A company that developed entrepreneurial spirit is always evolving and developing new engineering technologies that are able to survive in a competitive environment (Kropp and Zolin, 2005). Entrepreneurial orientation serves as a key mechanism in the process of organizational learning. Entrepreneurial orientation emphasizes the spirit of creating new things, change and rejuvenate the old ways that are less productive. Frishammar and Horte (2007) found that entrepreneurial orientation encourages the creation of new products. Li et al. (2008) found that based on the company with a greater entrepreneurial orientation will emphasize the use of technology. Company with an entrepreneurial orientation capture new market opportunities and proactively compete with their competitors.

Entrepreneurs who have the ability to learn are more likely to have decision-making capabilities more quickly and successfully in response to market changes or new information (Krauss et al., 2005). Entrepreneur will have the ability to absorb and receive information from outside the organization. This case is similar to that presented Morris et al. (2007) stated that companies with more learning orientation has a chance to enter new markets as successfully synthesize information, implementation and strategies, and influencing the market.

2. Orientation Entrepreneurship and Competitiveness.

Testing results show the effect of entrepreneurial orientation in Bondowoso tape businessmen affect the sustainable competitive advantage of having a significant positive path coefficients. Hypothesis 2 of the research stated that the entrepreneurial orientation significantly influence organizational learning proven tape industry. Zainol and Ayadurai (2011) found that there are significant entrepreneurial orientation with the company's performance. McCarthy (2003) shows that entrepreneurial orientation will be followed by the formation of product strategy, market scale and a higher competitive element. Entrepreneurial would tend to push to sell goods or services with better (Neshamba, 2003). Grinstein (2008) concluded that the company's performance will be better if the entrepreneurial orientation of innovation and entrepreneurial orientation. This orientation substantially affect the company's performance. If the entrepreneur has an entrepreneurial orientation, innovation and the market simultaneously, the performance will be better than a company that has only one orientation.

Lava (2012) examined the Influence Strategy *Resource-Based* and Entrepreneurship Orientation Against Competitive Advantage In Business By-By Food Typical Kota Probolinggo. Findings indicate that entrepreneurial orientation and direct a significant effect on improving the competitiveness of businesses. While Supranoto (2009) found that the entrepreneurial orientation of the positive and significant impact on competitive advantage and positive effect competitive advantage of marketing performance.

These results differ from Djodjobo and Alum (2014). They found that entrepreneurial orientation is not to competitiveness. theystated due to the application of the elements of entrepreneurial orientation that has not been done completely or thoroughly by the manager of the business because of the existence of these efforts are mostly still traditional.

Entrepreneurial orientation is a key driver of the improvement. This improvement may be related to value addition or creation of new products. The research of Sange (2005); Grinstein (2008), and Xin Sheng and Yicui (2007) shows that entrepreneurial orientation have a significant impact on the competitiveness and performance. The third indicator (innovative, proactive and risk-taking) contribute to shaping the orientation of the capture market opportunities and serve customers.

3. Organizational Learning and Competitiveness

The results show the influence of organizational learning for sustainable competitive advantage has significant coefficients. Hypothesis 3 state organizational learning influence the sustainable competitive advantage can be accepted. Entrepreneurs who put up with innovation and able to learn from his experiences tended to be more successful than organizations that do not do it (Wheelen and Hunger, 2002: 9). Valid (2010) stated that entrepreneurs are able to obtain, integrate and apply new and unique knowledge through experimentation, improvement and innovation in the internal activities of the organization.

Wang *and* Lo (2003) stated that organizational learning positive effect on the company's core competencies. The learning process will be implemented through experimentation, improvement efforts, and innovation. Entrepreneurial always learn so that the company's operational processes work effectively and efficiently.

4. Entrepreneurship Orientation and Business Performance

Based on test results directly influence the path coefficients are presented in Table 2, showing that the effect of entrepreneurial orientation on business performance tape industry has no significant coefficient. Hypothesis 4 stated entrepreneurial orientation influence business performance has not been accepted. The relationship between the entrepreneurial orientation on performance is insignificant. These results are consistent with the findings Bhaumik and Estrin (2012) which found that the concept of entrepreneurial orientation, did not significantly affect the company's performance in emerging markets.

In contrast to the research (Risnawati and Noermijati, 2011), Li (2008), Yick (2006), Liu *et.al* (2009), Hassim*et.al* (2011), Bhaumik*et.al* (2012), and Mahmood and Hanafi (2013) which state that there is a positive relationship between the orientation of Entrepreneurship and Business Performance. That the higher entrepreneurial orientation of the company's performance will also be higher.

Entrepreneurial orientation immediate positive effect on the performance (Risnawati and Noermijati, 2011). Research results indicate that entrepreneurial orientation have direct influence on the performance. These results are in line with Li (2008) which found that there is a positive relationship between entrepreneurial orientation and performance of the company, as well as Giri and Yick (2006) who found that there is a positive correlation between entrepreneurial orientation and strategy form. Li (2008) stated that the entrepreneurial orientation is a desire to improve the organization. Flexibility and risk considerations, which emphasizes entrepreneurial orientation to always innovate, take risks, autonomy, become more proactive and progressive than the competitor.

5. Organizational Learning and Business Performance

Results show influence of organizational learning on business performance tape industry has a significant coefficients. Hypothesis 5 stated organizational learning influence business performance industrial tape's is accepted. Learning organization is considered to bring positive changes in the way people act and they looked at the internal and external environment (cognitive changes). These changes are expected to have a positive impact on organizational performance (Thompson and Kahnweiler, 2002; Egan et al, 2004; Kandemir and Hult, 2005).

Hernaus*, and* Dimovski (2012) found evidence empirical correlation positive between organizational learning and organizational performance. Organizations that develop learning to improve their performance. The research also revealed, and confirmed some previous findings, that financial performance is not a good predictor for the performance of the organization. Zhao,Li et al, (2009); Michna (2009); Park and Lee, (2010) showed findings the positive influence of organizational learning on the performance of SMEs.

6. Competitiveness and Business Performance

Based on test results, showing that the effect of the sustainable competitiveness of the industry business performance tape have significant coefficients. Hypothesis 6 stated that the level of competitiveness sustained significant effect on business performance industrial tape's proved. The results of this research examined the following, that the competitiveness is a collection of factors that differentiate a company from its competitors and provide a unique position in the market is crucial to success of the company.

Supranoto (2009), Sismanto (2006) and Djodjobo & Alum (2014) find a competitive advantage in partial positive and significant impact on the performance of your marketing efforts. The uniqueness of the product attributes and quality assured product taste and the price still held in accordance with the ability of consumers to make consumers want to visit, purchases that bring profit to the business. Istanto (2010) stated that a competitive advantage can be expected to produce superior market performance and financial performance. Analysis of competitive advantage shows the differences and uniqueness among the competitors. A source of competitive advantage is the skills, resources and superior control. Prasetiawan et al., (2015) found that competitiveness can affect economic performance. This may indicate that the areas which are in first quadrant is the area that has the high economic performance and competitiveness.

Conclusion and Limitations

Results shows the influence of entrepreneurial orientation on organizational learning have a significant positive coefficients, entrepreneurial orientation significantly influence organizational learning of tape industry is acceptable, entrepreneurial orientation have an effect and a significant relationship between with organizational learning, the entrepreneurial orientation affect competitiveness having a significant positive coefficients, the influence of organizational learning for competitiveness has significant coefficients, entrepreneurial orientation has no significant coefficient on business performance of tape industry, the influence of organizational learning on business performance tape industry has a significant coefficients, and competitiveness effect business performance.

Limited ability to understand the perception of respondents accurately, due to the possibility that not all the questionnaires are answered directly by the president / owner of the business because there may be delegated to employees in giving perception. Limitations of the research can also be caused by the relatively low level of education of respondents indicated by the data level of education that most of the lower middle-level education, so the effect on the quality perception.

IS THERE A POLITICIZATION OF THE BUDGET EXPENDITURE BY INCUMBENT?

Alwan Sri Kustono, Universitas Jember
Rochman Effendi, Universitas Jember
Wulan Pangestu, Universitas Jember

Abstract

This research aims to know the fairness level of significance increase on expenditure items in incumbent election area compare with nonincumbent election area, and non-election area. This research use secondary data getting from Directorate General of Financial Balance. Data analyze methode use comparative description methode which describe the result from ourdata observation that will be compared with one observation subject and other observation subject. The result shows that all of expenditure items not used as politicization object by incumbent. It's because of increasing expenditure items trend not only occur on incumbent area, but also on some nonincumbent area and some non-election area. So that the significance increase on incumbent area can not conclude as politicization of budget and expenditure area by incumbent to preserve their power.

Keywords*: incumbent, election area, budget and expenditure, regent*

Introduction

The implementation of decentralization in Indonesia looks at the several autonomous regions and the transfer a part of central power and authority to local governments to set and implement their own household (UU Nomor 32 Tahun 2004). To support the implementation of local autonomy through the provision of financial sources based on decentralization, deconcentration, and assistance tasks, need a set of financial balancing between central and local government in the financial system. The financial system is used to fund the decentralization program implementation that implemented in a region commonly referred to the local government budget revenues and expenditure.

Budget is a periodical financial plan compiled based on approved program and a written plan concerning the organization activities which expressed quantitatively and are generally expressed in monetary units for a certain period. Also in the government, decentralization activities doing by local governments also need a budget as a authorization's function, planning function, monitoring function, allocation function, and distribution function. Therefor, the local government should make budget on each fiscal year as a written plan concerning the decentralization activities that will be done. All local revenues and expenditure concerned in the budget year should be included in the local government budget revenues and expenditure.

One of the decentralization activities is the implementation of direct election in each region. Based on data from the Indonesian Power of Democracy and the Konrad Adenauer Stiftung in 2009, Indonesia has been implementing the Regional Head Election directly since 2005 in each district/city. The election activities under the authority and responsibility of local governments in spite of the central government which only served as a supervisory function. UU No. 12 Thn 2003 states that the law gives special powers to the Regional Election Commission to organize the regional head and deputy regional head in each province and/or district/city.

Ritonga &Alam (2010) stated that since the first performed until now, the effectiveness and efficiency of this election has never been evaluated both by the central government and the House of Representatives. Implementation of this election is only supervised by the Election

Supervisory Committee provincial and district/city. Some have argued that the implementation of this election is a burden for local governments because of the cost. It is also disclosed by Prasojo (2009) which states that the high cost of election implementation in Indonesia because it is a grand feast and be financed in particular, ranging from registration, procurement of goods and services used during the election, until the cost of the campaign for prospective head region.

Allegations of potential irregularities of Local Government Budget Revenues and Expenditure (APBD) will increase when the regent that ended his tenure in the period and then move forward again as a candidate incumbent was at the time as a crucial point, since they have to compete again so as not shifted the reins of power (Ritonga & Alam, 2010). As regional head candidate at the election, incumbent has a huge opportunity using the certain expenditure items in the budget period that still He led for saking his candidacy. As has been stated in the legislation, that the budget includes expenditures that have been established and approved by the Regent and the Regional Representatives Council, so that it triggers the alleged politicization of the budget. From the results of FITRA's monitoring (Indonesian Forum for Budget Transparency) that in the region there is a tendency incumbent to hold the budget in order to perpetuate its power in the election (Republika.co.id, Jakarta).

The election budget using through the local government budget revenues and expenditure vulnerable of politicization of budget by the ruling party and also potential for local corruption. That's because there is a gap in the budget allocated for playing money politics through specific spending items in the budget. This is reinforced by all the conducted costs of the election that is financed by the budget, including in terms of campaign financing. This situation is certainly an opportunity for the incumbent to politicize the budget.

Literature Review

According to Abdullah and Asmara (2006) and Freeman and Shoulders (2003: 94) in Ritonga & Alam (2010) says that the budget establishment can be viewed as a contract between the legislative and executive performance. Rubin (2000: 4) states that the public budget is a reflection of the relative strength of the various budget actors who have different interests or preferences on budget outcomes. Limitations of funds owned by the government led to the mechanism of budgeting becomes important for the allocation of its resources. Budget is an instrument of the government's responsibility for the funds management obtained from the public to fund their activities.

According to Mardiasmo (2009: 62), budgeting in the public sector organizations is a stage that is quite complex and contains a high political nuances. In the administration world, budgeting is a political process that is processed through the thick political red tape. In this process, the decision-making mechanism includes lobbying, negotiation, adu-argument (reinforcement), until get the conflict related to the interests that must be incorporated into the resulting political.

In accordance with that stated in the agency theory, that the principal and the agent has each interest, so that the conflict of interest over this has the potential to occur at any time. The agent capable to further highlight its importance because it has more information than the principal due to their more control of the pitch. In terms of governance, budgeting can be seen as a form of contract transactions mandate given to agents at different levels.

While Garamfalvi (1997) states that politicians use influence and power to determine the resources allocation would then benefit them individually or in groups. More politicians in this case is the regent can take advantage of their position to obtain rents or profits in particular economic advantage by manipulating politics over public policy that led to the resources allocation in the budget are not effective and efficient.

The Issues of Politicization of budget

In the implementation of the previous election in 2011 in Banten Regional Government, has proven that social assistance funds channeled to families and supporting organizations incumbent regional head candidate. In addition, the elections in South Sumatra in 2012, the Constitutional Court asked a repeat election because the incumbent regional head candidate proven using social assistance funds and grants to affect the community to choose him in distribution of goods and services way.

Meanwhile, the results of research conducted by the Indonesia Corruption Watch (ICW) in cooperation with Murdoch University (Kompas 14/4 2009) found an increased allocation of grants and social spending in the budget at the time of the 2008 election in Tabanan (Bali), City Bau-Bau (Southeast Sulawesi), and Bandung (West Java), followed by the winning of incumbent candidates.

Indonesia Budget Center (IBC) research states that the amount of the grant in the city budget in 2012 increased eight-fold compared with the previous five-year allocation. 215 percent increase reached two years ahead of the elections. Based on data collected by IBC, the amount of grants from the budget in 2008 is to Rp 177 billion. In 2009, grants increased to Rp 339 billion. Then a year then back up to Rp 883 billion. (Tempo.Co, Jakarta 20/05 2012).

Accomplished Studies

Previously, Ritonga & Alam (2010) has conducted research related to the politicization of the budget in the area of election incumbent and nonincumbent. In his research, component studied only includes budgeting grants and social aid expenditure. Both are components in the budget with the same characteristics, namely expenditure component that can attract the hearts of the people who read it. This is because the grant expenditure and social aid spending is spending that is not definite in tune with the current period. Because of the uncertainty related to the amount of these two components include as components that can be made the object of the budget utilization.

In this study showed that the proportion of grant expenditure and social aid expenditures incumbent election area larger than the nonincumbent election area. The proportion of grant expenditure and social aid at the time of the election in incumbent area are larger than before the election. From these results, it can be concluded that there are indications incumbent utilize the budget for his nomination as regent.

It is also disclosed by Indarti (2011) in his research entitled "Ratio Expenditure Allocation Analysis between Regions Incumbent and Regional Non-Incumbent Before and At the Time of Election" that the budget allocation of grants and financial aid district/city Incumbent following the election more greater than the district/city its incumbent not following the election.

Syafrizal and Fachruzzaman (2013) in his study states that there is a difference ratio of grants expenditure allocation where the grant expenditure incumbent upon the election of Java is greater than before. There is a difference ratio of social aid expenditure allocation where social aid spending Incumbent Java at the time the election is greater than before.

From these studies, the authors intend to conduct research related to the politicization of the budget in the election in the incumbent and nonincumbent with doing an observation on certain expenditure items contained in the budget. The posts included are subsidies expenditure, grants expenditure, social aid expenditure, Results expenditure for the Province/District/City and Village Government, financial aid expenditure to Province/Regency/City and Village Government, goods and services expenditure, modal expenditure, and unexpected expenditures. The study was conducted by analyzing the trend chart between the increase in expenditure component before the election and at the time of

the election. Presentation doing with descriptive method by comparing the comparative significance of irregularities increase in the value of existing expenditure in the budget.

Research Method

The data used in this research is secondary data, is data obtained, collected, and processed first by the other person. The type and source of this research is the Regional Budget Year 2011-2015 incumbent area and nonincumbent that followed the election in December 2015 obtained from the official website of the Directorate General of Domestic Fiscal Balance. The nature of the data is quantitative data that is data such as numbers and objective.

Secondary data used in this study were taken researchers by collecting data related to the budget and the election budget 2015. Data obtained from data taken from the website of the Interior Director General of Fiscal Balance (http://www.djpk.kemenkeu.go.id /). The data includes the election area and the election of regional head candidate status data obtained from the Commission's website Indonesia.

Data analysis method used is descriptive comparative method which describe research findings derived from data collected through the observation process on the object of research which will then be compared between the study subjects with other subjects research. Results of comparative analysis between the incumbent budget and nonincumbent budget then will be interpretedin narrative argumentative as a result of the analysis description to show a general overview related to the budget politicization made by the head of the prospective incumbent.

Results and Discussion Research

The local government budget revenues and expenditure preparation process in each region is a political process which involves multiple parties, from the mayor/regent, Parliament, NGOs and all levels of bureaucracy that is in local government circles. Each side has different interests both hidden and overt. In the interaction in the local government budget revenues and expenditure preparation process is not uncommon that related parties are in conflict. The politicization of the public budget can be traced from the amount budget received and the parties who benefited or harmed.

The alleged politicization on some spending items in the budget and many cases related to the budget politicization made by the incumbent candidate in the election of 2010 should be used as a reference in the budget politicization research in the incumbent and nonincumbent election area 2015. Budget politicization not only necessarily such as grant expenditure, social aid expenditure, and financial aid expenditure. However other posts expenditure also needs to be examined further relevant indication of the budget politicization.

Total Budget in the Conducting and Not Conducting Election Area.

From the table B.1.1, obtained an average total spending in areas that conducting the election has increased every year. However, the percentage increase in the total budget each year looks volatile. The increasing percentage in 2011 to 2012 is 16%. In the next year the increasing percentage decreased 3% to 13%. In 2013 towards 2014 the increasing percentage is increased of 4% to 17%. In the implementation of the 2015 election the increasing percentage is increased 2% to 19%.

From this analysis it can be concluded that in areas that conducting election the increasing expenditure are same in each year. In addition, researchers also process data of local governments that do not conducting simultaneous election in 2015. The results show that the trend of total budget expenditure of local governments that do not conducting the election also increased every year since 2013. The increase was also seen regularly every year.

However there are some areas that have the increasing percentage in total expenditure in this election year increased sharply compared with the previous year.

From the table B.1.2 shows that in 2011 to 2012 the average of increasing percentage in the area that does not conducting the election is 35%. In 2012 to 2013 total budget in areas that do not conducting the election also increased. However, the increasing percentage is decreased compared to the previous year to 16%. In 2013 to 2014 total budget in areas that do not carry back election has increased. However, as in previous years that the increasing percentage is decreased to 15%. In 2015, although these areas do not hold the election but the average of increasing percentage in the total budget of the previous year also increased to 20%.

If both are compared, then the area that carry the election and areas that do not conducting the election have the same pattern, which has increased the total budget each year. But in terms of the increasing percentage, both increases and decreases fluctuating. It can be concluded that from the analysis of the total budget, which is carrying out the election area does not politicize the budget because the budget patterns in areas that conducting the election looks the same as the area does not conducting the election.

Total Budget in the Election Incumbent and Nonincumbent Area.

From tables B.1.3, we know that the total average budget has increased every year in the election incumbent area since 2011-2015. Each area has increased every year. From the year 2011 to 2012 the average total budget increased by 15%. In the next year, expenditure also increased but the increasing percentage was less than the previous year on 13%. In 2013 to 2014 the increasing percentage of expenditure in the incumbent area increased 5% to 18%. In the implementation of the 2015 election, the average expenditure in the incumbent has increased. The increasing percentage was also seen greater than 5% from the previous year to 20%.

From increasing percentage table B.1.4, the average expenditure of nonincumbent also shows that there is an increasing on average total expenditure but the increasing percentage is volatile. From 2011 to 2012 the increasing percentage is 20%. In the next year percentage increase is decreased to 15%. on increasing towards 2014 and 2015 the percentage of the increase amounted to 16%.

From this analysis, there is little difference between the pattern of incumbent regional election and nonincumbent in the implementation of the election. This is evidenced by the increasing percentage increase in the incumbent while the increasing percentage in the nonincumbent area unchanged. The differences of pattern on regional incumbent is further compared with the patterns in areas that do not conducting the election. Judging from the data table area which does not conducting the election, incumbent local patterns have a similar thing that increasing percentage increase in the 2015 election year.

It concluded that although there are differences between the patterns of regional incumbent and nonincumbent, this can not be called the politicization of the local government budget revenues and expenditure due to the comparison used in the area that do not conducting the election also have a similar pattern with the incumbent. So it is said as a reasonable increase.

Profit Sharing Expenditure to Prov/district/city and Village Government on Conducting and Not Conducting Election Area.

From the table B.1.5 of the increasing percentage expenditure, the result in the election areas can be seen that the average percentage increase in 2011 to 2012 is 226%. The percentage decrease in 2012 to 2013 become 43%. In 2013 to 2014 increasing percentage of profit

sharing expenditures decrease 5% become 38%. In the implementation of election in 2015 the increasing percentage is increased significantly84% become 122%.

From the table B.1.6in the increasing percentage of profit sharing expenditure in nonelection area can be seen that the budget for this expenditure did not appear in each year and each region. In 2011 to 2012 the increasing percentage average is high 1563%. This is because in 2011 some areas raises no budget in this post and bring this budget in 2012. In 2012 to 2013 average decreased by 3%. This is because some areas erase the value in 2013. In the next year, in 2014 the increasing percentage average in an increase of 8%. In the implementation of the election in 2015 the percentage increased to 1745%.

In contrast to the election area, the increase occurring in nonelection area has increased very significantly. This shows that the profit sharing expenditure indicated not made for object utilization of the local government budget revenues and expenditure by the local head candidates to perpetuate his power in the 2015 election.

Profit Sharing Expenditure to Prov/district/city and Village Government on Incumbent and Nonincumbent Election Area.

From tables B.1.7 can be seen that the profit sharing budget expenditure in incumbent for the election is very volatile annually. As explained earlier, that this happens because this expenditure do not always show up in the fiscal year and did not always appear in every area. Based on the table below it can be seen that in 2011 there are four areas that do not raise this budget. They are Ngawi, Situbondo, Sumenep, and Mojokerto. In 2012 the Ngawi begun to raise this budget. The increasing percentage between 2011 to 2012 is 266%. This increase is quite significant. Although it is quite significant, but there are areas that have a decrease in this expenditure, Kab. Blitar. In 2012 to2013 despite increased, but the increasing percentage is lower than the previous year by 56%. In 2013 to 2014 the percentage decreased to 30%. After a three-year budget period the increasing percentage decreased, in the election year 2015 the percentage of this expenditure increased to 96% in the election of incumbent candidates. This increasing percentage is quite significant. But there are two areas that have a decrease in the increasing percentage, they are Kab. Mojokerto and Kab. Trenggalek.

From table B.1.8 can be seen that the increasing percentage pattern in each nonincumbent region is different. Kab. Jember have the same pattern every year. Kab. Tuban have a reasonable increase every year. A significant increasing percentage occurred in Kab. Gresik and Kab. Kediri. An increasing in Kab. Gresik looks very significant. This can be seen of the stems in 2015 which is very high compared with four years earlier who has the same level stems. In Kab. Kediri different patterns seen in the last two years of the fiscal year, 2014 and 2015. Three years earlier, in 2011 until 2013 the increasing between years is not much different. However, in 2014 the increase is starting look significant. Budget of this expenditure increase again in 2015.

From the analysis above, if it is compared, the increasing percentage significance in nonincumbent area is higher than incumbent area. Although in incumbent area have an increasing percentage of this budget expenditure, but it also occurs in the nonincumbent area. It concluded that both of them have the same pattern that fluctuates each year, but tended to increase in some regions in the implementation of the election in the incumbent and nonincumbent.

Similarly, when compared with the areas that do not conducting the election, the budget expenditure pattern has the same pattern that is not always present in some areas and not always appear each year. The increasing budget of this expenditure involves some areas that conducting the election, the incumbent and nonincumbent areas, and the area that do not conducting the election.

Therefore, it can be concluded that the budget of this expenditure are not made as utilization object by incumbent candidates to perpetuate their power. Some areas in East Java who conducting the election and also which not conducting election increase the sharing profit budget expenditure to particular interests in certain years.

Social Aid Budget Expenditure in the Conducting and Not Conducting Local Election

From the table B.1.9can be seen that the average of social aid expenditure in areas that conducting the election have increased and decreased fluctuative annually. The value of the social aid budget expenditure in 2011 to 2012 decreased -24%. In the next year the value of the social aid budget expenditure has increased become 7%. In 2013 to 2014 the increasing percentage has increased significantly to 92%. But instead in the implementation of the election2015 budget value of social aid expenditure decreased -3%. This is very clear that social aid expenditure is no longer become a target object in the implementation of the election budget utilization as found in previous research.

In areas that do not conducting the elections, in 2011 to 2012 the social aid budget expenditure decreased in 14%. But in the next year budget value began increase very significantly on 145%. In 2014 the social aid budget expenditure in areas that do not conducting the election have increased but the increasing percentage is decreased to 42%. In the implementation of election 2015 the social aid budget expenditure has increased the increasing percentage to 61%.

This shows that social aid budget expenditure do not use as the object of budget utilization in implementation of the election. This is proved by the lower value and the increasing percentage of social aid budget expenditure in areas that conducting the election compared to areas that do not conducting the election.

Social Aid Budget Expenditure in the Incumbent and Nonincumbent Regional Election

From tables B.1.10 that have been made can be seen that social aid expenditure has decreased and increased fluctuatively in each region annually. In 2011 to 2012 budget value of incumbent in the election area decreased 25%. There are only five areas that have increased the value, they areKab. Blitar, Kab. Lamongan, Kab. Malang, Kab. Mojokerto, and Kab. Sidoarjo. From the fifth area, Kab.Mojokerto which increased 185% from the previous year. In 2013 the average value increased by 2%. However, when look at each region, there are only six regions has increased. Region that have a significant increase was Kab. Ngawi and Mojokerto. In 2014 the value of the social aid budget expenditure in the incumbent increased significantly to 114%. Significant increases occurred in the city of Malang that is equal to 1502%. On 2015 the value of the social aid budget increased, but the increasing percentage is actually lower than the previous year to 16%. Significant increase occurred in the Kab. Sumenep, reaching 322% of the previous year.

From the inceasing percentage table B.1.16 in nonincumbent area appears that the average value of the social aid budget expenditure in 2012 decreased by -23%. In 2013 the average increased by 27%. A significant increase in 2013 occurred in Kab. Tuban. In 2014 all regions have an increase in value. The increasing percentage also increased in three regions, except Kab. Tuban that increases in value, but the percentage is smaller than the previous year become 19%. On 2015 the value of the social aid budget expenditure in nonincumbent area decreased by -21%.

When compared with the incumbent local, social aid expenditure patterns from 2011 to 2013 suffered equation. However, on 2015 the average value of the budget has increased although the increasing percentage value decreased become 16%. When compared with areas that do

not conducting the election, things like this are still fairly reasonable because in some areas that do not conducting the election, the social aid expenditure also rise highly with an increasing average of 61%. There are only two incumbent regions which have an above-average percentage, they are Kab. Sumenep amounted to 322% and Kab. Trenggalek amounted to 100%. It can be concluded that social aid expenditure not use as object utilization of the budget by the incumbent candidate because a significance level rise also occurred in areas that do not conducting the election so that the increase is still practically so fair.

Unexpected Budget Expenditure in Conducting and Not Conducting Local Election.
The increasing percentage average of unexpected expenditure in areas conducting the election in 2012 from the previous year was 70%. The increasing percentage was decreased in 2013 amounted to 33%. In 2014 the increase in percentage in unexpected expenditure fell back to 12%. After two consecutive years the increasing percentage is declining, in the implementation of election 2015 the increasing percentage is increased to 27%. The area that have a significant increase in its value is Kab. Blitar.
The increasing percentage of unexpected expenditure in 2012 amounted to 278%. In 2013 the increasing percentage is decreased to 78%. The increasing percentage of the budget had increased in 2014 amounted to 165%. By 2015, the increasing percentage is decreased to 65%.
When compared with areas that conducting the election, the increasing percentage in area which does not conducting the election is greater than the area that conducting the election. However, the percentage is quite high and significant in areas that do not conducting in the prior election year 2015. This may be caused at the time these areas conducting the election in each region.
When comparing the percentage in 2015, there are six areas that have an increasing value in areas that conducting the election, they are Kab.Blitar 200%, Kab. Kediri by 71%, Kab. Lamongan by 51%, Kab. Malang by 100%, Kab. Trenggalek by 48%, and Kab. Mojokerto by 84%. While in the Kab. Bojonegoro which is an area that does not conducting the election would occur a very significant increase in the amount of 968% over the previous year.
So from this analysis cannot be concluded that the utilization of the budget is only carried out in areas that are conducting the election. Areas that do not conducting the election 2015 need further scrutiny due to the utilization of the unexpected budget.

Unexpected Budget Expenditure in Incumbent and Nonincumbent Local Election
In 2012 the increasing percentage average of unexpected expenditure in the incumbent is 46%. This value has decreased significantly in 2013 amounted to 7%. In 2014 the increasing percentage is increase of 3% to become 10%. In the implementation of the election in 2015 the increasing percentage average of unexpected expenditure increased to 33%.
There are five areas that have an increasing value in the 2015. They are Kab. Blitar 200%, Kab. Lamongan by 51%, Kab. Malang by 100%, Kab. Trenggalek by 48%, and Kab. Mojokerto by 84%.
When compared with nonincumbent election area, in general the increasing percentage in the incumbent regions are higher. The increasing percentage average of nonincumbent regional election in 2012 is 16%. This value decreased in 2013 amounted to 7% and continued to decline in 2014 amounted to 2%. In the implementation of the election 2015 the increasing percentage average is 6%. Despite the increase in the percentage increase in 2015, but there is only one area that have an increasing value, it is Kab. Kediri by 71% compared to the previous year. Three other regions have a declining value.

From the analysis, it is concluded that the unexpected budget expenditure is not made as the object of utilization budget by the incumbent candidate because of a significant increase also occurred in the area of nonincumbent election and in areas that do not conducting the election. So the increase is still quite reasonable because in areas that do not conducting the election were used as a comparison also had a significant increase.

Conclusions and Limitations
1. Conclusion
The results of this study concluded that all the expenditure is not used as objects utilization of the budget by the incumbent candidate. This is due to the significant upward trend of expenditure not only occur in the incumbent election, but also occurs in the nonincumbent areas and in areas that do not conducting the election. The significance of increasing budget expenditure in the incumbent cannot be said as an incumbent candidate politicization of budget to maintain its power in the region because nonincumnbent and areas that do not conducting also have a significance expenditure increasing.

2. Limitation
Researchers only use data on the districts/cities in East Java province, this cause the research results cannot be generalized to all provinces in Indonesia. Therefore, the researchers recommend to use more than one province in future studies, in order to compare one province to another province and the results can be generalized to all provinces in Indonesia. It is advisable to pay attention to other factors affecting the increasing budget expenditure. In addition, researchers also suggested that further research conduct qualitative ethnography methods following the budget-making process to know whether there is any utilization of budget or not.

ANALYSIS ON IMPLEMENTATION OF CORPORATE SOCIAL RESPONSIBILITY (CSR) ACTUATOR TO THE COMPANY EXISTENCE THROUGH THE BENEFITS OBTAINED BY COMMUNITY (A STUDY AT PT. PJB UP GRESIK)

Nur Laily, STIESIA Surabaya
Dewi Urip Wahyuni, STIESIA Surabaya

Abstract

Corporate Social Responsibility (CSR) becomes commitment of companies or business sector to contribute in developing the sustainable economy by viewing social responsibility as materialization of the company's care to its surrounding environment. This research is intended to know the *direct and indirect influence* of Corporate Social Responsibility (CSR) Program to the Company Existence and to the Benefits obtained by community at the surrounding. This research is carried out in Regency of Gresik. The samples of research consist of 75 respondents receiving the CSR program from the Limited Liability Company PT. Pembangkit Jawa Bali Unit Pelaksana Gresik, or commonly abbreviated to 'PT. PJB UP Gresik'. This research applies the *PLS – Partial Least Square* Analysis using the PLS Smart Software. Output of this research indicates that the program of Corporate Social Responsibility (CSR) does not influence the Company existence, but it gives influence to the Benefits received by community and such benefit influences the existence of the Company. The testing on the influence of mediation by using the *Sobel formula* proves that the program of Corporate Social Responsibility has the indirect influence to the existence of the Company through mediator of benefits obtained by community at the company surrounding.

Keywords: *Corporate Social Responsibility, Existence of the Company, Benefit Obtained by Community.*

Introduction

Corporate Social Responsibility (CSR) constitutes a future investment for the company to gain the profit. The obtained profit is not merely the financial one but more, namely the trust of the surrounding community and the *stakeholders* based on the voluntary and partnership principles. Stakeholders are not only community in a narrow sense, namely the ones living at surrounding of the company's site, but the community in a large sense, such as the government, investors, political elites, and the like. The form of cooperation established between the company and the *stakeholders* should be the cooperation mutually able to give opportunities to jointly make progress and develop together. The CSR programs established for the welfare of community in the end will turn its direction back, namely giving the profit again to the company. It is expected that the company together with the whole *stakeholders* can jointly develop the sustainable CSR, so that either the economic (financial) or the social and environmental profits can be materialized. *Corporate Social Responsibility (CSR)* is the commitment of companies or business sector to contribute in developing the sustainable economy by taking care of the social responsibility. In Indonesia, the obligation of a company to hold the *Corporate Social Responsibility (CSR)* has been launched by the socializing the Law No. 40 the year 2007 on the Limited liability Company. The company needs to be committed to try to give the biggest benefit to the community.

Theoretical Review

1. **Corporate Social Responsibility:**

Corporate Social Responsibility (CSR) as a concept getting more and more popular recently, has not yet got a single definition able to be applied at a company in general, but there are several definitions able to be used as references. The meaning of *Corporate Social Responsibility* according to some experts is as follows: *The World Business Council for Sustainable Development* (Wibisono, 2007:7) defines Corporate Social Responsibility (CSR) as *"a continuing commitment by business to behave ethically and contribute to economic development while improving the quality of life of the workforce and their families as well as of the local community and society at large".* Kotler and Lee (2005) in (Solihin 2009) formulates, *"Corporate Social Responsibility is a commitment to improve community well being through discretionary business practices and contribution of corporate resources."* In this definition, Kotler and Lee give emphasis on the word '*discretionary*' meaning that the CSR activity is merely the company's commitment voluntarily to participate in improving the welfare of community and is not a business activity obliged by the law just like the obligation to pay taxes and the adherence of company to the employment / manpower law. The word *'discretionary'* also gives a nuance that the company conducting the CSR activity shall be the company that has already been adhering the law in doing its business operation (Solihin 2009:5). Definition according to ISO 26000 in (Prastowo and Huda 2011:101) is as follows, *" Responsibility of organization for the impacts of its decisions and activities on society and the environment, through transparent and ethical behaviour that contribute to sustainable development, including health and welfare of society; takes into account the expectations of stakeholders; is in compliance with applicable law and consistent with international norms of behaviour; and is integrated throughout the organization and practiced in its relationship."*

2. Model of Corporate Social Responsibility Implementation

Model of CSR Implementation varies. There are at least four models of CSR implementation commonly applied in Indonesia. Those four models are as follows:

1. *Direct Involvement*. In carrying out the CSR program, the company performs it itself without any intermediary or other party.
2. *Through the Foundation or the Company's Social Organization*. The company establishes its foundation under the company or its group.
3. *Making partnership with other party*. In running the CSR, the company makes a cooperation with other parties, such as non-government social institution, government institution, mass media and other organization.
4. *Supporting or joining a consortium*. The company has some reasons in carrying out the CSR Program, among others are: Social Reason, Economic Reason and Legal Reason.

3. Benefit of Corporate Social Responsibility

Gurvy Kavei in (Kartini, 2009: 124-125) confirms that each company implementing CSR in its business activities will get 5 (five) primary benefits as follows: (1) Increasing the profitability and stronger financial performance, for example through the environmental efficiency. (2) Increasing the accountability, assessment and investment community. (3) Motivating the employees' commitment, because they are taken care of and appreciated. (4) Decreasing the vulnerable turmoil with the community, and (5) Increasing reputation and the corporate branding.

