bilhah et al., (1997) that the performance of employees affected by work motivation. Meanwhile, according to Mc.Cormick and Tiffin (1974) there are variables that can affect the performance of employees, namely the individual variables and situational variables. The Individual variable consists of experience, education, gender, age, motivation, physical, personality and attitude. While situational variables related to physical and occupational factors includes working methods, arrangements and conditions, work equipment, working space setting, noise, lighting and temperature. Steers (1985) argues

there are several important factors that affect the performance of the ability, personality and work interests; clarity and acceptance of work and the work motivation.

Work Motivation

Work motivationMotivation are the driving (driving force) that exist in a person to act (Fuad Mas'ud, 2004). The concept of motivation in the literature have frequently emphasized _ the stimulation arising from someone either from within (intrinsic motivation) or from outside (extrinsic motivation). On the other hand, motivators or gratification such as achievement, responsibility, and appreciation to support the job satisfaction. Motivator closely associated with the work itself, or the resulting in direct outcomes, such as promotion opportunities, personal growth opportunities, recognition of responsibility and achievement. Improvements in the mission lead to the increasing of employment satisfaction and motivation to work better.

Basic Theory of Motivation

The basic concept of employee motivation refers to several previous studies eg motivation studies play an important role in the resulting performance of the company (Pullins et al., 2000). The concept of motivation in the literature have frequently emphasized in the stimulation arising from someone either from within (intrinsic motivation), or from outside (extrinsic motivation).

Dimensions of employee motivation in this study are as follows: (1) Intrinsic motivation, and (2) Extrinsic motivation. Intrinsic motivation is the state that creates a condition in which individuals who are intrinsically motivated appear "to be part of the job" undertaken (krivonos, 2006). While extrinsic motivation is an overview of work done with the purpose of completing some of the objectives of non-assignments such as reducing feelings of guilt, trying to please a friend, get a promotion. Extrinsic motivation refers to the performance of an activity caused by activity leading to some external rewards (rewards given by others instead of implementers of the task) as well as wages, status, friendship, recognition, uncommon benefits and so forth (krivonos, 2006).

Job satisfaction

Job satisfactionIn simple terms, the definition of job satisfaction is the satisfaction be perceived by a worker on an individual basis through the comparison between the inputs that being used and the results obtained. does the result in accordance wit the expected outcome ?. The closer to the level of expectation of the results obtained, an employee's job satisfaction will also be higher. It also can not be separated from a variety of factors from both internal and external of workers.

Goldtorpe et.al (in Fraser, 1983), has conducted a trial on the issue of intrinsic and extrinsic. In that study seen whether a worker, oriented inward or oriented outward, as a tool of fulfillment outside his job, or all his necessity are already getting fulfillment from his own work. The results are the first group is more likely to the working class and the second group tends to be to the middle class.

Organizational support

Support organizations can be considered as something that is very important for the behavior of the employee's job. Organizations have an obligation to develop an environment conducive to consumer orientation. (Grönroos (1990) found that the support of the

organization and management will increase the motivation of the behavior of the customer orientation, of its workers.

Locke (1976) and Scheineder (1998) suggested that, an individual interested in and feel comfortable in the organization, due to the similarity of characteristics between the two. Meglino, (1989) suggested that individuals who have the same values with the organization, then they will easily interact efficiently with the value system of the organization, reducing the uncertainty, and conflict and increase satisfaction and improve performance.

Susskind et al., (2000) argues that corporate support can be used to increase the motivation of workers who in touch with customers, so we can say that company support variables can contribute positively to the motivation of workers. Support from organization developed by Susskind

et al (2000) consists of three items, namely respect for the values, the willingness of the company to help and concern from the company.

Positive support from the leadership and all staff member, will create a conducive situation of working environment. By gaining such support, the performance of employees will be encouraged to be better. In addition, positive support also raise the spirit of workers team, so that they can trust each other and help each other, then will be generated good relations between employees within the work environment (Shaam et al., 1999).

Leadership
Concept of Leadership

Issues of leadership have coincided with the beginning of human history, which since humans realized the importance of living in groups to achieve common goals. They need someone or some people who have advantages than others, regardless of what form the human group was formed. It can not be denied, because humans always have limitations and specific advantages.

According to Rival (2004), leadership is also said to be a process of directing and influencing the activities that are related to the work group members. Three important implications contained in this are:

Leadership involves others either subordinates or followers. Leadership involves the distribution of power between the leader and the group members equally, because the group members are not powerless.

Siagian (1997) argues that the role of leaders in the organization is very central to the achievement of the objectives of the various targets which has been set earlier. According to Siagian (1997) leadership behavior has a tendency on two things:namely the consideration or relationship with a subordinate and structure of the initiation or outcome achieved. The tendency of leadership describes the intimate relationship with a subordinate, for example be friendly, helpful and defend the interests of subordinates, willing to accept subordinate consultations and provide welfare.

Leadership is the process that is used by the leader to direct the organization, and a process of setting the example to the behavior of the followers (subordinates) (Mas'ud, 2004). While the style of leadership is the norm of behavior used by someone, by the time attempt to influence the behavior of others or of subordinates. Leaders can not use the same style of leadership to lead his subordinates, but must be adapted to the characters of subordinates, of subordinates ability level, and in each subordinate task.

An effective leader has their own method of leadership, in applying a particular style of leadership they must first understand who are the subordinate they lead ,understand the

strengths and weaknesses of their subordinates, and understand how to harness the power of subordinates to offset the weaknesses they have. The term style is one method being used by a leader in influencing followers (Miftah Thoha, 2001).

In the past two decades, the concept of transactional (transactional leadership) and transformational (transformational leadership) develops and got the attention of many academics and practitioners (Locander et.al., 2002; Yammarino et.al., 1993). This is according to Humphreys (2002) and Liu et al (2003) due to a concept popularized by Bass in 1985 is able to accommodate the concept of leadership which has a comprehensive spectrum, including covers behavioral approach, situational approach, as well as contingency approach. Therefore, this study focuses on the concept of transformational and transactional leadership.

Bass et al (2003) and Sarros and Santora (2001) explains that the character of contingent reward describe the reciprocal positive relationship between leaders and subordinates because leaders provide explanations and guidance in the process of achieving objectives in an effort to spur the performance of the subordinate. Instead, management by ecception (active or passive) according to Yammarino et al (1993) can negatively impact the performance the subordinate because of subordinates afraid to make mistakes in order to avoid penalties, thereby making the subordinate feel to work under pressure. This condition causes the organization process will not be effective. While passive management by exception does not encourage the subordinate to work hard. As long as the target is reached and the system of organization is running properly, everyone will contend and happy. However, there is No adventure or a new challenge.

Previous Research

Previous research is very important as a foundation for the preparation of this study. Its purpose is to find out the result of that has been done by previous researchers.

Table 2.1
Previous research results

No	Researcher	Research	Research Result
1	Adi Parminto (1991)	The influence of factors of job satisfaction to employees performance at PT. XXI-XXII plantations in East Java	Job satisfaction consists of variable salary, the job itself, supervision, promotion, working groups, working conditions and motivation have a positive influence on employee performance PT. XXI-XXIII plantations in East Java
2	Chruden (1998) dan Timmreck (2001)	Job satisfaction	Job satisfaction as the fulfillment of the needs and desires of individuals who obtained from work, job satisfaction derived from the job itself / from individual personal relationship to the environment.

3	Cheri Ostroff (1992)	Analysis of influence of the factors of motivation and job satisfaction on employee performance,	The results showed that job satisfaction which has a positive significant impact on employee motivation and employee performance
4	Dyer dan Parker (1975)	Motivation and job satisfaction	Job satisfaction has a positive significant impact on employee motivation
5	Emilia Rossyana Putri (2001)	Analysis of the influence of the motivation factors of work on employee performance at	Motivational factors such as salary, environment employment, promotion, interpersonal relationships, and job security have positive influence on employee performance
6	Ferry Agustian	The influence of job satisfaction and motivation on employee performance (study on PPD PT.Pusri Central	There is a positive influence between motivation with employee performance
7	Harel dan Tzafrir (2001)	Motivation and job satisfaction	Job satisfaction has positive significant influence on employee motivation
8	Kirkman dan Shapiro (2001)	The influence of job satisfaction and motivation	Job satisfaction has positive significant influence on employee motivation and employee performance
9	Becker dan Klimoski (1989)	Performance	Performance is not just related to the quantity, but also relate to quality, and other things that support the realization of the two. The dimensions of the work are new ideas, quality, quantity, cooperation.
10	Kurniasari dan Forestry (2006)	leadership style positive and significant influence on employee performance	The results support the study of Chen (2005), which states transactional leadership increases job satisfaction, and employee performance. Kurniasari and Forestry (2006) mentions

			The relationship of transformational leadership has a significant influence on the performance. Toyib (2005) state leadership influence on employee performance.
11	Kreitner & Kenichi (2005)	Motivation (of job satisfaction positively and significant effect on the performance of employees)	Motivating factors associated with work which offers achievement, recognition, challenging work, responsibility and advancement prospects. These motivating factors will improve employee performance.
12	Mc Cue & Gianakis (1997)	The relationship between the job satisfaction and performance	The award/reward system within the organization greatly affect the level of satisfaction of the professionals
13	Perry et al (2006)	Motivation and job satisfaction	Job satisfaction has a positive significant impact on employee motivation
14	Tierney et al (1999)	The relationship between Motivation and job satisfaction	Intrinsic motivation of employees for creative tasks will have a positive influence on employee job satisfaction.
15	Cooke, Ernest F (1999)	Employee performance, motivation work, leadership	Motivation and leadership influence significant positive on employee performance.

RESEARCH METHODS
Research Framework

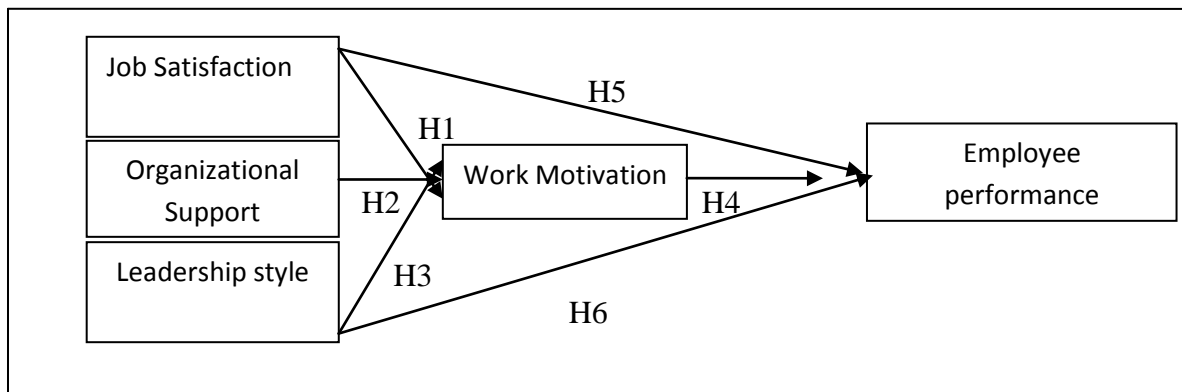
Based on the above hypothesis, the research framework can be described as follows:


Figure 2.1

The influence of Job Satisfaction, Organizational Support and Leadership Style on Work Motivation Work to Improve Employee Performance

Hypothesis

H1 : Job satisfaction positively effects on the work motivation.

H2 : Support from organization affected positively on work motivation.

H3 : Leadership Style positively effects on the motivation Of work.

H4 : Motivation affected positively on performance Of employees.

H5 : Job satisfaction has positive influence on employee performance.

H6 : Leadership Style positively effects the performance of Employee

Research sites location

The location of this research is PT. Bank Mandiri throughout South Sulawesi, consisting of Luwu and vicinity of Bank Mandiri Branch, Sidrap Branch and vicinity, Takalar Branch and surrounding areas in South Sulawesi.

Types and Sources of Data

The type of data that will be used in this research is the data subject, the research data of opinion, attitude or character of a person or group of people who become subjects of research / respondent (Indriantoro & Supomo, 2002).

While the data source of this research is the primary data source, ie research data obtained directly from the source data which is collected specifically and directly related to the issues that have been examined (Indriantoro & Supomo, 2002). Primary data needed in this research is data obtained from the respondents' answers to the question posed by researchers. The respondents who answered the questionnaire eventually are all employees of PT. Bank Mandiri Tbk throughout South Sulawesi.

In addition to primary data, this study also used secondary data. Secondary data is the data type, which its collection is not done directly by the researcher (Indriantoro 7 Supomo, 1999). Secondary data this study were obtained from PT. Bank Mandiri Tbk South Sulawesi. Secondary data were also obtained via the the Internet, as well as journals that are required in this study.

Population

The population is a collection of individuals or objects of research that have the qualities and characteristics that have been set. Based on the quality and characteristics of the population can be understood as a group of individuals or objects of observation that has at least one common characteristic (Cooper and Emory, 1995).

Hair (1995) states that the appropriate sample size for SEM is between 100-200 samples. With reference to the opinion of Hair, the number of samples to be used in this study ranged between 100-200 samples. Therefore the number of employees at some random PT.Bank Mandiri branches amounted to 110 people, the sampling technique used in this research was the census method that the entire population is used as a sample.

Method of collecting data
Questionnaire

Methods of collecting primary data by distributing questionnaires used in this study. The questionnaire is the collection of data obtained directly from respondents, conducted by providing a list of questions to respondents who has been adapted to the purpose of research. A closed question is made using a numerical scale. Research using Numerical Scale 1-7.

Interviews

The interview is the method of data collection by using a question and answer to the respondents, namely by using a questionnaire to be filled with descriptions by respondents. Interviews were also used to expand the firmament of research on other data that is not formulated in the questionnaire, but would have strategic implications for PT. Bank Mandiri, making it feasible to conduct any further research. In addition, interviews were also used to supplement data collected through questionnaires.

Validity and Reliability

Before the study was conducted, necessary to test the validity and reliability, to the list of the questions used. Testing the validity and reliability of the questionnaire, intended to be a list of questions used to obtain research data, have a high level of validity and reliability that meet the required limits.

Data analysis technique

The method used in this research is a quantitative method. Latent variables (constructs) that exist, realized in the manifest variables (indicators) and further elaborated into question items. The answer to the question of respondents was measured with a scale, so the result is in the form of figures (scores). Furthermore, this score is processed with statistical methods. From a wide range of analysis tools researchers identified several tools that fit the needs of the research hypotheses for verification. There are two types of Analytical tools that will be used in this study such as of test data and the second to test the model.

1. Data Test
   a. Univariate normality test / Multivariate
   b. Outliers Univariate test / Multivariate
2. Model Test
   a. Goodness of Fit Test
   b. The effect test (Regression Weight)

To perform data analysis in this study using Structural Equation Modeling analysis techniques or Structural Equation Model (SEM) of a statistical software package of AMOS, namely in the modeling and testing of hypothesis. SEM is a combination of factor analysis and regression analysis.

The use of AMOS program is because: suitable for analyzing problems that are structural, and are used to analyze and test the hypothesized model, because the AMOS program can be used:

1. Estimating the unknown coefficients of a linear structural equation; accommodate models that include latent variable; accommodate measurement error either dependent or independent; accommodating issues of causation, simultaneous and mutual dependence.
2. The advantage of SEM is able to analyze multivariate simultaneously.

While the purpose of the use of multivariate techniques is to expand the ability of

researchers to explain and achieve statistical efficiency. The following is The reasons why SEM is an interesting techniques are:

    a. Provides a method which can explain many relationships (multiple relationships) simultaneously, quickly and efficiently statistically.

    b. Its ability to assess the relationship (relationship) in a comprehensive manner has made a transition from exploratory to explanatory (Hair et al, 1995).

       With these considerations, the AMOS used to test the research model proposed in the theoretical framework. With SEM, will perform statistical testing research models simultaneously. This study uses two kinds of analysis techniques, which is done in stages as follows:

1.   Measurement Model (Measurement Model) Measurement Model or the measurement model is intended to confirm the dimensions developed in a variable / factor which has been studied. The Unidimensionality of Research variables will be tested in forming a latent variable.

2.   Structural Model (Structural Model)

Structural Model is a model regarding the structure of relationships that form, or explain the causality between variables / factors been studied. With this program will also be measured the causality relationship between the various concepts of the variables measured. Hypothesis testing performed through the Goodness of Fit of research models and relationships in the model presented (Hair, et al, 1995).

       According to Ferdinand (2002) a SEM modeling requires the sample size, the normality of the data, the absence of outliers and the absence of problems in multicollinearity and singularity. While To create a complete modeling of SEM.

3.   The conversion of Flowchart into Equation

After the theoretical model developed and described in the flowchart, the next step is to convert the model specification into a series of equations, consisting of:

  a. Structural equation (structural equation), which was formulated to express causality between various constructs and are usually prepared with the following guidelines:

    Endogenous variable = Exogenous Variable + Endogenous Variable

  b. Specification measurement model equation (measurement model), where researchers determine which variables that measure which construct , as well as define a series of matrices that show the correlation between the hypothesized constructs or variables.

4.   Evaluate the criteria of Goodness of Fit.

At this stage, implement the testing of the suitability of the model through the study of various criteria of goodness of it. For the first action taken is to evaluate whether the data that being used meet the assumptions of SEM.

DATA ANALYSIS AND DISCUSSION
Descriptive Analysis
Overview of Respondents Research

       The first descriptive analysis performed in this study is an analysis of the demographic data of respondents. This analysis was conducted to obtain an overview of gender, age, education, and the tenure of respondents working period.

Respondents Gender

The first demographic analysis conducted on data by gender. According to Robbins (2006), an analysis of the data by gender needs to performed because of the important differences between men and women that can affect their performance. The differences are related to problem-solving skills, analytical skills, driving competition, motivation, sociability, and learning the ability. The results of the analysis of the data by gender are presented in Table 4.1 below.

Table 4.1
Distribution of Respondents' Gender

Gender	Frek	%
Male	45	40.9
Female	75	59.1
Total	**110**	**100**

Sources: Primary data processed, 2016

Respondent's age

The second demographic analysis conducted on the age of the respondents. According to Robbins (2006), an analysis of the data the age of respondents needs to be done, because of the important issues concerning the relationship between the age and employee performance related to a positive quality that is brought into the work, namely the experience, judgment, strong work ethic, commitment to quality, and a low-level of resignation. The results of the analysis are presented in Table 4.2 below.

Table 4.2
Respondent's Age Distribution

Age (years)	Freq	%
25 – 34	40	36.4
35 – 44	50	45.5
45 – 54	30	18.1
Total	**110**	**100**

Sources: Primary data processed, 2016

The data in Table 4.2 above shows that most respondents (45.5%) are 35-44 years old. It can be concluded that employees in the study have had a number of positive qualities that are brought into the work, namely the experience, considerations, strong work ethic, commitment to quality, and a low level of resignation.

Respondent's education level

The third demographic analysis conducted on the respondents' education. Analysis of the education necessary to analyze, because each type of job imposes different demands on a person, and that everyone should have the ability to match the demands of the job. Where the capabilities required for an adequate job performance on a particular job depends on the capability requirements requested for the job. The results of the analysis are presented in Table 4.3 below.

Table 4.3
Respondent's Distribution of Education

Education	Freq	%
D3	20	18.1
S1	80	72.7
S2	10	09.1
Total	**110**	**100**

Sources: Primary data processed, 2016

The data presented in Table 4.3 shows that most respondents have educated as S1 (72.7%). This is because the rules require, minimum education of employees is S1. In addition, based on the data presented in Table 4.3 can also be concluded that, with the fulfillment of minimal formal education eligibility, the employee which in place performed the research, mostly have had minimal ability to be able to carry out the work task.

Respondent's Tenure (length of employment)

The next Demographic analysis perform is on the data of the length of employment (tenure) of respondents. According to Robbins (2006), duration / tenure someone in a company shows seniority of an employee, where seniority is closely related to the productivity of an employee and the level of staff turnover. The results of the analysis are presented in Table 4.4 below.

Table 4.4
Respondent's Tenure Period distribution

Tenure (years)	Freq	%
1 – 5	22	20.0
5 – 10	50	45.5
> 10	28	25.5
Total	**110**	**100**

Sources: Primary data processed, 2016

Based on the data in Table 4.4 shows that most of the respondents have had a working period / tenure of 5-10 years (45.5%). This could be an indication that most of the respondents in the study were able to demonstrate a high productivity and can also be an indication of the low level of resignation (turnover) of employees.

An overview of Respondent's answer on Research Variables

Analysis on the respondent's answers on the variables of research was conducted to obtain an idea of the tendency of respondents to the items which being used to measure these variables, as well as to determine the condition of the variables examined in the study.

This analysis was conducted to gain an insight into the respondents' answers regarding the variables used in this study. This the analysis was done by using index analysis, to describe the perception of respondents, regarding items of questions, that has been posed.

Job Satisfaction Variables

Descriptive analysis of the variables of the study, was first conducted on job satisfaction variables. This analysis was conducted to obtain an overview of the respondents' answers to the items used to measure job satisfaction variables.

An analysis of employee satisfaction need to be implemented, because job satisfaction is a reflection of the feelings of employees to their work, where it will have an impact on employee attitudes towards work on daily basis, and to the work environment, which in turn affect the productivity of labor or work performance of employees (performance) , The descriptive analysis conducted on job satisfaction variables are presented in Table 4.5 below.

Table 4.5
Job satisfaction Variable Description

Indicator	Respondents response Frequency About Job satisfaction							Index	Category
	1	**2**	**3**	**4**	**5**	**6**	**7**		
Salary (X1)	7.3	9.1	20.0	19.4	24.2	13.3	6.7	58.7	Medium
Promotion (X2)	6.7	14.5	14.5	18.8	15.8	12.1	17.6	61.3	Medium
Coworkers (X3)	4.8	15.2	22.4	18.8	16.4	12.1	10.3	57.7	Medium
Supervisor (X4)	14.5	15.2	15.8	12.1	21.2	13.9	7.3	54.5	Medium
The job itself (X5)	12.7	18.2	15.2	17.6	19.4	8.5	8.5	53.2	Medium
Mean	9,2	14,4	17,6	17,3	19,4	12	10,1	**57.1**	**Medium**

Sources: Primary data processed, 2016

Descriptive analysis of the variables of job satisfaction shows that job satisfaction has a variable index value of 57.1 where the value of this index is included in the medium category. Based on the above information it can be concluded that job satisfaction of employees at PT. Bank Mandiri South Sulawesi has not been optimal.

Organizational Support Variable

Subsequent analysis is the analysis of the answers of respondents regarding the variable organizational support. This analysis aims to obtain an overview of the respondents' answers to the items used to measure the variables of the organizational support.

Analysis of the organizational support that is applied in PT. Bank Mandiri Tbk South Sulawesi, need to be implemented, because with the support from organization and support from management, then, will be able to increase the motivation of 'customer orientation' behavior of workers. The results of the analysis are presented in Table 4.6.

Table 4.6
Organizational Support variable descriptions

Indicators	The frequency of response Respondents About Organizational Support							Index	Category
	1	**2**	**3**	**4**	**5**	**6**	**7**		
Welfare care Support X6)	11.5	16.4	12.7	19.4	12.1	17.0	10.9	57.0	medium
Organization assisting the task (X7)	10.3	14.5	21.2	23.6	11.5	7.9	10.9	54.1	medium
Leaders help solve the problem (X8)	7.3	10.3	21.2	16.4	17.6	13.3	13.9	60.3	medium
Leaders willing to listen to problems (X9)	12.7	17.0	15.8	15.8	13.9	10.9	13.9	55.7	medium

	1	2	3	4	5	6	7	Index	Category
Colleagues willing to listen to problems (X10)	13.3	15.2	21.2	15.8	15.2	7.9	11.5	53.4	medium
Fellow aid / colleagues willing to give a help(X11)	4.2	14.5	17.6	20.6	21.2	12.7	9.1	59.2	medium
Mean								**56.6**	**medium**

Sources: Primary data processed, 2016

Descriptive analysis of the organizational support variable showed that organizational support variable has an index value of 56.6 where the index value categorized as the medium category. Of the six indicators being used to measure the organizational support variable, an indicator of 'colleagues willing to listen to the problem' (X10) perceived the lowest by the respondents. While the indicator of the 'leadership is willing to help to solve the problem' (X8) perceived the highest by respondents, so it can be concluded that in the place where research is conducted, the leadership is more dominant in providing support to employees.

Leadership Style Variable

Subsequent analysis is the analysis of the answers of respondents regarding the leadership style variable. This analysis is important to performed, is to gather information on respondents' answers to the items used to measure the variable of leadership style.

Analysis of the leadership style that is applied in PT. Bank Mandiri Tbk South Sulawesi is necessary because of a person's leadership style, involves the ability of a leader to make decisions and influence his subordinate or members in achieving organizational goals. The results of the analysis are presented in Table 4.7.

Table 4.7
Leadership Style Variable Description

Indicators	The frequency of response Respondents About Leadership style							**Index**	Category
	1	**2**	**3**	**4**	**5**	**6**	**7**		
Instilling a sense of pride (X12)	9.7	13.3	19.4	16.4	19.4	10.3	11.5	57.1	medium
Instilling values of the organization (X13)	7.9	17.6	20.0	16.4	20.0	10.3	7.9	55.1	medium
Having a vision that spurs (X14)	12.1	15.8	14.5	16.4	17.6	17.6	6.1	55.5	medium
Being able to think of new ways (X15)	5.5	8.5	19.4	12.1	23.6	14.5	16.4	64.2	medium
Impose more employees (X16)	6.7	17.6	13.9	20.6	17.0	16.4	7.9	57.7	medium
Contingent reward (X17)	9.1	11.5	10.9	18.2	13.9	11.5	24.8	64.3	medium

Management by expectation (X18)	3.6	10.9	17.0	18.2	20.0	17.0	13.3	63.5	medium
Mean								**59.6**	**medium**

Sources: Primary data processed, 2016

Descriptive analysis of the variable of leadership style shows that leadership style variable has an index value of 59.6, where the value of the index included and categorized in the medium category. Of the seven indicators used to measure the leadership style variable, an indicator of 'instilling organizational values' (X13) the lowest perceived by the respondents. While indicators of 'contingent reward' (X17) is the highest perceived by respondent means that the style of leadership that is applied in PT. Bank Mandiri (Persero) Tbk South Sulawesi tend to apply the transformational leadership style.

Work Motivation Variable

The next analysis is, analysis of the respondents' answers regarding work motivation. This analysis aims to obtain an overview of the respondents' answers to the items used to measure work motivation variable.

Analysis of employee motivation in PT. Bank Mandiri Tbk South Sulawesi is necessary because motivation is driving force (activator) existing in a person (employee) to take action. The results of the analysis are presented in Table 4.8.

Tabel 4.8
Work Motivation Variable Description

Indicators	Frequency response Respondents About Work Motivation							Index	Category
	1	**2**	**3**	**4**	**5**	**6**	**7**		
Awareness on the job (x19)	13.3	10.9	14.5	11.5	14.5	21.2	13.9	60.3	medium
The challenge in working (X20)	12.1	16.4	18.8	17.0	13.9	14.5	7.3	53.9	medium
Learning new things (X21)	16.4	13.3	16.4	18.8	15.2	12.1	7.9	53.0	medium
The amount of income (X22)	21.8	13.9	16.4	14.5	10.9	5.5	17.0	51.9	medium
Mean								**54.8**	**medium**

Sources: Primary data processed, 2016

Descriptive analysis of the variable of work motivation, shows that work motivation variable has an index value of 54.8, where the value of the index included and categorized in the medium/moderate category. Of the four indicators used to measure the work motivation variable, an indicator of the amount of income (X22) the lowest perceived by the respondents. While indicators of awareness for the job (x19) is a highest perceived by respondent, meaning that factors of concern or awareness on the job as a motivator most likely to play a role in motivating employees to generate a good performance.

Performance Variable

This analysis was conducted to obtain an overview of the respondents' answers to the items being used to measure the performance variable. Analysis of the performance variables is necessary because it shows the success rate of an overall employee during the specified period, in performing the task, compared to the standard of the work, the target or goals or criteria that have been determined in advance and has agreed upon. As for the results of the analysis are presented in Table 4.9 ,

Tabel 4.9
Performance Variable Description

Indicators	Frequency of response of Respondents About performance							Index	Category
	1	**2**	**3**	**4**	**5**	**6**	**7**		
Quality (X23)	5.5	15.2	17.0	24.2	17.6	13.9	6.7	57.4	Medium
The task on time (X24)	12.7	13.3	15.2	18.2	12.1	20.0	8.5	56.8	Medium
Work without supervision (X25)	16.4	13.3	18.8	13.3	21.2	10.9	6.1	52.4	Medium
Work Planning (X26)	17.6	14.5	17.0	12.1	17.6	11.5	9.7	53.0	Medium
Better results (X27)	12.7	18.2	15.2	15.2	13.3	13.9	11.5	55.2	Medium
Meet the contribution target (X28)	11.5	15.8	19.4	18.2	12.1	15.2	7.9	54.4	Medium
Mean								**54.8**	**medium**

Sources: Primary data processed, 2016

Descriptive analysis of the performance variables showed that performance variable has an index value of 54.8. Wherein the index value included in the medium category. Indicators of quality (X23) is a highest perceived by the leadership, meaning at PT. Bank Mandiri (Persero) Tbk South Sulawesi tend to give priority to the quality of the work.

Validity and Reliability Test
Validity Data Test

Test the validity of the questionnaire, conducted with the aim to determine the reliability of the questionnaire. The reliability of the questionnaire means that the questionnaire is able to measure what should be measured. The validity Measurement in this study indicates the amount of variance of the indicator extracted by constructs / developed latent variable. Extract Variance value that can be accepted is minimal 0:50.

Table 4.10
Validity Data test Result

Variable	*Variance Extract*	*Nilai*
Job satisfaction	0.6	Be accepted
Organizational support	0.5	Be accepted
Leadership style	0.5	Be accepted
Work motivation	0.6	Be accepted

Performance	0.5	Be accepted

Sources: Primary data processed, 2016

Validity test results using Extract Variance values presented in Table 4.10 shows that Extract Variance value for each variable has fulfilled the required criteria. This shows that the amount of variance of the indicator extracted by constructs / latent variable that was developed has able to measure what should be measured.

Reliability Test

Test of reliability is a reliability test which aims to find out how far a measuring instrument reliable or trustworthy. Reliability test indicates the extent to which a measuring instrument can provide relatively similar results when performed measurements back on the same object. Reliability test in this research is done by using the value of Reliability Construct. The minimum reliability value of dimension / indicator forming latent variables that can be received is equal to 0.70.

Table 4.11
Reliability Test Result

Variable	*Reliability*	*Reliability value*
Job satisfaction	0.8	Be accepted
Organizational support	0.8	Be accepted
Leadership style	0.8	Be accepted
Work motivation	0.8	Be accepted
Performance	0.8	Be accepted

Sources: Primary data processed, 2016

Reliability test results which presented in Table 4.11 shows that the value of Reliability Construct for each latent variable> 0.7 so that it can be concluded that the measuring instrument of each latent variable reliable or trustworthy.

Inferential analysis

Inferential analysis technique used in this study is the Equal Structural Modeling (SEM). In the SEM analysis, there are two stages the analysis that must be done, first, perform testing of the factors that make up each of the variables, where testing is done using confirmatory factor analysis models and second, perform testing of regression weight in the full model analysis.

Confirmatory Factor Analysis (Confirmatory Factor Analysis)

This confirmatory factor analysis, is the phase measurement of the dimensions that make up the latent variables in the research model. Latent variables or constructs that are used in this study model consisted of five constructs of the total number of indicators are 28. The goal of the confirmatory factor analysis is to examine unidimensionality of indicators forming respective latent variables. The following will describe the results of the confirmatory factor analysis of each construct.

Confirmatory analysis Exogenous Variables

Confirmatory factor analysis phase is the first stage of measurements made on the indicators that make up the exogenous variables consisting of three variables with 18 indicators. The results of data processing for confirmatory factor analysis of exogenous variables described below.

a. Feasibility Test of Exogenous Variables Model

Analysis of the first stage, carried out in an exogenous variable confirmatory factor analysis is to conduct feasibility testing of the confirmatory exogenous variables which are presented in Table 4.12.

Table 4.12
Feasibility Test of Exogenous Variables Result

Goodness of Fit Index	Cut-off Value	Result	Model Evaluation
Chi-Square	Kecil (<159.8135)	119.923	Baik
Probability	$\geq$	0.766	Baik
RMSEA	$\leq$	0.000	Baik
GFI	$\geq$	0.927	Baik
AGFI	$\geq$	0.906	Baik
CMIN/DF	$\leq$	0.909	Baik
TLI	$\geq$	1.015	Baik
CFI	$\geq$	1.000	Baik

Sources: Primary data processed, 2016

From the results of confirmatory testing the feasibility of the model of exogenous variables is known that the model can fulfill the criteria of goodness of fit predetermined demonstrated by testing value of $\chi 2$ goodness of fit amounted of 119.923 with a probability equal to 0,766 and measures the feasibility of the other models are in either category are showed no differences between the models predicted with observational data. Thus the predicted model fit with the values of the observations which have been already qualified.

b. Unidimensionality Testing and Convergent Validation of Exogenous Variables

Furthermore, the analysis of the second phase of the confirmatory factor analysis of exogenous variables is to test the significance of the indicators that make up the exogenous variables which analyzed from the value of standardized regression weight of each indicator presented in Table 4.13

Table 4.13
Regression Weight Confirmatory Factor Exogenous Variables

			Std.Est	Estimate	SE	CR	P
X1	Å	Job satisfaction	0.714	1.000			
X2	Å	Job satisfaction	0.814	1.087	0.120	9.048	0.000
X3	Å	Job satisfaction	0.636	0.984	0.141	6.972	0.000
X4	Å	Job satisfaction	0.622	0.932	0.132	7.042	0.000
X5	Å	Job satisfaction	0.606	0.936	0.135	6.955	0.000
X7	Å	Organizational	0.610	0.910	0.139	6.526	0.000
X8	Å	Organizational	0.719	1.051	0.142	7.418	0.000
X9	Å	Organizational	0.643	0.889	0.130	6.819	0.000
X10	Å	Organizational	0.610	0.857	0.131	6.524	0.000
X13	Å	Leadership Style	0.510	1.000			
X14	Å	Leadership Style	0.517	0.853	0.171	4.973	0.000
X15	Å	Leadership Style	0.706	1.257	0.214	5.886	0.000
X16	Å	Leadership Style	0.697	1.170	0.200	5.859	0.000

X17	Å	Leadership Style	0.753	1.277	0.211	6.049	0.000
X18	Å	Leadership Style	0.682	1.209	0.209	5.780	0.000
X12	Å	Leadership Style	0.633	1.091	0.193	5.653	0.000
X11	Å	Organizational	0.705	0.904	0.124	7.278	0.000
X6	Å	Organizational	0.652	1.000			

Sources: Primary data processed, 2016

Results of confirmatory analysis of exogenous variables showed that all 18 indicators or dimensions forming respective exogenous variables indicate the value of standardized regression weight> 0.4, CR> 2:00 and the probability of <0.05 so that it can be concluded that all 18 indicators can be used as the determinant / measuring the variables exogenous.

c. Discriminant Validity of Exogenous Variables

In the test implementation of exogenous variables model that are not constrained (free models) generate Chi Square value amounted of 119.923 with a probability equal to 0766 and df of 132. At this discriminant validity test, exogenous variables models tested by constrained .

The results of the analysis of the constrained exogenous variables testing model show that the model of the constrained exogenous variables generate Chi Square value amounted of 124.491 with a probability equal to 0,731 and Df amounted to 135.

Based on the test results on exogenous variables free model and constrained model above, furthermore, we able to conduct the different test of Chi Square on both models as presented in the following table.

Table 4.14
The different test of Chi Square of Exogen Variable

Free			Constrain Model			Dif.
Chi Square	df	Probability	Chi Square	df	Probability	Chi Square
119.923	132	0.766	124.491	135	0.731	4.568

Sources: Primary data processed, 2016

Based on the data in Table 4:14, is generated a difference between the value of free models and constrain models was 4,568 smaller than its cut of value amounted to 7.8147 at 5% error level and based on the different test of Chi Square, constrained model can not be denied. However, the chi-square value generated on the free models lesser than the value of Chi Square on constrained models show that the three constructs are not perfectly correlated because the discriminant validity can be achieved.

Confirmatory Analysis of Variable Endogenous

The second stage of the confirmatory factor analysis is phase of measurements made on the indicators that make up the endogenous variables consisting of two variables with 10 indicators. The results of data processing for confirmatory factor analysis of endogenous variables described as below.

a. Feasibility Testing of Model Endogenous Variables

The first analysis phase in the confirmatory factor analysis carried out in the endogenous variable is to conduct the feasibility testing of confirmatory models of endogenous variables that are presented in Table 4:15.

Table 4.15
Endogenous Variable Feasibility Test Result

Goodness of Fit Index	Cut-off Value	Result	Model Evaluation
Chi-Square (df=34)	Kecil (<48.6024)	25.248	Good
Probability	≥	0.861	Good
RMSEA	≤	0.000	Good
GFI	≥	0.968	Good
AGFI	≥	0.949	Good
CMIN/DF	≤	0.743	Good
TLI	≥	1.025	Good
CFI	≥	1.000	Good

Sources: Primary data processed, 2016

From the results of feasibility testing the confirmatory models of endogenous variables is known that the model can fulfill the criteria of goodness of fit that has been determined previously, demonstrated by testing value of $\chi2$ of goodness of fit amounted 25.248 with probability equal to 0,861, and measurements of the feasibility of the other models are in either category which showed no differences between the models predicted with observational data. Thus the predicted model fit with the values of the observations which have been already qualified.

b. Unidimensionality Testing and Convergent Validity of Variables Endogenous

Furthermore, the second phase analysis of the confirmatory factor analysis of endogenous variables is to test the significance of the indicators that make up the endogenous variables which analyzed from value of standardized regression weight of each indicator presented in Table 4:16

Table 4.16
Regression Weight Factor
Endogenous Variable confirmatory

			Std.Est	Estimate	SE	CR	P
X23	Å	Performance	0.765	1.000			
X24	Å	Performance	0.678	0.993	0.123	8.073	0.000
X25	Å	Performance	0.552	0.839	0.129	6.494	0.000
X26	Å	Performance	0.575	0.844	0.124	6.832	0.000
X27	Å	Performance	0.613	0.964	0.132	7.290	0.000
X28	Å	Performance	0.594	0.930	0.134	6.953	0.000
X19	Å	Work Motivation	0.710	1.000			
X20	Å	Work Motivation	0.738	0.965	0.121	7.944	0.000
X21	Å	Work Motivation	0.634	0.939	0.134	7.018	0.000
X22	Å	Work Motivation	0.624	0.795	0.118	6.738	0.000

Sources: Primary data processed, 2016

Results of confirmatory analysis of endogenous variables, showed that the ten indicators or dimensions which forming each endogenous variable indicates value of standardized regression weight> 0.4, CR> 2:00 and the probability of <0.05 so that it can be concluded that the ten indicators can be used as the determinant / measuring endogenous variables.

c. Discriminant Validity test of Endogenous Variable

Based on the test of endogenous variables model that are not constrained (free models) generate Chi Square value of 25.248 with probability equal to 0,861 and Df amounted to 34. In this discriminant validity test models endogenous variables were tested by being constrained.

The results of the analysis of the constrained model testing endogenous variable indicate that the constrained endogenous variable model generate Chi Square value of 27.537 with a probability of 0.811 and df at 35.

Based on test results on the free models and constrained models of endogenous variables above, it is possible to conduct the different test of Chi Square on both models as presented in the following table.

Table 4.17
Distinction test ofChi Square For Endogenous Variables

Free			Constrain Model			Dif.
Chi Square	df	Probability	Chi Square	Df	Probability	Chi Square
25.248	34	0.861	27.537	35	0.811	2.289

Sources: Primary data processed, 2016

Based on the data in Table 4:17, is generated the difference value between free models and constrain models was 2,289 smaller than its cut value amounted of 3.8415 at 5% error level, then based on this different test of Chi Square , the constrained model can not be denied. However, the chi-square value is generated on the free models lesser than the value of Chi Square on constrained models show that the three constructs are not perfectly correlated, as for this reason the discriminant validity can be achieved.

Full Model Analysis

After conducting a confirmatory analysis of the indicators which forming latent variables, further analysis is an analysis of Structural Equal Modeling (SEM) in a full model method. The test results of the feasibility (goodness of fit) of full model SEM are presented in Table 4:18.

Table 4.18
Full Model Feasibility Testing Results

Goodness of Fit Index	*Cut-off Value*	Result	ModelEvaluation
Chi-Square (df=341)	Kecil (< 385.0622)	357.867	Good
Probability	≥ 0.05	0.254	Good
RMSEA	≤ 0.08	0.017	Good
GFI	≥ 0.90	0.874	Marginal
AGFI	≥ 0.90	0.851	Marginal
CMIN/DF	≤ 2.00	1.049	Good

| TLI | ≥ 0,95 | 0.988 | Good |
| CFI | ≥ 0,95 | 0.989 | Good |

Sources: Primary data processed, 2016

Based on the results of testing the feasibility of the model presented in Table 4:18 is known that the model we analyzed is a recursive model with sample number amounted of165, the value of Chi-Square = 357 867 with df = 341 and probability 0.254. Chi-Square results indicate that the models which have been studied equally with empirical data which mean that the model is fit.

Research outcome discussion
Research Summary

Business banking is a business of trust, so that the safety factor for customers who save their money in the Bank is the main thing and this factor becomes the mainstay for the bank, in this case, in particular PT.Bank Mandiri Tbk throughout South Sulawesi, in competition with private banks , It should be emphasized that in order to achieve the vision and mission of the Bank, the company determined some goals that are aligned to stakeholders, that include providing the highest quality of services, accompanied with added value to customers for the sake of maintaining relationships with customers as a sustainable partnerships. The improvement of the quality of services provided by banks could encourage the achievement of the banking business success today and in the future.

One of the factors that affect the performance of employees is job satisfaction. Results of research conducted by Ostroff (1992), Dyer and Parker (1975), Harel and Tzafrir (2001), Kirkman and Shapiro (2001), Perry et al (2006) showed that job satisfaction has a positive influence on employee motivation. In addition to the job satisfaction, Shaam et al (1999), Susskind et al (2000), states that the support of organizations can also be utilized to increase the motivation of workers who are in touch and deal with customers directly, so we can say that the organizational support variable might positively effect on the motivation of workers. Besides having a strong organizational support, the company must also have leadership that can bring the company achieve the objectives and goals.

This study is an attempt to answer the research problem, which at the chapter I mentioned that the problem of this research is how the organizational support given by PT. Bank Mandiri Tbk, leadership style, and the level of job satisfaction of employees thus increasing employee motivation that impact on employee performance which is strong and able to work in accordance with expectations by deploying all the capabilities they have for the advancement of PT. Bank Mandiri Tbk. In response to the study, employees of PT. Bank Mandiri Tbk took as respondents.

The questionnaire has been designed to find out how the respondents' perceptions of job satisfaction, organizational support, leadership style, employee motivation, and employee performance. From the results of the analysis reveal that to improve employee performance, can be done by increasing employee motivation at work, in which this high employee's work motivation can be achieved by increasing employee's job satisfaction, organizational support, and leadership style.

Job satisfaction which examined in this study was measured using five indicators covering satisfaction on salary, satisfaction on promotion, satisfaction on coworkers, satisfaction on the supervisor, and satisfaction with work itself. Where of the five indicators, indicators of satisfaction on work is the lowest perceived by the respondents.

The organizational support which examined in this study was measured using six indicators include: organization concerned with the welfare, the organization helped complete the task, leadership help solve the problem, the leadership would listen to the problem, colleagues willing to listen to the problem, and colleagues willing to provide assistance. Where of the six indicators, an indicator of colleagues willing to listen to problems is the lowest perceived by the respondents.

The questionnaire was prepared in such a way in order to measure the variables studied. The number of respondents which used in this study were 110 respondents who are employees of PT. Bank Mandiri Tbk. Collected data were analyzed by Structural Equation Modeling analysis techniques.

The test results of SEM showed value of goodness of fit for the the model developed in this study are Chi-Squares = 357.867, probability = 0.254, CMIN / DF = 1049, GFI = 0,874, AGFI = 0,851, RMSEA = 0,017, TLI = 0,988, and CFI = 0,989. While the results of hypothesis testing show that six hypotheses proposed in this study, all of them can be received significantly.

Closing
Conclusion

Based on the results of research and discussion that has been presented in the previous chapter, therefore, can be taken some conclusions as follows:

1. Job satisfaction has a positive influence on work motivation. It can be concluded that the higher the level of employee satisfaction, the higher employee motivation of PT. Bank Mandiri Tbk South Sulawesi.
2. Support from the organization has a positive influence on work motivation. It can be concluded that the better the support of an organization of PT. Bank Mandiri, the more it will increase employee motivation of PT.Bank Mandiri in South Sulawesi.
3. The style of leadership has a positive influence on work motivation. It can be concluded that the better the style of leadership at Bank Mandiri South Sulawesi, the more it will increase employee motivation of Bank Mandiri South Sulawesi.
4. Work Motivation has a positive influence on employee performance. It can be concluded that the higher motivation of employees of Bank Mandiri in South Sulawesi will further improve the performance of employees of PT. Bank Mandiri South Sulawesi.
5. Job satisfaction has a positive influence on employee performance. It can be concluded that the higher employee satisfaction , the better the performance of employees of PT.Bank Mandiri South Sulawesi.
6. The style of leadership has a positive influence on employee performance. It can be concluded that the better the style of leadership at Bank Mandiri South Sulawesi the better the performance of employees of Bank Mandiri in South Sulawesi.

Policy implications

1. The leadership style variable:
   a. The leader must show a good behavior that makes organization proud, either inside and outside the organization.
   b. Leaders are applying the values espoused in the organization of each activity / activities.

    c. Leaders are able to provide a vision that can encourage employees to work for the organization.

    d. Leaders are not stodgy conservative but able to think out of the box and modern and innovative.

    e. Leader enforces employee / subordinate as a partner / partner.

    f. Leaders are willing to give a reward in the form of praise and flattery to employees who are able to demonstrate a good level of performance.

2. Organizational Support Variable:

    a. Organization provides the opportunity for employees to improve their capabilities and skills concerning the task implementation.

    b. Leaders and management are willing to help employees who have difficulty in completing tasks.

    c. Promote solidarity between fellow colleagues through activities of familiarity.

3. Job satisfaction Variable:

    a. Providing promotional opportunities equitably to every employee who is able to demonstrate a good performance.

    b. Provide incentives equitably . Proportionally with duties and responsibilities were undertaken.

    c. Placing employees on the department in accordance with the educational background in order to create comfort in the work.

Research limitations

       The limitations found in this study are:

1. There are several respondents whose in answering the questionnaire are incomplete and should be returned, to be completed.

2. There are some respondents who are less eager to answer the questionnaire due to no rewards provided (souvenir) in this case due to limited funding.

3. Respondents are not in their post, when approached for filling out the questionnaire, so that they have to be visited and asked for the second time.

4. The GFI (0874) and AGFI (0851) situated in the marginal category.

Future Research Agenda

       Research on the analysis of the factors that affect the work motivation and its influence on employee performance is likely to be developed further in future research. Things that might be developed is on further research can be considered to add a variable that can affect the performance of employees such as variable of occupational safety (Borg & Elizur, 1992) that are empirically proven to have a significant impact on employee performance as well as adding a number of respondents and indicators for improve or enhance the value of GFI and AGFI.

Suggestion

       SuggestionBased on the research and the description above, with all my limitations of knowledge and experience as an author, the author tries to give advice relating to performance improvement and motivation through leadership styles, organizational support, and job satisfaction,

1. In order to improve the motivation and performance of employees of PT. Bank Mandiri Tbk South Sulawesi, the company should pay more attention to job

satisfaction, organizational support, as well as leadership style in order to synergize with each other, leaders able to be a working partner and collaborate with subordinates, establish familiarity among employees, provide mutual support motivation to employees whose performance is less good and provide achievements on the employees who have a higher potential.

2. The Bank Mandiri South Sulawesi need to conduct regular evaluation regarding job satisfaction, organizational support, and leadership style, so that disadvantages associated with three variables can be improved in the future in order to increase motivation and performance of the employees.

EMPLOYMENT AND EMPLOYABILITY FOR ECONOMIC AND SOCIAL INCLUSION IN INDIA

D. Tripati Rao, Indian Institute of Management at Lucknow, India
Swarnima Singh, Indian Institute of Management at Lucknow, India

Abstract

Indian economy's stellar performance over last two decades has been shaped by three quintessential socio-economic-political forces such as, democracy, demand (market) and demography which defines Indian economic outlook. While India is buoyed with new found confidence by information, communication and technological revolution, yet there has been a marginal improvement in the lives of a large number of underprivileged by the economic growth especially in the late'00. There has been a significant rise in inequality with the slowdown in fall in poverty numbers and rise in unemployment. Against this backdrop, the role   of   education hardly   needs   any   emphasis. Investment in education, employment, health and other basic economic and social infrastructure expands human capacity to participate in new economic and social opportunities. While growth ensues resources released   for a sustained improvements in human capacities, expanded   human   capacities   enable   people   to   make   greater   contributions   to growth. Investment in skill-based higher education is to expand human capacity in terms of "employability". It broadens and makes equally accessible to lower income strata to seek out economic opportunities. This results in improved income distribution over time. Sound policies and institutions at the first place are sine-qua-non for creating economic opportunities and to promote social inclusion. Therefore, it is important for ensuring economic and social justice access to quality and 'decent' employment opportunities for all. A key element of promoting social and economic justice should be to ensure that men and women can earn a fair level of income from their work and enjoy decent working conditions. This should be the prime agenda in our Millennia Goal.
Keywords: Employment, Employability, Economic inclusion, Social inclusion, India

INTRODUCTION

India at 69 continues to be a fascinating story of a nation rich with economic, social and cultural diversity. The young-India has entered into the twenty-first century buoyed by a new found confidence in its economic prosperity and propelled by skillful-youth-led information, communication and technological revolution. Three quintessential socio-economic-political forces such as, democracy, demand (market) and demography are defining character of Indian economic outlook. However, notwithstanding the attainment of higher economic growth , for being one among the countable few during these times of collapsed global economy, the large underprivileged quite untouched by the rapid economic growth during the 90s and especially in the late'00. Even after over five decades of post-independence and over a decade and halve of economic reforms, the "human face" remains elusive! Not only that along with economic growth there has been a significant rise in inequality with the slowdown in fall in poverty numbers, but also there has been widening gap in rural-urban incidence of poverty, top-bottom income quintile inequality, and male-

female unemployment rate. And it is the later that is alarmingly emerging as a gargantuan macroeconomic and social policy problem of "jobless growth" to deal with. Ironically, the chief architects of reforms only now are showing the urgency for achieving "inclusive" growth for long-term political and social stability.

Unfortunately, the post-independence efforts to make the growth process more inclusive at best ended up as the politics of 'populism'. The Nehruvian Socialism fostered the *petit bourgeoisie*; the "intermediate regime" defining the politics of Indian policy making (Mody 2006). The piecemeal and ad-hoc policy making, in trying to appease diverse interest groups in the guile of inclusion, has succeeded very little in being inclusive *insofar* as benefiting the large underprivileged. Notwithstanding the change in the composition of intermediate class and their influence with the emergence of and realignment of new groups during reforms, policy making continues to vacillate between the interests of powerful new 'elite' in the one hand and on the other by the growing political assertiveness of a large underprivileged social class (Vaidyanathan 2007). The experiences at the state level highlighting the tension between political democracy vis-à-vis market-oriented reforms points to an intensification of these tensions. The fine balance between the two, therefore, squarely depends on the 'delivery' of reform measures and polities capacity in satisfying diverse interest groups including the larger poor (Rao, 2007). But for that to happen first the democratic state need to be clear as to what type of economic reforms will be macroeconomic-political-socially sustainable. Any quintessential policy strategy must aim at mobilizing fiscal resources for the provision of basic education, employment, health and infrastructure that is accessible to the large underprivileged rural mass.

The Politics of Inclusion and Negligence of Education

An all-around emancipation/participation be it economic, social and political processes is inclusion. The espousal of individual freedom irrespective of religion, caste, language, region, gender and age is very core of Indian nationhood (Mody 2006). Breaking down social hierarchies in order to make the political process more inclusive of diverse economic and social groups lays a strong foundation for economic prosperity. Unfortunately the post-independence history failed on the process of inclusive growth for that the political class and the policy making have been vacillating between one of growth agenda and populism.

The need for inclusion through spread of education, employment and income can be found as early as in the writings of social entrepreneur Visvesvaraya and in Bombay Plan of 1944 as a prerequisite for nation building and higher and stable economic growth. Subsequently five-year planned development programmes are made as instruments for achieving inclusion. The state-guided public sector were entrusted with the responsibility for improving the standard of living and equitable distribution of income, through moblising fiscal resources, land reforms, public utility services, investing in basic and heavy industries and setting up of small and medium scale enterprises dispersed across regions. The latter two was to generate required employment and to produce consumer goods for the middle class. However, in practice in contrast to South-East Asia, Indian planners conspicuously remained rather silent on primary and secondary education. Therefore, in mid 70s India witnessed the rise in rural unemployment and hence the deterioration in the politics of inclusion. The mid 80s witnessed small doses of reforms but neither could be sustained or comprehensive enough to generate employment and income and one had to wait for the comprehensive economic reform measures during early 90s that are carried out in the wake of

macroeconomic crisis. The policy making continues to be populist ridden on the name of inclusion, piecemeal and ad-hoc and trying to appease diverse interest groups with little success in being inclusive insofar as benefiting the large underprivileged in creating sustainable livelihoods through employment and income generation. It is in the backdrop of state failing in its objective of generating employment and livelihoods that the role of education in long term economic growth needs any further emphasis.

Trends in Quantity and Quality of Employment Generation

The employment growth was just halve a percent per annum from 2004-05 to 2011-12 during the period that saw the highest growth of GDP of 8.5% per annum giving rise to the phenomenon of "Jobless Growth". Low productive agriculture sector still is the biggest contributor to employment of 245 million by 2009-10 (Table 1). While the manufacturing sector is shedding its labour, sectors such as, constructions and services dominated largely by informal workforce have seen the highest growth in employment numbers of more than 10% and 20% during 2009-10 (Table 2). The employment elasticity at the aggregate output level has decreased sharply from 0.79 during 1977-78 to 1982-83 to 0.17 during 2009-10 to 2011-12 (Basu and Das,2016). With both the manufacturing and non-manufacturing sector showing a negative employment elasticity to gross value added (output) and it is only the services showing highest employment elasticity (Table 3). Therefore, there is rise in the proportion of informal employment in the unorganized sector which has increased from 41% in 1999-2000 to 58% in 2011-12. Quite disturbing to observe that subsequently casualisation of labour force has been unabated especially in the rural area and there is a significant spike during the recent years and the real wages of casual labour is just around one-third of regular labour for male and less than one-fourth for the regular female labour force (Chowdhury 2011).

Table 1: Sectoral Contribution to Employment Generation

Sectors	Employment (in millions) 1999-2000	Employment (in millions) 2004-05	Employment (in millions) 2009-10

Source: Planning Commission, Twelfth General Commission Report, 2015

The evidence emerging out of NSSO 2011-12 data on the nature of employment outside of crop production is quite striking. Among the employees in the AGEGC and non-agricultural sectors about 79 per cent had no written job contract. The proportion was about 85 per cent in rural areas (86 per cent for males and 81 per cent for females) and about 73 per cent in the urban areas (73 per cent for males and 72 per cent for females). Moreover, the proportion of employees without written job contract has increased between 2004-05 and 2011-12 for males and females of both rural and urban areas. In the AGEGC and non-agriculture sector, the proportion of employees without written job contract increased from 74 per cent in 2004-05 to 79 per cent in 2011-12. During this period, this proportion increased from 79 per cent to 86 per cent for rural males, from 78 per cent to 81 per cent for rural females, from 68 per cent to 73 per cent for urban males and from 69 per cent to 72 per cent for urban females. So, there is lot to be desired in terms of the quality of employment too. One may infer from this trend that the demographic dividend may turn into demographic liability unless higher educational attainment translates as employment opportunities to both the genders equally.

Education and Employablitiy and The Role of Government

The role of education is a *sine-a-qua-non* for economic growth and development of a nation. Education provides a growing number of young and skilled human capital; a source of productive labour supply. Indian educational system is characterized by a wide and varied curricula offered by a growing number of universities and colleges in India. Commensurate with the economic development, one notices a proportional rise in gross enrollment rate (high

school and college going) along with the rising per capita income India as can be seen from Figure 1.

Figure 1: GER vs Per Capita Income
Source: Economy Indicators, Economic Times, September 2014

While sustained economic growth led to rise in enrollment and hence rise in adult literacy rate, the unemployment rate which was showing a declining trend during 90's and in the early '00, has risen in the last decade and halve. Moreover, while with increased social mobility one witnesses increased accessibility of urban female to higher education, but that has not been equally translated in terms of employment opportunity. This can be seen in Table 4 that the highest incidence of unemployment rate is in the higher education category both for rural and urban male labour force and it is even much higher for rural and urban female force. Further, during the last decade it has risen substantially. Figure 2 reinforces these above observations as there has been a reversal in trend and a substantial rise in the incidence of unemployment among urban female labour force.

Table 4: Unmenployment Rates by Education Levels for Population Above 15 Years

General level of education	Rural Male			Rural Female		
	1993-94	1999-00	2004-05	1993-94	1999-00	2004-05
Not Literate	1.8	3.0	2.7	2.2	2.7	2.5

Figure 2: Unemployment vs Adult literacy vs GDP Growth

Source: World Bank, Data Bank on Key Indicators: http://databank.worldbank.org/data
Thus the failure to absorb growing labour force points out the structural flaws in the present educational system and why it needs to change its objective of employment to employability goal. Some of the deficiencies in the present education system are such as, (i) the present educational system generates and fortifies, but only partially, the type of knowledge that is relevant to our changing societal structure, (ii) technology associated with a particular stream of knowledge found to be inappropriate or wanting to the present stage of development in India in terms of its employment potential, and (iii) the current infrastructure in India, both physical and financial, is not at par with the current skill requirements for employment. The global rankings are one the most telling indicator of the quality of higher education in India currently is the employment outcomes of its graduates. As Figure 3 shows the vast majority of graduates in India, i.e., of the order of 75% or more are not even considered employable.