4. Conceptual Framework

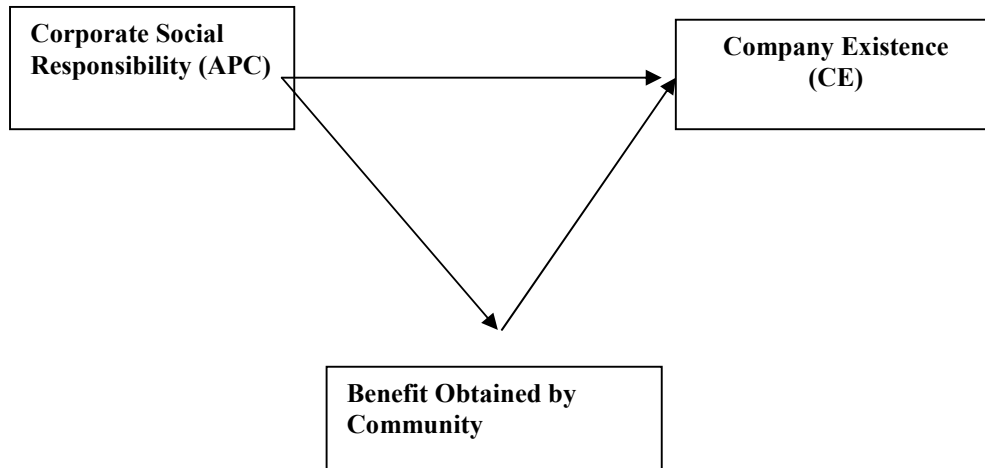
Conceptual framework set up in this research is as the one presented at the drawing below:


Figure 1. Conceptual Framework

Research Method

Population in this research are the community obtaining the assistance of CSR program from the Limited Liability Company**,** *PT. Pembangkit Jawa Bali Unit Pelaksana Gresik* for the year 2014. In this research, 75 respondents are taken as the samples. Meanwhile the sample taking is carried out by using the *non-probability sampling* and accidental sampling techniques. The data applied in this research are collected through the questionnaire while the method of data analysis in this research uses the *PLS – Partial Least Square* approach. PLS is an equation model of *SEM – Structural Equation Modeling* with the component or variant basis.

Outputs of Research

 1. Outer Model

Convergent Validity of measurement model by reflective indicator evaluated based on correlation between the item score and component score estimated by using the *PLS Software*. The individual reflective size is said to be valid according to Chin, 1998 (in Ghozali, 2006) for the early stage of research from development of loading factor measuring scale of 0.5 till 0.6 is deemed sufficient and valid. In this research, limit of the loading factor applied will be at the amount of 0.60.
Drawing-2: Outer Model.

The processing output using PLS Smart Software indicates the loading value of variable connection and all indicators statistically have been significant and valid in measuring the respective sub-indicator with the loading factor at the amount of ≥ 0.6 and t-statistic is > 1.96 at the significant stage of $\alpha = 0.1$ or 10%. It means all indicators are statistically significant and valid in measuring their respective indicators.

Validity and Reliability criteria can also be observed from the reliability value of a construct and the *Average Variance Extracted (AVE) value* of each construct. Construct is said to have a high reliability if its value is 0.70 and its AVE is above 0.50. Table-1 presents the values of Composite Reliability, and the AVE for the whole variables have the value of AVE > 0.5 and CR > 0.7; then it can be concluded that the indicators applied at the said variables are very good and able to measure its construct.

Table-1: Composite Reliability & AVE

	Average Variant Extracted (AVE)	Composite Reliability	Remarks
APC	0.510	0.838	Reliable
Existence	0.523	0.845	Reliable
Benefit	0.683	0.896	Reliable

Source: PLS Smart 's Data Processing.

2. Inner Model:

Table-2: Inner Model

Causality Relation	Line Parameter Coefficient	Sub-sample Average (Bootstrap)	Standard Error (Bootstrap)	t-Statistic
APC>Existence	0.004	-0.013	0.163	0.028
APAC> Benefit	0.7590.	0.752	0,057	13.209
Benefit >Existence	0.747	0.795	0.112	6.701

Source: PLS Smart's Data Processing.

Outputs of the First Hypothetical Testing shows that the variable relation between CSR Program Actuator (APC) and the Company Existence (Existence) indicates the line coefficient value at the amount of 0.04 with the t-value of 0.028 < t-table (1.960). This result

means that there is no influence of the variable of CSR Program Actuator to that of the Company Existence. *Thus, the First Hypothesis is rejected.*

Outputs of the Second Hypothetical Testing indicates that the variable connection between CSR Program Actuator (APC) and the Benefit obtained by community shows the line coefficient value at the amount of 0.759 with the t-value of 13.209 > t-table (1.960). This result means that there is a significant influence of the variable of CSR Program Actuator to that of the Benefit received by community. *So, the Second Hypothesis is accepted.*

The Third Hypothetical Testing shows that the variable connection between Benefit obtained by community and the Company Existence indicates the line coefficient value at the amount of 0.747 with the t-value of 6.707 > t-table (1.960). This result means that there is a significant influence of the variable of Benefit received by community and that of the Company Existence. *In this way, the Third Hypothesis is accepted.*

The Fourth Hypothetical Testing namely testing the Indirect Influence of the variable between CSR Program Actuator and the Company Existence through Benefit obtained by Community at the Company surrounding. The testing is conducted by using the *Sobel Formula*. The amount of indirect coefficient of APC variable to the Company Existence is the multiplication of the influence of APC Variable to the Benefit Variable and also the Benefit Variable to the Existence Variable, so that the following values are obtained: $P_{12} = P_1 \cdot P_2 = 0.566973$. The value of indirect standard error of APC variable to the Existence variable is the multiplication of APC influence to Benefit and the Benefit to Existence, so that the equation is obtained as follows: $S_{e12} = 0.0956$ and the value of t-test = 5.94. Since the t-value is at the amount of 5.94 > 1,96 it means that the said mediation parameter is significant. Thus, model of Indirect Influence of CSR Program Actuator variable to Company Existence through mediator of Benefit obtained by community at the company surrounding can be accepted. Thus, *the Fourth Hypothesis is acceptable.*

Discussion:

The CSR Program gives emphasis on positive contribution to community and its surrounding. If the CSR program is not implemented pursuant to the benefit received by community, the CSR program will not give impact to the company existence. This output is in conformity with the CSR concept of the World Bank stating, *"The commitment for business to contribute to sustainable economic development working with employees and their representatives the local community and society at large to improve quality of life, in ways that are both good for business and good for development* (Wibisono, 2007:7).

The implementation of CSR Program by PT BJB UP Gresik is pursuant the needs of community and gives impact, namely the community feel getting the benefit due to the implementation of CSR programs, consisting of: the assistance programs in the scopes of education, health, social economy, community order and security, and assistance in environmental facilities. The CSR concept shows that the company cares to the community and its environment. The company gives contribution for the establishment of a better community and cleaner environment. This is pursuant to the CSR Formulation from the Commission for European Community in the Green Paper, namely, *"Essentially a concept whereby companies decide voluntarily to contribute to better society and a cleaner environment"* (*Kartini, 2009:3*).

The CSR Program of PT BJB UP Gresik is useful, since it is able to improve the image of the Company, to strengthen the Company's Brand and able to distinguish the company and its competitors. The Company will be known more by community as a company which always carries out good activities for community and always accommodates the interest of community in Gresik. The activities performed by this Company are frequently called as *"Corporate Citizenship"* intended to develop the people's welfare, the so-called

"Community Development" (Kartini, 2009:16). The implementation of CSR Program is expected to be able to improve the life quality for the coming generation pursuant to the *Concept of Sustainable Development.* The company's contribution is not only on the aspect of company's business profit increase, but also positive contribution for community and environment in the scheme of people welfare. This output is in conformity with Wibisono (2007; 7*)* declaring that the company's contribution is not only on the aspect of company's business profit increase, but also positive contribution for community and environment in the scheme of increasing the people welfare.

Conclusion

The CSR program gives emphasis on positive contribution to community and its surrounding. If the CSR program is only for the interest of Company business and not paying attention to the interests of people, the said CSR program will not give any impact to the Company Existence.

The CSR Program implemented by PT BJB UP Gresik is pursuant the needs of community, namely in the fields of education, health, social economy, community order and security, and assistance in environmental facilities. The CSR concept shows that the company cares to the community and its environment. The company gives contribution for the establishment of a better community and cleaner environment. The CSR program already been conducted by PT PJB Gresik is able to raise the company image, to strengthen the company brand and able to distinguish the company to its competitors. Implementation of CSR Program is expected to be able to improve quality of life for the coming generation in conformity with the concept of *sustainable development.*

THE EFFECT OF PROFIT LOSS SHARING RATIO TO MUDHARABAH FINANCING IN ISLAMIC RURAL BANK (BPRS) IN INDONESIA, 2010-2014

Khodijah Mustaqimah, Institut Pertanian Bogor, Indonesia
Sri Hartoyo, Institut Pertanian Bogor, Indonesia
Ranti Wiliasih, Institut Pertanian Bogor, Indonesia

Abstract

The objective of this study is to analyze the influence of the profit loss sharing ratio to mudharabah financing. This study uses a *Vector Error Correction Model* (VECM) to see the long term effect and response to shock that occur in the studied variables. The result shows that in the short run NPF has negative and significant effect, in the long run ratio of profit loss sharing, and BOPO has negative and significant effect, FDR and deposit of mudharabah has positive significant to mudharabah financing. Shock to deposit of mudharabah, FDR, and ROA are positively responded by mudharabah financing and stable in 8th, 10th, and 9th. Shock to profit loss sharing ratio, BOPO, NPF are negatively responded by mudharabah financing and stable in 6th, 9th, and 5th month.

Keywords: *ratio of profit loss sharing, mudharabah financing, VECM.*

Introduction

Bank is a financial institution whose main activity is to receive savings and realocate them to the third sides, and also to provide services in the traffic of payment (Soemitra 2009). In the article 5 of Law number 7/1972, according to its type, bank is catagorized into general bank and rural bank (including islamic rural bank). General bank is a kind of bank which can provide services in the traffic of payment, meanwhile rural bank is a bank which can receive savings in the form term deposit, savings, and other services. Islamic rural bank (BPRS) is a conventional bank yet the operation is based on the islamic principles.

Statistical data of islamic banking state that in 2013 there were 163 islamic rural banks. The increase of this islamic bank is very significant since in 2004, there were only 89 banks. This improvement of the islamic bank is quite good if it is based on the total third party capital (DPK), number of asset, and the total of financing fund. The statistical data of islamic bank state that in December 2013, the total asset of all islamic rural bank (BPRS) in Indonesia reached 4.46 trillion rupiahs. In the period of 2010 until 2014, the improvement of total DPK taken by BPRS in average increased 31% each year, and the total of financing fund provided by BPRS also increased as many as 29% each year (Statistic of Islamic Banking).

The strong point of BPRS compared to other banking institutions is the ability in providing the wider range of service to society especially UMKM (the Outlook of Islamic Banking in 2013). BPRS, which function to intermediate, is showed by the ability of BPRS in collecting and allocating the DPK. The distribution of DPK by BPRS is by financing. The statistical data of islamic banking in 2013 states that almost all of the DPK in BPRS in Indonesia is distributed in the financing side with the percentage of 77.68%, meanwhile the rest is deposited in other banks as much as 22.32%.

BPRS has several contracts or agreement such as wadiah, mudharabah, murabahah, istishna, salam, qardh, ijarah, musyarakah, and multiservice. According to the basic principles of product, islamic banking including BPRS have main product which is financing in the system of profit loss sharing; one of them is developed in the term of

mudharabah financing (Nihar and Subramanyan 2011). Mudharabah is a contract of cooperation between two parties, where the first party acts as the fund owner(shahibul maal), and the second one acts as the fund organizer (mudharib) to organize an economical activity with a commitment of profit loss sharing system, meanwhile the fund owner takes all the risk of the loss as long as mudharid does not cheat or commit unfair action (Umam 2013)

The statistical data of islamic bannking states that among all the the alternatives contract existing in BPRS, the composition of mudharabah financing only gets 2.43% each year. It can be seen in Table 1 that even though the mudharabah financing composition improves each year, the amount of mudharabah contract is still lower than the amount of murabaha which reaches 69.55% each year.

Tabel 1 The Composition of Islamic Rural Bank Financing in Indonesia 2010-2014

No	Jenis Akad	Tahun				
		2010	2011	2012	2013	2014
		Juta Rupiah (persen)				
1.	Mudharabah	65 471 (3.71)	75 807 (2.83)	99 361 (2.79)	106 851 (2.41)	122 467 (2.45)
2.	Musyarakah	217 954 (10.58)	246 796 (9.22)	321 131 (9.03)	426 528 (9.62)	567 658 (11.34)
3.	Murabahah	1 621 526 (78.69)	2 154 494 (80.51)	2 854 646 (80.33)	3 546 361 (79.99)	3 965 543 (79.23)
4.	Salam	45 (0.002)	20 (0.0007)	197 (0.005)	26 (0.0005)	16 (0.0003)
5.	Istishna	27 598 (1.34)	23 673 (0.88)	20 751 (0.58)	17 614 (0.39)	12 881 (0.25)
6.	Ijarah	13 499 (0.65)	13 815 (0.51)	13 522 (0.38)	8 318 (0.18)	5 179 (0.10)
7.	Qardh	63 000 (3.06)	72 095 (2.69)	81 666 (2.29)	93 325 (2.10)	97 709 (1.95)
8.	Multijasa	51 344 (2.49)	89 230 (3.33)	162 245 (4.56)	234 469 (5.28)	233 456 (4.66)

Source: Islamic Banking Statistic 2010-2014

According to Wahab (2011) the low mudharabah financing is caused by several factors which are among others the perception factor of people and the organizer of islamic banking. The fact that the number of mudharabah financing is still low shows that islamic banking, including BPRS, still has not reflected the real core business. Instead, the mudharabah financing is very potential in improving the real sector (Andraeny 2011). According to Antonio (2001), the reason why the mudharabah financing is still low is that mudharabah financing is catagorized as natural uncertain contract, where mudharib cannot feel sure about the income, both about the amount and the time. This makes bank to become hesitant to allocate mudharabah financing. It also has high risks, such as the inappropriate use of the money by the customer stated in the contract, intented mistake, and the hiding of profit by dishonest customer.

Based on the data in Table 1, it is seen that the composition of mudharabah contract is still low. In fact, mudharabah contract which is the main product of BPRS is supposed to dominate all kinds of contracts existing in BPRS (Wulandari and Kiswanto 2013). The reason is that mudharabah financing is the right financing skim to accelerate the development of the people's economic wealth (Hadi 2011)

If we obsereve from the internal side of BPRS, the offer of mudharabah financing is effectd by the profit sharing, mudharabah deposit, and financial ratio such as Non Performing Financing (NPF), Financing to Deposits Ratio (FDR), BOPO, and Return to Asset (ROA). The financing with is described with NPF, the high NPF will lower the bank ability in distributing the financing (Andraeny 2011). According to Maryanah (2006), the number of offer of mudharabah financing is effectd by profit factor. Adzimatinur research (2014) shows that the level of FDR has positive effect toward financing, meanwhile BOPO has no significant effect toward financing. The Gianini research (2012) concerning the factors influencing mudharabah financing at Islamic bank in Indonesia shows that the degree of profit sharing, ROA has significant positive effects toward Mudharabah financing, while NPF gives the opposite effect.

Due to this fact, the purposes of the research are among others :
1. To analyze the effect of profit sharing variables toward mudharabah financing at BPRS in Indonesia in the short term as well as in the long term.
2. To analyze the effect of mudharabah deposit and the variables of financial ratio toward mudharabah financing at BPRS in Indonesia in the short term as well as in the long term.
3. To analyze the response of mudharabah financing at BPRS in Indonesia toward the shock that occured to the profit share, mudharabah deposit, and financial ratio variables.

The scope of research is restricted to the mudharabah financing, by viewing the effect of the ratio of profit loss sharing toward mudharabah financing at BPRS in Indonesia and paying attention to other factors that effect, such as mudharabah deposit and BPRS financial ratio. The variable of ratio profit loss sharing used in the research is an equivalent rate of mudharabah financing which is subjected to the customers. Due to the insufficient data toward islamic banking, the research only uses monthly data in the period of January 2010 until December 2014.

Theoritical Base

The ratio of profit loss sharing used in the research is represented with equivalent rate of mudharabah financing, which is the ratio of profit loss sharing subjected to the customers that carry out the financing (Beik and Apriyanti 2006). According to Maryamah (2006), the number of offer of mudharabah and musyarakah financing is affected by profit factor (ratio of profit loss sharing). Equivalent rate is one consideration for someone to do the financing. The higher the equivalent rate is, the higher the profit loss sharing that must be paid by the customers to BPRS. Consequently, the people's interest or ability toward the financing becomes lower, and it causes the demmand toward the financing becomes lower too. Picture 1 shows that the increase of equivalent rate will lower the demand of mudharabah financing, which can affect of decreasing supply of mudharabah financing.
Picture 1 Relation of equivalent rate and demand loan

In conventional bank, there is a term the interest rate of credit, which is interest that is given by the bank to loaner or the price that must be paid by customers to the bank, in the context of the customers who receive the loan (Kasmir 2004). The interest rate becomes the indicator of the capital returning over the risk taken by fund owner. The higher the bank determine the interest rate of credit, the lower the people's interest for credit, because they must pay the loan and the high interest and vice versa (Anandita 2011). Picture 2a shows that the rise of interest rate at conventional bank causes the the decline of investment. The reason is that the interest rate is the loan for funding the projects of investment so that the rise of interest rate will lower the investment (Mankiw 2007). In the same analogy, picture 2b shows that the equivalent rate of the financing at islamic bank has negative relation with the investment.

a. Conventional Bank
   (i = suku bunga kredit)
b. Sharia Bank
Picture 2 Relation of interest rate and investment in conventional bank, relation of *equivalent rate* and investment in sharia bank

Warjiyo (2004) states that besides fund from third party (DPK), the offer of banking credit is also affected by the bank perception toward the business prospect of the debtor and the condition of the banking itself, like the number of unpaid credit (NPL), and Loan to Deposit Ratio (LDR). Suseno and Pieter A (2003) state that the rentability factors or the profit level shown in Return on assets (ROA) also has the effect to banking credit.

Factors which can effect the mudharabah financing based on the theory above are the ratio of profit loss sharing, mudharabah deposit, NPF, FDR, and ROA. BOPO which is the ratio between operational cost and operational revenue also becomes the research variable since it is one of the the measuring ratio of bank rentability.

Mudharabah deposit is one of DPK collected by BPRS, and the withdrawl can be carried out in the certain period of time. The deposit which can be collected by BPRS is allocated into the mudharabah financing. Based on Pramono's research, mudharabah deposit effects positively toward mudharabah financing. The higher the collected deposit is, then the higher fund that BPRS can allocate in the form of mudharabah financing.

Non Performing Financing (NPF) is the ratio describing the number of risky financing toward total financing. According to Andraeny (2011), the increase of NPF will effect to the increase of the amount of PPAP, and this will lower the bank capital so that it will effect the bank ability in distributing the financing. Based on Pratama's research, Non Performing Loan (NPL) gives negative effects significantly toward the allocation of banking credit. Thus, NPF effects negatively and significantly to mudharabah financing. The higher NPF is, the lower the bank interest to distribute the fund through financing.

FDR is ratio between all the credit given by the bank and that received by the bank (Dendawijaya 2005). Thus, FDR gives positive effects to mudharabah financing since the higher the FDR is, the higher the financing distributed by the bank from the third party which will be received.

Dendawijaya (2005) states that ROA is used to measure the ability of bank management in getting profit in a whole. The bigger the ROA of the bank is, the the higher profit that the bank can get, and the better position the bank will receive in the aspect of asset using. According to Gianini research, ROA positively effects the mudharabah financing since the higher ROA is, the bigger profit the bank can get so that the higher fund which can be distributed is.

BOPO is ratio between operational cost and operational revenue. BOPO is used to measure the level of efficiency and the ability of a bank in running the operational activity (Dendawijaya 2005). The lower BOPO confirms that bank operational cost is lowr than the operational revenue so that bank can increace the financing. Thus, BOPO gives negative effect significantly to mudharabah financing.

Method Of Research

1. Type and Source of Data

The type of data used in the research is secondary data in the form of time series. The time series includes monthly data from January 2010 until December 2014. The data source is from Islamic banking statistic and library as well as from internet.

2. Analytical Method

The method of data analysis used in the research is quantitative method, and analysis tool is method of econometric through Vector Autoregression (VAR) if the data are stationary and not intercointegrated. Then, it is continued by using VECM if the data are stationary and cointegrated. In this research, the dependent variable Y is defined as mudharabah financing, while the defining variable is the ratio of profit loss sharing, ROA, CAR, FDR, NPF, Mudharabah deposit, and BOPO. Juanda and Junaidi (2012) state that most econometrical models of time series are constructed based on existed economical theory. The theory of economy becomes the foundation in developing the relation in the models, yet the theory often finds difficulty in finding the right specification for the models due to the complex economical phenomena. The model of VAR can be used to overcome all the problems in the time series data.

There are several models of VAR. One of them is Vector Error Correction Model (VECM). VECM is restricted VAR which is used for non stationary variables but having potential to cointegrated. In VECM, additional restriction must be given due to the existence of data form which are not stationary in certain level, but cointegrated (Firdaus 2011). To analyze VAR and VECM requires several tests such as stationery test, stability test, optimal interval test cointgration test, VECM, Technique of IRF, and FEVD test.

The data stationery test is carried out to meet the requirement of time series model, where the data used in thest are stationary. The test uses Augmented Dickey Fuller Test in the level and the first difference. The data are said stationary when the result of calculation is smaller than T-critical MacKinmon in the real level of 5%. The optimal interval test is to minimalize the autocorrelation. In VAR stability test, if the module value is less than 1, then the VAR model is considered stable (Firdaus 2011). The VAR stability test is carried out to make IRF and FEVD become valid.

Cointegrated test is carried out when the data are not stationary in the level, but it is in the first difference. If there is no cointegration, the VAR in the first difference will be used. If vice versa, VECM will be used. IN VECM model, there is a correction through short-term adjusment toward deviation from long run equilibirum (Juanda and Juandi 2012). The IRF test is to observe the response of endogen variable toward the shock The FEVD test can describe the contribution of each variable toward the shock to the main endogen variable that has been observed (Firdaus 2011).

3. VECM Model

The VECM model used in the research is:

$$
\begin{bmatrix} \Delta lnPM \\ \Delta Nisbah \\ \Delta ROA \\ \Delta FDR \\ \Delta NPF \\ \Delta lnDepoMudha \\ \Delta BOPO \end{bmatrix} = \begin{bmatrix} \alpha_{10} \\ \vdots \\ \alpha_{70} \end{bmatrix} + \begin{bmatrix} \alpha_{11} & \cdots & \alpha_{17} \\ \vdots & \ddots & \vdots \\ \alpha_{71} & \cdots & \alpha_{77} \end{bmatrix} \begin{bmatrix} \Delta lnPM_{t-1} \\ \Delta Nisbah_{t-1} \\ \Delta ROA_{t-1} \\ \Delta FDR_{t-1} \\ \Delta NPF_{t-1} \\ \Delta lnDepoMudha_{t-1} \\ \Delta BOPO_{t-1} \end{bmatrix} + \begin{bmatrix} e_{1c} \\ \vdots \\ e_{7c} \end{bmatrix}
$$

Note:

$lnPM_t$	= Mudharabah Financing
$Nisbah_t$	= Equivalent Rate
ROA_t	= Return On Asset
FDR_t	= Financing to Deposit Ratio
NPF_t	= Non Performing Financing
$lnDepoMudha_t$	= Mudharabah Deposit
$BOPO_t$	= Ratio between operational cost and operational revenue.

Finding and Discussion

1. Result of Model Estimation

VECM estimation can show the effect from observed factors in the short term and long term. The real level used in the research is 5%.

Table 2 shows the result of VECM estimation which has short term and long term effect. The existence of long term cointegration is showed with the value of contEq1 valued negative and significant, while the numbers in bold show significant variables. In the short term, only NPF variable does influence significantly, and the variables of mudharabah deposits, BOPO, ratio of profit loss sharing, NPF, and FDR give effect in the long term, while ROA has no significant effect in the long term or in the short term toward mudharabah financing.

The ratio of profit loss sharing represented in equivalent rate of financing effects significantly in the long term and has negative relation. The result of VECM estimation shows that when there is a 1% rise in ratio of profit loss sharing, it will lower the mudharabah financing as many as 0.01369%. The hypothesis stating that the ratio of profit loss sharing has negative effect toward mudharabah financing is acceptable. The equivalent rate of mudharabah financing is ratio of profit loss sharing from the financing subjected to customers by BPRS. The higher the equivalent rate is, the bigger the ratio of profit loss sharing that must be paid is, and it tends to lower the customer's interest in financing, which will give impacts to the declining of mudharabah financing. The same case happens to conventional bank showed in Anindita research (2011) stating that the interest rate effects negatively to the distribution of UMKM, due to the fact that the interest rate is one of the considerations in credit demand to the bank. If the interest rate rises, then the demand will decrease and vice versa.

Mudharabah deposit effects positively in the long term toward mudharabah financing. The estimation result shows when mudharabah deposit increases as many as 1%, then the mudharabah financing will increase 0.318754%. The hypothesisi stating that mudharabah deposit gives positive effect to mudharabah financing is acceptable. Mudharabah deposit is one of fund source of DPK so that the higher mudharabah deposit is, then BPRS can distribute bigger fund in mudharabah financing. Wulandari and Kiswanto (2014) state that the mudharabah deposit collected by the bank becomes one of the sources used in the distribution of frofit -loss -sharing-based financing. The result of the research is suitable with Pramono research (2013) which discusses concerning the optimalization of profit-loss-

sharing-based financing in islamic bank in Indonesia. Pramono defines that mudharabah deposit has positive effects to mudharabah financing. It is also suitable with the research result carried out by Makiyan (2001), stating that the bigger fund we the bank can collect, the bigger fund the bank can distribute.

NPF has negative and significant relation in the short term. The estimation result shows that when NPF increases as many as 1%, then mudharabah financing will decrease 0.035325%. The hypothesis stating that NPF has negative effect to mudharabah financing is acceptable. NPF is the ratio of unpaid financing toward total of given financing. The high NPF shows the high unpaid financing so that the risk level is high too. Thus, the higher NPF is, then the higher the back up financing cost that must be possesed by BPRS is. The high level of NPF will cause BPRS has less interest in distributing the mudharabah financing (Dendawijaya 2005). According to Andraeny (2011), the increase of NPF will affect the increase of PPAP. This will lower the bank capital so that it will effect tha bank ability in distributing the financing. This is suitable with Pratama research (2010) which discusses concerning the factors effecting the policy of distribution of bank credit. Pratama (2010) states that NPL has negative and significant effect to the distribution of banking credit.

FDR has positive and significant relation in the long term. This shows that when FDR increase about 1%, then mudharabah financing will increase 0.010744%. The hypothesis stating that FDR has positive effects to mudharabah financing is acceptable. FDR is the ratio between all the credit given by the bank and the fund received by the bank. The higher FDR is, then the higher the mudharabah financing that must be distributed by BPRS is. This research is suitable with Prasasti research (2014) which discusses concerning the effect of FDR, NPF, spread of profit losss sharing, and the level of profit loss sharing to the financing. Prasasti states that FDR has positive effect to the financing of profit loss sharing (mudharabah financing). This research is also suitable with the research of (Aal et al 2013) stating that if the FDR is higher, then it will improve the activity of financing by the bank. Aal et al 2013 states that this condition occurs since islamic bank can keep the needs of fund collected from the third party very well so that bank has fund flow which can be used to do the financing.

BOPO has negative and significant relation in the long term. The estimation result shows that when BOPO increase 1%, then mudharabah financing will decrease 0.012199%. The hypothesis stating that BOPO has negative effect to mudharabah financing is acceptable. BOPO is ratio between operational cost with operational revenue. The high BOPO shows that operational cost is higher than operational revenue. Thus, the higher BOPO is, then BPRS tends to lower the the distribution of mudharabah financing.

ROA is a ratio of bank's profit. ROA has no significant relation neither in the long term nor in the short term to mudharabah financing. The hypothesis stating that ROA has positive effect to mudharabah financing is denied. This is based on the Adzmatinur research (2014) stating that the profit received by the bank is not allocated to the financing, since bank only distributes the fund from the third party. In this case, the fund source of BPRS distributed to mudharabah financing is from mudharabah deposit.

2. The Response of Mudharabah Financing to The Shock Occurring In Each Variable.

In the analysis of IRF, it will be defined about the response of mudharabah financing if there is a shock in other variables, which are among others ratio of profit loss sharing (represented with equivalent rate), mudharabah deposit, NPF, BOPO, and FDR. This research observes the effects of shock during 30 periods.

The result in Picture 3 shows that the shock as much as one deviation standard in the variable of ratio of profit loss sharing is responded negatively in the 3rd month as much as 0.005% and it becomes stable in the 6th month as much as 0.008%. The shock of NPF as much as one deviation standard effects in the increase of mudharabah financing in the 2nd month until the 3rd month. Then it becomes negative in the 4th month as much as 0.002% and it becomes stable in the 5th month as much as 0.003%. The shock of one deviation standard in variable ROA is responded positively in the 2nd month as much as 0.001% and it started to be stable in the 9th month as much as 0.013%.
Picture 3 Effects of the shock of ratio of profit loss sharing, NPF, ROA

The result in Picture 4 shows that the shock of one of deviation standard in variable BOPO gives negative response in the 2nd month as much as 0.001% and becomes stable in the 9th month as much as 0.009%. The shock of one of deviation standard in variable of FDR is responded positively in the 2nd month as much as 0.011% and it begins to be stable in the 10th month as much as 0.033%. The shock in variable of mudharabah deposit gives positive response in the 2nd month as much as 0.005% and becomes stable in the 8th month as much as 0.018%.
Picture 4 Effects of the shock of BOPO, FDR, mudharabah deposit

3. The Analysis of *Forecasting Error Variance Decomposition* (FEVD)

The analysis of FEVD is a model VAR whose purpose is to predict the variance percentage each variable since there is a change in certain variable in VAR system. The analysis of FEVD is used to describe the importance of every variable in the VAR system due to the shock (Juanda and Junaidi 2012).

The result of Picture 5 shows that in the first month the fluctuation of mudharabah financing is effectd by the shock of mudharabah financing itself as much as 100%. The effect of other variables starts to be seen in the second month. In this period, the fluctuation of mudharabah financing is still dominated by mudharabah financing itself as much as 89.39%, FDR as much as 6.32%, NPF as much as 2.87%, mudharabah deposit as much as 1.19%, and BOPO as much as 0.98%.

In the 10th month, there is a decline of effect of mudharabah financing toward the variety of mudharabah financing itself. Picture 5 shows that the effect of mudharabah financing becomes 35.46%. In the tenth month, there is a rise of effect of FDR and it becomes 41.64%, mudharabah deposit as much as 11.08%, and it is effectd by BOPO as much as 3.23%. Mudharabah financing is also effectd by ratio as much as 2.31% and NPF as much as 0.61%.
Picture 5 *Variance decomposition*

The result of FEVD shows te dynamic contribution from observed variables toward the variety of mudharabah financing. This variety is mostly effectd by mudharabah financing itself, FDR, NPF, and mudharabah deposit in the second month. In the tenth month, the contribution is from the mudharabah financing itself toward the variety of financing.

Conclusion and Suggestion
1. Conclusions
a. The variable of ratio of profit loss sharing gives negative and significant effectin the long term to mudharabah financing.
b. In the short term, only NPF variable does give significant effect, while mudharabah deposit, BOPO, and FDR give significant effect in the long term and in the short term. Mudharabah deposit and FDR give positive and significant effect to mudharabah financing, meanwhile NPF and BOPO variable give negative and significant influernce to mudharabah financing.
c. The shock occuring in mudharabah financing, ROA, mudharabah deposit, and FDR receive positive response by mudharabah financing, and will be stable in the long term. The shock occuring to ratio of profit loss sharing and BOPO receive negative response from mudharabah financing in the long term, while NPF variable receives negative one, and it will be stable in the short term.

2. Suggestion
a. BPRS should improve mudharabah deposit which is more than 5 month term by giving interesting incentive for customers in order not to cause mismatch, and give a much longer financing. Besides, BPRS should reduce unnecessary cost to be more effective.
b. Mitigation of risk is necessary to do to minimalize the possibilities of potential risks. Mitigation of risk can be carried out by giving extra careful assessment toward the business that will be funded, like analyzing the risks, and improving the control to the business so that the financing will result the optimal return.
c. The next research can add more external banking variables which effect mudharabah financing like macro-economy variables. Besides, we can also add other variables taken from direct observation (primary data) such as perception of BPRS human resources concerning mudharabah financing.

BOUNDARY MANAGEMENT IN WORK FAMILY CONFLICT AND COPING STRATEGIES AMONG FEMALE ACADEMICS IN INDONESIA

Rosma Fyki Kamala, Universitas Alma Ata, Indonesia

Abstract

Work family conflict has become a major problem for individuals when their role at work interrupts family life or vice versa. With the changing nature of work and technology development, individuals are using different boundary management style as the approaches to manage and organize between their work and family life. The aims of this study are to examine the influence of boundary management style in work family conflict by looking on the source of conflict that it is creating as well as the appropriate coping strategies that is effective to be adopted by female academics in Indonesia. Within a qualitative study, the data were obtained by semi-structured interviews which were considered as the best method after the pilot study. The findings revealed that boundary management style affects the appearance of time-based, strain-based, and behavior-based conflict which becomes the source of work family conflict with different levels and intentions influenced by role identity centric and perceived boundary control. Five effective coping strategies emerged; direct action, help seeking, cognitive restructuring, support from others, and religious coping. Problem-focused coping was the most common coping strategy and was found to be more effective than emotion-focused coping. Religious coping appears by the influence of the context of the study which should be taken into account in the future research of work family conflict. The implications of how boundary management affects an individual's work family life are discussed in this study. The research outcomes suggest that organizations could establish an organizational policy which supports employee's boundary management style and coping strategies in minimizing work family conflict.

Keywords –*boundary management, work to family conflict, family to work conflict, coping strategy*

Introduction

Work and family are considered as the most important two distinctive domains in every individual's life. Over the past decades the two domains have been increasingly recognized as many researches have suggested that the two are intertwined and influence one another (Edwards and Rothbard, 2000).There are a considerable amount of studies that examine the implication of the work-family interface and the primary result is generally that the interface between the two domains has the capacity to create positive and negative implications for an individual's experience (Eby et al., 2005). One perspective considers work and family as positive interdependencies, suggesting that a person's role in one domain might be beneficial to the other domain due to positive spill-over where positive experiences from one domain will positively affect the other (Chen et al., 2009).Another perspective, however, focuses on the negative impact of one domain on the other, suggesting that individuals can experience conflict when the demands of one role interfere with the other. The life domains of work and family are often not compatible and an individual's experience in one domain can negatively affect the other. According to Kelly et al. (2014), huge number of workers experience work family conflict to the increasing number of female workers and dual career families. Work family conflict has many kinds of impact on individuals as it creates strain on the individual as well as becoming a stressor that affects the individual's health and well-being (Landy and Conte,

2014).

In order to maintain their role in work and family life as well as minimize the appearance of work family conflict, people make attempt by managing boundary between the two domains. Boundary management style is considered as an individual's approaches to managing and organizing work and family life (Kossek & Lautsch, 2008; Ammons, 2013; Matthews et al, 2010).People who like to make a clear boundary between the two are included in integration style while some others who prefer to make a thick line between the work and family life included into segmentation style. However, there is still a debate on the effectiveness of segmentation and integration of boundary management style in determining the level of work family conflict.

Technological advance creates opportunity for individuals to easily reach their work anywhere and anytime as nowadays there is an increasing number of telecommuting methods as well as people who work from home (Beal, 2004; Madden & Jones, 2008). However, this is in fact perceived by individuals to create more work family conflict rather than eliminating it as a result of individuals experience rapid transitions from one role to another and opportunities for role blurring also appear (Olson-Buchanan & Boswell, 2006).When the boundary is becoming more and more permeable due to various emerging trends and factors, this study would like to focus on how boundary management style influences the appearance of negative interference between work and family life in the context of female academics in Indonesia. This becomes interesting since Indonesia as a developing country has hugely increasing number of women in employment in this country. Aycan (2013) explained Indonesian cultures that are characterized by specificity and low tolerance for contradiction will perceive work family conflict as a threat that must be prevented. Thus, this study is conducted to fill the gap where there is still little empirical study about boundary management in work family conflict in Indonesia.

Also with the issues of work family conflict having such negative consequences upon individual as well as family and organizational levels (Lande and Conte, 2014), it is important that individuals can cope with the conflict. An individual's ability to cope with work family conflict is pivotal to reduce the level of conflict within a specific context, such as cultural or personal values (Rotondo, 2003). It is therefore the secondary focus of this study to examine effective coping strategies in overcoming work family conflict.

Academia as a profession has a personal job autonomy and the capacity to control when and where the work is done, thus it leads to better coordination in meeting work family demands and creates less work family conflict (Kossek et al., 2005). However, on the other hand, Eby et al (2005) suggested that academicians also have long working hours which leads to greater tendency for experiencing work family conflict as this requires time availability as well as an individual's energy (Steiber, 2009). Thus, academic as a profession is seen as a good example of the changing nature in the workforce where they can reach their work anywhere and anytime which also has big possibility to experience work family conflict.