Figure 3: Percentage of Graduates Considered Employable (2012)
Source: http://www.aspiringminds.in/docs/national_employability_report_graduates_2013

Since independence, while the enrolment at various levels has gone up substantially but the achievement in terms of Gross Enrolment Rate (GER) in higher education is still very low. As the level of education increases, talent enrolment decreases resulting in very low GERs in graduation and above academic levels. The obvious question for a rapid expansion of higher education is whether or not quality can be maintained. India is already facing some serious hurdles in this respect. In spite of an elaborative higher educational system not only that there are very few Indian institutions are globally ranked but also it lags behind in some of the key benchmarks compared to the higher educational institutions of emerging economies. While the trends show that there is substantial increase in GERs at higher education levels, the enrolments continue to be very discouraging if we observe the actual numbers, as can be seen in Table 3. One can observed that there is sharp drop in the educational enrolment numbers at the post graduate and at higher technical and doctoral levels. This drop in numbers is one of the key reason for the lack of employability.

Unfortunately, the role of state appears to be abysmal in promoting education and employment. As can be seen in Figure 6 government expenditure in education as percentage of GDP is below 4 percent and in promoting research and development is abysmal. It is now that the government seems to have woken-up and showing earnestness as now it is running around 15 prominent skilled development programmes (Table 6).

MSMEs and Employment

The Micro, Small and Medium Enterprises (MSME) sector has emerged as a highly vibrant and dynamic sector of the Indian economy over the last five decades. MSMEs not only play crucial role in providing large employment opportunities at comparatively lower capital cost than large industries but also help in industrialization of rural & backward areas, thereby, reducing regional imbalances, assuring more equitable distribution of national income and wealth. MSMEs are complementary to large industries as ancillary units and this sector contributes enormously to the socio-economic development of the country. There are over 6000 products ranging from traditional to high-technology items, which are being manufactured by the MSME Sector in addition to provide wide range of services. As per MoSPI, Central Stastical Organisation estimates of contribution of MSME sector to GDP is significant to the manufacturing sector and fairly to the services sector (Figure 5).

Figure 5: Share of MSME sector in total GDP (%)
Source: Annual Survey of Industries, CSO MOSPI 2013-2014

As per the results of Fourth All India Census of MSME, the sector contributes significantly to the number of enterprises, employment and output of the country. Based on the data sets of Fourth All India Census of MSME, augmented with data sets of EC, 2005 and growth rates observed during Fourth (1998) and Fifth (2005) Economic Census, the performance of MSME Sector in terms of employment generate and fixed assets is significant (Table 5).

Table 5: Performance of MSMEs

Year	Total Working Enterprises (in Lakh)	Employment (in Lakh)	Market Value of Fixed Assets (Rs. in Crore)
2006-07	361.76	805.23	868,543.79
2007-08	377.36	842	920,459.84
2008-09	393.7	880.84	977,114.72
2009-10	410.8	921.79	1,038,546.08
2010-11	428.73	965.15	1,105,934.09
2011-12	447.64	1,011.69	1,182,757.64
2012-13	447.54	1,061.40	1.268,763.67
2013-14	488.46	1,114.29	1,363,700.54

Source: MSME Annual Report 2014-2015

The estimated number of enterprises growth at 3.76% annually in case of manufacturing sector and 0.47% for services sector respectively in registered sector during 2001-02 to 2006-07, as per Fourth All India Census of MSME 2006-07, The growth in the estimated number of MSME was 2.61% for the period referred above, taking manufacturing and services together. The employment increased at an annual growth rate of 9.84% for manufacturing sector and 2.06% for services sector during 2001-02 to 2006-07. As per Fourth All India Census of MSME 2006- 07 while the growth rate of estimated number of enterprises and employment recorded for the service sector was 32.83% and 36.11% respectively during the period of 2001-02 to 2006-07, but taking into account the expanded coverage of the sector, the growth rate was 10.03% and 10.88%.

Policy Imperative for Employment and Sustainable Livelihoods

Investment in education, employment, health and other basic economic and social infrastructure expands human capacity to participate in new economic and social opportunities. While growth ensues resources released for a sustained improvements in human capacities, expanded human capacities enable people to make greater contributions to growth. Investment in skill-based higher education is to expand human capacity in terms of "employability". It broadens and makes equally accessible to lower income strata to seek out economic opportunities. This results in improved income distribution over time. Sound policies and institutions at the first place are sine-qua-non for creating economic opportunities and to promote social inclusion. Therefore, it is important for ensuring economic and social justice access to employment opportunities for all. Further, as empirical evidence has shown that along with the number of jobs created in the growth process, it is equally important to look into the quality and decency of jobs too for that there is a strong linkage between productivity and decency of jobs. The quality and decent jobs, those that pay a fair wage rate, provide social security, offer good working conditions, and allow a voice at work, improve productivity. In developing Asia, including India, a substantial share of poor people are already at work, i.e., they are the "working poor", particularly among migrant workers. For them, it is not the absence of economic activity that is the source of their poverty, but the lack of decency and low productivity of that activity. A key element of promoting social and economic justice should be to ensure that men and women can earn a fair level of income from their work and enjoy decent working conditions. This should be the prime agenda in our Millennia Goal.

GAINING AN UNDERSTANDING OF THE RATIONALE FOR THE FLUCTUATIONS IN THE YEMENI ECONOMY: CONSIDERING THE ARAB SPRING

Sulaiman Abdullah Saif Alnasser Mohammed, University Utara Malaysia, Malaysia
Ebrahim Mohammed Al-Matari, University Utara Malaysia, Malaysia
Yahya ali Al-Matari, University Utara Malaysia, Malaysia

Abstract

This paper, by way of an analytical research review, examines the reasons for the fluctuations in the economic growth of the country of Yemen during the period from 2000 to 2014. We have found that very low number of papers have written about the topic. Yemen, as a developing country, has been under the influence of an Arab Spring. The term 'Arab Spring' refers to the series of independent uprisings that occurred in 2010 across the Arab world. These uprisings originated in Tunisia and rapidly took hold in Libya, Egypt, Bahrain and also in Yemen. There is a lack of understanding concerning the economic growth status in the existing literature during this period. Despite oil prices having appreciated and the unemployment rate having improved, particularly after the Arab Spring, political instability has dominated the scope of determinants for economic growth in Yemen. To address the objective of this study, we utilize vector error correction model to examine the impact of candidate variables .This review and analysis could provide an additional understanding in terms of the factors contributing to economic growth in Yemen; particularly before and after the Arab Spring.

INTRODUCTION

Economic growth is a key element in macroeconomic studies. It is through comprehending and understanding the status of economic growth in one country or a number of countries, that proper policy guidelines and standardisation can be formulated. A country's stability, its oil price and its tourism industry are all important determinants for the economic growth status. There are a number of studies which have examined the determinants of economic growth in developing countries. However, there is a dearth of studies in the context of the country of Yemen. Yemen is a small country located in the Arabic peninsula, with a population of 27 million people. It has struggled to develop due to the independence hurdles, followed by the unity war, and exacerbated by period of transformation during the Arab Spring. During this period of time Yemen encountered instability, with unemployment as well as increases in the price of oil through the reduction and elimination of subsidies on oil derivates.

The economy was badly hit by downturn in the order of 13 per cent and this has been attributed, in the main, to the country's ongoing 2011 protests. A rebound in 2012 was due to a slight improvement in trade, manufacturing and agriculture. Worth noting, the production of oil, which contributes more than 70 per cent of the country's budget, was not fully operational due to continuous attacks on the oil locations. Moreover, Yemen's unemployment rate is the highest among the countries in the region. The situation has worsened with the deportation of illegal Yemeni workers in the Gulf; with 700000 Yemeni workers having been reported as arriving in Yemen from Saudi Arabia. Yemen also has the highest poverty rate among the Middle Eastern and North African (MENA) countries; and alarmingly in 2010 the

poverty rate was close to 17 per cent of the total population. The Gross Domestic Product (GDP) is influenced by the fluctuated deficit in the budget and wages consume 11 per cent of the total GDP amount in 2012 as Table 1.0 indicates.

Table 1.0 Yemen's Real GDP Growth

Real GDP Growth per Year in Yemen	
Year	Real GDP (percentage)
2000	5.93
2001	5.93
2002	5.93
2003	5.04
2004	5.76
2005	4.64
2006	5.14
2007	4.64
2008	3.48
2009	3.6
2010	7.7
2011	-12.7
2012	2.4
2013	3.0
2014	6.0

Source :World Bank

These obstacles have impacted upon Yemen's economic growth; however this impact has yet to be reviewed. According to Aisen and Veiga (2013), political instability is likely to create volatility and frequent change in policies. Tensions such as this are potentially harmful to the macroeconomic performance of any country (see also Campos and Nugent, 2002). Moreover, a recent study conducted by Ingram *et al*. (2013) found that political instability is likely to jeopardise the peace and security of a country. Fletcher and Morakabati (2008) have also highlighted similar outcomes. Therefore, political instability is an important factor impacting upon the economic growth of a country as shown in Table 2.0 below.

The purpose of this study is to undertake an analytical review of the role of political instability, oil price and tourism on the economic growth of Yemen before and after the time of the Arab Spring. Within the neoclassical growth framework, a comparison is made of the performance of economic growth in relation to the proposed independent variables of the oil price, political instability and tourism. Therefore, a better level of understanding provides more informative insight for researchers and policy-makers who are interested in the economic growth status in Yemen. Yemen was chosen as the focus of this study because empirical analysis of the country in this context is relatively scarce. Indeed, the author of this paper intends to examine to what extent the proposed factors have changed in relation to the occurrence of the Arab Spring.

Table 2.0 Yemen's Unemployment, Oil Price and Inflation Rate

Unemployment (percentage)	Inflation Rate (percentage)	Crude Oil Price Average	Tourism	Political Instability Index
16.2	10	30.38	73000	-1.3

Unemployment (percentage)	Inflation Rate (percentage)	Crude Oil Price Average	Tourism	Political Instability Index
16.2	10	25.98	76000	-1.3
16.2	12.2	26.18	98000	-1.4
16.2	10.08	31.08	154667	-1.5
16.2	12.2	41.51	273732	-1.6
16.1	11.8	56.64	336070	-1.4
16.1	14.8	66.5	382332	-1.3
15.7	10	27.34	948000	-1.5

LITERATURE REVIEW

For this paper, the examination of the articles for the review of the literature commenced by exploring the determinants of economic growth. A number of articles explaining the determinants of economic growth theoretically and empirically using microeconomic and macroeconomic values were found. From these articles, two main strands can be distinguished. The first is the neoclassical view, which is based on Solow's growth model, and has emphasised the importance of investment. Secondly, the more recent theory of endogenous growth, as developed by Romer and Lucas, has drawn attention to human capital and innovation capacity. Furthermore, important contributions on economic growth have been provided by Myrdal's cumulative causation theory, and by the New Economic Geography School. In addition, other explanations have been highlighted in the literature concerning the significant role non-economic (in the conventional sense) factors play on economic performance. Indeed, three highly influential early studies of the determinants of economic growth are: Barro (1996); Fischer *et al.* (1993); and Levine and Renelt (1992). They were among the first to use the Penn World Tables data (Summers & Heston, 1991), and to interpret their results in light of theoretical models of economic growth developed in the late 1980s (e.g., Lucas, 1988; Romer, 1986). It is worth noting that the GDP growth rate and GDP per capital income were the most common proxies for economic growth. Payne (2010) indicates that most of the previous studies are based on a time-series model and very few are based on panel data models. For this paper a focus was made on reviewing the studies concerning panel data models since they are closest to our study and hence provide some insights into the relationship between the independent variables and economic growth.

Furthermore, for this paper a significant element was to detect the most important determinants of economic growth in developing countries. The search resulted in many determinants such as Foreign Direct Investment (FDI) (Mielnik and Goldemberg, 2000; Hsiao and Shen, 2003; Nguyen and Nguyen, 2007); exchange rate (Cortes-Jimenez and Pulina, 2006); tourism (Cortes-Jimenez and Pulina, 2009); financial development (Tang, 2003), energy consumption (Belloumi, 2009), education, export (Awokuse, 2003) etc. In

addition, (Awokuse1 and XIE, 2015) used a selected developing countries model to investigate the role of agriculture in promoting economic growth. The results showed that it plays an important role in determining the economic growth. In contrast, the results for some other countries indicate that having a vibrant aggregate economy is a prerequisite for agricultural development. Furthermore, narrowing our search to Yemen, as a context, has indicated there are some studies related to economic growth in developing countries and MENA countries. However, studies focussing on Yemen are few. One such study (Dahan, 2014) found that both income and efficiency variables have a significant impact, as expected, on the demand for energy consumption in Yemen and away from the oil price, tourism and political stability influence on economic growth. Furthermore, (Mehra and Musi, 2013) showed a long term relationship exists between investment and GDP, when examining a number of countries of which Yemen was amongst those. Therefore, a study in the Yemeni economic context is an added merit to the current ongoing research.

Political Instability

Yemen, as one of the least developed countries, has suffered from political instability for a long time. The occurrence of the Arab Spring in 2011 was preceded by the unity war in 1997 and an examination during this period has shed light on the issues related to economic growth while being politically unstable. The literature review reveals that political instability could adversely influence investment, lead to higher levels of unemployment, an increased rate of inflation, and increases the risks thereby impacting upon the growth of the economy as demonstrated in Figure 1.0.

<p style="text-align:center">**INSERT Figure 1.0**</p>

As indicated in Figure 1.0, political instability is negatively related to economic growth, and it is empirically proven to reduce the economic growth in the MENA region (Chor and Salah, 2014), and the high inflation rate is associated with high levels of political instability which is proven by examining a sample of 100 countries by utilising panel data analysis (Aisen and Veiga, 2008). Moreover, the literature has documented the existence of a relationship between political instability and economic growth using the Generalised Method of Moments (GMM) analysis and the results has proven that GDP, inflation and investment has a negative relationship with political stability. In addition, similar result have been attested to when Aisen and Veiga (2013) examined the relationship between political instability and economic growth of 169 countries using GMM estimator from 1960 to 2004, and the results showed that human and physical capital is lowered because of political instability.

Accordingly, the majority of research consistently documents the negative influence of political instability on economic growth. However, the studies are lacking in empirical evidence in relation to the influence of political instability on economic growth in Yemen, and as Yemen has its unique status and historical charters it is therefore a necessity to purse an examination of political instability and economic growth in the Yemen context.

In general, the previous papers examining the political stability-growth links may be classified into four groups. The first strand in the economic literature argues that political instability has a negative impact on economic growth, but that there is no causality in the opposite direction (Alesina *et al.,* 1996). Another group of contributions supplies evidence that economic growth causes political stability, but not vice versa (Borner and Paldam, 1998). Another tendency in the literature argues that causality in the relationship between political instability and economic growth runs both ways (Zablotsky, 1996; Gyimah-Brempong and

Traynor, 1999). Finally, the last group of papers contains evidence supporting a lack of causality between the variables (Campos and Nugent, 2000).

Brunetti (1997) comprehensively surveyed and summarised the main political variables affecting economic growth, and concluded that among several variables, the measures of policy volatility and subjective perception of politics are the most successful in cross-country growth regressions, while democracy is the least successful. Alesina *et al.* (1996) utilised data from 113 countries from 1950 to 1982 to show that GDP growth is significantly lower in countries during time periods with a high propensity of government collapse. Chen and Feng (1996) show that regime instability, political polarisation and government repression all have a negative impact on economic growth. In a more recent paper, Jong-a-Pin (2009) used factor analysis to examine the effect of 25 political instability indicators and their effect on economic growth. The main finding is that higher degrees of instability of a political regime lead to lower levels of economic growth. In regard to private investment, Alesina and Perotti (1996) indicated that socio-political instability generates an uncertain politico-economic environment, raising risks and reducing investment. Alesina *et al.* (1996) used growth rates of GDP per capita as the dependent variable and government changes to measure political instability. They examined a panel of 113 countries and found that political instability had a negative impact on GDP growth, whereas there was no dependence in the opposite direction. Within a similar research framework Campos and Nugent (2000) found for African countries that political instability was a reason for slower economic growth. However, no relationship was found for any other group of countries.

There is inconsistency concerning the measurement of political instability from the qualitative to ready indicators, from the change of governments to mass civil protest. However, the majority of articles agreed that political instability adversely impacts the economic process and growth. With respect to Yemen, unfortunately, the author of this paper was not able to locate studies which take into consideration the political instability and economic growth. Thus, an examination on political instability would add value to the previous studies.

Oil Price

Oil prices remains a subject of importance, as a change in oil price can influence a country's economic growth and is dependent on a variety of conditions such as domestic consumption, domestic production cost, and rate of imported oil to the rate of exported oil. Countries have adjusted their annual budget in accordance with the fluctuation in the rate of oil prices. An increase of oil price is documented to increase the currency value, and increase the purchasing power in oil exporting countries on a condition that an effective use of oil revenue is applied. Indeed, some studies did argue that the wrong fiscal policy may harm the effectiveness of oil income. In addition, an increase in the oil prices may enhance the profitability of the energy sector for oil exporting countries, and this may also appreciate the demand of labour and capital.

Hamilton (1983), in a pioneering paper, showed that the increase in oil prices has caused almost every post-World War Two recession in the United States of America (US). Subsequent to the Hamilton paper in (1983) some researchers have examined countries like Canada, United Kingdom (UK), Japan and other OECD countries by mainly investigating the economic activities and its response to oil stocks. However, there are considerable studies on oil prices in relation to employment because rising energy prices meant an increase in the cost of product. Uri (1996) studied the relationship between oil prices and agricultural

employment covering the US agricultural employment between 1947 and 1995. On the other hand, Darby (1982) argued that changes in oil prices has no effect on changes in real Gross National Product (GNP) and hence no impact on the employment rate.

Extensive studies have examined the relationship between oil prices and economic growth. The result are mixed; in the developed countries context as indicated by Cuñado and Pérez de Gracia (2003), Jiménez-Rodríguez and Sánchez (2005), and Mork, Olsen, and Mysen (1994). Cuñado and Pérez de Gracia (2003) documented that the relationship has appeared to be positive for Denmark but negative for the UK, and the same outcome was seen when the effect was examined in Norway and Denmark in the industrial context. However, studies examining Saudi Arabia, as one of the main oil exporting countries, have documented that 1 dollar of decrease in oil price corresponds to 2.5 billon dollar loss for Saudi GDP annually (Brown and Yucel, 2000). In fact, the exchange rate and inflation rate has a significant relationship with the Saudi economic growth rate (Aleisa and Dibooglu, 2002).

In the case of Yemen, Yemen produces approximately 160,000 barrels a day. Yemen depends largely on oil income, and oil accounts for large share of Yemen GDP. The country's economy is dominated by the production and export of crude oil, which generates 70 to 80 per cent of government revenues and most of the country's foreign exchange reserves. As a result, Yemeni consumers are highly vulnerable to shifts in international commodity prices, domestic oil output, the country's overall fiscal position and domestic security.

Therefore, the author of the paper found little evidence documenting the impact of oil prices on the Yemeni economy, and further examination in this context may enhance the literature concerning developing countries within the Middle East. and this current study can provide an in-depth investigation, not only in the past in Yemen, but can examine the economy in more recent times to include the occurrence of the Arab Spring.

Tourism

Yemen is a country with a potential tourism character, with historical places to visit and beautiful islands are the special merits of the country. Furthermore, Yemen is also a destination for many religious groups as a land which is mentioned in the Holy Book. However, subsequent Yemeni governments have not given full support to build unique tourism infrastructure due to political instability.

The 2011 revolution took a heavy toll on the travel and tourism industry, as violence erupted in several areas, and the rise of extremism and militant groups caused more fears among international tourists. A recent election in 2012 did not seem to solve the country's inherent and deeply rooted issues, and with travel warnings still in place in many countries, advising their residents against travel to Yemen, it is a difficult time for the country's travel and tourism operators. In fact, tourism outlets were forced to close amidst the revolution and violence, as occupancy levels often reached just 5 per cent at the height of the violence in 2011 and early in 2012. While many are likely to reopen their doors gradually, performance will remain poor and losses incurred have been substantial and difficult to recover for many operators.

In examining the period prior to the Arab Spring, in 1996 the international arrivals were estimated at 60 000 and tourist earnings stood at US$39 million, and by 2000 the tourism industry contributed 1.7 per cent to GDP which is 135 million USD. About 56 per cent of the GDP can be accounted by international tourist visitation with arrivals in 2000 totalling 72,836. In 2012 the central statistics in Yemen revealed that the arrivals reached 459,329 persons, where in 2013 the number amounted to 439,846 only from international

countries whereby Yemeni people stayed abroad and returned for vacations numbered to 495,720 as indicated in Table 1.0.

Furthermore, the tourism and economic growth relationship has been extensively researched in the regional context, and a debate has appeared on the casual relationship between tourism and economic growth, as high economic growth could provide benefits for the tourism industry where tourism is also good for economic growth. However, a question can be posed; does economic growth cause tourism development or does tourism development lead to economic growth? Based on the previous research, three different empirical results can be found: bidirectional causality between tourism and economic growth; unidirectional causality with either the tourism-led growth; or economic-driven tourism growth hypotheses.

METHOD

The source of the data collection is derived from different data bases. For oil price the author of this study utilised data provided by US Energy Information Administration web site; in particular the crude oil price per year provided from reports published by the International Energy Agency in regard to world oil price and demand. For the other variables in the study the author relied upon the World Bank database and the Trading Economic website, as these two sources provided reports on unemployment, tourism, inflation and the GDP rate. The author has indeed browsed into articles and previous studies to gain more accurate information related to economic indicators. Yemen's Ministry of Tourism was one of the sources relied upon for research data about tourism by examining the statistics from 2006 and 2008. The study uses data from 2000 to 2014, and as the Arab Spring happened during 2010 in Yemen, thus 2010 is the year of differentiation between the period before Arab Spring and after the Arab Spring. Moreover, the E views software is used to examine the stationary of data, contegration test reaching to vector error analysis .

$$\ln GDP_{i,t} = \beta_0 + \beta_1 \ln K_{i,t} + \beta_2 \ln TR_{i,t} + \beta_3 \ln EC_{i,t} + \beta_4 \ln POL_{i,t} + \varepsilon_{i,t}$$

$$\ln GDP_{i,t} = \lambda_i + \mu_t + \beta_0 + \beta_1 \ln K_{i,t} + \beta_2 \ln TR_{i,t} + \beta_3 \ln EC_{i,t} + \beta_4 \ln POL_{i,t} + \varepsilon_{i,t}$$

$$\ln GDP_{i,t} = \alpha_i + \delta_1 \ln GDP_{i,t-1} + \delta_2 \ln K_{i,t} + \delta_3 \ln TR_{i,t} + \delta_4 \ln EC_{i,t} + \delta_5 \ln POL_{i,t} + \xi_{i,t}$$

RESULTS

Firstly, we conducted a stationary data analysis using the unit root test, the result confirmed the existence of a unit root status, thus, we had to convert the data by creating a new objects in E views, these objects represent the old variables multiplied by Difference (D), the result showed no unit root test at 5% level in majority of the variables where all variables showed non-existence of unit root status at first difference as per showed below in Table 8.1. Secondly, we proceeded to perform the cointergration test, the result showed there is a strong possibilities of conintergration status. Therefore, we proceeded to implement the vector auto regression (VAR) analysis which would help in capturing the interdependences among variables. We found that a relationship do appear between tourism, political instability, unemployment ,oil price and economic growth in Yemen Table 8.2.

Table 8.1 Unit root Test

Variable	Level		First Difference	
	ADF	PValue	ADF	Pvalue
Oil Price	-3.96	0.0130	-5.06	0.0028
Tourism	-1.8	0.3	-3.20	0.047
Po Instability	-3.35	0.035	-3.17	0.04
Unemployment	-2.66Non	0.021Non	1.70	0.99
Inflation	-7.018	0.0001	-5.468	0.002
GDP	-3.57	0.026	-5.20	0.0029

The result of Var test Showed that , oil price has a significant negative relationship with oil price at 5% level, but we found a bi-directional relationship, we justify that by assuming that, the reason for the diagnosis divergence in the use of these two criteria, which arrives often in the reality are due to a small sample and less data. Indeed, increases in oil prices have caused growth in Yemeni economic to lower performance. Provided, tourism has appeared to be negatively related to GDP on directional basis at 5% level, the number of tourism is decreased during the period of the Arab spring which caused economic growth to downsize. In addition, unemployment is appeared to be negatively related to GDP at 5% level on bi-directional basis. The high rate of unemployment is Yemen is a result of low economic growth and vice versa. Moreover, politically instability is negatively and significantly related to economic growth on directional basis at 5% level , the Yemeni economy has experienced a heavy turbulence of political instability which was the main reason why economic was performing badly.

CONCLUSION

For this paper, the author reviewed the economic growth status in Yemen, and the analytical review involved an examination of the factors documented in the literature critical to economic growth in Yemen, of which oil prices, political instability, inflation, tourism status and unemployment rate were the key factors. It was found that the Yemeni economy suffers from political instability due to the occurrence of the Arab Spring, and the political instability caused tourism to depreciate, in spite of an improvement in the employment and inflation rate. However, an increase in the price of oil could not provide ample room to

improve the political instability indicator. Meanwhile, An analytical review of the data during the period of political instability showed that from 2008 to 2014, the political instability in Yemen adversely impacted on the economy, and the percentage of disturbance in the political process have caused conditions which have increased the level of uncertainty. However, the data showed that prior to Arab Spring there was some increment in uncertainty but not the high level of deviation in comparison to the years after the Arab Spring.

The surprising fact in the figures is that unemployment rate had been very high prior to Arab Spring but experienced an improvement after the occurrence of Arab Spring which implicitly contradicted a comprehension of political instability worsening with unemployment rate depreciated simultaneously. Furthermore, the tourism industry had been in recession, as tourists tended to leave the country in the presence of public protests, with protestors appearing on the streets in Yemen, and this fact corresponds to a downward trend of political instability. Worth noting, inflation rate and oil prices have experienced an improvement in the years after the Arab Spring. Indeed, the GDP has shown vitality since the occurrence of the Arab Spring in Yemen and even though it showed revival towards 2012 to 2014, the GDP improvement may have been influenced by the improvement in the oil prices.

COST EFFICIENCY AND DYNAMIC OF CONSTRUCTION SECTOR AND BUSINESS IN INDONESIA

Anang Muftiadi
Universitas Padjajaran, Indonesia

Abstract

Government of Republic of Indonesia is encouraging construction sector growth in national medium term development plan because it plays important role in economy. This will become more interesting for business and goverment. Therefore business and government need to study efficiency level of construction sector for their decision making process.

This research used time-series Leontief Input-Output Table, on changes in coefficient of technology overtime as a measurement of construction sector cost efficiency.

The results showed that construction sector growth in 2000-2008 was accompanied by increase of efficiency. This was good situation for business and goverment. However, in 2008-2010, the tendency of inefficiency arised. This means that construction sector growth required higher input proportion than ever before. Trend of coefficient shows that in medium term future, construction sector still tend to become more inefficient. This dynamic may weigh on construction business and impede infrastructure development plan in Indonesia in the future.

Keywords: Input-Output Table, Efficiency, Technology Coefficient.

INTRODUCTION

In National Development Plan Year 2015-2019, Indonesia will built roads, railways, transport, electricity, oil, gas, information and communication technology, water resources, drinking water and housing infrastructures. This infrastructures provide a foundation for achieving higher economic growth and welfare of the population in the future. This infrastructure (construction sector) has an important role in economic growth and have strong backward linkage to other sectors. National Development Plan Agency (Bappenas) estimated the investment needed reaches Rp.4.796.00 billions. The government of RI is expected to provide government budget as much as 42%, 22% of state- owned enterprises and 36% of public private partnership.

The plan is an big opportunity for business in construction sector in the medium to long term future. In anticipation of the plan, government and businesses need to study the level of production efficiency in construction sector as an essential input for policies and strategies setting. Therefore, this study aimed to identify the efficiency in construction sector and forecast its trend into the future.

LITERATURE
Production Efficiency

Production is a process of transforming inputs into outputs serve the market. Production activities are an important part of the business. Lipczynski and Wilson (2004: 35-64), states that,

Production in economics can be thought of as any activity which alters the form of materials, their quality and their availability over space and time. It can be thought of as a process of transformation of goods and services into different goods and services.

The linkage between production and effort choosing a particular technology for leading efficiency. From the viewpoint, the goal is to try to use the minimum input to achieve a given level of output. Production manager, with a variety of technology studies can properly take into account the technical efficiency of production methods. However, it's need to take into account the cost of production or cost- efficiency or economic efficiency. Production efficiency is an important goal in the production, as Barro and Sala-i-Martin (1995;146-150) stated that; ... a firm increases its physical capital learns simultaneously how to produce more efficiently.

The concept of efficiency in Lipczynski and Wilson (2004: 35-64) is;
Two fundamental concepts of efficiency:
technical and economic efficiency. Technical efficiency relates to the actual physical material ratios of inputs to outputs. Economic efficiency is the relationship between input prices or costs and output values. .... From a range of technically efficient input combinations, a firm selects that combination that costs the least.

Leontief Input Output Table.

Input-Output Table is a picture of the circular flow of the broad economy developed developed by Wassily Leontief. This table described the structure of the economic system that emphasizes the importance of technological change with a mechanistic understanding.

Structure of standard Input-Output Table and position of coefficient of technology ara as follows;

		Intermediate Demand			Final Demand	Total Output
		Sector 1	Sector 2	Sector 3		
Inter-mediate Input	Sector 1	w11	w12	w13	FD1	X1
	Sector 2	w21	w22	w23	FD2	X2
	Sector 3	w31	w32	w33	FD3	X3
Value Added		VA1	VA2	VA3		
Total Input		X1	X2	X3		

Figure 1. **Coefficient Technology in I-O Table Structure**

The usefullness of IO Table are various as described by Thirwall (1994; 246-263);

Input-Output may be used for projections and forecasting purposes. Information of this nature is importance if planning is to achieve consistency and if future bottlenecks in the productive process are to be avoided. Input-Output Table also to show the strength of linkages between activities in an economy to portray the technology of an economy.

Further description about the use of IO Table came from Rosenberg (Drejer, 1999: 32 -35):

The usefulness of input-output analysis is breaking open the 'black box' in which the primary factors of production, capital, and labor are somehow transformed into a flow of the final output, [and input-output analysis] displays a wealth of information on the sectoral flow of intermediate inputs. The technique makes it possible to study the process of technological change by examining   changing intermediate input requirements.

Measuring   Production   Efficiency   With Leontief Input-Output Tables

The key information for study of efficiency is the IO matrices or so called coefficient of technology. Interpretation of the coefficient matrix between the input or inverse Leotief as actual embodiment described also by Leontief technology (Drejer, 1998: 2);

Technology in a Leontief input-output framework is represented by a technical coefficient of the which express average values, partly by referring to groups of industries (a on certain degree of aggregation is unavoidable) with different cost structures, partly by referring to the whole series of techniques applied simultaneously in each line of production reaching   from the oldest techniques the which is still applied to the most recent technique which has just been introduced in the most modern production units (Leontief,1953: 23).

Raa (2005:108-125) describe the measurement of inefficieny by using IO Table as follows;

the degree by which a net output vector could be extended until the production possibility frontiers (PPFs) was hit is a measure of the inefficiency of the economy. Inefficiency may be due to differentt misallocations.... and or underutilization.

Within framework of this study, changes in cost efficiency will be analyze by using the coefficient input to the output, especially in the construction sector. Specification of the model that will be used in this research is to follow the basic framework of the model input-output table.

METHODOLOGY AND DATA
Research Variables and The Model

The I-O Table above can be converted into the following general equation Raa,2005);

The analysis was based on the results of technological coefficient changes over time. Steps being taken in preparation of data are as follows (Muftiadi, 2015):

$$x = (I - A)^{-1} fd \quad (1)$$

Specification:

X = output

I = identity matrix

A = coefficient Leontief technology

fd = final demand

Each output of production sectors need input. Each input coefficients (Leontief Technology) is obtained by;

$$a_{ij} = \frac{w_{ij}}{X_j} \qquad (2)$$

Research variables are the coefficient of technology (aij) in equation (2). It is a demand for a wide range of input supplies summation. The analysis was based on the results of technological coefficient changes over time. Steps being taken in preparation of data are as follows (Muftiadi, 2015):

1. To calculate coefficient technology of construction sector for 2000,2005,2008, and 2010.
2. To transform all construction sector value- added into year 2000 constant prices.
3. Analyze changes in technology coefficients(aij) over time. Possibilities are, if:
   ➢ (aij) t-1 <(aij) t = indicates decrease in efficiency of production.
   ➢ (aij) t-1> (aij) t = indicates increase of efficiency in production
   ➢ (aij) t-1 = (aij) t = indicates no changes.
4. To plot the value added and coefficient technology in a scatter diagram. Track path on coefficient changes year on year.
5. Analyze value-added in relation to changes in production technology coefficients. This analysis shows the comparability between output growth with technological changes in the time line of research. Likely the result of plotting are as follows;
   ➢ Value-added increase as the process production is more efficient.
   ➢ Value-added increase as the process production is more inefficient.
   ➢ Value-added decrease as the process production is more efficient.
   ➢ Value-added decrease as the process production is more inefficient.
6. To forecast path and future value of coefficient technology and its value added. This trends will be linier or non-linier depend on the path of data. Higher value of coefficient technology indicates trend of inefficiency vice-versa;

$$a_{ii} = f(t) \qquad (3)$$

7. Analyze the trends of production technology coefficients over time.

Data Collection

The Input-Output Table data obtained from the Indonesia Statistics, The Central Statistics Agency (BPS) Jakarta Indonesia, Year 2000, 2005,2008 and 2010, especially on construction sector.

RESULT
Construction Sector

During period of 2000-2014, construction sector always grew higher than the rate of economic growth. Construction sector grew 6.87% on average , while the economy grew 5.42%. GDP of the construction sector in 2014 reached Rp.1.014.541 billions. However, 2011- 2014 data showed a decrease in the growth rate of the construction sector, while economic growth remain higher than the previous year.

Average contribution of construction sector on GDP reached 8.28% which is likely to increase, so that in 2011-2014 the contribution reached 10.11%. This growth and contribution is expected to provide a foundation of better economic growth in following years. Refer to this situation, then government targeted to develop various infrastructures in year 2015- 2019.

Table 1. **Construction Sector and The Economy 2000-2014**

	2001 -2005	2006 -2010	2011 -2014	Average
Construction Growth (%)	6.24	7.69	6.65	6.87
Construction per GDP (%)	6.32	8.78	10.11	8.28
Economic Growth (%)	4.73	5.74	5.89	5.42
Construction Inflation (%)	12.00	20.43	5.78	12.79

Source: Indonesia Statistics (2016)
Figure 2. **Construction and Contribution of Construction Sector and and Economic Growth 2000-2014 (%)**

The number of enterprises in construction sector in 2014 as many as 129,819, declined 1,04% from 2011 (134,004 enterprises). This sector absorbed labor as many as 946,424 person, increase almost 29,04% from 2011.

Changes in Efficiency

From processed Input-Output data, construction sector technology coefficient obtained in 2000, 2005, 2008, and 2010 as well as its value added (GDP) data of the same year.

Table 2. **Construction Sector Coefficient of Technology and Value Added**

Year	Coefficient of Technology	Value Added (Rp. Billions)
20	0.664	76,573
20	0.642	103,598

20	0.637	131,010
20	0.653	150,022

Source: Indonesia Statistics (2000,2005,2008,2010)

Data in table no.3 are plotted in a scatter diagram then drawn the path changes, so it looks like as follow,

Figure 2. **Construction and Contribution of Construction Sector and and Economic Growth 2000-2014 (%)**
Figure 3. **Path Changes of Construction Efficiency and Its Value Added**

In 2000, the technology coefficient of cosntruction sector was 0.664 and then decreased to 0.642 in 2005. The decline of coefficient showed an increase efficient production in the construction sector. That is, by 2005, the fewer proportion of inputs used to produce construction sector (more efficient) than proportion of the inputs in 2000. The increase in efficiency is accompanied by an increase in value added (GDP) of the construction sector.

In 2005, the technology coefficient was 0.642 and then decreased to 0.637 in 2008. The decline coefficient showed an increase efficient production in the construction sector.

That is, in 2008, the fewer proportion of inputs used to produce construction sector (more efficient) than the proportion of the inputs in the previous year. This increased efficiency is accompanied by an increase in value added (GDP) of construction sector.

In 2008, the technology coefficient of construction sector was 0.637 and then increased to 0.653 in 2010. The increase coefficient showed a decrease in efficient production in the construction sector. That is, by 2010, the higher proportion of inputs used to produce construction sector (less efficient) than the proportion of the inputs in the previous year. The decline in efficiency is also accompanied by an increase in value added (GDP) of construction sector.

Highest increase of production efficiency in construction sector was from year 2000 to 2005. The increase is due to the new balance of Indonesian economy after the monetary crisis in 1998. Since then the construction sector to move more efficiently. However, the increase in efficiency is then run slow, later on 2010 tend to be inefficient. The efficiency level of production in 2010 fell back to near efficiency level in 2000. It could be argued that the decrease in the efficiency of year 2008-2010 was very fast, compared to an increase of efficiency from year 2000-2005. The data above shows that, although the production efficiency continues to become more/less efficient, but the construction sector continues to grow. Growth in this sector does not seem too affected by the change in efficiency level. The key growth of this sector is a continuity of demand increase and as the result of government policy to build infrastructure to maintain the momentum of economic growth. In general, although construction sector continued to experience growth in its operations, but it tends to be accompanied by wasteful use of resources. For the national development process, it is an big opportunity cost. Similarly, for business, this cost is actually not add to company's profits. Various factors that cause the inefficiency of the construction sector. of the authority in the overlapping investment. Natsir (2013.14-15), explaining as follows;

Strategic issues concerning investment in infrastructure and construction sectors include high investment risk, the cost of economic transactions is high, the credibility of investors who are still in doubt, the supply chain of materials and construction equipment have not been solid, distortion of the construction market is still large, land acquisition for infrastructure development, which is still very complicated, low investment cost recovery and the authority.

All those factors need to be anticipated and solved by business sector dan government.

The Future Trend

Based on data from Table 3, and then this paper predict the dynamics of coefficient of technology and value added of construction sectors with respect to time.

Dynamic of coefficient technology pattern was non-linear (cubic) with respect to time. Determination coefficient is 0.909. It is expected that after the year of 2010, construction sector increasingly inefficient. The added value of the construction sector is likely to have a dynamic linear growth pattern over time, with a determination coefficient of 0.999. The trend shows that in 2014, the construction sector production is much less efficient than 2010. But construction sector is still continue to grow in the future. AECOM Technology Corporation, one of the world's largest construction companies in Asia Construction Outlook 2013 says that Indonesia is a country with the fastest growth rate of the construction market in the region, on top of China and India (Kiprah;2013).
Figure 4. **Dynamic Trend of Efficiency and Value Added of Construction Sector.**

Assuming that the trend coefficient will remain constant, or no change in policy, construction sector is increasingly inefficient. This situation is clearly less favorable for the government's efforts to encourage the growth of construction sector on a large scale infrastructure in 2015- 2019. Similarly to the business on construction sector, which is partly the result of their hard work will be lost in inefficiency (deadweight lose). These circumstances clearly require the attention of government and business in construction sector, including businesses in other sectors that are closely related to the construction sector.

Bank Indonesia (Central Bank) Policy to lower Certificates of Bank Indonesia rate and the government's efforts to encourage simplification of licensing for accelerating infrastructure development is expected to reduce the trend of the inefficiencies in the future.

CONCLUSION

As a source of growth, construction sector always grew higher than the rate of economic growth and continue its contribution to economy in 2000-2014. Construction sector growth in 2000-2008 was accompanied by increase of efficiency but then became inefficient in 2008-2010. The tendency of inefficiency arised in the future. This means that construction sector growth required higher input proportion for future economic growth. This dynamic may weigh on construction business and impede infrastructure development plan in Indonesia in the future.

Factors causing inefficiency comes from onstruction business systems itself, logistics sector support, transaction costs and insufficient overnment policies to support the construction sector.

THE DEVELOPMENT OF FLYPAPER EFFECT AND INCLUSIVE ECONOMIC GROWTH MODEL ON BORNEO ISLAND

Prima Rosita Arini S., YKPN School of Business, Indonesia
Rudy Badrudin, YKPN School of Business, Indonesia
Baldric Siregar, YKPN School of Business, Indonesia

Abstract

This study aims to determine whether there flypaper and inclusive growth on Borneo island. Source data used is secondary data in the form of financial statements Local Government on Borneo island from 2006 to 2013. This study uses 5 variables, namely the general allocation fund, local revenue, capital expenditure, economic growth, and public welfare. The contribution of this study to show whether there flypaper effect and inclusive economic growth in Borneo island. The analysis technique used is the Partial Least Square ($\alpha = 0.05$). Tests conducted in seven samples of different areas but with same model. The results showed that 1) general allocation fund give a positive effect but the effect on capital expenditures is not significant; 2) local revenue has positive and significant impact on capital expenditures; 3) capital expenditure has negative and significant effect on economic growth; 4) economic growth has positive and significant effect on public welfare.

Keywords: flypaper effect, inclusive economic growth, public welfare

INTRODUCTION

In Act 32 of 2004 on Regional Government, the autonomous region has the meaning that the rights, powers and obligations of autonomous regions to set up and manage their own affairs and interests of local communities in accordance with the legislation. The implementation of regional autonomy in Indonesia is regulated by Law No. 32 of 2004 on Regional Government which separates the functions of the Local Government (Executive) to the function of the Regional Representatives Council (Legislature). Separation of functions as expressly provided in the Act indicates that the executive planning, execution, and reporting on local budgets is a manifestation of the service to the public, while the legislature active role in implementing the legislation, budgeting, and oversight.

In Law No. 32/2004 states that for the implementation of the authority of the Regional Government, the Central Government will transfer Balance Fund, which consists of the General Allocation Fund (DAU), Special Allocation Fund (DAK), and DBH consists of taxes and natural resources. Besides the Balance Fund, the Regional Government has its own funding sources in the form of local revenue (PAD), financing, and other income.

Indonesia, Malaysia, Philippines, and Thailand have the same revenue sources such as local taxes (property, hotels and restaurants as well as entertainment tax), licenses, fees, and revenues from Local Owned Enterprises (Saffel and Basehart, 2001). But in practice, the transfer of the central government is a major source of funding for local governments to finance their daily operations and reported in the calculation of the budget. The purpose of the transfer was to reduce the fiscal gap between government and ensure the achievement of minimum service standards across the country.

The budget process begins with making the agreement between the executive and the legislature on Budgets and Public Policy Priorities and Budget Ceiling that will serve as

guidelines to prepare the budget revenue and expenditure budget. Executive draft budget correspond Public Policy Budgets and Priorities and Budget Ceiling then submitted to the legislature to be studied and discussed before it is set as Local Regulation (Badrudin, 2011).

The scope of the budget is relevant and important in local government. This corresponds to the budgetary impact on the performance of the government, with respect to the functions of government in providing services to the public. Furthermore, the council will oversee the performance of the government through the budget. This form of supervision in accordance with agency theory in this case the local government as an agent and Parliament as a principal.

Importance of budgeting will affect the economic growth that will also have an impact on the welfare of the community, because with the increase in economic growth is expected to be accompanied by an increase in community welfare improvement. Economic growth combined with increasing public welfare can be done if the capital expenditure allocated appropriately. Economic growth can be realized if the fiscal decentralization in countries/cities can run well. The extent to the local government to determine the allocation of expenditure their region, become a very important factor in determining the fiscal decentralization. Inclusive economic growth can be achieved if an area can spend capital expenditures appropriately.

Capital expenditure could be funded with block grants and revenue. If the capital expenditure in an area more dominant funded using public funds allocation, this region still relies on the transfer of funds from the central government or called flypaper effect. Flypaper effect is phenomenon to describe when a dollar of exogenous intergovernmental fiscal transfer leads to significantly greater public spending than an equivalent dollar of citizen income: money sticks where it hits (Inman, 2008). Some other empirical studies of flypaper effect were conducted, e.g., Deller et. al., (2007). In the implementation of regional autonomy, local government is able to manage its own finances and financing its capital expenditure are expected to rely more on the local revenue. If the economic growth of a region can be improved, it is expected to improve welfare society and reduce poverty. This is an inclusive economic growth (Todaro and Smith, 2006). In this study the researchers chose the island of Borneo as samples with the consideration that not too many researchers who studied the island of Borneo and in addition it has a province of Kalimantan spread in quadrant one, three, and four on the Klassen typology. Researchers wanted to see whether there is economic growth and increased prosperity evenly throughout the province, especially in West Kalimantan and South Kalimantan, which are in quadrant four which means that the area is an area that remains very needs special attention because it has the lower amount of GDP per capita and a lower growth rate compared to other regions (Badrudin, 2015).

Research Purposes

This study aims to determine how the influence of General Allocation Fund (DAU) and the Local Revenue (PAD) on Capital Expenditure, effect of Capital Expenditure on economic growth, and see how the influence of economic growth on public welfare.

Research Contribution

Previous studies have examined the relationship between DAU, PAD, Capital Expenditure, economic growth, and prosperity separately with different models. In this study, researchers wanted to test how the relationship between DAU and PAD to Capital Expenditure, Capital Expenditure on economic growth, and economic growth in the

welfare of the community in 1 models, but these models are tested for 7 samples of research in the area of the island of Borneo. The hypothesis to be tested would show how the results if the model was applied in every province, every district, every city, and Borneo as a whole.

LITERATURE STUDY AND HYPOTHESIS DEVELOPMENT
Literature Study

Much research in various fields of study to apply basic science research agency theory as though it is still a lot of controversy in it (Eisenhardt, 1989). Moe (1984) argues that in government there is a connection in agreements principal-agent that can be traced through the budget process, namely, voter to legislature, the legislature to the government, the minister of finance to budget users, the prime minister to bureaucrats, and officials and service providers. In a government agency relationship between the executive and the legislature, the executive and the legislative is the principal agent. The problems facing the legislature can be interpreted as a phenomenon called agency problems. Similarly, in the public sector, in Law No. 32 of 2004 on Regional Government, the autonomous region has the meaning that the rights, powers and obligations of autonomous regions to set up and manage their own affairs and interests of local communities in accordance with the legislation. The implementation of regional autonomy in Indonesia is regulated by Law No. 32 of 2004 on Regional Government which separates the functions of the Local Government (Executive) with the function of representing the people (Legislature). The law also stipulates that the legislature has the authority to select, appoint, and dismiss heads of regions. This shows the inequality between the executive and legislative positions. The purpose of the position inequality is permitted to delegate legislative authority to the head area chosen by the consequences dismissed if the regional head can not perform as desired legislative   authority. Relationships   that   are   not   parallel   can   be   called by   the agency relationship. Agency theory can be applied in public organizations (Lane, 2003).

In Law No. 32/2004 states that for the implementation of the authority of the Regional Government, the Central Government will transfer Balance Fund, which consists of the General Allocation Fund (DAU), Special Allocation Fund (DAK), and Profit Sahring Fund (DBH) consists of taxes and natural resources. Besides the Balance Fund, the Regional Government has its own funding sources in the form of local revenue (PAD), financing and other income.

According to Law No. 33/2004 proportion of DAU between provincial and district/city defined by the balance of powers between provincial and district/city. But when the response or the larger shopping areas financed by transfer rather than by the PAD will display a phenomenon called flypaper (Hines and Thaler, 1995). Local government will use transfers received from the central government to increase spending. Transfer will increase the consumption of public goods, but not a substitute for local taxes. The phenomenon in much of the literature referred to as flypaper effect. Phenomena which occur in developing countries, governments rely more on transfers than PAD. According to Law No.33/2004 revenue (PAD) is a local earned income levied by local regulations in accordance with the legislation. The scope of the budget is relevant and important in local government. This corresponds to the budgetary impact on the performance of the government, with respect to the functions of government in providing services to the public. Furthermore, the council will oversee the performance of the government through the

budget. This form of supervision in accordance with agency theory in this case the local government as an agent and Parliament as a principal.

Lately, research in the public sector is also an increased focus on the contribution of public capital to economic growth. In this study, the public capital of a country depicted in Capital Expenditure. Capital spending is said to be one of the factors that affect a country's economic growth and in previous studies there are many studies showing that capital spending has a positive impact on economic growth. Therefore, researchers wanted to see also whether the Borneo Island Capital expenditures also have a positive impact on economic growth.

It is generally known that economic growth is an indicator that is commonly used to look at the success of the development. In the implementation of development, high economic growth is the main target for developing countries because economic growth has a close relationship with an increase in the goods and services produced within the community, so that more and more goods and services produced in the welfare of society will increase. Social welfare is a way to associate welfare with social choices objectively obtained by summing the satisfaction of individuals in society.

HYPOTHESIS DEVELOPMENT
The influence of the DAU to the Capital Expenditure
To provide support to the implementation of regional autonomy has issued Law 33/2004 on Financial Balance between Central and Local Government. Sources of financing for local governments within the framework of the financial balance between central and local governments implemented on the basis of decentralization, deconcentration, and assistance.

BPS states that General Allocation Fund (DAU), is funding from the state budget allocated for the purpose of financial equalization between regions to finance its expenditures within the framework of the implementation of decentralization. In connection with the financial balance between central and local government, it is a consequence of the transfer of power from central government to local governments. Thus, there is significant transfer in the state budget from central government to local governments, and local governments can freely use this fund is to provide better services to the public or for other purposes that are not important.

Based on empirical research conducted by Holtz-Eakin et. al. (1985) states that there is a very close link between the transfer of the central government and local government spending. Specifically, they assert that variables local government policy in the short term adjustment (adjusted) to transfer the received, enabling the response of non-linear and asymmetric. Research conducted by Simanjuntak, et.al (2013) showed that DAU has a real connection with capital expenditure. Based on research that has been done before and theories of other supporters, then the hypothesis can be formed as follows:

H1: DAU has positive effect on capital expenditure
The influence of the PAD to the Capital Expenditure
The decentralization policy is intended to realize the independence of the region, the autonomous regional government has the authority to regulate and manage the interests of the local community at its own initiative based on the aspirations of the people (Law 32/2004). The region's ability to provide funding from areas highly dependent on the ability to realize the economic potential into forms of economic activity that is able to create a revolving fund for sustainable regional development.

The amount of authority of the legislature in the budget process (Law 32/2004) opened the door for the legislature to "impose" his personal interests. Legislative position as a supervisor for the implementation of government policy, can be used to prioritize their preferences in budgeting. To realize his personal interests, politicians have a preference for allocations containing lucrative opportunities and have a long-term political impact. Therefore, the legislature will recommend the executive to raise the allocation to the sectors that support their interests. Legislators tend to propose a reduction of allocations for education, health, and other public spending that is not job programs and targetable.

According to research conducted Iskandar (2015) local owned revenue (PAD) is the own source of local revenues that should be constantly increased to be capable of bearing a part of expenditure burden required for implementing governmental affairs and development activities. It is expected to be steadily increasing year by year so that the self-sufficiency of broad, real, and responsible regional autonomy can be realized. The key characteristics of a local government that is capable in implementing its autonomy may be characterized by regional financial capacity and dependency to central aid. These findings support the research hypothesis which states PAD positive effect on the capital expenditure local government district/city in Indonesia, and it is consistent with research findings Simanjuntak, et.al (2013). With the increase in local revenue, the region will also indirectly improve public facilities by allocating capital spending by a larger amount because of their financial resources to fund the repairs to the facility. Based on previous research findings and theories supporting the hypothesis can be formed as follows:

H2: PAD has positive effect on capital spending
The Effect of Capital Expenditure to Economic Growth

The relationship between public investment and growth could even turn negative once public capital is above a certain threshold. For example, maintaining and/or expanding the existing capital stock may require high (and potentially distortionary) tax rates, which would reduce growth, all else being equal (Aschauer 2000; Barro 1990). Thus, the productivity of public investment can vary depending on the initial stock of public capital. Capital expenditure is part of the fiscal policy, which is a government action to regulate the course of the economy by determining the amount of government revenues and expenditures each year, which is reflected in the documents the State Budget (APBN) for national and local budget (APBD) for local or regional.

Some researchers studied more on the interpretation of the relationship by focusing on public capital as a factor of growth in the private sector. This argument is based on the provision of infrastructure and services from the government to the private sector, and the flow of public investment explain some variation of private sector output will eventually boost economic growth (Zemguilene, 2012). So it can be said that one form of public investment is in the form of public infrastructure (Hjerppe, et al., 2007).

Todaro (2006) says there are three major factors or components in economic growth. First, the accumulation of capital which includes all forms and types of new investments were invested in land, physical equipment and human resources. Second, population growth the next few years by itself bring labor force growth. Third, advances in technology.

Fixed assets held as a result of capital expenditure is the main prerequisite in providing public services by local governments. To add to the fixed assets, the local government allocated funds in the form of capital expenditure in the budget. Capital

expenditure allocation is based on the local needs for facilities and infrastructure, both for the smooth implementation of the tasks for the government and public facilities.

Substainability of economic growth can be achieved by an area if the area can always improve

the existing infrastructure in the region. Capital expenditures intended to obtain local government fixed assets, namely equipment, buildings, infrastructure and other fixed assets. With the increase in government spending, particularly capital spending is expected to boost the local economy, which in turn can spur the growth of per capita income. Besides the increased capital expenditures are also expected to be a driving factor in the emergence of new investments in the area of optimizing the utilization of various resources that can ultimately boost regional economic growth.

Capital expenditure is expenditure that benefits exceed one fiscal year and will add an asset or property as well as the area will have consequences add to shopping routine such as maintenance costs.

Barro (1990) states that public investment and significant positive effect on economic growth. Then some research done to find evidence that public investment has positive influence on economic growth. Many studies conducted in developed countries and developing countries to see how the statistical relationship between aggregate infrastructure investment and GDP growth. For research conducted by Stephan (2003) indicate a positive relationship between public investment and GDP. Based on the results of previous studies, the hypothesis can be formed as follows:

H3: The capital expenditure has positive influence on economic growth.
The Effect of Economic Growth to the Public Welfare

Economic growth according to Todaro and Smith (2006) is a study of the increased production of goods and services in economic activities. Economic growth is also a science that studies the increase in Gross Domestic Product (GDP) or Gross National Product (GNP) regardless of whether the increase in GDP/GNP was larger or smaller than the rate of population growth. If a country can provide economic goods, it is hoped that people can use so that the society welfare is increasing and reducing poverty. This is an inclusive economic growth. Economic growth is a picture of an economies of the region. Sustainable economic growth can increase the prosperity of society. For the region, this indicator is important to know the success of development in the future. Economic growth characterized by increasing the amount of goods and services (output) generated by a particular area in this study is the island of Borneo.

Furthermore, indicators used to measure economic growth is the growth rate of Gross Domestic Product (GDP). In the context of the regional economy, the size of which is often used is the Gross Domestic Product (GDP), the sum of gross value added (gross value added) generated by all sectors of the economy in the region. Economic growth is measured using real GDP is to provide an overview of the gross value added produced by the production units in an area within a certain period. According to BPS, GDP at current prices is the sum of the production value or the income or expenditure is assessed according to the prices prevailing during the year.

Furthermore, the development of the amount of the value of GDP is one indicator that can be used as a measure for assessing the success of development of a region, or in other words the economic growth of a region can be reflected through the growth in value of GDP. Economic growth is also a change in the value of the economic activity of the year for one period to another by taking the average in the same time, it is to say

economic growth rate should be compared with the level of national income from year to year. What is meant by regional economic growth is the increase of people's income that occurred in the area, which is the entire value added that occurred in the area. Added revenue is measured in real terms, that is expressed in constant prices.

Increased the welfare of society is an appropriate indicator to assess the success or failure of the implementation of regional autonomy. The failure of regional autonomy shown by the unchanged or even lowered the public welfare. On the other hand, the success of regional autonomy should be seen from the growing prosperity of society (Badrudin and Siregar, 2015).

If the people's income increases could mean that the level of welfare is also increasing. The welfare of society can be measured by the Human Development Index. The government's role in improving the HDI can also be influenced by the realization of state spending in the public service.

The role of government policy and the implementation of regional autonomy and fiscal decentralization is based on pertibangan that daerahlah better know the needs and standards of care for people in the region, thereby granting regional autonomy is expected to spur increased prosperity in the region through increased economic growth.

According to Kuznets one of the characteristics of modern economic growth is the high growth of output per capita (Todaro, 2006). Growth in output is meant is the GDP per capita, high output growth to make changes in consumption patterns in fulfillment. This means increasing economic growth, the higher per capita output growth and changing consumption patterns in this case the level of people's purchasing power will also be higher. High purchasing power will improve the Human Development Index for the purchasing power of people is one of the composite indicator in the HDI-called indicators of income. It can be concluded that the higher economic growth will improve the Human Development Index. Research conducted by Badrudin and Siregar (2015) shows that economic growth and has a positive and significant relationship to the public welfare. Based on existing theories, it can be established the following hypotheses:

H4: Economic growth positively affects the public welfare.

Based on the background of the problem, the study of theory, prior research and development of hypotheses, it established a framework of thinking as follows:
Figure 1
Theoretical Framework

RESEARCH METHODS
Sources and Data Research

The data used in this research is secondary data. The data obtained from the Directorate General of Budget Ministry of Finance in the form of data Realized budget from 2006 to 2013. The data is data DAU, the data PAD, GRDP data, and the Human Development Index data Borneo Island. Due to limitations on the availability of data, the period of the study is the year 2006-2013. The data used is by using a data sample 4 provinces in Kalimantan except for the new North Borneo inaugurated on October 25, 2012.

Variables and Operational Definitions

Classification of variables is based on theoretical and empirical studies as a reference framework of thinking that consists of two variables are exogenous and endogenous. Exogenous variables are variables that affect the operation of a model economy and the variable is not affected by any relationship described by the model. Exogenous variables in this study is the DAU and PAD. According to Law No. 33 of 2004, DAU has a definition that funds from the state budget allocated to the purpose of equalization of fiscal capacity among regions to fund the needs of the region in the implementation of decentralization, while the PAD has a definition of regional income sourced from the local tax, the results of retribution, results management wealth separated areas, and others are legitimate, which aims to provide flexibility to local governments in funding dig in decentralization as a manifestation of the principle of decentralization.

Endogenous variables are variables that are influenced by exogenous variables. Endogenous variables in this study are: (a) an endogenous variable that has a meaning *intervening* variables that take effect when the exogenous variables affect the endogenous variables depend. Endogenous variables intervening in this study is the capital expenditure by Government Accounting Standards (SAP) has a definition of expenditure made in the context of capital formation that are adding fixed assets / inventory that benefit more than one accounting period, including the expenses for the maintenance cost nature maintain or increase its useful life, as well as increasing the capacity and quality of assets; (b) an endogenous dependent variable is the variable that is influenced by exogenous and endogenous variables intervening. Dependent endogenous variables in this study is the economic growth and prosperity. Economic growth is described by the value of GDP over prices come into force in a region. According to BPS, GDP at current prices is the sum of the production value or the income or expenditure is assessed according to the prices prevailing during the year. According to Law No. 11 of 2009, the Social Welfare is the fulfillment of the conditions of material, spiritual, social and citizens in order to live a decent and able to develop themselves, so that they can perform their social function. Public welfare in this peneitian illustrated with HDI value of an area. According to BPS, the definition of IPM explain how residents can access development results in obtaining income, health, education, and so forth.

DATA ANALYSIS
Descriptive Statistics

Table 1
Descriptive Analysis Results

	PAD* (Rp)	DAU* (Rp)	Capital Expenditure*	Economic Growth %	Public Welfare
Mean	48.691,04	316.377,66	340.320,19	5,73	71,62
Minimum	1.187,85	1.365,82	36.593,75	-8,36	62,13

| Maximum | 470.719,06 | 997.880,07 | 23.624.390,60 | 22,39 | 79,87 |
| Standard Deviation | 57.594,77 | 168.960,95 | 1.160.253,74 | 2,70 | 3,38 |

Remarks: *) In millions of rupiah
Source: Output (data processed, 2016)

Based on the results of descriptive analysis in Table 1, it appears that the Local Revenue had an average of Rp48.691.044.423 and standard deviation amount of Rp57.594.772.608 which is has high amount of standard deviation. Value indicates that there is a distance between the data and the value of the average is equal to plus minus Rp57.594.772.608. The highest value represented by the Local Revenue Balikpapan City in 2013 amounted Rp470.719.063.633, while the lowest value for the original income represented by the District of North Kayong in 2008 amounted Rp1.187.844.759 General Allocation Fund has an average of Rp316.377.633.301 and standard deviation amount of Rp168.960.948.795 which is has higher amount of standard deviation than the amount of standard deviation from Local Revenue. Value indicates that there is a distance between the data and the value of the average is equal to plus minus Rp 168.960.948.795. The highest amount of general allocation funds represented by the East Kutai Regency in 2009 amounted Rp997.880.086.844, while the lowest value General Allocation Fund represented by Kutai in 2011 amounted   to   Rp1.365.820.000. Capital Expenditure on Borneo island has an average of Rp340.320.193.754 and standard deviation amount of Rp1.160.253.740.292 which is has the highest amount of standard deviation than the amount of standard deviation from Local Revenue and General Allocation FundS. Value from standard deviation indicates that there is a distance between the data and the value of the average is equal to plus minus Rp1.160.253.740.292. The highest value Capital Expenditure represented by Sukamara in 2013 amounted Rp23.624.390.602.615, while to the lowest value in Capital Expenditure represented by Tapin on 2013 by Rp36.593.746.359. Economic growth that occurs on Borneo island an average of 5.73% and standard deviation amount of 2,70% which is has low amount of standard deviation. Value indicates that there is a distance between the data and the value of the average is equal to plus minus 2,70%, the figure shows that the rate of economic growth in the island of Borneo is still low. In table 1 shows that there is an imbalance of economic growth due at the maximum rate of economic growth was able to show a value of 22.39%, which represents the increase in the economic growth of East Kutai in 2006, but the minimum value obtained from descriptive statistics unbelievably far to the maximum value that is equal -8.36% which would indicate the lowest economic growth have occurred in the city in 2011. Lastly, Public Welfare on the island of Borneo has an average of 71.62% and standard deviation amount of 3,38% which is has low amount of standard deviation. Value indicates that there is a distance between the data and the value of the average is equal to plus minus 3,38% the highest level of social welfare represented by the City of Balikpapan in 2013 at 79, 87% and the lowest level of social welfare represented by the City of Sambas in 2006 amounted to 62.13%.

Inductive Analysis With Partial Least Square (PLS)
Inductive analysis using Partial Least Square (PLS) includes research *goodness of fit model (inner model),* which serves to determine the suitability of a model used in the study using variables General Allocation Fund, Local Revenue, Capital Expenditure, economic growth, and public welfare. Results of testing the *goodness of fit model* can be seen in Table 2 below:

Table 2
Value Goodness of Fit Models

APC = 0.113, P =	Good if P
ARS = 0.022, P =	Good if P
AVIF = 1.062	Good if ≤ 5

Source: Output (data processed, 2016)

Based on the results of model testing, Average R-Squared value (ARS) obtained a value of 0.022 with a P-value = 0.162. Based on these results can be concluded that the value of the ARS is not significant because the P-value>0.05, while the value of 0.022 indicates that the variables in the study are only able to affect the dependent variable of 2.2% and the remaining 97.8% is influenced by other factors beyond the variables in research. Average value of Path Coefficient (APC) of 0.113 with a P value = 0.004, this means a significant APC value for the value of P-<0.05. Because APC enerated significant value, it can be proved that the endogenous and exogenous variables have a cause and effect relationship either directly or indirectly. In this research multicolinearity model is not happen, it is proved from the Average Variance Inflation Factor (AVIF) of 1,062 whose value ≤ 5.

DAU has positive effect on Capital Expenditure

Testing hypotheses regarding the influence of DAU to the Capital Expenditure conducted using seven different samples but with the same model. Table 3 shows how the relationship between the DAU to the Capital Expenditure on Borneo island. Data from the table shows that overall on Borneo island DAU has a positive relationship but not significant to capital expenditures for the p-value was 0.37 greater than the significance level set at 5%. The path coefficients indicate a positive direction that is equal to 0.02. Based on the results obtained, when testing was conducted overall in H1 Borneo island is not accepted, the test results showed that although the DAU provides a positive effect on capital expenditure but not significant influence exerted.

However, when tested separately for each province, the results indicate a positive and significant influence of the DAU to the Capital Expenditure. Positive and significant influence are represented with the results obtained from the three provinces of the four provinces in Kalimantan, the province of West Kalimantan, South Kalimantan and Central Kalimantan. The results obtained are consistent with Klassen typology picture. The position of Central Kalimantan province are in quadrant 1, that area is growing fast, provinces that are in quadrant it should be given more attention by the local government because even though the area is growing fast but has the GDP per capita is still low, so it needs the intervention of the central government to develop it.

West Kalimantan and South Kalimantan both are in quadrant 4 on Klassen typology. Provinces that are in quadrant 4 is referred to as disadvantaged areas so it needs special attention as compared to other areas of the province that are in quadrant 4 have the amount of GDP per capita and its growth rate is lower.

East Kalimantan Province is located in quadrant 3 on Klassen typology. Provinces that are in quadrant 3 is the area of advanced but depressed. Areas that are in quadrant 3 has reached a high level of economy, but its growth rate is relatively lower than the provincial average. East Kalimantan Province has been more able to rely on the original income so that the DAU of the local government despite positively affect capital expenditure, the resulting effect is not significant. Therefore it can be concluded that the

test results for each province in accordance with the concept of Klassen typology. Overall hypothesis one that DAU positive effect on capital spending is rejected.

Table 3
Hypothesis 1
DAU Has Positive Effect on Capital Expenditure

No.	Samples	Coefficient	P-Value	R^2	Prediction	Finding	Conclusion
1	The whole province	0.02	0.37	0.02	+	+	Rejected
2	The entire district	-0.00	0.48	0.02	+	-	Rejected
3	Citywide	-0.13	0.23	0.59	+	-	Rejected
4	West Kalimantan	0.53	<0.01	0.58	+	+	Accepted
5	South Kalimantan	0.48	<0.01	0.22	+	+	Accepted
6	Central Kalimantan	0.07	<0.01	0.01	+	+	Accepted
7	East Kalimantan	-0.18	0.02	0.37	+	-	Rejected

Source: Output (data processed, 2016)

PAD has positive effect on Capital Expenditure

H2 testing is also done by testing seven samples of different but with the same model. Table 4 shows how the relationship between the PAD to the Capital Expenditure on Borneo island. Data from the table shows that when H2 tested as a whole on the island of Borneo, the PAD has a positive and significant relationship to the Capital Expenditure. This is indicated with a p-value < 0.01 were smaller than specified signfikansi level of 5% and koefisisen lines also showed a positive effect amounting to 0.13. From the results obtained it can be concluded that the second hypothesis, namely PAD positive effect on Capital Expenditure accepted. These test results support the results of research conducted by Simanjuntak, et.al (2013) and Iskandar (2015) which showed that the original income positive effect on capital expenditure in a region.

However, if the H2 to be further investigated in the table shows that in South Kalimantan and Central Kalimantan PAD would have a negative relationship and no significant effect on capital spending. When viewed from Klassen typology of Central Kalimantan and South Kalimantan are in quadrant 1 and 4 have in common that should receive special attention from the government. Central Kalimantan is at region that expand rapidly, but less able to develop or allocate assets appropriately so we need government intervention. Meanwhile, South Kalimantan Province is located in quadrant 4 that are classified as disadvantaged areas that do require special attention from the government. So when it is associated with one hypothesis, these two provinces was more relying on transfers from the government in the form of DAU and seen that phenomenon flypaper effect on these two areas.

Table 4
Hypothesis 2
PAD Has Positive Effect on Capital Expenditure

No.	Samples	Coefficient	P-Value	R^2	Predictio	Finding	Conclusion
1	The whole province	0.13	<0.01	0.02	+	+	Accepted
2	The entire district.	0.14	<0.01	0.02	+	+	Accepted
3	Citywide	0.73	<0.01	0.59	+	+	Accepted

4	West Kalimantan	0.35	<0.01	0.58	+	+	Accepted
5	South Kalimantan	-0.04	0.40	0.22	+	-	Rejected
6	Central Kalimantan	-0.04	0.05	0.01	+	-	Rejected
7	East Kalimantan	0.54	<0.01	0.37	+	+	Accepted

Capital expenditures negatively affect economic growth

Testing for H3 is also done by testing seven samples of different but with the same model. Table 5 shows how the relationship between the Capital Expenditure to Economic Growth in the island of Borneo. Results from the table show that when H3 is tested in its entirety on the island of Borneo, Capital Expenditure has a negative and significant effect on economic growth. It is seen from the path coefficient values indicate a negative number that is equal to -0.15, but the p-value obtained is <0.01 smaller than the significance level has been determined, and the p-value figures indicate that the influence given is significant. Negative and significant impact possible. That is because on Borneo island phenomenon of economic growth that occurred was exclusively economic growth.

Exclusive economic growth can occur because of development that do not qualified or not equitable or could be caused by increased government spending in capital expenditure but not accompanied by a decrease in poverty or unemployment on the island of Borneo. This can be demonstrated by three of the four provinces in Kalimantan is the province of East Kalimantan, West Kalimantan, and South Kalimantan Klassen typology is in quadrant 3 and 4 which show that these areas the level of growth is still slow. While Central Kalimantan are in quadrant 1, which indicates that the area is growing rapidly, although not able to efficiently allocate capital expenditure so that the GDP per capita which is owned still low. But the government gave special attention to the area that is in quadrant 1 still has a chance to grow better. So from the results obtained and the analysis of the results it can be concluded that the hypothesis that states the Capital Expenditure has positive effect on economic growth declined.

Table 5
Hypothesis 3
Capital Expenditure Has Positive Influence on Economic Growth

No.	Samples	Coefficien	P-Value	R 2	Predictio	Findin	Conclusion
1	The whole province	-0.15	<0.01	0.02	+	-	Rejected
2	The entire district.	-0.21	<0.01	0.05	+	-	Rejected
3	Citywide	-0.28	<0.01	0.08	+	-	Rejected
4	West Kalimantan	0.31	<0.01	0.09	+	+	Accepted
5	South Kalimantan	0.07	0.35	0.01	+	+	Rejected
6	Central Kalimantan	0.11	0.16	0.01	+	+	Rejected
7	East Kalimantan	-0.27	<0.01	0.07	+	-	Rejected

Source: Output (data processed, 2016)

Economic growth has positive influence on public welfare

Testing the hypothesis for the H4 is also done by testing seven samples of different but with the same model. Table 6 shows how the relationship between the Economic Growth of the Public Welfare on the island of Borneo. From the results obtained, when

testing the hypothesis as a whole then in Table 6 shows that the economic growth gives a negative influence on the welfare of society. The effect is shown by the path coefficient of -0.15. However, when viewed from the level of significance, given the influence of economic growth on the welfare of society can be said to have a significant effect. This is indicated with a p-value <0.01, the value is smaller than the specified significance level of 5%.

If further investigation, the data contained in Table 6 shows that three of the four provinces in Kalimantan, namely South Kalimantan, Central Kalimantan, and East Kalimantan have test results that provide economic growth and a significant positive impact on economic growth. West Kalimantan Province also showed a positive influence of economic growth on public welfare, but the effect is not significant. The results of this study are also consistent with the theoretical basis proposed by Kuznets stating that one of the characteristics of modern economic growth is the high growth of output per capita (Todaro, 2006). Growth in output is meant is the GDP per capita, high output growth to make changes in consumption patterns in fulfillment. This means increasing economic growth, the higher per capita output growth and changing consumption patterns in this case the level of people's purchasing power will also be higher. High purchasing power will improve the Human Development Index for the purchasing power of people is one of the composite indicator in the HDI-called indicators of income. The fourth hypothesis testing results also support the results of research conducted by Badrudin and Siregar (2015) which showed that economic growth has positive an significant influence on people's welfare. If the economic growth, the better the income levels will also increase. Addition of the increase in revenue occurred public will be able to better meet their needs and this shows that the welfare of the community in the form of income began to increase so that the public welfare can be achieved. So from the results obtained can be concluded that the four hypotheses that economic growth positively affects the welfare of the community received.

CONCLUSION

Researcher expects that General Allocation Fund has positive effect on capital spending, but based on the results obtained DAU provides a positive effect on capital expenditure but not significant influence exerted.

Data from the table shows that when H2 tested as a whole on the island of Borneo, the PAD has a positive and significant relationship to the Capital Expenditure. From the results obtained it can be concluded that the second hypothesis, namely PAD has positive effect on Capital Expenditure accepted. These test results support the results of research conducted by Simanjuntak, et.al (2013) and Iskandar (2015) which showed that the original income has positive effect on capital spending in a region.

Capital expenditures negatively affect economic growth. Exclusive economic growth can occur because of development that do not qualified or not equitable or could be caused by increased government spending in capital expenditure but not accompanied by a decrease in poverty or unemployment on the island of Borneo. This can be demonstrated by three of the four provinces in Kalimantan is the province of East Kalimantan, West Kalimantan, and South Kalimantan. Those provinces are in quadrant 3 and 4 Klassen typology which show that these areas level of growth is still slow. While Central Kalimantan is in quadrant 1, which indicates that the area is growing rapidly, although not able to efficiently allocate capital expenditure so that the GDP per capita which is owned still low.

Economic growth has positive influence on people's welfare. The results of the study in accordance with the opinion of Professor Kuznets stating that one of the characteristics of modern economic growth is the high growth of output per capita (Todaro, 2006). Growth in output is meant is the GDP per capita, high output growth to make changes in consumption patterns in fulfillment. This means increasing economic growth, the higher per capita output growth and changing consumption patterns in this case the level of people's purchasing power will also be higher. High purchasing power will improve the Human Development Index for the purchasing power of people is one of the composite indicator in the HDI-called indicators of income. The fourth hypothesis testing results also support the results of research conducted by Badrudin and Siregar (2015) which showed that economic growth has positive and significance effect on people's welfare. If the economic growth, the income levels will also increase. Addition of the increase in revenue occurred public will be able to better meet their needs and this shows that the welfare of the community in the form of income began to increase so that the public welfare can be achieved.

IMPLICATIONS

Based on the analysis of the hypothesis and the hypothesis of the two in all districts/cities on the island of Borneo, it turns out, if examined further seen that in South Kalimantan and Central Kalimantan PAD would have a negative relationship and no significant effect on capital spending. When viewed from Klassen typology of Central Kalimantan and South Kalimantan are in quadrant 1 and 4 have in common that should receive special attention from the government. Central Kalimantan is at region that expand rapidly, but less able to develop or allocate assets appropriately so we need government intervention. Meanwhile, South Kalimantan Province is located in quadrant 4 that classified as disadvantaged areas that do require special attention from the government. So when it is associated with hypothesis one, these two provinces was more relying on transfers from the government in the form of DAU and seen that phenomenon flypaper effect on these two areas.

Based on the results of hypothesis three and four seem that the economic growth that occurred in Indonesia is the exclusive economic growth. This is because economic growth has not been evenly distributed in Kalimantan. Exclusive economic growth can occur because of development that do not qualified or not equitable or could be caused by

increased government spending in capital expenditure but not accompanied by a decrease in poverty or unemployment on the island of Borneo. It can be concluded that the allocation of capital expenditures in Kalimantan has not been so efficient that the expected increase in economic growth has not been achieved.

BUILDING ECONOMICS EQUILIBRIUM MODEL IN INDONESIA TOWARD MACROECONOMIC VARIABLES, *NEW CONSENSUS MACROECONOMICS* APPROACH

Marselina Djayasinga, University of Lampung, Bandar Lampung, Indonesia

Debt management and budget deficit in Indonesia is based on ACT No 17 of 2003 and followed by Government Regulation No 23 of 2003, in which government sets maximum limit on government debt of 60 % GDP and maximum limit on budget deficit of 3 %. This concept like Maastricht Treaty which is used in some European Countries which are facing high debt and to be default countries, which the researcher worried about. The weakness of this concept is that it does not describe when government is supposed to do the policy deficit, balanced, or surplus budget. As long as GDP increases, government debt can be increased, regardless of whether the economy needs it or not. Debt burden make fiscal space limited and it has happened in Indonesia in 1990's. It is important to build an equilibrium model to control debt and budget deficit and the important thing is it keeps fiscal sustainability and economic growth. Fiscal sustainability happened if debt is kept stable. This research is conducted by using New Consensus Macroeconomic (MKB) school to make an optimal decision through inter temporal choices. Using micro foundation and adding debt stabilizing deficit variable, Arestis model was elaborated. The result found that deficit debt stabilizer in the model for a long term, gives positive impact on output gaps, the level of prices, exchange rates, current account, and primary budget deficits in Indonesia but it has no impact on the level of interest rates. Conversely, in a short term, debt deficit stabilizer in model gives positive impact toward output gap, exchange rate, and the primary deficit budget, but it does not significantly influence interest rates, the level of price, and current account.

Keywords*: fiscal rule, fiscal sustainability, debt stabilizing deficit*

Introduction
Debt management and budget deficit in Indonesia are based on on ACT No 17 of 2003. Government set maximum limit on debt ratio at 60 % of GDP and maximum limit on budget deficit ratio of 3 %. The weakness of this concept is, debt will increase every year whether the economy needs it or not. As long GDP increase, the debt will always increase and the debt ratio is not more than 60%. In fact, GDP will always increase because the price increases every year. Indonesia has experienced this condition in 1997 In that year government debt ratio was 89 % of GDP so that restraints the economic growth is to -13, 2 %. Having those experiences, another concept of debt management is required and budget deficit able to execute the fiscal sustainability and economic stability in the long run.

One of management debt and budget deficit properties related to the steady state is debt stabilizing deficit. This is the fiscal rule concept that maintaining the level of budget deficit is stable. The concept of maintaining this stabilization of the debt is known as debt stabilizing deficit. The advantage of this policy according to Rahmani (2009) and Mitchell et.al.(1999) Mitchell *et al,* that the fiscal can be sustained. The question is if the concept is implemented in Indonesia, how can it influences the performance of the macroeconomic ? This study is a deductive research which examines the implementation of New Consensus Macroeconomics as an economic thinking in a general equilibrium. Arestis model is modified by using some

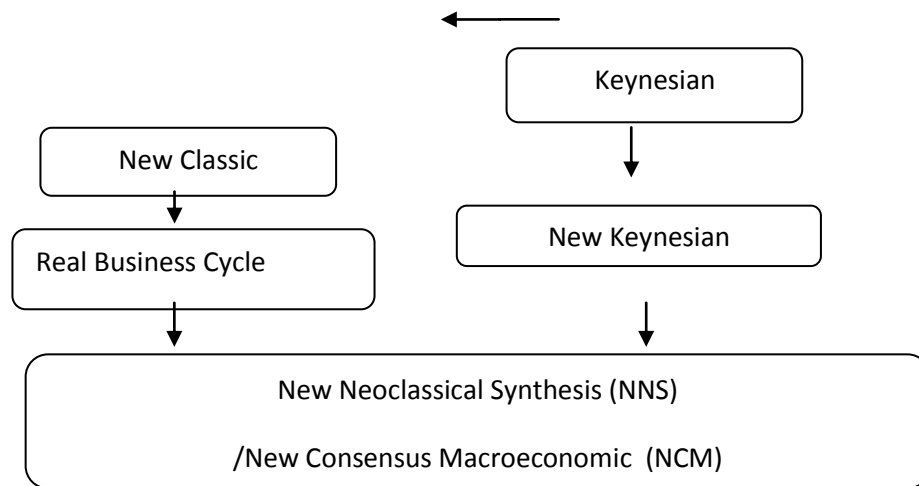
assumption, adding fiscal variable in each equation and the model to be debt stabilizing deficit model.

Theoretically and empirically it is find that the budget deficit influences the macroeconomic performance such as economic growth, inflation, interest rate, and exchange rate. Ballassone (2005), for instance, found that the elevating of budget deficit will increase the aggregate and encourage economic growth. Sargent and Wallace (1981) stated that in a long run, budget deficit will influence inflation, but not in short run. Metin (1998) found that in Turkey when budget deficit is increased it will increase the inflation and decrease the domestic revenue. Cebula (1997) described that in the long run, budget deficit will influence the interest rate. The relation between budget deficit and interest rate is observed by Beare (1978) and Laubach (2009)They found that the increase of budget deficit through the sale of bonds will increase the interest rate and Laubach (2009) also found that when the budget deficit increased 1 % the interest rate will increase by 25-30 point base in the long run. Burney (1992) and Bernheim (1988) found that twin deficit, the condition of economy experiences the increasing of budget deficit which will drive the increasing of the real domestic exchange rate. Based on some research, It is needed to conduct a research of building model against the macroeconomic performance in Indonesia.

The school of thought of this study is by utilizing the idea of New Consensus Macroeconomic (NCM). NCM is the latest development of newest macroeconomic concept that is the convergence of New Keynesian and Business Cycle Theory. Aspects which attach to the NCM relatively are in accordance with the economy in Indonesia. *First,* economic is facing imperfect market competition. *Second,* the economy in Indonesia often experiences shock particularly from supply shock, such as disaster, technology development, disturbance of goods distribution, and demonstration of workers. *Third*, agent makes inter temporal choices decision using some relevant information. *Fourth,* the economy is facing sticky price. *Fifth,* monetary policy in Indonesia implements Taylor Rule to maintain the stabilization of price through the determination of interest rate target and inflation.

The objective of this research is, *first,* to estimate the effect of implementing the debt stabilizing deficit model against the macroeconomic performance in Indonesia such as economic output gap, level of domestic price, domestic interest rate, exchange rate, current account, and budget primary deficit; *second,* to estimate the pattern of output gap response, domestic price level, domestic interest rate, exchange rate, current account, and budget primary deficit when facing shock. The contribution of this research is to give the alternative model of fiscal policy with deficit and government debt controlled. This situation can fulfill the sustainability of fiscal and economic growth in the long run.

Material and Method

New Consensus Macroeconomics (NCM)is appropriate with some assumptions established. The terminology of NCM conceptually similar to New Neoclassical Synthesis (NNS). NCM is the convergence concept between the New Keynesian and Real Business Cycle Theory. If the terminology of New Neoclassical Synthesis (NNS) is used, then the thinking tends to use Real Business Cycle Theory that more to use the rationality of decision of the economic and market actors in facing the shock of supply. If New Consensus Macroeconomic (NCM) is used, the thinking tends to use the New Keynesian that put the role of the government.


Source: Insukindro (2010)
Figure 1. New Consensus Macroeconomic Among Other Economic Thought

NCM has some properties, such as a dynamic model, representative agent, general equilibrium and empiric verification. NCM contains two main elements: optimization between time and the importance of fiscal policy derives from New Keynesian thinking as well as the decision of looking forward price setting as the core of the thinking of the Business Cycle Theory. Those two elements put into a dynamic model to describe the real economic fluctuation. The economic actors counter imperfect market competition or incomplete market countering the sticky price. This sticky price indicates that the price experiences adaptation but slow. The initial NCM is developed by Giese and Wagner (2007) by building IS-LM-IA model in a closed economy in monetary policy domination. The economy is assumed of three blocks, finance block, investment block, and consumption block and stock. Model was developing continuously by Tcherneva (2008) by adding the government expenditures variable on IS equation. Arestis model (2009) is stressed and applied to the role of fiscal policy. It is assumed that fiscal policy is seen in the magnitude of output gap equation and central bank controls the rate of inflation and exchange rate. This model consists of six equations reduced forms as follows:

1. $Y_{gt} = a_0 + a_1 Y_{gt-1} + a_2 E_t(Y_{gt+1}) + a_3[R_t - Et(P_{t+1})] + a_4(rer)t + s_1$

2. $P_t = b_1 Y_{gt} + b_2 P_{t-1} + b_3 E_{t(}P_{t+1}) + b_4 [E_{t(}P_{wt+1}) - E_t \Delta(er)_t] + s_2$

3. $R_t = (1 - c_3)[RR^* + Et(P_{t+1}). + c_1.Y_{gt-1} + c_2(P_{t-1} - P^*)] + c_3.R_{t-1} + s_3.$

4. $(rer_t) = d_0 + d_1[[R_t - Et(P_{t+1})] - [(R_{wt} - E_(P_{wt+1})]] + d_2.(CA)_{t+} d_3 E(rer)_{t+1} + s_4$

5. $(CA)t = e_0 + e_1(rer)t + e_2.Y_{gt} + e_3 Y_{gwt} + s_5$

6. $er_t = rer_t + P_{wt} - P_t$

In order to focus on fiscal policy effect, these equations are modified by adding debt stabilizing deficit variable in each equation. According to Edwards (2003), the sustainability of fiscal is condition where the government is able to maintain expenditure, tax and other fiscal policy in the long term without any doubt of any default on some of its obligations. The sustainability of fiscal is a condition where State Budget is dynamically able to conduct its function as catalyst and economic stabilyzer and able to meet various expenditure requirement or obligation safely in the long term. To set of fiscal sustainability, debt must be

maintained. According to Farmer (2002:311), debt is stable for every year if debt this year isequal to last year. Debt stabilizing deficit variable is constructed by Favero and Monacelli (2005)as follows $d_t^* = -\frac{(i_t - g_t)}{(1 + g_t)} b_{t-1}$ where d^*_t is debt stabilizing, i_t is interest rate, g_t is economic growth, and b_{t-1} is government debt last period. The equation is as follows:

$$B_t = (r.B_{t-1}) + B_{t-1} + (G_t - T_t)$$
$$B_t = (1 + r)B_{t-1} + (G_t - T_t)$$
$$\frac{B_t}{Y_t} = 1 + r\left(\frac{B_{t-1}}{Y_t}\right) + \frac{G_t - T_t}{Y_t}$$
$$\frac{B_{t-1}}{Y_t} = \left(\frac{B_{t-1}}{Y_{t-1}}\right)\left(\frac{Y_{t-1}}{Y_t}\right) \text{ dan } \frac{Y_{t-1}}{Y_t} = \frac{1}{(1+g)}$$
$$\frac{B_t}{Y_t} = \left(\frac{1+r}{1+g}\right)\frac{B_{t-1}}{Y_t} + \frac{G_t - T_t}{Y_t}$$

If $\frac{B_t}{Y_t}$ is b_t, $\frac{B_{t-1}}{Y_t}$ and $\frac{Y_{t-1}}{Y_t} = \frac{1}{(1+g)}$ is budget primary deficit, consequently government budget equation is: $\frac{B_t}{Y_t} = \left(\frac{1+r}{1+g}\right)\frac{B_{t-1}}{Y_t} + \frac{G_t - T_t}{Y_t}$.   Volume of debt depends on the payment of debt interest expense, level of the economic growth, as well as the consideration of the condition of budget primary deficit incurred. Debt interest burden is higher than economic growth as the result, government debt will increase, but if the debt interest expense is lesser than economic growth, consequently government debt ratio will decrease. For the reason, debt stabilizing deficit variable is added in all equation, IS, Inflation Adjustment (IA), Monetary Policy (MP), Exchange Rate, Current Account and also is added fiscal policy equation. Debt stabilizing deficit model has seven equation and the model in the long run are:

1. IS $y_t^d = a_0 + a_1 r_t^d + a_2 d_t^* + a_3 e_t + a_4 E[y_{t+1}^d] + \varepsilon_{1t}$
2. IA $p_t^d = b_1 y_t^d + b_2 d_t^* + b_3\{E[p_{t+1}^d] - E[p_{t+1}^w]\} + \varepsilon_{2t}$
3. MP $r_t^d = c_0 + c_1 y_t^d + c_2 E[p_{t+1}^d] + c_3 d_t^* + c_4 r^* + \varepsilon_{3t}$
4. Exchange Rate $e_t = f_0 + f_1[r_t^d - r_t^w] + f_2 d_t^* + f_3 CA_t + f_4 E[e_{t+1}] + \varepsilon_{4t}$
5. Current Account $CA_t = h_0 + h_1[y_t^d - y_t^w] + h_2 d_t^* + h_3 e_t + \varepsilon_{5t}$
6. Fiscal Policy$\bar{d}_t = j_0 + j_1 y_t^d + j_2 d_t^* + \varepsilon_{6t}$
7. Debt Stabilizing Deficit $d_t^* = -\frac{(i_t - g_t)}{(1 + g_t)} b_{t-1}$

Time series data usually face spurious regression. To avoid spurious regression, unit root test is conducted by using ADF test and Phillips Perron Test. The unit root test on error term is also used in this step to make sure that there are no problems in heteroscedasticity and autocorrelation (I(0)). In order to examine whether there is as long term relation between variables, co-integration test has to be conducted with Johansen co-integration approach. The whole variables have already the same grade of integration in first difference and are followed by building Vector Error Correction Model (VECM). VECM according to Boschi (2005) is to analyze long term and short term variables behavior in dynamic equation system model. In order to process VECM, his study used Two Stage Least Square (2SLS). The next step is continued by doing simulation with converting debt stabilizing deficit magnitude (dt) is (+/-) 1 % on each equation and assuming other variables considered constant.   The simulation result on each question response pattern is observed. Using lag optimum test, the model in the short run has four optimum lag. So, for the short run model, the debt stabilizing deficit model , are

1. $\Delta_4 y_t^d = \alpha_0 + \alpha_1 \Delta_4(r_t^d) + \alpha_2 \Delta_4(d_t^*) + \alpha_3 \Delta_4(e_t) + \alpha_4 \Delta_4(E[y_{t+4}^d]) + \alpha_5 \, ect(-4)$

2. $\Delta_4 p_t^d = \beta_1 \Delta_4 (y_t^d) + \beta_2 \Delta_4 (d_t^*) + \beta_3 \Delta_4 \{E[p_{t+4}^d] - E[p_{t+4}^w]\} + \beta_4 \text{ect}(-4)$

3. $\Delta_4 r_t^d = \gamma_0 + \gamma_1 \Delta_4 (r_t^*) + \gamma_2 \Delta_4 (y_t^d) + \gamma_3 \Delta_4 (E[p_{t+4}^d]) + \gamma_4 \Delta_4 (d_t^*) + \gamma_5 \text{ect}(-4)$

4. $\Delta_4 CA_t = \varphi_0 + \varphi_1 \Delta_4 [y_t^d - y_t^w] + \varphi_2 \Delta_4 (d_t^*) + \varphi_3 \Delta_4 (e_t) + \varphi_4 \text{ect}(-4)$

5. $\Delta_4 \bar{d}_t = \vartheta_0 + \vartheta_1 \Delta_4 (y_t^d) + \vartheta_2 \Delta_4 (d_t^*) + \vartheta_3 \text{ect}(-4)$

Where:

y_t^d is output gap

r^d is interest rate

r^* is policy interest rate

e is rupiah exchange rate against euro

p^d is domestic price level

ca is current account

d^* is debt stabilizing deficit

$\bar{d}$ is primary budget deficit

$[r_t^d - r_t^w]$ is domestic interest rate balance with the interest rate of European Union

$[y_t^d - y_t^w]$ is domestic output gap with output average in Europe Union

$(E[y_{t+4}^d])$ is output gap expectation

$(E[e_{t+4}])$ is expectation rupiah exchange rate against euro currency

$\{E[p_{t+4}^d] - E[p_{t+4}^w]\}$ is balance between domestic price expectation with average price expectation in Europe Union , $\text{ECT}(-4)_{ia}, \text{ECT}(-4)_r, \text{ECT}(-4)_e, \text{ECT}(-4)_{ca}, \text{ECT}(-4)_{dt}$ are Error correction term $\alpha_0, \gamma_0, \varphi_0, \delta_0, \vartheta_0$ are constant, $i_0 > 0$

$\alpha_1, \alpha_2, \alpha_3, \alpha_4, \beta_1, \beta_2, \beta_3, \gamma_1, \gamma_2, \gamma_3 \gamma_4, \varphi_1, \varphi_2, \varphi_3, \varphi_4, \delta_1, \delta_2, \delta_3, \vartheta_1, \vartheta_2$ are coefficient elasticity independent variable independent to dependent variable

Result and Discussion

The main problem of time series, is un-stationer data. Unit root test can be used to check it. The test founded that there are 13 un-stationer data. In order to avoid the spurious regression, the un-stationer data are differentiated to get stationer. It used ADF and PP test, the result is followed.

Table 1. Unit Root Test Approaching ADF test and PP Test.

Variable	Symbol	ADF Test		PP test

In short term model, the changing of dependent variable is not only described by the changing of the independent variable but by the in-stability of the variable of the past as well. The ECT rate and its rate are between 0 and negative 1. The ECT rate coefficient indicates are hat the speed of the adjustment of a variable is returning to its stability when countering shock. This condition indicates that the prediction that resulted from the equation system is valid, because there are between 0 and 1. The result of estimation short and long terms is in Table 4.

*significant at α=1%, ** significant at α=5%,*** significant at α=10%,

Based on the result, if debt stabilizing deficit model is implemented in Indonesia, in the long run it has positive influence on output gap, price level, and budget primary deficit but negative influence on current account. Debt stabilizing deficit does not influence significantly on interest rate and exchange rate as a monetary instruments variable. When debt stabilizing deficit is implemented in the economy, besides primary deficit increase, it will also increase the output gap. Government spending will push actual output and leaving potential output. The increasing of demand from government spending increases the level of domestic price. In the other side, policy of budget deficit in the long run has a negative effect on current account but in the long mechanism. The longer steps, the less significant the variable is Budget deficit which is financed by loan causes currency inflow, local currency will appreciate, nd it penetrate current account. The appreciation of rupiah result in the net export performance decreases. The decrease of the foreign trade will penetrate the current account deficit. It is also founded that fiscal variables are not supported well by monetary variables. It is approved when debt stabilizing deficit is implemented, it has no influence on interest rate and exchange rate. The central of bank will control interest rate by central bank rate (BI Rate) without considered budget deficit condition or other. It is a monetary rule concepts. This situation describes that there is lack of coordination between central bank (or Bank Indonesia) and Ministry of Finance as fiscal authority to achieve their target goal variables. So, the Central Bank must build a good coordination with fiscal authority to make

a better macro economic performance, economic growth, and fiscal sustainability. It also find that, fiscal policy is less effective than monetary policy, related to the time lag. The expectation on the domestic goods price encourages instantly when the government just informs the media to increase civil servant salary. When the expectation is too high, this expectation tends to encourage the economic actors to purchase goods real time that may trigger the increase of the goods price. The increase of the goods price will encourage Central Bank (Bank of Indonesia) to play its role in stabilizing the price through interest rate policy that the market interest rate will increase. When the actual price increases, central bank will make some effort to hold the increase of this goods price by influencing that the interest rate decreases until the aggregate offering shifted to the right. To make a fiscal sustainability , it should be considered as the implementing of Fiscal Policy Rule.

The short run analysis has the same form and sign with the long run. When debt stabilizing deficit model is implemented, it has positive influence on output gap and primary deficit but negative influence on current account. The main differences is on price level. If debt stabilizing deficit model is implemented, domestic price level is not a significantly influence. Fiscal policy on debt stabilizing deficit model has no influence on domestic price and this finding is understandable. It indicates that sticky price is in the economy in the short term.

Coefficient rate in the interest rate equation statistically significant at the rate 1.2187. This ECT rate indicates that interest rate equation is shaped from interest rate policy. Theoretically when the interest rate gap enlarges as the result of that the interest rate is increased continually compared to the average interest rate in the European Union countries, the capital will flow into the country that in the long term will strengthened the rupiah rate (appreciation), yet from the result of the research indicates the other way around. Floating exchange rate system used Indonesia is very much influenced by the world condition. For the investors, other than the consideration to obtain yield from the long term investment in a country, foreign investors will consider the external factors in a country as well. External factors are mentioned such as security and convenience in doing business, legal certainty, facility are mentioned, and infrastructure licensing. As long as those factors are not fulfilled, no capital flows into the country. The implication of the debt stabilizing deficit has influence on rupiah exchange rate. When the government must pay its debt obligation, the government will purchase more foreign currencies. The demand on the foreign currencies is not only needed by the government but also the speculators. The increase of demand foreign currency causes depreciation in rupiahs. Depreciation in rupiahs causes negative of current account. This finding is in accordance with the theory and the assumption of the research.

Exchange rate has negative effect on the output gap. It means that if the rupiah exchange rate against the foreign currency is experiencing appreciation, this condition will result in decreasing ouput gap. The appreciation of exchange rate in the long term significantly will increase the production cost, particularly manufactured production industry in Indonesia that still using imported raw material. If in the long run, when cost of production is increased, the national production level will decrease. This condition resulting the output gap decreased. The expectation toward the output gap increases 1 % this will encourage the increasing gap by of the actual output gap by 1.11 billion IDR and on the other hand, when the expectation toward the output gap decreases then the actual output gap will decrease.

The expectation of the exchange rate has a positively significant influence on rupiah exchange rate on euro currency. The increase of the exchange rate expectation will encourage the actual exchange rate to follow the same direction of its expectation. In the long term there is negative relationship between domestic output gap and average output level in the European Union countries toward the current account in Indonesia. When the output gap is

getting bigger and away from the potential output, the goods price tends to be even bigger. As the recovery economic crisis influence does not complete that spread in some parts of developed country and Indonesia, this resulting the domestic demand on imported goods is not automatically significant. Yet, in the short term it is the opposite. In the long term, debt stabilizing deficit has positive influence on budget primary, output gap has relationship with budget primary deficit. In the short term when the output gap increases by 1 trillion IDR, this will result in the increase of demand, which primary deficit will increase the deficit by 131%. This condition indicates how important is the fiscal policy to address the requirement of financing because of the increase of demand. From the simulation, it indicates that when the shock occurs in the form of adding and subtracting of the magnitude of 1 % of debt stabilizing deficit from data base line debt stabilizing deficit, response pattern of output gap equation, price, interest rate, exchange rate, current account, and budget primary deficit have the same pattern with response pattern before simulation is conducted which is return to the equilibrium. If debt stabilizing deficit is added 1 % those five equations indicate that the curve position is below the curve before simulation is conducted. When the magnitude of debt stabilizing deficit subtracted 1 % base line, curve position is above the curve position before simulation is conducted where the its coefficient higher compared to simulation earlier for all equations. It means that it is important for government to keep the debt stable.

Conclusions

First, if debt stabilizing deficit model is implemented in Indonesia, in the long run it has positive influence on output gap, price level, budget primary deficit but negative influence on current account. Debt stabilizing deficit does not influence on interest rate and exchange rate as a monetary instrument variables. In the short run, fiscal policy does not influence significantly on domestic price level, interest rate, and exchange rate. These variables are neither significant in long rung nor short run because these variables are controlled by Central Bank. So, the Central Bank must build a good coordination with fiscal authority to make a better economic performance, economic growth, and fiscal sustainability. S*econd*, sticky price happened in economic phenomena in Indonesia. *Third,* the inflation equation is the fastest equations in adjusting to the new equilibrium. It happened because inflation rate or monetary variable is directly controlled by central bank. In the other side, fiscal equation is the slowest equation in adjusting to the new equilibrium. Fiscal policy face the *policy lag*, it means if fiscal policy is implemented, it need a long time to execute the policy because new fiscal policy must be approved by legislative. It is the reason why fiscal policy is less effective than monetary policy. *Fourth,* all expectation variable have a positive influence and significant on each represented variables, such as actual price level, actual exchange rate, and output gap. So, in order to make a good macroeconomics and policy, expectation variable must also be considered. *Fifth,* conducting simulation on the magnitude of debt stabilizing deficit, it is indicated that the increasing of debt stabilizing deficit causes the economic performance to be lower than before. It responds that it is important for government to implement counter cycle strategy when economy is growing to keep debt stabilizing, but it still needs further discussion.

THE IMPORTANCE OF ASMAUL HUSNA'S VALUES AND ETHICS TO DEVELOP ETHICAL LEADERSHIP IN THE ACCOUNTING PROFESSION

Doni Sagitarian Warganegara, University of Lampung, Indonesia

Abstract

Religion and Spirituality play important roles in defining ethics and culture in many parts of the world and can have a significant effect on business practice. Under the religion of Islam, the Islamic holly book, Al-Quran, provides guidance with respect to issues to run the human conducts and where all ethics are coming from . The word of Asma Ul Husna is also coming from the Al-Quran. It introduces all values and characters of Asma Ul Husna which is defined as the beauty names of God.

When we see the business practice, from the beginning of the twenty-first century, there are many violations of the code of professional conduct by especially for accounting firms which will lead to a loss of public trust on public accounting profession. It was also plagued with extensive, evasive, and disheartening the Indonesian businesses and political leadership failures in other arena.

In response to these ethical leadership failings, renewed interest in developing accounting more professionals with strong ethical principles and ethical leadership behaviors emerged. In many firms, training and development in ethical behavior from the leadership training companies, are now at the forefront of communications and professional development efforts. The Asma Ul Husna has been trained also to know Who and What The God is. Now, Indonesia is still seeing situations to keep and maintain all principles to avoid the failure. From these principles, it will create key factors of imagery accountant profession determined by Trust from citizens to use accountant services.

In response to the call for leaders who are ethical and moral, this research study examined a model of ethical values leadership in Indonesia and its impact on leader effectiveness for leaders among the accounting profession and other professions, which is knowing the Asma Ul Husna and choosing and practicing each characters to their firms. This research is willing to know after each characters of Asma Ul Husna implemented, are the firms able to get with strong ethical principles?, Will it create ethical and transformational leadership after learning the Asma Ul Husna? and , also Does it have significant contributions leader effectiveness to implement accounting ethics cultures in any countries?

Asma Ul Husna is based on the premise of Islamic guidelines and principles, which can be universally applied and customized by any country which is belief about Islam.

Keywords: Asma Ul Husna Values, Accounting Ethics, Culture, and Leadership

The Model

This study attempts to contribute to the leadership and accounting literature by proposing and empirically testing a multifaceted model for explaining the Nobel Values effectiveness of God Spot to create antecedents of effective leadership in accounting profession. The proposed model examines the contribution of ethical leadership behavior in the evaluation of the effectiveness of a leader. (Avolio & Gardner, 2005; Brown & Trevin˜ o, 2006; Brown et al., 2005) while also considering the potential moderating influences of subordinate expectations for ethical leadership and the perceived ethical climate of the organization. Analysis of these moderating variables and the context in which leaders and subordinates are

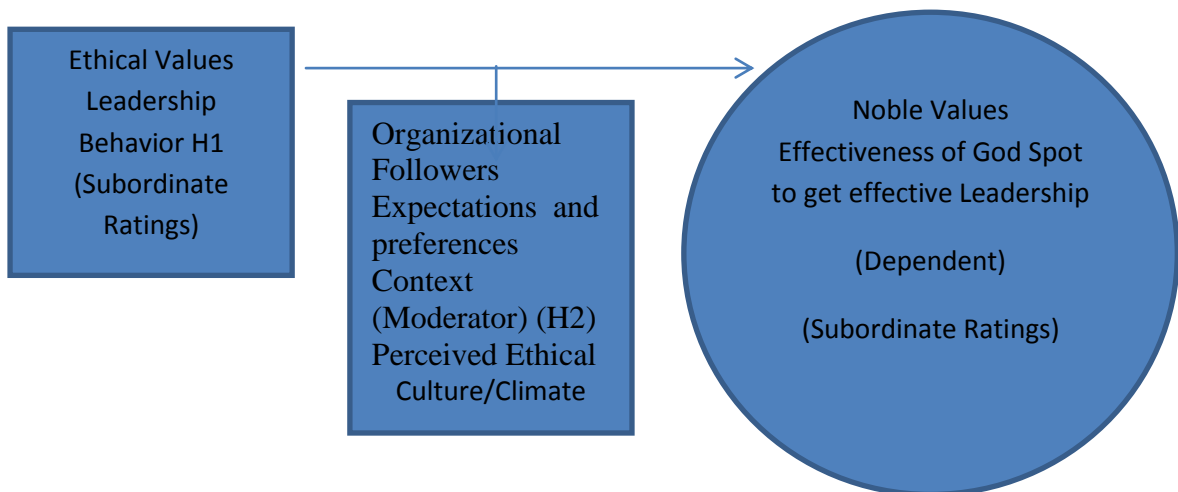
submersed are essential to understand the impact of ethical values leadership and the true effective Nobel Values of God Spot to create antecedents of effective leadership. (De Meuse, Dai, & Hallenbeck, 2010; Lord & Maher, 1993; Norton, 2010; Yukl, 2010; Yukl & Mahsud, 2010). This multifaceted model is presented in Fig. 1.

The model is adaption from accounting literature, but the writer has found the other concepts to create new things to contribut the leadership effectiveness from the Nobel Values effectiveness of God Spot.

Hypotheses

Based on variable relationships in the multifaceted model of Nobel Values effectiveness of God Spot to seek te leader effectiveness, two research questions are presented for consideration in this study:

1.	In a univariate model, to what extent does ethical value leadership predict Noble values Effectiveness of God Spot?

2.	Do the organizational follower expectations and preferences for ethical behaviors and the perceived ethical climate of the organization moderate the relationship between ethical values leadership behavior and Noble Values Effectiveness of God Spot?


Survey Method
Data Collection Procedures

To test the hypotheses, data were collected to (a) measure the ethical values leadership behaviors in a leader; (b) measure the transformational leadership behaviors in a leader after practicing the Asma Ul Husna Characters; (c) evaluate other control variables, including the number of years the subordinate has worked for the leader, the number of years subject has worked for the organization, and the subordinate's gender; (d) assess the subordinate's evaluation of noble values effectiveness of God Spot to get the effective leadership; (e) assess the superior's evaluation of of noble values effectiveness of God Spot to get the effective leadership; and (f) examine if the follower's expectations of ethical leadership, and an organizational culture had a moderating influence. Detailed procedures were as follows.

Sample

The data were collected from individuals who work for a large regional certified public accounting firm in Jakarta and Lampung, Indonesia. The majority of the professionals are from public accounting firms in the region. It provides the calculation for the sample. The

actual sample size was determined from the number participants will be fulfilled minimum 100 Participants using PLS models analysis.

Online Questionnaire

The investigation utilized online questionnaires to collect data from subjects. The subjects were asked to evaluate a specific direct supervisor or leader of their organization. They were asked to respond to all questions describing the attributes of the focal leader. An email will be sent to each individual within each organization that explained the survey, encouraged participation, assigned a specific leader to be evaluated, and provided a link to the online survey.

Participation Request

The individuals were directly asked if they would be willing to participate. Subjects were informed that answers would be confidential and anonymous; the questionnaire would be using online and tabulated by an independent third party. The survey will be ensured that no one responded twice

CORPORATE SOCIAL RESPONSIBILITY MOTIVES : PATH IN CREATING SOCIAL AND BUSINESS PERFORMANCE

Tengku Ezni Balqiah, Universitas Indonesia, Indonesia
Nurdin Sobari, Universitas Indonesia, Indonesia
Elevita Yuliati, Universitas Indonesia, Indonesia
Rifelly Dewi Astuti, Universitas Indonesia, Indonesia

Abstract

Various forms of CSR activities will deliver different values for different parties associated with those CSR activities, because has perceived that it was driven by different motives. This empirical study examines the role of health CSR activities–CSR activities concerning health and well-being of mothers and children–in creating social and business performance. The survey conducted in five locations in Indonesia, using 450 respondents who are the customers of three companies-as object of research- that operate in Indonesia. Using multiple regression analysis, the result shows that different motivations will be generated from CSR activities that had been conducted by three brands, and has different path to influence social and business performance.

Introduction

The advancement of technology and improvement in economic conditions affect the quality of life and drive the speed of changing patterns of consumption, which in turn will have impacts on the environment. Companies are demanded to emphasize the importance of evaluating performance through the parameters of economic prosperity, environmental quality, and welfare of the community, known as the People-Planet-Profit. The implication of ethical responsibilities is that companies must operate according to the high standards, norms, and expectation of their stakeholders.

Their responses by doing philanthropic activities to show that businesses are-in fact-are form of good corporate citizenship. Firms should act in socially responsible ways and embrace Corporate Social Responsibilities (CSR) as a key component of their overall strategy (Kotler and Lee, 2005). In the past two decades, corporate social responsibility (CSR) has emerged as an important construct in both academic literature and business practices (Fatma and Rahman, 2015)

Corporate Social Responsibilities (CSR) activities have the potential needed to create a strong bond between companies and their stakeholders, including customers and society (Peloza and Shang, 2011). Barnett (2007) stated that the ability of CSR activities to create values for companies depend on their ability to create a positive relationship with the companies' stakeholders. Not only that CSR activities can create profits, they also have impacts on social and environmental issues (Peloza dan Shang, 2011) CSR and the issue of sustainability are the two common themes repeatedly used in the discussion of economic contributions, social, environment, and the consequences of business activities (Torugsa, O'Donohue, dan Hecker, 2013).

The different forms of CSR activities will result different values for all interested parties that involved. These CSR activities have different impact on companies' profits, even to the value of those companies (Malik, 2015). Liu, Wong, Shi, Chu, and Brock (2014) have stated that three different forms of CSR activities will improve perceptions on the quality of a brand, which in turn will make the brand more preferable. Some researchers have also shown that CSR activities have impact on consumers' behavior (Maignan and Ferrel, 2004; Luo and Bhattacharya, 2006, Du, Bhattacharya, and Sen, 2007). CSR will build an image of a company, which in turn will improve the customers' loyalty (Plewa, Conduit, Quester, and Johnson, 2015). CSR activities are not only social activities which will burden companies' budget. Satisfied and loyal consumers are intangible assets that will produce income in the future. Therefore, CSR activities are social activities which can also be an investment for the company.

The main objective of CSR activities is to maximize benefits for the social welfare of societies, which also shows the companies' responsibility to the effects of business activities on consumers, employees, shareholders, and the rest of the society in which the companies operate. (Narwal and Singh, 2013). Companies must engage in CSR activities to avoid the negative image and mistrust from stakeholders.

Previous research in Indonesia have shown that CSR activities of Pertamina, Toyota, Sampoerna, Lifebuoy, and Aqua-Danone affected the quality of life of the recipient society, and also the customers' behavior. (Balqiah, Setyowardhani and Khairani, 2011). Another research has shown that there is a positive, significant relationship between CSR motives and children's quality of life (Balqiah, Setyowardhani, Daryanti, Mukhtar, and Khairani, 2012), and society's quality of life (Balqiah, Astuti & Yuliati, 2013These researches have proven the impact of CSR activities on society and less fortunate children, who are also stakeholders of a company.

To continue previous researches, this research is conducted by choosing companies which conducted some CSR activities and has committed in building a better quality of life for society for several years. Authors choose CSR activities directed at children's health, because children as future generation, and future customers. The purpose of this study is to identify what is the customer perception toward CSR motives, and how it could influence the quality of life (represent social performance), and attitude toward brand (as business performance), further increase customer loyalty (as business performance) in a competitive market situation.

In the next section, this paper will explain about some construct and literature review as foundation to develop a conceptual framework. Further, it discusses the methodology adopted in this study and discussion of result followed by the conclusion and, finally, a discussion on future research and research implications.

Literature Review
A. Corporate Social Responsibility
According to Vidaver-Cohen and Brønn (2015), Corporate responsibilities involve three principal components: conducting business transactions in a sincere and transparent fashion, considering the welfare of all organizational constituents in managerial decisions, and seeking to exert a positive impact on society and the environment beyond minimal requirements of the law Maignan and Ferrell (2004) have shown the importance for a company to expand the scope of their social contributions to stakeholders other than customers through various social initiatives. Some of a company's stakeholders are directly involved in production activities, such as employees and managers, and some other are outside the

scope of production, such as investors and partners. Other stakeholders are the parties outside the companies that become involved with the company or various reasons. The examples of this type of stakeholders are customers and local communities.

Kotler and Lee (2005) defined CSR as the commitment to improve the community well-being through the chosen business activities which contributes companies' resources. The companies' social initiatives can be seen from the companies' main activities to support social causes and to fulfill the commitment to do CSR. There are various forms of CSR activities that companies can choose from. The types of this social initiative, according to the two authors are:

a. Cause Promotions: Companies provide funds or other resources to increase awareness and concerns on a social issue or to support fundraisings, participations and mobilization of volunteers for that particular cause.

b. Cause-Related Marketing: Companies commit to contribute or donate a portion of their revenues for a particular cause based on product sales.

c. Corporate Social Marketing: Companies support fundraisings or start a campaign to promote changes in behavior to improve the public health, safety, environment, or well-being in general.

d. Corporate Philanthropy: Companies make direct contribution to charities or special causes in the forms of grants, donations or services.

e. Community Volunteering: Companies support and encourage their employees, intermediaries or other partners to voluntarily donate their time to support social or community organizations and activities.

f. Socially Responsible Business Practices: Companies adopt business practices and make special investments to support social causes in order to improve community well-being and to protect environment.

B. *CSR Motives*

Many CSR activities are driven directly or indirectly by stakeholders (Kiessling, Isaksson, and Yasar, 2015). Various forms of CSR activities will deliver different values for different parties associated with those CSR activities. CSR activities will have impacts on corporate profits and the value of a firm (Malik, 2015; Gonzalez-Rodriguez, Diaz-Fernandez, and Simonetti, 2015).

Different individuals and different stakeholders may perceive CSR practice differently (Story and Neves, 2014). Individuals use context and environment to make attributions concerning the CSR motives. Companies that perform many activities related to CSR have some background derived from different strategies, such as reactive or proactive strategy (Groza, Pronschinske, and Walker, 2011). A reactive strategy is implemented in an effort to respond or neutralize negative issues related to the company, whereas a proactive strategy is implemented before the emergence of these negative issues. The reasons for selecting a CSR strategy, of course, will give different effects on the formation of consumer attitudes towards CSR activities, brands and companies doing CSR. A research by Groza *et al* (2011) has shown that a proactive strategy of CSR generates more positive attitude compared to a reactive strategy. Furthermore, this positive attitude can encourage higher purchase intentions of the target customers and increase the loyalty of existing customers.

According to Ellen, Webb, and Mohr (2006), there are four motives which becomes the reason to carry out CSR activities. The first factor is the value-driven attributions. These attributions produce the motive to care about the cause of CSR activities. The second factor is the stakeholder-driven attributions. These attributions reflect responses to the expectations of

different stakeholders. The third factor is the egoistic attributions, which bring the firms' participations to more prominent self-centered reasons (e.g., taking advantage of the cause). The fourth factor, strategic attributions that relate the firms' participation to self-centered goals reflecting typical business objectives (e.g., making a profit). Egoistic-driven motives deal with exploiting the cause rather than helping it. Strategic-driven motives support the executives in attaining business goals (e.g., increase market share, create positive impressions). Stakeholder-driven motives are related to the support of social causes solely because of the pressures from stakeholders. Finally, values-driven motives are related to benevolence-motivated giving (Vlachos, Tsamakos, Vrechopoulos , and Avramidis, 2009). Executives may contribute to CSR for various reasons. CSR activities are driven by two main motives of the executives namely extrinsic and intrinsic motives (Graafland and Schouten, 2012). Extrinsic motives are the financial motives, in which CSR must contribute to the long term financial performance of the company. Intrinsic motives are the non-financial ones, such as managers' personal values and beliefs that can be an important motivating factor for CSR, particularly in Small and Medium Enterprises (SMEs) or even in larger companies. The other intrinsic motive is altruism. Executives may contribute to CSR because they enjoy helping others or want to contribute to the others' prosperity.

C. *Quality of Life*
Jozefiak, Larsson, Wichstrøm, Mattejat, and Ravens-Sieberer (2008) defined quality of life as a subjective assessment related to well-being in terms of physical and mental health, self-esteem, perception of personal activities (playing or hobby), and perceived connection with friends and family as well as school. One instrument measuring the children quality of life is KIDSCREEN, which was based on the definition of quality of life as a multidimensional measure that includes physical, emotional, mental, social, and behavioral components related to well-being and function, as perceived by children or other individuals (Ravens-Sieberer, Herdman, Devine, Otto, Bullinger, Rose, and Klasen, 2014). KIDSCREEN dimensions consist of physical well-being, psychological well-being, moods and emotions, self-perception, autonomy, parent relations and home life, social support and peers, school environment, social acceptance (bullying), and financial resources.

The corporate social responsibility supports the belief that businesses can work together with governments and other stakeholders to promote a better life. CSR is the commitment of businesses to contribute to sustainable economic development, to work with employees, their families and the local community, and to improve the overall quality of their lives (World Business Council for Sustainability Development, 2004). CSR activity should be directly related to the provision and delivery of products that minimize negative impacts for consumers. CSR may be conducted with the purpose of improving the lives of the public at large, who is also one of the stakeholders of the company.