Literature Review
1. Work family conflict

Work family conflict has been defined by Greenhaus and Beutell (1985) as a form of inter-role conflict when there is role pressure between work and family domain which are non-compatible in some respect. Individuals tend to have multiple roles in their lives where each role has its particular demands, including responsibilities, requirements, duties, commitments, and expectations, all of which should be generally fulfilled by the person (Netemeyer, 1996). According to Lande and Conte (2014), there are two types of role conflict; intra-role conflict and inter-role conflict. Intra-role conflict happens within one

domain of life, such as when individuals experience role ambiguity, uncertainty in the type of job behavior they need to perform in a given situation. Inter-role conflict appears between two different domains in an individual's life. As part of a family and an organization member, employees tend to have multiple roles in the work and family domains that can often cause conflict when the use of time and the negative impact of the job role are opposite to family responsibilities and vice versa (Byron, 2005; Anatan, 2013). Work family conflict is hence seen as a form of inter-role conflict, which occurs when the role demands of work or family make it harder for people to perform their role in the other side.

According to Greenhaus and Beutell (1985), there are three forms which are the sources of work family conflict in an individual's life; time-based conflict, behavior-based conflict, and strain-based conflict. Time-based conflict is conflict that happens when individuals devote time to the demands of roles in one domain and consume their time in meeting the role demands in the other domain. The second form is strain-based conflict, which happens when strain or stress from one role makes it difficult to comply with the demands of the other. Steiber (2009) admitted that strain-based conflict, including anxiety and fatigue, could come from work pressure such as high workload and tight deadlines. Lastly, behavior-based conflict happens when behaviors that may be appropriate for use in one domain are incongruous with behaviors in the other domain. Thoits (1991) posited every individual's role has a set of behavioral expectations, which lead them to creating a set of appropriate behaviors for that role. Behaviour-based conflicts might occur in the workplace or home for example when at home employees are forced to perform emotional stability that they are expected to be warm, caring, and emotionally open whilst at the office they are expected to be more discipline, assertive, and hard work (Anatan, 2013). However, this final source of conflict has been notably absent from the literature unlike the two previous conflicts, which have received the most attention in research (Chen, Powell, & Greenhaus, 2009; Dierdoff and Eliington, 2008; Steiber, 2009).

Earlier research in the measurement of work family conflict has not distinguished between the directions of conflict, even though there is often an ambiguity and overlap between the two domains (Eby et al., 2005). Work family conflict as two different dimensions and as bidirectional was first introduced by Kopelman et al (1983) who stated that work demands that exceed family will contribute to work to family conflict and family demands that exceed work leads to family to work conflict.

Work to family conflict and family to work conflict have sufficient unique variance to warrant independent examination and require different interventions or solutions to prevent and reduce the occurrence of this phenomenon (Mesmer-Magnus and Viswesvaran, 2005). Employees who experience more stress on the job are more likely to have interference from their work demands that exceed family lives, while people who experience more stress at home are likely to have more interference from the family domain on their day to day work (Byron, 2005).

From the previous research it can be seen that work family conflict will affect an individual's role in one domain very differently depending on the direction between work to family or family to work. Theoretical rationale and empirical findings that family variables affect employee's behaviors, particularly work outcomes such as absenteeism, job performance, and turnover (Eby et al., 2005).A lot of studies also mention that family to work conflict has a significant impact on job satisfaction (Anatan, 2013). Family to work conflict also has a significant impact on an individual's career involvement as well as turnover rates (Greenhaus et al., 2001) while in contrast, Wiley (1987) found that people who experience work to family conflict are considered to have more involvement and commitment to an organisation.

On the other side, Frone et al. (1997) examined the impact of work family conflict on an individual's health and found that work to family conflict impacted stress, physical health complaints, and hypertension, whilst family to work conflict created a tendency for higher consumption of alcohol. In other study, Frone (2000) also found that people with work to family conflict are as much as 30 times more likely to experience anxiety disorders, mood disorders, and substance abuse disorders than people who do not experienced it. In the workplace, people who experience family to work conflict are related to higher turnover rate, low perceived career success, and less career satisfaction (Parasurman and Simmers, 2001). With the evidences of unique pattern and different impact of work to family and family to work conflict, hence it is important to use a bidirectional concept to understand the antecedents and consequences of these two forms of conflict.

Boundary Management

Boundary theory examines an individual's approach to establishing and maintaining boundaries between multiple roles, such as work and family, both of which influence the other and transition over the two domains (Ashforth et al., 2000).People have different preferences in terms of managing and organizing their work and family roles. Some people tend to separate the cognitive, physical, temporal, and behavioral aspects, which will sharpen the boundaries between one role and the other, whilst others prefer to integrate them, which makes it easier to cross between the role boundaries (Nippert-Eng,1996). Furthermore, Nippert-Eng (1996) defined boundary management as a continuum with segmentation and integration each at the end, within which an individual's style will likely fall somewhere in the range. Study from Ashforth and (2001) revealed that segmentation style decreases role blurring but increases the magnitude of change make it more difficult to cross over the boundaries, whilst integration style decreases the magnitude of change but increases role blurring and make it more difficult to maintain.

Flexibility and permeability are seen as two important aspects in managing role boundaries, where flexibility refers to the degree to which the role can be enacted in various times and settings; permeability refers to the degree to which a role could be enacted psychologically or behaviorally within the other role's domain (Ashforth, 2000; Kossek & Lautsch, 2012). An individual's tendency to separate their roles with low flexibility and permeability leads to a segmentation boundary management style and the tendency to integrate the roles with high flexibility and permeability leads them to an integration boundary management style.

Individuals have different preferences in terms of boundary management style which is seen to be fit with their values, needs, and desires. To capture the boundary preferences and boundary enactments, Kossek et al. (2012) developed a person-centered approach which can be generally used to identify an individual's boundary management style by examining the three main characteristics: cross-role interruption behaviors, role identity centric, and perceived boundary control. Cross-role interruption behavior is defined as the degree to which an individual allows for interruptions from one role to another. It includes three dimensions of flexibility, permeability, and directionality in the measurement of boundary interruptions. While flexibility and permeability have already been considered as important aspects in managing boundaries, directionality refers to the degree of allowing interruptions in a symmetrical (equal between work to family and family to work) or asymmetrical (more interruption from one domain to another) way. Secondly, identity centrality is an indication of the individual's values towards the different roles, which could be relatively different between work and family. As Ashforth (2001) suggested that each individual is composed of several role identities, which are not equally valued between people; one role can be more important than the others in different people. This leads individuals to focus more effort on one role, where individuals with work role

centrality tend to spend more time on their work and individuals with family centrality prefer to spend more time on their family life (Bagger et al., 2014). The third characteristic of boundary management is perceived boundary control, which is defined by Kossek et al. (2012) as an individual's psychological interpretations of their perceived control over their environment. This was justified by Ammons (2013) that boundary management style is not only influence by individual's needs and desires, but is also influenced by an individual's specific circumstances which offers resources as positive reinforcement over their preference or constraints and potentially becomes negative reinforcement of their boundary management desired. Research found that people with high boundary control were able to enact their boundary management style preference, while those with low control were forced to enact a boundary style that they felt uncomfortable with and this leads to more work family conflict (Kossek and Lautsch, 2008).

Given the concerns of the environmental factor, Kossek and Lautsch (2008) mentioned organisational climate as an important factor which shapes an individual's boundary management style. In a standardised work environment, people usually conform to enacting boundary management style as they are expected to adapt to the organisation's preferred method of managing boundaries with work demands and standard dictations for boundary management enactment. In contrast, organisations which have a more customised organisational work family climate will allow more flexibility for individuals to explore their preferences in managing work and family roles. Here, individuals have a better chance of enacting a boundary management style preference in fitting with their own needs and values that leads to reduce the work family conflict.

Boundary management style and work family conflict

People with a high integration style are seen to be better at work life as they have greater accessibility to work, but also potentially greater work family conflict with a possible negative impact on personal well-being and family outcomes (Kossek, Lautsch, & Eaton, 2005). On the other hand, segmentation style is widely believed to create less work family conflict as there is separation between roles thereby preventing distraction and increasing performance (Roberts et al., 2005). However, this may lead to dissatisfaction when individuals face difficulty crossing role boundaries and transitioning between the role at work and the role at home (Sutton & Noe, 2005). Thus, when boundary style is described as a continuum model with segmentation and integration style at each end (Nippert-Eng, 1996), an individual will still have a negative experience in the work and family life as each style has advantages and disadvantages that are seemingly inevitable. When many research reveal implications of an individual's boundary management style in terms of work family conflict, it is still hard to state which boundary management style is better for decreasing work family conflict as every individual has different preferences and environmental conditions which make individual boundaries diverse and unique.

In order to understand how individuals get control over their preferences of boundary management style, it is important to demonstrate the influence on the degree of work family conflict rather than examining the impact of one style on work family conflict. As the topic of boundary management and work family conflict is quite new, there is still a debate on the effectiveness of segmentation and integration boundary management style in determining the level of work family conflict. Furthermore, existing literature haven't show any evidence of the boundary management style that give influence on different source of work family conflict. A study of Chen et al. (2009) revealed segmentation boundary management style influences time-based and strain-based conflict. The authors posited that a high congruency of segmentation style with the environment is positively related to positive spillover, which leads to a lower degree of work to family conflict. However, the study only examined the influence of segmentation boundary management

style with source of work family conflict but only for time-based and strain-based conflict with no differentiation of work to family conflict or family to work conflict.

Coping Strategy

The role of coping is important to overcoming and preventing the simultaneous demands of work and family that create unfavorable situations and negative consequences for individuals. Rotondo et al. (2003) posited that an individual's ability to effectively coping with the stressful demands of their roles in the work and family domains is an important way to reduce work family conflict.

Coping is defined by Lazarus and Folkman (1984) as the cognitive and behavioral efforts used by individuals to manage the taxing demands that are considered as exceeding an individual's resources. Furthermore, Lazarus and Folkman (1984) defined coping in two main broad categories: problem-focused coping and emotion-focused coping. Problem focused coping is a coping strategy that concentrates on a direct action to reduce or eliminate the event that they feel threatened by. Emotion-focused coping is attempted to minimize the psychological effects of a stressor on the individual. Lovallo (1997) described the main factor that differentiates these coping strategies is the proximate goal that individuals want to reach. Problem-focused coping concerns on eliminating the stressor, while emotion-focused coping would likely be more focused on reducing the strain.

Originally,the two categories of problem-focused coping and emotion-focused coping are seen to be facilitating one another. Lazarus and Folkman (1984) explained that problem-focused and emotion-focused are interrelated and complementary, problem-focused eliminates the threat and emotion-focused decreases the level of distress so the person can be more calm to think about the problem, which also increases their ability for problem-focused coping. More recently, researchers sought the effects of problem-focused and emotion-focused coping strategy and found that adults tend to use a problem-focused strategy in order to cope with stress, which is linked to higher well-being than emotional-focused coping (Mayordomo-Rodríguez et al., 2014).

Coping Strategy and Work Family Conflict

A review of the related literature shows that most employees use different strategies to cope with conflicting family roles and work demands, however, in general problem-focused coping shows higher satisfaction and lower conflict levels in both work to family conflict and family to work conflict. Rotondo et al. (2003) examined the effectiveness of various coping strategies that affect work family conflict. Direct action and help-seeking are perceived as problem focused coping and seen to be effective in reducing work family conflict, whilst avoidance or resignation are found to be associated with higher levels of work family conflict. Statt (2004) admitted that social support from family or a close personal relationship which also a form of problem focused coping will reduce the effect of stress from work family conflict as it creates a positive feeling like concern, liking, respect, and trust for the person, and affirmation of their basic beliefs about themselves and life in general. Only Seiffge-Krenke et al. (2009) suggested the use of emotion-focused coping for people in family to work conflict in order to increase job satisfaction, however this can also have a negative effect on family satisfaction. Seiffge-Krenke et al. (2009) also suggested an avoidance coping strategy to increase satisfaction among family members, but again this contradicts the study by Rotondo et al. (2003) that suggests avoidance will only increase the level of family work conflict.

Besides individual coping strategies that reduce work family conflict there is also the organizational coping role that can help to maximize an employee's ability to cope with stress including work family conflict, for example in the form of family friendly policies, flexible working hours, stress training, employee assistance meetings, etc. Allen et al.

(2014) explained that work family conflict decreased when personal coping and organizational support were aligned. Landy and Conte (2004) mentioned flexible time schedules and child care are becoming more and more important for employees with work family conflict as it reduces their concern about balancing work and family, allowing them to concentrate on their work. Flexible employment, working time and the reconciliation of work and family life are central issues of current policy and academic debate.

Methodology

This study is conducted by using a qualitative research with descriptive-exploratory to portray a deep understanding and an accurate phenomenon of boundary management style and work family conflict, also give insight of the coping strategies adopted in a particular context.

Data collection

A pilot study was conducted to decide the most suitable data collection technique for this study. A focus group was the first method considered as it provides the opportunity for discussion between participants, however, there is doubt about the issue of sensitivity in the topic runs. Participants tend to be unable to speak clearly and fluently and tend to shy away from questions relating to conflict, making the situation not really conducive. When the individual interview is conducted, participants feel more comfortable with giving a response and the situation is very conducive which leads the researcher to obtain more data. Thus, a semi-structured interview was considered as the most suitable method to collect data in this research.

Semi-structured interview data collection techniques enable the researcher to find the most important sources of information required for the study with a clear direction, as well as giving more flexibility to the respondents to explain their answers in detail.The interview questions were open-ended questions that allowed the opportunity for participants to elaborate on their answers. All of the questions were based on existing literature with the aim of filling the gaps in theoretical propositions with the data collection.

Sample Study

Non-probability and heterogeneous purposive sampling was used in the data collection in anticipation of variation in the data from female academicians in public and private university in Indonesia. This technique was beneficial in enabling the demonstration of a particular interest and value, representing the key themes (Patton, 2002). Ten interviews were conducted and then analyzed to obtain equivalent amount of participants, which are five participants from private university and five participants from public university. All respondents chosen were female academics who are married with regard to the work family conflict based on increasing number of female worker and dual career earner in the family as discussed in the literature review. Not only female workers have stronger tendency to experience work family conflict but also academician as a profession have more flexibility at work but more tension. Hence, female academics are seen to be the most appropriate sample of this study.

Data Analysis

Qualitative data analyses were performed to develop the results by reviewing the data, synthesizing, and then interpreting in order to explain the phenomena being studied. Thus, the data were transcribed, then themed and coded to address the research questions. In order to address the research questions, the data that emerged were themed into:

- Boundary management style

- Source of work to family conflict
- Source of family to work conflict
- Work to family coping strategies
- Family to work coping strategies

The participant's boundary management styles were examined using the person-centered approach of Kossek et al. (2012), as mentioned in the literature review which includes three main characteristics: cross-role interruption, role identity centric and perceived boundary control. From the data that has been collected, from the big theme data then were then categorized and coded based on the following codes were assigned to them:

Boundary management style	Source of work to family conflict	Source of family to work conflict	Coping strategies adopted
- Cross-role interruption - Role identity centric - Perceived boundary control	- Time-based - Strain-based - Behaviors-based	- Time-based - Strain-based - Behavior-based	- Problem focused - Emotion focused

Result

1. Boundary management style

The findings show that participants have different level of perceived boundary control affected by organizational climate in private and public institutions that influence participant's preference and enacted boundary management style. Private institution has more a standardized work environment with 7.30 to 4 working hour, creating female academics conform to prefer and enact more segmentation boundary management style. Participants from public university, on the other hand, can follow their own preferences when it comes to boundary management styles, as they have more flexibility to control their work. However, influence of family particularly husband that enable them to use their boundary management style is also taken into account. They are thus in a position to change between integration and segmentation depending on the opportunities and constraints of the environment. They are most likely to choose alternation as a boundary management style which likely is defined by Kossek and Lautsch (2012) as the notion of when and where to adapt one's style to either integrate or separate the role between work and family. Table 1 gives overview of participants boundary management style.

Participant	Cross-role Interruptions			Role Identity Centric	Perceived Boundary Control
	Flexibility	Permeability	Direction		
A1	Low	Low	Asymmetric	Family	High
A2	Low	High	Symmetric	Dual centric	Low
A3	Low	Low	Asymmetric	Family	High
A4	Low	High	Asymmetric	Family	Low
A5	Low	Low	Symmetric	Dual centric	High
A6	High	Low	Symmetric	Dual centric	High

A7	High	Low	Symmetric	Dual centric	High
A8	High	High	Symmetric	Dual centric	High
A9	High	High	Symmetric	Dual centric	High
A10	High	High	Asymmetric	Family	High

2. Influence of Boundary Management Style in Work Family Conflict

The findings show that the boundary management style enacted by participants influences the type of conflict appearance and all of the forms might be interrelated. In order to highlight the source of conflict influenced by boundary management style, this section is divided into two directions, i.e. work to family conflict and family to work conflict to take into account the bi-directionality of work family conflict, with each direction having unique and specific characteristics (Eby et al., 2005).

Work to family conflict

Participants with a stronger tendency to integrate work and family domains tend to experience more work to family conflict in their everyday lives, unlike participants with a stronger segmentation style. This finding is in line with a previous study by Kossek et al. (2005) which argues that integration style may negatively affect personal well-being and family outcomes, which then increases work to family conflict. The effect of boundary management style enacted by individuals creates different source of work to family conflict that are in keeping with the three forms of work family conflict by Greenhaus and Beutell (1985) stated in the literature review: time based, strain based, and behavioral based.

A. Time Based

Participants who separate the work and family role tend to not experience time-based conflict in their everyday lives, with the exception of certain periods when an increased workload forces them to work over time. This affects their time that is supposed to be spent in their family role and often creates conflict.

B. Strain based

Participants who separate work and family domain also admit little strain based conflict in their family lives, in line with Chenet al. (2009) who found that people who enact a segmentation boundary style tend to experience less strain-based conflict.Meanwhile, participants who often take work to home concede that work pressure usually becomes the main problem that results in work to family conflict outcomes, such as being unable to focus on their responsibility at home or to be emotionally sensitive with their family. The findings show that role ambiguity becomes the major source that caused strain-based conflict in the work to family domain, matching Soltani et al. (2013) who find that role ambiguity has a significant impact on work family conflict.

C. Behavioral Based

The findings revealed that participants either segmentation or integrator experience conflict when they are being too busy to fulfil behaviour expectations from work that decrease their capability to do their responsibility in family role. Participants who separate the two domains are more likely to experience behavioural-based of work to family conflict as small acts such as answering the phone could create conflict between the work and family domain.

3. Family to Work Conflict

In family to work conflict, all of the participants admit that they experience difficulties in their everyday lives between their role in family faced with the obligation to work. Findings show that the major conflict experienced by participants comes from family expectation upon their role. Boundary management style enacted by participants influences the source of conflict appearance with all of the forms might be interrelated.

A. Time based

Participants who tend to exhibita segmentation style often come late to the office because they have finish their role at home before they leave the house. Meanwhile, participants with integration style more often experience time-based conflict since there are family demands such as taking care of the children, picking up the children, and taking care of the household.

B. Strain based

The findings show that participants experience family to work conflict because problems from home make it difficult for them to work. Participants who have a segmentation style experience high level of strain-based conflict as it is hard for them to take control of home when they are away. In addition, participants who have more flexibility to integrate the work and family domain experience more strain-based conflict because of the quick inter-role change that is expected of them.

C. Behavior based

The findings show that behavior-based conflict appears in the family to work direction, as behavior and psychological expectations in the family role makes it difficult for participants to fulfill work requirements. The conflict appears across all participants regardless of boundary management style. A number of participants admitted that their role as a mother or wife in a family often prevents them from achieving the best results in their work role.

From the findings it can be seen that boundary management style influence work family conflict only in different level and type of sources. Integrators found it more difficult to face work interferes with family causing work to family conflict in terms of time and strain rather than the separators. This is in line with previous study by Chen et al. (2009) which argues that segmentation style will lower the level of time-based and strain-based work to family conflict. Integrators found to experience work to family conflict might be because the rapid and quick boundary crossing activity that decreases the magnitude of change but increases role blurring and make it more difficult to maintain. However, behavioral based is mostly experienced by people with segmentation style as it decreases role blurring but increases the magnitude of change make it more difficult to cross over the boundaries. To conclude, the findings show that integrators are more frequent to experience work family conflict rather than separators, but when a conflict occurs that will be harder for separators to face particularly when the environment does not give them ability to enact their boundary management preferences.

Mostly participants put off their work role and focus on their family role when there is high family demand, which they perceived as pivotal for them, showing family identity centric. This could be influenced by contextual factor where the study was taken in a high culture that women are the most responsible for family as a study by Grover & Crooker (1995) suggested that women tend to restructure their work to meet the demands of family needs.

4. Effective Coping Strategies

The data collection provides evidence of a range of specific coping strategies that are adopted by participants to overcome work to family conflict. Even when there is a significant difference between the source of work to family conflict and family to work conflict, the coping strategies are quite similar between the two directions so that the finding will not be divided into two categories.

- Direct action

In order to cope with work to family conflict or family to work conflict, all participants tend to more directly cope with the problem when they have enough resources to do so. Direct action is a form of problem-focused coping where the person does something to directly affect whatever is interpreted as a strain (Lazarus and Folkman, 1985). Direct action coping tends to be used to overcome time-based and strain-based conflict between work and family roles. People who adopted direct coping strategies in facing work to family conflict tend to have lower levels of work family conflict. However, some participants look for more enjoyable tasks before addressing the problem even if there is enough resource to do so. Dewe and Guest (1991) defined this as postponing action, where individuals distract their attention away from the particular issue by engaging in a more pleasurable activity.

- Cognitive Restructuring

As discussed in the literature review, cognitive restructuring is a form of problem-focused coping which is also defined by Rotondo (2013) as a coping strategy that has a significant influence on work family conflict. Participants tend to restructure their mind over a behavioral-based conflict, particularly within family to work conflicts.

- Help Seeking

Another strategy that emerged is to seek help from others to ease their duties. Rotondo (2003) found that help seeking is a form of problem-focused coping which is strongly effective in reducing work family conflict. In this study, participants usually search out help in the organization environment as well as in the family environment to reduce the conflict between work and family.

- Social Support

According to Lazarus and Folkman (1985), social support is a form of emotional focused coping which refers to seeking emotional support from other people. Participants tend to share their problems with other people in their family and work environment to seek emotional support and advice regarding problems, particularly when facing strain-based and behavioral-based work family conflict. Carlson & Perrewe (1999) suggested social support as an important strategy to cope with work family conflict which will affect the entire stress process. Judging by the findings, problems resulting from work demand tend to be shared with people in the family domain, whilst problems arising from family demands are more likely to be shared with people in the work environment.

- Religious coping

In contrast to the strategies mentioned above, the findings from this sample identified the emergence of religious coping, which was not considered in the literature review. Drawing on the participant's responses, religious coping is commonly used to overcome work family conflict. Somechand Drach-Zahavy (2007) emphasize that no single coping style is considered universally appropriate. This is in line with a previous argument of Rotondo et al. (2003) who claim that some specific forms of coping might work better within a specific context, such as cultural or personal values. In this study, religious coping appeared to be used by participants in work to family conflict as well as family to work conflict by taking recourse to the guidance of the Islamic religion, praying, and the

remembrance of God.

Problem focused coping strategies more often appear and are more effective than emotion focused coping in overcoming work to family conflict as well as family to work conflict by female academics in Indonesia. The tendency to use problem focused coping shows that participants perceive themselves as having sufficient ability to change the unfavorable situation and deal with the problem. As Somechand Drach-Zahavy (2007) stated the use of problem focused coping in work family conflict can only can be effective in situations where individuals have the ability to make changes, whereas emotion focused coping is preferable when there is insufficient ability for individuals to change the situation. The findings of the study hence support previous studies which claimed that problem focused coping was more effective in reducing work family conflict (Rotondo, 2003; Dewe & Guest, 1991). The appearance of religious coping highlights the importance of the context of the study, as an individual's culture and religion influence their coping behavior. Therefore, it is important for organizations and or future research to consider the context. Organizational support and family support are needed to enhance female academic's ability to cope with work family conflict.

Better Coping Strategies: Employee Perceptions
Somech and Drach-Zahavy (2007) pointed that individual's personal coping strategies required organisational support to decrease work family conflict. Participants admitted that environmental support would be beneficial for them to cope with work family conflict. In organizational environment, participants suggested that institutions could provide routine religious activities to help employees reduce stress and tension. This is seen as important for them to have such activity in the midst of their busy life showing the importance religious coping for them. Participants also asked for a clear definition of their role by the organization in order to feel less overwhelmed by their workload. In the family environment, participants hope more flexibility from their spouse even they understand their role in the family.

Conclusion
The findings of this study demonstrated the potential role of boundary management style in the source of work family conflict. This provides a comprehensive view for the literature by showing the influence of boundary management style in creating the source of work family conflict with regard to the bi-directionality attached into it. Finding shows that the source of work family conflict is in keeping with the model of Greenhaus and Beutell (1985), which conflict happens when time from one domain interrupts the other, strain from one domain interrupts the other, and behavior expectation from one domain interrupts in the other. While every individual's boundary management style preferences, (either to separate or to integrate the work and family domain) has the potential to create all of the three forms of work family conflict, the study reveals that role identity centric and perceived boundary control will likely to have more influence in determining the direction and level of work family conflict.
In order to cope with work family conflict, there are five coping strategies that appears in this study which are seen to be effective; direct action, help-seeking, cognitive restructuring, support from others, and religious coping. Problem-focused coping is more likely to be used to overcome work family conflict than emotion-focused coping. One interesting finding shows that cultural context influences the preference of coping strategy. Organization as well as family environment are considered to help individuals cope better with work family conflict by providing support for personal coping strategies and making

clear definition of their role by the organization in order to avoid role ambiguity.

The rapid increase of women who work and also dual earners in the family brings with it huge issues of work family conflict. As flexible working hours usually are a common way to decrease conflict between work and family roles experienced by employees, the changing nature of work brings more opportunities for people to manage their work and family lives. Future research might be required to explore this further, although individual differences are perhaps inevitable.

Recommendations

This study offers recommendations for companies to minimize work family conflict that experienced by employees. First, organizations need to take action to actively manage cultures that appropriate for employees to perceived boundary management control which growing to be diverse from time to time. This may ultimately enhance organizational effectiveness as well as improve an individual's satisfaction and decrease work family conflict. Managers or supervisors need to better understand, prepare, and support employees by applying a family friendly policy, either formally or informally, which is in line with their boundary management style. For example, if the person tends to separate their work and family life domains, then do not give any sudden events or workloads that will create time-based and strain-based work family conflict. In order to do that, training could be implemented to improve the knowledge of managers, to allow them as well as employees a more manageable life. Training might also help employees with increasing self-awareness over their boundary management style, including helping them feel more or less within the perceived boundary control. Hence, better communication could be established between employees, managers, and families in order to better set and manage expectations and to identify the solutions.

Secondly, the study also emphasized the role of coping strategies in overcoming work family conflict. Organizational interventions might also be initiated or developed to help individuals adjust effective coping strategies to overcome work family conflict. As coping strategies might be used and important for individuals, organizations could enhance personal coping strategies by taking them into account in the organizational strategy. For example, in response to the case of religious coping that appears in this study, organizations could conduct a routine religious meeting which will require an allocated time and fund. The event could be implemented without taking up more than an hour, because this would further create time interruption from work to family which is not intended.

OPENING THE BLACK BOX: THE ANTAGONISTIC RELATIONSHIP OF LEADERSHIP ON EMPLOYEE PERFORMANCE

Muhammad Su'ud, STIE Widya Wiwaha
Suci Utami Wikaningtyas, STIE Widya Wiwaha

Abstract

Purpose - To examine the effect of transformational leadership, transactional leadership, empowerment, commitment on employee performance and to examine the difference of employee characteristics, transformational leadership, transactional leadership, empowerment, commitment and employee performance between upper level management and lower level management.

Design/ Methodology/ Approach – The research population is employee on industry, specially middle and large organization. The sampling method is purposive sampling and accidental sampling. Analysis method is structural equation model.

Findings – This research conduct two models of the relationship of leadership on employee performance. Findings of the first model show there are not significant relationship between independent variables and dependent variable. Then, the model is modified as the second model. Findings of this research show eight relationships. Firstly, the positive and significant relationship between transformational leadership and employee performance. Secondly, the positive and significant between transactional leadership and commitment. Thirdly, the positive and significant between empowerment and employee performance. Fourthly, the positive and significant between empowerment and commitment. Fifthly, the positive and insignificant relationship between transactional leadership and employee performance. Sixthly, the positive and insignificant transformational leadership and empowerment. Seventhly, the positive and insignificant commitment and employee performance. Eightly, the negative and significant between transformational leadership and commitment.

The second findings of this research show there are mean score difference of employee characteristics, transformational leadership, transactional leadership, empowerment, commitment on employee performance between upper level management and lower level management. Specially, there is not mean score difference of commitment between upper level management and lower level management.

Research Limitation/ Implications – This research conduct five variables only. To determine model of relationship between leadership and employee performance, it can use many variables or more than five variables. So, the further research should use other variables, for instance organization culture, moral and ethics as moderating variables.

Practical Implications – Firstly, the companies should pay attention for implementation of transformational leadership, transactional leadership, empowerment, commitment on employee performance. Secondly, the companies should pay attention for management level, specially upper level management and lower level management.

Introduction
1. Research Background

Leadership continued to be one of the most widely discussed topic by the researchers from all over the world (Kuchler, 2008). Jong & Hartog (2007) described leadership as a process to influence people in order to get desired results. Lok and Crawford (2004) proclaimed that leadership plays a vital role in determining the success and failure a firm.

There are many different styles of leadership. Nevertheless, in its development, this relatively new model in the field of leadership study is called transformational model (Yukl, 2007).

Transactional leadership is the second part of transformational leadership theory. Transactional leadership concentrates on the exchanges that occur between leaders and followers (Northouse, 2007). These type of leadership deals with maintaining the current situation and motivating people through contractual agreement (Bass, 1985; Jung, et.al., 2008).

The effect of transformational and transactional leadership on performance was first proposed by Burns (1978), then developed by Bass (1985), and followed by other researchers. Various researches such as Lowe, Kroeck and Sivasubramaniam (1996) in their meta-analysis study support the positive effect of transformational and transactional leadership on performance.

Although many researches support the effect of transformational and transactional leadership on performance, only a few researches stress on how leadership style affects performance and infact the process was complicated (Sparks & Schenk, 2001). Therefore, studies are needed to reveal what is behind the effect of transformational and transactional leadership on performance (Kirkpatrick & Locke, 1996) and this study tries to reveal the affecting process. The study about the effect of transformational and transactional leadership on performance is important for three considerations.

First, transformational and transactional leadership will encourage employees, directly or indirectly to achieve organizational goal and to encourage employees for extra effort for the sake of reaching the expected performance (Burns, 1978; Bass, 1985). Hall et.al. (2008) defined transformational leadership as a system of changing and transforming people.

Second, this study explores variables included in the effect of transformational and transactional leadership on performance. Previous researches developed new variables such as, value congruence and trust (Jung & Avolio, 2000); emotion and frustration (Kennedy & Anderson, 2002) and other researches as well. The findings show that there is a need for other variables about the effect of transformational and transactional leadership on performance. This study expands variables by including empowerment and commitment in this research model.

Empowerment is chosen because it has potentials to affect performance that benefits organization and individuals (Liden & Tewksbury, 1995 as quoted by Liden et al., 2000). Commitment also plays an important role in increasing performance. Meyer and Allen (1997) in Brown (2003) explain that commitment potentially predicts performance.

Based on the various studies mentioned above, this research intend to study the effect of transformational leadership, transactional leadership, empowerment, and commitment on performance. That study is needed because the four variables will stimulate employees in developing their full potential to achieve performance (Hartog et al., 1997).

This study also intends to reveal " the black box" within the effect process of transformational leadership, transactional leadership, empowerment and commitment on performance viewed by the psychological theory perspectives. It is necessary for better understanding about leadership effect on performance by adding other variables into the whole relationship**.**

Third, subjects of this research are employees working for both upper and lower management level. This reseach examines the mean differences of respondent characteristics, transformational leadership, transactional leadership, empowerment, commitment, and performance based on management level. The study about the score differences is important because researches merely examine the transformational and transactional leadership on upper management level and is still limited to lower management level, whereas management level is important contextual factors in organization (Antonaksis et al, 2003). The existing study of empowerment is limited to middle management level (Quinn & Spreitzer, 1996). Moreover, the study of the respondent characteristic, transformational leadership, transactional leadership,

empowerment, commitment, and performance differences based on management levels.
The topic of the prior research is the effect of transformational and transactional, empowerment and commitment on performance conclude that there were not influence of transformational leadership, transactional leadership, empowerment and commitment toward employee performance. Based on the information, the further research conduct modifying model. Specially, the influence of empowerment toward commitment.

This study is built and based on previous theories and research model such as: (1) transformational and transactional leadership (Burns,1978 dan Bass, 1985; Bass & Avolio,1990; 1995), (2) empowerment theory (Spreitzer, 1995), (3) commitment theory (Allen and Meyer, 1990), (4) management level theory (Katz & Kahn, 1966), (5) Jung and Avolio model (2000), and (6) relevant psychological theories such as self efficacy theory (Zulkosky, K., 2009), substitute for leadership theory (Lunenbrug, F.C., 2010), social identity theory (Hogg, M.A., 2001), the psychological contract theory (Linde, B., 2015), self determination theory (Gagne, M & Dect, E., 2005), self management theory (Grady,P., 2014).

2. Research Objectives

This study has two objectives : 1) to examine the effect of transformational and transactional leadership, empowerment, and commitment on performance and 2) to examine mean differences of respondent, transformational and transactional leadership, empowerment, and commitment on upper management level and lower management level.

Hypotheses and the underlying theories
1. The Theory Of Transformational And Transactional Leadership

Burns (1978) defined leadership as leader's activities in driving followers to achieve established goals as the representation of values, motivation, wants, needs, aspirations, and the expectation of leader and his followers. Burns divided leadership into transformational leadership and transactional leadership.

Transformational leadership is a process that increased moral and motivates followers to higher level of motivation. Transformational leadership also strive to increase awareness of the followers by imposing moral value and idealism, giving emotional response to follower, and making the follower change their beliefs, values, capabilities, motives in order to increase their performance for the sake of organization rather than their own interest (Burns, 1978; Tichy & Devanna, 1986; Druskat, 1994).

Transformational leaders can create significant organizational change and act change agents, foster higher level of intrinsic motivation and loyalty among follower, introduce a new image or view of the future and create a commitment to this image among followers (Kinicki & Kreitner, 2008; Noorshahi & Yammai Dozi Sarkhabi, 2008). Transformational leadership is comprised of five dimensions which are idealized influence (attribute and behavior), inspirational motivation, intellectual stimulation and individualized consideration.

Transactional leadership concentrates on the exchanges that occur between leaders and their followers (Northouse, 2007), in which helps follower to fulfill their own self interest (Bass, 1999). Transactional leadership is leader's effort to encourage subordinates in achieving the determined performance (Burns, 1978). Transactional leadership has two dimension; contingent reward and management by exception /MBE (consisting of active management by exception /MBE-A and passive management by exception /MBE-P) (Bass, 1985).

2. The Empowerment Theory

Voght and Murrell (1990) defined empowerment as activities to build, develop, and increase power through cooperation, sharing, and working together. That interaction process is

continuous and is based on sinergy. Empowerment can also be defined as the authority to make decisions in an area of responsibility without necessity of prior consents from others (Luthans, 2011 as quoted by Ekaningsih, A.S., 2014). Empowerment is viewed as management technique used by a leader in increasing employee performance (Conger & Kanungo,1988; Kanter, 1989; Spreitzer, 1995, 1996). Empowerment consist of: (1) Impact (2) Competence (3) Meaningfulness: (4) Self- determination (Thomas & Velthouse 1990).

3. The Commitment Theory
Ghosh, et.al. (2014) asserted there has been substantial review of the organizational commitment literature from the approach proposed by Becker (1960) through Meyer and Allen (1999) till Somers (2009). Commitment is defined as a relative power owned by someone in identifying and involving himself to the organization, that is marked especially with the trust of the organizational values and objectives, the willingness to show effort on behalf of organization and strong willingness to remain in the organizational member (Oliver, 1990). Organizational Commitment has three dimensions: 1) Affective commitment, 2) Continuance commitment, 3) Normative commitment (Allen & Meyer,1990).

4. The Performance Theory
Performance has two dimension such as task performance and contextual performance. Task performance is in role behavior, whereas contextual performance is extra role behavior.
Component of task performance such as : 1) job specific task performance, 2) non job specific task performance, 3) written and oral communication proficiency, 4) supervision and 5) management or administration. Whereas component of contextual performance such as demonstrating extra effort, following organization rule and policy, helping and cooperating with others and alerting colleagues about work related problems.