D. Brand Attitude
Consumers' attitude towards brands is the consumers' way to attach the brand in their memory that affects their buying behavior (Low and Lamb, 2000). This attitude is significant in marketing because it will form a perception in consumer behavior.

Attitude toward brand in multi attribute model is a function of some relevant attributes and benefits that describes the functional and symbolic benefit of one brand (Keller, 2008). Functional benefit of a brand describes the intrinsic advantage of product or service, while the symbolic benefit describes the extrinsic advantage of a product and relates to the social

actualization needs. Keller (2008) stated that the symbolic benefit is relevant to symbolic products.

E. Customer Loyalty

Customers have varying levels of loyalty to the brand, the store, and the company (Kotler and Keller, 2011). Loyalty is a commitment to buy back or re-subscribe to the preferred product or service in the future although it may be influenced by situational factors and marketing efforts which lead to switching behavior (Oliver in Kotler and Keller, 2011). Customer loyalty is defined as" a deeply held commitment to rebuy or repurchase a preferred product/service consistently in the future, thereby causing repetitive same-brand-set purchasing, despite situational influences and marketing effort having the potential to cause switching behavior " (Oliver, 1999, p. 34)

Dick and Basu (1994) concluded that loyalty is associated with behavior, which is not enough to explain how and why the brand loyalty is developed. In the concept of loyalty, Dick and Basu (1994) also suggested to consider the attitudes and conditions that direct consumers to the buying behavior. One of the loyalty consequences is word of mouth, which is defined as the willingness of consumers to communicate their product experiences to other. Reich held (1996) in Gupta and Lehmann (2005) stated that the more customers have relations with company, the more profit that company will get.

Methodology
Research Model

CSR initiatives towards society lead to the creation of added value not only for the society but also for the company. These initiatives reflect a brand personality that is in line with altruistic values, therefore might resulted in the connections and identification states with the customers (Sen, Bhattacharya, & Korschun, 2006). Customers are known to specially notice the more tangible aspects of companies that might influence their buying decisions directly, such as quality, innovation, compliance to standards, guarantees and other information provided about the product (Maignan and Ferrell, 2004). As a result, customers usually respond more positively to customer-centric initiatives than to other types of the CSR motives.

Maignan and Ferrell (2004) also presented a theoretical framework that demonstrates how important it is for companies to expand the contribution of their social activities not only to customers but also to other stakeholders through various social initiatives. Some of the stakeholders are directly related to the production activities of the company (e.g. the employees and managers), and some of the stakeholders are indirectly related and only

supporting some activities of the company (e.g. investors and partners). Other stakeholders are outside parties which became involved with a company for various reasons (e.g. customers, regulators, and local residents). The local residents can be actively supporting the CSR activities of the company or they may benefit directly from the CSR activities.

Companies use CSR activities to build and strengthen the relationship with their multiple stakeholders, such as consumers, suppliers, competitors, investors, etc (Raghubir, Roberts, Lemon, and Winer, 2010). When CSR activities target society, the goal is usually to improve education, health, welfare, happiness, and stability of the society. The success of such activities can be measured by using the Quality of Life indicators, namely economy, social, health, subjective assessment on happiness and life satisfaction (Sirgy, Yu, Lee, Wei, Huang, 2012).

The conceptual model of this research is intended to evaluate the relationship between health CSR and customers' loyalty and also perceived quality of life. This model is built through an extensive literature study. The effects of CSR on general quality of life is in accordance with previous studies (Sirgy and Lee, 1996; Wilkie and Moore, 1999; Sen, *et al*, 2006; Castaldo, Perrini, Misani, dan Tencati, 2009; Raghubir *et al*, 2010; Balqiah *et. al*, 2011, 2012). The main difference between previous studies and this research is the constructs of attitude towards brand, and the type of CSR activities.

Consumers' perceptions of companies' motives for engaging in CSR influence their evaluation and responsiveness to CSR activities (Becker-Olsen, Cudmore, & Hill, 2006; Ellen *et al*, 2006; Vlachos *et al*, 2009). Consumers distinguished between others-centred, self-centred, and win–win motives. Most consumers assumed companies have mixed motives for their CSR activities. The research model is depicted in Figure 1.
Figure 1: Research Model

Hypothesis

Marin, Cuetas, and Roman (2016) explained about the possibility that CSR activities will create positive or negative customer's perception toward the company. Becker-Olsen *et al* (2006) also had some arguments that there are various motivations of consumer responses to CSR actions. When motivations are considered to be profit related, attitudes toward the firm are likely to be negative; however, when motivations are considered socially motivated or society/community focused, attitudes are likely to be enhanced.

Ellen *et al* (2006), also identify four different motivations that had different impact on customer's responds. Egoistic motives related to exploiting the cause rather than helping it, strategic motives that support the attainment of business while benefiting the cause, stakeholder-driven motives related to supporting social causes solely because of pressure from stakeholders, and values-driven motives related to benevolence-motivated giving. When motivations are considered firm serving or profit-related, attitudes toward firms are likely to

diminish; when motivations are considered socially motivated, attitudes toward firms are likely to be enhanced (Becker-Olsen *et al*, 2006).

In this paper, the author investigates specifically CSR activities involve with children's health. When customers perceived the CSR activities were implemented to focus on society and to give to society, especially children, it will create more positive attitude to the brand. Otherwise, if customer perceived those activities are only concerned about business aspects, such as sales, and profit, it will create negative attitude.

Hypothesis 1: CSR motives will influence Brand Attitude

According to Sheehy (2014), there is a perception from political participants that mention CSR as a means to advance particular preferences with respect to corporate and economic policy of distinct political philosophies. On the other side, customers increasingly expect business to consider human rights in their employment practices and demonstrate stewardship toward the natural environment, therefore companies around the globe suggests that managers no longer see social engagement as ancillary to economic performance but rather as an integral component of corporate strategy on which they will be judged by their constituents (Bronn and Vidaver-Cohen, 2009). Social Initiative in the business context is defined here as any program, practice, or policy undertaken by a business firm to benefit society. However, customers distinguished between other centered, self-centered, and win–win motives, and most customers assume companies have mixed motives for their CSR activities (Öberseder, Schlegelmilch, and Murphy, 2013). If CSR's motives are sincere on giving back to society by providing social projects for people in need (e.g. children as vulnerable stakeholder), it could increase their quality of life, vice versa.

Hypothesis 2: CSR motives will influence Child's Quality of Life

Concerning the four-type of CSR activities of the firm (Carroll, 1991, 1999), there must be social activities that focus on supporting core business activities in relation to all stakeholders. Two-sided coin of CSR activities, one side as social activities that "give" to society, and the other side is to create competitive advantage (Gupta, 2002; Hult, 2011; Hunt, 2011; Huang and Rust, 2011). Bronn and Vidaver-Cohen (2009) discuss about instrumental motives of CSR which revolve fundamentally around managerial beliefs that engaging in social initiatives can have a direct impact on profitability. It can be concluded that the performance of the company in social activity will have an impact on the performance of the company in business. Creating a good quality of life for children who are the target of CSR activities will surely build a positive attitude of customers towards the brand. Based on this reasoning, we propose the following:

Hypothesis 3*: Child's Quality of Life positively influence Brand Attitude

Corporate Social Responsibility (CSR) creates strong relationships to the stakeholder, enhance profit, and also has impact to social and environment issues (Peloza dan Shang, 2011). Social exchange is based on the expectation of trust and reciprocation, as the exact nature of the return and the time frame is left unspecified (Lii and Lee, 2012). When company engages in a CSR activity, consumers may perceive the company to be altruistic, which lead to more favorable attitudinal and behavioral evaluation of the same company. We propose here that these results shed some light on this issue of when brand attitude, that

reflect the business capabilities, and child quality of life that reflect social initiative, have a joint impact to the customer perception and loyalty. We expect that perception about a value of company offering (brand) and quality of life will positively influence customer's loyalty to the company's products. Based on this reasoning, we propose the following:

Hypothesis 4: Child's Quality of Life positively influence Customer Loyalty
Hypothesis 5: Brand Attitude positively influence Customer Loyalty

Data

Data were collected by cross-sectional survey at 5 area/cities: Makassar and Kupang (representing eastern part of Indonesia) and Jabodetabek, Padang, and Surabaya (representing western part of Indonesia), using self-administered questionnaires from 450 respondents (30 respondents from each brand and area) that were selected by purposive sampling. The objects are AQUA-DANONE (mineral water), PERTAMINA (lubricant product), FRISIAN FLAG INDONESIA (milk). The background to study these firms are the heterogeneity of health CSR activities that they do to support society, (eg. AQUA supply clean water for children; PERTAMINA help children and mothers' healthy lifestyle; and FRISIAN FLAG induce children to drink milk and lead a healthy lifestyle). These firms are big and well-known companies, and have done continuous health CSR activities during the past years.

Questionnaire development is done by conducting a study of the literature and previous studies associated with each construct. The questionnaire consists of 33 questions with six points liker scale regarding five research constructs: 16 questions for Health CSR, 8 questions for Quality of Life, 3 questions for Brand Attitude, and 6 questions for Loyalty. Before the main survey, authors conducted a pretest using 30 respondents to ensure reliability and validity of the constructs. The pretest was done to refine the questionnaires by reducing response error. Furthermore, after 450 questionnaires were collected, a factor analysis and multiple regression analysis with SPSS 22 were used to test the hypotheses at $\alpha=5\%$.

Result and Discussion

The sample included 45.1 per cent male and 54.9 per cent female, 55.1 per cent customers in the sample were under 25 years, 29.6 per cent between 25 and 39 years and 13.3 per cent over 40 years. Regarding education, 68.3 per cent lower do not have bachelor degree, 31.7 per cent bachelor and higher.

A. CSR **motives**

There are three (3) dimensions of Health-CSR exploratory factor analysis that represent three (3) motives of companies to conduct CSR activities, as perceived by their customers (see Table 1). The three motives are business, moral, and stakeholder motives. The name of each motives (factors) represented the items in each factors. This research shows that business and stakeholder orientations are negative, and moral is positive motive. Business motive concern financial benefit, that is economic performance. Stakeholder motive is reactive to stakeholder expectation, that is strategic consideration. Business and stakeholder motives represent strategic and egoistic motives that are perceived by customers as negative motives. This is similar with the perception of internal stakeholders who assumed that companies only executed CSR activities because they are forced by their employees and shareholders. This is not perceived as sincere and considered as negative motives. This motive might be perceived as institutional motives for social initiatives, suggesting that companies engage in social initiatives primarily due to institutional pressures

(Bronn and Vidaver-Cohen, 2009). On the other side, moral obligation is perceived as a positive motive, because this motive shows that companies has concerns about social aspects of the business.

Table 1: Loading Factor of CSR's motives

Variables	Factors		
	1	2	3
Moral responsibilities		.65	
Care to society		.78	
Positive benefit beliefs		.76	
It easy for customers involved in		.65

Meet the customer's expectation			.60
Respond to employee's expectation			.84
Respond to shareholder's expectation			.77
Respond to society's expectation			.61
Get benefit through collaboration	.70		
Support business activities	.74		
Minimize income tax	.67		
Publicity'	.77		
Get more customers	.87		
Retain customers	.85		
Increase profit	.89		
CSR's MOTIVES	**Business**	**Moral**	**Stakeholder**

B. The Effect of CSR on Brand Attitude

There are difference direction how CSR motives could influence Brand attitude. The result in table 2 (Model 1).

Table 2: Mutiple Regression Analysis

Indpendent Variables	Model 1 : Brand Attitude as Dependent	Model 2 : Child-QOL as Dependent	Model 3 : Loyalty as Dependent
CSR Moral	0.378^*	0.351^*	
CSR Stakeholder	0.056	0.111^*	
CSR Business	-0.115^*	-0.053	
Child-QOL	0.165^*		0.648^*
Brand Attitude			0.262^*
Rsquare	**0.185**	**0.108**	**0.395**

Moral motives that represented positive motive increase Brand Attitude, while Business motives that represented negative motive decrease Brand Attitude. This result in accordance with Ellen *et al* (2006) that mention positive motives will positively impact on customer

perception, and negative motive can decrease it. Refer to Bronn dan Vidaver-Cohen (2008), negative motives as an instrumental motives, the reason why company conducted social initiatives because it concern to business performance, such as brand attitude. It can be seen on table 3, the highest mean of Moral Motives is Pertamina (4.79), and the highest mean of Stakeholder and Business Motives are Aqua (4.17 and 3.82), while the highest mean of Brand Attitude is Aqua (5.03). All companies have high mean Brand Attitude (larger than 3). Despite both motives has impact on Brand Attitude, Moral Motives has stronger impact on Brand Attitude than Business Motives. Therefore Hypothesis 1 is supported.

Table 3: Mean of Constructs in Each Location

Dimensiona (Motives)	Firm	Location					TOTAL
		Jabodetabek	Padang	Surabaya	Makasar	Kupang	
CSR_Moral	Pertamina	4.75	4.69	4.72	4.53	5.25	4.79
	Frisian Flag	4.45	4.81	4.77	4.46	4.82	4.66
	Aqua	4.95	4.83	4.59	4.56	4.89	4.77
CSR_Stakeholder	Pertamina	4.21	3.67	4.16	4.41	4.08	4.11
	Frisian Flag	3.66	3.87	4.06	4.12	3.87	3.91
	Aqua	4.64	3.78	3.88	4.03	4.48	4.17
CSR_Business	Pertamina	4.06	3.46	3.98	3.79	3.53	3.76
	Frisian Flag	4.38	3.75	4.32	2.77	3.57	3.76
	Aqua	4.43	3.72	4.11	2.79	4.06	3.82
Brand Attitude	Pertamina	4.61	4.62	4.69	4.24	5.20	4.67
	Frisian Flag	4.49	4.82	4.58	5.08	4.97	4.79
	Aqua	5.06	5.03	4.70	4.98	5.40	5.03
Child-QOL	Pertamina	4.18	4.30	4.20	4.11	4.48	4.25
	Frisian Flag	4.21	4.70	4.45	4.85	4.54	4.55
	Aqua	4.22	4.42	4.03	4.50	4.66	4.37
Loyalty	Pertamina	4.18	4.36	4.12	3.88	4.77	4.26
	Frisian Flag	3.66	4.56	3.69	4.14	4.48	4.11
	Aqua	4.72	4.42	4.16	3.91	5.35	4.51

This result confirm Öberseder, Schlegelmilch, and Murphy (2013), CSR is multifaceted construct. It has more than one customer's perception toward CSR activities. It this result, there 3 dimensions of CSR that reflected 3 motives which is combination of positive and negative motives. Further, Customers' perceptions of the underlying motivations for the act may drive their evaluations of the firm and impact beliefs, attitudes, and intentions (Becker-Olsen, *et.al*, 2006). In terms of positive motives in the attribution process of consumers' reactions to CSR action, consumers are likely to accept attributions because they consider companies to be acting with sincere and benevolent intentions, care, and tend to view CSR activities as derived from companies' moral behaviour (Vlachos *et al*, 2009). Corporate social responsibility can bolster perceptions of product performance and that this effect is more pronounced when consumers believe that a company's motivation for engaging in prosaically behavior is benevolence rather than self-interest (Chervev & Blair, 2015).

C. The Effect of CSR on Child-Quality of Life
Two type of CSR motives could influence Child-Quality of Life positively (Table 2, Model 2). Moral and Stakeholder Motives increase Brand Attitude. Despite CSR activities is perceived a response to stakeholder expectation, this action still could increase the child-

quality of life. CSR support the belief that businesses can work together with government and other stakeholders to promote a better life, since CSR itself is basically the commitment of a business company to contribute to sustainable economic developments by working with employees and local communities to improve their overall quality of life (World Business Council for Sustainability Development, 2004). Therefore, stakeholder motives-negative and reaction motives-has contribute to society. It could be, there is belief this activities still has positive impact to society. Despite both motives has impact on Brand Attitude, Moral Motives has stronger impact on Child-Quality of Life than Stakeholder Motives. Therefore Hypothesis 2 is supported.

Intrinsic CSR practices can be described as practices perceived as sincere (Story and Neves, 2005), organizations engage in these practices because they care (Vlachos *et al*.2013). In this research, if a company conducted CSR-concerning health of children-respondents (customers) truly believe it driven by caring to society. This attribution is related to the moral motives of the firm, in which customers trust the 'benevolent' of the company, and CSR activities could improve quality of life for children. Extrinsic CSR practices are perceived to be conducted because there is intention of getting something back or to avoid some kind of punishment from the community in general (Vlachos *et al*. 2013). In this research, CSR activities has driven by stakeholder because company react to stakeholder expectation. This does not mean that organizational practices are ineffective or not good for the community, but that stakeholders might perceive that the organization is being strategic in its investment (Story and Naves, 2005). In this case, stakeholder motives could be interpreted has both intrinsic and extrinsic motives. Refer to Amaeshi and Adi (2007), CSR is a complicated construct that has been tied into a duality of either/or economic maximization and benevolent practices.

The Effect of Brand Attitude and Child-Quality of Life on Loyalty
Both Child-Quality of Life and Brand Attitude could influence Loyalty positively (Table 2, Model 1 and Model 3). Child-Quality of Life has direct and indirect effect to build Loyalty. This result indicated that social performance can increase business performance, because Child-Quality of Life (social performance), has direct positive impact on Brand Attitude and Loyalty (business performance) and also has indirect effect to Loyalty through Brand Attitude (business performance). Therefore Hypothesis 3, 4, and 5 are supported.

This result confirms that instrumental motives revolve fundamentally around managerial beliefs that engaging in social initiatives can have a direct impact on profitability – improving revenue or protecting existing profit levels (Bronn and Vidaver-Cohen, 2009). In this research, brand attitude and customer loyalty, as a representation of business performance, can enhance revenue and profitability. Different path in evaluating the CSR activities effectiveness indicate that different CSR's motives will have different impact on attitude and consumer behavior (Bronn and Vidaver-Cohen, 2008; Becker-Olsen, *et al*, 2006; Marı´n, *et al*, 2015). Being socially responsible is important, but firms must also make a conscious decision about the ratio of doing good thing to strategic benefits in their CSR activities. The sustainability concepts direct the need to harmonize the social aspect and the business aspect of the company in creating value.

Conclusion
The stakeholders might have different perceptions of the reasons why a company is engaged in CSR activities (Ellen et al, 2006; Bronn and Vidaver-Cohen, 2009; Feldman and Vasquez-Parraga, 2013; Cantrell et al 2014). The results of this study is consistent with the findings

that Health CSR activities have positive and negative motives as perceived by customers, namely Moral, Stakeholder, and Business Motives. Each motives have different impact on social performance and business performance that indicate there is still obtain strategic objective, despite doing social initiatives. Companies that fulfill their responsibilities by carrying out health CSR activities (consideration social) will be able to improve customer perceptions on the quality of life in places where the company conducts its CSR activity (consideration people). This in turn will impact positively on brand attitude and customer loyalty (business considerations).

In this research, only focus on philanthropy activities concerning health of children, future research could investigate the effectiveness of other type of CSR activities or combination some activities . Regarding of Quality of Life, future research should consider the difference of quality of life in different location, and refine the measurement of child-quality of life.

THE MODEL OF CORPORATE SOCIAL RESPONSIBILITY IMAGE IN BUILDING BRAND EQUITY

Mahrinasari MS, University of Lampung Indonesia
Basu Swastha Dharmmesta, Universitas Gadjah Mada, Indonesia

Abstract.
This research aims to develop the model of Corporate Social Responsibility (CSR) image in building brand equity, as empirical support for the model proposed by Chahal and Sharma (2006) and Hoeffler and Keller (2002). Data of 564 individually potential consumers were collected using on-line and off-line surveys and analyzed using Two Step Approach of SEM (Structural Equation Modeling). The main finding is that while CSR communication has the greatest role in creating positive CSR image and brand equity, compared to CSR dimensions and company credibility. On the other hand, economic responsibility has no significant effect both on CSR image and brand equity. Another important finding is that CSR image acts as a mediating variable. It can be concluded that CSR communication is a strategic tool to eliminate the stakeholders' skepticism toward the CSR activity in building the strong brand equity value.

Introduction

CSR currently becomes a part of business strategies to gain competitive advantage (Drumwright, 1996; Du et al., 2007; Pérez, 2009; Alcaniz et al., 2010), so many Indonesia public listing companies disclose their CSR activities during 2006-2008 (Fairuzza, 2011). However, stakeholders especially communities and consumers skeptically perceive it as the legal obligations fulfillment and the artificial activity. The activity does not provide either social benefits or empower the stakeholders' life quality and prosperity. It concerns only to the managements' subjective desire and economic benefits but not to the stakeholder's needs (Hadi, 2011; Ardana, 2008; Ambadar, 2008). Speed and Thompson (2000); Webb and Mohr (1998) also state that the CSR practice is a selfish activity of the company (Alcaniz et al., 2010).

Those sceptical thinkings rise to the negative CSR image (Pomering and Johnson idea, 2009), even though the company has a good corporate credibility (Alcaniz et al., 2010). Meanwhile, Hoeffler and Keller (2002); Ricks Jr. (2005); Chahal and Sharma (2006); Poolthong and Mandhachitara (2009); Pomering and Dolnicar (2009); Perez (2009), Lai et al. (2010). On the other side, Dawkins and Lewis (2003) stated that the CSR practice should be implemented to anticipate the declining of the company credibility, such as CSR implementation in Indonesia. Most of CSR practice by large, credible, trustworthy public listed Indonesian companies is conducted to maintain the company credibility in order to be credible and knowledgeable. This is in line with Erdem and Swait idea (1998; 2004) that the expertise and trustworthiness credibility of the company effects on CSR image. Contrary, western companies do not pay attention to the company's credibility when implementing the CSR activity. The most important for them is how to win the competition as a business strategy (Kotler and Lee, 2005, p. 9; Du et al., 2010a).

On the other hand, Pomering and Dolnicar (2009) and Hedberg and Malmborg (2003) suggested that company should build strong communication through the activity of CSR communication in order to boost the positive CSR image. Meanwhile, Melo and Galan (2011) reveal that the positive CSR image can build strong brand equity.

Furthermore, the research finding of Ricks Jr. (2005) showed that the activity of proactive philanthropy as part of a philanthropic strategy type has an effect on the company's positive brand association, but this effect does not apply to brand evaluation. This finding implies that the economic and ethical-legal responsibility of CSR dimension (Carroll, 1979.1991, 1999, 2006) are required to investigate the effect of the CSR image on brand equity.

In addition, the result of empirical test by Lai et al. (2010) to prove Hoeffler and Keller (2002); Chahal and Sharma thought (2006), is that the buyer's perception on CSR activity has a positive effect on brand equity. However, the specific research about the effect of various CSR dimensions on a negative or positive CSR image in building brand equity strength has not much been done (Beckmann, 2006, p.164; Chomvilailuk and Butcher, 2010; Vaaland et al., 2008; Singh et al., 2008; Polonsky and Jevons, 2006), neither do especially by including the variable CSR communication and the company credibility. Beckmann (2007) also stated that research on consumer perception of CSR is still limited and the spectrum of CSR dimensions used is incomplete.

Therefore, this research objectives are 1) to test the effect of three-dimensional CSR from Carroll (1979, 1991, 1999, 2006) whether it is a dominant effect compared to the company credibility and CSR communication on CSR image; 2) to examine the effect of CSR dimensions and CSR communication on brand equity, whether mediated by CSR image or not.

Literature Review and Hypothesis

Stakeholder theory, legitimacy theory, social contract theory, and attribution theory are implemented to test the effect of CSR dimension, company credibility, and CSR communication on CSR image in building brand equity. In particular, the first three theories have an important role to discuss about the effect of CSR dimensions (economic, ethical-legal, and philanthropic responsibility) on CSR image. Meanwhile, attribution theory plays a role mainly for arguing the effects of the CSR dimensions, CSR communication, and company credibility on CSR image and then consequentially build brand equity value.

1. **The effect of CSR Dimension on CSR Image**

Multidimensional concept of CSR from Carroll (1979, 1991, 1999, 2006), which was developed by Salmones et al. (2005) in economic, ethical-legal, and philanthropic responsibility, is expected to have a positive impact on CSR image (Brown and Dacin, 1997; Maignan and Ferrell, 2001; Murray and Vogel, 1997; Sen and Bhattacharya, 2001; Sen et al., 2006). Economic responsibility is the company's activities to provide economic benefits such as providing fair wages according to labor productivity. Ethical - legal responsibility is a responsible activity of the company to legally operate and run the business operations in accordance with the applicable laws and norms to avoid the dangers and losses to society. Philanthropic responsibility is a responsible activity of the company in the form of charity. Meanwhile, Brown and Dacin (1997) defines CSR image is an impression of the CSR activity. The negative CSR image will arise whenever the CSR activity is skeptically perceived by the public. The CSR activity just fulfills a legal obligation, is a cosmetic activity and does not provide social benefits.

The effect of CSR dimension on CSR image is based on stakeholder theory. In general, stakeholder theory suggests that management's decisions should adopt not only fulfill the company's profits, but also to to meet the stakeholders' needs (Freeman, 1994). The company requires stakeholders to maintain the balance of business sustainability and business growth itself. If the company's CSR activity is consistent with the fulfilling of stakeholders'

needs, the positive image of CSR will be created. Stakeholders are all parties involved in the business activities of both internal and external, that directly and indirectly affect and are affected by the company activity (Luke et al., 2005 in Hadi, 2011; Clarkson, 1995; Freeman, 1984).

Satisfying the stakeholders' needs are expected to create legitimate stakeholders over the company's CSR activity. If the legitimacy of the company's CSR activity is created, the company's operations will be sustained, maintained, and safe, away from protests and anger of the stakeholders. This is consistent with legitimacy theory that the company sustainably operates within a system of norms, bounded values, and beliefs that exist in the community or other stakeholders, so that the stakeholders get satisfaction on that CSR activity (Suchman, 1995; Woodward et al., 1996). It means that if the fulfillment of stakeholders' needs are met through CSR activities, the legitimacy of stakeholders can be obtained as a vehicle for the company to put itself in the stakeholder environment, so it creates more secure corporate sustainability. This condition can create a harmonious relationship between the company and stakeholders, in accordance with the perspective of social contract theory.

Social contract theory based on Plato thought, then which was formulated by Thomas Hobbes (1588-1679), later developed by John Locke (1632-1704) in Hadi (2011, p . 96), suggests that people keep their life and environment mutually through a social contract or agreement, in order to maintain the regularity of the laws of nature and get a harmonious life. CSR activity in the perspective of social contract theory would be responded positively by stakeholders if the CSR activity is consistent with the needs of stakeholders. The positively beneficial CSR activities can erode the skeptical thinking of the stakeholders and create a harmonious interrelationship between the company implementing CSR and stakeholders. This condition is expected to create a positive CSR image. Petkus and Woodruff (1992) revealed that consumers as one of the stakeholders expect the companies to implement CSR activities in order to eliminate skeptical thinking over the company's operational activities that are detrimental, such as the devastation of the environment and the creation of dangerous or unsafe products for consumption, as a result of the illegal requirement. This condition allows company to implement ethical-legal responsibility. It means that ethical-legal responsibility can enhance the positive CSR image.

Philanthropic responsibility activity also has an impact on the company's CSR image and hinder skeptical thoughts or negative publicity (Ricks Jr., 2005). The stakeholders will portray a positive CSR activity if they perceive philanthropic responsibility activity could provide benefits and is an effective activity to targeted stakeholders. This is consistent with the scheme concept by Wright (1986 in Ricks Jr., 2005) that if the activities of philanthropic responsibility is seen as a scheme to eliminate the negative publicity, then everything related to CSR activities will be associated as a positive scheme, so as to create the positive CSR image.

Economic responsibility is also expected to establish a positive CSR image. Economic responsibility activity is fundamentally aimed to get the company's revenue growth or sustainable profit growth in the long run (Poolthong and Mandhachitara, 2009; Salmones et al., 2005). If the companies gain sustainable profit in the long run, it is expected to produce larger scale of its business opportunity. The larger scale of the business tends to receive a higher level of attention from the public or other stakeholders. This condition is expected to encourage companies to implement higher CSR activities (Stanwick and Stanwick, 1998). When the larger the scale of the business, the greater the opportunity for the company to invest in CSR activities in order to fulfill the needs of stakeholders in the long run, so that a

positive CSR image is created (McWilliam and Siegel, 2001). Therefore, the proposed hypothesis are:

H1a: Economic responsibility has a positive effect on CSR image
H1b: Ethical-legal responsibility has a positive effect on CSR image
H1c: Philanthropic responsibility has a positive effect on CSR image

2.   The Effect of the CSR Dimension on Brand Equity

The CSR dimension is predicted to have an effect not only on CSR image but also on brand equity. This statement is consistent with the idea and the findings of Melo and Galan (2011); Lai et al. (2010); Chahal and Sharma (2006); Becker-Olsen and Hill (2006); Ricks Jr (2005); Salmones et al. (2005); Jones (2005); Klein and Dawar (2004); Blumenthal and Bergstrom (2003); Yan (2003); Girod and Michael (2003); Hoffler and Keller (2002); Sen and Bhattacharya (2001); Brown and Dacin (1997). They concluded that the CSR activity dimension essentially has strong relationship to build brand equity value, after the positive CSR image was created.

Specifically, Chahal and Sharma (2006) which refers to Lichtenstein's et al. idea (2004) proposed that if the CSR activity provides social benefits, CSR can create the positive CSR image and build strong brand equity, so that the CSR activity is considered as a means of competitive advantage (Aaker, 1996a, 1996b; Polonsky and Jevons, 2006). This implies that CSR image has a function as the mediating effect to intervene the effect of CSR activity dimension on brand equity.

Brand equity established as the result of co-creative interaction between company's brand and stakeholders, is a set of brand assets and liabilities linked to a brand, its name and symbol that add to or subtract from the value provided by a product or service of the firm perceived by customers (Aaker, 1991, 1992a, 1992b, 1996b). The higher co-creative interaction between the brand and the company's products or services, the more brand equity value will grow. It will bring about the positive image of the CSR activity. Then, the positive image of the CSR activity will increase the powerful value of the company's brand equity (Jones, 2005). This means that economic, ethical-legal, and philanthropic responsibility have a positive effect on brand equity. This statement is also supported by Podnar and Golob (2007), Becker-Olsen and Hill (2006); Ricks Jr. (2005); Varadarajan and Menon (1988), and consistent with attribution theory (Dean, 2003, referring to Kelley, 1973 and Kelley and Michela, 1980; Schiffman and Kanuk, 2007, p. 258). Based on attribution theory, the result of causal inference in understanding CSR activity, CSR communication, and credibility of the company, creates the positive CSR image as an outcome of a cognitive process of the stakeholders. Then, the positive CSR image attributes to strengthen the positive value of brand equity, such as in term of support and appreciation for building the committed loyalty to the company's brand. Thus, the CSR image in this research serves as an intervening variable mediating the effects of CSR activity on brand equity. Therefore, the proposed hypothesis are:

H2a: Economic responsibility has a positive effect on brand equity, either mediated or not mediated by CSR image.
H2b: Ethical-legal responsibility has a positive effect on brand equity, either mediated or not mediated by CSR image.
H2c: Philanthropic responsibility has a positive effect on brand equity, either mediated or not mediated by CSR image.

3. The Effect of CSR Communication on CSR Image

CSR communication is a tool to convey information CSR activities that aim to eliminate skeptical thinking over the company's CSR activities and to obtain causal inference over positive CSR activities, so that the positive CSR image is created (Du et al., 2010b; Pomering and Johnson, 2009; Jahdi and Acikdilli, 2009; Morsing and Schultz, 2006; Maignan et al., 1999).

Brown and Dancin (1997), Sen and Bhattacharya (2001) revealed that consumer response to the positive CSR information activity when the information is presented through the effective CSR message format. The positive response has led to the positive CSR image. This is consistent with information process theory (Miller, 1956, also cited in Tian et al., 2011). Firstly, the focused attention by stakeholders is to assess the idea of CSR message through the process of remembering information, awareness and associations. Later it forms over CSR information and then end up with interest and desire on positive CSR information, so that the positive CSR image is created. Reminding process on the idea of CSR information creating the positive CSR image is consistent with attribution theory (Sparkman Jr. and Locander (1980). Therefore, the formulated hypothesis is:

H3: CSR communication has a positive effect on CSR image.

4. The Effect of CSR Communication on Brand Equity

Not only can CSR communication produce the positive image of the CSR activity, but also can strengthen the brand equity value. This statement is supported by Johnson (1984 in Cobb-Walgren et al., 1995); Aaker and Biel, 1993 in Cobb-Walgren et al. (1995); Cobb-Walgren et al. (1995); Jeong (2004); Ven (2008); Pomering and Dolnicar (2009); Polonsky and Jevon (2009); Hsu (2012). They said that in order to build strong brand equity value, the company should be encouraged to establish effective and intensive CSR communication. Balabanis et al. (1998) revealed that positive CSR performance relates to economic performance measured with brand equity, when the CSR activities are effectively communicated (Barwise, 1993; Keller, 1993; Aaker and Jacobson, 1994; Ambler and Barwise, 1998; Selnes, 1993; Simon and Sullivan, 1993; Lasser et al., 1995). It implies CSR image, as a mediating variable, can build the positive brand equity value.

Based on attribution theory, CSR communication could create stakeholders' commitment on sustaining CSR activity. The commitment would create the stakeholders' loyalty, in order to strengthen the brand equity value. Therefore, the hypothesis in this model is:

H4: CSR communication has a positive effect on brand equity, either mediated or not by CSR image.

5. The effect of Company Credibility on CSR Image

The company credibility measured by the dimensions of trustworthiness and expertise will have a chance to make the consumer react to the positive CSR image (Alcaniz et al., 2010). The trustworthiness credibility is defined as corporate behavior that acts honestly and correctly. The expertise dimension measures the company's ability to produce and deliver the high performs of products or services (Aqueveque and Encina, 2010). If stakeholders 'perception and confidence exist caused by emotional factors over the CSR activity, the credibility of trustworthiness is a key element in determining the positive CSR image.

Goldsmith et al. (2000) revealed that the company's credibility can influence consumer reactions in assessing the company's CSR activities and is expected to shape the attitude in creating the positive CSR image. In particular, Lafferty and Goldsmith (2005); Trimble and Rifon (2006) revealed that consumers use the company's credibility as an instrument to eliminate skeptical thoughts of consumers about negative CSR activities. If they feel the CSR activities provide economic and social benefits, the positive CSR image is created. Erdem and Swait (1998, 2004) stated that the company credibility plays a role as a major determining factor in creating the positive CSR image.

In addition, the theoretical framework of the contrast effect proposed by Dean (2003) and balance theory by Heider (1958, also cited in Alcaniz et al., 2010) explains that the trustworthiness and expertise have a positive effect on the company's CSR image. In balance theory perspective, consumers will look for a balanced and harmonious set of beliefs on the brand and be motivated to reconcile unsuitable thought about the company, so that the potential scenario of the CSR perceived skeptics will be corrected by the perception of trustworthiness and expertise credibility (Basil and Herr, 2006 in Alcaniz et al., 2010). Therefore, the hypothesis of this study are formulated as follows.

H5a: The company's credibility: Trustworthiness has a positive effect on CSR image.
H5b: The company's credibility: Expertise has a positive effect on CSR image.

6.   The Effect of CSR Image on Brand Equity

The positive CSR image has a positive effect on the value of the company's brand equity. This statement is supported by the idea of Bronn and Vrionni (2001); Ogrizek (2002); Hoffler and Keller (2002); Blumenthal and Bergstrom (2003); Yan (2003); Girod and Michael (2003); Klein and Dawar (2004); Chahal and Sharma (2006).

Hsu (2012); Lai et al. (2010); Jones (2005); Brickley et al. (2002 in Lai et al., 2010); Varadarajan and Menon (1988); Smith and Higgins (2000) revealed that the higher expectation of stakeholders in the CSR activity is fulfilled, so that the positive CSR image is created and builds the more valuable brand equity. In particular, Hsu (2012); Chahal and Sharma (2006) revealed that the positively perceived CSR is considered as a means of competitive advantage to build the positive brand equity. This occurs corresponding to the attribution theory perspective. The CSR activity that previously is perceived positively will lead to attribute the positive CSR image as an outcome of CSR activity providing positive benefits (Vlachos et al., 2009). When the CSR image is positively created, the causal inference will be created in the form of positive commitment to the company's brand, thus brand equity building is positvitely created. Therefore, the formulation of the following hypothesis is

H6: CSR image has a direct positive effect on brand equity.

Methodology

This research applies survey design and uses judgmental sampling method (Hair et al., 2009, p. 322; Malhotra, 2007, p. 332-335; Neuman, 2000, p. 198), with the respondents criteria, as follows 1) respondents know the CSR activities, 2) respondents know the products or services of the company which implements CSR; 3) respondents know and ever see and or are looking at CSR activities that are communicated through online and or offline media. Using 564 questionnaires as the statistical tool, as a result of non-bias response, that were collected from 638 copies of questionnaires.

The measurement using a 7 points interval scale is derived from the previous instruments. The CSR dimension measurement uses the concept of Carroll (1979, 1991, 1999, 2006), developed by Salmones et al. (2005). CSR Image refers to the instrument of Alcaniz et al. (2010). Instrument credibility adopts the instrument by Alcaniz et al. (2010) in the context of CSR activity. Brand equity instrument adopts a three-dimensional measurements of Chang and Liu (2009); Lai et al. (2010). The measurement of brand equity is considered as a single indicator measurement because of the validity test results showing the factor loading values above 0.5. Meanwhile, CSR communication measurement uses the concept of communication effectiveness (Birth et al., 2008; Boush et al., 1994), by adopting a hierarchical model of AIDA (Aware, Interest, Desire, and Action).

The validity test used face validity, convergent validity and discriminant validity (Malhotra, 2007, p. 279; Kerlinger and Lee, 2000, p. 671; Hartono, 2008, p. 63-64). The validity test results demonstrate valid, unless the item number of the philanthropic construct (PR3: sponsorship event; PR4: donation to the healthy, education, and religion activity; PR5: improving social welfare) and the brand equity item (BE5: difficulty in imagining the brand of the company's products or services). Reliability test results carried out with coefficient Cronbach's Alpha and Composite Reliability (Sekaran, 2003 in Hartono, 2008, p 36; Hair et al., 2006, p. 137; Hartono, 2008, p. 52), show reliable items and consistent with the valid item's measurements with the values above 0.70.

Structural Equation Modeling (SEM)-based covariance model with AMOS 4:01 application is used to test the hypothesis with a single composite indicator method. The sample size fulfills a qualified sample size (Hair et al., 2006, p. 744; 2010, p. 662) and the normality of the data based on the value of Mahalanobis Distance statistic (Hair et al., 2006, p. 77) also meets the requirement of SEM.

Results

The model meets the recommended value index of the model fit, measured by 1) the index of Absolute Fit, consisting of the value of Normed Chi-square (χ^2/df; atau CMIN/DF) index 1.046 (the recommended value $\leq$ 5.00), the value of Goodness of Fit Index (GFI) 0.999 (the recommended value > 0.90, the value of RMR index 0.002 (the recommended value < 0.05), and the value of RMSEA index 0.009 (the recommended value < 0.07); 2) Incremental Fit Index, measured by NFI 0.998 (the recommended value > 0.95) and CFI index 1.000 (the recommended value > 0.95; 3) Parsimony Fit Index, measured by AGIF index 0.983 (the required index > 0.90).

The Estimated SEM Results in Figure 1 show that three proposed hypothesis are not supported because the value of CR (*critical ratio)* is less than 1.96 in two tailed or less than 1.64 in one tailed of α significance 0.05 (Byrne, 2001, p.76; Hartono and Abdillah, 2009, p. 87).

The results of the mediating effect test in Table 1 show that only two hypothesis of the mediating effect are supported, that can be seen from the value of estimated parameter total increases (Hair et al., 2006, p. 866-870; Baron and Kenny, 1986). The other two hypothesis are not supported because it does not meet the mediating effect testing requirements (Baron and Kenny, 1986).

Table 1. The Mediating Effect Hypothesis Testing, Based on SEM Model

Proposed Hypothesis	Standardized Estimated Value of the Regression, Indirect Effect	Total Effect of Estimated Regression Value	Hypothesis Testing Results: Direct Effect	Hypothesis Decision
H2b: Ethical-legal Responsibility has a positive effect on Brand Equity indirectly, mediated by CSR Image	= 0.123x 0.276 = 0.034	= 0.178+0.034 = 0.212	$\beta = 0.178$ CR $\geq$ 1.64	**Supported**
H4: CSR Communication has a positive effect on Brand Equity Indirectly, mediated by CSR Image	= 0.374 x 0.276 = 0.103	= 0.361+0.103 = 0.464	$\beta = 0.361$ CR $\geq$ 1.64	**Supported**

Discussion

The effect of economic responsibility shows positively insignificant on CSR image and brand equity. These results also demonstrate the effect of mediating role of CSR image is not supported in the effect of economic responsibility on brand equity. These findings confirm the findings of Salmones et al. (2005); Podnar and Golob (2007), Du et al. (2010b); and consistent with stakeholder, legitimacy, social contract, and attribution theory.

The insignificance of the economic responsibility effect occurs because the company's motives in implementing CSR activities are perceived by prospective customers solely for the sake of the corporate profit improvement in the long run, not for the motive of the company's commitment to care for the social needs. This perception occurs, corresponding to the measurement instrument use, developed by Salmones et al. (2005). Instrument measurement of economic responsibility taken from Salmones et al. (2005) does not include the context of economic activity that is consistent with the economic needs of potential customers, such as the measurement by Jackson and Apostolakou (2010); Wibisono (2007).

If the measurement of economic responsibility based on Jackson and Apostolakou (2010) and or Wibisono (2007) is applied, the result may be different because the economic responsibility practice reflects the needs of consumers and or investors and is consistent with the economic needs of stakeholders. The result of the respondent's response shows the distribution of philanthropic responsibility practice dominates (60.63%), compared to the economic responsibility practice delivers the lowest distribution (14.09%). This implies that the economic responsibility practice is not an effective measurement because only small portion of the activity can fulfills the needs of potential consumers. These conditions result in the insignificant economic responsibility effect on CSR image as well as on brand equity.

Based on attribution theory (Dean 2003; Schiffman and Kanuk, 2007, p. 258) and the stakeholder theory (Friedman, 1962 in Jamali, 2008), when the company considered to focus on profit as the main reason, the potential consumers' attitude to the CSR activity tend to create high skeptical thinking (Maignan, 2001; Becker - Olsen and Hill, 2006; Sen et al., 2006), hence the CSR image is negative and insignificant. This brings about insignificant effect on brand equity value. Conversely, when the company's motivation to implement the CSR activity is considered as a motive for the sake of purely social benefits, the potential consumer confidence in the company's CSR activities is increasingly positive (Becker -

Olsen et al., 2006; Sen et al., 2006), so that the positive CSR image is created, the legitimacy toward the company is more secure, and harmonious relationship between the potential consumers and companies is maintained, according to the stakeholder, legitimacy and social contract theory.

The positively significant effect of the ethical-legal responsibility on CSR image and brand equity demonstrate the mediating effect of CSR image (Table 1). The significant effect of the ethical-legal responsibility on CSR image supports the findings of Maignan (2001); Podnar and Golob (2007), and consistent with stakeholder, legitimacy and social contract theory. Maignan (2001) specifically supports the finding effect of the ethical-legal responsibility on brand equity. Attribution theory supports the mediating effect of CSR image whenever there is the effect of the ethical-legal responsibility on brand equity.

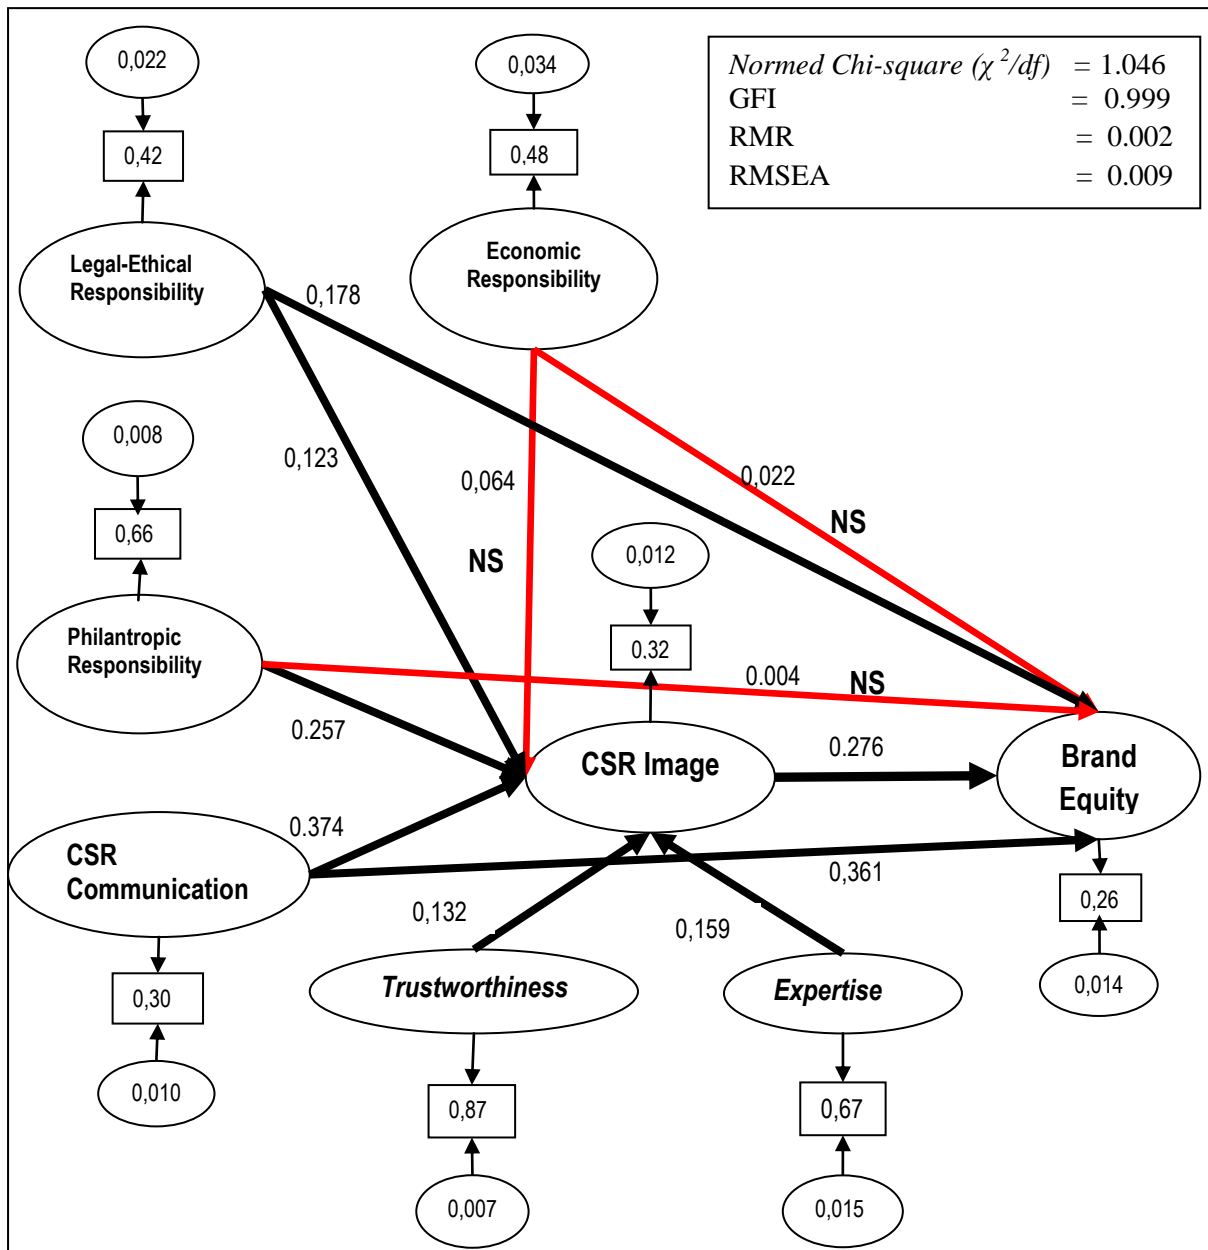
The positively significant effect of ethical-legal responsibility on CSR image occurs because the potential consumers perceive ethical-legal responsibility activity meets the legal requirements, compliance with the norms and ethical values that are developed by the potential customers. These conditions create a positive CSR image, in line with the stakeholder, legitimacy and social contract theory.


Figure 1. The Research Model of CSR Image in Building Brand Equity, Based on SEM
Note: NS = Not Significant;

Based on stakeholder theory, companies need to satisfy the needs of potential customers, corresponding to the moral and ethical values, such as offering and delivering the healthy and safe products. Then, if potential customers gain benefits from the ethical-legal responsibility activity, the potential consumers' support on CSR activity are created (legitimacy theory). Then, this condition brings about the commitment of the social contract between potential customers and the company who implements CSR in order to sustain each other (social contract theory), so as to constitute a positive CSR image. The social contract is created to get the balance and harmony in building natural and healthy environment.

The effect of philanthropic responsibility on CSR image results in a significant effect, but not on brand equity (Table 2). This finding reflects the mediating effect of CSR image in the effect of philanthropic responsibility on brand equity also is not significant. The significant

effect of philanthropic responsibility on CSR image supports the findings of Podnar and Golob (2007), Chen (2011), and consistent with stakeholder, legitimacy and social contract theory. This effect occurs because the corporate philanthropic activity is believed to create a natural and healthy environment that is very useful for customers and other stakeholders. This is very important especially in dealing with the issue of global warming that will destroy human life mainly related to the risky life, drought, pollution and natural disasters, and in the end believed to have an effect on poverty, hunger and death.

Based on stakeholder theory, the potential consumers feel the benefits of CSR activities in term of philanthropic donations strongly associated with the development of economic and social environment. This condition creates the gratitude and support on the company's CSR activity (legitimacy theory). Then, this carries on the commitment to develop a social contract between the customers and the company implementing CSR activity for mutual support and harmonious relationships by creating and maintaining a wonderful social environment (social contract theory), so as to constitute a positive CSR image.

The effect of philanthropic responsibility on brand equity is not positively significant because of skepticism issue, according to attribution theory. This finding supports the findings of Ricks Jr. (2005), Porter and Kramer (2004), Luo and Bhattacharya (2006). The potential customers perceive the philanthropic activity is a short-term activity (Brady, 2003); as a short incidental activity (Godfrey, 2005), as an ineffectively reactive activity to build brand value (Ricks Jr., 2005); as a sporadic activity (Porter and Kramer, 2002, 2006); as an artificial activity for empowering and improving quality of life and just focus on the social donation instantaneously and reactively (Frankental, 2001); and as an activity that tends to be isolated and not integrated with the company's business operations (Halme and Laurila, 2009).

The effect of CSR communication on CSR image and brand equity is positively significant. This finding shows there is a mediating role of CSR image. This finding supports the idea of Woodward et al. (2001); Hedberg and Malmborg (2003); Morsing and Schultz (2006); Branco and Rodrigues (2006); Birth et al. (2008); Pomering and Dolnicar (2009) and Arvidsson (2010), although some of them have different opinions specifically on the use of the effective media as a tool to eliminate skeptical thinking. The effect of CSR communication on brand equity also supports some findings of previous studies, such as Jeong (2004), Jones et al. (2005); Jahdi and Acikdilli (2009), Hsu (2012).

The effect of of CSR communication on brand equity, either mediated or not by CSR image is also consistent with information processing theory (Miller, 1956) and attribution theory (Dean 2003; Schiffman and Kanuk, 2007, p. 258). Based on information processing theory, the potential customers are previously aware and give attention to the message content whether it is informative and right. Later, they will evaluate the right message content of the communication CSR. If the message content includes the right, informative, and pure information, not as a promotional tool, the logical expression and association toward CSR information and the company's brand are created.

The effect of the credibility of trustworthiness and expertise on CSR image is positively significant. This finding supports the findings of Bhattacharya and Sen (2004); Alcaniz et al. (2010); and consistent with attribution theory.

Based on attribution theory, when the potential consumer's perception and confidence is positive, caused by an emotional reaction to CSR activities, the positive CSR image is created. Emotional reactions attributes to the trustworthiness credibility due to the consumers' confidence over the credibility of trustworthiness is strongly related to CSR activity as a pure and honest activity for providing the social benefits. This enhances the confidence of the potential customers over the CSR activity into the establishment of a

positive image. On the other hand, the credibility of the company's expertise (Aqueveque and Encina, 2010), perceived bad or negative, if it is believed that CSR activity does not correspond to the credibility of the company's expertise, especially when the CSR activity is associated with the quality of products or services produced by the company that implements CSR.

The effect of the expertise credibility on CSR image is significantly positive caused by the potential consumers' attribution who believe the company's expertise credibility can be fundamentally influenced by the company ability in creating the functional value and products or services' innovation (Sen and Bhattacharya, 2001). Therefore, if it is believed the company's CSR activities corresponding to the company's expertise, the potential customers will lead to create the positive CSR image.

The positively significant effect of CSR image on brand equity supports the concept of Chahal and Sharma (2006). The positive CSR image is created as a result of the positive CSR activity attribution, then CSR image will have an impact on building strong brand equity, like the idea of Varadarajan and Menon (1988); Bronn and Vrionni (2001); Ogrizek (2002); Hoffler and Keller (2002); Blumenthal and Bergstrom (2003); Girod and Michael (2003), Yan (2003), Bhattacharya and Sen (2004), Klein and Dawar (2004), Jones (2005); Pirsch et al. (2007). This finding also supports the finding of Lai et al. (2010); Melo and Galan (2011).

The significant effect of CSR image on brand equity occurs when the potential consumers believe CSR activities provide positive benefits to empower and improve the life quality, so the positive CSR image is created. According to attribution theory, the positive CSR image will turn to build positive brand equity.

Based on attribution theory, the cognitive process would enable the potential customers to perceive and believe in the positive benefits of CSR activities. Later, the potential customers through the process of information knowledge, assessment, and experience stored in memory creating the positive CSR image, would attribute a strongly positive brand equity value. This finding is in accordance with the idea of Schiffman and Kanuk (2007, p. 259) that the positive CSR image gives an incentive to strengthen brand equity value.

Conclusion, Limitation and Future Research

Overall, it can be concluded that attribution theory has an important role in supporting the empirical testing of CSR dimension, company credibility, and CSR communication effect on CSR image in building brand equity. However, the stakeholder, legitimacy and social contract theory have a role especially for testing the effect of economic, ethical-legal, and philanthropic responsibility on CSR image.

The research finding mainly indicates CSR communication has the greatest role in creating the positive CSR image compared to the dimensions of CSR activity and corporate credibility.

CSR image performs as a mediating effect that provides the value of the estimated CSR communication effect on brand equity is greater than that of the estimated ethical-legal responsibility effect and company credibility. This illustrates that CSR communication as a strategic tool to eliminate skeptical thinking toward CSR activity that is manifested in creating the positive CSR image and in building strong brand equity value.

The expertise credibility is considered as a major factor in creating a positive CSR image, compared to the trustworthiness credibility because the potential customers' attribution toward the expertise credibility in CSR activity context is associated with the company's expertise in creating high quality of the products or services. In the meantime, the

trustworthiness credibility is very related to the implementation of CSR activities as pure and honest motives.

The model of this research contributes to the development of the CSR concept in marketing perspective, with a three-dimensional antecedent variable of Carroll's CSR (1979, 1991, 1999, 2006), the credibility of the company, and CSR communication in building brand equity. This model supports the idea of Maignan and Ferrell (2001), Sen and Bhattacharya (2001); Mohr et al. (2001); Balmer (2001); Maignan et al. (2002, 2005); Kotler and Lee (2005); Becker-Olsen and Hill (2006); Podnar and Golob (2007), Beckmann (2007), Wang and Juslin (2009); Marin et al. (2009); Castaldo et al. (2009), Moreno and Caprioti (2009); Trapero et al. (2010), and Tian et al. (2011).

Specifically, this research model supports the proposed model by Chahal and Sharma (2006); Hoeffler and Keller (2002). The research results also contribute to support the concept of CSR by Carroll (1979, 1991, 1999, 2006) by integrating three dimensions of CSR, so that the concept of CSR by Carroll can be a mainstream theory, appropriated with the Franklin statement (2008 in Vlachos et al., 2009).

This research model has several contributions to the management company, as follows 1) the effect model of CSR dimension, company credibility, and CSR communication on CSR image in building brand equity contributes as a marketing and business strategy to increase competitive advantage; 2) CSR communication is a key strategic tool to create CSR image and to strengthen brand equity of the company, so that the management needs to employ an intensive CSR communication through effective communication media; 3) the expertise credibility becomes a major factor in creating the company's CSR image, so the management of the company needs to improve the company's ability to produce good quality products or services and should have an expertise and experience in executing CSR activities in balancing the fulfillment of the potential customers' needs and business activities; 4) each dimensions of the CSR activities should be integrated when CSR activities are executed, not simply focusing on one dimension, as stated by Halme and Laurila (2009) that companies should create innovative and valuable CSR activities by executing the integrated CSR programs (a synergy program among the three dimensions of CSR).

On future research, the respondents can be expanded to apply the respondents who have ever bought incorporating with the behavior loyalty of the brand equity concept, as thought McConnell (1968), Jacoby and Kyner, (1973), Day (1969) ; Aaker (1991, 1992a, 1992b, 1996a, 1996b), Oliver et al. (1997) and Oliver (1999).

Next research also needs to examine the mediating role of credibility in the effect of CSR dimensions and CSR Communication on CSR image because CSR image when affected by the company's credibility (expertise and thrusworthiness) has a higher effect than when affected by the dimensions of CSR activities (especially by ethical-legal responsibility). This is supported by the idea of Hedberg and Malmborg (2003); Becker -Olsen and Hill (2006); Pirsch et al. (2007), Bae and Cameron (2006), Lafferty (2007); Vanhamme and Grobben (2009). They state that the CSR activity has an important role in increasing the company credibility and potentially reinforcing the positive CSR image. Likewise, the effect of CSR communication is expected to increase the company credibility and has an impact on strengthening the brand equity value (Forman and Argenti, 2005; Capriotti and Moreno, 2007; Nachailit and Ussahawanitchakit, 2009).

Other future researches should re-examine the effect of CSR dimension, company credibility and CSR communication on CSR image in building brand equity with a focus on the users or buyers of the brand in the products or services category in a particular company. This test also needs to be redone because it requires to anticipate common method bias that often

appears as social desirability bias or motive consistency bias. Common method bias is compulsory to examine because the items in the research instrument do not specify the products or services category and specific brands of the company implementing CSR, in that the respondents probably know more than one brand of the products or services that has different attributes.

Another future research needs to analyze the effectiveness of CSR communication media for creating CSR image and strengthening the company's brand equity value. Effective CSR communication media needs to be considered as a marketing strategy to increase competitive advantage and can even be said to be the heart of the organization to establish the company credibility and brand equity (Forman and Argenti, 2005; Capriotti and Moreno, 2007; Nachailit and Ussahawanitchakit, 2009).

The use of other economic responsibility measurements reflecting the economic needs of stakeholders and market in the future research is necessary such as the measurement by Jackson and Apostolakou (2010), so the research results may show that the economic responsibility will have significant effect on CSR Image anf Brand Equity.

THE INFLUENCE OF ISLAMIC ORGANIZATIONAL CULTURE ON ISLAMIC RURAL BANK PERFORMANCE

Muhammad Iqbal Fasa, Islamic State University Sunan Kalijaga Yogyakarta
Ridwansyah, Islamic State University Raden Intan Lampung

Abstract

In this research the implementation of Islamic organization culture and its effect toward the performances of Islamic rural bank. The qualitative approach was used during the examination. The data analysis was completed by employing in-depth interview, observation, and documentation of financial data performances of Islamic rural bank. The Sample of this research is Islamic rural bank in Bandar Lampung. The results show that the implementation of organization culture correlates with the performances improvement of Islamic rural bank in Indonesia. The enhancement is caused by the practice of Islamic leadership style, staffs empowerment, teamwork, innovation, and aggressiveness of the company based on Islamic values.

Keywords: *culture, organization, company performances, Islamic values*.

Introduction

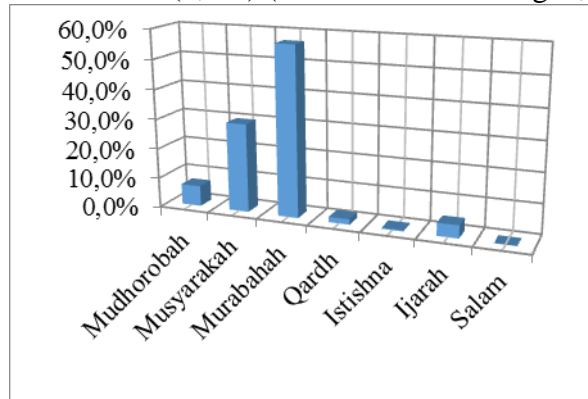
The globalization and economic recession at the end of 1990 have caused the companies radically changing their strategy and business operationalization. (Kuula, et.al, 2014). The advancement of technologies, markets, information system, global economy, social values, demography, workforce, and political environment has a significant effect toward the process of business, product, and service (Samuel, 2011).

Those changes experienced by the traditional banking institution that has converted into an Islamic bank. Islamic bank these days has developed numerously. In 1998, there are only one general Islamic bank and 76 Islamic rural banks. This figure increases significantly up to 12 general Islamic banks, 22 Islamic business units, and 165 Islamic rural banks.

The figure below demonstrates the development of Islamic banking in Indonesia:
(Otoritas Jasa Keuangan, 2016).

Even though the development and the growth of Islamic bank are significantly high along with products and markets, today's practical banking is far different from its theoretical model that relies on the practice of profit and loss sharing (Iqbal and Mirakhor, 2007). It can be seen from the significant anomaly in the existing asset structure (Rusydi, 2016).

Based on the statistical data of Islamic banking, the distribution of funding is still dominated by *murabahah* credit as much as Rp. 126.179 billion (56,8%) followed by *Musyarakah* at Rp.

66.313 billion (29,8%), *Mudhorobah* funding with Rp. 15,298 billion (6,9%), *Ijarah* as much as Rp. 9,535 billion (4,3%), *Qardh* credit that is only Rp. 4,057 billion (1,8%) and *Istishna product* as much as Rp. 794 million (0,4%) (Otoritas Jasa Keuangan, 2016).


The distortion of Islamic banking practice is not only those that has been mentioned. The similar case has also been conducted by Bank Mega Syariah through domination of funding distribution of *Murabahah* credit funding as large as 99.38% in 2013, and as much as 97.8% in 2014 and 2015 (Bank Mega Syariah, 2015). In 2013, Bank Syariah Mandiri branch of Bogor had been found guilty due to fraud. It was involving three staffs of Bank Syariah Mandiri branch of Bogor that committed the fictitious credit as much as Rp 102 billion (Viva News, 2016).

Systematically, Bank Syariah Mandiri has the largest capitalization funding in Indonesia. It also obtained many successes in the financial sector. However, the fraud that has been committed by top management still exist.

Due to it problematic situation, it can be concluded that the growth of Islamic banking is solely caused by the market share of Muslim in Indonesia. Moreover, the systematic demand of Bank Indonesia in order to convert regular bank to be an Islamic Bank. Thus, the general bank of Islamic operated today is based on the standards of Otoritas Jasa Keuangan (OJK), Fatwa Dewan Syariah Nasional Majelis Ulama Indonesia (DSN-MUI), and Dewan Pengawas Syariah (DPS).

The growth and development are supposed to be implemented booth by a system that is previously explained and by culture. Through the practice of organization culture that fits with the Islamic principles, it is highly likely creating more justice and less fraud. According to research that has been conducted by Rijal (2016); and Husein, et.al (2016), the existing of organization culture has been proven affects the growth and the development of particular organization positively. If the company does not encourage the good innovation and culture of the organization, it will affect business negatively in the future.

According to that case, if Islamic bank does not make a fundamental change of organization culture, there will be simultaneous fails. The fail factors are; leadership transformation failure, external change disrespectfulness, and managerial failure in showing the involvement of the staffs (Song, 2008). The failure shows that traditional model does not solve the problem faced (Kikelly, 2014).

Thus, this research will discuss in more detail regarding the implementation of organization culture in Islamic rural bank.

Literature Review

 1. **Organizational Culture**

Organization culture is a system of values, beliefs, and standards which governs the behaviors of people in the organization (Belak, 2016; Hitka, et.al, 2015). Guiso, et.al, (2015) states that organization can be formed as a result of creating integration between manager and staffs.

Organization culture includes mindset, feeling, and reaction that becomes a guidance for decision making and other activities of the organization members. The successful organization has a strong working culture, therefore, can attract, keep, and give feedback for those who fulfilled the obligation and reaching the target (Hakim, 2016).

Robbins (1996) in Uha (2015) states that seven characters of organizational cultures are innovation and courage to take a risk, attention to detail, goal orientation, people orientation, team orientation, aggressiveness, and stability.

The research regarding the change of organization culture is a contemporary issue that is developed massively. According to research that has been conducted by Gomez, et.al (2015); Alnasseri et.al (2013); Naserinajafabady et.al (2013); Danish et.al (2012); Tojari, et.al (2012); Yilmaz and Ergun (2008); Denison (2007); and Kwantes and Boglarsky (2007) show that there are positive correlation and significances between organization culture and company effectiveness.

However, some researchers disagree with the statement of miscorrelation in some indexes variables of organization culture. The results of research conducted by Heris (2014) explains that although consistency and mission has a significant positive correlation, the involvement and abilities to adapt does not affect significantly toward the organization effectivity.

The finding of Amah (2012) shows that the degree of adaptation skill positively correlated with organization profitability, and market share. However, there is no a significant correlation toward the organization productivity the company mission, involvement, and consistency.

The research of Coffey (2003) shows that the adaptation skills, consistency, and mission has a significant correlation and with the organization effectivity, however, it has less correlation with the organization involvement.

According to Fey and Denison (2003), the adaptation skills becomes the major driver for the companies' effectivity mainly in Russia that struggled in economic transition. On the other hand, businesses in the United States rely more on a mission for their effectivity.

The research that has been conducted by Denison et.al (2003) concludes that there is a significant correlation among 12 indexes of organization culture toward companies' effectivity in general in North America, Europe, Middle East, and Africa. Those 12 indexes are empowerment, teamwork, skills development, core values, dealing, changing coordination, customer focus, organization development, strategic direction, aim, and vision. However, there is no strong correlation in the regions such as Asia. As the elaboration of the research, the discussion regarding the organization culture narrowed to those related to the approach of the ethical of organization culture. The research that has been conducted by Chadegani, et.al (2016); Semradova dan Hubackova (2015); Novelskaite (2014); Said, et.al (2013); Schwartz (2013); Jondle et.al (2013) emphasize the importance of organization culture.

With the creation of good organization culture, will effect in the enhancement of the staffs' quality (Krishna, et.al, 2016; Deem, et.al, 2015; Amah and Ahiauzu, 2013; Hakim, 2012),

organization performances (Laforet, 2016; Shihabeldeen, 2015) as well as the increment of customer satisfaction (Triznova, 2015; Altindag, 2015; dan Turro, 2014).

2. Islamic Organizational Culture

The Islamic organization culture is a value, thinking, and symbol based on Islam that affect norm, attitude, Iman, and habit of people in life (Kusumawati, 2015). Hakim (2016) describes the values of Islamic organization based on Al-Qur'an and Hadiths. They are; firstly, working is the functional practice of human as *khalifah*. Secondly, working is a form of worship. Thirdly, working with principles of benefit and *maslahat*. Fourthly, working through the optimization of intelligence. Fifthly, working with full of desire and optimistic. Sixthly, the existing of *tawazun* attitude, finally, working with the consideration of halal and haram aspect.

Hoque, et.al (2013) offers the features of organizational culture in Islamic perspective. Some dimensions that are offered are justice; honesty; hard work; sacrifice; accountability; mutual respect; cooperation; trust in God; missionary spirit; and sincerity. However, the weakness of discussion conducted by Lukman Hakim and Haque, et.al are still simplistic, and not analyzed empirically.

In supporting the previous research, Hakim (2012) states that organizational culture has a positive relationship with the employee's performance. Research conducted by Hakim said that the leadership of the Islamic and Islamic organization cultural have influence over the Islamic working motivation and Employee Performance at PT Bank Muamalat Indonesia Central Java Tbk. The Islamic leadership variables used are *Sidiq*; *amanah*; *tablig*; *fathonah*. While the Organization of Islamic cultural variables that are used is: Smile; regards; brotherhood; honesty; help each other; and discipline.

The empirical research of Islamic organization culture conducted by Kusumawati (2015) states that culturally Islamic organizations have been associated with an increase in Islamic work behavior. The Behavioral indicators of Islamic work done by Kusumawati are Commitment; Professional; Truly; Amanah; and Loyalty. While indicators of Islamic organizational culture are still a simple, namely: Movement *thaharah*; prayers in congregation; and the Islamic dress

The weakness of research conducted both Kusumati (2015) and Judge (2012) is still focused on the influence of Islamic organizational culture toward the behavior of Islamic performance. It has not explored in depth related to the impact on profitability, productivity and market share obtained by the Company.

Research Methods

This research is a qualitative research. With a case study approach. In this study, researchers explore the data from the field. In-depth research in conjunction with the Implementation of Organizational Culture Change in the Islamic Rural Credit Bank (BPRS) Bandar Lampung.

The source of data is done using primary data and secondary data. The primary data obtained through in-depth interviews with top managers, employees and customers to of SRB Bandar Lampung. Secondary data obtained through the financial statements, the data organization, institution profiles, brochures, and various media Sharia Rural Bank (BPRS) Bandar Lampung.

Purposive based sampling was employed in this research. The Sample used in this research is located in Islamic Rural Bank (BPRS) of Bandar Lampung. Regarding data collection, the authors apply observation, interview, and documentation on the financial statements of Islamic Rural Bank in Bandar Lampung.

The analysis used in this research is descriptive, in which the data obtained in the study was treated in data reduction, data presentation, and conclusion

Results

The Islamic culture of the organization was formed by the enactment of Islamic business standardization, as already offered by Veitzal et.al (2013). The standardizations of Islamic business are: First, doing business transactions in accordance with Sharia Corridor. Second, not conducting business in a way falsehood like: *maysir, gharar, riba, dzulm*, Third, the only purpose of a charitable act is not only focused on the profit (*Qimah Muhammadiyah*), the value of humanity (*Qimah Insaniyah*), moral values (*Qimah Khuluqiyah*), and the value ruhiyah (*Qimah ruhiyah*).

The implementation of Islamic business standardization will form the Organization of Islamic Culture characteristics. They are Innovations that are constantly evolving and enforcement for the results (profit and loss sharing); Attention to detail of appropriate sharia corridor; halal-result oriented, *maslahah* maximization, and the creation of the balance of advantages and Hereafter (Falah); Human orientation as caliph in the world; Sidiq based team orientation, trust, sermons, Fatonah and principles of friendship; aggressiveness which is not value-free, and pay attention to the social aspects (zakat, donation, charity, endowments); Stability in terms of the fulfillment of *maqasid* sharia, and the creation of a blessing.

The application of Islamic organizational culture in the Islamic Rural Bank credit Bandar Lampung is able to improve the company's performance significantly. It can be seen from the development of Sharia Rural Bank's performance as follows:

	2010	2011	2012	2013	2014	2015
Asset	11,123	16,182	22,220	28,893	40,102	61,225
Financing	8,745	12,971	17,923	28,893	32,659	47,052

The application of Islamic Cultural Organization on Financing Islamic Rural Bank in Bandar Lampung proves to improve the company performance. The table below demonstrates an authentic proof of the People's Bank Financing Sharia (SRB) Bandar Lampung in getting diverse national achievement:

Year	Category	Organizer
2016	The Best BUMD on Business Turn Around Category	Selindo
2015	The Best Sharia Finance Award 2015 kategori BPRS asset Rp. 25 Miliar to Rp. 50 Miliar	Info Bank Jakarta
2014	The Best Sharia Finance Award 2014 kategori BPRS asset Rp. 25 Miliar to Rp. 50 Miliar	Info Bank Jakarta
2012	The Best Sharia Finance Award 2012	Infobank Jakarta

	kategori BPRS asset Rp.10 Miliar to Rp.25 Miliar	
2012	The Best Islamic Rural Bank "BSM UMKM AWARD"	Head Office Bank Syariah Mandiri
2011	Third Finalis "BSM UMKM AWARD"	Head Office Bank Syariah Mandiri Jakarta

These results support the previous research conducted by Hakim (2012) and Kusumawati (2015). They emphasize that the culture of Islamic organizations has a significant role in improving performance. It was caused by the implementation of Islamic leadership style, employee empowerment, teamwork, encourage Innovation Company, as well as the aggressiveness of the company based on Islamic values.

Due to its simple approach and the test that involving only one sample, this research can further be improved through comparison of multiple Islamic Rural Bank (SRB) from various regions in Indonesia.

DEVELOPMENT OF JATROPHA BASED BIOFUEL TO CREATE SELF-SUSTAINED ENERGY VILLAGE

Nuning Setyowati, Sebelas Maret University, Indonesia
Erlyna Wida Riptanti, Sebelas Maret University, Indonesia
Mohd. Harisudin, Sebelas Maret University, Indonesia

Abstract

This study aims to formulate development strategies of jatropha based biofuel industry. The basic method of this research is descriptive. Data used includes strengths, weaknesses, opportunities and threats of jatropha based biofuel development. Data analysis used IFE, EFE and SWOT matrix. The alternative development strategies of jatropha based biofuel as follow: Strengthening motivation and mentoring continuously to farmers to increase the capacity and quality of castor beans, strengthening the commitment and synergy of local government with farmers to redevelop the jatropha based biofuel, facilitating biofuel production technologies to increase the independence of production by farmers, regulating trade system of jatropha beans to increase income and motivation of farmers, determining advisability of escort company to maintain business continuity development of biofuels, developing network of partnerships to expand market share of biofuel and strengthening biofuels institutional to improve the bargaining position of farmers.

Keyword: *Biofuel, Jatropha, Development Strategy, Self-Sustained Energy Village*

Introduction

The energy crisis that hit the world as a result of scarcity of fossil fuels has led to rising price of fuel oil (BBM). The domestic energy supply constrained due to the trend of production tends to be lower than the level of consumption. These conditions are accommodated by the government through the provision of energy in sufficient quantity and price should be affordable by the community. This has prompted the government to seek alternative energy from renewable materials which are biofuels.

Biofuels have been becoming prevalent rapidly because of constantly gaining economic value and concordantly having less negative effects on the environment. All plant and animal substances based on the carbohydrate compound as the main component is a source of biofuel. Wood, oilseed crops, plant carbohydrates, plant fiber, plant protein, and herbal waste is a biofuel plant resources (Aydogan et al, 2014). Biofuels are fuels derived from biomass. Biomass is organic material taken from plants and animals. Consisting of wood, agricultural crops, water plants, forestry products, waste and residues and animal wastes (Uriarte, 2010). One of the plants that have the potential as a source of biofuel is Jatropha (Jatropha curcas L). Jatropha is a plant shrubs, small trees and shrubs form large, irregular branching, height of 2 to 5 m, it can even reach 8 to 10 m on fertile soil conditions. Jatropha can grow well in places infertile or on marginal land barren and critical, making it easy to determine the place of growth (Mariam, 2006). Jatropha processing industry should be developed in order to support the General Plan of Regional Energy Development of Central Java Province targeting the energy mix in 2016 amounted to 68.9%, which met from several sources including energy from Renewable Energy (EBT) amounted to 23.343%.

This study aims to identify the factors of internal development of Jatropha based biofuel industry, identify the external factors the development of Jatropha based biofuel industry and formulate strategic development of Jatropha based biofuel industry.

Method
1. Basic Research Methods
The basic method used in this research is descriptive, the research focused on solving the existing problems by arranging the data that has been collected, after it was described and then analyzed.

2.   Methods Siting and Respondents
Based on the initial survey of the study sites in Grobogan obtained data from the Forest Village Community Institution "General Business of Perhutani KPH Purwodadi" there are six sub districts in Grobogan ever planted Jatropha that are Klambu Sub District, Brati, Grobogan, Tawangharjo, Wirosari and the Ngaringan. Based on the results of a survey among the six districts there are two districts that are still found Jatropha which are in Ngaringan and Brati sub district. Therefore, both locations purposively (intentionally) be used as a research location. Total respondents 24 people included 16 Jatropha farmers, 4 head of farmer groups, 2 Head (Subdistrict Ngaringan and Brati), 2 staff "General Business of Perhutani". Sampling technique using purposive techniques and data collection techniques done through indept interview, observation and recording.

3.   Data analysis method
Internal factors analysis of the development of Jatropha based biofuel industry is done by using a matrix of IFE (Internal Factor Evaluation). IFE matrix is used to determine the internal factors of the development of Jatropha based biofuel industry with regard to strengths and weaknesses that are considered important (Rangkuti, 2001). As for the internal factors that will be examined include the factors of production, human resources, financial, institutional and government.

Analysis of external factors developing Jatropha based biofuel industry is done using a matrix approach EFE (External Factor Evaluation). EFE matrix used to evaluate external factors the development of Jatropha based biofuel industry. External factors examined included the economic, social, cultural, demographic, environmental, political, legal, and technology. This is important because of external factors influence directly and indirectly to the development of the biofuels industry.

The formulation of strategic alternatives industrial development Jatropha based biofuel made using SWOT analysis (Strengths, Weakness, Opportunities, and Threats). SWOT analysis is an important support tool for decision-making, and is commonly used as a means to systematically analyze an organization's internal management capability and its external environment (Hui, 2008). SWOT analysis in this research approach was used to formulate the strategy of Jatropha based biofuel business development. SWOT matrix were conceived into four alternative strategy, the which were strategies of strengths-opportunities (SO strategies), strategies of weakness-opportunities (WO strategies) strategies of strengths-threats (ST strategies), and strategies of weakness-threats (WT strategies).

SO strategy implementation, the organization strives to make external opportunities by leveraging internal strength. The purpose of WO strategy is to help companies improve internal weaknesses by using external opportunity. ST strategy implementation, the company seeks to minimize threats in the external environment using the internal strength of the company. In WT strategy, the company took a defensive position so that they can minimize the threat of external environment by using the strength of the company (Jamshidi et al., 2012).

Result and Discussion

 1. **The internal factors of development Jatropha based biofuel industry**

DME program is implemented in some areas both based Jatropha and cassava face many obstacles and challenges that if not bear to face obstacles then the program will stop. It also occurs in the development of the biofuels industry in Grobogan where the industry is closed or no longer in operation. The development of Jatropha based biofuel industry in Grobogan is inseparable from internal factors such as the strengths and weaknesses.

 2. **Strength development of Jatropha based biofuel industry are as follows:**

   a) Jatropha has good prospects as a renewable energy source

   Jatropha has good prospects for development. Castor bean produced from this plant is a raw material for biofuel. Innovation of energy needs as a solution to the depletion availability of renewable energy supply makes distances seed into commodity which has a strategic position. High economic value makes Jatropha feasible to develop.

   b) **Farmer's enthusiastic in developing the cultivation of Jatropha**

   DME program based Jatropha greeted very enthusiastically by farmers which the farmers who are in various locations to implement development programs Jatropha cultivation of Jatropha without coercion. Either independently farmers who have their own land, farmers in LMDH and farmers who use the land owned by "Perhutani", which are in the region to cultivate Jatropha development program. This is based on motivation and a strong desire improving the living conditions of farming jatropha.

   c) **The commitment of the parties in Grobogan in developing Jatropha industries**

   Grobogan chosen as a pilot project for the development of Jatropha DME Program for the commitment of the Central Government and Local Government to make the program successful development of alternative energy. In terms of policy-makers, along with the Provincial Government and Regional Technical Implementation Unit associated with the program is committed to developing a Jatropha based industries. Farmers / farmer groups / LMDH / "Perhutani" as implementers the lowest level in the program have the commitment in cultivating Jatropha.

   d) **The potency of marginal lands in Grobogan that suitable for the cultivation of Jatropha**

   Jatropha in its cultivation does not require arable land because if they are grown in the fertile soil result not compete with food crops. Grobogan have not agricultural land measuring 99 674 hectares of rice fields scattered throughout the districts consisting of moor / garden: 23 917 hectares of plantations: 87 hectares, the forest folk: 4,160 hectares and more: 71 510 hectares. The land area is a potential land that can be used for the cultivation of Jatropha including marginal land/ critical in it.

   e) **Quality of Jatropha biofuel produced was good**

   Jatropha biofuel products produced in Grobogan have good quality. This is because Grobogan has a natural potential support for the cultivation of Jatropha that castor bean produced is also of good quality. With the quality of the raw material Jatropha seed is well supported with good production technology has excellent potential for the development of biofuel Jatropha in Grobogan.

 3. **Weakness of Jatropha based biofuel development are as follows:**

   Besides having some strengths, the development of Jatropha based biofuel industry also has the following weakness:

a) **Farmers have limited resources**

Jatropha farmers in Grobogan district has limited resources in developing Jatropha biofuel industry. In terms of farming Jatropha, with a relatively narrow land ownership, farming limited capital and low mastery of post-harvest and farmers depend a lot on the partner company. Moreover, in terms of biofuel processing farmers also do not have the capacity, capital and production facilities so that when a partner company stopped production so farmers can't do their own processing. Farmers haven't been able to independently develop the biofuel industry.

b) **Management of Jatropha farming is still weak**

Jatropha farms run farmers still weak. There are no related innovations cultivation technology to improve the productivity of Jatropha. Even at the time of the study, Jatropha farming is not managed as a farm, but the Jatropha plant is left to grow wild without maintenance. This is because the three partner companies do not continue to cooperate in the production of biofuels so that Jatropha produced nothing accommodate or process.

c) **Mastery of biofuel production technology by farmers is weak**

Jatropha farmers in Grobogan not be able to process castor beans produced themselves. Poor access by farmers biofuel production technologies cause high dependency on the partner company. Farmers do not master the technology of production and are also able to access their own biofuel production technologies required due to capital constraints and facilitation from the government. Mastery of production technology become a requirement for farmers to be able to process biofuel independently.

d) **Dependency of farmers on the companies**

Jatropha farmers during this depends entirely on the company in terms of marketing partners castor beans. This is because farmers do not have sufficient information relevant market castor beans and biofuel production technologies. Even related to the selling price of castor seed is determined by the company escort. However, due to strong commitments from all three companies that had become partners to Jatropha farmers, the farmers lose the market and no longer able to sell the castor bean produced.

e) **Limitations of Jatropha biofuel market**

Biofuels as renewable energy products does not currently have a broad market even though in terms of market potential is great. Dissemination efforts are still needed concerning utilization of biofuel Jatropha as an energy product that can be used for household or industrial sector. Moreover, the world market potential is still untapped well so that the development of the biofuels industry still requires market penetration efforts.

f) **Promotion of jatropha biofuel is weak**

Efforts to promote biofuel Jatropha has not been made to the maximum, so there are many segments are not familiar with and interested in using biofuel Jatropha as an energy source. The market share is still narrow demands intensive promotional efforts both to local communities, industry and international markets regarding biofuel Jatropha.

g) **It is not yet enable to produce biofuel Jatropha independently**

 Jatropha biofuel potential as new products have not been able to push the government or its own farmers to produce biofuels. Although in terms of market potential and raw materials is very supportive. The relation between farmers and three companies is not

a good experience before can be a motivation to develop Jatropha biofuel industry independently.

Early DME program was launched, socialization/ education/ training Jatropha cultivation intensively implemented either by the Department of Agriculture and the Technical Committee of the processing industry. However, after farmers cultivate Jatropha DME program is no supervision or assistance from the parties concerned. The local government and provincial particular Department of Energy and Minerals Resources, Department of Agriculture and "PT. Perhutani" not conduct intensive monitoring of third processing industry within the fence. If there is intensive monitoring, a better chance for these companies to be responsible for running the program DME.

Agriculture, Plantation and Forestry Grobogan not implement assistance programs of post-harvest Jatropha cultivation so that the problems faced by farmers is not quickly resolved. The company refused Jatropha seeds from farmers because it is considered of low quality. On the other hand, farmers feel Jatropha seeds produced in accordance with the quality standards set at the socialization of the program will run. This is causing the problem is not quickly resolved.

4. External factors of Jatropha based biofuel

Opportunities of Jatropha based Biofuel as follows:

   a) **The need for renewable energy is increasing because of non-renewable sources of energy to fuel is declining**
      Indonesia no doubt has the potential of large energy resources. However, looking at developments in the availability of natural energy is dwindling and one side of the energy needs, especially in Indonesia were bigger then, the energy diversification efforts through the creation of renewable energies become an urgent need to do. The energy needs of both the industrial sector and to the needs of society become a major opportunity for the development of the biofuel industry. The raw material of Jatropha seeds are relatively easy and continuously cultivated into a good potential for the development of the biofuels industry.

   b) **Goverment regulation to combining biofuels with fossil fuels**
      Innovation renewable energy become a necessity that should be expedited, including Jatropha based biofuel. However, efforts to develop Jatropha based biofuel would be more effective if supported by the strengthening of the policy of the central government. Government policies that can be done for example by combining biofuels with fossil fuels. With the policy through government regulation is expected to be a motivation for local governments, farmers and the company partners to jointly develop the biofuel industry in Grobogan.

   c) **The price of fossil fuel is increasing**
      Availability of fuel dwindling to rises in the prices higher and higher. This condition requires solutions which are innovative renewable energy and biofuels can be an alternative renewable energy. This requirement is an opportunity for the development of biofuel industry in Grobogan.

   d) **The development of biofuel production technology**
      Biofuels became one of the products of innovation that is expected to be a solution like a drop in the supply of energy in Indonesia. Biofuel production technology has been developed in an effort to encourage the creation of renewable energy with a variety of products based on a commodity that exist in each region. Likewise with

the production technology of Jatropha based biofuel developed to encourage development. Various machines or technology exists and is needed in the production process is an opportunity for the development of Jatropha biofuel industry in Grobogan.

5. DME program development contained in the General Plan of Regional Energy Development of Central Java Province

Vision Department of Energy and Mineral Resources (ESDM) Central Java 2013-2018: Towards a Prosperous Through Strengthening Management of Energy and Mineral Resources and Energy Independence

Mission:

1) Improving the Management of Mining and Utilization of Groundwater through Optimization With Conservation Principles Consider
2) Improve the Management and Utilization of Electricity and Gas, To Ensure Availability of Energy Through Enhancing Infrastructure And Energy Diversification
3) Develop Potential New and Renewable Energy through Optimization Application of Appropriate Technology Independently
4) Increase the Risk of Natural Disaster Prevention Efforts Towards Geological Disaster Risk Aware
5) Improve the Performance of the Professional Public Service in the Field of Energy and Mineral Resources (Department of Energy and Mineral Resources of Central Java, 2015).
6) Central Java province that target energy mix in 2016 amounted to 68.9%, which met from several sources including energy from Renewable Energy (EBT) amounted to 23.343%.

6. Threats of Jatropha based biofuel development are as follows:

a) Jatropha oil market uncertainty

As product innovation, Jatropha based biofuel is quite new to the market. Although biofuel Jatropha is a product with a promising market prospects, but efforts to introduce this product has not been done. Moreover, the existence of energy products preexisting also a threat to biofuel Jatropha. The market of biofuel Jatropha is still uncertain and the presence of competitors is a threat have to solve.

b) Trade system of jatropha beans is weak

The marketing of castor bean as a raw material for biofuel is still not strong. Dependence on the partner company as a single market castor bean produced by farmers made biofuels still weak bargaining power. It is becoming a threat to the development of Jatropha biofuel future. Jatropha based DME program launched by the Central Government is not accompanied by clear technical instructions on setting the marketing of Jatropha seeds. In this case the farmers have a weak bargaining position due to inability to sell or cultivate Jatropha seeds of Jatropha distance. Oil processing industry limited distance makes the industry as a determinant of price, quality and the marketing of Jatropha seeds. On the other hand, PT. Jatropha and PT. Waterland not have representation unit purchase raw materials at the level of farmers in purchasing seeds of J Jatropha which facilitate farmers to sell seeds within the fence. Farmers directly sell Jatropha seeds to the processing industry even though the distance is very far. This resulted in an expensive transportation costs and may not be comparable to the amount of Jatropha seeds produced, so the cost be very expensive for a kilogram.

c) Standard quality Jatropha oil is high

To be competitive with existing energy product, the quality of biofuel Jatropha become an important factor that must be considered. As new products are being pioneered, the quality of biofuel produced still needs to be improved. While the energy products that have been there previously had a relatively good quality. Demand high product standards to be accepted into a threat to the biofuel market is still at the development stage.

d) Competition from non Jatropha biofuel

Renewable energy in Indonesia is being developed as a solution to the depletion of energy reserves. Jatropha based biofuel has good prospects for development. However, biofuel Jatropha also has many competitors including biofuels by feedstock palm oil, few seeds, coconut, and sunan candlenut. Development of various types of biofuel be a threat for biofuel Jatropha. If biofuel Jatropha is not able to maintain the production capacity and quality it can easily be defeated by a palm-based biofuel, few seeds, coconut, and sunan candlenut.

e) The commitment of the partner companies

Commitment is lower from the firm companion in developing biofuels industry.

In the development of Jatropha based biofuel industry in Grobogan, farmers still rely on partner companies (private). However, the experience has been a partner company does not have a strong commitment to develop biofuels. In fact, farmers enthusiastic in cultivation of Jatropha as a biofuel feedstock. Create conditions for the development of biofuels to be difficult without the support of partner companies as producers of biofuels, farmers will find it hard to cultivate Jatropha seed produced into biofuel.

PT. Enhill, PT. Jatropha and PT. Waterland is a three company Jatropha based biofuel developers who failed to develop biofuels in Grobogan. Three companies are allegedly not actually operate and just take advantage of the DME program is a pilot project of national scale.

The three companies have made a cooperation contract / agreement with farmer groups / LMDH / "Perhutani", but throughout the cooperation contract / agreement are violated by the three companies. PT. Enhill before produce biofuel production has shut down the factory and all production equipment was moved to the outside of Grobogan. The factory been sold to other parties and has undergone several changes of ownership. In this case Jatropha farmers in Sub Ngaringan feel aggrieved because they have not had time to enjoy the fruits of production of Jatropha seeds to be sold to PT. Enhill.

PT. Jatropha and PT. Waterland operates only produce castor oil of approximately 2 years. The results of the study can't be known with certainty why these two companies to halt production. This should be communicated to the relevant parties, including farmers / farmer groups / LMDH and "Perhutani" directly involved in this program. The plant closure is implemented unilaterally by the company so that farmers who have produced Jatropha seeds can't sell their production. The other hand, farmers do not have the ability to cultivate these seeds into oil within the distance that is ready for use as fuel oil. This causes Jatropha farmers cut down and replace it with food crops.

Development strategies of Jatropha based biofuel based on the identification of factors of strengths, weaknesses, opportunities and threats are then formulated alternative biofuel industry development strategy in Grobogan. Alternative formulation of biofuel industry development strategy presented in the SWOT matrix as follows (Table 1)

As for the details, alternative strategies are formulated as an effort to develop Jatropha based biofuel is as follows:

1. Strategy S-O
   1) Strengthening the motivation and continuous assistance to farmers in the cultivation of Jatropha to increase the capacity and quality of castor bean
   Considering the business conditions of biofuels in Grobogan today, efforts are needed to motivate farmers to be more optimistic in the cultivation of Jatropha. Resource potential of land and suitable climate be a great asset for the development of Jatropha commodity which is the raw material for biofuel. Through socialization and mentoring intensive cultivation to farmers are expected to Jatropha production capacity will increase with the better quality. This is because the current cultivation of Jatropha has not been intensified and limited to only be used as garden plants without maintenance. This condition causes the quality of Jatropha produced slightly lower quality. Lethargy production of biofuels and biofuel uncertainties trade system makes farmers less optimistic run Jatropha cultivation.

2. Strategy W-O
   1) Strengthening of local government commitment and synergy with farmers to redevelop Jatropha based biofuel
   Biofuel industry conditions weakened in Grobogan very unfortunate because revenue opportunities and increased prosperity for farmers and the area lost. With the potential of natural and promising market opportunities, the development of the biofuels industry in Grobogan needs to be pursued. The good cooperation between the local government and farmers Jatropha is indispensable for mutual support biofuels development. The local government role in financing, expanding partnerships with stakeholders and increasing the capacity of farmers especially in Jatropha cultivation and post-harvest handling. While farmers as producers of Jatropha to make the cultivation of Jatropha so well that produced quality Jatropha as a biofuel feedstock. This is necessary because during this time, farmers felt the motivation and facilitation of local government is less than optimal.

   2) Facilitation of biofuel production technologies to increase the independence of production by farmers
   The weak development of the biofuels industry in Grobogan such as the dependence of biofuel production to the private sector as a partner. This is because farmers and farmer groups are not able to produce biofuels themselves for not having mastered the advanced electronic or biofuel production. Thus, when the private sector is a partner not to continue the cooperation, the farmers also stopped doing the cultivation of Jatropha because no one will cultivate crops. This condition is unfortunate given the strategic potential of biofuels as an alternative energy source. To that end, the good farmer does not only rely on the cooperation with private companies in the production of biofuels. Gradually required biofuels production technology introduction by local governments then managed jointly by farmer groups or clusters that are trusted with the full assistance of the local government. Thus, farmers have alternatives in marketing the castor bean.

3. Strategy S-T
   1) Realignment of business administration castor beans to increase income and motivation of farmers
   Trade system for Jatropha is actually very simple. Yields of Jatropha a seeds for farmers is collected and sent to the factory to be processed into biofuel. Short chain

markets makes revenue and profits high so farmers are very enthusiastic farmers cultivate Jatropha. However, the risk of this trading system is when a company becomes a partner does not have a strong commitment and responsibility towards the agreed cooperation. Moreover, if farmers are partnering with a company then the risk will be even greater. To that end, it is necessary realignment of the marketing of castor seed so that farmers do not face great risks in marketing the seeds away. Facilitation of local governments in the selection of companies who are partners of farmers is needed so the only company with commitment, transparency and responsibility in maintaining strong partnerships. In addition, the government's involvement in the supply chain castor beans are needed to evaluate and monitor the course of the partnership.

2) Standardize eligibility escort company to maintain business continuity development of biofuels
Some cases of fraud by private companies as partners in the development of biofuels should be an important consideration in determining factor counterparts. The feasibility of the company's partner in the production of biofuels is needed to minimize potential problems in partnership. Standardization and clear requirements for private companies will be partners in the development of biofuels need to set the tone da special team involving local government and a team of experts who intensively evaluate the course of the partnership.

4. Strategy W-T
1) Development of a network of partnerships to expand market share Jatropha based biofuel
Biofuel is a renewable energy product has a promising market prospect. However, because all this for production activities and well as marketing of biofuels depend entirely on the partner company, the profit earned Jatropha farmers are still not optimal. In fact, farmers are not able to market seeds stopping distance when the partner company partnerships. For the development of the biofuel industry in the future of local government should be more pro-active in facilitating the expansion of market share for biofuels marketing. Partner companies as producers of biofuels should not just one so that no reliance in terms of marketing of castor seeds.

2) Institutional strengthening biofuels effort to improve the bargaining position of farmers
With this form of partnership that runs for this, farmers' bargaining position can be said to be low because farmers rely entirely on marketing seed distance to the partner company. This is because farmers do not have a comprehensive reference market for castor bean produced. To improve the bargaining position of farmers within the fence will require institutional strengthening. Needed clarity of roles and responsibilities in a partnership that exists. In addition, specific institutional needs on the part of the farmer which is a container and protector of Jatropha farmers as a bridge between farmers, enterprises and government partners. Thus, farmers will be better prepared and have a strong bargaining position in partnership to develop the biofuel industry.

Conclusions and Recommendations
1. Conclusion
a) Factors Internal Factors development of Jatropha based biofuel industry that is a factor of weakness and strength. Areas of weakness include: 1) Limitations of resource owned by farmers, 2) Management of farming Jatropha is still weak, 3) Mastery weak biofuel production technology by farmers, 4) Dependence on company resource companion, 5) Limitations Jatropha biofuel market, 6) Promotion of biofuel

Jatropha less than the maximum, 7) The absence of courage farmers and local authorities to produce biofuel Jatropha independently. While factors force development of the biofuels industry include: 1) Jatropha has good prospects as a renewable energy source, 2) Farmers enthusiastic in developing the cultivation of Jatropha, 3) The commitment of the parties in Grobogan in developing Jatropha industries, 4) The potential of marginal lands in Grobogan adequate and suitable for the cultivation of Jatropha, 5) Quality of Jatropha biofuel produced good.

b) External factors development of Jatropha based biofuel industry factors include opportunities and threats. Areas of opportunity include: 1) The need for renewable energy is increasing because of non-renewable sources of energy to fuel the wane, 2) Regulation of goverment in combining biofuels with fossil fuels, 3) The price of fuel is increasing 4) The development of biofuel production technology and 5) Program DME development of Jatropha contained in the General Plan Regional Energy Development of Central Java Province. While the threat factors include: 1) Jatropha oil market uncertainty, 2) Weak trade system castor seeds, 3) Standard quality Jatropha oil is high, 4) Competition from non Jatropha biofuel and 5) The commitment of the partner company / companion.

c) Alternative development strategies Jatropha based biofuel in Grobogan among others: 1) Strengthening the motivation and continuous assistance to farmers in the cultivation of Jatropha to increase the capacity and quality of the castor beans, 2) Strengthening local government commitment and synergy with farmers to redevelop biofuels Jatropha based bioufel, 3) Facilitation of biofuel production technologies to increase the independence of production by farmers, 4) Realigment of business administration castor beans to increase income and motivation of farmers, 5) Standardize eligibility escort company to maintain business continuity development of biofuels, 6) The development of a network of partnerships to expand market share Jatropha based biofuel and 7) Institutional strengthening biofuels efforts to improve the bargaining position of farmers

2. Recommendation

The development of Jatropha based biofuel industry in the DME program is a government program that should receive the support of all parties. The failure of the development of biofuel industry in the DME program is an important lesson that synergy between farmers - the biofuels industry - government - stakeholders are indispensable in this program. This synergy that seems sturdy yet built in the development of this DME program. Therefore, if the program will be developed in the next time then the foundation of this synergy needs to be built first.

The DME program before further developed the feasibility study should be carried out in advance so that the program can run or not depends on the results of the study. The feasibility study shows the potential of the market, the ability and readiness of farmers / farmer groups, the production capacity of the people, trade, land cultivation and technology are developed. If the results of the feasibility study results DME viable then the program can be implemented.

RESEARCH OF WHILE BBV INFECTED AND DOSAGE OF RICE CHAFF ON THE INCREASING OF PATHOGEN STEM ROT RESILIENCE OF VANILLA (BBV) WHICH INDUCED OF RHIZOCTONIA BINUCLEATE (BNR) AND THE EFFECT ON THE INCREASING OF ORGANIC MATTERS AND SOIL PHOSPHORUS

Haryuni, Tunas Pembangunan University, Indonesia
Tyas Soemarah K.D, Tunas Pembangunan University, Indonesia
Teguh Supriyadi, Tunas Pembangunan University, Indonesia
Supriyadi, Sebelas Maret University, Indonesia

Abstract

The using of healthy vanilla seedlings can increases productivity, quality, and plant's production life, however seeing the fact that inoculum *F. oxysporum* f.sp.*vanillae* (Stem Rot of Vanilla or BBV) scattered on the land then the utilization of microbial antagonism as a control agents which can decreasing level of the attacks. The effectivity of *Rhizoctonia* Binucleate (BNR) on plants affected by while BBV infected and dosage of chaff on plants. Before the treatment of every sample vanilla plants were inoculated with 15 grams of *Rhizoctonia* Binucleate and 9 grams of phosporus. This research consisted of two treatment which first treatment is when inoculation of BBV with a level without inoculation of BBV, consists of (while doing planting, after fifteen days and after thirty days) or (H_1, H_2, H_3), the second treatment is dosage of rice chaff consists of (0, 5, 10, 15) grams/plant or (S_0, S_1, S_2, S_3), soil type is Alfisol. With those variables on research units which organized around broad substantive research topics. Every research units consists of planted ten vanilla seeds in polybag which contain of 500 grams medium soil. Whereas sampling units consists of overall individual research units. The result of research shows that the interaction when inoculation of BBV and dosage of chaff truely different with the level of organic material, phosporus and percentage of seedling death. Higher result of organic matter observation's parameter on the treatment H_3S_3 was 4.10%, phosporus on the treatment H_3S_3 was 12.14%.

Key words: *Rhizoctonia binucleate, rice chaff, organic matter, phosporus, vanilla*

Introduction

Vanilla plant (*Vanilla planifolia* Andrew) is one of industry plants which has economic values (Hadisutrisno, 2005). Vanilla can be augmented generatively with seeds and vegetative by cuttings. Because of augmentation with seeds takes time and blooming slower, then vanilla augmentation for commercial did by cuttings way. Farmer usually uses vanilla plants substance in the form of long cuttings (50-60 cm), at least consist of five joint as an augmentation substance. Vanilla seed or cutting needs every year around sixteen million of seeds, then needed a comprehensive main garden. Until now, adding seeds is still an obstacle factor in areas expansion, so need to think about adding cheap and efficient vanilla seeds from the best varieties (Sukarman, 2011). The main disease of vanilla plants in Indonesia is foul stem of vanilla (BBV), which caused by fungus *Fusarium oxysporum* f.sp *vanilla.* This disease can causing a great damage which makes 50% to 100% plants death (Hadisutrisno, 2004). Every controlling effort of foul stem of vanilla which had been done, there are utilization of soil microorganism such as fungus rizosfer which profitable and has an antagonism characteristics on soil borne pathogen (Sukarman, 2011; Haryuni *et al.,* 2014a; Haryuni & Tyas, 2014b).

Fusarium is an uncontrollable fungi (Singh *et al.*, 1999), lives as saprofit in soil for two until four years, the infection is so fast by the sparks of soil water, water flow, insects, soil and plants cutting substance (Hadisutrisno, 2005). Fungus *Fusarium* sppin plants tissue creates polypeptide which has a role as a toxin and creat fusarat acid as pectolytic enzyme which is *pektinmetilesterase* (PME) and *depolimerase* (DP) which have roles to split the pectin in the cell wall of xylem and create colloidal mass as non-pectin which clogging the xylem until change into brown (Semangun, 2000; Semangun, 2001; Mukarlina *et al.*, 2010). Infection of fungus *F. oxysporum* through by lateral roots tip or the main of roots tip in parenchyma intercellularly and intracellulary, after that the infection is hamperring roots growth. This fungi survives in saprofit condition which shaped as chlamydospora on period of time up to five years (Sukamto &Tombe, 1995; Sudantha & Abadi, 20011).

The function of organic matter are to change nutrient uptake of soil to unravel, 90% lost very fast because decomposition process around 5% only which have a form as mineral. Those lost in the soil are affected by temperature, oxygen, and humidity, even with too much soil processing (Funderburg, 2001). Organic matter *Gliricidie sepium*, haulm and animal manure which are organic matter that worth to be used for farmer, it is because those have high quality, availability and high potential as well (Minardi *et al.*, 2011).

Phosphat is essential nutrition which as plants needs for its growth and progress. There are huge of phosphat in the soil, but around 95% to 99% phosphat which unavailable, so it can't be used by plants (Sanjotha, *et al.*, 2011). Efficiency of phosphorus fertilization usually around 15% to 20%, the last is lost because of abstersion and adsorbed by soil colloids (Moljono *cit* Soeminaboedy & Tejowulan, 2012).

BNR has a role as mikoryza (Haryuni, 2012), mikoryza fungi is fixing chemistry, physics and biology of soil characteristics because hyphae external of mikoryza fungi is able to penetrate the soil pore space, both micro or macro. Hyphae external and root existence is very important becauce it can absorbs and keep soil moisture (Dhillion & Friese, 1997; Nelson & Safir *cit.* Harahap, 2009). The existance of BNR and phosphorus before been inoculated with BBV is increasing plant resilience.

There is no final result of research about the effect of BNR and rice chaff on vanilla resiliences progress on pathogen of BBV, so we need to do testing, the aim of this research is to getting know while infection of BBV and rice chaff dosages happens, then increasing plant tissues resilience and its effect of the increasing of organic substance and soil phosphorus.

Methods
Give 9 grams phosphorus/plants and 15 grams fungus *Rhizoctonia* binucleate in every treatment, first treatment is inoculated by BBV with a giving variation by inoculated when planting, inoculated on fifteen days after planting and the second treatment's parameter rice chaff with a dosage without rice chaff, 5 grams/plant, 10 grams/plant, 15 grams/plant which the soil type is Alfisol. With those variables above research units use organized around broad substantive research topics project. Every research units consist of ten vanilla seeds which been planted in polybag which contain of 500 grams medium soil. Whereas the sampling unit consist of the whole of individu in research units.

Analysis
Soil analysis: example is soil that has been dried until the weight is constant, crushed or mashed, be strained with sieve size 2 mm, then put into plastic bowl. Soil characteristics that being observed in laboratory involve soil organic matter and phosphorus of soil with Bray II methods. Determination of organic material started with determination of C-organic

substances (COT) with Walkley and Black methods (1934). Soil C-organic substances which next is being synchronized with soil organic substances (BOT) with the formula BOT = 1.724 x % COT (Sabaruddin *et al*., 2009).

Analysis of variance was conducted to test soil organic matter content and available soil phosphorus based on organized around broad substantive research topics project and continue with BNT test on the 5% of totally different standard.

Result and Discussion

1. Soil Organic matter

Soil organic matter is one of material forming soil aggregates which has a role as adhesive material between the soil particles to unite into soil aggregates, so then organic matter is important in forming soil structure (Suntoro, 2003). Soil degradation and land happens because of the contamination of agrochemistry materials, erosion, and improper land management resulting decrease in the carrying capacity of the physical, chemical and biological soil. Organic matter is one of the most effective ways to control the occurrence of degradation of land.
Figure 1. Soil of organic matter

Figure 1. shows that vanilla seeds which infected by BBV a month after planting (H_3) shows truely different with seeds that has been infected by BBV while were planting (H_1) whereas (H_1) and (H_2) was 3.09% and 3.31%. It caused by phosphorus (P) that has been given before planting could change P to available with hyphae help which formed from BNR, BNR existence has function as affected organic matter even by directly through mineralisation process or indirectly by helps the release of P which has been fixed (Suntoro, 2003). Soil organic matter serves as a reservoir of nutrients for crops, provides soil aggregation, increases nutrient exchange, retains moisture, reduces compaction, reduces surface crusting, and increases water infiltration into soil. Components vary in proportion and have many intermediate stages.

The treatment of giving dosage of 15 grams rice chaff is 3.65 grams shows truly different and tend to increase soil organic matter while the amount of (R_0), (R_1), and (R_2) are 2.86%, 3.26%, and 3.47% (Picture 1). 15 grams of rice chaff together with BNR and P for a month give a room and time to decompose organic matter. Suwahyono (2011) thought that the content of humic acid on organic matter is an important substance from humus molecule which has a role to recondition soil as medium planting, help to loosen the soil, and help to uptake the nutrient, also increasing retention of water content, and spur the growth of microbes in the soil. Everyday humic acid is called humus and these compounds contribute to the physical and chemical quality of the soil. Support by Funderburg (2001) benefits of

organic matter are 1) nutrient supply, 2) water holding capacity, 3) soil structure aggregation, 4) erosion prevention.
Figure 2. Effect of interaction of variation of BBV infected and dosage of rice chaff to soil of organic matter

Figure 2 shows that variant interaction while BBV infection and dosage of rice chaff effected it and tend to increase soil organic material content. The increasing of rice chaff and increasing while BBV infections on plants give real effect (Haryuni, 2012) by 4.1%. Whereas the lowest organic material content on treatment (R_0H_1) is 2.93%. It is because of increasing of dosage of rice chaff from (0, 5,10) grams to 15 grams causing in increasing organic material contents. Based on forming process, rice chaff doesn't bring microorganism pathogen because it was passing through burning process, then it is relative sterile. Its role in the soil increasing soil porosity then the soil becomes flabby also increasing soils ability to absorb water. The content of carbon is high, wherein the carbon element is indispensable in the composting process. Research result from Gawansyah *cit*. Tamtomo *et al*., (2015) shows that rice chaff charcoal serves as the organic material can increase the productivity of soil and fertilizer efficiency as well as reducing the need for fertilizers. Organic matter is an energy source of macro and microbiology of soil so then increasing activity and microbiology population which has relation with decomposition activity and mineralisation of organic matter (Stevenson, 2007). Supported by result of analysis data Tamtomo *et al.,* (2015) that the content of rice chaffs charcoal are 0.2107% phosphorus, 0.3979% Calium, 0.4758% Calsium, 0.0868% Magnesium and 3.2816% neutralization power. Rice chaff charcoal contains a lot of nutrient which have a role in increasing soil organic matter through decomposition process which give effect to the resistance and growth of plants. Sympatric microorganisms that influence microenvironment, such as water balance, nutrient content and substrate quality (Rasmussen *et al*., 2015).

2. Soil Phosphorus

Nutrient which can be absorbed by plants with mycorrhizal fungi helps and roots are phosphorus, this element is required in relatively high amounts of plant (Marschner, 1986). Phosphorus which has been absorbed by hyphae external that resulting from BNR and modified root into polyphosphate compound. Hyphae is the important part of mycorrhizal fungi that are outside and inside the roots and serves to absorb the phosphorus in the soil (Dhillion & Friese, 1997; Brundrett, 2000; Krishna, 2005). Bolan (1991) thought that roots which been inoculated with mycorrhizal fungi, phosphorus levels higher than the roots do not bermikoriza. Supported by research of Haryuni (2012) dan Haryuni & Tyas (2015) BNR hyphae external increasing soil phosphorus levels. Support by Cameron *et al*., (2007) *Goodyera repens* can obtain significant amounts of P from its mycorrhizal partner. These results provide further support for the view that mycorrhizal associations in some adult green orchids are mutualistic.
Figure 3. Soil of phosphorus

Time of BBV infected is truly different and increasing soil phosphorus levels, BBV infected while planting (H_1) is 9.45% but (H_2) and (H_3) increased to 9.60% and 10.38% (Figure 3). That is because BNR which has been inoculated before planting forming threads hyphae, then issued a phosphatase enzymes and organic acids, especially oxalate can help liberate phosphorus (Bolan, 1991; Sasli, 2004). Research on sorghum were inoculated with mycorrhizal fungi showed that phosphorus levels higher than those without inoculated mycorrhizal fungi. Menurut Sasli (2004), thought, plants that have been with mycorrhizal fungi can grow better because can uptake nutrient such as N, P, dan K more than in the infected soil and root mycorrhizal fungi can increase the absorption of nutrients. BNR inoculation forms hyphae then helps the roots absorb and store water.

The increasing of husk dosage gives real effect and tend to increase soil phosphorus levels (R_3) is 11.95% whereas on dosage (R_0) (R_1) and (R_2) 7.77%, 9.41% and 10.1%. Increasing of phosphorus because husk contains of humic acid which is organic material components (Tamtomo *et al.,* 2015). Adding organic material can increase soil microorganism population even fungi or decomposers (Haryuni, 2012). The microorganisms that play a role here is BNR which grows forming threads hyphae thus improving nutrient absorption P. Supported by the research of Priyadharsini & Srane (2009) which states that rice husk ash improve the growth and yield of cowpea. BNR is microorganism which has ability to extract phosphate from insoluble form into a form available to plants through secretion of organic acids that

produced for the release of the complex P sorption (Hanafiah *et al.,* 2009; Haryuni, 2012). Inoculation can be increased available soil P concentrations, so that inoculated roots mobilize more P and plants may have up taken more P from soil. Arbuscular mycorrhizal fungi inoculation can be used as a component of integrated nutrient management strategies (Cozzolino *et al.*, 2013).

Figure 4 shows that variant interaction while infection BBV and rice shaff dosages gives different effect and tend to increasing soil phosphorus levels. On interaction (R_3H_1) the highest phosphorus levels is 13.03%, meanwhile (R_3H_2) and ($R_3H_1$3) are 10,61% and 12,22%. That was because of BNR and chaff contains of chitinase activity or microbial kitinolik, then hydrolyze chitin BBV compounds that has a role as organizer of cell walls, so BBV weaks even death (Fakamizo *et al., cit*. Ferniah *et al.*, 20011; Semangun, 2001; Haryuni *et al.*, 2014a). BNR and chaff which degrade chitin BBV called as biopesticides and has a role as enzym producer and Plant Growth Promoting Fungi (PGPF) which produce metabolites growth regulators and provide nutrients for plants (Suryanto *et al*, 2010; Bustaman *cit*. Khaeruni & Rahman, 2012; Haryuni *et al.*, 2014).
Figure 4. Effect interaction of variation of BBV infected and dosage of rice chaff to soil of phosphorus

BNR and rice chaff which degrades BBV has a role as microorganism that can release P bound so available shaped to plants. BNR as mycorrhizal can absorb P from mineral P sourches which soluble because produce organic acids and phosphatase enzyme, with the mechanism of infection of the root system of the host plant, produces interwoven hyphae intensively then mycorrhizal roots can increase nutrient absorption capacity (Iskandar, 2001; Haryuni, 2014). Wherein P in soil substances is increasing, then P absorbtions by plants will be increase as well (Mengel & Kirkby, 2007). Organic substances and mycorrhizal increase availability of P on corn crop (Sufardi *et al*., 2013). The higher of population of mycorrhizal increase the absorption of water and nutrients needed by plants (Sastrahidayat, 2011; Subhi *et al,* 2014). Microorganism existance is needed oc n P element because (1) the amount in soil

is little, (2) unavailability of the original P, and (3) P fixation occurs in soils derived from fertilization (Buckman dan Brady, 1980).

Conclusion

Based on the analysis and the discussion above it can be concluded that while infection BBV, rice chaff dosages and its interaction really effecting on organic material levels and soil phosphorus and tend to increase. Infection BBV on the base of the trunk does not infect but degraded by BNR, contains of humic acid then decomposes into organic matter. Organic matter which has been formed is an energy source of BNR of hyphae external growth which has a role to absorb available P to plants.

DOES INFORMATION SYSTEM TECHNOLOGY SUCCEED IN HELPING MANAGE DEBT?

Permana, D. Sukma, Sebelas Maret University, Indonesia
Sutaryo Sutaryo, Sebelas Maret University, Indonesia

Abstract

Using DeLone& McLean IS success model, we investigate succeed of Debt Management and Financial Analysis System (DMFAS) that used by Indonesia to manage around USD 57,2billion of government debt. We use 84 samples from 100 DMFAS user and multiple regression analysis was applied to evaluate the model. Except link from system quality to intention to use and user satisfaction to intention to use, the hypothesized relationships between the success variables are significantly or marginally supported. Moreover – based on direct and indirect effect of causal path – among three antecedents quality, information quality has strongest influence to net benefit while net benefit influenced stronger by intention to use than user satisfaction. The findings of this study can be used to assess DMFAS succeed that used in other country from user perspective.

Keyword: *DMFAS, Debt Management, IS success model, Mandatory System, G2G System*

Introduction

As a developing country, Indonesia must maintain its economic growth. In order to maintain that economic growth, Indonesia has some fiscal policy.This fiscal policy has two main instrument, taxation and government expenditure. To make economic growth positively, the government must increase its expenditure to productive sector and that's why now Indonesia applied a deficit budgeting. This is inline with Wagner's Law that predicts that the development of an industrial economy will be accompanied by an increased share of public expenditure in gross national product. Indonesia's main financing source for that expenditure is taxation. Unfortunately, money from taxation is not enough for financing the government expenditureproven by low tax ratio at around 11% in 2015[28]. To cover that gap, Indonesia borrow money with two main instrument, state bonds and debt. Thus, borrowing money from creditur is unavoidable. Data per 30 September 2016, Indonesia's debt outstanding is USD 57,2 billion[29]. In order to make this debt usefull for economic instead of burden for economic, Indonesia must apply international best practices to manage its debt which is one of them is using information system technology in managing debt. The Directorat General of Financing and Risk Management Ministry of Finance (DGFRM) and Central Bank are institutions that managing Indonesia's debt. Since 1989, those 2 institutions

use a system called Debt Management and Financial Analysis System (DMFAS) to manage the debt.

DMFAS is a G2G information system that has main role to managing government debt including manage general debt information, amortization schedule, debt service operations, data projection and debt analysis. Developed by DMFAS Programme – a program under United Nations Conference on Trade and Development – DMFAS has been used in 57 countries all around the world. Since its vital role for managing Indonesia's debt and fact that its one of world class information system, it is become important to measure DMFAS success in Indonesia.