5. The Hypothesis Formulation
A. The Effect of Transformational and Transactional Leadership on Performance
Transformational and transactional leadership can encourage employees to achieve established organizational goal and are able to motivate followers to work hard reaching performance outcome. Previous empirical studies indicated that transformational leadership has positive effect on performance (Kirkpatrick & Locke, 1996; Lowe et al., 1996). Empirical studies concerning transactional leadership also find that transactional leadership (contingent reward) has positive effect on performance (Hunt & Schuler, 1976, as quoted by Howell & Hall-Marenda, 1999). Bass (1985a, 1985 b, 1985c) The three empirical studies find that transformational leadership and transactional leadership have positive effect on performance. Bass (2005) study conclusion that there is a significant relationship between transformational leadership on performance. Transactional leadership has positive and significant on performance (Ahn, et.al.,2005 as quoted by Sundi, K., 2013).
H_{1a}: Transformational leadership has positive effect on performance
H_{1b}: Transactional leadership has positive effect on performance

B. The Effect of Transformational and Transactional Leadership on Empowerment
Transformational leadership created a sense of self identification in group until employees feels empowered and inspires employees in order to achieve performance beyond the established standard with focusing on employee empowerment (Yammarino & Dubinsky, 1994, Kark et al., 2003).
Transactional leadership empowerd employees by giving contingent reward through recognition, strengthening personal competence, and giving insentives to make employees participate and affect the decision making process in their work (Spreitzer,1995). Through

transformational leadership and transactional leadership dimension, a leader empowers employees. The empirical studies Keller and Danserau (1995); Gomez and Rosen (2001); Jung (2001); Ozaralli (2002) and Kark, Shamir and Chen (2003) found that leadership has positive effect on empowerment. So, the hyphotesis are :

H_{2a}: Transformational leadership has positive effect on empowerment

H_{2b}: Transactional leadership has positive effect on empowerment

C. The Effect of Transformational and Transactional Leadership on Commitment

Transformational leader kept on motivating employees so that they are ready to accept and internalize values and goals directed to them. That internalization process grew and increased commitment (Homrig, 2004). Through idealized influence and individual consideration dimension, transformational leader is able to motivate employees by emotional attachment. Emotional attchment grows because the employees' admiration to leader will develop affective commitment. Emotional attachment grew because employees accept individual attention through individual consideration. This enables affective commitment to grow (O'Reilly, 1989).

Transactional leadership affected short term commitment. The relationship between leader and employees in the transactional leadership is based on economical motive (Crossman, 2004). Bass (1988) stated that transactional leadership is needed when employees commitment and involvement decrease. Employee can be encouraged by contingent reward. Their interest can be developed for achieving their goal. Reward is given in accordance with performance. Management by exception will encourage employee's interest for achieving reward. Cooperation is based on the negotiation, not on problem solving or mission (Bass & Avolio, 1994). Empirical study of Koh et al., (1995), Purwanto (2002), Brown (2003) found that transformatianal and transactional leadership has positive effect on commitment.

Limsili & Ogunlana (2008) proclaimed that transformational leadership is a better leadership style and worker productivity and organizational commitment is facilitated by transformational leadership. Ismail & Yusuf (2009) studied the impact of transformational leadership on followers commitment and concluded there is significant positive relation between these two variables. The hyphotesis are :

H_{3a}: Transformational leadership has positive effect on commitment

H_{3b}: Transactional leadership has positive effect on commitment

D. The Effect of Empowerment on Performance

Empowerment had positive potential for affecting individual and organizational performance (Liden & Tewksbury, 1995 as quoted by Liden et al., 2000). Employee empowerment process is implemented by delegating the authority of decision making to lower level of organizational hierarchy, and by providing opportunities to employees for affecting organizational performance. According to Kennedy (1995), performance can be increased through employee empowerment. Liden et al. (2000) also found that empowerment has positive effect on performance.

H_4: Empowerment has positive effect on performance

E. The Effect of Commitment on Performance

Commitment was a power that binds an individual to a certain action to make relevant to the established target (Meyer & Hersovitch, 2001 as quoted by Kark & Van Dijk, 2007). Commitment affected various important behaviors to effective organizational functioning (McCaul et al., 1995). Commitment is needed for productivity. Productivity can be achieved when employees participate with high involvement in achieving the organizational

objectives. It comes through solidarity and behavioral support to achieve the objectives which in turn increase performance (Bass, 1990).

Organizational commitment is a core predictor of employee attitude to the organization and is a strong indicator of turnover behavior, withdrawal tendency and organizational citizenship behavior (Mathieu and Sajac, 1990; Morrow, 1993; Sinclair & Wright, 2005 as quoted by Ghosh, S., et.al, 2014).

High commitment empoloyees will be more likely to stay (in the organization, not leaving), to make extra efforts, and to show good performance (Podsakoff *et al.,* 1996). Morrow (1983) and Pinder (1998) stated that commitment can be used for predicting organization, and performance. Researchers, including Meyer et al (1989) and Brown (2003) found the effect of commitment on performance. Suliman and Iles (2000) found that affective commitment had stronger relationship with employee's performance than continuance commitment and normative commitment. Hackett *et al.* (1994) found that affective commitment has positive effect on performance. Meanwhile normative commitment has no effect on performance and continuance commitment has negative effect on performance.

H_5: Commitment has positive effect on performance

6. Research framework

This previous research framework describes the effect of transformational and transactional leadership, empowerment, and commitment on performance is presented in figure 2.1.
Figure 2.1.
The effect of transformational and transactional leadership, empowerment, and commitment on performance
Research Method

Research data were collected through survey using questionnaire distributed to 35 manufacturing companies at eight regencies and two municipolities in Central Java and Special Teritory of Yogyakarta (D.I.Y). Questionnaires were distributed to a sample of respondents consisting of 155 employee from upper- management levels and 1562 employee from lower-level management levels. Thus, both groups are 1717 repondents. The collected data were analyzed with Structural Equation Model, using AMOS-4.

1. Transformational Leadership and Transactional Leadership Variables

Measuring transformational leadership and transactional leadership is used by MLQ instrument. The reason of choicing of MLQ such as 1) MLQ is specilly instrument for leadership research, 2) MLQ has done many researchers, even the by using MLQ has done

meta analysis such as Lowe, et.al (1996) analyse 39 research, judge and Piccolo analyse 87 research, 3) MLQ is standardized instrument, so it is fit for using this research.

MLQ instrument comprise transformational leadership, transactional leadership and non leader factor (laisezz faire). Yet, the non leader factor is not included in this research, because this research does not analyse the factor.

Transformational leadership comprise 5 dimension, such as idealized influence (attribute), idealized influence (behavior), inspirational motivation, intellectual stimulation and individual consideration. Whereas transactional leadership comprise two dimension such as contingent reward and management by exception-active. Management by exception passive is not valid.

2. Empowerment Variable and Commitment Variable

Empowerment comprises meaningfulness, competence, self determined and impact. Whereas commitment has three dimension such as affective commitment, normative commitment and continuance commitment.

Research Result And Analyses

The Statistical calculation results shows reliability coeficient, lamda, error term, and standard deviation of each construct in research model as shown in table 4.1.

Table 4.1.

Construct Reliability, Lamda, Error Term, and Standard Deviation for each construct

Construct	Construct Reliability (α)	Lamda	Error	Standard Deviation
Transformational leadership	0,7045	0,3546	0,0527	0,4225
Transactional leadership	0,8724	0,4446	0,0289	0,4761
Empowerment	0,6754	0,3427	0,1785	0,4736
Commitment	0,6057	0,2384	0,0778	0,3068
Performance	0,8448	0,5566	0,0569	0,6056

Source: Data Research analyses result

Model testing was done through two steps. The first step, the initial research tests the structural model of the effect of transformational and transactional leadership, empowerment, and commitment on performance. The results are shown in table 4.2.

Table 4. 2.

Structural Equation Modelling Research Result

Structural Relationship			Regression Weights	Standard Error	C.R.
Performance	←	Transformational leadership	0.298	3.866	0.077
Performance	←	Transactional leadership	0.553	4.038	0.137
Empowerment	←	Transformational leadership	-1.634	0.499	-3.277*
Empowerment	←	Transactional leadership	1.770	0.504	3.510*
Commitment	←	Transformational leadership	-4.521	3.945	-1.146
Commitment	←	Transactional leadership	4.682	3.997	1.171

Performance ← Empowerment	0.441	0.366	1.204
Performance ← Commitment	-0.056	1.628	-0.034

Significant * p ≤0.05
Chi-square   326.007 ; d.f. 21; Probability level 0.000
Goodness-of-fit index (GFI) 0.959

The results of the initial structural equation modelling   show that transformational and transactional leadership do   not have significant effect on performance. Transformational leadership has negative significant effect on empowerment. Transactional leadership has effect on empowerment. Transformational and transactional leadership do not have any effect on commitment. Empowerment does not have any effect on performance. Thus, there was only one relation that has positive and significant effect i.e transactional leadership and empowerment. Since there is too little significant relation, the initial model will be modified. The next step was to modify the model by including the relationship between empowerment and commitment in new model. The relationship between empowerment and commitment is based on the   previous empirical studies findings concerning the   relationship between empowerment and commitment (Dewettinck et al., 2003). The findings show five significant relationships (four significant and positive relationship and one significant but negative relationship) and four non- significant relationship as shown in table 4.3.

Table 4. 3.
The result of Structural Equation Modelling

Structural Relationship	Regression Weights	Standard Error	C.R.
Performance ← Transformational leadership	0.647	0.267	2.428*
Performance ← Transactional leadership	0.188	0.277	0.677
Empowerment ← Transformational leadership	0.006	0.123	0.048
Empowerment ← Transactional leadership	0.108	0.125	0.864
Commitment ← Transformational leadership	-0.281	0.147	-1.907*
Commitment ← Transactional leadership	0.331	0.150	2.210*
Performance ← Empowerment	0.407	0.118	3.455*

Figure 4.1. shows the result of structural equation model testing for each research construct.

Figure 4.1.
Research Structural Equation Modelling

Figure 4.1. shows that transformational leadership and empowerment do have direct effect positively on performance. Empowerment does not mediate relationship between transformational leadership and empowerment.

Transformational leadership and transactional leadership do not have any effect on empowerment. On the other hand, empowerment does have effect on performance. Transactional leadership and empowerment do not have positive effect on commitment. Transformational leadership does have negative effect on commitment. Commitment does have any effect on performance.

In structural model testing, each construct: transformational leadership, transactional leadership, empowerment, commitment, and performance are formulated into variables. However, in the analysis of hypothesis testing, the mentioned variables are explained in the conceptual framework of transformational and transactional leadership. Based on the result of model modification, there is alternative relationship that is needed to test i.e. relationship between empowerment and commitment. The result testing of significant relationship among variables as shown in Table 4.4.

Table 4. 4.
The relationship among variables in model development

	Relationship	Hypothesis sign	Testing result	
H1a	Performance ← Transformational leadership	+	Significant	Supported
H1b	Performance ← Transactional leadership	+	Non significant	Non Supported
H2a	Empowerment ← Transformational leadership	+	Non significant	Non Supported
H2b	Empowerment ← Transactional leadership	+	Non significant	Non Supported
H3a	Commitment ← Transformational leadership	-	Significant	Non Supported
H3b	Commitment ← Transactional leadership	+	Significant	Supported
H4	Performance ← Empowerment	+	Significant	Supported
H5	Performance ← Commitment	+	Non significant	Non Supported
H addition	Commitment ← Empowerment	+	Significant	Supported

Signifikan * p ≤0.05

The result of testing in table 4.4. shows that there are supported and not supported Hypothesis and the comparation of hypothesis with the result of testing sign. Hypothesis 1a, 3b, 4, and additional hypothesis are supported. Hypothesis 1b, 2a, 2b, 3b and 5 are not supported.

The test result shows that transformational leadership does have positive effect on performance. Viewed from the social identity theory, subordinates identify themselves to their leader through idealized influence dimension. In this context, transformational leader is able to take part as role model in the belief formating process and feeling, so that subordinates imitate leader's belief, feeling, and behavior (Shamir et al.,1993 in Kark et al. 2003).

The test result also shows that the relationship between transactional leadership and performance is significant. Viewed from self efficacy theory, non influence transactional leadership on performance indicates that the absence of the influence of transactional leadership that stresses on contingent reward or punishment in subordinates willingness in achieving performance cannot support   subordinate's efficacy for increasing expected performance.

 The test results also show that transformational and transactional leadership do not have any effect on empowerment significantly. Viewed from Substitute for Leadership theory, the research objects are large and middle manufacturing companies with the organizational structure that is formally well managed. It also has fixed task distribution and individual subordinates who work professionally.   Such a company condition enables the leadership role to become neutral so that the effect of leadership on subordinates empowerment is low.

The test result also shows that transformational leadership does have effect on commitment significantly and negatively. Viewed from Joffres and Haughey perspectives   (2001), subordinates in fact have a feeling that they are not able to respond motivation imposed by transformational leader with negative perception. This finding indicates that when transformational leader stimulates and supports innovation and creativity to subordinates, and realizes the vision and mission of the company, it is possible that the subordinates commitment decreases because of the inefficacy of subordinates.

The test result also shows that transactional leadership does have positive effect on commitment significantly. This finding indicates that transactional leadership is perceived by subordinates positively. Subordinates do the task in line with the guidelines and   guidance given by their leader obediently. That phenomenon describes the existing form of paternalistic society that is indicated by subordinate's dependence on the figure of a leader. They are also more interested in contingent reward.

The test result also shows that empowerment does have positive effect on performance. This finding indicates that empowered subordinates will focus on their full potential on achieving performance.   According to the self-management perspective, the process absorbing the vision and mission of the organization from the leader to the subordinates has been the belonging of the subordinates. The subordinates play an important role to realize the vision and the mission of organization in their performance.

The result of this research shows that commitment does not have positive effect on performance. According to Ellemer et al. (1997) perspective, employees who are identified with low performance are perceived as employees with low commitment to their group. They intend to move the organization with high status group than those with high identification understable if a commited employee has low performance. This might be caused by employees' low identification.

The result of additional hypothesis testing shows that empowerment does have positive effect on commitment. Empowerment process increases subordinate's emotional strength.

Motivated subordinates formulate higher identification, increase commitment and believes their leader and mission, and work beyond expectation (Carlson & Perrewe, 1995) because there is trust between a leader and subordinates.

The additional study of T test found that there is mean difference of respondent characteristics, transformational leadership, transactional leadership, and empowerment on upper and lower management level significantly. Yet, T test also found that there is no mean difference of commitment between both management levels significantly. In addition, this research found the result of mean scores of respondent characteristics, transformational leadership, transactional leadership, empowerment, commitment and performance higher on upper management level than on lower level management

The occurrence of mean difference of leadership between both management levels can be studied from leader and subordinates aspect. Study of leadership aspect can be viewed through leadership development perspectives. According to A life Span approach, development process can be implemented through experiences, events, giving meaningfulness to every life events that takes place (Avolio & Gibbons, 1988).

Through the leadership career development, it is understandable if a leader on upper management level obtains higher mean score of leadership than that of lower management level. Because of his long career, it enables him to have higher leadership. Therefore, subordinates score their leader on upper management level higher than lower management level.

Conclusion and Research Contribution

1. Conclusion

This research studies two fold. First is the main study testing the effect of transformational and transactional leadership, empowerment, and commitment on performance. Second is additional studies testing the difference of mean scores of respondent characteristics, transformational leadership, transactional leadership, empowerment, commitment, and performance based on upper management level and lower management level.

The main study found that transformational leadership does have effect on performance. The transactional leadership does not have effect on performance. The transformational and transactional leadership do not have effect on empowerment. The transformational leadership does have negative effect on commitment significantly. The transactional leadership does have positive effect on commitment significantly. The empowerment does have effect on performance significantly. The commitment does not have effect on performance.

The additional studies found that there is mean difference of respondent characteristics, transformational leadership, transactional leadership, empowerment on upper and lower management levels significantly. Yet, T test also found that there is no mean difference of commitment between both level management. This research found that mean scores of respondent characteristics, transformational and transactional leadership, empowerment, commitment and performance were higher on upper level management than lower level management

2. Theoritical contributions

This research gives theoritical contribution on leadership and human resource management literature in sum of matter. This research results various findings. First finding shows that there are positive direction and significant on relationship between two variables in the research model. The testing of effect transformational leadership on performance, effect transactional leadership on performance, effect empowerment on commitment, and effect empowerment on performance show result significantly and positively.

This research finding shows that transformational leadership does have effect on performance. The result of research consistents with previous researches (Bass, 1985; Hater & Bass, 1988; Howell & Hall-Marenda, 1999; Dvir et al., 2002; Hayward, Davidson, Pascoe, Tasker, Amos & Pearse, 2003; Casimir et al., 2006).

The finding of researches that is implemented on manufacturing companies of Central Java and Special Teritory of Yogyakarta with research subject consist of upper and lower management levels support the theory of leadership Burns (1978) and Bass (1985;1997;1999) that reveal transformational leadership does have effect on performance universally and across continents, and are able to implement on all over coutries including Indonesia (Central Java and Special Teritory of Yogyakarta).

The research result shows that transactional leadership does have effect on commitment. This research support empirical researches of Purwanto (2000); Brown (2003); and Walumbwa et al. (2004). This finding indicates the need paying attention to the demographical characteristic factors of research subject in the research of effect transactional leadership on commitment.

The result of research shows that empowerment does have effect on commitment.   This research support empirical researches of Dewettinck et al., (2003); Avolio *et al.,* (2004); and Ugboro (2006). This finding indicates that empowerment is one factor that plays an important role in increasing commitment. This research shows that empowerment does have positive effect on performance. This finding supports empirical researches of Conger and Kanungo (1988); Wat and Shaffer (2005) and Webster (2006). This research indicates that empowerment plays an important role in increasing performance. Thus, followers play an important role in increasing performance. Therefore, followership needs to be developed so that the followers can participate in increasing performance actively.

The second finding is that this research shows the sign of relationship between two variables in research model that is significant but negative. This   finding shows that transformational leadership does have negative effect on commitment. This research finding is consistent with the research of Felfe and Schyn (2004) that found the corelation between transformational leadership (except intellectual stimulation) and affective commitment. This research finding indicates that the study about subordinates as research respondents and the cultural background as the object of research is needed. It means that demografical characteristic of the research subject and the organizational setting that become the research object must occupy the spotlight.

The third finding shows that transactional leadership does not have effect on performance. Commitment does not have effect on performance. These findings also shows that transformational and transactional leadership do not have effect on empowerment. This result of research indicates that transformational and transactional leadership do not have effect on performance. This finding can be studied from the theory substitute for Leadership theory and self-management.

The research result shows that commitment does not have effect on performance. This finding indicates the importantance of further study of other variables that may affect performance. That study is required in order to reveal the phenomena that become the back ground of their research.

3. Practical Contribution

This research is able to give benefits to companies. This research result indicates that companies must pay attention to leadership, empowerment, and commitment in implementing the company strategies that are orientated in incresing performance. Thus, if a leader intends to achieve the success in performance, he must behave as a transformational leader. Consequently, he must force himself to become a leader who is able to meet the

requirements included in the dimensions of transformational leader, consisting of idealized influence, intellectual stimulation, individual consideration, and inspirational motivation.

A leader is demanded to be able to give example that becomes the guideline. Such a leader is considered charismatic leader. He is able to support subordinates in such way so that they behave creatively and innovatively. In addition, they expected to solve the problems with new approaches. Beside, he has to care for the problems faced by his subordinates and motivate them for higher performance.

The research result reveals that transactional leadership does have positive effect on commitment. This finding indicates that if a leader intends to increase subordinates commitment, he has to be able to influence his subordinate's commitment by giving guidance concerning tasks that must be implemented by subordinates along with contingent reward and management by exception. Both dimension of transactional leadership affect subordinate commitment. It mean that for increasing a leader reprimand, warn, and punish in order subordinates do not make mistakes. On the other hand he must does a task in line with leader's guidelines.

The research result shows that empowerment does have effect on commitment. This finding indicates that empowerment is able to increase commitment. Thus, for increasing commitment, a leader must encourage sense of self meaningfulness, competence, subordinates self determination. He is also able determine him self and his action so that subordinates feels empowered. If leader trusts to subordinates, it can encourage psychological attachment and contract to subordinates. Both elements increase commitment.

The result of the research shows that there is positive effect of empowerment on performance. This research indicates that empowerment can increase performance. Empowerment can encourage a sense of meaningfulness, competence, self determination, and performance–affecting action by subordinates. Therefore, increasing performance can be done by empowering subordinates.

This finding implies managerially that increasing subordinate's commitment can be affected by transactional leadership and empowerment. Meanwhile, increasing performance is affected by transformational leadership and empowerment. Thus, for increasing commitment, a leader must consider transactional leadership and empowerment. On other hand, for increasing performance a leader must consider transformational leadership and empowerment. The finding can be important for companies in running training for their employees.

The research finding shows that there are mean difference of respondent characteristics, transformational leadership, transactional leadership, empowerment, and performance based on upper and lower level management significantly. Yet, commitment between both level management is not different significantly. This research also found the result of mean scores of respondent characteristics, transformational and transactional, empowerment, commitment and performance are higher on upper level management than those of the lower level management.

The mean difference of each variable indicate that if a leader wants to achieve success in acting leadership, empowerment and performance increasing efforts, management need to be cared of. Therefore, any policies that a company takes in acting leadership, empowerment, and striving to increase performance effort on upper management level must be different from those on lower management level. Yet, company policies in striving to increase commitment can be implemented with the same policies on both management levels.

LEADERS' WILLINGNESS TO SACRIFICE:
A PHENOMENOLOGY OF BATIK ENTREPRENEURS IN SURAKARTA

Abstract

This research discussed a leader's willingness to sacrifice. The purpose of this study was to develop a model of leader's willingness to make sacrifices in accordance with the values of local wisdom. This research was conducted to explore the meaning of a leader's willingness to sacrifice. This study employed a qualitative research with a phenomenological approach to explore the leader's willingness to sacrifice among batik entrepreneurs in Surakarta. Batik industry was chosen as the research object with the consideration that batik is one product that is unique or distinctive that will improve the nation's competitiveness. The results showed that there were nine factors underlying the willingness to sacrifice of a leader in the context of batik entrepreneurs in Surakarta, namely: confidence, dare to take risks, responsibility, respecting history (lara lapa), sincere, preserving culture, customer orientation, liability and spirit to rise.

Keywords: *leader's willingness to sacrifice, entrepreneur and values of local wisdom*

Introduction

As part of the Indonesian culture, batik has high historical value, not only as fashion or commodity, but as visual communication of cultural philosophy and value (Rarick & Sunaryo, 2013). Batik industry recently faces tighter competition. According to Indonesian Bureau of Statistics, 1,037 tons of Chinese batik worth of US$30 million were imported to Indonesia (www.kemenperin.go.id, 2012). To be able to compete with other countries, the industries should continuously improve their competitiveness. This effort is done by looking inside the industry on its human resource aspect and adopting practices with values and uniqueness. Every organization has unique human resource competence (Barney, 1991, 2001). One of the uniqueness is leadership.

Studies on leadership were focused more on the transformational leadership than on transactional leadership model (Bass, 1985; Burns 1978). Transformational leadership model motivates the subordinates to internalize common and bigger value and objective (Bass, 1995; Burns, 1978). This leadership tradition highlights charismatic leadership which directly focuses on the importance a certain leadership aspect, i.e. "the leader's willingness to sacrifice" (Conger & Kanungo, 1998). This behavior contributes substantially on the effectiveness of the leadership (Choi & Mai-Dalton, 1998), and the leader's willingness to sacrifice is an important component in the charismatic leadership (Conger & Kanungo, 1987; Yorges et al., 1999).

The model was first empirically elaborated by Choi & Mai-Dalton (1999). They show that the willingness to sacrifice improves transformational quality perception and that a leader with such willingness is more influential than that with no willingness. Other studies confirm the relationship between the willingness and a leader's effectiveness. Yorges *et al.,* (1999) shows that a sacrificing leader will be perceived more charismatic and could motivate the subordinates better to contribute in charities. Further, De Cremer (2002) and De Cremer & Knippenberg (2002) also show that the willingness will result in better subordinates' performance.

On the other hand, organizations nowadays focus more on improving transformational leadership for their managers because it will result in better organizations" performance (Waldman et al., 2001). One of the variables to improve transformational leadership is the leaders" willingness to sacrifice (Choi & Mai Dalton, 1999; De Cremer & van Knippinberg, 2002, 2004; Yorges et al., 1999). Previous studies show that the willingness to sacrifice influences the subordinates by encouraging reciprocal norm (Choi & Mai Dalton, 1999) by projecting the leader as the example (Shamir et al. 1993), and by projecting the personal needs that the leader is closely related with the vision (Avolio & Locke, 2002).

The inconsistencies on research findings about the leader"s willingness to sacrifice are indicated to happen because of the differences in research contexts, especially the local contexts. On the other hand, there are still a few empirical studies discussing the model of a leader"s willingness to sacrifice that is in accordance with local wisdom values. In this case, the form of willingness might be different between west and east. Western concept of leadership highlight competition, meanwhile the Eastern leadership suggests cooperation. While western leadership concept focuses on mind and rationale, Eastern leadership is on wisdom. Therefore, it is crucial to develop a model of leaders" willingness to sacrifice that is based on the local context and in accordance with local wisdom values.

This research was qualitative in nature and employed phenomenology method. Phenomenology method is not only a study that tries to describe behaviors (shown in attitude, expression, and or discussions between subjects) as it is in detail, holistic and contextual, but it also tries to explicate the meanings behind the phenomena, that are *noumena* which are in line with local wisdom values.

This study specifically was conducted on batik industries which recently face tighter competitions. Batik is one of the products which has uniqueness to elevate the nation"s competitiveness.

Literature Review
 1. Leaders' Willingness to Sacrifice
Leaders could be categorized into two, transactional and transformational leaders. Transactional leaders make initiative in contacts with the subordinates by exchanging something valuable. On the contrary, transformational leaders attracts the subordinates to higher moral value (Burns, 1978).

The influence of transformational leadership process is through internalization; the subordinates tend to accept (internalize) the interesting vision promoted by the leader. A vision becomes interesting to the subordinates when it is in line with their value and principle (Dvir and Shamir, 2003). A leader could elevate the subordinates" commitment to his vision through the willingness to sacrifice. This willingness contributes on many important things, such as charismatic perception, reciprocal norm, contribution on public"s goodness, willingness to show extra effort, willingness to be part of a group, and attributions done on the leader"s behavior (Choi & Mai-Dalton, 1999; De Cremer & van Knippenberg, 2002, 2004; Halverson et al., 2004; Yorges et al., 1999).

Most literatures suggest that the willingness to sacrifice shows one"s disposition to „suffer certain loss to preserve personal belief and value" (Yorges et al., 1999) and it is acknowledged as the common practice done by great leaders (Burn, 1978). The concept of leaders" willingness to sacrifice shows a similarity with an approach in which the leader leads by serving the others (Greenleaf & Spear, 2002), although there is no clear indication of the leaders" benefit (Avolio & Locke, 2002).

The concept of leaders" willingness to sacrifice shows that a leader is willing to take risks personally to achieve the objective or mission of certain group or organization (Conger & Kanungo, 1987). The willingness improves the subordinates" feeling and perception as well as dependencies. In this case, the leader with such willingness is evaluated as charismatic and interesting, as well as a perfect example (Conger & Kanungo, 1987).

The other concept of leaders" willingness to sacrifice defines this leadership as „the total/partial omission and/or permanent deferment of personal interest, privilege or prosperity in labor division, reward distribution, and power application" (Choi & Mai Dalton, 1998). This statement is supported by Yorges et al. (1999) who define the willingness as „giving up or losing something important". The point highlighted here is that both definitions focus on „giving up personal benefit". On the other hand, De Cremer & Knippenberg (2004) see this construct in a wider perspective by including benefits taken by other parties if a leader is willing to sacrifice. They define the willingness as a leader"s disposition to „spend personal expense (or bear the cost) to achieve the objective or mission of certain group or organization".

Transformational leaders are those who are willing to sacrifice for common good (Bass & Steidlmeier, 1999). Such willingness builds trust, receives public acceptance, and helps in shaping community.

Smith et al., (1983) state that the willingness focuses on „personal sacrifice". Meanwhile, Singh & Khrishnan (2008) in agreement with Choi & Mai Dalton (1998) operationalize and define the willingness as the action of omission or deferment of personal interest, privilege, and prosperity.

2. The Measurement of Leaders' Willingness to Sacrifice

Some previous studies has identified indicators to measure leaders" willingness to sacrifice (Table 1).

Table 1.
Measurement of Leaders' Willingness to Sacrifice

No	Researcher	Dimension	Indicator
1	Conger & Kanungo (1987)	Providing one dimension of leaders" willingness to sacrifice	Proposing two questions
2	Choi & Mai Dalton (1999)	Developing a model of leaders" willingness to sacrifice which consists of one dimension	Developing 13 questions
3	Singh & Khrishnan (2008)	Providing two dimensions, but the second dimension consists of items with low reliability that should be omitted so only one dimension that could be used	Developing six questions

Source: Various sources, edited, 2016

Conger et al., (2000) finds that showing the willingness to sacrifice results in positive influence on the subordinates" respect to the leader. Such willingness leads to giving out and being not egoistic cultures in organization (Choi & Mai-Dalton, 1999).

Based on Table 1 above, it can be seen that the previous studies result in inconsistence findings which were indicated as a result of research"s context differences.

Research Method
 1. **Research Design**
This research was a qualitative study with phenomenology approach. The assumption of employing phenomenology is that individuals in interacting with others will give various meanings. The meaning of experiences forms realities performed by each individual (Waters, 1994; Dimyati, 2000; Collin, 1997). This phenomenology approach studies the meaning conceptualized by individuals which then is expressed in phenomena and tries to answer the question of what a certain phenomenon means to the individual (Ritzer, 1992).
The phenomenology approach in a qualitative study states that to understand someone"s behavior, it is related to various kinds of because motives and in order to motives (Schutz, 1972). The steps in this phenomenology study refer to the steps proposed by Fatchan (2013).

 2. **Population, Sample and Sampling Technique**
The population of this research was batik entrepreneurs in Surakarta. The sampling technique of this study employed purposive sampling technique with consideration that the number of owners in the companies is not the same. The samples were taken from those who were willing to participate in this study and the sampling stopped when the last sample did not provide new information on the research topic. The total entrepreneurs who became the respondents of this study was four people.

 3. **Type of Data**
This research used data got from primary source through direct interviews with the respondents and active participation in the respondents" business during the data and information gathering stage.

Findings and Discussion
 1. **Informants/Process of finding the informants**
In finding the informants, the researcher tried to find batik entrepreneurs in Surakarta who are willing to share their experiences in preserving their business in the midst difficult condition through snowballing (Neuman, 2009: 220). The process was done by using reference from one informant who recommended the next competent informant to provide relevant information for the study. Meanwhile, for the sampling method, the researcher employed purposive sampling, in which the researcher by design looked for several batik entrepreneurs for this study. The main purpose of sampling in qualitative studies is to find specific cases, events or behaviors to clarify certain context (Neuman, 2009: 219). The respondents participated in this study were:
 1. Informant 1 is a neighbor of one of the researchers" parents-in-law who is a batik entrepreneur from Boyolali. The good relationship between the researcher and her started with the frequent interaction between them since the informant is the researcher"s parents-in-law"s best friend who also joins the same Koran recitation group. The first informant has been an entrepreneur for more than 25 years. She started from zero, from being a retailer who bought batik from bigger entrepreneurs to a business owner who has a big industry and her own production unit.

2. Informant 2 is the founder of Batik Mayaratna in Mojosongo Surakarta. The researcher interviewed her in one of the charity gatherings of Lions Club Solo Putri. She runs a beauty salon and batik business by building both conventional shop and the online one.

3. Informant 3 established handmade batik in Penumping Solo inheriting the industry initiated by Eyang Broto. The business has been running for more than 25 years supplying batik to entrepreneurs in Jakarta and other areas through social media.

4. Informant 4, a brother of one of the researchers, is an entrepreneur who is running a family-owned batik industry which has been running for generations in one of batik centers in Solo, namely Laweyan. The kinship between the informant and the researcher is very helpful in the effort of understanding the psyche of the informant. In Laweyan, batik industry is ingrained since the industries existed even before the city was established and continued from generation to generation.

2. Data Analysis and Data Analysis Procedure

This part provides in-depth explanation on the procedure used in this study. This explanation provides information on how the data analysis was conducted and shows how the themes were extracted. The in-depth analysis covers short repetition of data analysis procedure implemented and is followed by specific examples from the data. The themes extracted described important general and essential experiences from the informants in terms of their willingness to sacrifice.

The data analysis process followed Fatchan‟s procedures (2013) which cover: 1) conducting general observation, 2) deciding focus and subject as well as the informants, 3) conducting participation observation, 4) conducting observation on discussions among research subjects, 5) conducting description analysis and data validation, 6) conducting in-depth interviews in form of dialogs with research subjects, 7) conducting substantial analysis and data validation, 8) extracting the subjects‟ meaning, 9) understanding the subjects‟ meaning. The essence of this data was word-by-word quotations from the informants and in general was represented by the dimension presented.

In one or two weeks after each interview, the researcher finished transcribing the interview. Every transcript was checked its accuracy and the researcher read over and over to be able to internalize the meaning in the interview completely. The data analysis was started when the researcher examined the transcript and isolated significant statements from each participant. The comprehensive narration description of each informant then was analyzed to become dimensions and indicators. Appendix 1 provides short version of narrative description for each informant and the corresponding themes. The themes from all informants were analyzed and some similarities were gathered to extract the main themes that represented all informants.

3. The phenomenology of leaders' willingness to sacrifice
A. Confidence

The business deterioration experienced by batik entrepreneurs in Surakarta did not deter them. The underlying reason they were struggling to be better was confidence. This could be seen from the first informant‟s statement as follows.

"In facing problems, my thought is simple, "every business could experience deficit." The second is when some of my friends close their business and change to other business (usually because they are running out of money, goods, etc.) I will not follow them changing lines of business. In my mind and heart, I say "I have done this for long time"

Based on the description above, researchers proposed the following proposition:

P1. Confidence is the cause of the leaders‟ willingness to sacrifice in batik industries in Surakarta.

B. Dare to Take Risks

The other background why the entrepreneurs are willing to sacrifice for the sustainability of their business was their business instinct. The instinct is close to the courage to take risks. This can be seen in the first informant‟s statement as follows.

"The thing I think about is how I keep running the business and my employees are not leaving or fired. That is, it is too bad if the employees are leaving because the market is stagnant. I return to the initial thought I said, "every business could experience loss". In addition, my bad feeling was also based on the feeling and the assumption that the employees that I have are not just employees, I consider them as my "children". If we are happy so everybody is happy, and when everything is hard we understand one another well."

Based on the description above, researchers proposed the following proposition:

P2. Dare to take risks is the cause of the leaders‟ willingness to sacrifice in batik industries in Surakarta.

C. Attachment

The entrepreneurs were willing to sacrifice to continue the business because they have strong feeling of having the business. This can be seen in the first informant‟s statement as follows.

"The point is batik is my life that is inherent with my life. So, I extremely hope that my children continue the business, and thank God, my oldest son has started opening business gradually (he also is my merchant)."

They considered business has been attached in them. The job they do was an important aspect in their lives, not only for the sake of money but it was inseparable bond.

Based on the description above, researchers proposed the following proposition:

P3. Responsibility is the cause of the leaders‟ willingness to sacrifice in batik industries in Surakarta.

D. Respecting History (*lara lapa*)

The other background that became the reason why they struggled was their liability to respect history.

"It is clear that the efforts have led me up to this kind of life. At first my father (deceased) and I had the determination, the most important is working without considering the benefit. It turned out that with diligence, sincerity, and love, the benefit was beyond our forecast when we did not have anything. At that time, my father was only a driver and after undergoing this effort, thank God, he could pay for schools, have a home, etc. Now we have stamp and embroidery businesses, and our employees could also have children and they all go to school. This "lara lapa" time cannot be overlooked. I am sincere if I need to sacrifice a lot to maintain this business."

Respecting culture is not only done to memorize the past, but to continue what has been done by the predecessors. This this reason, an entrepreneur will never leave his/her job even though they experience hard times. Their tactical thought was they have experienced harder times when they started the business. All problems they have now could not be compared to the problems they had when clearing their ways for the business.

Based on the description above, researchers proposed the following proposition:

P4. Respecting culture (*lara lapa*) is the cause of the leaders‟ willingness to sacrifice in batik industries in Surakarta.

E. Sincere

The entrepreneurs" motivation to keep their business was their willingness to sacrifice. This could be seen from informant 2 statement as follow.

"It turned out that with diligence, sincerity, and love, the benefit was beyond our forecast when we did not have anything."

The batik entrepreneurs in Surakarta sacrificed a lot sincerely. They did not do any transaction with the business they have. They were willing to do anything to keep the business running. This cannot be separated from the role of business they have gone through in providing livings for them.

Based on the description above, researchers proposed the following proposition:

P5. Being sincere is the cause of the leaders" willingness to sacrifice in batik industries in Surakarta.

F. Preserving Culture

The thing underlying the entrepreneurs to keep their business although they experience hard times was their responsibility to preserve culture which is inherited from the predecessors. This can be seen in the fourth informant"s statement as follows:

"Because batik is an inherited business. Laweyan is a batik center in Solo, even before the city existed. Batik from my great-grandparents that I continue made me survive. Batik is also a cultural and family heritage that should not be abandoned let alone forgotten".

From the statement above, this study could be compared to the previous studies in which the leaders could improve the commitment perception towards the vision by looking at the leaders" willingness to sacrifice. The willingness contributes to many important results, such as charismatic perception, reciprocal norm, contribution on public"s goodness, willingness to show extra effort, willingness to be part of a group, and attributions done on the leader"s behavior (Choi & Mai-Dalton, 1999; De Cremer & van Knippenberg, 2002, 2004; Halverson et al., 2004; Yorges et al., 1999). The strong culture creates bond with the subordinates who feel that they belonged to the same group that wanted to preserve their culture. The vision becomes interesting for the subordinates since it is in line with their value and ideal (Dvir and Shamir, 2003). The same vision between the leaders with their subordinates on the importance of preserving culture makes stronger bond to maintain the business. The culture also made the leaders stronger in facing critical business situations. They do not easily change direction to other more "prospective" business, but they will struggle to respect the cultural inheritance which they think should not be abandoned or even forgotten.

Based on the description above, researchers proposed the following proposition:

P6. Preserving culture is the cause of the leaders" willingness to sacrifice in batik industries in Surakarta.

G. Customer Orientation

The next background that motivated batik entrepreneurs to maintain the business was their care to the customers who are the most valuable assets of the industry. There are many family businesses who experience declines in customer"s demand since they are not responsive in taking care of the customers" needs. This was an example provided by informants 2 and 3 in developing their business. Informant 2 showed that the way a business could survive is by employing technology (internet), that is by opening online shops. The use of technology also helps companies to survive that is by promoting through WhatsApps and Blackberry Messenger as described by informant 3.

"We have supportive business climate to promote batik. Especially in Solo? I promote batik through WA or BBM. I send Batik pattern pictures so the customer knows the meaning of the patterns. Trend style sometimes is not idealistic, I receive any customer's feedback, the buyer is our king, right?"

Based on the description above, researchers proposed the following proposition:

P7. Customer orientation is the cause of the leaders" willingness to sacrifice in batik industries in Surakarta.

H. Liability

The sustainability of a business that is inherited from the predecessors is something that should be preserved. This encourages the entrepreneurs in Surakarta to be willing to sacrifice for the business.

"There should be someone who will continue a family business, right? Because I am the oldest son, I become the backbone of the family."

A prevailing cultural value in the Javanese community is that preserving culture is obligatory. The predecessors" inheritance is an heirloom which should be taken care of and respected. This motivation leads to the willingness to sacrifice on batik entrepreneurs in Surakarta in their efforts of maintaining the business.

Based on the description above, researchers proposed the following proposition:

P8. Liability is the cause of the leaders" willingness to sacrifice in batik industries in Surakarta.

I. Spirit to Rise

A business owner migrated to Malaysia to work for two years in the attempt to collect funds as well as experience. There, the owner got precious experience which turned him 180 degrees since the change of role from an owner to an employee. In Malaysia, apparently the owner learned many new skills, including screen printing. After the monetary crisis was over, he went back to Indonesia with funding and experiences got from Malaysia. His business is expanding today. From the story of the business owner, it could be seen that the leader"s willingness to sacrifice showed one"s willingness to "suffer to preserve personal belief and value" (Yorges et al. 1999). This spirit to rise is similar with the concept of leaders" willingness to sacrifice in which the leaders are willing to take risks personally to achieve the objective and mission of a group or organization (Conger & Kanungo, 1987). The leader was willing to leave his stagnant business to maintain the sustainability of the business and his subordinates" fate. He was willing to go to other country to get money to support the survival of his batik business in Laweyan. This spirit to rise makes the leader stronger in facing critical conditions as well as him becoming an example to the subordinates, as stated by Conger et al. (2000) who find that the willingness to sacrifice influence positively to the subordinates" respect to the leader. This spirit to rise and willingness to sacrifice of a leader will result in giving out and being not egoistic culture in the organization (Choi & Mai-Dalton, 1999).

Based on the description above, researchers proposed the following proposition:

P9. Spirit to rise is the cause of the leaders" willingness to sacrifice in batik industries in Surakarta.

Conclusion and Suggestion

The conclusion drawn from this research was nine factors influencing batik entrepreneurs in Surakarta to be willing to sacrifice to maintain the sustainability of their business, they are:

    a. Confidence

b. Dare to take risks
c. Responsibility
d. Respecting culture (*lara lapa*)
e. Being sincere
f. Preserving culture
g. Customer orientation
h. Liability
i. Spirit to rise

The suggestions for the next studies are as follows:
1. The research could be done with wider scope for multi-industries so that it could be used to generalize the findings.
2. Longitudinal study could be conducted to measure the leaders‟ willingness to sacrifice level from time to time.

Appendix 1. The Narrative Description and Its Corresponding Themes

No	Informant	Narrative Description	Corresponding Theme
1	Informant 1	In facing problems, my thought is simple, "every business could experience deficit." The second is when some of my friends close their business and change to other business (usually because they are running out of money, goods, etc.) I will not follow them changing lines of business. In my mind and heart, I say "I have done this for long time"	Confidence
2	Informant 1	The thing I think about is how I keep running the business and my employees are not leaving or laid off. That is, it is too bad if the employees are leaving because the market is stagnant. I return to the initial thought I said, "every business could experience loss." In addition, my bad feeling was also based on the feeling and the assumption that the employees that I have are not just employees, I consider them as my "children". If we are happy so everybody is happy, and when everything is hard we understand one another well.	Dare to take risks
3	Informant 1	The point is batik is my life that is inherent in my life. So, I extremely hope that my children continue the business, and thank God, my oldest son has started opening business gradually (he also is my merchant).	Responsibility
4	Informant 1	It is clear that the efforts have led me up to this kind of life. At first my father (deceased) and I had the determination, the most important thing is working without considering the benefit. It turned out that with diligence, sincerity, and love, the benefit was beyond our forecast when we did not have anything. At that time, my father was only a driver and after undergoing this effort, thank God, he could pay for schools, had a home, etc. Now we have stamp and embroidery businesses, and our employees could also have children and they all go to school. This "lara lapa" time cannot be overlooked. I am sincere if I need to sacrifice a lot to maintain this business.	Respecting history (*lara lapa*)
5	Informant 2	Sacrifices sometimes are not worth the effort. I rotated employees, and even cross-subsidy the business with other businesses. To build the market I tried to modify conventional and online marketing. The thing I sometimes cannot handle, while I am out ot town, and the clients remain determined to be served by me and does not want the employees to serve him.	Sincere

6	Informant 4	Because batik is an inherited business. Laweyan is a batik center in Solo, even before the city existed. Batik from my great-grandparents that I continue made me survive. Batik is also a cultural and family heritage that should not be abandoned, let alone forgotten.	Preserving culture
7	Informant 3	We have supportive business climate to promote batik. Especially in Solo? I promote batik through WA or BBM. I send Batik pattern pictures so the curtomers know the meaning of the patterns. Trend style sometimes is not idealistic, I receive any customer's feedback, the buyer is our king, right? "	Customer orientation
8	Informant 3	There should be someone who will continue a family business, right? Because I am the oldest son, I become the backbone of the family.	Liability
9	Informant 4	The owner worked in Malaysia for two years to raise money as well as experience. After the financial crisis has returned to normal, the owner returned to Indonesian armed with funds and experience gained in Malaysia and the business continues to grow until today.	Spirit to rise

ECONOMIC BEHAVIOR OF COFFEE SMALL FARMERS:
CASE IN BONDOWOSO

Alwansri Kustono, University of Jember
Nur Hisamuddin, University of Jember

Abstract

Coffee small farmers in District of Tlogosari sell their product with tebas system or independent harvesting (self-harvesting). The existence of the tebas system may cut value chain in coffee agribusiness. The consequence of this is cost reduction. On other side, reduction allows the possibility of income farmers decreasing.

This study used a phenomenology method, because it is associated with symptoms and social phenomena and their interactions on the environment and conditions. Farmers have option to direct selling early or harvest.

In value chain analysis, development of modified warehouse receipt considered very necessary. MWR must be built with sufficient ability in assessment activities that cover plant maintenance, processing and finishing of yields, and selling. Coffee farmers' income levels are very concerned. With an area of 1 ha coffee plantation, farmers only earn between 2 million rupiahs in bad condition up to 12 million rupiahs in good condition per year.

Keywords: *Coffee farmers, harvest, value chain, modified warehouse receipt system*

Introduction

Most coffee farmers in the district of Tlogosari sell coffee with a few ways: tebas system and self-harvest. Tebas system is pursued because farmers get money quickly and did not think about various expenses. Expenses in coffee plantation include labor wage, especially for harvesting and post-harvest activities. It is a factor that drives the majority of farmers to choose not handles self-harvest and post-harvest activities.

The impact of tebas system, in a region that coffee stocks decreased. Only a percentage of just farmers who bring their crops to be stored. Harvest by tebas system way is an option because farmers can calculate profit and loss directly. Farmers can give high price, when coffee plants bargained for. This system provides the opportunity to earn money quickly. The existence of tebas system in coffee farming looks like cutting the coffee value chain in agribusiness. The consequence of it is cost reduction. On the other hand, the reduction of cost may be cut farmers income.

One of the main problems is the lack of ability of small farmers to determine cost of products. At the time of harvest, farmers only based on the price offered by the buyer without knowing whether the loss or profit. In fact, by knowing the price of coffee, farmers to take the decision to hold or sell coffee (Baswir, 1990).

The various harvest treatment in coffee plantation raises questions what is the reason coffee farmers in Kembang District Tlogosari choose harvesting system and how farmer behaviors post harvest.

Literature Review

Accounting research related to coffee farmers is still relatively rare. Some of which highlighted the environmental costs (Pramastiwi et al., 2013); adoption patterns of farming (Junaidi and Yamin, 2012); revenue organic and non-organic farmers (Gani, 2010), and the competitiveness of robusta coffee (Sutriono, 2011).

Gani (2010) conducted a study to determine the difference in the income of coffee growers of organic and non-organic in the Gayo highlands, Bener Meriah, Nanggroe Aceh Darussalam. The results showed that the organic coffee farmers' income is higher than the non-organic. The difference of income caused organic coffee production which is higher than the non-organic. The price of organic coffee production is also higher than ones.

The market structure is the organization that determined by characteristics of the relationship between the seller with the buyer. It can be seen from the number of agencies involved in marketing, market share, market concentration and market conditions. Based on the characteristic, market can be classified into two kinds, namely that markets are perfectly competitive and imperfectly competitive markets (Kottler, 1999). Imperfectly competitive market consists of monopoly, duopoly, oligopoly market, monopsony, and oligopsony market.

Methods
1. Research Approach

This study used phenomenology method, because it is associated with symptoms and social phenomena and their interactions with the environment and specific conditions. Technique used qualitative techniques to understand reality. The results are expected to provide a summary of the information as possible regarding the consideration of small farmers about the decision to sell coffee with tebas system and independent self-harvesting system. Farmer's motivation was obtained through in-depth interviews against the informant. Observation and in-depth interview process is primary data gathering.

2. Subject and Object Research

Subjects were farmers, harvesters, transporters, and coffee merchants in Kembang-Tlogosari. Researchers act as collectors in an effort to collect data in the field. Other data collection instruments are a variety of tools and other documents that can be used to support the validity of research results. The presence of researchers in field directly attempt to better understand the research problem. The data used in this study were interviews and observations. Techniques of data analysis is the process of sequence categories of data, organizing it into a pattern, categorizing and summarizing description of the basic unit. Data analysis was performed to formulate propositions.

Data analysis was performed with the set, sort, categorize and provide a specific code and categorized. Data management aims to find themes and propositions are finally promoted to substantive propositions. Data analysis was performed from data collection and intensively. Researchers also need to be confirmed until a response is saturated.

Results and Discussion

Participants in this study were coffee farmers who have land. Fifteen people ask to be primer participants and forty farmers is added to be additional informants in this study. All live in and have a coffee plantation in Kembang Village. The youngest participants were 23 years old and the oldest 65 years old. Education level of participants varies, such as elementary, junior high schools, and high school.

All participants came from all Muslim and Madurese tribes. Because the researchers can not communicate Madurese language, the interview process and the data acquisition ask local people to help field data collection. Land holdings varies between one-half acre to five acres. Scattered locations in the Kradjan, Salak, Koparas, and Kradjan Pedukaran village.

1 Cluster Research Themes

The research results obtained through in-depth interviews with participants. From the results of the data analysis, the researcher found four clusters of research themes that describe the problem. Theme clusters obtained on the production and selling of coffee is (1) the amount of production is uncertain, (2) the effect of weather on production, (3) effect of treatment on the production, (4) select tebas system or self-harvesting; (5) choose to sell directly or further processing; (6) selling in village or in the city, (7) ability to determine prices.

Determination of the theme clusters formed from the analysis of data derived from fifteen participants. Initial analysis process did to determined keywords each participant, and then set the first level theme of each participant. Here is a list that contains the level 1 theme 57 statement. The first level themes that have same meaning analyzed and incorporated into the second level. Further analyses of the second-level themes that have similar meanings are combined in a cluster theme.

57 codification statements are reduced to the level 2 statement. The following list is a statement in second levels of summarization of statement: number of production fluctuations, decline of production, weather influences production, treatments improve yields, treatment had no effect on yields, more profitable, further processing yields, better direct selling, more simple to sell in location, choose to sell in big buyer, price is determined buyer, and hold the coffee production is as strategies to obtain a good price.

Of the twelve statements in second level theme compile following research themes: production amount is uncertain; the influence of weather on production results; effect of treatment on the production; Choosing tebas system or self-harvest; Choose to sell directly or further processing; Sell on the location or in the city; and ability to determine prices.

2 Interpretation of Results

The purpose of this study focuses on the determinants of coffee production, alternative choice to self-harvest or tebas system, cultivate more or direct selling, selling on location or in Bondowoso city, and ability farmers to determine their coffee prices. Four themes result are weather effects and treatment effects on farmers' crops, self-harvest or tebas system, further processing or direct selling, selling in locations or city, and whether farmers have the bargaining power to determine prices of their product.

Yusriadi (2013) states that the decline in coffee production due to adverse weather factors. Natural factors does not result in the fertilization process is complete because of the interest already falling, following the absence of rain. During the process of fertilization, coffee plants need rain. Due to the unpredictable weather lead to decreased production.

Climate change cannot be predicted now. Many stages to be followed in making climate predictions. Including estimates of greenhouse, gas emissions in the future, calculation of the effects of emissions on the global climate and local climate. Each stage produces a number of uncertainties that continue to grow (British Council, 2013). Because climate change is causing changes in the weather, so the weather is too fickle. This is disclose by the participants. Impact to yields is also confirmed. It is revealed from the statement of the participants decreased crop yields.

This uncertainty affects the weather as well as the impact of foster. Maintenance cannot be carried out during the rainy season. It often affect to no optimal fertilization. One reason is the non-fulfillment of the basic principle that timely fertilization, the right type, the right dosage and the right application. Timely fertilization also refers to precisely the time of fertilization and plant age. Fertilization should be done at the beginning of the rainy season. Because this time the difference between wet and dry seasons is not sure then fertilizing should be done in the air humid weather conditions (high rain probability). Fertilization is

done during the dry season causing volatile fertilizer and plants become dry. Improper application allows the amount of fertilizer that is lost due to evaporation and leached by rain.

Mindset easily and efficiently is also owned by the people in the village coffee in Kembang-Bondowoso. They sell coffee fruit is red and almost ready to harvest. The deal price is obtained by estimating the amount of coffee that may be harvested.

Tebas system would spoil farmers. Farmers process land preparation, seed preparation, planting and maintenance. When the fruit has begun to ripen, then the middlemen come buy with tebas system (Bisnis Bali, 2012). Farmers who sell their crops in the field are generally sold with a tebas system. Farmers see the advantages of the system of tebas system and profitable on both sides (Rusastra et al. 2001).

Coffee farmers in the village who did tebas system constituted by several reasons: practicality, more profitable, speed up the acquisition time money, fluctuations in the price of coffee.

The coffee farmers who choose tebas system found more profitable because tebas system avoid potential losses resulting from price fluctuations. This is in contrast with the general opinion that the tebas system considered detrimental to farmers because of the low price obtained.

Farmers who self-harvesting reasoned that this harvest type is more beneficial because can hold coffee to improved selling prices, buyer caused tree damage inadvertently, the social aspect in considering: in part harvesters who are neighbors, and already done every year routinely.

Farmers generally cannot be considered in calculating the economic costs and benefits. Most farmers employ family to participate process. Labor costs of this kind do not enter the calculation yields. The others reason, farmers can determine the time of selling, in accordance with the price good. Farmers who have other sources of income will generally perform this action. They are not too hasty to sell the crop at the time immediately after harvest. But it must be supported with a warehouse or storage area either.

Farmers will further processing coffee if you feel it will gain good results and can hold coffee to obtain the expected price. In the conditions when farmers are faced with the immediate needs, they can do sales under expect profit.

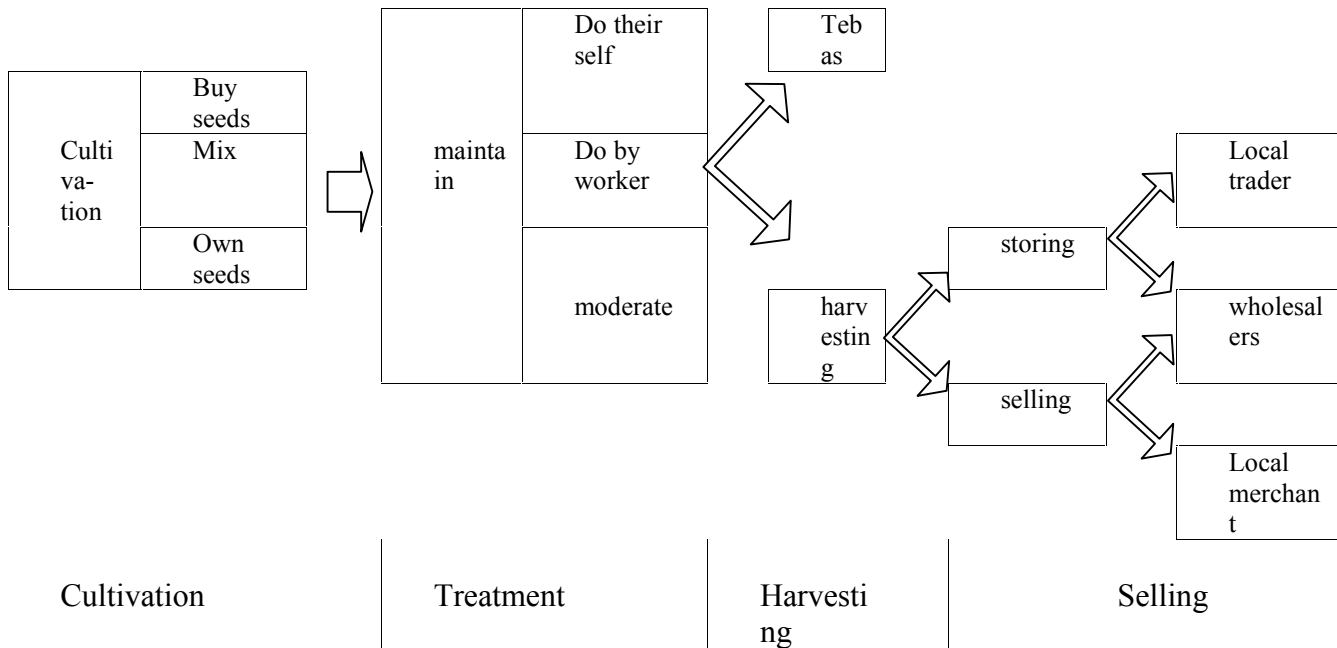
Some farmers even prefer to directly sell because there is still long the processing of coffee beans and the treatment depends on the weather. However, it depends on the weather. Farmers still process by traditional way, and it depends on natural conditions. The more rain the longer drying, and price of coffee beans sometimes are bad.


Figure 1. Value chain of coffee agribusiness in Kembang Village

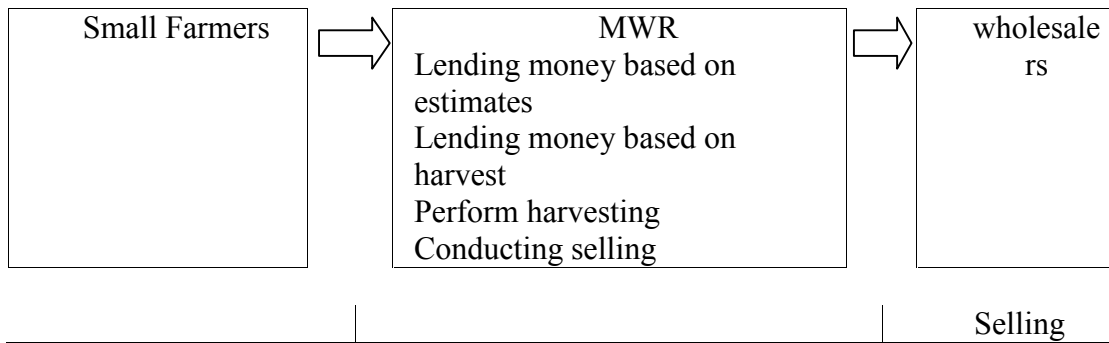
There is some activity on the chain coffee farmers in Kembang-Bondowoso. Each stage has contribution margins. The focus of the discussion centered on the stage of harvest and direct selling. Value chain of coffee agribusiness consists of two i.e, tebas and harvest. In detail, there is a value chain

1. Planting - treatment- tebas
2. Planting - Maintain -harvesting-storing-Small Traders
3. Planting - Maintain -harvesting-storing-Wholesalers
4. Planting - Maintain –harvesting –selling -Local Merchants
5. Planting - Maintain -harvesting-selling-Wholesalers

To strengthen the bargaining position, farmers who have adequate storage space generally save the crop to be sold at a good time. They are farmers who have a warehouse, not being chased needs and have other sources of income. Revenues can be increased, so it will help farmers.


Comparison of each step contribution margin can be explained as follows:

Table 1. Comparison of tebas system and self-harvesting profit

	Operational profit				
	2010	2011	2012	2012	2013
Tebas	2.153.760	1.993.600	7.350.400	3.480.260	2.987.700
Harvesting-local traders	3.395.410	5.101.700	11.768.800	7.539.660	2.752.450
harvesting-wholesalers	3.345.210	5.010.200	11.632.900	7.672.710	2.657.950

The pattern of warehouse receipts is ideal for farmers. Patterns of warehouse receipt can be an alternative marketing system because of the potential benefits that can be achieved is quite high, besides containing a social mission to help farmers.

Models that use modified ware house receipt system looks as follows:

Small Farmers	⇒	MWR Lending money based on estimates Lending money based on harvest Perform harvesting Conducting selling	⇒	wholesale rs

Selling

Figure 2. Modified ware house receipt

Modified warehouse receipt must be built with sufficient ability in the assessment activities include crops, processing crops, and selling. The adequacy of the initial funds can be obtained from the local government or other agencies. For Kembang-Tlogosari district, with an area of about 100 ha of coffee plantations, the estimated production of 60 tons of dry coffee, the current market price of Rp. 21.500,00 / kg. Outside investment is needed Rp. 1,290,000,000.00 for each harvesting period. But note, the coffee farmers' income were very sadden. With an area of 1 ha plantation ownership, coffee farmers only earn between 2 million rupiahs in bad condition up to 12 million rupiahs in good condition. Its mean, coffee plantations only provide between Rp. 160.000,00 to 1.000.000,00 per month per Ha.

Conclusions and Recommendations

1. Conclusion

The purpose of this study focuses on the determinants of coffee production, alternative choice to self-harvest or tebas system, cultivate more or direct selling, selling on location or in Bondowoso city, and ability farmers to determine their coffee prices. Four themes result are weather effects and treatment effects on farmers' crops, self-harvest or tebas system, further processing or direct selling, selling in locations or city, and whether farmers have the bargaining power to determine prices of their product.

Farmers in the Kembang village have the option to tebas system or self-harvest. Tebas system choice base on reasons of practicality, more profitable, accelerating time to earn of money, and fluctuations in the price of coffee.

Farmers who do self-harvesting reasoned that the harvest is more beneficial because: mostly done himself and family, can hold coffee to improved selling prices, tebas system caused tree damage inadvertently, the social aspect in considering the interests of workers in part harvesters who are neighbors, and already routinely done every year.

2. Limitations and Suggestions

This study has several limitations. Many farmers are not willing to be interviewed for reasons that are not clear so comprehensive information that is not expected to be fully achieved. Future research should be conducted in a long time and involvement with the community researchers attached.

Farmers do not have the written records so that more data is just a memory. This leads to the calculation in detail. Future research may begin with teaching regarding the recording data.

The selling price is determined by world market demand so that the results of this study are only intended to assist farmers in making decisions.

THE GOVERNMENT SYSTEM OF INTERNAL CONTROL, QUALITY FINANCIAL STATEMENTS AND ACTS OF CORRUPTION LOCAL GOVERNMENT IN INDONESIA

Aris Eddy Sarwono, Slamet Riyadi University, Indonesia
Rahmawati, Universitas Sebelas Maret, Indonesia
Y Anni Aryani, Universitas Sebelas Maret, Indonesia
Agung Nur Probohudono, Universitas Sebelas Maret, Indonesia

Abstract
This research aims test the influence of the system of Internal control systems (SPIP) Government and the quality of the financial report of local government (local government) against acts of corruption of local government in Indonesia. The data used in this study is an overview of the data the Agency's inspection results Badan Pemeriksa Keuangan (BPK) from 2013 and 2014. The number of samples used in the study was 239 regional Governments in Indonesia, while the number of panels (balanced) observations used in analysis as much as 478. The results showed the weakness of the Government internal control systems which include the weakness of the control system of accounting and reporting, the weakness of the budgetary implementation of control systems revenue and budget as well as the weakness of the internal control structure of the positive effect against acts of corruption, while the variable quality of the financial report of the Government of the region of negative effect against the acts of local government corruption in Indonesia.

Introduction

Corruption in Indonesia is described as issues that are difficult to enforce because of the acts of corruption has become a culture. Basically, corruption is a form of violation of the law that has become a habit. Survey of Corruption Perception Index (CPI) 2015 indicates the level of corruption in Indonesia is still high, because Indonesia is at position 88 of 168 countries with a score of CPI (Corruption Perception Index) of 36 (CPI, 2015), while the survey Indonesia Corruption Watch (ICW) corruption going on in the financial sector of the area with the perpetrators of corruption in most areas is carried out by local government officials (ICW, 2015). The second survey results the Institute described the condition of corruption in Indonesia is still high and thoroughly and not only occurred in the Central Government, but already in the existing local government in Indonesia. The system of Government in Indonesia since the issued Act No. 22 of 1999 on local government impact on granting autonomy to the larger areas of the region. The impact of the promulgation of these laws is the duty of local authorities to complete and more accountable. On the other, the granting of autonomy to local governments in need of a good surveillance so that it does not happen cheating (fraud) in the area. Cheating in government sectors as well as the private sector essentially caused by weak internal control is done. Cheating survey results reported by the Association of Certified Fraud Examiners (ACFE) based on the results of a survey of 106 countries in 2010, that losses caused by fraud companies around the world is 5% of total annual revenues or if applied on the value of estimated value of Gross World Product in 2009 reached the value of potential losses amounting 2.9 billion dollars. Cases of cheating that is at most asset misappropriations (86%), then followed by corruption (33%) and the least amount (5%) are financial reporting fraud (fraudulent statements). Nevertheless the cheating financial report brings the most losses by a median loss of approximately 4.1 million dollar (ACFE, 2012). Internal control has a very important role for an organization including local

governments. In Act No. 1 of 2004 article 56 paragraph 4 explaining that the financial management area should be supported by an appropriate internal control system. Research on internal control a lot done in the private sector and non-profit organizations among them perpetrated by Ge and McVay (2005); Doyle, Ge and McVay (2007); Ashbaugh-Skife, Collins and Kinney (2007); Zhang, Niu and Zheng (2009); Petrovits, Shakespeare and Shih (2010). The results of the study indicate that internal control can be affected by several factors. Results of the audit of the financial statements BPK local government semester 1 2013 showed that the weakness of the system of internal control which is dominant in the examination of the financial weakness of the control systems is the implementation of budget revenue and spending as much as 2,498 cases (42%), the weakness of the control system of accounting and reporting as much as 2,136 cases (36%) and weak internal control structure as much as 1,314 cases (22%). These weaknesses by looking at the level of internal control compliance audit standards.

The problem of the quality of the financial report of the Government is an issue that is interesting enough to be examined further, because some research is rarely research examines the problem of the quality of the financial report of the Government much less associated with the problem of corruption. Some researchers who study the problem of public sector financial statements include Gu, *et al.* (2002); Francis., *et al.* (2004,2005); Pagalung (2006); Cohen (2003, 2006); Chaney, *et al* (2006) performed with the approach of the study on the factors of what causes the resulting quality financial reporting. The study tested the influence of the quality of accounting information of Government have also done Arvanitidou Virginia, *et al* (2007) explained that the use of the transparency of financial accounting information can improve the effectiveness of Government that can eventually prevent corruption. While in Indonesia, Santoso and Pambelum (2008) explains that the implementation of the public sector accounting and accounting information quality affecting the accountability of the Government. This meaning that the better the quality of the financial report of the Government, then it will increase the accountability of the performance of government agencies. Therefore, on the basis of a variety of conditions, it provides motivation for research by testing the influence of the quality of the financial report of the Government of the region against acts of corruption of local government. In this research the question the problem is whether the weakness of the system of internal control and the quality of the financial report of the Government of the region to follow up the corruption of local government in Indonesia. This research is expected to contribute to the study of materials relating to the system of internal control of the Government, the quality of the financial report of the Government of the region and acts of corruption that occur in local government in Indonesia. In the next part of the review of literature related to research and present the research hypothesis. The next section describes the research methods, data analysis and statistical test results. The final part describes the main research findings and limitations, as well as implications for subsequent research.

Literature Review and Hypothesis Development
1. Agency Theory in Government Sector
Agency theory can be applied in public organizations (Lane, 2003). Further described Lane (2003), that modern democracies are based on a series of principal-agent relationship. MoE (1984); Bergman and Lane (1990); Christensen (1992); Strom (2000); Andvig *et al.* (2001) and Gilardi (2001) explains that organizations in the public sector with regard to the theory of Agency. Moe (1984) argued that the concept of a public sector organization economics by using agency theory explanation. Bergman and Lane (1990) the framework of the relationship with the principal agent is a very important approach to analyze public policy commitments. The making and application of public policy related

to problems contractual, is an information that is not symmetric (asymmetric information), moral hazard, and adverse selection. Further, Christensen (1992) States the theory of principal-agent can be analytical tools for the preparation and implementation of the budget of the public. Gilardi (2001) and Strom (2000) describes the relationship of the Agency as the delegation relationship (chains of delegation), the delegation of the community to his Deputy in Parliament, from Parliament to the Government, from the Government as a whole to a Minister, and from the Government to the bureaucracy. The relationship does not always reflect the hierarchy, but can only be relations delegation, as stated by Andvig *et. al*, (2001). In Indonesia, agency theory began gaining attention since the establishment of autonomous region in 1999 which was subsequently amended by law No. 32 of 2004. In the agency relationship, the legislature delegate the authority to run the Government to the Executive. This shows that between the legislative and Executive Agency relation (Halim and Abdullah, 2006). Agency relations is a concept that describes the relationship between principals and contractual agents. This form of accountability over authority given, agents provide accountability reporting against the principal, although it does not occur directly, but through existing community representatives in Dewan Perwakilan Rakyat (DPR). Agency relationships in the Government between the Executive and the legislature, the Executive and the legislature is an agent is the principal (Halim, 2002; Fozzard, 2001; Moe, 1984). Lupia and McCubbins (2000) explains that the issues facing the legislature refers to a phenomenon called the agency problems. Executive-Legislative relations agency also expressed by Andvig et al. (2001) and; Lupia and McCubbins (2000). As a Principal, the legislature can also behave moral hazard or in realizing its self-interest (Elgie and Jones, 2001) as it applies to corrupt (corrupt principals) (Andvig *et al*. 2001). According, Colombatto (2001) the existence of the discretionary power in one party will give rise to breach of contract agents, such as the occurrence of rent seeking behavior and occurrence of acts of corruption.

In the context of the preparation of the budget, the proposal put forward by the Executive in charge of Executive interests (Smith and Bertozzi, 1998). The Executive submits budget that can enlarge the agency, both in terms of financial as well as nonfinansial. While Keefer and

Khemani (2003); Mauro (1995); and Von Hagen (2005) implicitly stated that the budget was also used by the legislature (politicians) to meet its self-interest. In the end the primacy of the information owned by executives who used to draw up the draft budget will be dealing with the primacy of authority (discretionary power) owned by the legislature.

2. Hypothesis Development

In the Government Regulation Number 60 in 2008 described that is the internal control System (SPI) is an integral process in actions and activities performed continuously by the leadership and all employees to give appropriate confidence top goal the Organization through effective and efficient activities, the reliability of financial reporting, the State asset security and adherence to laws and regulations. The system of internal control the system of internal control is the Government organized thoroughly surroundings of the Central Government and local governments. In article 56 paragraph 4 of Act No. 1 of 2004 on the Treasury of the State explained that regional financial management must be supported by an adequate internal control system. Thus the internal control has a very important role for an organization, including local governments.