DeLone and McLean (1992)did some comprehensive review with some measurement concept of information system success and propose 6 information system success factor as a taxonomy and framework to measure independent variable in information system success research. The model known as D&M IS success model. In 2003, DeLone and McLean (2003) did update to their model which is generally give a multidimensional relationship between 3 antecedant quality: information quality, system quality and service quality with 2 satisfaction construct: intention to use/use and user satisfaction and their ultimate link with net benefit.

Although D&M IS success model has been widely used by researcher to be a framework for their research, there are still few research on DMFAS success. One of them was conduct by Ariffudin (2014) that investigate about user acceptance toward DMFAS adoption with technology acceptance model as his framework. Inline with Wang and Liao (2008), measuring and evaluating eGovernment progressand success have become a priority for decision makers in all countries and theyemphasized on the need for evaluation efforts that assess the effectiveness of theeGovernment systems, this research aims to find out what factors affecting DMFAS success besides validating a multidimensional G2G and mandatory systems success model based on theDeLone and McLean (2003) IS success model.

This paper is structured as follows. Section 2 is literature review about D&M IS success model and DMFAS. Section3 presents our research model and hypotheses. Section 4 presents research design and method. Section 5 presents the results. Section 6 presentsa discussion ofthe results of the study.Section 7 presents a conclusion of the study.

Literature Review
Information system success model

The DeLone & McLean information success model (hereafter called D&M IS Success Model) was first introduced in 1992. The primary purposeof the originalDeLone and McLean paper (Delone and McLean, 1992)was to synthesize previous research involving IS success into a more coherent body of knowledge and to provide guidance to future researchers (Delone and McLean, 2003). The model was based on communication research of Shannon and Weaverin 1949 and Mason in 1978 (Rai et al, 2014). As in Rai et al (2014), Shannon and Weaver devide 3 level of communications: (1) the technical level of communications asthe accuracy and efficiency of the communication system that produces information, (2) the semantic level is the success of the information in conveying the intended meaning, and (3) the effectiveness level is the effect of the information on the receiver.In theD&M IS Success Model, "systems quality"measures technicalsuccess; "informationquality" measures semantic success; and "use, user satisfaction, individual impacts,"and "organizational impacts" measure effectiveness success.

As in Rai et al (2014), Mason (1978) adaptedShannon and Weaver's three levels of communicationproblems to an IS context. Mason interpreted the effectiveness level to include influence on users and defined the effectiveness-influence level in terms of eventsthat

may influence users. The events include receipt ofinformation, evaluation of information, and application of information. Evaluation and application of information may effect a change in the user's behavior.

Based on both process and causal considerations, these six dimensions of successare proposed to be interrelated rather than independent(As in figure 1)(Agrifoglio et al: 2015):(1) system quality, the measurement of the system itself; (2) information quality, the measurement of the IS output; (3) information use, recipient's consumption of the IS output; (4) user satisfaction, recipient's responses to the use of the IS output; (5)individual impact, the effect of the system on user behavior; and (6) organizational impact, the effect of the information on organizational performance.

This model makes two important contributions to the understanding of IS success. First, it provides a scheme for categorizing the multitude of IS success measures which have been used in the research literature. Second, it suggests a model of temporal and causal interdependencies between the categories (Seddon, 1997).
Figure 1. 1992 D&M IS success model (DeLone & McLean, 1992 p. 87)

The D&M IS Success Model, though published in 1992, was based on theoreticaland empirical IS research conducted by a number of researchers in the 1970s and1980s and the role of IS has changed and progressed during the last decade (Delone and McLean, 2003).The explosive development of e-commerce was became DeLone and McLean motivation to update their IS success model in 2003 (Wang & Liao, 2008). Figure 2 shows the updated IS success model with changes: (a) the additionof service quality to reflect the importance of service and support in successful IS systems, (b) the addition of intention to use to measure user attitude and (c) the collapsing of individual impacts and organizationalimpacts into a more parsimonious net benefits construct (Dewi, 2010). Thus, the dimension of IS success in updated D&M IS Success Model are: information quality, system quality, service quality, intention to use/use, user satisfaction and net benefit.
Figure 2. 2003 D&M IS success model (DeLone & McLean, 2003 p. 24)

Number of study has been conduct to test and validation the model, some of them are focus on public sector informations system.

Seyal and Rahman (2015) conduct a pilot study undertakes and validates the Delone & McLean's (2003)instrument to measure users' success of Financial and Accounting Information System (FAIS)developed for Brunei Government under its e-Government initiative and found that success of the FAIS is measured by the net benefit which in turn is determined by users'satisfaction and system use.

Fadhilah et al (2016) investigates the role ofmanagement accountants in Indonesia by adopting the D&MIS success model (2003) and found that both management accounting informationquality and management accounting service quality have significantrelationship with user satisfaction.

Aditiawarman et al. (2014) using D&M IS success model investigate Sipendalih (Indonesia voter management system) effectiveness and found that information and systemquality as well as system ease of use significantly influencedvoter's intention to use Sipendalih.

Edrees and Mahmood (2014) conduct study that provides an empirical test of an adaptation of D&M IS success model in the context of G2C eGovernment and found that the model was valid and all of relationship between six success dimensions was significantly or marginally supported.

Kerta and Suryawan (2013) conduct study to measure success of information system in Binus University using D&M IS success model and measure its maturity level using COBIT. They conclude that the information system was good enough and the maturity level at repeatable but intuitive.

Hu& Wu (2016) conduct study that provides an empiricaltest of the D&M IS success model in G2B contexts for environment information system and found that the use of the information system corresponds to both informationquality and the system quality, and the system quality providedthe greater contribution when it comes to the system's application.

Xinli (2015) examine the effectiveness ofElectronic Monitoring Systems (EMS)in reducing corruption in China usingD&M IS success model and found that the application of EMS has a positive effecton reducing corruption. Information Technology (IT) thus has the potential toreduce corruption, but the institution and the people are more important.

Agrifoglio et al. (2015) conduct study for understanding the effectiveness of e-court applications in Italy using D&M IS success model and found the explanatory role of the model and the salient contribution of system andinformation quality variables on court staff's performance.

Leylan (2016) conduct study toward e-Police service Officers of Iran using D&M IS success model and found a sequence of factors that influence the success of the system: service quality, net benefits, user trust, use, system information and systemquality.

Agbabbiaka and Ugaddan (2016) conduct study to investigate the salient factors that are significantin predicting the public value creation ofKorean eGovernmentfrom the citizen perspective using D&M ISSuccess Model and the public value approach. They found that information quality and system quality were significantly predict trust in eGovernment, while forcitizen satisfaction, information quality and servicequality were critical. Moreover, information quality, servicequality and citizen satisfaction are significant inpredicting net benefits.

Rai et al. (2014) conduct a research for empirically and theoretically assessing DeLone and McLean's (1992) and Seddon's (1997) models of information systems (IS) success in aquasi-voluntary IS use context and their results support DeLone and McLean's focus on integrated IS success models and their observationthat IS success models need to be carefully specified in a given context.

Chen et al. (2015) examines citizens' propensity to use e-governmental website services through the lens of theIS Success Model in general with trust theory addition, and in the context of the Philippine online tax filing system. They found that trust in technology, trust in government, and prior experience directlyaffected the trust in e-government websites, which in turn directly influenced all three IS quality dimensions. Of these three dimensions, information quality was found to be the most consistently and significantly influence perceptions of usefulness and satisfaction, implying that this dimension is the mostcritical one beyond the service quality and system quality for taxpayers to use the system.

Manandhar et al. (2015) using D&M IS success model investigate the factors related to the successfulimplementation of online e-government service delivery mechanism inKathmandu, Nepal and conclude that the successful implementation of onlineservices depends on the system quality which functions as an integral part of allquality measures in the Nepalese perspective.

Stefanovic et al. (2016) investigates the success of e-government system in Serbia and found that system quality is the main component of measuring the success of an e-government system in a municipality.

Khayun & Ractham (2011) attempted to identify the e-Excise (the online excise tax payment) successfactors by employing the IS success model and found that by increasingTrust in the e-Government website, Perceptions ofInformation Quality, Perceptions of System Quality, andPerceptions of Service Quality will influence SystemUsage and User Satisfaction, and will ultimately haveconsequences for the Perceived Net Benefits.

Awwad & Mohammad (2010) conduct a study that using DeLone and McLean's IS success model in the mandatory context of onlineregistration system (ORS) in one Jordanian university and empiricalexamination of the model's hypotheses has indicated that students' "intention to use" ORS isdependent on system quality, service quality, user satisfaction and net benefits.

Floropoulos et al (2010) conduct an investigation the success of the Greek TaxationInformation System (TAXIS) from theperspective of expert employees, who work in public taxation agencie. They results provide evidence that there are strong connections

between thefive success constructs. All hypothesized relationships are supported, except for the relationship betweensystem quality and user satisfaction.

As a conclusion, weassume that the updated D&M IS Success Model can be adapted to measure DMFAS success from the user perspective. As the focus of this study is on themeasurement of the success of DMFAS from the user perspective, the net benefit in thisstudy refers to the user-perceived net benefit evaluation of DMFAS.

Debt Management and Financial Analysis System (DMFAS)

Based on DMFAS 6 Brochure, DMFAS is software designed to help countries manage their external and domestic public debt. DMFAS monitors debt obligations such as government, government-guaranteed and on-lending debts, as well as grants. It can also be used to monitor private non-guaranteed external debt.

DMFAS 6 is the sixth major release of the DMFAS Programme software since 1982. Based on state-of-the-art web technology, DMFAS 6 is accessible from commonly used web browsers, with a customizable user interface and enhanced security. It offers all the existing functions of the previous version (5.3) and many new features for all levels of users.DMFAS 6.0 was designed to meet needs for modern debt management office with separation of: front-office (issuance of debt securities), middle-office (analysis) and back-office (registration and management of operations) tasks.

Usually installed in the Central Bank and/or Ministry of Finance, it provides accurate and timely information for debt management. DMFAS enables debt officers to carry out the following operations:
1) Record all information concerning loans, grants and debt securities, including their possible relationship to projects and to different national budget accounts,
2) Create and update estimated disbursements automatically,
3) Calculate all amortization tables automatically,
4) Record real drawings, real subscriptions and debt service operations,
5) Identify loans where debt service is in arrears and calculate late interest,
6) Produce a wide range of standard and customized reports, including reports for validation, control and statistical bulletins,
7) Perform analysis of debt portfolio and build debt strategies

DMFAS has so far worked directly at the country level with 57 countries (list country that use DMFAS available in appendix 2).

As one of the developing countries, Indonesia has used DMFAS primarily to monitor government foreign debt and grants.In Indonesia there are four institution that use DMFAS, (1) Directorate General of Financing and Risk Management MoF for managing foreign debt and grant, (2) Central Bank for managing foreign debt, (3) Directorat System of Investment Management MoF for managing subsidiary loan agreement – a forward lending loan from foreign to local government mediated by central government – and (4) Indonesia Investment Agency MoF for managing local government loan as investment. This study focus on use DMFAS in managing foreign debt so the target institution of this study was DGFRM and Central Bank.

Research Model and Hypotheses

Using DeLoneand McLean's original IS success model (1992), we consider system quality, information quality, service quality,intention to use,user satisfaction, and net benefit as key variables in assessing the success of DMFAS. The research model is shown in Figure 4. There are 2 main difference with original D&M IS success model, first we use intention to

use instead of use since DeLone and McLean suggest that for mandatory system intention to use is more proper than use. Since DMFAS is mandatory system, then we use intention to use. Second, we eliminate the link from net benefit to intention to use and user satisfaction to avoid model complexity.

Information quality

Informationquality captures the system contentissue. The content shouldbe personalized, complete, relevant, easy to understand, and secure. (DeLone &McLean, 2003).In this context, information quality is about how well the information provided in DMFAS so that can help user in his or her daily task. Higher information quality will bring positive intention to use toward DMFAS. Thus, we hypothesise:

H1. Information quality will positively affect intention to use.

Moreover, if the information provided is complete, relevant, easy to understand, and secure, user will experience satisfactionin using the system, because such information helps them to do their daily task more accurate and faster. Thus, we hypothesise:

H5. Information quality will positively affect user satisfaction.

System quality

System quality is concerned with whether or not thereare 'bugs' in the system, the consistency of the userinterface, ease of use, quality of documentation, andsometimes, quality and maintainability of theprogram code (Seddon 1997). If DMFAS has a good system quality, then user will experience less error and bugs when using it. If user experience system better, it will lead to positive intention to use and higher user satisfaction. Thus, we hypothesise:

H2. System quality will positively affect intention to use.
H6. System quality will positively affect user satisfaction.

Service quality

Service quality is concerned with the quality of thesupport that system users received from the ISdepartment and IT support personnel. For example,responsiveness, accuracy, reliability, technicalcompetence, and empathy of the personnel staff (Pitt et al. 1995). Better service quality will make user feel comfortable and secure when using DMFAS – since they know that there is a good technical support from IT department – and then will lead to positive intention to use and higher user satisfaction. Thus we hypothesise:

H3. Service quality will positively affect intention to use.
H7. Service quality will positively affect user satisfaction.

User satisfaction

User satisfaction is recipient response to the use of the output of an information system (DeLone & McLean, 1992). User satisfaction towards systemmeasure as an user psychological or affective state due to the cognitive appraisal of their experiences with system in question (Chen, 2015).

In this context, user satisfaction is belong to user of DMFAS that use DMFAS for its daily task or routine.As reported by DeLone & McLean (2003), increased "user satisfaction" will lead to increased "intention to use" and as a result of this "user satisfaction," certain "net benefits" will occur. Thus we hypothesise:

H4. User satisfaction will positively affect intention to use
H9. User satisfaction will positively affect perceived net benefit

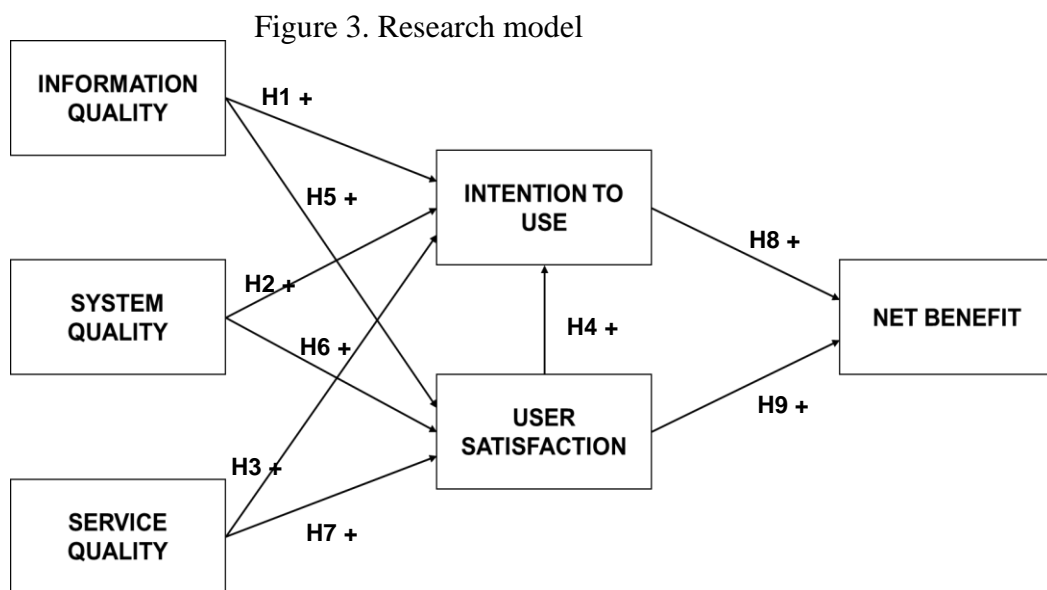
Intention to use

Reported by Wu and Wang (2006) in Awwad & Al-Mohammad (2010), intention to use is a measure of the likelihood a personwill employ the application. It is a predictivevariable for system use. DeLone and McLean (2003) contendthat use and intention to use are alternativesin their model, and that intention to use maybe a more acceptable variable in the contextof mandatory usage (Wang and Liao, 2008).

The "intention to use"variable has not been widely addressed inempirical IS research, perhaps due to thevoluntary nature of most examined systems (Awwad & Al-Mohammad, 2010). Since DMFAS is a mandatory system, intention to use was used instead of use. As reported by DeLone & McLean that the three quality antecedent – singularly or jointly – and user satisfaction will affect intention to use (we hypothesise it in H1, H2, H3 and H4) and as a result of this intention to use certain net benefits will occur. Thus, we hypothesise:
H8. Intention to use will positively affect net benefit

Net benefit

Net benefits is a comprehensive measure comparing past and expected benefits against past and expected costs attributed to the use of an information technology system (Seddon, 1997).In this context, netbenefits is referred to as the user-perceived net benefit evaluation, most notably in terms of making the job easier, time savings, and achieving DMFAS goals.

Figure 3. Research model


Research Design and Method

Measures of the construct

In order to ensure the validity of the scales used in this research, items from previous study with Likert scale (1-4) ranging from "Strongly disagree" to "Strongly agree" was used:

Table 1. Item used in study

Construct	Code	Indicator	References
Information Quality	IQ 1	Precise	Doll &Torkzadeh's (1988)
	IQ 2	Sufficient	
	IQ 3	Up-to-date	
System Quality	SQ 1	User friendly	Doll &Torkzadeh's (1988)
	SQ 2	Easy to use	
	SQ 3	Dependable	Hu & Wu (2016)
Service Quality	SV 1	Sincere service	Y.-S. Wang & Liao (2008)
	SV 2	Safe transaction	
	SV 3	Individual attention	
User Satisfaction	US 1	Satisfaction	Doll &Torkzadeh(1988);
	US 2	Expectation	Palvia(1996);
	US 3	Perceived utility	Y.-S. Wang et al (2007)
Intention to Use	IN 1	Intention to use	Venkatesh et al. (2003)
	IN 2	Prediction to use	
	IN 3	Plan to use	
Net Benefit	NB 1	Making job easier	Etezadi-Amoli&
	NB 2	Saving time	Farhoomand's (1996)
	NB 3	Achieving the goal	Hu & Wu (2016)

Data collection procedure

The data used to test the research model were obtained from a population of users of DMFAS system in DGFRM and Central Bank. According to DMFAS active user list that given by DGFRM IT Department, there are 93 active user in DGFRM and 7 active user in Central Bank. The respondents were then instructed in the questionnaire to answer the questions for assessing the DMFAS system. For each question, respondents were asked to circle the response which best described their level of agreement. A total of 87 responses were obtained and 84 is usable.

Results

Demographic data (Table 2) shows that most of the respondents were male, at productive age, highly educated and experienced enough with DMFAS so that we can assume that they have enough insight to give an objective assessment about DMFAS.

Table 2. Characteristics of the respondents

	Characteristic	Number	%
Gender	Male	63	75
	Female	21	25
Age	< 25	1	1
	25 – 35	55	65
	36 – 45	23	27
	> 45	5	6
Degree	Diploma	14	17

	Characteristic	Number	%
	Undergraduate	52	62
	Graduate	18	21
Experience	< 1	4	5
	1 – 3	22	26
	3 – 5	17	20
	> 5	41	49

Validity and reliability test was applied to the research instrument. The result of validity test show that all of questionnaire items was valid since all of the r-statistics excess r-table (5%, 82) 0,2146. Each variables had Cronbach's alpha more than 0.8 which indicates a high level of internal reliability for our scale with this specific sample. The descriptive statistic of responses for each questionnaire item is shown in table 3.

Table 3. Descriptive statistic of responses

Item	Mean	Med	Mode	Stdev	Min	Max	Frequency (n)			
							Strongly Disagree	Disagree	Agree	Strongly Agree
IQ1	3,29	3	3	0,50	2	4	0	2	56	26
IQ2	3,35	3	3	0,55	2	4	0	3	49	32
IQ3	3,26	3	3	0,56	2	4	0	5	52	27

SV2	3,19	3	3	0,53	2	4	0	6	69	25
SV3	2,79	3	3	0,73	1	4	2	27	42	13
US1	3,10	3	3	0,59	2	4	0	11	54	19
US2	2,95	3	3	0,67	2	4	0	21	46	17
US3	3,08	3	3	0,66	2	4	0	15	47	22
IU1	3,21	3	3	0,52	2	4	0	4	58	22
IU2	3,15	3	3	0,57	1	4	1	5	58	20
IU3	3,20	3	3	0,49	2	4	0	3	61	20
NB1	3,24	3	3	0,55	2	4	0	5	54	25
NB2	3,19	3	3	0,59	2	4	0	8	52	24
NB3	3,12	3	3	0,52	2	4	0	7	60	17

Classic assumption tests was conduct as a requirement for multiple regression analysis. After eliminate 3 responses (87 responses gathered and 84 is used) the result reveal that there was no violation on classic assumptions.

In this research we use two types of statistical analysis, Pearson correlation was conducted to test the relationship between the variables and multiple regressions analysis was

conducted to test hypothesized causal path. Table 2 shows the result from Pearson correlation analysis, all relationship between variable were found statistically significant at p<0,01. Moreover, except relationship between SQ – IU and US – IU, all correlation values exceed 0,5 which is considered as a strong relationship.

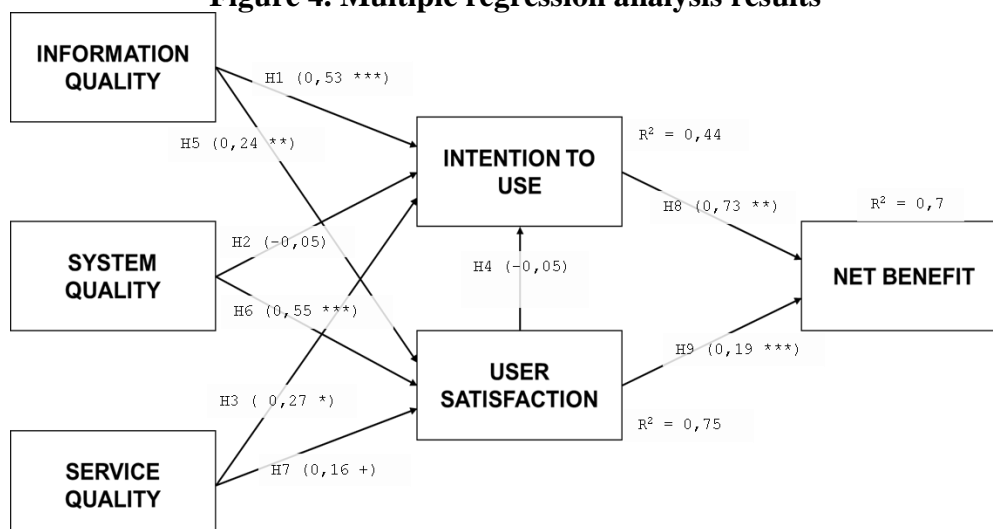
Table 4. Pearson correlation results

	IQ	SQ	SV	US	IU	NB
IQ	1					
SQ	.725**	1				
SV	.691**	.692**	1			
US	.744**	.832**	.702**	1		
IU	.640**	.476**	.563**	.489**	1	
NB	.771**	.751**	.674**	.817**	.544**	1

**. Correlation is significant at the 0.01 level (2-tailed).

To examine hypothesized causal paths, multiple regressions analysis wasconducted. Figure4 shows standardized path coefficient, p-values, and r square value. Except link from system quality to intention to use and user satisfaction to intention to use, the hypothesized relationships between the six success variables are significantly or marginally supported. Thus, H1 (β=0,53), H3 (β=0,27), H5 (β=0,24), and H6 (β=0,55) were supported. The influences of service quality on user satisfaction were not significant at p<0.05, but significant at p<0.1. Thus, H7 were marginally supported (β=0,16). As a consequentcy, among 3 antecedent quality, information quality was strongest influence for intention to use while strongest influence on user satisfaction was system quality. Both user satisfaction (β=0,19) and intention to use (0,73) had a significant influence on net benefit thus H8 and H9 was supported.

In term of variance explained by the model, 70% of the variance in net benefit was explained by intention to use and user satisfaction with intention to use exerting a stronger direct effect than user satisfaction. Fourty-four percent of the variance in intention to use was explained by information quality, system quality, service quality and user satisfaction while 75% of the variance in user satisfaction was explained by information quality, system quality and service quality.

Figure 4. Multiple regression analysis results


+ p < 0,1 ; * p < 0,05 ; ** p < 0,01 ; *** p < 0,001

Summarized in Table 5, the direct and total effect of user satisfaction on net benefit were 0,19 and 0,15, respectively. The direct and total effect of intention to use on net benefit was 0,73. Thus, intention to use exhibited stronger direct and total effect on net benefit than user satisfaction. Among 3 antecedant quality, information quality gained the strongest total effect on net benefit.

Discussion

Among the three quality antecedent, information quality gained strongest influence on intention to use. This means the attitude of user about DMFAS was most influenced by information quality. Although DMFAS is a mandatory system, user intention, plan and predict to use DMFAS was depend on quality of information that provided by DMFAS.

Table 5. Direct, indirect and total effect

	DIRECT			INDIRECT			TOTAL EFFECT		
	IU	US	NB	IU	US	NB	IU	US	NB
IQ	0,53	0,24		-0,01		0,42	0,52	0,24	0,42
SQ	-0,05	0,54		-0,03		0,05	-0,08	0,54	0,05
SV	0,27	0,16		-0,01		0,22	0,26	0,16	0,22
US	-0,05		0,19			-0,04	-0,05		0,15
IU			0,73						0,73

The satisfaction, fulfill expectation and perceived utility of DMFAS was influenced most by system quality. DMFAS was build in web-based platform, one of its main advantage is its multiplatform, which means user can use any operating system that has web browser in it to access DMFAS. This advantage make user more flexible in accessing DMFAS. The disadvantage of using web-based platform is its loading speed. DMFAS takes a while for loading its user interface before user can use it. This disadvantage was complained by some of respondents beside the report issue and will be discussed on next pharagraph.

The closest construct to measure IS success is net benefit. This construct influenced most by intention to use. DMFAS is a mandatory system which means user must use DMFAS to do their jobs whether they like it or not. In this case, whether the user was satisfied or not, as long as the positive intention to use was exist, net benefit of the system will exist too. This finding is a base for DGFRM to take a policy about how to build user positive attitude about DMFAS. For example, conduct more training for user with DMFAS expert from UNCTAD as a trainer so there will be a good knowledge and experience transfer that can lead to positive attitude toward DMFAS.

In term of system quality, DMFAS was not success enough as the link between system quality and intention to use was not significant. This finding was supported by complain from some of DMFAS user that complaining about the loading speed of DMFAS and the flexibility of report producing. One of advantage having web-based system is its flexibility of access, user can access it using variety operating system. In other side, that advantage bring a consequence. Since all of system user interface is served by application server, it will take a while to operate the system. Some respondent still compare DMFAS 6.0 with DMFAS 5.3 which is in other means it is comparation between desktop-based system (DMFAS 5.3) and web-based system (DMFAS 6.0). Such kind of comparation is not apple-to-apple comparation regarding commonly desktop-based system load its user interface faster than web-based system. However, to overcome this constraint, the IT support team must

increase DMFAS server and network capacity so it will load with no time. About the report, DMFAS already has a modul to produce many style of report but if thats not enough, user can generate its own report with Query Builder. The query builder is not something that operated by just click it, user must type certain syntax to get their report. We suggest that the DGFRM and Central Bank must conduct intensive training on query builder so that every user can operate the query builder and if more complex report layout needed, they can build their own modul to produce report.

Another interesting finding was the link between user satisfaction and intention to use was not significant. This means the intention to use existance is not depend on whether user feel satisfied or not. This finding was supported by logic that in the mandatory environment, user must intent to use the system no matter they satisfied or not with the system.

Finally, we talk about the effect of 3 antecedent quality and 2 satisfaction construct to net benefit. Among 3 antecedent quality, information quality gained strongest total effect on net benefit and intention to use had stronger effect that user satisfaction on net benefit.Based on this finding, to gain maximum net benefit of DMFAS, DGFRM and Central Bank can start with maintain information quality that provided by DMFAS. Higher information quality will lead to higher intention to use and user satisfaction that at the end will bring maximum system net benefit.

Conclusion& Limitations

This research paper examined the IS success of DMFAS from user perspective. A field survey was conducted in the DGFRM MoF and Central Bank of Indonesia to test the model. The empirical results verified the validity of the D&M IS success model. Except link from system quality to intention to use and user satisfaction to intention to use, the hypothesized relationships between the six success variables are significantly or marginally supported. Both intention to use and user satisfaction were significant in predicting net benefit with intention to use gained higher direct effect on net benefit. Moreover, compared with the other two antecedent quality, information quality had more vital role for the sucess of DMFAS.

This research has its limitation as we did not examine the feedback from net benefit to intention to use and user satisfaction. Future study should consider to take the feedback and investigate it to get better understand about IS success model. Another limitation is used of intention to use in mandatory system. Even DeLone and McLean (2003), however, were rather brief andambiguous in their justification of such an introduction. They simply suggested that intention to use may be a worthwhile alternative measure in some contexts(Koh et al. 2010).

Recommendations & Implications

We recommend future study should consider to take the feedback and investigate it to get better understand about IS success model. Moreover, there is an alternative of using "attitude" construct instead of "intention to use" (Koh et al. 2010) that can be investigate to validate which one is the best success dimension.

Since DMFAS was used widely in all around the world, we recommend to do a global research about DMFAS success for assessing DMFAS succeed from user perspective so that the UNCTAD's DMFAS Programme can obtain empiric evidence about DMFAS success that can be a base for improvement the system.

Findings of this study provides implications for the seniormanagement in DGFRM and Central Bank. First, a policy about information quality must be issued for maintain

current high level of information quality. Second, an upgrade and improvement in DMFAS access speed and if neededan easier tailored report modul.

Appendix 1. Survey items used in this study

Question	Code
DMFAS provides the precise information you need.	IQ1
DMFAS provides sufficient information.	IQ2
DMFAS provides up-to-date information.	IQ3
DMFAS is user friendly.	SQ1
DMFAS is easy to use.	SQ2
Using DMFAS you can access the debt information every time you need	SQ3
When you have a problem, DMFAS service shows a sincere interest in solving it.	SV1
You feel safe in your transactions with DMFAS service.	SV2
When you have a problem, DMFAS service gives you individual attention.	SV3
. You are satisfied with DMFAS.	US1
. DMFAS has met your expectations.	US2
. Services of DMFAS are of high quality.	US3
. You intend to use DMFAS in the next 12 months.	IU1
. You predict you would use DMFAS in the next 12 months.	IU2
. You plan to use DMFAS in the next 12 months.	IU3
. DMFAS makes your job easier.	NB1
. DMFAS saves your time.	NB2
. DMFAS has achieved its intended goals.	NB3

PROPOSED EFFECTIVE MARKETING STRATEGY FOR EXPAT HELPER INDONESIA (EHI)

Refki Hedianto, Bandung Institute of Technology, Indonesia
Ira Fachira , Bandung Institute of Technology, Indonesia

Abstract

Expat Helper Indonesia which under PT. Manggala Daksa Raharja, is a service based company that established in March 2015 and focusing the business to provide various kind of services to assist expatriates during their repatriation. Expat Helper Indonesia identifies itself as Expatriate/Repatriation Consultant which also in-line with its tagline "Your Domestic Partner". As a newly established company. Expat Helper Indonesia is facing several fundamental business issues particularly in Marketing aspect. In this paper, the Author who also have the role as Chief Executive Officer (CEO) of PT. Expat Helper Indonesia intend to conduct a deep research to formulate an appropriate marketing strategies for EHI. This marketing strategies are expected to be the company's guideline to penetrate the current expatriate market and capturing future potential customers. In doing so, Author examines the internal and external situation of the company. For external analysis, this research exercise several analysis, such as PEST(EL) analysis, Porter's Five Forces, and Competitor analysis. These analysis is to give comprehensive description of external factors related to the business. For internal analysis, this research exercise several analysis, such as Segmentation, Targeting, and Positioning (STP) analysis, Marketing Mix (7P) analysis, and VRIO. These internal analysis is to give clear description related to company's internal situation. SWOT analysis utilized to summarize external and internal analysis results. In strategy formulation, Author conducted EFAS and IFAS analysis in order to examine and quantify the strategic factors from SWOT analysis results. After that, TOWS matrix is developed in order to create relevant alternative marketing strategies. Finally, Author summarized the proposed strategies into anew proposed Marketing Mix (7P) for Expat Helper Indonesia. As an output of the research, Author proposed a one year implementation plan as a guideline for the Expat Helper Indonesia in performing marketing activities. The implementation plan emphasized the company to educate the customers about the related repatriation issues and how the company eases the process.

Keywords: *Expat Helper Indonesia, Marketing Strategy, Consultant, EFAS IFAS, TOWS Matrix*

Introduction

Indonesia as the largest economy in Southeast Asia has performed impressive economic growth since the Asian financial crisis at 1997-1998. The crisis paralyzed the country with losing its currency value up to 80% against US dollar. Today, Indonesia is the world's fourth most populous nation, the world's 10th largest economy in terms of purchasing power parity, and a member of G-20 (World Bank, 2016).The data above has attracted many global business stakeholders to consider Indonesia as their business destination.

The country's foreign policy, which is called "free-active", also identifies Indonesia as a friendly country. Certain condition create a conducive environment for global citizen to live and do their business in Indonesia. Those global citizen, or refers to foreign workers usually called as expatriates. An expatriate (often shortened to expat) is defined as a person who has citizenship in at least one country, but who is living in the foreign country for a certain period

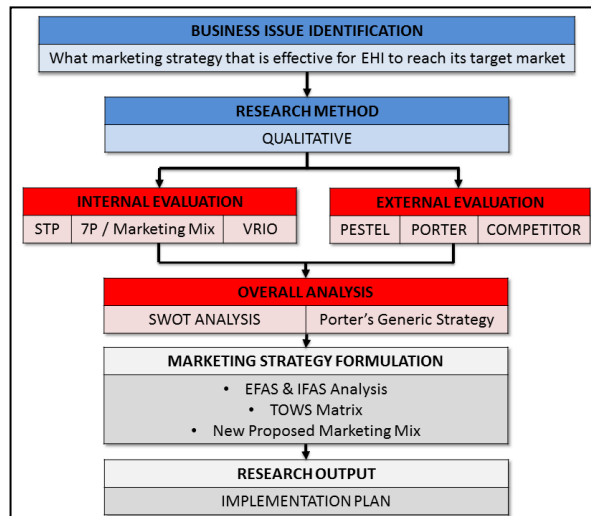
of time, and plan to return to their home country eventually although there are some who never return to their country or citizenship. Number of expatriates working in Indonesia in the past few years is figured in the following table.

Number of Expatriates Working in Indonesia				
#Expatriate	2011	2012	2013	2014	2015
	77.307	72.427	68.957	68.762	69.025

Seen from business perspective, expatriates create unique demand. At the time they move from the home country to the destination country, there are a lot of issues to be handled. This moving process often called "Repatriation". Since EHI operates as a professional company in early 2015, it has served various companies and organizations, such as Phillip Morris, Ogilvy, Kaneka Food International, Gushcloud, British Petroleum, British Council, French Embassy, and Lebanese Embassy. The company also attracted many individual expatriates from various countries, such as USA, England, Korea, Vietnam, Turkey, and also Cameroon. In fact, not all the mentioned customers are turned into a business deal even EHI has established intense communication and also efforts to satisfy the customers. However, all those portfolios were obtained by limited marketing efforts and also limited resources available for the start-up company.

The problem is clearly reflected to the company's financial performance, where during initial year, the company failed to achieve its financial target. The cash flow realization is still below the projection in 2015.
Figure 1 Expat Helper Indoensia Actual vs Projection Cashlow in 2015

A.　　　　　　**Business Issue Exploration**

In conducting the research, Author illustrate the flow of research using framework as follow:


To examine the external situation of the company, the Author performed PEST(EL) analysis, Porter's Five Forces analysis, and Competitor analysis. These analysis describe comprehensive external situation that affect the company in doing business.

1.   PEST(EL) analysis, examines several factors in the external environment such as Political-Legal, Economical, Socio Cultural, and Technology.

-           For Political-Legal aspect, there are two current issue that highly related to the flow of foreign workers in Indonesia. First, Indonesia government has signed ASEAN Free Trade Area (AFTA) agreement in 1992, which is effective in 2015. AFTA (ASEAN Free Trade Area) is an agreement among the ASEAN countries to impose a free trade area in Southeast Asia. This agreement become the legal standing of free movement of goods, services, investment, skilled labor, and capital. Indonesia, as one of the ASEAN founders was also one of the initiator of AFTA, responds the agreement through constitution amendment. The government has revised Ministry of Manpower Regulation Number 16 to 35 year 2015 about "The Employment Procedures of Foreign Workers".

-           For Economical aspect, in the initial year of establishment, EHI faced the global economic slowdown, which led by slower economic growth in emerging market economies, such as China. The country is facing slowest economic growth in 25 years. This slowdown came when the advanced economies, such as Eurozone, Japan, and USA are having stagnancy and not enough to drive the global growth. China, as the leading economy in Asia region, is also triggered the Southeast Asia economy growth due to the close trade and investment links. The slowdown sentiment fears the Southeast Asia countries, including Indonesia.

-           For Socio-cultural aspect, there are several characteristic of Expatriate community that makes it a promising target market. First, Expatriates are highly segmented demographic and considered as an attractive niche market. Second, Expatriates have no existing loyalties. Third, Expatriates are tribal. Fourth, Expatriates community is dynamic (Reach Expats, 2013)

-           For technological aspect, the technology application is not only accessible for well- established companies, but also small businesses. Technology is now way much affordable for any business scales in every dimension of business. Not only to enhance the productivity, but also useful in marketing activities. For example, the use of internet, online

advertising, gadgets, and social media for promotional purposes.

2. In order to describe the industry environment where Expat Helper Indonesia run the business, Author performed Porter 5 forces analysis, which summarized in the following table:

Table 1 Porter Five Forces Analysis of Expat Helper Indonesia

Competitive Forces	High	Moderate	Low
Threat of new entrants	V		
Bargaining power of suppliers		V	
Bargaining power of customers			V
Threat of substitutes		V	
Competitive rivalry		V	

Source: Author Analysis, 2016

a. Threat of new entrants

The EHI business model is considered to have low entry barrier for new entrants, which is high threads for new entrants to enter the market. As a service based business, this industry may not require high investment because there is low research and development budget.

b. Bargaining Power of Suppliers

Since in this phase EHI is only establishing selection system, and there is no legal MoU to the vendors, the company has flexibility to select vendors for a project. Therefore it would be easy to switch from one supplier to another. Despite the flexibility, there is no guarantee that certain vendors would prioritize EHI as their partner because there is no official agreement in advance. For that reasons, it is assumed that the bargaining power of supplier in this type of business is moderate.

c. Bargaining Power of Customers

Expat Helper Indonesia is currently still struggling in competing for market share and gaining brand awareness and create consistency in sales. Meanwhile, there are significant numbers of competitors and possible substitutes in other industry towards the company's each service lines. It is easy for customers to switch the service to another providers. Thus, the bargaining power of customers/buyers for EHI is considered high.

d. Threat of Substitutes

EHI's varied service lines are actually available in some other industries. There is high possibility for customers to switch to other service providers while EHI is new and have received no brand loyalty and credibility. According to the data collected by authors, there are several firms that provides exactly the same service with EHI, even emphasizing in different target market. However, expatriates usually have little knowledge of the local service, unless they are provided assistance from the organization. The company's positioning as a particular one-stop solution platform for expatriate can highlight it from the substitutes. Thus, the threat of substitutes for EHI is considered moderate.

e. Competitive Rivalry

There are only few companies that target expatriates as their target audience. This situation is normal, because the expatriate community itself is considered as a niche market in business

perspective. EHI has identified several competitors in the industry, both from small-medium local company to the big multinational company. EHI considers Santa Fe Relo and AJLB as its main competitors since both companies provide various services like EHI. Nevertheless, the three companies do not provide identical services. For example, none of the competitors provide Family Support like EHI. For that reasons, competitive rivalry among existing competitors is considered moderate.

3.   To identify the existing competitors of EHI, the Author conducted Competitor analysis to Santa Fe Relo and Aneka Jasa Lima Benua (AJLB) as the closest competitors according to the similarity of services.

-    Santa Fe is a multinational relocation service company that established since 1980. This company has branches in 6 continents, consist of Australia, Europe, Middle East, Africa, Asia, North and South America. Those global branches have made Santa Fe become the leading global mobility services company. In Indonesia, Santa Fe Relo (www.santaferelo.com), was established under PT. Santa Fe Indonusa, which located in Jl. Karangan Muda Raya No. 59, Gunung Putri, Bogor, Jawa Barat. Quoting its tagline "Global Relocation Service", this company is actually specialized in relocation services and keeps innovation to provide various kind of services to follow its customers need.

-    AJLB (www.ajlb.co.id) is a local company, founded in 1999, claimed itself as General Management Services for expatriates. There are not much information related to this company. This company devides its services into two categories, which are Expatriates Strategic Partner and Manpower Consulting. The Expatriate Strategic Partner includes the relocation, formalities, and other general services for expatriates.

For Internal analysis, the Author performed STP (segmentation, Targeting and Positioning) analysis, Marketing Mix (7P) analysis, and VRIO analysis.

1.   Segmentation, Targeting, and Positioning (STP) analysis.

-    For segmentation, is an analysis to identify and categorize broad target market according to common customers' characteristics. From this analysis, the Author segmented the EHI customers' into 5 (five) possible segmentation, which are Top Level Management (TLS), Managerial Level Management (MLS), Staff Level Segment (SLS), Foreign Student Segment (FSS), and Unemployed/Job Seeker Segment (UJSS).

-    For Targeting, the Author suggests the company to focus on the existing target market, which are the TLS, MLS, and SLS. EHI should be able to perform marketing efforts to capture the target market optimally.

-    Based on short discussion with EHI's CMO, the author may conclude that EHI is designed as an Expatriate Consultant / Repatriation Consultant company, which provides its target audience a "one-stop-solution" service for Expatriate needs and wants.

2.   Marketing Mix (7P) analysis.
Marketing Mix (7P) analysis is used to describe the current marketing strategies of the company from seven aspects.

-    First "P" is Product. EHI has 5 (five) service lines to be delivered to the customers, which claimed as the most fundamental needs of repatriation. Those service lines are property consulting, property maintenance, immigration assistance, domestic moving, and family support. In the first year establishment, the company only successfully sold 2 out of 5 services, which are property consultancy and maintenance.

-    Second "P" is Price. Commonly, the service-based business will not provide the

customers exact pricing, because there are many factors that configure the prices, such as vendors' rate, HR wages, type of services, tool prices, etc. EHI requires its customers a project quotation before delivering the services.

- Third "P" is Promotion. Since the company is not selling tangible products, it seems to focus the promotional activities to gain awareness and brand selling. The company has performed both online and offline promotional activities. For online activities, EHI has conducted social media marketing, online forum interaction, email blasting to potential customer, and website development. On the other hand, for offline activities, EHI has conducted engaging to expatriates community, contacting the founders' network, and launching referral program (Expat Angel).

- Fourth "P" is Place. In the first year establishment, EHI used the virtual office service as its temporary headquarter to fulfill the legal requirement. In fact, most of the business activities were done in mobility, such as in restaurants, cafés, or even Founders' apartment.

- Fifth "P" is People. Now, there are 9 team members that actively involve in EHI business. There are 3 founders, and the rest 6 members are the Co-founders.

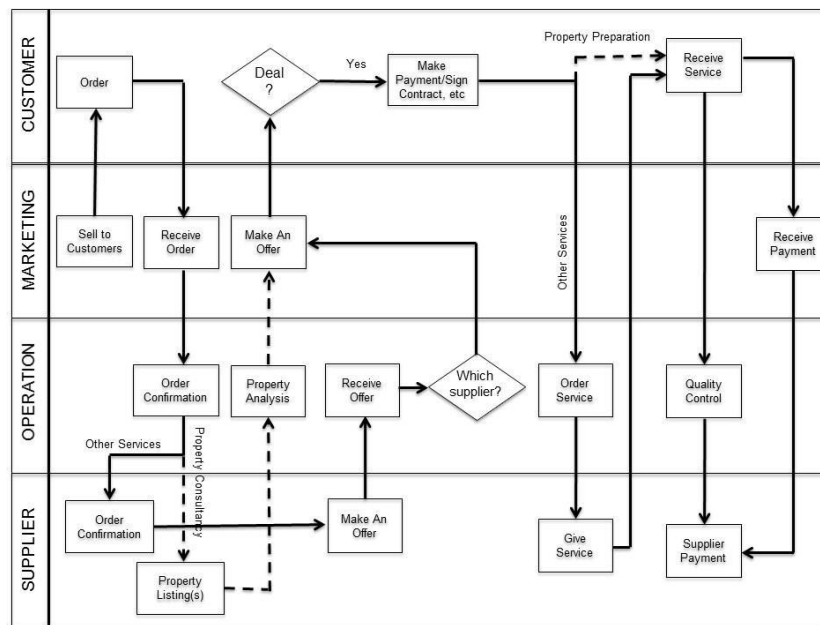
- Sixth "P" is Process. The figure below shows the current EHI's business process


illustration.

Figure 3 EHI Business Process Ilustration

- Seventh "P" is Physical Evidence. As a service-based company, there are no tangible products to be seen to the customers. EHI delivers the evidence to its clients and outsiders
through Company Profile and Portfolio that usually presented in form of business contracts or photos. The company's official website is also accessible for anyone, which addressed at www.expathelperindonesia.com. Also, to help the team perform the business and interact with clients, there is well-designed business card provided by the company.

3. VRIO analysis.
VRIO framework helps company to evaluate whether it has sustainable competitive advantage or not, and helps company to identify its resources and capabilities whether they are valuable

or rare and that competitor cannot imitate. The VRIO analysis involved the customers' point of view in order to get objectivity of the analysis from their experience while using EHI's services.

Table 2 VRIO analysis result of Expat Helper Indonesia

VRIO Criterion				Competitiveness
Valuable	Rare	Costly to	Organize	
No	No	No	No	Competitive Disadvantages
Yes	No	No	No	Competitive Parity
Yes	Yes	No	No	Temporary Competitive
Yes	Yes	Yes	No	Competitive Advantage
Yes	Yes	Yes	Yes	Sustainable Competitive

Source: Author Analysis, 2016

The results of external and internal analysis is summarized in the SWOT analysis. Author summarizes external and internal environment analysis into SWOT analysis that will be further develop as the input for strategy formulation. Table below shows the SWOT analysis for EHI.

Table 3 SWOT Analysis Summary of Expat Helper Indonesia

STRENGTHS	WEAKNESSESS
Unique Brand Identity One-Stop-Service concept for expatriates Qualified HR to communicate, negotiate and building network with foreigners Good digital presence (website &	Limited capital to invest more in the business Inconsistency of performing marketing activities Providing most of its service lines from vendors Using virtual office instead of real
OPPORTUNITIES	THREATS
Stable, yet potentially increasing flow of the foreign workers to Indonesia Expatriates' behavior that makes them demand for assistance ASEAN Economy Community 2016 that leads to AFTA and CAFTA Technology advancement that ease the company in reaching and serving	New and tighter regulation for foreign workers employment Global economic slowdown that leads to decreasing flow of expatriates Competition with Multinational and local service companies

Source: Author Analysis, 2016

Before getting into marketing strategy formulation, the Author consider to define what general strategy should be applied by the company. According to Porter (1980), a company tends to target cost leadership, differentiation, or focus in selected target market. The Porter's Generic Strategies analysis is an analytical tool to describe how company pursues competitive advantage across its chosen target market. The illustration of each strategies are explained as follows:

- If a company targets broad customer segments of an industry by offering lowest

price to the market, it applies the cost leadership strategy.
- If a company targets broad customer segments of an industry by offering different type of product or service (commonly followed by higher pricing), it applies the differentiation strategy.
- If a company target specific target markets, it applies a focus strategy. This role could be cost focus (if the company offers lower cost to specific segments) and differentiation focus (if the company offers different product/service to specific segments).

If a company applies more than one strategy, it would have "stuck in the middle" position as stated in Competitive Strategy by Porters (1980). Porters suggested a company should apply one out of three generic strategies to be more efficient to use the company's resources. The chosen strategy would also reflect to the marketing strategies that the company delivers to approach its target market. There are several consideration should be take into account to define the general strategy of EHI, which are:
- The target market of EHI is Indonesia Expatriates community, which is a segmented market that relatively has low number of population.
- EHI innovates the business from current competitors by designing set of service lines that fits to the current issues and customers demand.
- The industry has not led to the price war situation since there are not many player in the business.

Therefore, the Author suggested EHI to apply the Differentiation Focus strategy.

Figure 2.17. Porter's Generic Strategies

B.   **Strategy Formulation**

Based on the SWOT analysis, strategy formulation will be conducted with EFAS and IFAS and TOWS Matrix. TOWS Matrix developed by matching external opportunities and strengths with Internal Strengths and Weaknesses that already stated in SWOT analysis.

Table 4 TOWS Matrix Result of EHI

Internal Factors	Internal Strengths (S)	Internal Weaknesses (W)
External Factors	[S1] Unique brand identity (Expatriate Helper, Expatriate Consultant) [S2] One-Stop-Service concept for expatriates [S3] Qualified HR to communicate, negotiate and building network with foreigners [S4] Good digital presence (website and emailing system) [S5] Relatively cheaper price than competitor	[W1] Limited capital to invest more in the business [W2] Inconsistency in performing marketing activities, caused the low brand awareness [W4] Providing most of its service lines from vendors [W5] Using virtual office instead of real operational office
External Opportunities (O)	**SO Strategy**	**WO Strategy**
[O1] Stable, yet potentially increasing flow of the foreign workers to Indonesia [O2] Expatriates' behaviour and characteristics that makes them demand for assistance	[SO-1] EHI to deliver the concept of "Helper", "Expatriate/Repatriation Consultant" and "One-Stop-Service" keywords to every promotional activities (O1-S1-S2-S3-S4) [SO-2] EHI to engage with local expatriate communities and follow the dynamic environment of their lifestyle (O2-S1-S2-S3- S4)	[WO-1] EHI to invest more in performing effective marketing strategies (O1-W1-W2)

[O3] ASEAN Economy Community 2016 that leads to AFTA and CAFTA	[SO-3] EHI to prepare spesific promotional tools to attract the ASEAN expatriates (O3-S1- S2-S3-S4-S5)	-
[O4] Technology advancement that ease the company in reaching and serving customers	[SO-4] EHI to focus on the digital advertising, including more advanced website development and any payable advertising media (such as SEO, Google Ads,Google AdWords, etc) (O4-S1-S2-S4)	[WO-2] Activation of online marketing activities consistently (O4-W2)
External Threats (T)	**ST Strategy**	**WT Strategy**
[T1] New and tighter regulation for foreign workers employment	[ST-1] Socialization of new regulation through promotional tools (T1-S2-S3-S4)	-
[T2] Global economic slowdown that leads to decreasing flow of expatriates	[ST-2] EHI to seek for overseas cooperation or promotion channel to expand business coverage, and reach customers from their home country (T2-S1-S2-S3-S4-S5)	-
[T3] Competition with multinational and local	[ST-3] EHI to claim the company to give better	[WT-1] Develop marketing implementation

Source: Author Analysis, 2016

Based on alternative strategies developed TOWS matrix above, there are 10 marketing strategies developed for EHI:

1. [ST-1] Socialization of the new regulation through promotional tools. (T1-S2-S3-S4)
2. [ST-2] EHI to seek for overseas cooperation to expand business coverage, and reach customers from their home country. (T2-S1-S2-S3-S4-S5)
3. [SO-1] EHI to deliver the concept of "Helper", "Expatriate Consultant" and "One Stop Service" keywords to every promotional activities. (O1-S1-S2-S3-S4)
4. [WO-1] EHI to invest more in performing effective marketing strategies. In order to run every marketing activities. (O1-W1-W2)
5. [SO-3] EHI to prepare spesific promotional tools to target the ASEAN expatriates, especially to capture the foreign job seekers. (O3-S1-S2-S3-S4-S5)
6. [SO-2] EHI to engage with local expatriate communities and follow the dynamic environment of their lifestyle. (O2-S1-S2-S3-S4)
7. [SO-4] EHI to focus on the digital advertising, including more advanced website

development and any payable advertising media. (O4-S1-S2-S4)

8.   [WT-1] Develop Marketing Implementation plan to ensure consistency of marketing efforts. (T3-W2)

9.   [WO-2] Activation of online marketing activities consistently. (O4-W2)

10.   [ST-3] EHI to claim the company to give better price rather than competitor. (T3-S5)

Those strategies above later will be broken down into several promotional activities which form a new Marketing Mix. The table below shows how the marketing mix aspects adapt to the new proposed strategies, especially the Promotion aspect.

Table 5 Marketing Mix Related to Proposed Strategies

Marketing Mix (7P)	Related Proposed Strategies
Product	None
Price	None
Promotion	**All the Strategies**

a	Attending the internation.org expat gathering	Once per 2 months											
b	Delivering brochures in public spots	(same with poin 2a)											
7	[SO-4] EHI to focus on the digital advertising, including more advanced website development and any payable advertising media (such as SEO, Google Ads,Google AdWords, etc) (O4-S1-S2-S4)												
a	Hire IT support	Expected salary @3 mio per month											
b	SEO/Google Ads activation	Allocate budget for IDR 1 mio/month											
8	[WT-1] Develop marketing implementation plan to ensure consistency of marketing efforts (T3-W2)												
a	Marketing implementation plan development												
9	[WO-2] Activation of online marketing activities consistently (O4-W2)												
a	Training for HR in online marketing management	Allocate IDR 5 mio for training											
10	[ST-3] EHI to claim the company to give better price rather than competitors (T3-S5)												
a	Delivering brochures in public spots	(same with poin 2a)											

Source: Author Analysis, 2016

Furthermore, the Author also estimated the budget to do all the proposed marketing strategies to ease the company prioritize and ensure the feasibility of the strategies according to the current company's resources. The budget estimation is presented in the table below.

Table 7 Proposed Budget for Marketing Strategies

NO	STRATEGIES	KPI	COST ESTIMATION
1	[ST-1] Socialization of new regulation through promotional tools (T1-S2-S3-S4)		
a	Publication official respond related to new regulation to potential customers through email blasting	Distributed the publication at least to 100 multinational organization	1,000,000
b	Seminar / road show to companies and community gathering	Holding seminars at least once in 3 months (allocate at least IDR 3 mio/seminars)	12,000,000
2	[SO-1] EHI to deliver the concept of "Helper". "Expatriate/Repatriation Consultant" and "One-Stop-Service" keywords to every promotional activities (O1-S1-S2-S3-S4)		
a	Delivering brochures in public spots	Print out and distribute at least 200 per months (@IDR 3000/pcs)	7,200,000
b	Creating souvenirs (such as pins, pens, notebooks, stickers)	Allocate budget for IDR 5 mio to create and distribute souvenirs	5,000,000
c	Printing out the Company Profile to be distributed	Print out for at least 100 pcs (@ 50.000)	5,000,000
3	[ST-2] EHI to seek for overseas cooperation or promotion channel to expand business coverage, and reach customers from their home country (T2-S1-S2-S3-S4-S5)		
a	Survey through internet and initiate cooperation	Initiate at least 5 cooperation proposal	2,000,000

4	[WO-1] EHI to invest more in performing effective marketing strategies (O1-W1-W2)		
a	Marketing budget formulation	Marketing budget documents	1,000,000
b	Funding to marketing activities	All the marketing activities are done	-
5	[SO-3] EHI to prepare spesific promotional tools to attract the ASEAN expatriates (O3-S1-S2-S3-S4-S5)		
a	Seminars / roadshow to ASEAN Institution (such as ASEAN Secretariat)	Hold the seminars together with strategy 1a.	(same allocation with 1b)
b	Promoting the ASEAN Economic Community through online promotional tools	Update the website content and bring the issue to the seminars	(same allocation with 1b)
6	[SO-2] EHI to engage with local expatriate communities and follow the dynamic environment of their lifestyle (O2-S1-S2-S3-S4)		
a	Attending the internation.org expat gathering	Once per 2 months (@400000)	2,800,000
b	Delivering brochures in public spots	(same with poin 2a)	(same allocation with 2a)
7	[SO-4] EHI to focus on the digital advertising, including more advanced website development and any payable advertising media (such as SEO, Google Ads,Google AdWords, etc) (O4-S1-S2-S4)		
a	Hire IT support	Expected salary @2 mio per month	24,000,000
b	SEO/Google Ads activation	Allocate budget for IDR 1 mio/month	12,000,000
8	[WT-1] Develop marketing implementation plan to ensure consistency of marketing efforts (T3-W2)		

a	Marketing implementation plan development		-
9	[WO-2] Activation of online marketing activities consistently (O4-W2)		
a	Training for HR in online marketing management	Allocate IDR 3 mio for training	3,000,000
10	[ST-3] EHI to claim the company to give better price rather than competitors (T3-S5)		
a	Delivering brochures in public spots	(same with poin 2a)	(same allocation with 2a)
TOTAL MARKETING INVESTMENT			75,000,000

Abstract

While previous research has identified determinants of conflict, little is known about its mechanism through cultural values. Based on wide range survey of different cultural clustersand socioeconomics background with vast majority between lower-income on Klaten and Surakarta city, the current study aims to examine the influence of cultural values on conflict. The results of survey and conflict analysis show that in particular cultural values and management control system influence preference for the conflict. Our study contributes to a more comprehensive understanding on the role of culture and management control system in conflict.

Key words : *Local Water Supply Utility, Local Wisdom, Javanese Culture, Management Control System*

Introduction

For years of conceptual and empirical studies, the management control system (MCS) research are now addressed since the integration of sustainability and environmental aspects into management. The mechanism through which environmental activities translates into conflicts s proposed several factors. For instance, the commonly classified environmental strategy employed may affect related parties' abilities to gain both financial and social benefits from the activity.