According to Anthony and Govindarajan (2011) internal factors within an organization is the most important is the culture within the Organization itself. The cultural environment is good, then it can strengthen the internal control system and will played an important role in preventing the occurrence of fraud in an organization. About *et al* (2002) describes

the internal control that can effectively reduce the tendency of cheating, it is in line with the statement of the research conducted by Wilopo (2006) States that effective internal controls provide a significant influence and negatively to accounting fraud. Some of the research that examines the issue of internal control within an organization associated with the cheating has done some researchers, such as Khanna (2009); Coram *et al* (2006); Shanmugam *et al* (2012); Josiah, Samson and Elizabeth (2012); and Omar and bakar (2012). Research results Khanna (2009) describes a powerful control system can prevent the occurrence of a form of fraud in the Organization, while Coram *et al* (2006) argued that internal audit can provide added value by making improvements in control and monitoring to detect the occurrence of fraud. Shanmugam *et al* (2012) holds internal control conducted within an organization can improve the performance and accountability of the Organization, while Josiah, Samson and Elizabeth (2012) the existence of acts of corruption in an organization, are a reflection of the weakness of the system of internal control. Based on some of the arguments can be formulated the hypothesis as follows:

H1: Accounting and reporting Control Weaknesses influential positive against acts of corruption of local government in Indonesia
H2: Internal control weaknesses of the implementation of the budget and the positive effect of income against acts of corruption of local government in Indonesia
H3: The weakness of internal control structures control the positive effect against acts of corruption of local government in Indonesia

The quality of financial reporting in the private sector according to Schipper (2004) can be seen from two views, first stated that the quality of financial reporting is closely related to the performance of the company that realized in profit the company earned in the current year. The second view is that the quality of financial reporting related to the performance of the company's shares on the capital market. The same view about the quality of financial reporting is also delivered by Francis et al. (2004) which divides into two groups become attributes based accounting and market-based. In the public sector, the problem of the quality of financial reporting more accountability for the implementation of the Government to the community. In Indonesia, especially in local government, the issue of the representation of financial reporting and management has been carried out since the enactment of Act No. 17 of 2003 that oblige the Central Government or local governments to present a financial report as a form was. As a form of accountability, financial reporting quality should be used to detect the existence of acts of corruption.
Some research like Klitgaard (1998) and De Asis (2006) that examines the issue of public accountability in corruption eradication needs to be attention given the issue of public accountability is considered to have significant influence towards acts of corruption. Klitgaard (1998) and De Asis (2006) also argued that one of the strategies that can be done to eradicate corruption is to increase accountability. Accountability can be translated as accountability for resource management and implementation of the policy is entrusted to the reporting entities in achieving the objectives that have been set on a periodic basis (SAP, 2005). Research on the importance of accountability in efforts to combat corruption in the doing by Desta (2006) which found that for the case of Eritrea anti-corruption strategy is the most important thing to do is transparency in reporting. In the public sector, Haque (1997) explains that the problem of accountability associated with the increased responsibilities that should be run by the local government, i.e. by encouraging the creation of a climate that can realize its accountability. Increased and improved accountability of government performance will hopefully have implications for minimum

practices against corruption in Government. Some of these arguments can be formally formulated in the following hypothesis:

H4: The quality of the financial report of the Government of the region of negative effect against acts of corruption of local government in Indonesia

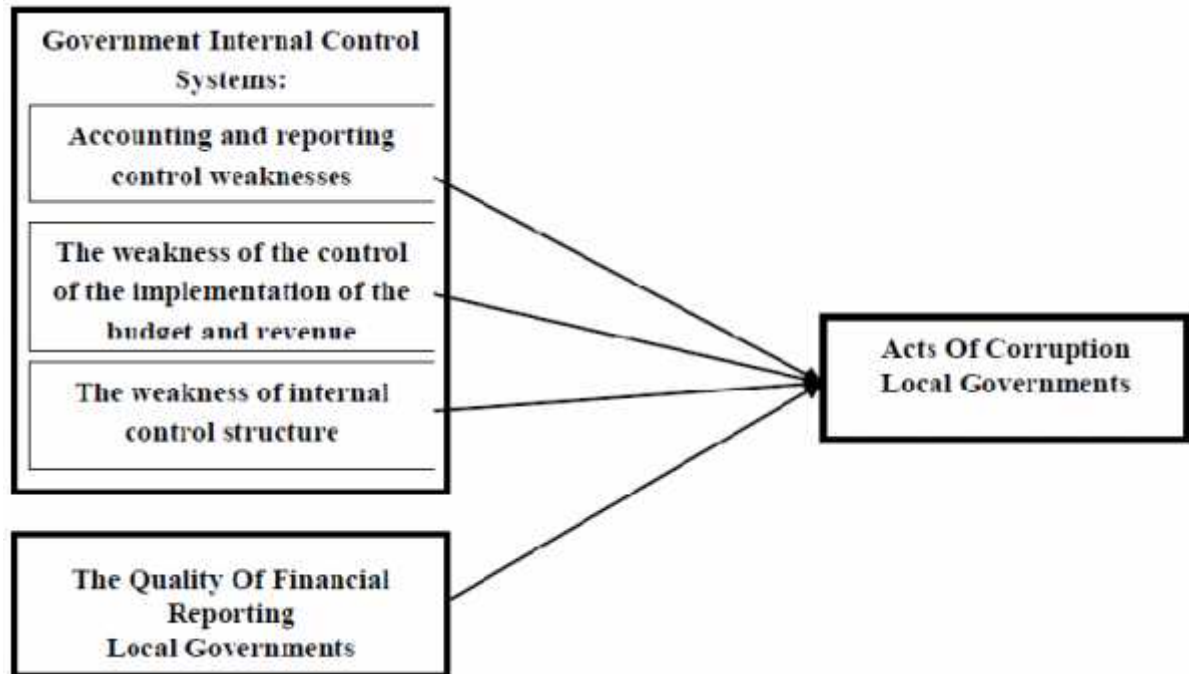

Figure 1. A Conceptual Framework For Research

Research Methods

1. **Samples, Data research and measurement of Variables**

The population in this research is local governments throughout Indonesia. The technique of determination of purposive sampling carried out sample i.e. the sample comes from the local government that has been submit the local government finance report (LKPD) and have been audited by Badan Pemeriksa Keuangan (BPK). Types of data used in this research is data sekuder that is an overview of the results of the examination of the BPK by 2013 and 2014. Internal control system variables in this study measured using a scale ratio i.e. the number of

Cases of weakness that are found from the audit results of the BPK. The measurement of the quality of local government financial reports using data opinion on audit results of the BPK while acts of corruption measured by using the findings of regional losses over the BPK findings have been acted upon in the review process.

2. **The Regression Model**

Testing the influence of the system of internal control and the quality of the financial report of the Government of the region against acts of corruption of local government in Indonesia using time series data for two years i.e. years 2013 and 2014. The regression model used in this study as follows:

Corruption = β0 + β1AK_LAP + β2ANGG_PEND + β3SPI - β4KUAL_LK + *e*

Where: Corruption   : Acts of corruption of local government
AK_LAP   : Accounting and reporting control weaknesses

ANGG_PEND   : The weakness of the control of the implementation of the budget and revenue.
SPI   : The weakness of internal control structure
KUAL_LK   : The quality of the local government finance report e : error

The Results of the Analysis and Discussion
Based on the sample criteria have been determined, the number of local governments used to do analysis for 238 local government is as much, while the data used to do analysis on the period of 2013 and 2014 as much as 476. The overall model in this study being estimated by using data panel model i.e. the fixed effect model. Gujarati (2003) explains that the data panel regression model estimation by fixed effects model approach depending on the estimation used in the slope coefficient, intercept and the error term. The use of fixed effect model is based on the results of testing with test Hausman and chow test by comparing the value of the probability. The results of the comparison of the probability value shows that the right model is a model of fixed effects models. The results of the regression using the fixed effect model are described in the following table 1:

Table 1. The regression results (*fixed effect model*)

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1163,939	397,8317	2,925707	0,0038
X1	2,316776	36,41345	0,063624	0,9493
X2	8,678851	23,70758	0,366079	0,7146
X3	5,695052	37,08406	0,153571	0,8781
X4	-193,8922	93,80427	-2,06699	0,0398**

Sample: 2013 2014

Periods included: 2

Cross-sections included: 239
Total panel (unbalanced)
observations: 478

R-squared	0,556868
Adjusted R-squared	0,098143
Durbin-Watson stat	3,007594
F-statistic	1,211499
Prob(F-statistic)	0,067285*

** Significant at alpha 0,05, * Significant at alpha 0,1

Based on the criteria of the sample used and samples have been determined based on sampling criteria, then the number of samples is used as many as 239 local governments, whereas periods used in this test is two years (2013 and 2014). The magnitude of the total panel used in the analysis is e-views in this research is as much 478. The model equations of regression results table 1 are as follows:

Corruption = 1163,939 + β1_2,316776 + β2_8,678851 + β3_5,695052 − β4_193,8922 + e

The results of the analysis show that variable weakness of internal control system of Government which include weakness of the control system of accounting and reporting,

the weakness of the budgetary implementation of control systems revenue and budget as well as the weakness of the internal control structure has a positive coefficient variable against acts of corruption, that is, the higher the number of cases of weakness in the internal control system elements the Government then have an impact on the high criminal corruption that occur in local government in Indonesia. The results of this study support several previous studies that have been done, such as Khanna (2009); Coram *et al* (2006); Shanmugam *et al* (2012); Josiah, Samson and Elizabeth (2012); and Omar and bakar (2012). Khanna (2009) and Coram *et al* (2006) holds a powerful control system can prevent the occurrence of a form of cheating, while Josiah, Samson and Elizabeth (2012) acts of corruption in an organization, are a reflection of the weakness of the system of internal control. Further analysis of the results from table 1 shows that the variable quality of the Government's financial reports significantly (p < 5%) negative effect against acts of corruption in local government in Indonesia with the value of the coefficient of 193.8922 means that the higher the quality of the financial report of the Government of the region then it can lose the follow corruption that occur in local government in Indonesia. The results of this research supports research conducted by Klitgaard (1998) and De Asis (2006). According to Klitgaard (1998) and De Asis (2006) public accountability the accountability demonstrated by transparent and accountable financial management has significant effects against acts of corruption. Further Klitgaard (1998) and De Asis (2006) argues that to eradicate the occurrence of corruption then done by increasing accountability in the management of resources as well as implementation of the policy is entrusted to the reporting entities in achieving the objectives that have been set. The results of the same study also dikemukaan by Desta (2006) which describes the importance of accountability in an effort to combat corruption, while Haque (1997) adds the issue of accountability associated with the increased responsibilities that should be run by the local government, i.e. by encouraging the creation of a climate that can realize the accountability so that it can have implications for minimum practices against corruption that happens in Government.

Conclusions, Suggestions and Implications

1. Conclusion

Corruption happens in Indonesia is a State problem that is rooted in the socio-political structure. Corruption is considered as a problem that is difficult to enforce because it has become a culture. One of the efforts to prevent and reduce the occurrence of corruption in the Government is to enhance the internal control in the Government sector. Internal control of the Government as a form of action and activities performed continuously to provide appropriate belief the top goal of the Organization through effective and efficient activity. The results showed the more weak internal control in Government, then in potentially increasing corruption that occur in local government, or in other words the Government internal control is good, then it can reduce the occurrence of acts of corruption, especially in local government in Indonesia. The results also describes the quality of local government financial reports are good, then it can also suppress the occurrence of acts of local government corruption in Indonesia. The quality of a good financial reports illustrate the increasing accountability in the management of resources as well as implementation of the policy is entrusted to the reporting entities in achieving the objectives that have been set.

2. Suggestions

The analysis of the data used in this study using a panel data for two periods namely by 2013 and 2014, the results of this research will further illustrate that better if the range of

data that is used for more than two years of examination results. The use of the variable corruption tend to use the criteria of regional losses set by the BPK from the results of the examination of the financial statements of local government (LKPD) is done, the use of variable corruption will further illustrate the actual corruption when the size of the corruption uses the size of the result of the decision of the courts over acts of corruption that occur in an area officials.

3. The implications

This research is expected to give an overview of the importance of the system of internal control and the quality of financial statements that are in the local government in Indonesia which is associated with the occurrence of acts of corruption that occur in Indonesia, especially in local government (county or city). Theoretically this research can give you an idea of the importance of financial management of local government that is transparent and accountable so it can improve the quality of financial reporting in the local government.

ANALYSIS OF TRAVELOKA.COM WEBSITE QUALITY WITH IMPORTANCE PERFORMANCE ANALYSIS (IPA) METHOD

Mahir Pradana, Telkom University, Indonesia
Danny Setyawan, Telkom University Indonesia

Abstract
At this time, the usefulness of a separate website to be excellent for companies in marketing their products. So that makes the proliferation of e-commerce website in Indonesia. One of the websites that follow this trend is traveloka.com. Websites traveloka.com give a service system new the website other e-commerce. This study aimed to describe the level of quality traveloka.com based on the judgment of the actual quality and perceived quality of the ideal. This research is quantitative descriptive WebQual dimensions namely usability, information quality, and service interaction is assessed based on the perspective of the level of performance and the level of importance. Respondents were examined in this study amounted to 100 users using incidental sampling technique. From this study showed that overall there is value gaps (gap) is negative between the actual quality (performance) and ideal quality (importance) of (-0.27). Value gap is greatest dimension of service interaction with the value (-0.42). Based on it can be concluded that the quality of actual felt could not met the ideal desirable website users traveloka.com especially of attributes quality associated with service interaction in website. An improvement priority of them are view that draws, website the inexperience positive when using, information in the proper format and having a good reputation.

Keywords: *Website quality, e-commerce, Importance Performance Analysis, digital business*

Background

In the information age of today, the need for computer-based information system is increasingly important, with globalization and free trade are happening around the world. The success of computer-based information system is strongly supported by the infrastructure and facilities are sufficient. The use of information technology in everyday life and the world of business in the community were very widespread. The computer-based information systems can provide a competitive advantage, so as to give high priority to a business enterprise.

Online business has now penetrated into various groups, one of the online businesses are constantly being developed today is developing a website. At this time, the website must be one that is owned by a company. In addition, many strategic benefits of which are owned website as a means of providing information, promotion and communication with customers. In this case the website has served as part of the customer relationship. Therefore, companies must be able to present a website that professionalism and quality.

One of the companies that follow this trend is Traveloka with the launch of their online business such as web site addresses Traveloka.com air. Previously the company was founded in 2012 by Ferry Unardi, Deniarto Kusuma, and Albert. At the beginning of the concept, Traveloka serves as a search engine to compare airfares from various other sites. In mid-2013 Traveloka then turned into air ticket reservation site. Users can make a booking on the official website. In addition, hotel booking services already available on the site Traveloka in July 2014.

Previously there was no outcome measurement study on the quality of traveloka.com website. Research on quality levels can be used as a reference for improving the

management of the website to be better again. With the indication of the authors interested in studying the quality of the website traveloka.com using WebQual. WebQual is one method for measuring the quality of a website based on an assessment of end users. WebQual based on three criteria, namely usability research, information and service interaction.

Literature Review and Methods

1. Website

According to O'Brien and Maracas (2010: 262), "The website is a facility that offers chat rooms, e-mail, and instant messaging where internet surfers can browse the World Wide Web using a browser software to get various kinds of information, entertainment and for business purposes ".

2. Website Quality

According Walczak (2010: 5) explains that "the quality or the quality of the website home page can be seen as an attribute of the website whose utility to help consumers". Previous research quality website identifies several dimensions of website quality, information quality dimensions, ease-of-use, usability, aesthetics, trust building technologies and the emotional appeal ".

3. WEBQUAL

The Website Quality theory is explained by Barnes and Vidgen (2002:114) that:
WebQual 1.0 The first version of the WebQual instrument was developed in the domain of UK business schools. development methodology for the instrument was to use quality function deployment (QFD), which is a structured and disciplined process that provides a means to identify and carry the voice of the customer through each stage of product and or service development and implementation.

4. Importance Performance Analysis

Wong, Hideki & George (2011:21) argues that the "importance Performance Analysis (IPA) is an evaluation tool used to determine the priority of attributes that must be corrected and can be used as guidelines in the strategic development". Moreover, it also explained that the two-dimensional model of the IPA is divided into four quadrants with importance on the x- axis and performance on the y- axis.

Research Method

This type of research is categorized into quantitative descriptive study. Variables used in this research are measurement criteria based approach to quality website WebQual 4.0 i.e, usability, information and service interaction is viewed from two perspectives: the actual perceived quality (performance) and the ideal desired quality (importance). Assessment indicators used can be seen in the table 1.

The population in this study is traveloka.com users in Indonesia. The sample used by 100 respondents to the sampling technique is done by sampling incidental. Sampling incidental is a sampling technique based on chance, that anyone who by chance / incidental met with investigators can be used as a sample, when viewed people who happen to encounter it suitable as a data source (Sugiyono, 2014: 156). Data was collected through an online questionnaire with a scale of 1-5 (1 = strongly disagree, 5 = strongly agree).

Table 1: Indicators

Dimensions	Indicators
Usability	Website is easy to operate
	Website has clear interaction
	Easy to navigate the website
	Website is easy to use
	Website design is appealing
	Website design is appropriate
	Website has competitive advantage
	Positive experience in using website
Information Quality	Accurate information
	Trustworthy information
	Actual information
	Relevant information
	Comprehensible information
	Good level of information details
	Appropriate format of information
Service Interaction	Good reputation
	Secure transaction
	Secure private information
	Personality room
	Sense of community
	Easy to interact with the company
	Quality service

Result and Discussion
Based on the research results, the characteristics of the respondents indicated the number of men more than the number of women, with a percentage of 63% men and 37% women. In terms of age, 58% aged 21-25 years, 34% aged <21 years, 6% at age 26-30, and 2% age> 30 years. Based on 76% work with student jobs, student jobs 8%, 6% and private employees, 6% to public servants, 4% with self-employed work.

1. **Scale Weighs**

Weighting the data questionnaire using Likert scale (1-5) is performed with a frequency tabulation of the overall indicator of each dimension of WEBQUAL are *usability, information quality,* and *service interaction*.

A. **Gap Analysis**

Analysis of the gap (gap) is taken to see the level of Traveloka website quality seen from the gap (gap) between the perceived quality (actual) and the desired quality (ideal). Shown by the actual quality of the respondents' assessment of the performance (performance) forming attributes based on the dimensions of website quality WebQual, while the quality of the intended ideal of respondents rating the level of importance (importance) of the quality attributes. To determine the value of the gap, it can be seen from the difference between the value of the actual quality (performance) and ideal quality (importance).

Qi= Pi- Ii

where:

Qi = quality level

Pi = actual quality value (performance) Ii = ideal quality value (importance)

Table 4.7. Gaps of Service Interaction Dimension

Indicator		Performance (P)	Importance (I)	Q (P-I)
1	Item 1	3.67	4.08	-0.41
2	Item 2	3.79	4.13	-0.34
3	Item 3	3.75	4.05	-0.3
4	Item 4	3.69	3.95	-0.26
5	Item 5	3.5	4.01	-0.51
6	Item 6	3.48	3.94	-0.46
7	Item 7	3.71	4.13	-0.42
	Average	**3.66**	**4.04**	**-0.39**

Table 4.8 Gap Values of all WEBQUAL dimensions

Dimensions	Perf. (P)	Imp. (I)	Q (P-I)
Usability	3.92	3.94	-0.02
Information Quality	3.68	4.10	-0.42
Service Interaction	3.66	4.04	-0.39
Average	3.75	4.02	-0.27

The table above shows the value of the gap (gap) of the three-dimensional WebQual. From the above table, overall, the value of the difference between the actual quality (performance) and ideal quality (importance) has a negative value. The differences of the average of (-0.27). Which has the largest gap dimension is information quality with a difference of (-0.42). From these results indicate a negative value or Q <0, which means the actual quality perceived not currently able to meet the desired quality of the user base, the level of quality is still bad otherwise.

2. **Importance Performance Analysis**
Importance Performance Analysis (IPA) is used to view any website quality indicators that have been in accordance with the wishes of the user and which need improvement. The results of the analysis of the IPA shows the location of each indicator in the IPA matrix consisting of 4 (four) quadrants.
Picture 1. Graphs of IPA Matrix

Based on the above chart image can be seen the position of each of the indicators in the IPA matrix. Each quadrant has a specific interpretation that explains what strategic actions that should be done for each indicator.

Conclusion

1. The results showed that the level of quality of website Traveloka not in accordance with user expectations. There are differences that indicate the gaps (gap) between the two perspectives between the level of performance assessment (performance) and the level of importance (importance) or the quality of the ideal. Overall, the difference from the two perspectives of this assessment is negative with the value of the average difference (-0.02). As for the difference in usability Indicators that have the biggest gap is the indicator number 1 is "easy to learn and operate" with the value gap by (1:07). Therefore, the level of quality dimensions Usability declared bad and cannot meet the ideal activity. Furthermore, the differences of the average of (-0.42). Indicators of quality informant who has the biggest gap is the number one indicator that is "easy to learn and operated" by a margin of (-0.49). Information Quality variable value is negative indicating that the level of quality dimensions of Information Quality declared bad and cannot meet the ideal activity, as well as the value of the average difference (-0.39). Indicators that have the biggest gap is the indicator of the number 5 is "sense of community" with a difference of (-0.51).

2. Based on the analysis of quadrant IPA consists of four (4) quadrants, the quality attributes that the top priority is the improvement of the information is accurate, reliable information, the actual information, easily understandable information, and information to the proper level of detail, the information in the appropriate format, good reputation, the implementation of the services as promised. Furthermore, competitive, relevant information, security in the interaction, the security of personal information is an important attribute and should be maintained. Easy to navigate, appropriate design, has room personnel, a sense of community and ease of access are things that users do not need to be in priority. Recently attributes according to ordinary users but is packed with excellent in Traveloka website is easy to learn and operate, interactions clear and understandable, easy to use, attractive appearance and perceived positive user experience.

EFFICIENCY OF ISLAMIC BANKING SCHEMES IN INDONESIA AND RELATION TO ITS GROWTH

Dita Herdiana, Intitut Teknologi Bandung, Indonesia
Taufik Faturrohman, Intitut Teknologi Bandung, Indonesia

Abstract

Initially, Islamic banking has developed to create partnership and share funds between depositor, creditor and bank as management towards Profit Loss Sharing (PLS) principle in business activities. But nowadays, Islamic banking has adapted markup and other non-PLS schemes which does not reflect Islamic principles. It also prevented Islamic banks from becoming the profit-loss investment intermediaries that the Islamic economic theory demands. This situation causes problem that Islamic banks have survived not on PLS principle (e.g.: *mudharaba, etc*) but via markup (*murabaha*) and other non-PLS transactions. The embarrassment happens because the greater complexity of the transactions involved puts Islamic banks at a disadvantage in comparison with conventional banks. This empirical research is based on data from 2004-2014 retrieved from Central Bank of Indonesia. The financial information (balance sheets and income statements) of all Islamic conventional banks and Islamic Banking Units (IBUs) in Indonesia is examined. This research investigates the efficiency of two schemes of Indonesian Islamic banking by using the non-parametric method of Data Envelopment Analysis (DEA) based on intermediation approach. The researched schemes are divided into Profit Loss Sharing (PLS) schemes and the schemes other than PLS (non-PLS). Mann Whitney test will be conducted whether there are differences of PLS and non-PLS schemes. Then, regression analysis is applied to determine the significance of each schemes efficiency results regards to the market share (represented by change of total asset) of Islamic banking in Indonesia and input and output variables toward its market share (represented by total assets). The finding from collected data is the average total deposits PLS is 88.32% and the average total loans 7.54%. While the average total deposits Non-PLS is 11.68% and the average total loans 93.46%. The proportion implies that Islamic banks is not fair with return-risk sharing. The finding from DEA efficiency measurement suggests that non-PLS scheme efficiency score is statistically significant higher than the efficiency score of PLS scheme consistently from 2004 to 2014. There is no statistically significant relationship between changes of efficiency toward its change of total assets for both PLS and non-PLS scheme and There is statistically significant relationship between Input and output variables toward its total asset. The findings provide useful guidelines for policies, regulations, and concerns of Islamic banking strategic planning in regard to future growth of Islamic banking transactions especially PLS schemes.

Keywords: *Islamic banking, Indonesia, Efficiency; Data Envelopment Analysis (DEA)*

Introduction

The Islamic banking existence is purposed to provide financial services which are free from interest practice, gambling, speculation and other prohibited things in Islamic principle. Islamic banking has developed in rapid growth around the world, including Indonesia. Nowadays Islamic banking is available not only in Moslem majority countries but also in Moslem minority countries. The first Islamic bank has established in 1992 named Bank Muamalat. In period 1992-1998, the growth of Islamic banking was not really significant because the regulation of free interest banking system was still on trial.

Moreover, some parties thought that free interest banking system was impossible. Based on Faturrohman (2013), the average total asset growth of Islamic banking industry exceeded 50% per annum over the period 2001 to 2010.

As largest Moslem population country, Indonesia has a potential to become a global player in Islamic banking. The prospect of Indonesia economy is high with 6-6.5% economy growth, increasing of sovereign credit rating Indonesia into investment grade attracts more investor, and abundance natural resources underlie Islamic finance industry transaction. Under dual banking system in compliance with the Indonesian Banking Architecture (API), Islamic banking and conventional banking systems jointly and support a wider public fund mobilization in the framework of fostering financing capability of national economic sectors. . By providing various products and banking services supported by various financial schemes, Islamic banking will become a credible alternative that gives benefits to all Indonesian people without exception

It is evident from the preceding information that Islamic banking growth in Indonesia is extensive due to 87% local moslem population. However it is slower than expected. Until June 2014, the market share is still below 5%. This research aims to determine the efficiency of Islamic Banking schemes, profit loss sharing (PLS) and non-profit loss sharing (non-PLS) scheme, to analyze the impact of the efficiency on total asset growth, and build a relationship model of efficiency and total asset growth.

Islamic banking is a rapidly growing part of the financial and banking sector in the world. More recently, it has caught the attention of conventional financial markets as well. According to some estimates, more than 250 financial institutions in over 45 countries that have been growing at a rate of more than 15 percent annually for the past five years (Helmy, Muhammad, 2012). This following table is described the comparison national banking and Islamic banking. The growth of Islamic banking from 2009 to 2013 is 2 times compared to national banking growth. According to IAEI in the 8th meeting, the average growth of Islamic banking in 2007-2011 is 40.2% compared to 16.7% national banking growth. The growth of institution networks, third party funds, total asset and market share of Islamic banking from 2009 to June 2014 can be seen in table 2. The total asset per June 2014 is about 4 times compared to 2009. The asset growth of Islamic banking in 2009 to 2012 was above 30% although in 2013 the asset growth was only 24.23%.

Table 1. Average CAGR Indonesia Banking 2009-2013

CAGR 2009-2013 (%)	National	Islamic Banking
Funding	16.88	36.89
Financing	20.57	40.77
Total Asset	18.25	38.37

Islamic banking systems which started in year 1940 has well-known reputation around the world (Antonio, 2001). According to Young, the Islamic banking growth is 1.9 times conventional banking growth in period 2009 to 2013 entirely. In Indonesia, Islamic banking started in 1992 through Bank Muamalat Indonesia. According to Faturrohman (2013), the growth of Islamic banking in period 2001 to 2013 is 46.8% while the growth of conventional banking is only 14.6% in respective year. Although, the growth of Islamic banking is faster than the growth of conventional banking, the market share of Islamic banking could not meet the expectation of Bank Indonesia and Karim Consulting Indonesia. The figure can be seen in this following chart.

According to the 8th meeting of Ikatan Ahli Ekonomi Islam (IAEI), Islamic banking has got more attentions because of these reasons. First, Islamic banking is closer to the real sector because offered products, especially financing products, use underlying transaction

in real sector thus the impact is more vivid in order or encourage economy growth. Next, the products of Islamic banking are free from speculation (gharar). It supports the durability and resilience of Islamic banking from a direct hit of global finance crisis. Last, the profit lost sharing (PLS) as the spirit of Islamic banking gives fairness to every involved party, like depositor as the investor, entrepreneur as the debtor and bank as the management.

Table 2. The growth of Islamic Banking (source: KCI Financial Outlook 2015)

	2009	2010	2011	2012	2013	2014*
Institutions	6 BUS, 25 UUS	11 BUS, 23 UUS	11 BUS, 24 UUS	11 BUS, 24 UUS	11 BUS, 23 UUS	11 BUS, 23 UUS
Third party funds (IDR)	52.271	76.036	115.415	147.512	183.534	185.508
Financing growth (%)	22.74	45.42	50.56	43.69	24.82	2.14
Asset (IDR)	66.1	97.5	145.5	195	242.3	244.2
Asset growth (%)	33.37	47.55	49.17	34.06	24.23	0.79
Market Share (%)	2.61	3.24	3.98	4.58	4.89	4.95

According to OJK Statistic 2014, the 41% of consumption financing in Islamic banking is used murabahah scheme while Working Capital Financing (Kredit Modal Kerja) in Islamic banking is 40%. The 40% of working capital financing is lower than conventional banking which is 47% because Islamic banking did not have encouragement to use mudharabah and musyarakah scheme. The reason is because financing with PLS scheme, such as mudharabah and musyarakah, has the higher risk than murabahah. The statistics tell us that theoretically Islamic banking uses PLS because its fairness and partnership system, while practically Islamic banking use non-PLS scheme because of its safety, convenient and low risk. According to Karim Consulting Indonesia, Deposito products with mudharabah product was dominant in 62%. The deposito proportion is higher than national banking, which is 43%. The other low-cost fund product, saving accounts, in wadiah and mudharabah scheme is 6% and 24%. In funding, PLS scheme which is mudharabah is more favorable than non-PLS scheme, which is wadiah, although wadiah saving account is free from administration expense.

According to Vogel in Islamic Law and Finance: Religion, Risk, and Return, Islamic finance has been limited to Islamic banking activities to try Islamic version of conventional commercial banking. Regardless the theory, Islamic banking found that their regulations make them resemble conventional bank. It is pushed them into short term and low-risk investment while give their depositor similar return and risk to those obtain by the conventional depositors. This means that the financing products in Islamic banking is not profit loss sharing based, partnership and long term, any more, which is similar to financing proportion data from chart above. According to EY Islamic Banking Competitiveness Report 2016, Indonesia Islamic banking would remain stagnant without initiative and encouragement of authority to nurture its participant banking. The regulation would attract new entrant and create an environment to help its banking industry.
Figure 1. The reality and expectation of Islamic Banking Market Share

Literature Review

Islamic finance products are contract-based and may be classified into three broad categories: (Hussain, Shahmoradi, and Turk 2015):

a. Debt-like financing structured as sales, which could be sales with mark up and deferred payments (Murabahah) or purchases with deferred delivery of the products (Salam for basic products and Istisna' for manufactured products), and lease (Ijārah) with different options to buy. Pure lending is allowed only when benevolent (Qard, which is often used for current deposits);

b. Profit-and-loss-sharing (PLS)-like financing with two modalities: (i) profit-sharing and loss-bearing (Mudarabah) whereby the financier (investor, bank) provides capital and the beneficiary provides labor and skills (profits are shared, but losses would be borne by the financier who does not have the right to interfere in the management of the financed operation, unless negligence, misconduct, or breach of contract can be proven); and (ii) pure profit-andloss-sharing (Musharakah) where the two parties have equity-like financing of the project and would share profits and losses; and

c. Services, such as safe-keeping contracts (Wadi'ah) as for current deposits, or agency contracts (Wakalah), which are also increasingly used for money market transactions.

The efficiency theory started from the microeconomic theory, it was about producer and consumer. The producer theory was to maximum the profit and minimizes the cost. Whereas, the consumer theory said that the consumer disposed to maximize their utility or satisfied (Diana Yumanita 2005). The efficiency of bank is a socially optimal target, because its decreasing the average cost of financial transactions therefore enhances the welfare of society (Hussein 2004). There are two methods that used to efficiency measurement, (1) non-parametric approach that included DEA (Data Environment Analysis) and Free Disposal Hull. (2) Parametric approach that include SFA (Stochastic Frontier Analysis), TFA (Thick Frontier Approach) and DFA Distribution Free Approach. The function of bank's efficiency measurement is to determine the performance level of distribution of financial services, based on the inputs that they use (Yousfi 2011).

Methodology

There are two methods used in this research. First is Data Envelopment Analysis (DEA) and second is regression analysis. DEA is used to determine the relative efficiency of Indonesian Islamic bank schemes, divided into profit loss sharing (PLS) scheme and other PLS (Non-PLS) scheme over 2004 to 2014. Regression analysis is used to determine statically correlation between; 1) the changed efficiency of each scheme towards its changed growth (total asset) and 2) output and input variables of each scheme towards its growth (total asset).

Central Bank of Indonesia runs Indonesia banking industry through implementation Indonesian Banking Architecture (API). Under API, Central Bank of Indonesia issues regulations to make banking industry runs and achieves improvement. According to BI, partnership and mutual benefit principle that provides alternatives for public and bank is the characteristic of Islamic banking operation. The system priorities fairness and ethical value of working together and partnership to create bigger impact and also avoids speculation in financial transaction. Thus, the commercial banks Indonesia were classified into conventional and Islamic commercial banks (called BUS) that included Islamic business units (called UUS). This research just uses BUS and UUS as data sample.

In DEA (Data Envelopment Analysis) approach, It have to be viewed the inputs and outputs specification that used to measure the efficiency (Yudistira 2004) In determining the inputs, this research applied the standard intermediation approach, where the capital and labor used to intermediate deposits into loans and other earning assets. Intermediation approach used to observe the financial institution as the intermediation. It used to change and transfer the financial assets from the excess fund units to the shortage fund units. The outputs of this research are total loan, total interest income and total non-interest expense while the inputs are total deposit, total interest expense, and total non-interest expense.

The data used in this research is secondary data of BUS and UUS in Indonesia from 2004 to 2014. The available data is collected from financial annual report, balance sheet and income statement, published by BI (later OJK).

No	Bank type	Number of banks in Indonesia										
		2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
1	BUS	3	3	3	3	5	6	11	11	11	11	12
2	UUS	15	19	20	26	27	25	23	23	24	23	22

No	Bank type	Number of available data										
		2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014
1	BUS	3	3	3	3	3	6	11	11	11	10	12
2	U	1	1	2	2	2	2	2	2	2	2	2

	US	5	7	0	6	7	5	3	3	4	1	2

Data with zero or negative figures cannot be used in DEA as all output and input variables. Data needs to be greater than zero (positive). Islamic banks (BUS or UUS) has zero figures in their financial data especially in newly established ones. The zero data can be seen in year one or two for total deposit and total loans variable. In this case, the application of DEA needs to consider treatment for that data set. The slacks in output and input variable in DEA application that need to be treated are a) ratio variable, b) zero or negative, c) outliers, d) imprecise number and e) data adjustment (T. Sueyoshi, M. Goto, 2013). According to Faturrohman (2013), the zero or negative data is replaced by 0.1. The replacement affect original data in minor deviation. For 2008, due to existed outliers in data set (5 banks reduced), it is necessary to drop them thus DEA can produce reliable result.

DEA (Data Envelopment Analysis) is a technique of linear programming that used to examining how DMU (Decision Making Unit) or banks operates relative to the other banks that included in the sample. The technique of DEA creates a frontier set by inefficient banks and compared with efficient bank to produce the score of efficiency (Yudistira 2004) He said that completely efficient bank have one score of efficiency, it bordered between zero and one scores, the most efficient bank generates the best practice level of output than the other banks in the sample, from given the inputs, It doesn't need to generate the maximum level of output.

DEA (Data Envelopment Analysis) is a mathematical technical program that measure the efficiency of Decision Making Unit (DMU) relative to the other kind of DMU, where the units consist of or under frontier efficiency curve (Ascarya 2005) Data Envelopment Analysis (DEA) is a tool of decision making that based on linear programming, It used to measuring the relative efficiency of a set of proportional units. DEA introduced the sources and level of inefficiency for each of the outputs and inputs, besides the identification of efficient and inefficient units that relative (Milan M. Martic 2009).

Findings
The explanation starts with descriptive analysis of output and input that used in this research. In DEA (Data Envelopment Analysis) approach, It have to be viewed the inputs and outputs specification that used to measure the efficiency (Yudistira 2004). Intermediation approach used to observe the financial institution as the intermediation. It used to change and transfer the financial assets from the excess fund units to the shortage fund units. The outputs of this research are total loan, total interest income and total non-interest expense while the inputs are total deposit, total interest expense, and total non-interest expense.

The input variables are total deposit (used as the input represents the customer trust to save the money), total interest expense (According to Avkiran (2000) it is a proxy for deposits in which to model bank behavior) and the non-interest expense (According to Batchelor and Wadud (2004) represents the resources expended in converting deposits to loan). The output variables are total loan (According to Yudistira (2004), mostly the Islamic transaction consisted by the total loans of the banks), total interest income (a proxy for net loans) and total non-interest income (a proxy to non-traditional activities (Batchelor and Wadud, 2005)).

1. Descriptive Statistics

The table below is average of input and output variables used to measure efficiency in 2004 to 2014. The changes of average percentage per year can be seen table 3 and 4. The table is from input and output variables of Islamic banks (BUS and UUS) divided into PLS and Non-PLS scheme from 2004 to 2014. From the chart, we can see that

- The average total deposits PLS is 88.32% while the average total loans 7.54%. it implies that most of deposit product in Islamic bank uses PLS scheme
- The average total deposits Non-PLS is 11.68% while the average total loans 93.46%. it implies that most of financing/loan products in Islamic bank uses Non-PLS scheme
- The average total interest expense PLS is 89.78% while the average total interest income 33.29%. It implies that most expenses uses PLS scheme, which means revenue sharing distributed from mudharabah and musyarakah contract is bigger than bonus expenses from wadiah and other Non-PLS contract.
- The average total interest expense Non-PLS is 10.22% while the average total interest income is 66.71%. it implies that most income is from Non-PLS scheme such as margin profit from murabahah and other Non-PLS contract

It can implies that,

- For example in 2004, as for output variable for PLS scheme, total deposit is 0.99 times total interest expense. While, for input variable, total loan is 0.08 times total interest income. Then, for output variable for Non-PLS scheme, total deposit is 1.03 times total interest expense. While total loan is 1.42 times total interest income. Comparing this result, *it shows that total deposit with PLS scheme has lowered interest expense* by 0.01 while *total deposit with Non-PLS scheme has increased interest expense* by 0.03. *Total loan with PLS scheme has lowered interest income* by 0.92 while *total loan with Non-PLS scheme has increased income* by 0.42.
- From the table, it can be seen that, total loan in PLS scheme has lowered the total interest income by 0.40 to 0.92. While total loan in Non-PLS scheme has increased the total interest income by 0.13 to 0.61.