Currently, water needs quantity and quality is degraded inthe responseof population growth (Famiglietti, et al., 2011), development, climate change, and the number of people turning to groundwater sources to meet their demand (Philpot, Hipel, & Johnson, 2016). A strategic analysis of the ongoing conflicts between Klaten and Surakarta over water allocation at Cokrotulung spring in Klaten, deep well water treatment in Surakarta, and water treatment plant in Bengawan Solo Surakarta is carried out in order to investigate factors causing the conflicts and how to resolve this dispute.Groundwater resource is out of sight and parties that use the water do not realize that they use the same water source until scarcity brings them to conflict. Of the three water sources, Cokrotulung spring in Klaten is the largest contributor in groundwater needs. Surakarta used to take its water source from the spring in Klaten since the late 1940s and lately conflicts start to arise between Klaten and Surakarta government. The conflict has become wider when government in Klaten threaten to shut down the water flow from the spring to Surakarta. Conflict between two government in Klaten and Surakarta in order to determine who has the rights to use more water affect the water received by the two cities. In the end, MCS is considered failed to resolve the problems.

Recently, MCS topic in environmental or sustainability management gain its momentum (Guenther, Endrikat, & Guenther, 2016). We argue that the environmental MCS provides a promising integration approach concerning the internal or external drivers that

leads to environmental conflicts. Conflicts is endemic to all social life, it refers more than just behaviour (Bercovitch). It is inevitable part of living when scarcity of resource start to take its part in human needs and leaves manyuncertainty about how to best cope with it.

If people consider the problems of conflict and understand that conflict stem from scarce resources, they might readily aware of conflict management and the need to find a solution. In this case, water is a unique resource that is essential for human life and one that is often not well understood nor protected compared to other natural resources. Water shows its uniqueness and its importance in the world's ecosystem and all life on this planet. It challenge the whole society, for individuals who do not have access to drinking water, for companies that depend on the groundwater, and for designers of public policies that seek to develop a regulatory approach to solve the dispute.

In Indonesia, each city has the authority to regulate the water resources within its boundaries. Problems occurred due to limited source of groundwater, Hurlbert, et al. (2009), overcome the challenge of climate change adaptation in water management institution. This research explores the potential to examines the roots of the conflict.

Literature review
Stakeholder Theory
The traditional definition of stakeholders is any group or individuals who can affect or is affected by the achievement of the organization's objectives (Freeman, 1984). Managers of a company is thought to fulfill its stakeholder management for the benefit of its stakeholder in order to ensure their right in the company. The manager also manage the corporation to ensure the survival of the company by safeguarding the long terms of each groups' stake. A common way to differentiate kinds of stakeholders is to consider groups of people who classified as organization related(Fontaine, Haarman, & Schmid, 2006).

The main focus in stakeholder theory it is the stakeholders consisted of many parties. Stakeholders are the group or individual who can affect or is affected by the achievements and goals of the company (Freeman, 1984). At first the concept of the stakeholders mentioned that without the support of the stakeholders in the Organization of the existence of these organizations would be useless (Zsolnai, 2006). More Gray, Dey, Owen, Evans, Zadek (1997) mention that the stakeholders is "someone with a right to the account".

a. Javanese Culture
Local wisdom stems from the culture of people living in certain region. It is applied in various aspects of life in the society and seep deeply in to the life of them, considered as the values and norms in the interaction between people, toward God, and nature. Every region possess local wisdom which create unique and different characteristics.

This research is taken place in one region in Indonesia. Suryadinata et al. (2003) explained that Indonesia is consisted of many ethnic groups spread in all over the country. More than 1.000 ethnic groups are spread in Indonesia (Efferin and Hartono 2015). Those ethnic groups possess different local wisdom and culture. Among 1.000 different ethnic groups in Indonesia, the country is dominated by Javanese ethnic which reach 41,71 percent of the population (Suryadinata et al. 2003).

Javanese ethnic group has special culture which commonly known as *Javanese culture.* Javanese[30] are often conducting certain rituals[31] to maintain the harmony between

---

[30] Javanese are often called by "Wong Jowo"

humans, God, and nature. They believe in "One and Only God" [32] which motivates them to always being nice, compassionate, and encourage strong work ethics. Most of Javanese are Moslem (Beatty 1999), and Islam is acculturated with *kejawen*[33]. Therefore, Javanese are known as people with high tolerance.

According to Efferin and Hopper (2007), javanese culture contains a set of righteous beahaviour as well as rigid rules. However, Efferin and Hopper (2007) also pointed out that Javanese culture possess social harmony (rukun) and spiritualism. On the other hand, Geertz (1961) explained that there are two principles in the interaction of Javanese society, consisting of the principle of social harmony and the principle of dignity. The two principles aim to preserve the harmony in the society.Harmony and dignity could be viewed as being in the state of harmony, composure, and peace, without conflicts and opposition, and united in cooperation (Mulder 1977). The principles are essential in decision making during the meeting for reaching the same conclusion (*Musyawarah*) and cooperating to one another (*Gotong royong*) (Efferin and Hartono 2015). Harmony and dignity ate parts of local wisdom which hold may noble values that applicable to solve conflicts. Apart from the two principle, Javanese culture is also rich of other local wisdom, such as social relationship, norm, traditional knowledge, social leadership, trust, reciprocity, loyalty and togetherness, social responsibility, and participation.

b. Management Control System

MCS in general can be defined as the process by which managers assure the resources are obtained and used effectively and efficiently in the accomplishment of the organizations' objective (Guenther, Endrikat, & Guenther, 2016). MCS have also been described as processes for influencing behavior and provider of means in gaining cooperation among individuals or organization who may share either same or partially objectives (Smith, 1997). Overtime, this definition has been extended to accommodate a more comprehensive understanding of MCS in solving a conflict.

Environmental management system (EMS) proposed by (Guenther, Endrikat, & Guenther, 2016) is considered as subsystem of general management system that specifically focuses on environmental issues. This subsystem is part of organization used to develop and implement its environmental policy in order either to manage its environmental aspects or to resolve environmental conflict.

In resolving conflicts, controls have been categorized in many ways such as formal and informal controls (Smith, 1997). Formal controls include rules, standard operation procedure, and budgeting system while informal control are not designed, more like unwritten policies of the organization. This controls are the main factors causing the conflicts in Klaten and Surakarta. Formally there is rules encompassing the groundwater allocation for both cities, but Javanese culture that applied as informal control is found as distraction in reality.

c. Water Source Management in Indonesia

In Indonesia, based on Law Number 25 Article 4 Year 1999, natural resource managed in a specified area where the resource is originally come from is considered revenue

---

[31] There are many rituals conducted by "Wong Jowo" to maintain the harmony between human, God, and nature. The examples of those rituals are meditation, *ngrowot* fasting, and *bersih desa* (the cleaning of the village).Every ritual conducted by "Wong Jowo"always possess certain meaning and goodness.

[32] "One and Only God" is described as "*Tuhan Yang Maha Esa*".

[33] A traditional Javanese spiritualism

for the government owning the area. Groundwater problems are divided into quantity, quality, continuity and distribution problems. All public decisions in those problems should be based on all stakeholder participation so the policy will be accepted by the public.

Management of water resource leave only one side to make the best use of the water, not to forget that behind every advantage there is a loss. Three aspects in water resource management are utilization, preservation, control(Samidjo 2014):

Method

a. Participants and data

This studyparticipants range from community leader, labor, farmer, and trader. They come from a wide range of socioeconomics background with vast majority between lower-income Klaten and Surakarta Citizen (labor and farmer). We also considering the working environment and documents stored in various agency involved.

We considered several reasons to establish the research setting, especially in conflict area In Klaten and Surakarta. Frequent conflicts over natural resources and environment such as conflict in utilizing water resources among district or province and among communities and local government, conflict in utilizing natural resource (land and water resource) among company, local government, and province, and faded local wisdom that plays important role in maintaining harmony and balance as our main reasons when choosing the research setting.

b. Selection of Outcomes

From this qualitative data, we identified problems that the respondents reported. With these in mind, within the academic literature we conduct an extensive search to identify corresponding construct and study goals. Through this process we ensured that our selection of construct was supported by the conflict management literature.

c. Construct and Measures

Below we describe the measurement selected, reasons for its selection, and the instrument development process. All measures generated use open question with no range answer.Following (Caldas, Broaddus, & Winch, 2016), our use of conflict management refers to a range of reactions to conflict, behaviors and intention during conflict situation.

d. Data Collection

We worked intensively with a view to observe and explore a wide range of community activities around the forest or edges of reservoirs. Primary data were collected through survey, direct observation, in depth interview and Focus Group Discussion (FGD). We conducted one rounds of survey. Surveys contained open questions are given to respondents, we asked them to write their name (respondents are freed to write their name or not for their convenience and privacy), age, job, and gender at the first page of the questionnaires. We encouraged participants to ask for assistance if there were any items or questions that they did not understand. We ensure that there were no items or questions that the participants have difficulties to comprehend. We ask participants about the key facts of an event as well as their opinion about the event. We also conduct FGD with the goal to find the meaning of an event based on the participants' understanding about the theme.

For quantitative data, we conduct survey with different participants from the first participants in qualitative data collection. We include employee, local government official,

non-profit organization, and communities. We obtain and analyze data from the participants in the form of records, books, meeting report, agenda, and ledger.

e. Data Analysis

This study use mix method because of its ability. This type of research will be able to capture a wide range of qualitative information with meticulous descriptions and full of nuances, which is more valuable than just a statement of the amount or frequency in the form of numbers (Sutopo, 2002). Qualitative data to provide complex textual description of how issues is experienced by people (International). It provides information that is contradictory in behavior, about the 'human' side of an issue that is intangible. When used along with quantitative data, qualitative study can help to interpret the complex reality of a given situation that quantitative study cannot reach. Some issues are not readily apparent, especially intangible issues such as gender roles, ethnicity, religion, norms, or status.

In depth interview is conducted for collecting data on individual's perspective by generating notes and audio recording. The flexibility of interview allow greater adaptation of interaction between the researchers and study participants. Participants have the opportunity to respond in greater detail and the researchers have the opportunity to respond immediately to what information the participants have provided.

According to Bogdan and Biklen (1982) special character of qualitative research is to have a natural setting as a source of data, the researcher is seen as a key instrument, descriptive, more concerned with process than results alone, data analysis tends to be inductive, and the meaning is the essential problem in the design of qualitative research.

In analyzing quantitative data, we first conduct experiment by dividing the participants into three groups, the first group is treated using conflict cases, the second is treated using local values knowledge approach, and the third group is left untreated. We use mechanical footage called purposive sampling described as criterion-based selection. We choose this mechanism since we based solely in our judgment based on theoretical concepts used, our curiosity, and empirical characteristics in research area. After each round of data collection we examined the response and the data. We test for errors and inconsistencies, we examine correlation of error values, and comparing means.

f. Validity of the Data

With the variety of data sources, we use triangulation techniques to ensure the study fulfils validity of data. We prove that what is observed is in accordance with what is happening in reality. To ensure and develop the validity, we seek information from other sources by using different techniques and extending the research to reduce data distortion. In addition, we also select who will be interviewed and where will be observed (Nasution, 1988).

Participants:

Subject	Subject's Status	Hours	Session
Mr. T (Warga sumber mata air Cokro Tulung, Klaten)	Community leader	2,5	2

Results and discussion

Water resource is an essential source of life. Its fundamental usefulness include agriculture, industrial household, recreational and environmental activities(Kumar, Singh, Sharma, 2005). Water preservation needs to be maintained(Hill, 2010)since many factors such as human population growth (Haglund, 2014) cause decrease in quantity and quality. Human population growth leads to conflict of interest. Cultural values, as a symbol of community's identity, have its importance as a reference of people's behavior with other different culture. In response with environmental conflict in Klaten and Surakarta, this cultural value is a form of response. As a tradition and folklore, this value translates into the views of life. By taking the values, society can understand how the elder look and live their live far before.

Javanese cultural values cannot be separated when the companies manage their business. Several values adapted from Javanese and it is expected not to cause conflicts. All participants in this research used to carry out the values and we summarized those as:
1. *Luwih Becik Pager Mangkok, Tinimbang Pager Tembok*
2. *Sing Guyub Rukun*
3. *Gotong Royong*
4. *Mendhemo Pari Sing Jero*
5. *Rukun Agawe Santoso*
6. *Gemah Ripah Loh Jinawi, Tata Tentrem Kerta Raharjo*
7. *SayukRukun Saiyeg Saeka Praya*

1. *Luwih Becik Pager Mangkok, Tinimbang Pager Tembok*

Better to have fence rather than a wall. A paradigm of security used by companies so they do not clash with the society around their workplace. In Javanese culture, a wall is a form of dis-respect toward other by limiting other people interactions through a high wall.

Fence in Javanese is a spirit of sharing and concern for people. Between neighbors, even though do not blood related, are considered as the closest family. The fence usually called 'bowl', because on certain days, when a family has a cooking event, the family give the food to their neighbors in a bowl. With mutual food delivering in neighbors, between neighbors got to know that each family have a taste of sharing and concern. 'Bowl' fence is a term used by Javanese which serves beauty of sharing and not to limit interactions from each other.

In the context of company, this fence will determine the company's presence in the community. The company implement the Java philosophy of sharing and taking care of each

other by providing assistance to their neighbors. Making sure that no boundaries such as disrespect-full toward other.

2. *Sing Guyub Rukun*

'Guyub' means feeling volunteered to join or participate in social activity to achieve social cohesiveness. Guyub also a form of social capital characterized by exchange of kindness among individuals between groups. The pattern of exchange is not reciprocally as in the process of buying and selling, but a combination of short-term and long-term altruism.

Guyub is aligned with Javanese living orientation, which is to live as humanist in harmony. Various aspects in this cultural values aim to achieve self balance and harmony with God, natural environment, and social environment. The company applies the cultural values by participating celebration or ritual held by local community. By involving in those activities, the company will be asissted by the community as long as they get the guyub.

Guyub rukun is a social capital, Mr. G and Mrs. S, our participant in this research, reveals that social capital is very important in their life. Here are the summary of the interview:

"Honesty is a form of social capital used by our village to resolve conflict. We used it to develop our village and we preserved it"
-Mr. G-

"We consider social capital as a product of human relationship, whenever a conflict arises, we used the capital as a solution. It grows by itself and it help the community"
-Mrs. S-

The philosophy means that a company or individual is willing to help without expecting any return. Maintaining harmony with local community involved in company's activity is very important. In today's modern era, this cultural values is reflected in village's celebration and rituals in a certain great day.

"We used to clean the village in our great day, it teach us how to tolerate, help, trust, and guyub with other. In our spring, we upheld the culture and we make sure that our children get used with this culture since their young age"
-Mrs. S-

3. *Gotong Royong*

'Gotong royong' means the spirit of cooperation and mutual help in Java. In the village, each neighbors will voluntarily help each other. Even for some activities they used to help each other, not by money, but more like a hand to help simple things. Harmony and respect are important in reach an ([Efferin dan Hartono, 2015](#)).From our survey, we found that in facing the water conflict, our participants reveals that this gotong royong have an important aspect:

'We think gotong royong is a form of helping each other. We help each other in our spring. We make sure that our spring is well managed and our culture remain exist".
-Mrs S-

In this modern era, the company use gotong royong to provide assistance to community around the company. The company will join in almost every celebration, ritual, and even death ceremony. Assuming that the company will get increase in both financial and social aspects by gotong royong, the company is voluntarily join every activities in the village.

But we find negative side of this gotong royong from our survey, some people are helping each other in negative things such as taking the water from the spring for their own. Saying that this is a kind of greed to get the water without caring other that also need the water.

4. *Mendhemo Pari Sing Jero*

Javanese philosophy give a lot of inspiration for government, companies, and communities. Javanese people always avoid conflict, the type of people that do not like conflict and do not drain their energy to lose their communities. 'Mendhemo paring sing jero' means giving good things to others in hope that someday God will return the kindness either in living or afterlife. For the company, they used to help children of their employee for taking their education, the company will make sure that everyone in the company do not lose their education. Based on Javanese expression we found in survey, the company began to provide assistance for things that is charitable, things that the company can easily provide.

5. *Rukun Agawe Santoso*

'Rukun' means a feeling of unity between people living in the same region. Javanese people tend to maintain its peace by promoting equality. Rukun is almost the same with guyub, but rukun is more like living in peace and thus there is guyub rukun. Guyub rukun means together in unity in maintain peace.

While 'santoso' means strong, there is a term 'rukun agawe santoso' which means that people are unity in maintain the peace so that the people will strengthen in both social and economic life. The company implement this Java expressions to foster relationship with social institution exixting near the company. Various activities are used by the company to strengthen the programs of the institution.

6. *Gemah Ripah Loh Jinawi, Tata Tentrem Kerta Raharjo*

'Gemah ripah loh jinawi' is a mindset that brings together the embodiment of gratitude to God for all Thy mercy. Natural beauty and soil fertility in Java is example of this gratitude that Javanese people gratefully accept as God's grace. Embodiment of this gratitude are applied in everyday life. There is a concept called 'tata tentrem kerta raharjo' which means that the community will maintain their life in accordance with state's rule. It aims for a synergy between elements in society and elements in states, making sure that harmony is achieved ranged from the household to the level of state.

'Tentrem' means that everyone feel save and comfortable in the community. This condition can be achieved if the concept of good governance is achieved. While 'raharjo' means a prosperous country because of a lot of ingratitude towards God. This concept become the foundation for realizing a fair and prosperous state in the mercy of God.

Gemah ripah loh jinawi has become one of the company's source of inspiration for maintaining harmony with company's internal and external environment. At internal level, management always seek a working conditions that will make them comfortable in working by providing health facilities for example. While at external level, the companies provides

many assistance facilities to citizens around the company by funding rituals or celebration around the company.

7. *SayukRukun Saiyeg Saeka Praya*

'Sayuk rukun saiyeg sakata' means united to achieve a target. 'Sayuk' is a feelings between individuals or between communities in accomplishing a work together. The point of this joint work is its spirit to work together without any pressure. 'Saiyeg saeka praya' means a spirit of solidarity to build social capital. This conception is reflected in company's recruitment. The company hire its employee from surrounding communities, igoring the facts that some of the employee might be lack in skill. But the company believes that this lack of skill can be overcome using a lot of training programs.

In the perspective of empowerment, the company participate in each programs necessary to create a condusive atmosphere both in the company and the community. If company develops it employee, which is part of community's people, the company's believe that the conception has been achieved.

Conclusion

Javanese culture as conflict resolver has two different sides and contradictory in maintaining water conflicts. The first is Javanese culture as the MCS that produces positive benefits in maintaining water conflict, and the second cultural value as MCS which had a negative impact. This means that the positive can resolve conflicts or reduce the conflict, while having the negative will aggravate the situation and cannot be used in conflict resolution.

In the today's modern era, Javanese culture can be translated into a corporate social responsibility (CSR) that the companies give to the surrounding environment. Corporate social responsibility is an activity of many kinds eg philanthropy or other charitable activities (Roberts, 1992). CSR is done routinely and sustainable will maintain harmony with the surrounding environment. Stakeholder theory is a representation of maintaining good relations Stakeholder theory reveals that a company must have a good relationship to its stakeholders will increasingly long life of the company (going concern) and also profitability increased (Roberts, 1992)

DOES STUDENTS' RELIGIOSITY MODERATING WORD OF MOUTH IN ISLAMIC PRIVATE HIGHER EDUCATION?

Eko Handayanto, Universitas Muhammadiyah Malang, Indonesia
Tulus Haryono, Universitas Sebelas Maret, Indonesia
Hunik Sri Runing Sawitri, Universitas Sebelas Maret, Indonesia

Abstract

Marketing communications by Word of Mouth or WOM universally important role in business success and is one of the marketing communication strategy, a strong impact on the performance of marketing, as well as playing an important role in influencing the purchasing decision back. WOM can be an alternative marketing communications for a private university based Islamic religion that have had difficulty in promoting the institution.

The research aims to analyze the influence of service quality on WOM marketing communications. Another research aim is to analyze the role of satisfaction as a mediator, and the role of religiosity as moderator effect of service quality on WOM marketing communications. Respondents are students of University of Muhammadiyah Malang and University of Islam Malang who had conducted WOM. Data collected by questionnaire and analyzed using SEM PLS.

The analysis showed that the service quality has no direct effect on WOM marketing communications. Service quality has direct effect on satisfaction, and satisfaction has direct effect on WOM. The important result is religiosity did not moderate the influence of satisfaction on WOM.

Keywords: *Service Quality, Satisfaction, Word of Mouth.*

Introduction

Word of Mouth or WOM is universally seen as an important factor of business success and over 50 years of informal communication between the customers has been used as a research topic (Oetting, 2009). Marketing researchers and practitioners believe that WOM is one of the marketing communication strategy that had a strong impact on marketing performance (Oetting & Jacob, 2007), and played an important role in influencing the re-purchasing decision (Money, Gilly & Graham, 1998; Gremler, Gwinner & Brown, 2001).

WOM can be done through online and offline (face to face) with a number of differences. First, offline WOM is the process of sharing information between two or more parties are mutually interested and it is voluntary, whereas the online WOM is a two-way communication that has a very wide range of opinions and experiences to share with others (Dellarocas, 2003). Second, WOM offline message's sender is closer and familiar with the receiver, so that the credibility of the sender and the message content can be easily understood by the receiver. While the nature of WOM online is to eliminate the ability of the receiver to assess the credibility of the sender and the message contents (Steffes & Burgee, 2009). Third, offline WOM is more persuasive than the online one (Herr, Kardess, & Kim, 1991). Differences in these characteristics indicate that the relative offline WOM is more credible and more persuasive than WOM online in influencing consumer purchasing decisions (Herr *et al*., 1991). WOM online also has its disadvantages outweigh the negative assessments offline WOM may spread rapidly and expanded in a short time, and have a negative impact on consumer attitudes (Chevalier & Mayzlin, 2003; Lee, Park, & Han,

2006). Therefore, the research is focused on offline WOM marketing communication (face to face).

WOM sender's behavior was motivated by a variety of antecedents, such as quality of service (Herman, 2007; Bruce & Edgington, 2008; de Matos & Rossi, 2008; Cahniotakis & Lymperpoulos 2009), satisfaction (Molinari *et al*., 2008; Casalo *et al.* 2008), loyalty (Wangenheim and Bayon, 2004; Podhosen, 2006), commitment (Harrison-Walker, 2001; de Matos & Rossi, 2008), and trust (Gremler *et al*., 2001; de Matos & Rossi, 2008). The diversity of the antecedents of WOM caused by different objects and basic theoretical research. WOM research objects include goods and services, but service research object is dominant rather than goods (Mangold & Miller, 1999). In terms of the theoretical foundation, a variety of theory was used to explain the phenomenon of WOM, such as cultural theory (Money *et al*., 1998; Podoshen, 2006), the attribution theory (Swanson & Kelley, 2001; Laczniak *et al*., 2001), the theory of satisfaction (Babin *et al*., 2005; Casalo *et al*., 2008; De Matos & Rossi, 2008; Chaniotakis & Lymperopoulos, 2009), and the theory of personal relationships (Bansal and Voyer, 2000; Ennew *et al*., 2000; Gremler *et al*. 2001; Dellarocas, 2002; Lang *et al*., 2006).

The object of WOM research differences has an implication for the diversity of variables in the model, it was resulted research model in a partial science expansion. Consequently, the research model has not ability to generalize. The diversity of the basic theory suggests that WOM activity can be viewed from various aspects. The results of WOM research that has been studied did not find based on the theory of causal attribution. Therefore, it is used as the theoretical basis of this research to develop a new alternative WOM models. Causal Attribution theory states that success is due to the internal and external factors. Attribution in marketing research is understood as an explanation of causality of events and consumer behavior (Folkes, 1988). In this study, Causal Attribution Theory is expected to explain the reasons for the success of WOM marketing of consumer communication, especially the success caused by internal factors. Empirically Babin *et al*. (2005), Bruce and Edgington (2008), Casalo *et al*. (2008), and Chaniotakis and Lymperpoulos (2009) indicate that customer satisfaction affects the WOM marketing communications. Several other studies indicate that WOM marketing communications not directly related to satisfaction (Wirtz and Chew, 2002; and Brown *et al*., 2005). While the study of Li (2013) and Naik, Anand, and Bashir (2013) indicate there are no satisfaction impact on WOM marketing communications.

The study results indicate there are three groups of previous research results. The first group is indicating the existence of a direct influence of satisfaction on WOM. The second group is indicating an indirect effect of satisfaction on WOM, and third group is indicating a direct effect that satisfaction has no effect on WOM. Those are demonstrates controversies in terms of the effect of satisfaction on WOM marketing communications and need to be reanalyzed. The relationship between satisfaction and WOM are expected to generate an alternative model of behavior WOM marketing communications. In the context of indirect relationships, the researchers added consumer religiosity variable as a moderator variable that is expected to strengthen the influence of satisfaction on WOM.

The object of the research is private higher education with Islamic religion background. The unit analysis of the research is student at University of Muhammadiyah University and University of Islamic Malang. Both private universities owned by the two organizations in Indonesia's largest Islamic community, namely Muhammadiyah and Nahdlatul Ulama (NU). Those are chosen because has uniqueness in communication patterns. The communication

pattern in NU well known as primordial or patron-client communication where elements of Kyai or the descendants of Kyai were in institutions and the community became a central figure, whereas in Muhammadiyah uphold collegial communication links. Both the communication pattern has been a tradition among Muhammadiyah and NU (Tafsir, 2009). Differences in patterns of communication is an interesting phenomenon to be studied from the perspective of WOM marketing communications, especially to determine whether religiosity that exists within every student is capable of moving them to do WOM marketing communications.

Literature Review

This study based on the theory of causal attribution as a basis for explaining the motivation of individual consumers to spread the information to others through word of mouth voluntarily. Attribution theory was first introduced by Fritz Heider in 1958. He suggests that if observing social behavior, the first thing you should do is determine in advance what caused it, ie, situational factors or personal. The assumption is that people try to understand their environment and explain the causes of internal and external to an event encountered. Attribution theory is also commonly called the external and internal causality (Jones & Nisbett, 1972).

Weiner (2000) states that there are three elements that underlie the causal properties that have cross situational generality, that is the locus, stability, and control. First, the cause of success or failure can be caused by internal or external factors. Second, the cause of success or failure can be either stable or unstable. Third, the cause of success or failure can be either controlled or uncontrolled. Controllable factor is one of the factors that are believed to be able to change a person if he wants to do. The uncontrollable factors explain if someone does not believe him then dai can easily turn. Thus, attribution theory explains that human behavior cannot be separated from the state within the individual and the environment.

Weiner attribution theory is the most influential contemporary implications on consumer behavior. Attribution theory interpreted on the success or failure of the business and the consumer tendency to do the same behavior in the future. Weiner attribution theory more widely adopted than other attribution theory by researchers in consumer behavior (Burnkrant, 1975; Wang, 2008). Therefore, Weiner's attribution theory was used as the theoretical basis of this research.

Effect of Service Quality on WOM

Athanassopoulos et al. (2001) indicate that consumers' assessment of service quality is positively related to WOM. Chen and Xie (2008) found that good quality services allowing consumers to recommend through the information by word of mouth (WOM). Next, Padma et al. (2009) in his research indicates that consumers who are glad to be able to share information voluntarily and invite family and their friends to visit the same service provider. In the perspective of college, Hermawan (2001) indicates the quality aspects of education have a significant effect on the willingness of students recommend their campus. Meanwhile, Abdullah (2006) indicated that service quality is positively related to WOM.

The hypothesis is the service quality of higher education has a positive effect on WOM.

Effect of Service Quality Satisfaction

Duggirala, Rajendran, and Anantharaman (2008) indicated a positive relationship between the dimensions of service quality and satisfaction. Likewise, Bansal and Taylor (2000), Cronin, Brady, Brand, Hightower, and Shemwell (2000) study indicates the existence of a high correlation between the service quality and satisfaction. In the perspective of higher education, student satisfaction is influenced by the service quality of the college (Danjuma & Rasli, 2012). The quality of higher education have a significant effect on student satisfaction (Hermawan, 2001). Keong (2006) indicates the quality of functional service has a significant effect on student satisfaction.

The hypothesis is the service quality of higher education has a positive effect on student satisfaction.

The Influence of Satisfaction on WOM Marketing Communications

Athanassopoulos *et al.* (2001) indicate that high customer satisfaction is positively related to WOM communication. Studies Babin *et al.* (2005), Bruce and Edgington (2008), and Chaniotakis and Lymperopoulos (2009) also indicate that customer satisfaction has positive effect on WOM marketing communications. Hermawan (2001) indicate that significant influence satisfaction on WOM recommendations. Ahmad *et al.* (2012) stated that the intention to encourage students doing positive WOM then universities should have a reputation for excellence and develop relationships with students is satisfactory. Bruce and Edgington (2008) stated that student satisfaction with quality of services college campus to encourage them to recommend to other prospective students voluntarily.

The hypothesis is that student satisfaction effect on WOM.

Religiosity Moderating Influence of Satisfaction on WOM

Bloodgood (2008) indictates that the higher religiosity student decreases their cheating behavior. La Barbera *et al*. (1997) suggested that higher religiosity consumers looked quantity and luxury products purchased did not make them satisfied. Ariffin *et al.* (2012) states that the level of consumers religiosity can weaken the influence of American popular culture on conspicuous consumption. The more religious of satisfied customers will do WOM more.

The hypothesis is the student religiosity will strengthen the influence of satisfaction on WOM.

RESEARCH METHODS

This research was conducted at the University of Muhammadiyah Malang (UMM) is located at Jalan Tlogomas 246, and the University of Islamic Malang (UNISMA) in Jalan MT. Haryono 193 Malang. This study was designed to build a model of word of mouth (WOM) marketing communication in the perspective of a private-higher education Islamic religion. Research type is a survey with students as an analysis unit. The study population is an registered undergraduate students at UNISMA and UMM who have ever convey information about the college to others through WOM face to face and voluntary.

Statistically, the number of students at UMM and UNISMA can be known, but the number of students who actually meet the criteria of population is not known. Therefore, the method of determining the sample follows the assumption that the Structural Equation Modeling to produce a good analysis of the size of the sample is determined at least 5 times

the number of indicators used variables (Ferdinand, 2006; Hair, 2004). The samples technique was conducted using a non-probability sampling using judgment method.

Primary data was used in this study, including service quality, satisfaction, religiosity, and WOM. Questionnaire method was used to data collection. Data that has been declared valid and reliable then analyzed using Smart PLS 2.0 version.

RESULTS
1. SEM PLS Analysis Results
    a. Model Specification
        1) Outer Model
            Outer model is a relationship specification between latent variables and the indicator that describes the characteristics of latent variables with the indicator. Outer loading value shows the value of each indicator as a measure of a variable based on the reflective value. Outer loading results shown in Table 4.1.

Table 4.1. *Outer Loading – Convergent Validity*

Indicators	*Original sample*	Validity
X101 <- SQ	0.5884	Valid
X102 <- SQ	0.5096	Valid
X103 <- SQ	0.5296	Valid
X104 <- SQ	0.6237	Valid
X105 <- SQ	0.6853	Valid
X106 <- SQ	0.660	Valid
X107 <- SQ	0.7122	Valid
X108 <- SQ	0.7233	Valid
X109 <- SQ	0.736	Valid
X110 <- SQ	0.5721	Valid
X111 <- SQ	0.6681	Valid
X112 <- SQ	0.6858	Valid
X113 <- SQ	0.6936	Valid
X114 <- SQ	0.6792	Valid
X115 <- SQ	0.6366	Valid
X116 <- SQ	0.6876	Valid
X117 <- SQ	0.5177	Valid
X118 <- SQ	0.6708	Valid
X119 <- SQ	0.5753	Valid
X120 <- SQ	0.6834	Valid
X201 <- SAT	0.7618	Valid
X202 <- SAT	0.7586	Valid

X406 <- WOM	0.8481	Valid
X407 <- WOM	0.8243	Valid

Source: SmartPLS Algorithm, 2016.

Outer loading value of all indicators of the service quality are above 0.50 with the highest loading indicator X109 (certainty of time service) of 0736. For satisfaction variable, the highest loading value was indicators X201 (student satisfied with their chosen), with a score of 0.764. The highest outer value on WOM is an indicator X30 (recommend to acquaintance) by a score of 0.848. The highest outer loading value indicates that the indicator has stronger reflect the latent variables compared with other indicators.

2) Inner model

Inner model is a relationship specification between latent variable (exogenous and endogenous) based on the theoretical foundation. Relationship between latent variable of service quality, satisfaction, and WOM was shown in Table 4.2.

Table 4.2. Path Coefficient

Path	Original Sample (O)	Sample Mean (M)	Standard Error (STERR)
SAT -> WOM	0.2673	0.1992	0.0942
SAT * REL -> WOM	0.2511	0.1693	0.329
SQ -> SAT	0.4281	0.4577	0.0874
SQ -> WOM	0.1866	0.1661	0.0945
REL -> WOM	0.22	0.237	0.0765

Source: SmartPLS *Bootstrapping*, 2016.

b. Path Diagram of SEM

Path diagram of SEM is basically a diagram that connects the structural model with the measurement model. Structural model is a model whose function is to look at the relationship between latent variables, whereas the measurement model has a function to see the connection indicator of the latent variables. Path diagram in this study connects the latent variables of service quality, satisfaction, WOM, and religiosity moderator variables and indicators of latent variables respectively as in Figure 4.1 and 4.2.

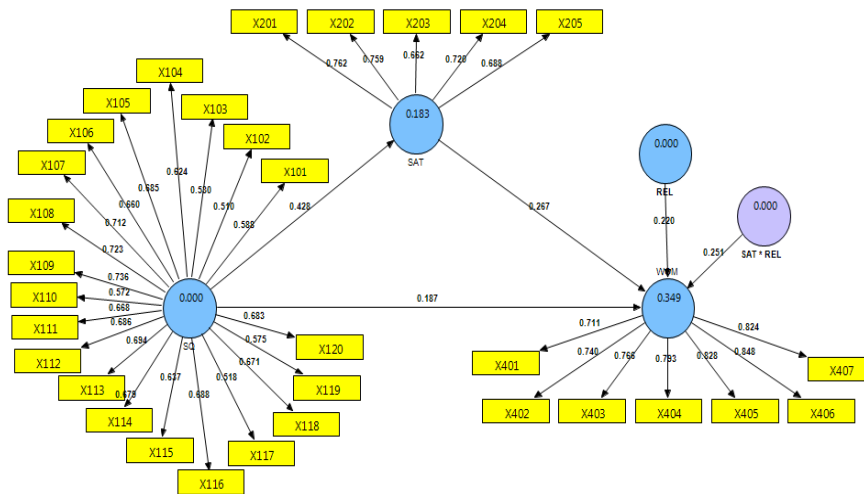
Figure 4.1 is the result of algorithm analysis PLS SEM that shows the outer and inner loading and also path coefficient values. It used to construct the outer and inner models. Whereas in Figure 4.2 is the result of bootstrapping analysis of PLS SEM showing the outer and inner significance of the model, the path model coefficients, as well as the coefficient of determination or R^2.


Figure 4.1. Diagram of Algorithm Structural Model
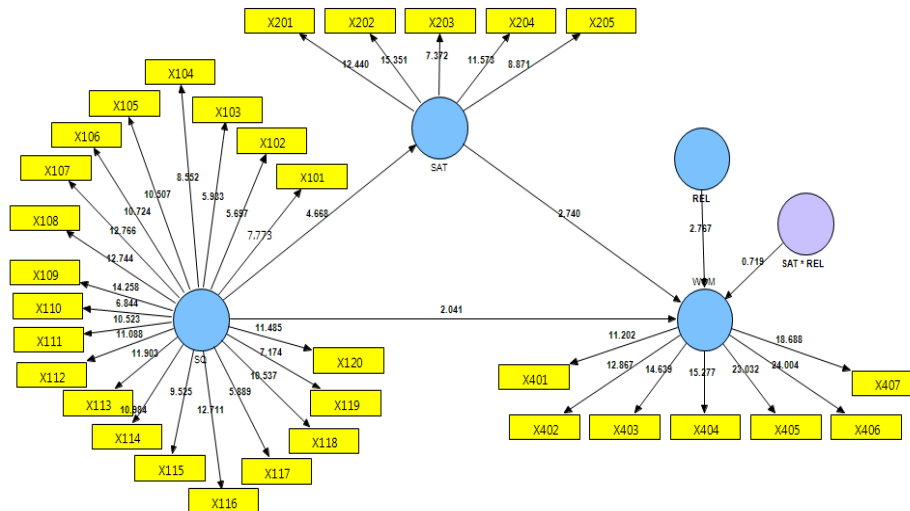

Figure 4.2. Diagram of *Bootstrapping* Structural Model

c. Path Diagram Conversion to Equation

1) Structural Equation (Inner Model)

WOM (η_2)   = 0.301SQ + 0.086
SAT (η_1)   = 0.428SQ + 0.087
WOM (η_2)   = 0.267SAT + 0.094
WOMmodSAT (η_2) = 0.251 + 0.267SAT + 0.329

2) Measurement Equation (Outer Model)

2.1) Service Quality

$SQ = 0.588SQ_{01} + 0.510SQ_{02} + 0.530SQ_{03} + 0.624SQ_{04} + 0.685SQ_{05} + 0.660SQ_{06} + 0.712SQ_{07} + 0.723SQ_{08} + 0.736SQ_{09} + 0.572SQ_{10} + 0.668SQ_{11} + 0.686SQ_{12} + 0.694SQ_{13} + 0.769SQ_{14} + 0.637SQ_{15} + 0.688SQ_{16} + 0.518SQ_{17} + 0.671SQ_{18} + 0.575SQ_{19} + 0.683SQ_{20}$

2.2) Satisfaction

$SAT = 0,762X_{201} + 0,759X_{202} + 0,662X_{203} + 0,720X_{204} + 0,688X_{205}$

2.3) Word of Mouth

$$WOM = 0{,}711X_{401} + 0{,}740X_{402} + 0{,}766X_{403} + 0{,}793X_{404} + 0{,}828X_{405} + 0{,}848X_{406} + 0{,}824X_{407}$$

d. Evaluation of Goodness of Fit Criteria
  1) Evaluation of Measurement Model (outer Model)
     1.1) Convergent Validity
          The results of convergent validity analysis as in Table 4.1 show that all indicators of latent variables have a correlation coefficient more than 0.50. it's means that all indicators of latent variables is valid as a tool to get information from respondents. Therefore, all the indicators of each latent variable statistically meets the requirements of convergent validity and valid for measuring service quality, satisfaction and WOM.
     1.2) *Discriminant validity*
          Discriminant validity is to measure that each indicator is a good comparator for latent variable. Indicators regarded as a good comparator if the value of cross loading greater than 0:50. Discriminant validity analysis results as in Table 4.5 show that all indicators of service quality, satisfaction, and WOM has cross loading greater than 0.50. Statistically all indicators considered valid, so the indicators of three latent variables are a good comparator.

Table 4.5. *Cross Loading*

Indicators	SQ	SAT	WOM	Validity
X101	0.5884			Valid
X102	0.5096			Valid
X103	0.5296			Valid
X104	0.6237			Valid
X105	0.6853			Valid
X106	0.6600			Valid
X107	0.7122			Valid
X108	0.7233			Valid
X109	0.7360			Valid
X110	0.5721			Valid
X111	0.6681			Valid
X112	0.6858			Valid
X113	0.6936			Valid
X114	0.6792			Valid
X115	0.6366			Valid
X116	0.6876			Valid
X117	0.5177			Valid
X118	0.6708			Valid
X119	0.5753			Valid
X120	0.6834			Valid
X201		0.7618		Valid
X202		0.7586		Valid
X203		0.6622		Valid
X204		0.7201		Valid

X205	0.6879		Valid
X401		0.7108	Valid
X402		0.7400	Valid
X403		0.7664	Valid
X404		0.7926	Valid
X405		0.8277	Valid
X406		0.8481	Valid
X407		0.8243	Valid

Source: SmartPLS *Bootstrapping*, 2016.

Discriminant validity can also be measured by the value of the root AVE. The results of the root of AVE analysis can be seen in Table 4.6. Indicators considered valid if the root AVE value greater than 0.50. The value of root AVE service quality, satisfaction and WOM is greater than 0.50, which means all the latent variables meet the criteria of discriminant validity. This may imply that the measurement variable has a low correlation with variables that predicted nothing to do.

Table 4.6. *Average Variance Extracted* **(AVE)**

Latents	AVE	Root AVE	Cut off	Validity
SQ	0.6795	0.6454	0.50	Valid
SAT	0.5172	0.7192	0.50	Valid
WOM	0.6218	0.7885	0.50	Valid

Sumber: Hasil analisis SmartPLS Algoritma, 2016.

1.3) Composite reliability

Composite reliability function is to test the reliability of composite indicator which is reflection of latent variables in the model. Composite reliability analysis results can be seen in Table 4.7.

Table 4.7. Composite Reliability

Latents	Composite Reliability	Cut off	Reliability
SQ	0.8423	0.70	Reliable
SAT	0.9127	0.70	Reliable
WOM	0.9339	0.70	Reliable

Source: SmartPLS Bootstrapping, 2016.

Latent variables stated reliable if the reliability value of the composite more than 0.60. The analysis showed that the composite value of each latent variable is more than 0.70. This means that each has fulfilled the criteria latent variable composite reliability and highly reliable.

2) Evaluation of Structural Model (Inner Model)

GOF evaluation structural model of the inner model using R square whose function is to see the significance of latent variables. As for seeing the relevance of the predictions of endogenous latent variables and indicators reflection by looking at Q square value, where the endogenous variables are said to have a good relevance if the Q square value greater than 0. R square value generated through bootstrapping SmartPLS analysis and the results can be seen in Table 4.8.

Table 4.8. R *Square*

Path	R Square	Original Sample (O)/ Koefisien Parameter	T Statistics (|O/STERR|)
SQ --> WOM	0	0.1866	3.5021
SQ --> SAT	0.1833	0.4281	4.9006
SAT --> WOM	0.349	0.2673	2.837

Source: SmartPLS Bootstrapping, 2016.

R square is the coefficient of determination, that is the ability of a construct to explain the model. R-square for satisfaction is 0.232, it demonstrates the ability of service quality to explain the satisfaction as for 23.2% and 76.8% remaining is explained by other variables never analyzed in this model. The R square WOM for 0.296 shows the ability of satisfaction in explaining WOM as for 29.6%, while 70.4% is influenced by other variables never analyzed in the model. Using R square value of satisfaction and WOM, then the resulting Q square value of 0.4683. The Q square value is greater than zero, so that the structural model has predictive relevance which is able to measure both the value of the observation models and parameter estimation.

2. **Hypothesis Testing**
a. Effect of Service Quality and Satisfaction on WOM

To test the significance of the effect of exogenous variables on the endogenous variables seen from the inner coefficient models. Said inner coefficient models significantly if the t statistic or t-test every latent variable is greater than t-table value (1.96) at 0:05 alpha. T value on the structural model or the path diagram modeling results lies in the direction of the arrows connecting the exogenous variables of service quality with satisfaction endogenous latent variables, latent variable exogenous latent variable service quality with WOM endogenous and exogenous latent variable of satisfaction with endogenous latent variable WOM.

Inner models show the meaningfulness of the relationship between the latent variables are used to test the research hypothesis. The study hypothesis was tested by comparing the value of the t statistic with a value of t table with the criteria if the value of the t statistic is greater than t table then the hypothesis is supported, and otherwise the hypothesis is not supported. Summary results of the analysis of the inner workings of the model shown by the path coefficients as set forth in Table 4.9.

Table 4.9. Path Coefficient

Path	Original Sample (O)	T Statistics (|O/STERR|)	Significance
SQ -> WOM	0.1866	3.5021	Sig
SQ -> SAT	0.4281	4.9006	Sig
SAT -> WOM	0.2673	2.837	Sig

Source: SmartPLS Bootstrapping, 2016.

The results of the analysis of inner models generate path coefficient is used to test the hypothesis of influence between exogenous and endogenous. To test the hypothesis service quality effect on WOM views of the coefficient paths service quality on WOM. The path coefficient was 0.1866, and significant at alpha 0.05 because the value of t statistics 3.5021 is greater than t table 1.96. This indicates the

services quality has a significant positive effect on WOM. Thus the hypothesis which states that service quality effect on WOM supported.

Testing the hypothesis affect service quality on satisfaction is determined by the path coefficients and significance. Magnitude coefficient the path is significant at alpha 0.4281 and 0.05 for the value of t statistics 4.9006 greater than t table value of 1.96. This indicates that services quality has a significant positive effect on satisfaction. Thus the hypothesis that stated affects service quality on satisfaction is supported.

Testing the hypothesis effect satisfaction on WOM is determined by the path coefficients and significance. The path coefficient is 0.2673 and significant at alpha 0.05 for the value of t statistics of 2.837 is greater than t table 1.96. This indicates that satisfaction has a significant effect on WOM. Thus the hypothesis that satisfaction has an effect on WOM is supported.

b. Moderating Effect

To examine the moderating of religiosity in the influence of satisfaction on WOM it is necessary to test the relationships between constructs. It is intended to obtain path coefficients between latent constructs. The result of the relationship between service quality and WOM can be seen from the estimated path coefficient and levels of significance as in Table 4.10.

Table 4.10. *Path Coefficcient*

Path	Original Sample (O)	T Statistics ($|O/STERR|$)	Significance
SQ -> WOM	0.1866	1.9747	Sig
SQ -> SAT	0.4281	4.9006	Sig
SAT -> WOM	0.2673	2.837	Sig
SAT * REL -> WOM	0.2511	0.7631	No Sig

Source: SmartPLS Bootstrapping, 2016.

The first analysis was done without involving the moderator variables of religiosity in relationship path between latent variables. Analysis results showed that the path coefficient linking service quality and WOM is 0.1866 and significant, since the value of the t statistic is 1.9747 greater than t table 1.96 at the 0.05 error level. That is, the quality of services and significant positive effect on WOM. Thus the hypothesis which stated that service quality effect on WOM supported.

Coefficient path which is connecting service quality and satisfaction is 0.4281 and significant, since the value of the t statistic 4.9006 is greater than t table value at 1.96 with 0.05 error level. That is, services quality has a positive and significant effect on satisfaction. Thus the hypothesis that stated service quality has an effect on satisfaction is supported.

Coefficient path which is connecting satisfaction and WOM is 0.2673 and significant, since the t statistic value of 2,837 greater than t table value at 1.96 with 0.05 error level. That is, the customer satisfaction and significant positive effect on WOM. Thus the hypothesis stated satisfaction has a direct effect on WOM supported.

The second analysis is to examine religiosity as a moderator variable on the relationship between satisfaction and WOM. The analysis resulted path coefficient of 0.2511 and t statistics value of 0763 is smaller than 1.96 or insignificant. That is, religiosity did not significantly moderate the influence of satisfaction on WOM. Thus

the hypothesis that religiosity moderates the effect of satisfaction on WOM is not supported.

Results And Discussion

Analyzing of the first hypotheses indicated service quality at UMM and UNISMA has a positive effect on students done marketing communication through WOM. It means better service quality at UMM and UNISMA will more motivated students to inform a positive thing about the college to others. Improvements of service quality to the students will be able to encourage students to recommend or induce others to study at UMM and UNISMA.

The results support the findings of Babin et al. (2005), which indicated that service quality has a positive effect on WOM. The results also supported other studies, such as Bruce and Edgington (2008), De Matos and Rossi (2008), and Ferguson *et al.* (2010) were indicated that service quality has a positive effect on word of mouth. In the college perspective, the results support the findings of Herman (2001), conch (2006), and Abdullah (2006) that the higher education quality has a significant effect on the students' willingness to recommend others through WOM and the superior service quality positively increasing the word of mouth feedback.

Some reasons underlying the service quality has a significant and positive effect on WOM is derived from most respondent's responses that service quality at UMM and UNISMA meet their expectations. Most respondents considered that UMM and UNISMA had modern equipment for lecturing, luxuries campus buildings, lectures have good performance appearance, and campus facilities reflect the superior service.

In terms of reliability dimension, most responded UMM and UNISMA lecturers are always kept their promises, their science are qualified, always provided timely service, and able to deal with the problem of students' academic accurately. In terms of the dimensions of responsiveness, the majority of respondents consider that the lecturers of UMM and UNISMA always gave assurance of time service, provide faster service, concern to help students deal with academic problems and always ready to answer students' questions.

In terms of assurance dimension, most respondents considered that lecturers of UMM and UNISMA always trustworthy, always gives a sense of security, always consistent in being polite, and knowledgeable in answering questions. In terms of dimension of empathy, most respondents stated that UMM lecturers and UNISMA always give personal attention to students, always concerned with the difficulties experienced by students in the learning process, and always gives a honest concern on students.

The second hypothesis test results show that service quality has a significant and positive effect on student satisfaction. It's indicated that service quality has been satisfying UMM and UNISMA students. In other words, the more service quality of UMM and UNISMA the more student satisfaction. So, the key to building a sense of satisfaction students is UMM and UNISMA should continuously and sincerely to improve superior service quality from time to time.

The results of this study support the research Cronin *et al.* (2000), Hermawan (2001), Keong (2006), as well as Danjuma and Rasli (2016), which indicated the quality of higher education, has a significant effect on student satisfaction. Meanwhile, this study do not support the results of research conducted by Gill and White (2009), Wu (2011), Markovic and Jankovic (2013), as well as Fatima and Razzaque (2014). Their results indicated that not all quality dimensions have a significant effect on satisfaction and quality of service as an exogenous variable was not able to provide customer satisfaction in several different research objects.

Some of the reasons underlying a significant effect service quality on satisfaction is derived from a variety of respondents. Most of the respondents were satisfied with the decision in choosing UMM and UNISMA and satisfied with good service. Students are also satisfied with academic program, as well as students settle into UMM and UNISMA.

The third hypothesis stated that satisfaction effect on WOM is supported. The analysis showed that satisfaction has a significant and positive effect on WOM. It's indicate that students satisfaction motivate them for communicating the institutions to others through WOM voluntarily. Thus, students who feel satisfied during their study at UMM and UNISMA will be compelled to say good things and recommend and persuade other people to choose UMM and UNISMA.

The results support research conducted by Babin *et al.* (2005), Bruce & Edgington (2008), Casalo *et al.* (2008), Chaniotakis & Lymperopoulos (2009), there are a direct relationship between satisfaction and WOM intention. But the results of this study do not support Wirtz and Chew (2002), Brown *et al.* (2005), Li (2013), Naik, Anand, and Bashir (2013) were indicated a positive relationship between consumer satisfaction and WOM. Thus, in terms of UMM and UNISMA, students who satisfied with their decision will be motivated to voluntarily told others about good things of UMM and UNISMA.

Path analysis showed that religiosity does not significantly moderate the influence of satisfaction on WOM. It means that religiosity does not moderate the influence of satisfaction on WOM. In other words, students' religiosity did not able to strengthen WOM marketing communications even though they have been satisfied with service quality at UMM and UNISMA.

The results of this study do not support a finding Budiman (2012) that religiosity moderating the intention of buying a pirated bag, as well as the findings Vitell and Paolillo (2003), and Kurpis *et al*, (2008) which indicated person religiosity can push a positive effect on ethical behavior. Religiosity that exists in students at private colleges Islamic religious background is not capable reinforce the students to do voluntary WOM marketing communications. Thus, both the higher education institutions in motivating students to perform WOM marketing communications simply by making the students feel satisfied with excellence service quality. In other words, in a private college environment based on Islamic religion did not necessary to use a religiosity variable to leverage students' WOM marketing communications.

Conclusion

The service quality indicated has a positive effect on student's satisfaction and WOM marketing communications. The more service quality the more students satisfied and motivated to do voluntary WOM marketing communications. This indicates strongly that to encourage marketing communications through WOM by a student, the student must be given a more superior service in fulfill their expectations.

Study also indicated that UMM and UNISMA's service quality had a direct impact to the students to do WOM marketing communication voluntarily. Student satisfaction has a direct positive effect on WOM marketing communications. The direct effect between latent variables indicated that students' satisfaction mediates the relationship between service quality and WOM marketing communications. Therefore, for future studies proposed to analyze the role of satisfaction as a mediator variable in the relationship between service quality and WOM marketing communications.

Students' religiosity at UMM and UNISMA did not able to strengthen WOM marketing communications although they were satisfied. This result indicated that even in the college

environment based on Islamic religion, religious variables does not guarantee to bring automated students action to tell good things of institution. The important result in this study is students' religiosity cannot be played as a moderator variable to strengthen the spirit of UMM and UNISMA students to do WOM for the institution.

In the neighborhood-based private colleges Islam, indicated that elements of religiosity cannot strengthen and are not able to contribute in improving the WOM marketing communications. Thus, religiosity cannot be played to strengthen the WOM marketing communications at UMM and UNISMA. For future research could examine the moderating role of religiosity in the relationship between service quality and WOM marketing communications at the college environment based on non-Islamic religion.

Inability religiosity of as moderating variable WOM marketing communications in Islamic higher education carried out a logical consequence that the variables such derived from religion are not necessarily able to support voluntarily activities. Thus the theoretical implications of this research are marketing through WOM communication can still be done without strengthening the non-material variable or variables derived from religion.

In practical terms, the management UMM and UNISMA can support their students who are satisfied to promote the campus to the community through WOM marketing communications. Service quality is the key factor of student satisfaction and encourages students doing marketing communication through WOM voluntarily. UMM management and UNISMA should be more concerned to regularly improving service quality to make student satisfaction increase and then they are more motivated to do WOM voluntarily.

EFFECT OF INTELLECTUAL CAPITAL ON FINANCIAL PERFORMANCE OF INSURANCE COMPANY

Avianti Zulaicha
Riyanti

Abstract

Purpose – The purpose of the paper is to assess and analyze the effect of intellectual capital on the financial performance of general insurance companies. The Intellectual capital measured by VAIC^{TM}, which consists of two components, namely intellectual capital efficiency (ICE), capital employed efficiency (CEE). Financial performance quantified by ROA and RBC.

Design/methodology/approach - The research used descriptive and associative methods. The seven sample insurance companies obtained by purposive sampling method. The study uses secondary data from company financial reports, and analyzed with SEM Partial Least Square (PLS – SEM).

Findings - The results showed that the intellectual capital (VAIC^{TM}) significantly affects financial performance. Indicators ICE and the CEE contributed significantly to the intellectual capital. Indicators ROA and RBC contributed significantly to the company's financial performance.

Practical implication - The results of this study can be used as a reference for general insurance companies to invest in the human capital, as part of intellectual capital, which needs to be synergized with organizational capital. Intellectual capital (IC) can be used as a "promotional tool" since IC referred as business performance indicator. So far, the general insurance companies used RBC as a promotional tool.

Originality / value - Most research on intellectual capital as measured by VAIC^{TM} in Indonesia have focused on three components, namely Value Added Capital Employed (same term as CEE), VAHU (same term as HCE) and STVA (same term as SCE). While this research focused on two coefficients of efficiency, i.e. CEE and ICE. ICE consisted of structural/organizational capital efficiency (SCE) and human capital efficiency (HCE), due to the role of human capital and organizational capital need to be synergized to generate added value for the company.

Keywords - *Intellectual capital, VAIC^{TM}, ICE, CEE, ROA and RBC*

Introduction

The challenge in this era of globalization, knowledge-based economy, and the evolution of technology, has prompted businesses to seek new ways of maintaining its competitive advantage. In response, in general it can be said that the success of the company depends on the existence of competent human resources. Individuals with high competence, in turn, will be a valuable asset for company and is reflected in the framework of its human capital.

Human capital expansively covers the meaning of 'man as creator' who has knowledge, skills, competencies, and experiences come from their relationship with 'self' and 'environment" continuously (Kwon, 2009). According to Dess, Lumpkin and Eisner (2007:127) human capital is the main pillar in the intellectual capital.

Intellectual capital plays an important role for an insurance company as an industry based on intellectuality to innovate in products and services. According to research carried out by

Rahim,H.(2013) the current intellectual capital / human capital and organizational assets in the insurance company have not been used optimally yet.

General insurance companies in Indonesia have a good business opportunity. The number of general insurance companies is quite significant compared to other types of insurance (Financial Services Authority/FSA per June 2013).
Source: www.ojk.go.id/asuransi
**Figure 1. Percentage number of general insurance company
in Indonesia per June 2013**

Intellectual capital cannot be measured directly, but through value -added indicator of efficiency. Among others is VAIC^{TM} method or value-added intellectual coefficient, introduced by Pulic (1997) to measure the added value of the enterprise resource of intellectual capital, and physical and financial capital. Intellectual capital is comprised of two components, namely human capital and structural capital as seen in Figure 2.
Source: Andriessen (2004)

**Figure 2. Two Keys Resources
Creating Added Value in the Company**

Results of previous studies on the effect of intellectual capital to the company's financial performance had not been consistent. Most research used three components of VAIC^{TM} i.e., value added capital employed (VACA or CEE), value added human capital (VAHU or HCE) and structural capital value added (STVA or SCE). In order to generate added value for the company, the role of organizational and human capital need to work together. Therefore, unify SCE and HCE into ICE deemed to be better. This study aims to assess and analyze the effect of intellectual capital as measured by VAIC^{TM} with its indicators ICE and CEE on the financial performance of general insurance companies. The discussion focused on the perspective of human resource management.

Literature review

1. Definition of Intellectual Capital

Intellectual capital (IC) is one of the approaches used to measure intangible assets of an enterprise. IC has been a concern of many fields, such as management, information technology, sociology and accounting (Petty and Guthrie, 2000 in Nawawi, 2012: 185).

According to Dess, Lumpkin and Eisner (2007: 125), IC is defined by many authors as the difference between market value and book value of a company which is a measurement of the value of intangible assets of the company. This broad definition involves assets such as reputation, loyalty and employee commitment, customer relations, corporate values, brand and the experience and skills of employees

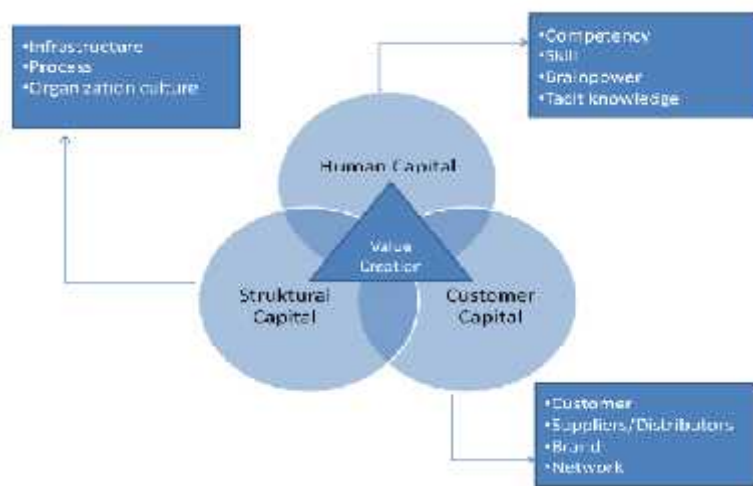
Conceptually, until now, there are various definitions of IC. Almost all definitions reveal that IC is considered as the source of the company's long-term value creation. Value creation models of IC by Tom Stewart (2001 in Nawawi, 2012: 185) is one model that is fairly well known, presented in Figure 3


Figure 3. Value Creation in Intellectual Capital Model Source: Tom Stewart, 2001 in Nawawi 2012: 185

The model illustrates that IC consists of three components, namely human capital, structural capital and customer capital that jointly will be able to create value for the company.