Table 3. Proportion of Output and Input Variables in PLS scheme

Year	Total Loans	Total Deposits	Interest Income	Interest Expense	TD/TIE	(+/-)	TL/TII	(+/-)
2004	0.03	0.86	0.31	0.86	0.99	0.01 (-)	0.08	0.92 (-)
2005	0.02	0.86	0.37	0.92	0.93	0.07 (-)	0.06	0.94 (-)
2006	0.05	0.82	0.38	0.86	0.95	0.05 (-)	0.12	0.88 (-)
2007	0.04	0.96	0.38	0.91	1.05	0.05 (+)	0.12	0.88 (-)
2008	0.08	0.86	0.43	0.90	0.96	0.04 (-)	0.19	0.81 (-)
2009	0.07	0.95	0.36	0.92	1.03	0.03 (+)	0.18	0.82 (-)

20 10	0.1 0	0.97	0.3 5	0.92	1.06	0.06 (+)	0. 28	0.72 (-)
20 11	0.1 4	0.87	0.2 4	0.90	0.97	0.03 (-)	0. 60	0.40 (-)
20 12	0.1 0	0.86	0.2 7	0.93	0.93	0.07 (-)	0. 38	0.62 (-)
20 13	0.1 1	0.84	0.2 8	0.90	0.93	0.07 (-)	0. 39	0.61 (-)
20 14	0.0 9	0.87	0.2 8	0.86	1.01	0.01 (+)	0. 31	0.69 (-)

Table 4 Proportion of Output and Input Variables in non-PLS scheme

Year	Total Loans	Total Deposits	Interest Income	Interest Expense	TD/TIE	(+/-)	TL/TII	(+/-)
2004	97.42%	14.20%	68.62%	13.76%	1.03	0.03 (+)	1.42	0.42 (+)
2005	97.94%	14.34%	62.86%	7.50%	1.91	0.91 (+)	1.56	0.56 (+)
2006	95.36%	18.09%	61.54%	14.15%	1.28	0.28 (+)	1.55	0.55 (+)
2007	95.60%	4.04%	61.85%	8.94%	0.45	0.55 (-)	1.55	0.55 (+)
2008	91.66%	13.96%	56.93%	10.36%	1.35	0.35 (+)	1.61	0.61 (+)
2009	93.48%	5.28%	64.46%	8.43%	0.63	0.37 (-)	1.45	0.45 (+)
2010	90.07%	2.79%	65.00%	8.34%	0.33	0.67 (-)	1.39	0.39 (+)
2011	85.66%	12.91%	75.97%	9.93%	1.30	0.30 (+)	1.13	0.13 (+)
2012	89.51%	13.99%	72.69%	7.20%	1.94	0.94 (+)	1.23	0.23 (+)
2013	89.02%	15.76%	71.76%	9.53%	1.65	0.65 (+)	1.24	0.24 (+)
2014	91.33%	13.09%	72.20%	14.28%	0.92	0.08 (-)	1.27	0.27 (+)

- It shows consistency in total loan and total interest income relationship from 2004-2014. At the same amount of total loans for each schemes, it will affect greater in Non-PLS scheme. For example in 2004, a $100 of total loan will make $8 of total income in PLS scheme and $142 in Non-PLS scheme. It implies that loan/products in Non-PLS scheme give greater interest income or more profitable than that in PLS scheme.
- It shows inconsistency in total deposit and total interest expense relationship. For example in 2004, total deposit in PLS scheme has lowered interest expense and in Non-PLS scheme has increased interest expense. While in 2007, 2009, 2010, and 2014, total deposit in PLS scheme has increased interest expense and in Non-PLS scheme has lowered interest expense. The increased range is 0.01 to 0.06 in PLS scheme. The decreased range is 0.08 to 0.67 in Non-PLS scheme. A $100 of total

deposit will make $99 of total interest expense in PLS scheme and $103 of total interest expense in Non-PLS scheme. It implies that deposit products in PLS scheme is more safely and profitable than that in Non-PLS scheme.

2. DEA Findings

Efficiency in this research conducted by using intermediary approach with output oriented. The computer software used DEAP 2.1 (Coelli, 1996) to obtain technical efficiency score of Variable Return to Scale (VRS) DEA model. Mann-Whitney test is conducted whether there are significance differences of PLS scheme and Non-PLS scheme. The benchmark for statistical significance was p-value of 0.05. The following table shows the summary of comparative efficiency of PLS scheme and Non-PLS scheme in Islamic banks.

Banks is called efficient if the efficiency score is 1 or 100% and inefficient if the score is below 1 or 100%. From the table 5, Non-PLS scheme has higher efficiency score each year from 2004 to 2014. The highest efficiency score of Non-PLS scheme is 0.934 in 2007, while the lowest score is 0.798 in 2010 and 2012. The highest efficiency score of PLS scheme is 0.900 in 2005, while the lowest score is 0.544 in 2008. Based on Mann-Whitney test, there are consistent differences in efficiency of PLS and Non-PLS scheme every year except 2007 and 2008.

Table 5. Summary of PLS and non-PLS efficiency

Year	Profit Loss Sharing		Non-Profit Loss Sharing	
2004	0.784	-	0.881	+
2005	0.900 (highest)	-	0.927	+
2006	0.820	-	0.846	+
2007	0.756	-	0.934 (highest)	+
2008	0.544 (lowest)	-	0.876	+
2009	0.755	-	0.878	+
2010	0.731	-	0.798 (lowest)	+
2011	0.722	-	0.866	+
2012	0.698	-	0.798 (lowest)	+
2013	0.787	-	0.830	+
2014	0.718	-	0.844	+

3. Regression analysis

The findings discussed in previous section show that there are differences between the efficiencies in PLS and Non-PLS scheme. In this section, we consider whether the differences of those schemes are associated with changes in total assets (it is the growth of banks). This issue will be addressed by utilizing regression analysis. The results will provide in this following section.

Finding Model I

The result of this regression analysis model indicate the impact of the changes in annual relative efficiency scores of bank schemes on the changes in their total assets. The missing data of this regression shows in following table

Table 6. Missing data for regression

	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014

HSBC, Ltd.										x	x

* eliminated to remove outliers

** become BUS

PLS

The significance level 0.472, which is higher than p-value of 0.05, explains that there is no statistically significant correlation between changes in efficiency of PLS scheme to changes in total assets.

Table 7. Model Summary Finding Model I PLS

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.041[a]	.002	-.002	2128144.241953

Table 8. ANOVA Finding Model I PLS

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	2347441309374.309	1	2347441309374.309	.518	.472[b]
1	Residual	1363228372281611.000	301	4528997914556.848		
	Total	1365575813590985.000	302			

Table 9. Coefficient Finding Model I PLS

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	873041.011	125002.797		6.984	.000
	Delta Efficiency	256730.382	356599.686	.041	.720	.472

Non-PLS

From table 11 and 12, the significance level 0.613, which is higher than p-value of 0.05, explains that there is no statistically significant correlation between changes in efficiency of Non-PLS scheme to changes in total assets.

Table 10. Model Summary Finding Model I non-PLS

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.029[a]	.001	-.002	2118847.304496

Table 11. ANOVA Finding Model I non-PLS

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	1149430501447.976	1	1149430501447.976	.256	.613[b]
1	Residual	1342364656031677.000	299	4489513899771.497		
	Total	1343514086533125.000	300			

From this regression analysis, we can see that both changes of efficiency of PLS and Non-PLS scheme have no statistically correlation to changes in their total assets. The next finding model is to find whether output and input variables of PLS and Non-PLS scheme are associated with total asset. The output and input variables are total loan, total interest expense, total non-interest expense, total deposit, total interest incomes and total non-interest income

Table 12. Coefficient Finding Model I non-PLS

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	881764.522	126194.589		6.987	.000
	Delta Efficiency	182897.577	361465.002	.029	.506	.613

Finding Model II
The result of this regression analysis model indicate the impact of the output and input variables on their total assets

PLS
The significance level 0.000, which is higher than p-value of 0.05, explains that there is statistically significant correlation between output and input variable of PLS scheme to total assets.

Table 13. Model Summary Finding Model II PLS

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.990[a]	.981	.980	1295720.84643

Table. 14 ANOVA Finding Model II PLS

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	26388127471549120.000	6	4398021245258187.500	2619.597	.000[b]
1	Residual	522135571188630.940	311	1678892511860.550		
	Total	26910263042737748.000	317			

From table 15, the significance implies positive relationship between total deposit, total interest income and total interest expense with total assets of banks. It suggests that
- Increasing in total deposit (which p value is 0.000 and coefficient is 0.866) of PLS scheme is aligned with increase in total asset,

- Increasing in total interest expense (which p value is 0.001 and coefficient is 4.417) is aligned with increase in total asset
- Increasing in total interest income (which p value is 0.009 and coefficient is 3.173) is aligned with increase in total asset

Table 15. Coefficient Finding Model II PLS

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	284846.992	80565.934		3.536	.000
Total Loans	.151	.131	.013	1.152	.250
Total Interest Income	3.173	1.206	.089	2.631	**.009**
Total Non-Interest Income	.532	.471	.015	1.129	.260
Total Deposit	.866	.056	.679	15.484	**.000**
Total Interest Expense	4.417	1.328	.165	3.326	**.001**
Total Non-Interest Expense	1.007	.595	.054	1.693	.092

The regression model can be stated as
Total Asset = 284846.992 + 0.866 Total Deposit + 4.417 Total Interest Expense + 3.173 Total Interest Income + 80565.934

Non-PLS
The significance level 0.000, which is higher than p-value of 0.05, explains that there is statistically significant correlation between output and input variable of Non-PLS scheme to total assets

Table 16. Model Summary Finding Model II non-PLS

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.988[a]	.976	.975	1446371.57043

Table 17. ANOVA Finding Model II non-PLS

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	26259653928897628.000	6	4376608988149604.000	2092.079	.000[b]
	Residual	650609113840128.000	311	2091990719743.177		
	Total	26910263042737748.000	317			

Table 18. Coefficient Finding Model II non-PLS

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	-27017.833	87814.905		-.308	.759
Total Loans	.410	.026	.324	15.523	**.000**
Total Interest Income	.756	.725	.044	1.043	.298
Total Non-Interest Income	2.729	.840	.076	3.250	**.001**
1					
Total Deposit	4.291	.226	.529	18.945	**.000**
Total Interest Expense	-4.245	1.568	-.034	-2.707	**.007**
Total Non-Interest Expense	1.772	1.024	.096	1.730	.085

The significance implies positive relationship between total loans and total deposit with total asset and negative relationship between total interest expenses with total asset. It implies that

- Increasing of total deposits of Non-PLS scheme of Islamic banks is aligned with increasing in total asset. It is positive statistically significant with p value 0.000 and coefficient 4.291
- The increasing of total loans is aligned with increasing in total asset. It is positive statistically significant with p value 0.000 and coefficient 0.410.
- While, increasing of total interest expense of Non-PLS scheme of Islamic banks is not aligned with increasing in total asset. It is negative statistically significant with p value 0.007 and coefficient -4.245.

The regression model can be stated as
Total Asset = -27017.833 + 4.291Total Deposit - 4.245Total Interest Expense + 0.410 Total Loan + 87814.905

This study measures the efficiency of PLS and Non-PLS schemes in Islamic banks using Variable Return to Scale (VRS) DEA models. Applying Mann Whitney test, this research finds statistically significant difference in in VRS efficiency of each schemes. The difference in VRS efficiency of PLS and Non-PLS scheme is consistent, which Non-PLS scheme is always greater than PLS scheme. A very interesting situation is that current average proportion of deposit as input is high and loan as output is low in PLS schemes. In gives hope that the competitiveness of PLS can improve by increasing loan and lowering deposit.

From the regression analysis. It is evident changes in total deposit, total interest income and total interest expense of PLS scheme have positive statistically significant impact to total asset while changes in total deposit and total loan have positive relationship and total interest expense has negative relationship in Non-PLS scheme.

Recommendation

Islamic banking of Indonesia has promising potential with government supports and commitments. It is also supported with great national and international potential market.

According to Ascarya in Islamic finance institution development strategy in Indonesia, the challenges that are faced by regulators are:
a. Limited human resources
b. People's lack of understanding
c. Limited networking offices
d. No standardized Islamic finance products
e. No synchronization with related institution

The challenges that are faced by practitioners are
a. Funding structures that makes cost of fund of Islamic banking is higher than conventional one
b. Financing structure that is dominated by murabahah (non-PLS)
c. Internal problem in Information Technology, limited products, limited human resources and limited CAR
d. External problem, no supported regulations, limited financial instrument, lack of competition spirit.

The funding and financing structures are proven by descriptive analysis in chapter 3. The funding scheme is dominated by mudharabah scheme (PLS scheme) from 2004 to 2014 while financing structure is dominated by murabahah scheme (non-PLS scheme). Islamic banking did not take risk for long term investment that require long term management and partnership. The murabahah scheme is chosen because of its convenient, safety, and low risk. However, the funding product that dominated by mudharabah scheme is known for profit loss sharing. The point of profit loss sharing financing is partnership. Depositor as investor have to maintain the business, debtor as entrepreneur have to make that business worked and bank as management need to provide support for both parties. Profit loss sharing as function of revenue (or loss) is more profitable in normal condition. The reason is this PLS scheme is not interest based thus it is spared from negative spread risk. Thus, it makes Islamic bank is not fair enough in taking risk.

Based on the result of this research and recommendation from previous research, the implementation plan is provided in points:
a. The fully support from government to make integrated development with political will, commitment and political courage. The creation of new jobs, especially in small medium enterprise, is in line with Islamic banking orientation. According to Ascarya, the factors that affect the development of Islamic banking in Indonesia are players, competitors/substitues, market/society, infrastructure, authorities, government, legislative and judicative.
b. Increasing the quantity and quality of involved human resource in Indonesia Islamic banking industry, such as government, practitioner, regulator, academician, religious scholars and citizens/people. The education can be formal and informal. There is small number of human resources with good qualifications, fiqh muamalah, finance and economics, in Indonesia. Government and educational institutions have to produce bachelors with those qualifies to meet high demand of Islamic banking. The education can be like mentorship, coaching or workshop about Islamic banking market and products and services. It can be done by partnership with other party such as Pusat Komunikasi Ekonomi Syaria (PKES). The membership of PKES is not only Islamic banking professional but also government, training and university ring. So, the education can be done more intensive, significant and integrated. The direct management of Islamic banking from higher to lower level such as manager, customer service, and tellers need to be educated about Islamic banking. Then, the

worker knows main scheme and alternative scheme that offered to customer in funding and financing. Thus, it increase management and quality service of Islamic banking

The quality of human resources, customers and management, in order to build economy system starts from preference building. According to Roadmap Islamic Banking 2015-2019, the preferences include fathanah (professional), amanah (trustworthy), shidiq (integrity), and tabliq (communicative). Professional concept is used to support competent and professional characteristic in order to make quality, operational efficiency and mental learning continuously (continuous learning process). Trustworthy concept is used to create discipline and commitment to increase accountability, productivity and keandalan of Islamic banking system entirely. Integrity concept is used to create integrity and consistency in order to increase transaction safety that will affect to people trust. Communicative concept is used to create transparent and communicative that can decrease problem from misinformation

c. Developing more products, services and networking office. Islamic economics point togetherness in gaining benefits (sharing benefits). This principle bases every transactions in Islam. So, someone could not get benefit upon others loss (dzalim). The development of Islamic economics is directed for economy activities that reflect togetherness in process and equity. For example, educating entrepreneurs of small and medium enterprises to develop their capacities and competitiveness. The program have to educate entrepreneurs from beginning until their business become bankable. The education need supports from academicians, banks, and government.

Then, the PLS schemes in financing proportion have to be increase. The profit loss sharing idea of Islamic banking does not work optimally. If the financing with PLS schemes works then the development of real sector and productive sector also increase. Then, the national welfare will be achieved.

By doing various products and service, Islamic banking have to socialized or educate public. Expansion of networking offices is also one of solution. The knowledge of banking system of Indonesian is also problem for expanding Islamic banking market share. According to financial literation study of OJK in 2013, 22% of Indonesian people knows banking service and 57% of Indonesian citizens uses banking services. One of factors that affects the people understanding about Islamic banking is networking office. In big cities, like Jakarta, Surabaya and Bandung, the customers are not only moeslem but also non-moeslem. Thus, expanding networking offices can support economy activities and educate more people about Islamic banking at the same time. It also support equalization of welfare and alleviation of poverty.

CORPORATE SOCIAL RESPONSIBILITY AND TAX AVOIDANCE

Titik Puji Astuti and Y. Anni Aryani

Abstract
This paper examines the effect of tax on corporate social responsibility avoidance. The sample that used in this research is companies listed on the Indonesia Stock Exchange (BEI), based on purposive sampling method was Obtained 27 companies. Observation period was 2010-2014. Corporate tax avoidance is a proxy by ETR. The disclosure of CSR indicators is using the Global Reporting Initiative (GRI) guidelines. The Data in this research was processed using SPSS with multiple regression method. The result of this research shows that the CSR have a significant negative influence to the practice of tax avoidance.

Keywords: *ETR, Corporate Social Responsibility (CSR).*

Background
The phenomenon of tax avoidance can be found in Indonesia. In 2005 there were 750 Foreign Investment Company (PMA) who are suspected of tax avoidance by reporting losses of the company for five consecutive years and did not pay taxes to the state (Bapennas, 2005). In 2012 there are 4000 companies PMA report nil tax is due to the losses for seven consecutive years. Generally, the company is engaged in manufacturing and processing of raw materials (Directorate General of Taxation, 2013). There are at least a quarter of the number of companies in the United States also has tax avoidance i.e pay less tax of 20 per cent while the average tax to be paid by the company close to 30 percent (Dyreng, Hanlon, and Maydew, 2008).
The manufacturing industry experienced the greatest growth from other industry sectors in the amount of 4.12% in 2012 increased from the year 2011 amounted to 4.10%. In 2010, the VAT contribution of the manufacturing sector increased to 46%, then surged 60.5% in 2011 and increased again to 74.2% in 2012. Contributions Income in 2010 increased to 34.7%, in 2011 at 41, 9% and in 2012 it again increased by 55% (CBS, 2012). Even so, there remains a gap between revenue due to the reception which actually occurred on taxes in the manufacturing sector both from income tax, VAT or other taxes related to the manufacturing sector. Reception gaps that occur due to the low tax payment compliance, there are many transactions that are not recorded *(underground economy)* and the tendency of tax avoidance (www.pajak.go.id accessed on October 23, 2014). This is due to the taxation system in Indonesia is still weak, so many companies are tax avoidance that eventually led to the tax revenues that are not optimal (merdeka.com, 2015)
Taxes for companies is a burden that will reduce net income that the company always wants a minimum tax payment (Hardika 2007; Kurniasih & Sari, 2013). The existence of the tax burden on businesses and their owners that there is an attempt to tax avoidance (Chen, 2010). Companies utilizing the regulations are not clear in the context of tax avoidance to obtain *outcome* favorable tax (Dyreng, Hanlon, and Maydew, 2008). Tax avoidance is a reduction of tax rates explicitly that represents a series of tax planning strategies that originated from the management of tax *(tax management),* tax planning *(tax planning),* aggressive tax *(tax aggressive), tax avoidance* and *tax sheltering* (Hanlon & Heitzman, 2010) , According to Lim (2011) tax avoidance can lead to conflicts of interest between management and creditors because of asymmetry of information and moral hazard problems. Tax avoidance can also leave a negative or positive reactions to the market. When the market expects that the company's expense rises, then there will be a negative reaction. If the market expects that the exposure increases, arising positive reaction (Frischman, Shevlin, & Wilson, 2008).

According to a social perspective, the act of tax avoidance can be detrimental to the country. Taxes are a source of state revenue is used to improve people's welfare. The higher the level of tax avoidance, the state revenues will decrease. High tax avoidance actions could be considered as an act that is not socially responsible and unethical (Lanis & Richardson, 2012). According to Watson (2011) revealed that companies that have low social responsibility is considered that the company would not be socially responsible in order to conduct a high tax avoidance. Lanis & Richardson (2012) and Yoehana (2013) proved that the lower the level of tax avoidance company, the higher the social responsibility of the company.

Corporate social responsibility can be described as the availability of financial information and non-financial interaction of the organization with the physical environment and the social environment, Disclosure of social responsibility in Indonesia has been regulated in the Law on Limited Liability 40 Article 74 of 2007 which explained that the company in carrying out business activities related to natural resources are required to conduct social responsibility and environment. Article 66 paragraph 2c Law 40 of 2007 states that all the company is obliged to report on implementation of social and environmental responsibility in the annual report. If the company does not undertake the social responsibility it will be penalized in accordance with the law.

The involvement of the company in the practice of tax avoidance became commonplace and legally carried out by the company, but it is not desired by the government. The government expects the company to pay the tax without a tax avoidance mechanism. The company's efforts to optimize the company's profit is still a firm reason for tax avoidance is considered less good for the community. Based on the above background, the purpose of this study was to examine the influence of corporate social responsibility (CSR) against tax avoidance. Other benefits of the research which is for the development of literature in the field of taxation, in particular to determine the impact of corporate social responsibility (CSR) against tax avoidance manufacturing company. This study is also beneficial for the government in making decisions about the creation of tax laws and can be input to the Directorate General of Taxes in detecting companies that undertake social responsibility activities that accompanied the activity of tax avoidance is high.

Prior Research and Development of Hypotheses
1. Agency Theory

Differences reporting between commercial profits with taxable income may pose a conflict of interest *(agency theory)* for managers in reporting activity / performance of the company. The manager *(agent)* will report higher earnings in the financial statements (profit commercial) in order to obtain compensation (bonus), or related regulations with the contract of debt *(debt covenant).*In the agency theory, tax planning can facilitate managerial *rent extraction* is justification for opportunistic behavior of managers to manipulate earnings or the placement of resources which are not appropriate (Desai and Dharmapala, 2006). Planning activities can be done through tax *avoidance* is by taking a tax deduction explicitly (Hanlon, 2010). Activities tax planning*(tax avoidance)* raises opportunities for management in an activity designed to conceal the bad news that mislead investors or managers lacked transparency in running the company's operations (Desai & Darmapala, 2006).

2. Theory of *Legitimacy*

According Lanis & Richardson (2011) explains that theories of legitimacy is a social contract between the company and community social and environmental disclosure. Their legitimacy theory provides the foundation that the company must comply with the norms prevailing in society so that operations can run smoothly without any conflict with the

surrounding communities (Adawiyah, 2013). To get legitimacy of stakeholders, the company's CSR activities conducted throughout the year in general will be reported and disclosed in the annual reports, sustainability reports, or on the company website.

3. Tax avoidance

Of taxation developments on *tax avoidance* continues to grow. In the past many people equate *tax avoidance* as legal action, but now the *tax avoidance* itself branched. Assume that there is no *tax avoidance acceptable* and *tax avoidance is unacceptable,* the differences were revealed by Slamet (2007): (i) the purpose of business is good / not, (ii) solely to avoid taxes / not, (iii) appropriate / not with the spirit and *intention of* parliament, (iv) does/does not do a transaction engineered. Meanwhile, Brian and Michael (2002) distinguishes *tax planning* becomes *defensive tax planning* is a *tax planning* is done by not placing experts or advisors taxation and was only based on domestic laws, and *offensive tax planning* that puts experts as advisors taxation and done with take advantage of the countries that entered the category of *tax haven* countries.

Lim (2010) defines tax avoidance as the tax savings arising by utilizing tax provisions legally do to minimize liability. Dyreng, *et al.* (2008) stated that tax avoidance is any activity that gives effect to the tax liability, both activities are allowed by tax or special activities to reduce taxes. Tax avoidance is part of *tax planning* is done with the aim of minimizing payment (Masri, 2013). This is different from *tax avoidance* where *tax avoidance* is tax avoidance and an attempt to minimize the amount of taxes by violating tax regulations and applicable law in a country. *Tax avoidance* is illegal and therefore may be subject to administrative and criminal sanction.

In Indonesia taxpayer given full discretion to calculate, pay and report tax obligations. This is due to the implementation of system *self-assessment* in the tax laws of Indonesia. The implementation of system *self-assessment* as providing an opportunity for the taxpayer to reduce the amount of taxes to be paid. Company which is a taxpayer of course want to reduce costs of companies including the tax burden. The company can use two ways to minimize the amount of taxes to be paid. First, reduce the tax value to stay abreast of tax laws that apply to the way tax avoidance. Both by reducing the tax value by taking action that is not in accordance with the tax laws by means of tax avoidance.

Tax avoidance is an attempt taxpayers to take advantage of the opportunities that exist in the tax laws so that the taxpayer can pay his taxes will be lower. Activities of tax avoidance when performed in accordance with the tax laws then such activity is an activity that is legal and acceptable.

Tax avoidance in this study was measured using ETR, as well as research Hanlon (2005), Graham & Tucker (2006), Desai and Dharmapala (2006), Dyreng, Hanlon, and Maydew (2008), Richardson & Lanis (2007; 2012; 2013), Chen *et al.* (2010) and Minnick & Noga (2012). Measurements made in research Hanlon (2005), Graham & Tucker (2006), Desai and Dharmapala (2006), Dyreng, Hanlon, and Maydew (2008), Richardson & Lanis (2007; 2012; 2013), Chen *et al.* (2010) and Minnick & Noga (2012) states that the ETR is one measure of *tax* avoidance.Here is the formula ETR.

$$ETR = \frac{\text{Tax Expense } i,}{t}$$

ETR is the effective *tax rate* based on the reporting of financial accounting regulations. *Tax expense* is the corporate income tax expense for the company i in year t based on the company's financial statements. *Pretax Income* is income before taxes for firm i in year t based on the company's financial statements.

ETR is calculated by dividing the income tax expense and profit before tax. The use of ETR is expected to provide an overall picture of the burden of the tax will have an impact on accounting earnings. ETR *(effective tax* rate) is expected to identify corporate tax avoidance is done using permanent differences and temporary differences (Chen, *et al,* 2010). Companies that have ETR *(effective tax* rate) is low will seek to raise the ETR with lower earnings because companies tend to want the accounting profit small to avoid the possibility of paying higher taxes in the future so that the company could carry out a policy on accrual contained in deferred *tax expense* by creating a deferred *tax expense* becomes smaller. *Deferred tax expense* is the product of temporary differences with the applicable tax rate (Harnanto, 2003).

4. Corporate Social responsibility (CSR)

Disclosure CSR aims to establish good communication and effective so intertwined a close relationship between the company and stakeholders about the CSR activities of companies (Novita & Djakman, 2008). CSR is a company's commitment as an act of responsibility by the company voluntarily. Benefits of CSR companies, among others, to create a company's reputation, obtaining a license to operate socially, reducing the risk of the company's business, expand access to resources for Operational business, expand market opportunities widely, reducing the costs associated with the impact of waste disposal, improving relations with stakeholders, adjust and improve relations with regulations, improve morale and productivity of employees and their chances of obtaining an award (Rasidah & Chairina, 2010). In this study, a component of CSR disclosure include the environment, energy, health and safety of workers, others labor, product, community involvement and the general adoption of research Hackston & Milne (1999) in Rasidah & Chairina (2010) which consists of 78 item.

Hypotheses Development

The theory legitimacy of the claim that the company can continue living in the long run if it has a good recognition in society. This can be expressed in the company's annual report. The company's reputation is getting nice if the level of disclosure of CSR is getting higher and vice versa, the lower the disclosure of CSR, companies deemed socially responsible so that it can conduct tax avoidance is high (Watson, 2011).

Research on the effect of CSR on tax avoidance has not been getting the results same. According Lanis & Richardson (2011) states that there is a positive relationship between CSR and so the higher tax avoidance disclosure of CSR, the lower rate of corporate tax avoidance. The logic is supposed to pay taxes in accordance with applicable law in any country it operates. If the company conducting tax avoidance is high then the company is considered to harm the country and in the long term can damage the reputation of the company. Thus the high tax avoidance activities should be regarded as an activity that does not have a social responsibility. Results of research Lanis & Richardson (2011), in line with Avi-Yonnah research stating that the company is a real entity. In the view of real entity, a separate company from the State or shareholders. The implication is that CSR has nothing to do with the company but CSR is beneficial to the people. So companies do CSR greatly appreciated although there is no law. On the revenue side, the company should not have to make the effort of tax avoidance.

The two of views above, Davis, Guenther, Krull, and Williams (2013) states the argument about the relationship of CSR and taxes is that the negative correlation between CSR with tax avoidance. It is based that the company can use the proceeds of the tax savings to directly invest in CSR activities. Furthermore, some activities that improve social welfare also be tax deductible. In the context of Indonesia, for example, some of the expenses related to the

company's CSR can be a tax deduction *(deductible* expenses) as stipulated in Government Regulation No. 93 Year 2010. As a result, the greater the CSR, the tax burden could be on the wane. Of the two views above, it can be hypothesized as follows.
Hypothesis 1: CSR negative effect on tax avoidance.

Methods
This study uses multiple regression analysis model with the dependent variable is the avoidance of corporation tax and the independent variable is CSR. To strengthen the testing, used some of the control variables that are most likely affect the taxation of companies which is a measure of companies and the size of the audit committee.

1. Samples
Samples were public companies listed on the Indonesia Stock Exchange for 2010-2014. Associated with a proxy measurement of tax avoidance in the form ETR then sampling criteria are:
a. manufacturing company in addition to *real estate*/ properties listed on the Indonesia Stock Exchange,
b. presenting the financial statements ended December 31,
c. have the data of financial statements and annual report for 2010-2014,
d. ETR value between 0 and 1,
e. did not experience a loss in the year 2010-2014,
f. Financial statements are presented in Rupiah.
The calculation of ETR, the data used are the financial statements while to develop the scores of CSR disclosure, the data used is the annual report. By doing content analysis, qualitative data to get a quantifiable CSR disclosure score.

2. Control Variables
Control variables in this study there are three, namely size, leverage, and the audit committee. SIZE is the control variables of the size of the company by proxy the natural logarithm of total assets. The use of firm size as a control variable is to control the size *effect* on the activity of tax avoidance (Lanis & Richardson, 2011). LEV is the control variables of the level of leverage of the company. The use of leverage as control variables based on the premise that the large the greater leverage of debt financing and the greater interest expense. Given the interest expenses can be deducted in calculating the income tax *(deductible expenses),* the interest charges can affect the tax payable and ETR. KOMAU is a control variable representing corporate governance mechanisms, namely the number of audit committee members. KOMAU is the control variables of the proportion of independent directors compared with the rest of the commissioners.

3. Methods of Analysis
The determination effect of CSR practices toward corporate tax avoidance, then the hypothesis testing is done by multiple linear regression method. Before testing the hypothesis test is conducted prior to the data, such as test and classical assumption of normality. The equation model hypothesis testing are:

$$\text{ETRi} = \alpha + \beta 1\ \text{CSRIit} + \beta 2\ \text{SIZEi} + \beta 3\ \text{LEVi} + \beta 4\ \text{KAi} + e$$

Results
The using purposive sampling method the number of samples are 27 companies with five-year study period. Descriptive statistical tests are shown in the following table:

Table 1.
Description Statistics

	N	Mean	Max	Min	St.Dev
ETR	100	0.25	0.36	0.18	0.032
SIZE	100	28.09	31.69	25.08	1.52
LEV	100	0.36	0.70	0.01	0.149
KAI	100	3.10	4.0	3.0	0.3
CSR	100	0.19	0.43	0.038	0.096

Source: Secondary data is processed 2016

Based on the above data, it can be concluded that the low levels of ETR which means that the high level of tax avoidance. As well as a high level of CSR, which can be seen from Table 1. Results of test for normality using the Kolmogorov-Smirnov showed that the research data was normally distributed with significant values of 0.29 is greater than 0.05. Further testing multicoloniarity classic assumption test, heteroscedasticity test, and test autocorrelation shows that research model free from the classical assumption test. Results of testing the hypothesis by using multiple linear regression can be seen in Table 2.

Table 2
Multiple Linear Regression Analysis

	B	t	Sig
Constant	0,485	3,82	0,000
CSR	-0,054	-1,36	0,177
SIZE	-0,008	-3,22	0,002
LEV	0,134	3,02	0,001
KAI	-0,013	-1,16	0,246

Source : Data are processed, 2016

Discussion of Results

Based on the results of the regression turns out that the level of CSR activity negatively affects tax avoidance represented by ETR. It points out that the size of the company (SIZE) has a negative effect on ETR as well as to leverage positive effect on ETR. Only the audit committee does not affect the ETR. CSR has a negative effect on tax avoidance. This means that the higher the level of CSR disclosure of a company, the lower the corporate tax avoidance practices. The results are consistent with research conducted by Lanis and Richardson (2012), Watson (2011), as well as Hoi, Wu and Zhang (2013). Companies with low rankings in CSR is not considered socially responsible so that tax avoidance is higher (Hoi *et* al, 2013) .The more responsible socially expected lower tax avoidance.

Reducing the tax burden could be seen as a matter of course in the company, due to the cost reduction can improve profitability, increase shareholder value. But also depends on the tax regulations to support the government's social programs. Tax avoidance actions are seen by some people as an act of irresponsible socially caused the company does not pay taxes fairly. It is given that the company has many stakeholders both internal and external. CSR is an act that not only take into account the economic but also the social, environmental and other impacts of actions by the company itself as a form of responsibility to stakeholders. Act of tax avoidance is high is seen as unethical and irresponsible by the public, and therefore CSR affects negative against acts of tax avoidance (Hoi *et* al, 2013).

Conclusions, suggestions and the limitations

This study have aim to examine the effect of CSR on tax avoidance in Indonesia. By using multiple regression analysis, it was found that in the context of Indonesia level of CSR activity negatively affects tax avoidance.

Limitations of this study include SSR assessment of social responsibility using the PROPER and use of annual reports that allow information related to CSR are incomplete and are not the same for each company.

For further research could use another more complete information about the company's CSR ratings and are expected to use a proxy vote or add other corporate governance.

DO MACHIAVELLIANISM AND ETHICAL CLIMATE AFFECT PUBLIC ACCOUNTANTS' ETHICAL PERCEPTIONS OF TAX EVASION? EVIDENCE FROM INDONESIA

Avi Sunani, STIE Perbanas Surabaya

Abstract

The purpose of our study is to investigate the effect of Machiavellianism, a general measure of the propensity for manipulative and deceitful behavior, and ethical climate on public accountants' ethical perception of tax evasion. Our study is based on a survey of 76 public accountants in Indonesia. The direct effect test was used to examine the effect of Machiavellianism and ethical climate on ethical perceptions of tax evasion. The results indicates that Machiavellianism was not influence public accountants' ethical perceptions of tax evasion. Consistent with the expectations, ethical climate positively affects ethical perceptions of tax evasion. In other words, public accountant perceptions of the extent to which the organization (public accounting firm) supports public interest and social responsibility clearly encourage them to judge tax evasion as more unethical. To our knowledge, this is the first study to address the effect of Machiavellianism and ethical climate on public accountants' ethical perceptions of tax evasion in Indonesia. The findings have important implications, suggesting that by enhancing ethical climate in a public accounting firm that encourages ethical behavior may lead public accountants to be more critical to tax evasion.

Keywords: *Ethical climate, ethical perceptions, Machiavellianism, public accountant, tax evasion*

Introduction

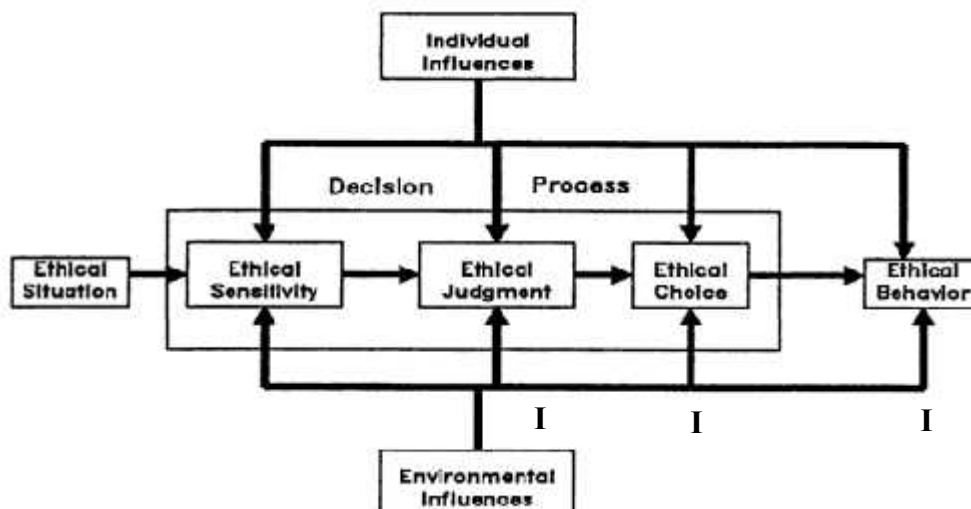
An effective system of taxation and revenue administration makes a significant contribution to the improvement of national welfare. However, tax evasion is one phenomenon that undesirably causes a serious threat to revenue generation efforts of government. Tax evasion is an illusive concept and can be defined as a condition in which, intentionally and by illegal means, individuals either partially pay the tax they are liable to pay or do not pay at all (Lewis, 1982, p. 123). Consequently, this will affect to the loss of tax revenue, which will in turn affect the effectiveness of the tax system in a great deal. Crowe (1944) stated that tax evasion is illegal, immoral and unethical. However, is that still unethical even if government is wasting the collections or spending the collected money on unworthy projects and unjust causes?. Thus, some groups of society have different perceptions, whether tax evasion is ethical or unethical.

The ethics of tax evasion has been discussed in the relevant literature for a long period of time. However, the vast majority of the studies have addresses the issue in the perspective of business student. Thenk (2012), McGee *et al.* (2008), McGee and Djatej (2007), and McGee and Maranjyan (2006) found that business student perceived tax evasion is ethical if the government corrupt, tax system is unfair and tax rates are too high. On the other hand, McGee and Gupta (2008) found that business student in New Zealand perceived tax evasion is unethical because every taxpayer have responsibility to pay tax in accordance with the tax regulations. A follow-up study McGee and Maranjyan (2006) found a widespread perception that tax evasion is often not unethical because of the widespread belief that there is no duty to pay taxes to a corrupt government. Moreover, Benk *et al.*

(2009), McGee and Bernal (2006), McGee and Lingle (2008), and McGee and Ho (2006) found that respondent perceived tax evasion is ethical in some cases but not in others. From those previous studies, we can conclude that respondent have different ethical perception of tax evasion, accordingly there is much opportunity for further work in this area.