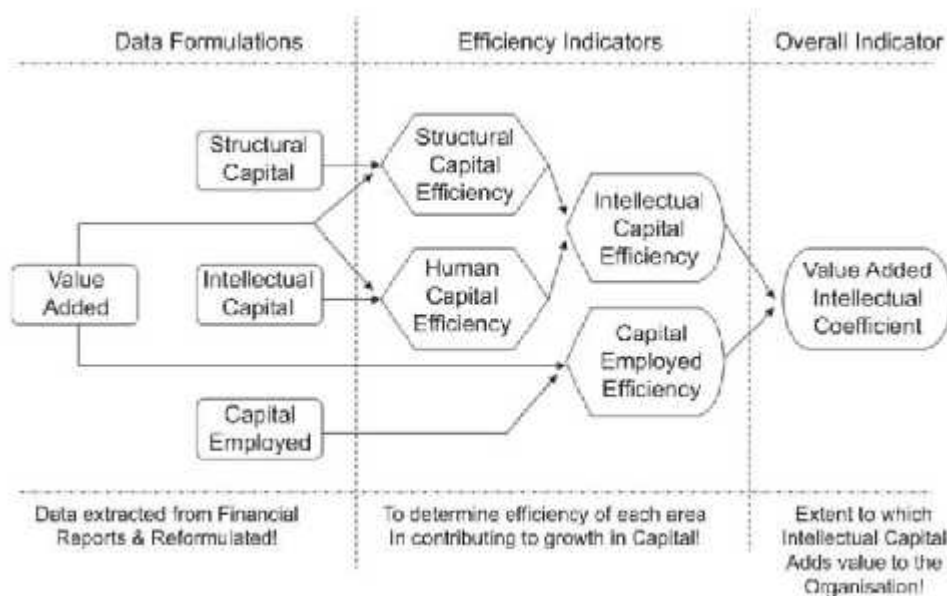
According to Pulic (1998, 2000), IC is one of the important resources for the success of the company's performance in the knowledge-based economy. The question arises is how companies create value in an intensive knowledge-based economy? According to Dess and Lumpkin (2003: 118), in general, is by attracting and controlling the human capital through mechanisms that create the value of products and services continuously. There are three basic concepts related to IC, i.e. the first, human capital is the ability of individuals, the knowledge, the skills of employees and company managers. Second, social capital can be defined as a network of relationships of the individual in the organization and also outside the scope of the organization that includes the relationship between the company and its suppliers, customers and partners. Third capital is related to the concept of 'knowledge' which consisted of two forms. The explicit knowledge that can be codified, documented, reproduced and disseminated, for example, engineering drawings, patents, sales collateral, etc. On the other side is tacit knowledge. This is knowledge that exists in the minds of the employees and based on the experience and background, can be shared through individual permits and participation.

While Bejinaru, R and S. Iordache (2011) argue that intellectual capital is the knowledge of various shapes, whether tangible or intangible, this can be used to generate a profit/ financial or other benefits for the organization. Intellectual capital is a dynamic component that can be continuously designed related to the quantity, quality, value, usefulness or intensity use and this is the essence implied from the learning organization that is the constant adaptation, continuous learning, continuous use of resources and opportunities.

Noting these linkages, the company is not able to create value by itself, without the initiative of the individuals involved in the organizational processes. Therefore, human capital is crucial for the survival of the company, because human capital is an amalgamation of intangible resources inherent in the organization's members. Likewise, individuals will not be able to contribute meaningfully to the company if not supported by condusive management so that employees are able to provide ideas, thought, innovation and creativity for the company.

2. Intellectual Capital Measurement - *Value Added Intellectual Coefficient* (VAIC™)

Measuring intellectual capital is not easy. However, according Ulum (2014) gauge IC with VAIC™ method developed by Pulic in 1997 is an approach that is relatively easy and possible to implement, because the necessary data derived from the company's financial statements / balance sheets, statements of income.

VAIC^{TM} stands for Value Added Intellectual Coefficient, is designed to provide a means to measure the efficiency of the three types of inputs: physical and financial capital, human capital and structural capital. VAIC™ is a most popular method for measuring the efficiency of the value added intellectual capital of the company. Figure 4 provides an overview of how VAIC™ is formed from 3 added value input, which is then divided into two types of efficiency, i.e. intellectual capital efficiency (ICE) which consists of human capital and structural / organizational capital, and non-intellectual efficiency, consisting of physical and financial capital called capital employed efficiency (CEE).


Source: Laing, Dunn and Hughes-Lucas (2010:276)
Figure 4. Overview Value Added Intellectual Coefficient (VAICTM)

VAIC^{TM} Model begins by looking at a company's ability to create value added. The added value is formed from the use of capital in the company, where VA is calculated as the difference between output and input. The output (OUT) represents the revenue and covers all

products and services sold in the market. Input (IN) covers the entire load used to earn income. Things to consider in this model is personnel expenses are not included in the IN for its active role in the value creation process, it is not considered as a cost, but labor is treated as an investment and as an entity of value creation (Pulic, 1998, 2000 and Ulum, 2014: 108)

Considering the difference in value added generated by non-intellectual capital and intellectual capital, the value added generated by non-intellectual capital is measured by the efficiency of the use of physical and financial capital used by the company are reflected in the financial statements . The added value is referred to as Capital Employed (CE). CE is the value added that occurs in the company calculated from the difference between output and input, divided by total assets other than intangible assets. CE efficiency indicator which is a plus for the CE notated CEE (Capital Employed Efficiency) which indicates if one unit CE in a company producing more profit than any other company then the company is better at using its CE. Thus, much better use of the CE becomes to be a part of the IC companies (Pulic, 2000, 2004).

Furthermore, the IC has two components, namely human capital and structural capital (Pulic, 2000, 2004). The added value resulting from the efficient use of human capital the company referred to as Human Capital Efficiency (HCE). Efficiency is measured by dividing the company's value added with expenses incurred for employees. HCE indicators showed the employee contributions to the increase in value-added enterprises.

The added value comes from structural capital component associated with organizational capital called Structural Capital Efficiency (SCE) or the efficiency of structural capital.

Intellectual capital efficiency (ICE) obtained by adding the partial efficiency of structural and human capita $VAIC^{TM}$ is calculated as follows:

$VAIC^{TM} = ICE + CEE$

Where ICE = intellectual capital efficiency (HCE + SCE),
CEE = efficiency of physical and financial capital

With this composite indicator makes it possible to understand the overall efficiency of the company and show their intellectual ability. High coefficient values indicate a higher value creation from the use of company resources, including its IC.

3. Company Financial Performance

The financial performance is the result of all management decisions made on an ongoing basis. To assess the performance of the company then those decisions need to be associated with cumulative financial performance and economics. The financial performance analysis is based on published financial data, as reflected in the financial statements prepared in accordance with accounting principles that are commonly used (Helfert, 2000: 52).

According to Brigham and Houston (2009: 95) the company's financial performance can be measured using ratios contained in the financial statements issued periodically. According to Fahmi (2014: 104), the condition of the company's performance can be seen from three of the most dominant financial ratios referenced to investors, that are the liquidity ratio, solvency, and profitability ratios.

Return on assets (ROA) is the ratio of net income to total assets, to measure the rate of return on total assets after interest expense and taxes. The larger the value, the better the company's financial performance (Brigham & Houston, 2009: 109). Thus, ROA can serve as formative indicators for financial performance. 8

Noting that the IC is the difference between the market value and the book value of the company, companies that can generate high levels of income from intangible assets, such as reputation, customer relations, employee loyalty, the values of the company, brand, etc., in

general have a higher market value than its book value. This is indicated by ROA. Thus ROA could be a benchmark of good and /or bad an intangible asset of a company or its IC.

Risk Based Capital (RBC) is a measurement to inform level of financial security or financial health of an insurance company. The greater of the RBC value, the more healthy financial condition of the insurance company.

Based on the financial minister regulation of No. 53 / PMK.010 / 2012, insurance companies and reinsurance companies shall meet the solvency level of at least 120%.

Considering the important of the size of RBC for indication of financial healthiness of insurance companies, it is often used as a promotional tool company to build the brand image well as improving the acquisition premium. Having regard to the RBC function, it can be said that reliability of intellectual capital and human capital will generate high RBC.

4. Conceptual Framework

In theory, as already explained, there is a relationship between intellectual capital and financial performance of the company. Intellectual capital can be measured by the value added intellectual coefficient (VAIC^{TM}) method developed by Pulic in 1997. VAIC TM describes the information about the efficiency of value creation of intangible assets and tangible assets owned by the company, which consists of three components: HCE (human capital efficiency), SCE (structural capital efficiency), and CEE (capital employed efficiency). Components HCE and SCE forms coefficients for Intellectual Capital Efficiency (ICE). Thus VAIC^{TM} will be formed from ICE and CEE. While financial performance is a variable formative formed from indicators ROA and RBC, as refer to Figure 5.
Figure 5.
Research Conceptual Framework

Data

The data collection was a literature study to get the insurance company's financial statements in Capital Market Information Center. The financial statements and financial ratios derived from the site (website) Indonesia Stock Exchange, www.idx.co.id. In addition, the literature studies also done by studying reference books and relevant journals.

Analyzing the initial data was done by examine the descriptive statistics of each variable and its correlation with other variables, to check their compatibility with the predictions and ensure no data outliers.

The research population is all general insurance companies listed on the Indonesian Stock Exchange in Year 2009 - 2013. The purposive sampling technique was used, with the following criteria:

- General insurance companies listed on the Indonesia Stock Exchange for five consecutive years (2009 - 2013)
- Have no negative ROA value.
- Have all the necessary data.

Based on the criteria, the number of samples in this study is 7 companies, as presented in Table 1.

Table 1. List of Research Sample

No	Name of Company	Code
1	Asuransi Bina Dana Arta Tbk	ABDA
2	Asuransi Harta Aman Pratama Tbk	AHAP
3	Asuransi Multi Artha Guna Tbk	AMAG
4	Asuransi Dayin Mitra Tbk	ASDM
5	Asuransi Jasa Tania Tbk	ASJT
6	Asuransi Ramayana Tbk	ASRM
7	Lippo General Insurance Tbk	LPGI

Results and Analysis

 1. Data Description

 A. Value Added Intellectual Coefficient (VAIC^{TM})

Referring to Table 2, the best VAIC^{TM} value over five years from 2009 to 2013 of the general insurance company is Asuransi Multi Artha Guna Tbk (AMAG), then the second best is Lippo General Insurance (LPGI), and the third is Asuransi Bina Dana Arta (ABDA) with the average value in that order is 4.44, 3.40 and 3.30. 10

Table 2. Value of VAIC^{TM} Year 2009 - 2013

No.	Name and Company Code	Year					Average
		2009	2010	2011	2012	2013	
1.	Asuransi Bina Dana Arta (ABDA)	2.37	2.70	3.72	3.48	4.24	3.30
2.	Asuransi Harta Aman Pratama (AHAP)	2.56	2.56	2.90	2.76	2.88	2.73
3.	Asuransi Multi Artha Guna (AMAG)	3.86	3.87	4.70	5.08	4.67	4.44
4.	Asuransi Dayin Mitra (ASDM)	1.63	1.88	2.30	2.32	2.53	2.13
5.	Asuransi Jasa Tania (ASJT)	2.14	2.40	2.12	2.23	1.59	2.10
6.	Asuransi Ramayana (ASRM)	2.24	2.18	1.88	2.17	2.21	2.14
7.	Lippo General Insurance (LPGI)	2.63	4.25	3.34	2.85	3.93	3.40

VAIC^{TM} not measure IC directly but measuring its impact of the IC management (Ulum, Ghozali, & Chairi, 2008). The assumption is if a company has a good IC, and also manage it well, it will be good to the company. VAIC^{TM} value indicates the efficiency of the value added intellectual capital of a company. Therefore, VAIC^{TM} more appropriately referred to as ICP or intellectual capital performance, which by Mavridis (2004), Kamath (2007) and Ulum (2009a) in Ulum (2014) referred to as business performance indicator (BPI), and categorized into 4 categories as follows

a. *Top performer* – VAIC^{TM} score above 3.
b. *Good performer* – VAIC^{TM} score between 2.0 and 2.99
c. *Common performer* – VAIC^{TM} score between 1.5 and 1.99
d. *Bad performer* – VAIC^{TM} score below 1.5
Figure 6. Value of VAIC^{TM} Year 2009 – 2013

Referring to Figure 6, Asuransi Multi Artha Guna Tbk (AMAG) in the category of top performers. While 5 other companies, namely Asuransi Bina Dana Arta (ABDA), Asuransi Harta Aman Pratama (AHAP), Asuransi Jasa Tania (ASJT), Asuransi Ramayana (ASRM) and Lippo General Insurance (LPGI) in the category of good performers, and one company in the category of common performer namely Asuransi Dayin Mitra (ASDM).

In 2010, the value VAIC^{TM} LPGI insurance company rose from 2.63 be 4:25, so LPGI be the company with the highest VAIC^{TM} value as well as being a top performance together with AMAG. While other companies still remain as a category in the previous year.

In 2011 the insurance company ABDA its VAIC^{TM} value rose from 2.70 to 3.72, in the category a top performance together with AMAG, and LPGI which remain in this position since in 2010. In the year 2012 the value of LPGI dropped from 3:34 be 2.85, so that the category good performance. However, in the Year 2013 VAIC^{TM} LPGI rose again to 3.93 so the category back into top performance.

There are three companies that entered the category of top performance in the Year 2013 that is ABDA, AMAG, and LPGI. ASJT company that for 4 years in a row in the category of good performance down to common performance with its value of 1.59.

Financial Performance

ROA describes the ability of management companies to gain profits from its assets management. The company with higher ROA value, the better of the company's assets management to obtain the added value. Referring to Table 3, the average value of the highest ROA is an insurance company AMAG is 9.77%, then AHAP 7.07%, ABDA 5.86%, ASJT% 5.13, LPGI 4.37%, ASRM 4.10, and ASDM% 2.82%. 12

Table 3. Return on Assset (ROA) Year 2009 – 2013 (in %)

No.	Name and Code of Company	Year					Average
		2009	2010	2011	2012	2013	
1	Asuransi Bina Dana Arta (ABDA)	5.03	5.36	6.14	5.74	7.03	5.86
2	Asuransi Harta Aman Pratama (AHAP)	7.21	7.44	6.86	6.56	7.27	7.07
3	Asuransi Multi Artha Guna (AMAG)	9.72	9.07	8.83	10.90	10.33	9.77
4	Asuransi Dayin Mitra (ASDM)	2.92	2.60	2.70	2.90	3.00	2.82
5	Asuransi Jasa Tania (ASJT)	5.16	6.58	4.54	6.59	2.80	5.13
6	Asuransi Ramayana (ASRM)	6.06	5.33	3.17	3.05	2.89	4.10
7	Lippo General Insurance (LPGI)	3.75	6.12	4.39	2.94	4.62	4.37

In Figure 7 can be seen more on ROA data visualization of each general insurance company listed on the Stock Exchange in Year 2009 - 2013. Referring to Figure 7, the three companies with the best ROA value during 5 years are AMAG, AHAP and ABDA correspondently.
Figure 7. ROA Year 2009 – 2013

RBC indicates the financial healthiness/security of an insurance company. Referring to Table 4, the RBC of seven general insurance companies showed that all companies can meet the minimum standards set by the government is 120%. The average value for 5 years, 2009-2013, the highest is the insurance company AMAG then LPGI and ABDA, amounted to 371%, 342%, and 248% respectively. Five other companies have RBC values above 120%

but below 200%. This shows that in the case at any time any claims from policyholders simultaneously, the company is able to handle it.

Table 4. RBC Year 2009 – 2013 (in %)

No.	Name and Company Code	Year					
		2009	2010	2011	2012	2013	Average
1	Asuransi Bina Dana Arta(ABDA)	126	150	284	312	368	248

Figure 8. RBC Year 2009 – 2013

2. Requirements Analysis Test

PLS is defined by two equations, inner and outer models. The inner model in this study is between intellectual capital and financial performance. The outer model is between the variables outer intellectual capital with its indicators, namely ICE and CEE. Besides, it is also between financial performance variable with its indicators, ROA and RBC. This research uses a model of formative relationships. PLS algorithm result is presented in Figure 9.

A. Path Coefficient
Figure 9. Result of PLS Algoritm

Referring to Figure 9 the estimated value of the path coefficient is 0.925, shows the strong influence of exogenous latent variables VAIC^{TM} against endogenous latent variables, financial performance. In Table 5, the significance test indicates that the value of t-statistic of 57.211, is greater than t table is 1,693 (one tail test, $\alpha = 0.05$ df =33). It can be explained that the effect of exogenous latent variables VAIC^{TM} against endogenous latent variables financial performance is strong and significant.

Table 5. Path Coefficients (Mean, STDEV, T Statistics)

Path Coefficients

	Mean, STDEV, T-Values, P-V...	Confidence Intervals	Confidence Intervals Bias ...	Samples

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
VAIC -> FPERF	0.925	0.937	0.016	57.211	0.000

B. Indicator Reliability Test

Indicator reliability test is an analysis to show the contribution indicator to the latent variables in the outer model. For this purpose value outer loading was used. An indicator is considered reliable when outer loading value > 0.5 and ideally the value outer loading > 0.7 (http://www.statsdata.my.id). According to Sarwono and Narimawati (2015: 70), reliable indicator has outer loading value > 0.7.

Referring to Table 6 and 7, the indicators of ICE, ROA and RBC is reliable to its variable. The outer loading value greater than 0.7 in that order of 0.915, 0.941 and 0.713. The t-statistics of the indicators are 19.06 18 621 and 6156 respectively, which means significant. While the CEE indicator almost reliable to the latent variable VAIC^{TM}, with a value of 0.426, but significant with t statistic of 2.740.

Table 6. Outer Loading Value

Outer Loadings

▣ Mean, STDEV, T-Values, P-V...	▣ Confidence Intervals	▣ Confidence Intervals Bias ...	▣ Samples		
	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
CEE -> VAIC	0.426	0.438	0.155	2.740	0.010
ICE -> VAIC	0.915	0.896	0.048	19.061	0.000
RBC -> FPERF	0.713	0.691	0.116	6.156	0.000
ROA -> FPERF	0.941	0.943	0.051	18.621	0.000

C. Indicator Discriminant Validity Test

Indicator validity test result showed that all the indicators are valid, because all the indicators have a higher correlation with its owned latent variables compare with other latent variables (Sarwono and Narimawati, 2015) as shown in Table 8.

Table 8. Cross Loading

Discriminant Validity

	▣ Fornell-Larcker Criter...	▣ Cross Loading:	
		FPERF	VAIC
CEE		0.394	0.426
ICE		0.847	0.915
RBC		0.713	0.660
ROA		0.941	0.870

D. Multicollinearity Test

The result showed no collinearity between variables and indicators, both the inner and the outer models, since no VIF is more than 10 (Sarwono and Narimawati, 2015: 23), as shown in Figure 10

Collinearity Statistic (VIF)

▣ Inner VIF Values	▣ Outer VIF Values	
	FPERF	VAIC
FPERF		
VAIC	1.000	

Collinearity Statistic (VIF)

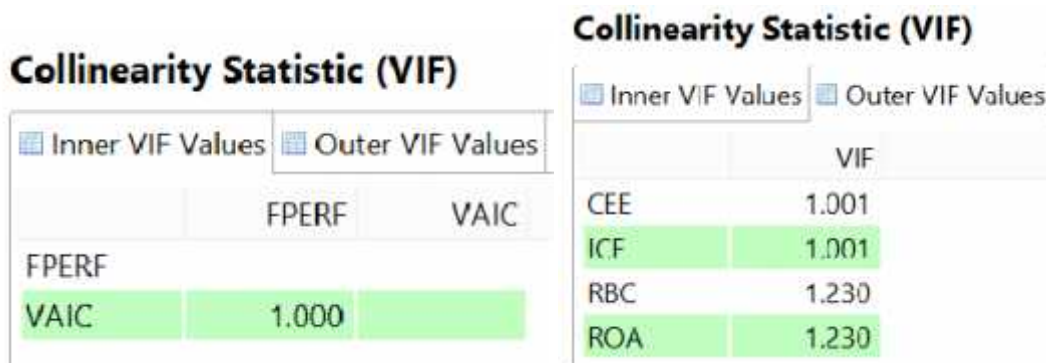
▣ Inner VIF Values	▣ Outer VIF Values
	VIF
CEE	1.001
ICF	1.001
RBC	1.230
ROA	1.230


Figure 10. Multicollinearity Test

E. Suitability of Structural Model

1. R Square (R2)

Referring to Table 9, the R Square (R2) is 0.856. Meaning that the ability of exogenous variables VAIC[TM] in explaining endogenous variable financial performance is 85.6%, and the rest is explained by other factors beyond the study. Relationships between variables VAIC[TM] and financial performance is substantial, since R2 is $0.856 > 0.67$ (Chin, 1988 in Sarwono and Narimawati, 2015: 23), and significant with t-statistic of 28.362.

Table 4.13. R Square (Mean, STDEV and T Statistics)

R Square

	Mean, STDEV, T-Values, P-V...	Confidence Intervals	Confidence Intervals Bias ...	Samples	
	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
FPERF	0.856	0.877	0.030	28.362	0.000

2. f Square

Value f square (f2) in this study is 5.956, as shown in Table 10, which means the effect of latent variables predictor (VAIC^TM) against endogenous variable financial performance considered strong at the level of structural theoretically, because the value greater than 0.35 (Sarwono and Narimawati, 2015: 24) and statistically significant with t-statistic of 2.815.

Table 10. f Square (Mean, STDEV and T Statistics)

f Square

	Mean, STDEV, T-Values, P-V...	Confidence Intervals	Confidence Intervals Bias ...	Samples	
	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
VAIC -> FPERF	5.956	7.659	2.116	2.815	0.008

3. Hypothesis Test

Testing the hypothesis includes hypothesis test for the inner and outer models. Bootstrapping calculation results to calculate the t statistic is presented in Figure 11.
Figure 11. Bootstrapping

A. Hypothesis test Inner Model

Referring to Table 11, the result of t statistics 57.211 shows that VAIC^TM with its indicators significantly affect the latent variable financial performance with its indicators at a significance level of 95% ($\alpha = 0.05$).

Table 11. Total Effects (Mean, STDEV, T Statistics)

Total Effects

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
VAIC -> FPERF	0.925	0.937	0.016	57.211	0.000

B. Hypothesis test Outer Model

Results of hypothesis testing the outer models consist of four indicators, namely ICE, CEE, ROA and RBC presented in Table 12.

Table 12. Outer Weights (Mean, STDEV, T Statistics)

Outer Weights

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
CEE -> VAIC	0.403	0.432	0.104	3.858	0.000
ICE -> VAIC	0.905	0.892	0.074	12.174	0.000
RBC -> FPERF	0.376	0.338	0.132	2.847	0.007
ROA -> FPERF	0.778	0.798	0.092	8.460	0.000

Referring to Table 12, shows that indicators ICE and CEE contribute to the latent variable VAIC^{TM} significantly, with the t statistic 12.174 and 3.858 respectively. Likewise, the indicators ROA and RBC contribute to latent variables financial performance significantly, with the t statistic 8.460 and 2.847 respectively.

4. Discussion

A. Inner Model

Referring to the result, the path coefficient value of 0.925 with t statistic 57.211, meaning that the intellectual capital (VAIC^{TM}) influences to financial performance positively and significantly. R squared value of 0.856 indicates that the intellectual capital (VAIC^{TM}) is able to explain the impact on the financial performance of 85.6%, while the remaining 14.4% is explained by other factors outside of the study. This can be explained that the general insurance companies listed on the Indonesia Stock Exchange Year 2009 - 2013 has been using its intellectual capital efficiently so as to create value for the company as indicated by good financial performance. These results concur with those of Subhan and Citraningrum (2010), Gozali and Hatane (2014) and Aji and Kurniasih (2015).

Intellectual capital, as indicated by many experts, is the difference between the market value and the book value of the company (Dess, Lumpkin and Eisner, 2007: 125). According to Pulic (2000a), the research conducted at the stock exchange showed that there is a relationship between the efficiency of value creation of and market value of the company. In this study, a significant effect of intellectual capital on the financial performance of general insurance companies showed that companies are able to manage knowledge, skills and experience of employees, supported by the organizational structure, systems and procedures and corporate culture that is conducive to such management, and is able to manage loyalty customers, commitment to shareholders and maintain its reputation, resulting in value creation, that is the increase in the market value and the company's financial performance was good with its indicators ROA and RBC.

B. Outer Model - Exogenous Variable of VAIC^{TM}

1. **Intellectual capital efficiency (ICE)**

Hypothesis test result of outer model for exogenous variable of VAIC^{TM} indicates that intellectual capital efficiency indicators or ICE in this research significantly contributed to VAIC^{TM}, with t statistic of 12.174. This can be explained from the view of Pulic (2000a) that the main goal of modern business is value creation. While the main purpose of the creation of value is to improve the ability of the company in the long term, which can be achieved by investing in intellectual resources (especially human capital, which is a key factor in the 19 value creation in modern business) and increased mobilization of internal company's potentials, starting from intangible potential. The existence of significant ICE influence to VAIC^{TM} indicates that the general insurance companies listed in the Indonesia Stock Exchange Year 2009 - 2013 has used its organization and human capital efficiently.

Key success of value creation, according to Pulic (2000a), is in creating a causal relationship between these two forms (tangible and intangible) of the value creation. One major challenge for management is to create conditions to enable creating intangible value such as knowledge, services, experience, benefits, quality, image) and transform it into a tangible form such as revenue, profits, value added, stocks, market value. Management of systematic value creation is based on the principle that this concept is deeply embedded in the company as an ultimate goal. It is important that it is "live" at all levels of the daily business activities, stimulated, rewarded, measured and communicated.

Synergy between human capital and organizational capital to intellectual capital also can be explained from the view of Dess and Lumpkin (2003), that the intellectual capital consists of reputation, loyalty, commitment, brand, experience and skills. Referring to this opinion, reputation, loyalty, commitment and experience besides belong to individual is also the company's reputation, loyalty and commitment to its customers and shareholders. Likewise experience, in addition to an individual property is also the experience of the company. While skills are exclusively individual, brands are exclusive the property of the company. In general insurance companies, these elements are synergizing each other to produce an innovation of new ideas to be applied to improve company‟s products and services, to create value.

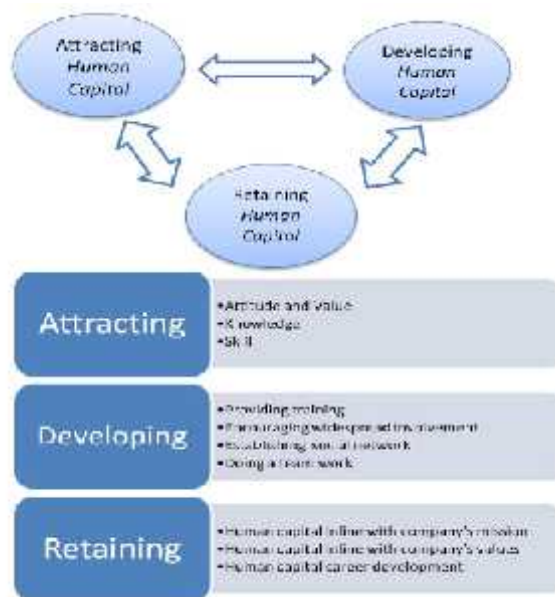
Moreover, synergy of organization and human capital can be explained from the theory of human resources management that according to Dess and Lumpkin (2003: 120) consisted of three activities, i.e. attracting, developing and retaining of human capital, where the relation depicted in Figure 12.


Figure 12. Tree Activities Human Capital Management

Source: Dess and Lumpkin (2003: 120-128)

Referring to Figure 12 can be explained that attracting human capital (HC), in recruiting focuses on general knowledge, experience, social skills, values and beliefs, as well as the attitude of the employees, as the first step in investing HC. At the time of developing HC conducted with various activities such as training, spread the spirit of engagement, forming a social network, and cooperation within the team. Furthermore, investment in HC continued with efforts to maintain HC in line with company"s mission, HC corresponding company"s value and career advancement. Such activities are carried out in a conducive situation of structures, systems and operations as well as the company's organizational culture resulting in a synergy between human capital and organizational capital. In such circumstances, the HC will be able to contribute optimally in the innovation process to produce insurance products and services which in turn contributes to value creation.

An innovation made by the insurance company to create value by synergizing and human capital enterprise organizations can be seen in the insurance company Lippo General Insurance (LIPPO).

LIPPO sustain the growth through increased value. The company maintains the quality in the back office and the interaction with customers simultaneously. Understanding customer needs and offer solutions to do with the approach not as a provider with customers but more towards relations consultant with the customer, in accordance with the theme energizing value creations, transforming organization. The company also understands the needs of information quickly and accurately as well as the increasingly high mobility of society, the company launched e-Benefit is an internet portal for customers' special Medicare, and services on line to facilitate registrars and pay the premiums, using a credit card and internet banking (Annual Report LIPPO Insurance, 2014).

2. Capital Employed Efficiency /CEE

Hypothesis test result outer model of exogenous variable VAIC^{TM} showed that indicators of physical and financial capital efficiency or Capital Employed Efficiency (CEE) in this research significantly contributed to VAIC^{TM}, with t-statistics 3.858. This is in line with the theory of value-added VAIC^{TM} (Pulic, 2000a), that the intellectual capital cannot create their own value. To obtain a clear picture of the value creation efficiency of resources, it is necessary to incorporate physical and financial capital in the calculation. Despite losing its dominant position in the new economy, its relevance cannot be ignored.

Physical and financial capital in general insurance companies related to insurance premiums earned from customers, which are then developed by the company in various ways in order to earn profits for the company. With the results of this study can be explained that the insurance companies listed on the Indonesia Stock Exchange Year 2009 - 2013 has been managing the physical and financial capital so well that results in financial performance was good as well. These result concurs with those of Aji and Kurniasih (2015) which indicates that the physical and financial capital efficiency (term as VACE) contributed significantly to VAIC^{TM} on Islamic insurance company listed on the Indonesia Stock Exchange Year 2009-2013.

C. Outer Model of endogenous variable Financial Performance
1. Contributions indicator ROA on an endogenous variable Financial Performance.

The result of hypothesis testing outer model endogenous variable of financial performance, shows that ROA indicator contributed positively and significantly to the financial performance of endogenous variable with t statistic value of 8.460 (> 1.693). This study

confirms the theory that the greater the value of ROA, the better the company's financial performance (Brigham & Houston, 2009: 109), so ROA can serve as formative indicator of financial performance in general insurance listed on the Stock Exchange Year 2009-2013.

The result concurs with those of Aji and Kurniasih (2015) that the ROA contribute positively and significantly to the endogenous variables on the financial performance of Islamic insurance company listed on the Stock Exchange in the year 2009-2013.

2. RBC Indicator contribution towards endogenous variable Financial Performance.

The result of hypothesis testing outer model of endogenous variable of financial performance, shows that RBC indicator contributed positively and significantly to the endogenous variable financial performance of general insurance companies listed on the Stock Exchange Year 2009-2013, with t statistics value of 2.847 (> 1.693). The result in line with result of Aji and Kurniasih (2015) that RBC contributed positively and significantly to the endogenous variables on the financial performance of Islamic insurance company listed on the Stock Exchange in the year 2009-2013.

Conclusion

The followings are the research conclusions:

1. Intellectual capital measured by the VAIC^{TM} with its indicators ICE and CEE significantly effect on the financial performance with its formative indicators of ROA and RBC, on general insurance companies listed on the Indonesia Stock Exchange Year 2009-2013. Path coefficient estimated for 0.925 with t-statistic of 57.211. Variable VAIC^{TM} able to explain its effect on the financial performance of the company amounted to 85.6%, which is indicated by the R2 value of 0.856. The remaining 14.4% is explained by other factors that do not included in this research model.

2. Formative indicators of intellectual capital efficiency (ICE), and capital employed efficiency (CEE) significantly affects VAIC^{TM} latent variables, with t-statistic 12.174 and 3.858 respectively.

3. Formative indicators of ROA and RBC contribute significantly to the company"s financial performance with t-statistic of 8.460 and 2.847 accordingly.

6. Suggestions

Based on the research findings in, it is suggested the following:

1. For the government/the Financial Services Authority (FSA)

The most valuable asset of a company in the 20th century was its production equipment. The most valuable asset of the company in the 21st century is knowledge workers and their productivity (Drucker, P., 1999, in Pulic, 2000). This study confirms the opinion for the general insurance company. Therefore, it is suggested to the FSA as a policy maker, to consider and incorporate elements of performance in terms of its intellectual capital, especially organizational and human capital, not only in terms of physical and financial only.

2. For the general insurance company.

The result of this study indicates that the synergy between human capital and organizational capital as 2 components of intellectual capital significantly positive effect on the financial performance of the company. Therefore, the findings could possibly be used as the model for managers of companies in investing and managing human capital, which proved if managed in synergy with organizational capital in the context of intellectual capital, will contribute to the company"s financial performance.

3. For the future research, it is advisable to:
- Continuing or complement this study, using primary data / interview in order to get a comprehensive overview of the intellectual capital management, so that the results can be more applicable directly.
- Conduct research with comparison method, considering many methods available for measuring intellectual capital.
- Conduct comparative studies for go public listed on the Indonesia Stock Exchange and not go public of general insurance companies.
- Conduct a research that able to provide input to the government on how to prepare the regulations related to the intellectual capital management.

THE EFFECT OF ACCOUNTING INFORMATION QUALITY AND MANAGEMENT ACCOUNTANT QUALITY TO SUCCESSFUL IMPLEMENTATIONOF DECISION SUPPORT SYSTEM (STUDY ON GOVERNMENT-OWNED BANK IN INDONESIA)

Vecco Suryahadi Saputro, Universitas Padjadjaran
Zaldy Adrianto, Universitas Padjadjaran

Abstract

Recent development in Information Technology, lead to the improvement of decision-making process in organization by utilizing the Decision Support System. Banking industries which one of the most intensive use of IT in the operation and financial reporting process. Therefore, the quality of accounting information and management accountant quality are important in the implementation of DSS.

This research uses descriptive analytic research method and using double linear regression and simple regression. Research Data is collected from questionnaire distributed and returned from the employees of Accounting Department and Information technology Department on Government-owned Bank as research's respondent.

The results indicate that there is a positive and significance effect between accounting information quality and management accountant quality to successful implementation Decision Support System simultaneously and a positive influence of accounting information quality and management accountant quality to successful implementation Decision Support System partially.

Keywords: *accounting information quality, management accountant quality, Decision Support System, implementation Decision Support System, Government-Owned Bank.*

Introduction

The recent development in Information Technology improving business process and the decision making process at the organization (Maharsi, 2000)(Kamel, Lakhder, & Ammar, 2012). Decision Support System concept developed in 1970s by Michael S Scott Morton, and itexpanding into creating a model to solve unstructured problems (Sprauge, 1980).

In Indonesia, Telkom e-service by PT.Telkom tbk, is an example of successful DSS implementation by analyzing complaint and suggestion from its customers (Kurniawan, 2014).Beside its successful implementation, the failure of DSS implementation because of the lack of ability from the DSS's user in a pre-qualification procurement phase(Suprapto & Wulandari, 2006).

DSS Implementation will be success when it is provided by a complete and high quality information(Suprapto & Wulandari, 2006)(Nurniah, 2005)(Baridwan & Hanum, 2007). One of research about the relation between accounting information quality and decision quality is the decision making case on the listed company at Indonesia Stock Exchange (IDX) (Harma & Wibowo, 2012).DSS implementation also depend on management accountant, as an information provider and DSS facilitator (Murphy C. , Currie, Fahy, & Golden , 1995).

The implementation case of PT. Telkom Indonesia, show that the quality of management accountant have an effect of DSS's implementation(Hermawan, 2009)(Ardinata, 2002). DSS also used by an environmental organization to mitigate the impact of earthquake and tsunami in Indonesia. In Banking Industry, DSS also widely implemented in a form of Internet Banking, Phone Banking, and ATM Banking (Bhatia, 2011)and also middle management requirement to decision making process.

Indonesian government owned bank (Bank BUMN) has a significant asset in Indonesian banking industry; all of them are included in top ten biggest assets bank, with two out of four banks is in the top (Djumena, 2015). As one of the most intensive user of Information Technology in their operation, Bank BUMN has been implementing and developing DSS since 2010 and 2011. Each bank discloses their DSS and information system implementation in their annual report(Annual Report BNI, 2010)(Annual Report BRI, 2010)(Annual Report BTN, 2010)(Annual Report Mandiri, 2011). In Bank BNI, DSS implemented to help management in loan decision, cash inflow prediction, customer data integration, and customer relationship management (Annual Report BNI, 2010)

Decision Support System is an information system that facilitates decision-making by providing information access, analytical model, and supporting tool (Alter 1977; Keen and Scott Morton 1978). Four domains can be used to measure the successful DSS implementation, those domain are effectiveness, efficiency, usefulness, and user satisfaction(Maynard & Arnott, 1995). On other hand, Hung et al (2005) describes the regret avoidance as a measure of DSS Success.

Management accountant influence in DSS implementation effected by education level (Morris & Venkatesh, 2000), they abilities in produce the information for DSS (Murphy C. , Currie, Fahy, & Golden, 1995), and work experience using the DSS software(Cascio, 1995).

Literature Review

Decision Support System has been developing since 1970s, and it was named Management Decision System. Academician and corporation develop DSS with computer based information system characteristic (Sprauge, 1980). Decision Support System is a personal system that assist management and must be based on a very detailed understanding of how managers makes decision (Keen, 1980), one of many alternative solution based on a computerize information system(Tripathi, 2002). DSS also used to aid users in judgment and choice activities interactively(Druzdzel & Flynn, 2002), by structuring of a decision, facilitate the use of analytical tools, and facilitate use of manipulation, retrieval and display of data(Eierman, Niederman, & Adams, 1995)(Moscato & Moscato, 2004).

DSS composed of three components(Druzdzel & Flynn, 2002): Database Management System, Model Base Management System (MBMS), Dialog Generation and Management System. Decision produced with the facility of DSS only focused to help top management and executive decision makers, DSS also should have flexibility, adaptable and fast respond, and support personal decision making of manage (Sprauge, 1980). DSS has model orientation in a form of text and graphic, and could do complex analysis using software(Tripathi, 2002).

As an abstraction of reality (Turban, 1998), model is an essential requirement of DSS; easy to use and understandable models are determinant factors for a useful DSS. Decision-making could be performed effectively through understandable model, especially graphical model(Sauter & Free, 2005).

In order to measure the successful DSS implementation, there are four successful criteria of domain: effectiveness, efficiency, usefulness, and user satisfaction(Maynard & Arnott, 1995). First domain is Effectiveness of DSS, this domain is measured by accuracy of information(Roy, 1999)(Ong & Lai, 2004); adequacy of information provided (Lilrank, 2003); completeness of information (Roy, 1999)(Ong & Lai, 2004); and quality of decision making process (Arnott, 2004)(Bruggen, 1998).

Secondly, Efficiency of DSS is measured by performance level with the criteria: user productivity (Djamasbi, 2007)(Schalk, 1988); reliability of system (Djamasbi, 2007)(Sprauge, 1980); time taken for task accomplishment (Djamasbi, 2007)(Roy, 1999)(Al-Jadeiah, 2010). Third domain is user satisfaction and measured by adaptiveness (Sprauge, 1980); critical question answering (Moscato & Moscato, 2004)(Boulesnane & Bouzidi,

2013)and perceived information quality (Murphy C. , Currie, Fahy, & Golden , 1995). Fourth domain is usefulness, and being measured by ease of use(Maynard & Arnott, 1995)(Kim, 1987); frequency of use (Druzdzel & Flynn, 2002)(Kumar, 1999)(Berner, 2009); and widespread of use (Maynard & Arnott, 1995).

Enterprise Resource Planning, as "de facto" software in a Banking industry, has a limitation in creating decision alternatives (Stanek, Sroka, & Twardowski, 2004).Therefore the successful information system implementation would combine the DSS with the information system that already installed in the organization, to create hybrid system of DSS and other Information system (Turban, 2005)(Chamoni & Gluchowski, 1999).

Four government-owned bank in Indonesia has implemented Decision Support System, those bank are Bank Rakyat Indonesia, Bank Mandiri, Bank Tabungan Negara, and Bank Negara Indonesia(Annual Report BNI, 2010)(Annual Report BRI, 2010)(Annual Report BTN, 2010)(Annual Report Mandiri, 2011). DSS support the management in cash prediction report, performance management, data integration, CRM, Risk management, credit evaluation, loan growth measurement, and risk analysis (Annual Report BNI, 2010)(Annual Report BRI, 2010)(Annual Report BTN, 2010)(Annual Report Mandiri, 2011).

Management accountant is a business partner of a corporation, because main focus of management accountant is to increase company's performance and profitability by providing relevant information (Balvinsdottir, Burns, Norreklit, & Scapens, 2009). Therefore it is a pressure to management accountant to provide information in a limited time (Murphy C. , Currie, Fahy, & Golden, 1995). By using DSS, management accountant could produce information and provide performance analysis for the corporation both financial and non-financial information(Murphy C. , Currie, Fahy, & Golden, 1995). Management accountant also has a role as the facilitator in DSS implementation, to assist manager in decision-making processes based on alternatives provided by DSS (Murphy C. , Currie, Fahy, & Golden , 1995).

Management accountant has become important business partners in the corporation because its role as information provider(Johnson, Walker, & Fleischman, 2012)(Mosley, Pietri, & Megginson, 1996). Hence, management accountant should posses a reliable quality for the corporation(Johnson, Walker, & Fleischman, 2012). In consequences, corporation has a requirement to measure the quality of management accountant. The quality measurements are: Education, Work Experience, and the ability in producing information(Cascio, 1995)(Murphy C. , Currie, Fahy, & Golden, 1995).

Accounting information will give benefit in Decision Support System if it has high quality, and it can be measured by a variable measurement (Forslund, 2007). The quality of information can be used to measure the output and content quality of information system (Jogiyanto, 2005)(Ong & Lai, 2004). The variables used to measure quality of information are: in time, Accurate, Convenient to access, and reliable (Forslund, 2007).

Methodology

The research objects are the quality of accounting information, management accountant quality and decision support system implementation. This study is use single country studies and explanatory research. Research instrument used in this study by using questionnaire consisted three instruments. **Accounting information quality** has four indicators, **Management Accountant Quality** by three indicators, and **Successful of DSS Implementation** by four indicator. The questions use Likert scale with a measurement score 1-5.

The research subjects are DSS user from accounting department and Information Technology department of four Government-owned bank in Indonesia. From each bank, 30 respondents would fill the questionnaire with a total 120 questionnaire.

The hypothesis test used by the author is multiple regression analysis (Sugiyono, 2012)(Nazir, 1988), The data was tested for classical assumption test; normality test, multicollinearity test, heteroscedasticity test and autocorrelation test.   (Supranto, 2008). Analysis of hypothesis testing, the stages through partial regression coefficient test(t-test), simultaneous significance test(test statistic F), and the coefficient of determination. The statistical tool that was used in this research is SPSS 22.

Results and Discussion
 1. Classical Assumption Test
  A. Normality test

Table 1. Normality test result

One- sample Kolgomorov Smirnov test		Unstardardized Residual
N		120
Normal Parameter[a,b]	Mean	0.000000
	Standar Deviation	6.43162651
Most Extreme Differences	Absolute	.053
	Positive	.053
	Negative	-.040
Kolgomorov-Smirnov Z		0.053
Asymp.Sig (2-tailed)		0.200

   a. Test Distribution is normal
   b. Calculated from data

Based on the results of normality test in this research using Kolgomorov- Smirnov test, it is found that the data are normally distributed with a statistic Z value of 0.053, it is greater than 0.05. So it can be concluded that the data in this study had normal distribution, and it indicates that one of the criteria for the classical assumption test has been met. In figure 1 data distribution histogram show that it form normal curve.
Figure 1. Normality test result

B. Multicollinearity test

Table 2. Multicollinearity

		Unstandardized Coefficients		Standardized Coefficients	t	Sig	Collinearity Statistic	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	14.491	4.947		3.020	.002		
	X_1 (Accounting Information Quality)	.863	.153	.450	5.646	.000	.802	1.247
	X_2 (Management Accountant Quality)	.387	.106	.290	3.638	.000	.802	1.247

Based on the table above, the value of tolerancefor X_1 Variable (Accounting Information Quality) and X_2 variable (Management Accountant Quality) is0.802 and then test result > 0.10. On other hand VIF value for X_1 Variable and X_2 variable are 1.247 and the result < 10.00. It can be concluded that multicollinearity is not an issue in our tests.

C. Heteroscedasticity test

Table 3. Heteroscedasticity

		Unstandardized Coefficients		Standardized Coefficients	t	Sig
		B	Std. Error	Beta		
1	(Constant)	8.510	3.096		2.749	.007
	X_1 (Accounting Information Quality)	-.041	.096	-.044	-.428	.669
	X_2 (Management Accountant Quality)	-.051	.067	-.079	-.771	.442

Based on the table 3result, the value of significance from X_1 Variable and X_2 variable is 0.669 and 0.442. Both test value more than 0.05, It can be concluded that the heteroscedasticity is not the case in this regression model.

D. Autocorrelation test

Table 4. Autocorrelation

Model	R	R square	Adjusted R Square	Std. Error of the estimate	Durbin Watson
1	0.635	0.403	0.393	6.48630	1.530

To detect the present of autocorrelation the Durbin-Watson (DW) statistic test is used. This testing is done by comparing the value of DW statistics obtained from the results of regression models with DW-table value. From the table 4, DW test result is 1.530 and near two. It can be concluded that autocorrelation is not the case in this study. Based on the test above, it can be concluded that all classical assumption in this study are eligible to do research with multiple regression model.

2. Hyphothesis Testing result
A. F-stat testing.
The Research Hyphotesis of this study are:

H_0: There are no positive and significant effect of Accounting Information quality and Management Accountant Quality to the successful of DSS Implementation.

H_1: There are positive and significant effect of Accounting Information quality and Management Accountant Quality to the successful of DSS Implementation.

Table 5. . F-Test Statistic Result

ANOVA[a]						
Model		Sum of Squares	df	Mean Square	F	Sig
1	Regression	3325.163	2	1662.582	39.517	0.000
	Residual	4922.440	117	42.072		
	Total	8247.603	119			

Based on the result show on table 5, the result of F-test statistic are Fstat = 39.517 with sig. = .000. Fstat = 39.517 > 3.92 (with $\alpha = 0.05$ df1 = k-1 = 3 – 1 = 2 and df2 = n – k = 120 – 3 = 117) or *p-value* = 0.000 < α = 0.05; significant. Ho rejected, therefore the accounting information quality and management accountant quality have positive and significant effect to successful of DSS Implementation.

B. T-stat testing.

Table 6. T-Test statistic result for X_1 Variable

Model		Coefficients[a]				
		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		β	Std.Error	β		
1	(Constant)	25.349	4.239		5.979	0.000
	Accounting Information Quality	1.111	0.144	0.59	7.722	0.000

a. Dependent variable: the successful implementation of Decision Support System

Based on the result show on table 6, the result of t-test statistic are Accounting Information Quality $t_1 = 7.722$ with error chance: p-value = sig. = 0.000. $t_1 = 7.722 > t_{table} = 1.65787$ (with $\alpha = 0.05$ and degree of freedom = n – 2 = 120 – 2 = 118) or p – value = 0.000 < $\alpha = 0.05$: Significant. Therefore the Accounting Information quality has a positive and significant effect to successful DSS Implementation.

Table 7. T-Test statistic result for X_2 Variable

Model		Coefficients[a]			t	Sig.
		Unstandardized Coefficients		Standardized Coefficients		
		β	Std.Error	β		
1	(Constant)	25.936	4.918		5.680	0.000
	Management Accountant Quality	0.654	0.107	0.490	6.114	0.000

a. Dependent variable: the successful implementation of Decision Support System

Meanwhile Management Accountant quality has $t_2 = 6.114$ with error chance: p-value = sig. = 0.000. $t_2 = 6.114 > t_{table} = 1.65787$ (with $\alpha = 0.05$ and degree of freedom = n – 2 = 120 – 2 = 118) or p-value = 0.000 < $\alpha = 0.05$: significant. It can be concluded that Management accountant quality has positive and significant effect to successful DSS Implementation.

C. The coefficient of determination (R2)

Table 8. The Coefficient Determination of X_1 and X_2 to Y

Model Summary[b]				
Model	R	R square	Adjusted R Square	Std. Error of the estimate
1	0.635[a]	0.403	0.393	6.48630

a. Predictor: (constant)
b. Dependent variable

Based on the result of regression estimation in table 8, it can be assessed that the value of R^2 is 0.403. It Illustrates that the value of both independent variables in the model able to explain the dependent variable for 40.3 %, while the remaining 59.7% is explained by other variables outside the model.

Table 9. The Coefficient Determination of X_1 to Y

Model	R	R square	Adjusted R Square	Std. Error of the estimate
1	0.579	0.336	0.330	6.81420

Based on the result of regression estimation of table 9, it can be assessed that the value of R^2 is 0.336. It illustrates that the value Accounting information Quality in the model able to explain the dependent variable for 33.6 %, while the remaining 66.4 % is explained by other variables outside the model.

Table 10. The Coefficient Determination of X_2 to Y

Model	R	R square	Adjusted	Std. Error

			R Square	of the estimate
1	0.490	0.241	0.234	7.28569

Based on the result of regression estimation of table 10, it can be assessed that the value of R^2 is 0.241. It Illustrates that the value Management Accountant Quality in the model able to explain the successful DSS Implementation for 24.1 %, while the remaining 74.9 % is explained by other variables outside the model.

Discussion
A. The Effect of Accounting Information Quality to successful DSS Implementation.
The value of coefficient determination of effect of accounting information quality to DSS implementation is 33.6%, therefore 33.6% successful DSS implementation is influence by accounting information quality. Meanwhile 66.4% influence by another variable such as data mining technique, supporting technology, and complexity of business environment (Rupnik, Kukar, & Krisper, 2007). Accounting information also has positive and significant effect to successful DSS Implementation. Therefore the respondent at Government-owned bank also have a perceived that the development of information system has a goal to produce high quality accounting information.

B. The Effect of Management Accountant Quality to successful DSS Implementation.
Management accountant quality has an effect to successful DSS Implementation with a coefficient determination value 24.1%, and 74.9% determined by another variable with a possibilities of management commitment in DSS implementation (Alhunaishel, 2001), and the effect of technology to management accounting (Maharsi, 2000).
Management accountant has a positive and significant effect to successful DSS Implementation, in accordance with previous research from (Bhatia, 2011).(Tsay, 1992),and (Murphy C. , Currie, Fahy, & Golden , 1995). This result also in accordance with (Kim, 1987), because DSS user is knowledge workers and professional level and they are essential part of DSS environment (Kim, 1987).

C. The effect of Accounting Information Quality and Management Accountant Quality to Successful DSS Implementation.
Simultaneously, accounting information quality and management accountant quality has effect to successful DSS Implementation with a coefficient determination value 40.3%, and 59.7% determined by another variables, with the possibilities are management commitment to DSS implementation, Information Technology effect(Alhunaishel, 2001), Technology effect to management accounting (Maharsi, 2000). Both variables have positive and significant effect to successful DSS implementation.

Conclusion
Based on the research result it can be concluded that in a government-owned bank in Indonesia:
1. Accounting information quality has positive and significant effect to successful DSS Implementation.
2. Management Accountant Quality has positive and significant effect to successful DSS Implementation.

3. Accounting information quality and management accountant quality has a positive and significant effect to successful DSS implementation simultaneously.

BUSINESS PERFORMANCE MODEL OF SMALL AND MEDIUM ENTERPRISES
(SMEs): Case in Fermented Cassava Small Industries

Alwan Sri Kustono
Imam Mas'ud
Reswanda T. Ade

Abstract

SME sector showed a dominant contribution to the gross domestic product. Competitiveness is an antecedent of the business performance in tape industrial. The higher competitiveness will increase higher business performance.

Keywords: *business performance, competitiveness, organizational learning, entrepreneurial orientation*

Introduction

SME sector data showed a dominant contribution to the economy. SMEs able to demonstrate the contribution to nation's economy and play an important role in the economic recovery of Indonesia. Data from the Badan Pusat Statistik ((BPS-Statistics Indonesia)) showed evidence of at least three important roles of SMEs in Indonesia. Total population of SMEs in 2008 reached 99.99% of the total business of the business unit in Indonesia, the number of employees they reach 97.04% of the total workforce in Indonesia. Employment, which reached 99.4% of the total labor force works. 55.56% of the Gross Domestic Product (GDP) was contributed by the SME sector. This fact shows the importance of SMEs to create economic stability through employment creation and income distribution.

SMEs must focus on developing internal capabilities that are superior so that it can compete in a sustainable and resilient to recession pressures. SME business performance is also influenced by the organization' learning. Organizational learning is the process of interaction with the environment and the organization. Such interactions involve individuals in it to seek and obtain information, interpret and distribute the information to solve problems.

Sustainable competitiveness and organizational learning is the formation of entrepreneurial skills for creative and innovative thinking. Results of creativity and innovation will lead to new ideas, methods and ways and produce products and services that are unique and produce or develop value-added products / services.

Cassava many processed into refined products. Tape is one of food products processed cassava-growing verygood in the regency. The existence of the tape is maintained by the community and foster the efforts of tape processing are quite crowded so the regency has a nickname as the city of tape. This research focuses on the performance of SMEs fermented cassava, so that by understanding the determinants can be used for development strategy of fermented cassava industry in the regency towards improving the welfare of society.

Problem Formulation
 1. Is the business performance of fermented cassava SMEs influence organizational learning and entrepreneurial orientation?
 2. Is a sustainable competitive advantage in fermented cassava SMEs influence by organizational learning and entrepreneurial orientation?
 3. Is organizational learning fermented cassava SMEs influence by entrepreneurial orientation?

Literature Review and Hypothesis

Small and Medium Enterprise business performance is very promising views of the SME sector's contribution to national GDP. Data growth contribution of micro, small and medium enterprises in GDP showed an increase from year to year. In 2010, the contribution of SMEs to GDP increased by 0.59% from 56.53% in 2009 to 57.12% in 2010. In 2011, increased again by 0.83% to 57.94% and in 2012 by becoming increasing 1.14% to 59.08%. This case shows the continuous growth of SMEs in Indonesia.

Performance is the results achieved from what has been done by entrepreneurs in running the business. Performance measured and multidimensional which is the result of crimes of an organization. Improved business performance is done by maximizing the utilization of strategic asset demonstrate the specificity of entrepreneurship and a competitive advantage that inhibits competitors (Amit and Schoemaker, 1993). Some indicators of the success of entrepreneurship is reflected on product excellence and superiority of market control. Measures of performance that is commonly used is the sales growth, employment growth, the growth of income and growth in market share (Kim and Choi, 1994; Lee and Miller, 1996; Luo, 1999; Miles *et al*, 2000; Hadjimanolis, 2000)

Empirical support has been shown by many researchers in the use of performance indicators small firms (Olson and Bokor, 1995; Hadjimonalis, 2000; Hadjimonalis and Dickson, 2000) used sales growth rate, employment growth, return on assets (ROA), market share profitability, and *size* as an indicator in measuring the company's performance.

Competitive advantage is the ability of a business to achieve better profit in the competitive industry by adding value to each process. When excellence is able to withstand the changes of competition, it can be said to have a sustainable competitive advantage (Barney, 1991).

Owned resources play an important role in the success of the entity. Good management of resources will lead to higher efficiency, cost reduction, quality improvement and market share and achieve higher profitability (Collis, 1994). Competitive advantage can be gained from the strategic resources of the organization (Dierickx and Coll, 1989; Barney, 1991; Peteraf, 1993; and Teece *et al.,* 1997) allowing the company to obtain superior performance in a certain time period (Pitts and Lei, 2003: 7), Competency of a fundamentally different entities because it has a set of resources (Grant, 2002: 139; Fleisher and Bensoussan, 2003: 187). The achievement of competitive advantage of the most effective is to use the company's competitiveness or capability (Wernerfelt, 1984; Barney, 1986a; Rumelt, 1991; Evans, 1991; Peteraf, 1993; Amit and Schoemaker, 1993; Prahalad and Hamel, 1989).

Wang and Lo (2003) found that organizational learning positive effect on the company's core competencies. Build and develop competitiveness can only be done through organizational learning. Learning will bring the process of acquisition, integration and application of new knowledge and unique to be implemented internally through experimentation, improvement efforts, and innovation.

Slater and Narver (1995) revealed that the success of a business is affected where appropriate entrepreneurial orientation. Entrepreneurial orientation is a major attribute to achieve a high performance company. Drucker (1994) stated that the entrepreneurial orientation as to the nature, character or characteristics that are attached to a person who has willpower to realize

innovative ideas into real business world and can develop it tough. Orientation entrepreneurship is the ability to create something new and different.

Glancey*et al* (1998) found a relationship one's motivation in entrepreneurship, with the success of the business. Orientation entrepreneurs determine business performance. Lumpkin and Dess (1996) and Wiklund and Shepherd (2005) stated that the entrepreneurial orientation is closely related to the process of formulating a strategy that will provide a basis for decision-making and implementation of the organization's business. Entrepreneurial orientation plays an important role in improving business performance (Keh*et al.,* 2007).Orientasi entrepreneurship refers to the processes, practices, and decision making that lead to new input and has three aspects of entrepreneurship, risk-taking, act proactively and always innovative (Lumpkin and Dess, 1996).

The research proposed hypothesis in processing SMEs of cassava: (1) Business performance influence sustainable competitive advantage; (2)Business performance influence organizational learning; (3) Business performance influence entrepreneurial orientation; (4) Competitivenesinfluenceorganizational learning; (5) Competitiveness influence the entrepreneurial orientation; (6) Organizational learning influence orientation entrepreneurship.