Not much has been written about tax evasion from an ethical perspective. Some early studies of tax evasion focused primarily on assessing and reporting attitudes toward such behaviors, thus, a limited number of independent variables affecting have been investigated. Therefore, there is clearly a need to obtain a better understanding of the behavioral factors (e.g. Machiavellianism, ethical climate) that influence ethical perceptions of tax evasion. Behavioral research on tax evasion provides a distinct advantage over market-based studies in this regard by focusing on the factors that influence the decision making processes of professional public accountants, the people who actually have responsibility to detect fraud, such as tax evasion.

Literature Review and Hypotheses Development
1. Ethical Perceptions

Rest (1986) proposed a four-stage ethical decision making sequence to describe individuals' cognitive stages when they faced an ethical dilemma. Rest's four-component model comprises 1) ethical perception – being able to interpret the situation as being ethical or unethical; 2) ethical judgment – deciding which course of action is morally right; 3) ethical intention/choice – prioritizing ethical alternative over other alternatives; and 4) ethical behavior – engaging in ethical behavior as shown in figure 1. This model influenced by various individual factors (e.g., personality trait, attitudinal measures) and environmental factors (e.g., ethical climate) (Jones, 1991; Trevino, 1986). This current study primarily focuses on the first stage of the ethical decision making (ethical perceptions) because this stage is the fundamental and crucial stage in the ethical decision making process and helps to initiate ethical decision making. Hunt and Vitell (1986) describe ethical perceptions as the catalyst that entirely drives ethical decision making process. Thus, an ability to identify and properly assess the ethical issue in a situation is a necessary prerequisite to right ethical decisions (Rest, 1986).


Source: Wittmer (2005:54)
Figure 1. Behavioral Model for Ethical Decision Making

2. The Ethics of Tax Evasion

Soyode and Kajola (2006) defined tax evasion as a deliberate and willful practice of not disclosing full taxable income in order to pay less tax. According to Fagbemi *et al.* (2010), tax evasion is the general term for efforts by individuals, firms, trusts and other entities to evade taxes by illegal means. Tax evasion usually entails taxpayers deliberately misrepresenting or concealing the true state of their affairs to the tax authorities to reduce their tax liability. The differentiation between tax evasion and tax avoidance lies on tax payer compliance with laws and regulations. In tax avoidance, tax payer take full advantage of the tax code to reduce their tax liabilities, without violate the law, such as postponement of taxes. Conversely, tax evasion is the illegal reduction in tax liabilities, such as declaring less income.

According to McGee (2006), from the legal, economic, and psychology perspective, there are some reasons that encourages taxpayer to evade tax. For instance, taxpayer do evade tax because the tax system is unfair, legal system is weak, tax rates are too high, and a large portion of the tax collected is wasted. The ethics of tax evasion can be examine from a number of perspective. Historically, there have been three main views on the morality of tax evasion (McGee, 2006; Crowe, 1944). First approach is to examine the relationship of the individual to the state. Second, the relationship between the individual and taxpaying community or some subset thereof. Finally, the relationship of the individual to God.

A. View One: Tax evasion is never ethical

One strand of this view is that individuals owe a duty to the state to pay whatever taxes the state demands (McGee, 2006). In a democracy, such as Indonesia, the leaders are elected and the people consent to be taxed. Thus, there is an absolute duty to pay whatever taxes the government imposes. Consequently, tax evasion is never ethical.

B. View Two: Tax evasion is always ethical

This viewpoint begins with the premise that all government is illegitimate (McGee, 2006). Government is a mere thief, which confiscates assets, percentages of paychecks, etc., without the consent of the owners of the property. The definition of theft is the taking of property without the owner's consent. Even though someone lives in a democracy, such as Indonesia, does not mean that the government represents the interests of all the people, or that the government works for the general welfare. Thus, some people perceived that tax evasion is always ethical because government is illegitimate.

C. View three: Tax evasion is sometimes ethical

This view holds that tax evasion is ethical in some cases and unethical in others (McGee, 2006). The point is that, once it is conceded that tax evasion is sometimes ethical, there is no clear dividing line that people can agree on regarding when evasion is ethical and when it is not.

3. Machiavellianism

The Machiavellianism construct was intended to describe individuals with manipulative, cold and calculating personalities and little concern for conventional standards of morality (Christie and Geis, 1970). High Machiavellians have traditionally been viewed as relatively aggressive and possessing a strong desire to pursue "winning" even at the expense of morality of ethics (Geis *et al.*, 1970). Recent studies have recognized the potential negative effects of Machiavellianism on ethical decision making. Shafer and Simmons (2008) found that high Machs' believe less strongly in the importance of

corporate and social responsibility and are more likely to condone aggressive tax avoidance. Hartmann and Mass (2010) also found that Machiavellianism has significant effects on business unit controllers' propensity to create budget slack. Moreover, Shafer and Wang (2011) found that high Machiavellians were more likely to perceive accounting manipulations as ethically acceptable.

We sought to replicate and extend those above findings by examining the effect of Machiavellianism on ethical perceptions of tax evasion. According to Gunnthorsdottir *et al.* (2002), "high Machs with their cool, rational attitude, should be true gamesmen, and better than Lows at going after their short-term self-interest [...]". This reasoning clearly suggests that high Machiavellian will be more likely to perceive tax evasion as more ethical. Accordingly, we propose the following hypothesis:

H1: Machiavellianism affects ethical perceptions of tax evasion

4. Ethical Climate

The organizational ethical climate is "the prevailing perceptions of typical organizational practices and procedures that have ethical content" (Victor and Cullen, 1988). The ethical climate constructs developed by Victor and Cullen (1987, 1988) is a two-dimensional matrix, which captures both the ethical criteria and locus of analysis involved in decision making. The ethical criteria derived from theories of moral philosophy and psychology, include egoism, benevolence and principle. The locus of analysis derived from sociological theory, specifies the scope of consideration when making ethical decisions, which may be on the individual, local or cosmopolitan level. The cross section of the two dimensions forms a 3 x 3 matrix consisting of nine types of ethical climates, as shown in Table 1.

Table 1
Theoretical Ethical Climate Types

Ethical Criteria	Locus of Analysis		
	Individual	**Local**	**Cosmopolitan**
Egoism	Self-Interest	Company Profit	Efficiency
Benevolence	Friendship	Team Interest	Social Responsibility
Principle	Personal Morality	Company Rules and Procedures	Laws and professional Codes

Source: Victor and Cullen (1988)

In the ethical criteria dimension, egoistic climates focus on self-interest; benevolent climates on the well-being of the parties involved; and principled climates on following rules, laws and professional codes of conduct. An individual locus of analysis encourages a focus on self-interest, relationships and personal moral principles of organizational members. The local level of analysis is usually interpreted as an emphasis on the company or organizational subunits. A cosmopolitan focus extends the scope of concern on the societal level. The research has documented the intuitive proposition that egoistic climate will tend to result in less ethical decisions in organizational contexts, while benevolent and principled climate will result in more ethical decisions (Peterson, 2002; Trevino *et al.*, 1998).When the ethical climate in an organization is perceived as supportive of ethical behavior and intolerant of unethical behavior, this should influence the employees' views of the moral acceptability of questionable actions. It seems apparent that these relationships should also true in the contexts of tax evasion. Shafer and Wang

(2011) found that ethical climate was influenced ethical perceptions. Consequently, we propose the following research hypotheses:

H2: Ethical climate affects ethical perceptions of tax evasion

Research Method

Before spreading the questionnaires, we conducted pre-test and pilot test to determine the validity and reliability of the research instrument. Participant responded to (1) fifteen items from the ethical perceptions of tax evasion scale adapted from McGee and Guo (2007); (2) fifteen items from the Ethical Climate Questionnaire (ECQ) (Cullen *et al*. 1993); (3) twenty items from the Mach IV Machiavellianism scale (Christie and Geis, 1970); and (4) a demographic questionnaire. Since all participants were Indonesian native speakers, the questionnaire was translated into Bahasa by researcher, who is an Indonesian native speaker, and checked by professional English lecturer. Bahasa questionnaires were piloted to 33 accounting students at STIE Perbanas Surabaya.

The respondents of this study were public accountants employed in Indonesia public accounting firm. Access to participant was obtained through personal contact. A total of 51 public accounting firm participated in the study. The survey was accompanied by a cover letter assuring participants that their responses would be treated as strictly confidential. The mailing also contained pre-paid, addressed envelope for sending replies directly to the researchers. The mailing was undertaken in early February 2016. Approximately 204 instruments were distributed and 87 respondents returned their instrument, giving a response rate of approximately 42.6 percent. Eleven instruments were discarded because of incomplete information given, resulting in a usable sample of 76 responses, as shows in Table 2. In order to check for non-response bias, early and late responses were compared, and no significant differences were noted, as shown in Table 3.

Table 2
Percentage of Questionnaire Returned

Description	Total	Percentage
Questionnaires sent	204	100%
Questionnaires not returned	117	57.3%
Questionnaires returned	87	42.6%
Questionnaires cannot be processed	11	5.4%
Questionnaires which can be processed	76	37.2%

		Sig. (2-tailed)
Pair 1	TE_E - TE_L	0.470*
Pair 2	EC_E - EC_L	0.501*
Pair 3	MACH_E - MACH_L	0.329*

Source: Proceed data.
Description: TE: Tax Evasion, EC: Ethical Climate, MACH: Machiavellianism, E: Early response, L: Late response
Note: *p<0.05

The exogenous variable in our study consists of ethical climate and Machiavellianism. Yet, the endogenous variable is ethical perception of tax evasion, as shown in Figure 2. The analytical tool used in our study is the *Partial Least Square* (PLS). This current study extends prior research by developing an integrated model of the effect of individual factor (Machiavellianism) and organizational factor (ethical climate) on ethical perceptions relating to tax evasion.
Figure 2
Research Model

Findings
1. Model Evaluation
Model evaluation consist of outer model and inner model. Outer model is used to evaluate the value of validity and reliability. Reliability test can be seen from Cronbach's Alpha and Composite Reliability value that must be higher than 0.7. This criterion was met for each of the latent construct, as shown in Table 4. Yet, validity test consist of convergent validity and discriminant validity. To test the convergent and discriminant validity of the measures of ethical perceptions, ethical climate, and Machiavellianism, we adopted the procedures recommended by Chin (1995). Chin (1995) recommended that to establish adequate convergent validity, the average variance extracted (AVE), communality and factor loading should exceed 0.5. This criterion was met for each of the latent construct, as shown in Table 5, Appendix 1 and Appendix 2.

Table 4
Result of Reliability Test

Variable	Composite Reliability	Cronbachs Alpha
EC	0.955185	0.946867
EP	0.973343	0.970598
MACH	0.924586	0.915620

Source: Proceed data.
Description: EC: Ethical Climate, EP: Ethical Perception of Tax Evasion, MACH: Machiavellianism

To establish discriminant validity between latent construct, Chin (1995) suggests that the correlation between the constructs should be less than squared each of the constructs' AVEs; and cross loading should exceed 0.5. This criterion was met for each of the comparison between the ethical perceptions, ethical climate, and Machiavellianism, providing evidence for discriminant validity, as shown in Table 5 and Appendix 1.

Table 5.
Result of Convergent and Discriminant Validity

Variable	Communality	AVE	Squared AVE	EC	EP	MACH
EC	0.663874	0.663874	0.814784	1.000000		
EP	0.509031	0.710048	0.842643	0.757031	1.000000	
MACH	0.710047	0.509031	0.713464	-0.264198	-0.281299	1.000000

Source: Proceed data.
Description: EC: Ethical Climate, EP: Ethical Perception of Tax Evasion, MACH: Machiavellianism

2. Hypotheses Testing (Inner Model)

Based on the research model (Figure 2), our study was testing 2 hypotheses. Hypotheses 1 (H1) states that Machiavellianism affect ethical perception of tax evasion. The result of total effect test for the inner model show that Machiavellianism was not affected ethical perception of tax evasion as indicated by the t-statistic value of 0.401 (less than t-table value of 1.96). Consequently, hypotheses 1 (H1) is rejected. Hypotheses 2 states that ethical climate affect ethical perception of tax evasion. Consistent with the expectation, the result show that ethical climate has positively effect on ethical perception of tax evasion, as indicated by the original sample estimate value (path coefficient) of 0.738594 and t-statistic value of 5.613 (higher that t-table value of 1.96). Therefore, hypotheses 2 (H2) is supported.

Table 5.
Result of the Total Effect Test

	Original Sample (O)	Standard Deviation (STDEV)	Standard Error (STERR)	T Statistics (|O/STERR|)
EC -> EP	**0.7386**	0.1316	0.1316	**5.612**
MACH -> EP	**-0.0589**	0.1471	0.1471	**0.400**

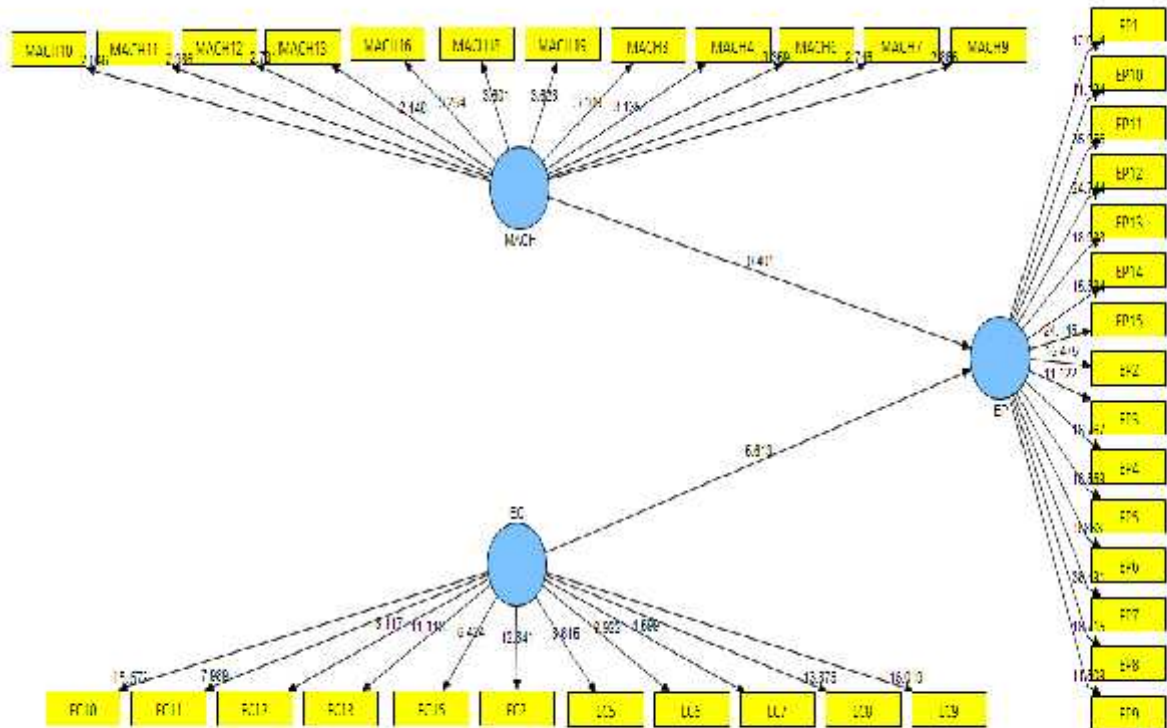

Figure 3
Inner Model

Discussion and Conclusions

This study provides some interesting findings with respect to ethical perceptions of tax evasion in Indonesia, and raises questions that should be addressed in future research. Inconsistent with prior accounting and business studies (Richmond, 2001; Wirtz and Kum, 2004; Shafer and Simmons, 2008; Hartmann and Maas, 2010; Shafer and Wang, 2011), we found that Machiavellianism as a basic personality trait of the respondents was not influenced their ethical perceptions. This result is surprising, inconsistent with four-component model Rest (1986), which is ethical perceptions were not influenced by individual factors (Machiavellianism). This finding may be due to the fact that the vast majority of the respondents' Machiavellianism scores were low (ninety five percent of the respondents' MACH IV score was below 100). In addition, different findings with the prior studies may be also due to cross-cultural studies. According to Hofstede (1991), Indonesia is classified as collectivism country with individualism score 14 (range 0-100). In other words, Indonesian may tend to do something together rather than relatively aggressive and possessing a strong desire to pursue "winning" or personal success at the expense of morality and ethics.

Consistent with the expectation, the results indicate that ethical climate positively affects ethical perceptions of tax evasion. In other words, respondents of this study feel that the company places a strong emphasis on the pursuit of public interest and social responsibility (benevolent and principled climate). This clearly encourages them to perceive tax evasion as more unethical. The result of the current study consistent with Peterson (2002), Martin and Cullen (2006) and Shafer and Wang (2011), if employees find

themselves in an environment that encourage ethical behavior, organizational climate may lead them to rationalize the dysfunctional behavior, such as tax evasion as morally unacceptable. Our study proved that an individual perception as part of ethical decision making is influenced by environmental (organizational factor). Therefore, public accounting firm can enhance ethical climate that encourages ethical behavior to lead public accountants to be more critical to tax evasion. The result of the current study provides support to the Rest's (1986) four-component model, which is ethical perceptions is influenced by environmental factors, such as ethical climate.

This study is subject to a number of limitations, consequently, the results should be interpreted with caution. First, the current study is that relied on a convenience sample obtained through a network of personal contact. Therefore, future research may consider using probability sampling method in order to assess high external validity of the research findings. Second, as the study was restricted to public accountant in Indonesia, further research is required in order to assess the generalizability of the result outside that territory. Finally, approximately eleven instruments were discarded because of incomplete information given. Thus, further research could confirm to the personal contact when the instruments have already distributed in order to minimize discarded instruments. One possible avenue for future research could also expand on the model used in the current paper to simultaneously examine the effects of Machiavellianism, ethical climate, and other personal or environmental variables that have been found to influence ethical decision making such as personal moral philosophy and code of ethics.

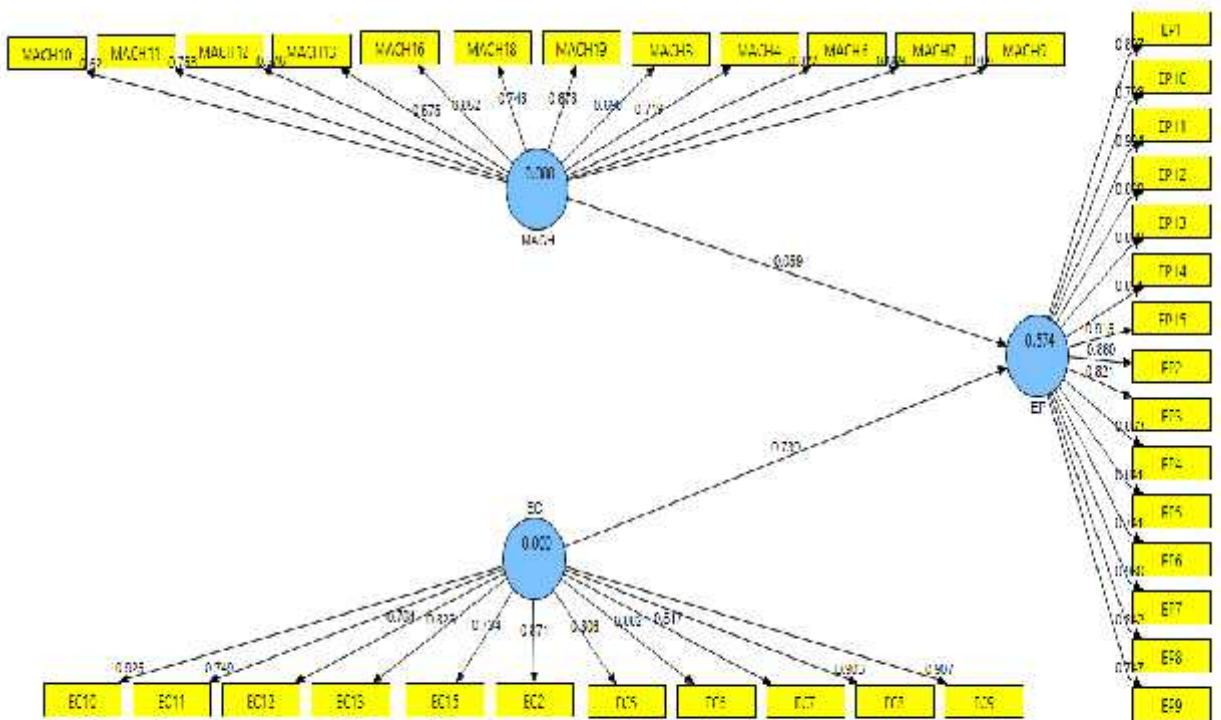
Description: EC: Ethical Climate, EP: Ethical Perception of Tax Evasion, MACH: Machiavellianism

Appendix 2. Outer Model


Appendix 3. Scale Items
Ethical Perception of Tax Evasion
1. Tax evasion is ethical if tax rates are too high.
2. Tax evasion is ethical even if tax rates are not too high because the government is not entitled to take as much as it is taking from me.
3. Tax evasion is ethical if the tax system is unfair.
4. Tax evasion is ethical if a large portion of the money collected is wasted.
5. Tax evasion is ethical even if most of the money collected is spent wisely.
6. Tax evasion is ethical if a large portion of the money collected is spent on projects that I morally disapprove of.
7. Tax evasion is ethical even if a large portion of the money collected is spent on worthy projects.
8. Tax evasion is ethical if a large portion of the money collected is spent on projects that do not benefit me.
9. Tax evasion is ethical even if a large portion of the money collected is spent on projects that do benefit me.
10. Tax evasion is ethical if everyone is doing it.
11. Tax evasion is ethical if a significant portion of the money collected winds up in the pockets of corrupt politicians or their families and friends.
12. Tax evasion is ethical if the probability of getting caught is low,
13. Tax evasion is ethical if some of the proceeds go to support a war that I consider to be unjust.
14. Tax evasion is ethical if I cannot afford to pay.
15. Tax evasion is ethical even if it means that if I pay less, others will have to pay more.

Ethical Climate
1. In this organization, people are mostly out for themselves.
2. People are expected to do anything to further the organization's interests.
3. There is no room for one's own personal morals or ethics in this organization.
4. Work is considered sub-standard only when it hurts the organization's interests.
5. In this organization, people protect their own interest above other considerations.
6. The first consideration is whether a decision violates any law or professional standard.
7. People are expected to comply with legal and professional standards over and above other considerations.
8. People are concerned with the organization's interests to the exclusion of all else.
9. In this organization, people are expected to strictly follow legal or professional standards.
10. In this organization, the law or ethical code of one's profession is the major consideration.
11. It is expected that you will always do what is right for the public.
12. People in this organization have a strong sense of responsibility to the outside community.
13. Decisions here are primarily viewed in terms of contribution to profit.
14. People in this organization are actively concerned about the public interest.
15. People in this organization are very concerned about what is best for them.
16. The effects of decisions on the public are a primary concern in this organization.

Machiavellianism
1. Never tell anyone the real reason you did something unless it is useful to do so.
2. The best way to handle people is to tell them what they want to hear.
3. One should take action only when sure it is morally right [1].
4. Most people are basically good and kind [1].
5. It is safest to assume that all people have a vicious streak and it will come out when they are given a chance.
6. Honesty is the best policy in all cases [1].
7. There is no excuse for lying to someone else [1].
8. Generally speaking people would not work hard unless they are forced to do so.
9. All in all, it is better to be humble and honest than to be important and dishonest [1].
10. When you ask someone to do something for you, it is best to give the real reasons for wanting it rather than giving reasons which carry more weight [1].
11. Most people who get ahead in the world lead clean, moral lives [1].
12. Anyone who completely trusts anyone else is asking for trouble.
13. The biggest difference between most criminals and other people is that the criminals are stupid enough to get caught.
14. Most people are brave [1].
15. It is wise to flatter important people.
16. It is possible to be good in all respects [1].
17. The man who said "there's a sucker born every minute was wrong [1].
18. It is hard to get ahead without cutting corners here and there.
19. People suffering from incurable diseases should have the choice of being put painlessly to death.
20. Most people forget more easily the death of a parent than the loss of their property.

Note
1. Reverse scored.

PROCESS OF POSITIVE ATTITUDE FORMATION OF SOCIETY TOWARD GREEN PRODUCTS
(QUALITATIVE STUDY OF GREEN PRODUCTS' CONSUMERS IN INDONESIA)

Eni Andari, Janabadra University, Indonesia
Budhi Haryanto, Sebelas Maret University, Indonesia

Abstract

This research aimed to explore the constructed variables that were to influence the process of the positive attitude formation of the developing country's society toward the green products. Those several variables were the green brand perception, green price fairness, and country of origin.

Next, exploratory study was used to understand these research variables through the deep interview toward 15 participants of the public area of Yogyakarta City.

The study results showed that the conceptualized variables could be used to build the process of the positive attitude formation of the society toward the green products and delivered some propositions. The study suggests several implications both theoretically and practically. The propositions in this study can be continued in the future study by testing the conceptualized variables in this research.

Keywords: *Green Brand Perception, Green Price Fairness, Country of Origin, Society Positive Attitude toward Green Products*

Introduction

The Attitude is the issue that is still interesting in this research, especially in the process of the positive attitude formation toward the green products. It is because the previous studies indicated the model inconsistencies that implicated on the limited model application's capability to explain the issue (Tsakiridou *et al.,* 2008; Chen and Chai, 2010; Cheah and Phau, 2011). The first factor assumed to contribute the inconsistencies was the problem developing in the observed objects and settings. Furthermore, the study approach perspective was the second factor assumed also to cause the inconsistencies.

The problem development in the previous studies appeared because the individual social responsibility sense to be aware of the environment and health (Kaiser *et al.,* 1999; Chan and Lau, 2000; Laroche *et al.,* 2001; Tsakiridou *et al.,* 2008; Barber *et al.*, 2009; Chen and Chai, 2010; Boztepe, 2012; Lim *et al.,* 2013). It was because there was still the differences of the society awareness level toward the green products both in the developed countries and developing countries. The developed countries' society such as Europeans and Americans had indicated the relative high awareness toward the green products expressed through the society's care about the environment, health, and the willingness to pay the high prices for the products (Laroche *et al.,* 2001; Barber *et al.*, 2009). Meanwhile the developing countries' society such as Asia still indicated the relative low awareness toward the green products uncovered by the still little-knowledge of the environment and green products (Chan and Lau, 2000; Bing *et al.,* 2011; Chen and Chai, 2010; Lim *et al.,* 2013; Kong *et al.,* 2014). Indonesia as one of the developing countries in Asia still had the society that also still indicated the relative low awareness toward the green products that was showed by the price perception of the relative expensive green products that did not bring advantages yet (Panjaitan & Sutapa, 2010; Suharjo *et al.,* 2013). This condition needed the effective strategies to grow the society's awareness through the liking in the green products as the first step.

Furthermore, the study approach perspective of the consumer research was assumed to also contribute in the inconsistencies of the attitude model. The intended study approaches were the *behavioral* and *attitudinal* approaches. It was because in the *behavioral* approach*,* the attitude was built by the individual learning process through the external environment factors (Foxall *et al.*, 2006; Bray, 2008; Foxall *et al.*, 2011). Meanwhile, in the *attitudinal* approach*,* the attitude was developed through the individual thinking process based on 3 components those were cognitive, affective, and conative components (Fazio and Olson, 2003; Schiffman and Kanuk, 2007).

This research model was developed by the *attitudinal* approach because it was to explain the consumers' ways of thinking through the society's positive attitude toward the green products. Then, 4 variables were observed in this research, those were the green brand perception, green price fairness, country of origin, and society's positive attitude toward the green products. These variables were assumed to be effective in the process of the positive attitude formation toward the green products because there were still the different meanings of these variables in several previous studies (Laroche *et al.,* 2001; Hartmann *et al.,* 2005, D'Souza *et al.,* 2006; Kinra, 2006; Ahmat *et al.,* 2011; Kabadayi & Lerman, 2011; Jap and Business, 2013; Sinrungtam, 2013). It gave the opportunity in this research to explore again the variables so the same understanding was obtained in the process of the positive attitude formation of the society toward the green products.

Literature Reviews
1. Theory of Consumer Behavior
The theory of consumers' behavior was used as the basic concept to build this research model because the consumer decision making in this research was explained as the process of thinking, behaving, and acting person (Bray, 2008). Literature reviews showed that there was the approach perspective difference in the consumer research, those were behavioral and attitudinal approaches (Pachauri, 2002; Foxall *et al.,* 2006; Bray, 2008; Foxall *et al.,* 2011). Nonetheless, attitudinal approach was used to build the individual's awareness in this research through the individual thinking process expressed in the variables of the green brand perception, green price fairness, and country of origin. Meanwhile, the behaving process was expressed in the variable of the society positive attitude considered as the first step to establish the society's awareness toward the green products.

2. Positive Attitude toward Green Products
Attitude was defined as the individual subjective assessment of a brand or product (Bodur *et al,* 2000; Peter and Olson, 2002; Bohner and Dickel, 2011). This evaluation result was then stated in the forms of the pleasant or unpleasant attitude, advantageous or disadvantageous object (Krosnick and Smith, 1994; Pachauri, 2002; Sciffman and Kanuk, 2007). So the attitude occurred as the society's awareness form toward the negative impacts of the consumed products or brands (Wise *et al.,* 2008).

The literature reviews indicated that the strong attitude influenced the strong behavior. It was because the strong attitude more resisted the change rather than the weak attitude (Krosnick *et al.,* 1993; Schwarz, 2007). Attitude was formed through the consumers' learning process at stimuli developed by the marketers to arouse the consumers' positive responses (Uta and Popescu, 2013). In the context of green products, the positive attitude could be built by the society's awareness first by the stimuli assumed to influence the consumers' interest in the green products.

3. Green Brand Perception

The green brand perception is conceptualized as the stimulus considered effective in influencing the process of the positive attitude formation of the society toward the green products. It is because several studies still indicate the perception variety of the green brands expressed through functional and emotional values (Hartmann *et al.,* 2005; Hartmann and Ibafiez, 2006; Chen, 2009), and the symbol uses of *eco labeling* in the products (Lim *et al.,* 2013; Kong *et al.,* 2014). The functional values of the green products can be revealed as the indicators of environment-friendly, air pollution minimalizing, save with the money, and having quality. Meanwhile, the emotional values can be reflected in the emotion encouragement through the pleasant image projection that arouses someone's feeling such as inhaling the fresh mountain air or feeling the healthier body (Hartmann *et al.,* 2005; Hartmann and Ibafiez, 2006; Koller *et al.,* 2011).

Furthermore, eco labelling was also commonly used by the marketers as the individual's guidance to choose the environment-friendly products with minimal impacts on the environment (D'Souza *et al.,* 2006; Rex and Baumann, 2007), but a part of the individuals still showed skeptical on the green brands (Aji, 2015). It was because the green brands were still perceived to have the inferior quality with the more expensive prices than the non-green products' prices, and there was still skeptic on the benefits and/or values offered by the green products (Mahenc, 2007; Chang, 2011; Suharjo *et al.,* 2013; Aji, 2015). This condition needed the right understanding development on the green products.

The empirical study showed not all products labelled as environment-friendly were perceived to be advantageous for the consumers because the lack of the individual's knowledge about the products (Lim *et al.,* 2013). Nevertheless, products labelled as environment-friendly could also influence positively the consumers' behavior when the label was established by the organization with the good reputation (Kong *et al.,* 2014). These studies still indicated the difference of the individual's perception on the green brands. It was because there were still the differences in individual's understanding, knowledge, and awareness so affecting the individual's attitude toward the brands (Hartmann *et al.,* 2005; Hartmann & Ibanez, 2006; Chen, 2009; Koller *et al.,* 2011; Kong *et al.,* 2014). Therefore, the further exploration was needed to get the same individual's understanding about the green brands' perception.

4. Green Price Fairness

Green price fairness is the next stimulus assumed to be effective in influencing the process of the positive attitude formation of the society toward the green products. It is because there are still the various consumers' understandings about the price fairness of the green products. The literature review defines the price fairness as the consumers' judgment and emotion related with the existence or non-existence of the prices' differences offered by the sellers compared with the other sides' prices in the transactions that can be accepted and approved by the consumers (Xia *et al.,* 2004). This definition indicates that a price is perceived as fair when the consumers have the positive motives in buying; on the contrary, a price is perceived as unfair when the consumers have the negative motives in buying (Campbell, 1999).

Commonly the green products are priced higher than the non-green products. It is because the production costs of the green products are relatively higher than the costs of the non-green products (Mahenc, 2007; Suharjo *et al.,* 2013). The several studies showed the contradiction of the high price influence on the behaving process (Laroche *et al.,* 2001; Shirsavar and Fashkamy, 2013; Suharjo *et al.,* 2013). On the other hand, a part of individuals were not interested in the green products because the relative high products' prices (Suharjo *et al.,* 2013). Meanwhile, the other individuals were interested to willing to pay the high green products' prices because the products gave the additional values

(Laroche *et al.,* 2001). This difference causes the variable of the green price fairness needs to be re-explored to get the same individual's understanding about the variable; so the individual is encouraged to have the liking in the green products.

5. Country of Origin

Commonly the country of origin (COC) is used by consumers as the indicator of the products' judgment. It happens when consumers have little information about the products (Lin and Sternquist, 1994), and when consumers have difficulties in judging the products objectively (Balestrini and Gamble, 2006). The COC is also used to show the country where the products are made (Bilkey and Nes, 1982; Cattin *et al.,* 1982), the brands' producer's country (Agrawal and Kamakura, 1999), country image (Balestrini and Gamble, 2006), and country of manufacturer, country of assembly, country of parts, country of design, country of corporation ownership (Ahmed *et al.,* 2004; Showers and Showers, 2009; Sinrungtam, 2013). Therefore, the COC is considered as the last stimulus that influences the process of the positive attitude formation of the society toward the green products. It is because there is still the variety of understandings about the COC (Bilkey and Nes, 1982; Cattin *et al.,* 1982; Agrawal and Kamakura, 1999; Showers and Showers, 2009; Sinrungtam, 2013). This condition needs the further exploration to understand the meanings of COC.

The previous studies indicated the influence difference of the COC in the consumer decision making (Kinra, 2006; Batra *et al.,* 2000; Magsusson *et al.*, 2011). On one side, COC was perceived as not influencing the consumers' decisions (Kinra, 2006); on the contrary, on the other side, COC influenced the consumers' decisions (Sinrungtam, 2013). In this research, COC is considered as the variable that has the role to strengthen or weaken the relationship between the green brand perception and green price fairness of the society positive attitude toward the green products. It is because the previous studies still indicated the various understandings and influences from the COC variable in the consumer decision making; so the further exploration is needed about the COC's role in the process of the positive attitude formation of the society toward the green products.

Methodology

This study is exploratory because it searches the understanding of the individual's perception about the stimuli that form the individual's positive attitude toward the green products. The qualitative deep interview was used to get the same understandings about the variables conceptualized in the study. Fifteen informants were recruited from several public areas such as campuses, offices, and shopping places in Yogyakarta City based on the individual's interest in the green products. The interview was done in the areas chosen as long as April, May, and June 2015. The informants were interviewed not by using the demography criteria and voluntarily. Seven males and eight females participated in this interview. The interview was done semi-structured, guided by a number of questions in the way of face-to-face with the informants. The interview results were documented by tape recorder as the media. The interpretative approach was used to analyze the interview results; that was through the involvement of the inductive thinking process by understanding the research subjects, balancing the findings with the interpretation that had conception based on the relevant theoretical reviews and empirical reviews, and doing the coherent concept testing. Finally the findings are presented in the next section.

Findings and Discussions
   1.   Definition of Green Products
        The interview results indicate that individuals still had the various opinions about the understanding of the green products; but there are 2 things related with the meanings of the green products, those are (1) the products focused in the environment and (2) the products focused in health. It is because the individual, who understands the green products as the products focused in environment, cares with the environment through the actions not to damage the environment and not to pollute the environment. When individuals were asked about "what they knew about the green products", so the participants who cared the environment can be explained as follows:

   I.1 : "… products do not damage or pollute environment'.
   I.2 : "….products care with environment's safety".
   I.11: "….products do not have negative effects toward air, surrounding environment".
   I.13: "Products do not affect negatively living beings' continuation, do not damage environment, materials do not pollute environment, products are made without polluting and damaging living environment. Production process and waste materials do not damage environment".

        This explanation implies that individual realized the consequences of the consumed products. This interview are consistent with Ottman's study (1997) in Ottman *et al* (2006) and Terenggana *et al* (2013) who described the green products as the products that protected or improved the realm environment, and the products that had minimal impacts on the environment. The next explanation about the meanings of the green products can be shown as follows:

   I.9 : "…. products which process from beginning until created have already minimalize environment damage aspect so becoming environment-friendly products".
   I.10: "… products which process from production until packaging care environment problems; it means that there is tendency that goods can be reduced, reused and recycled. Or not causing harmful effects toward surrounding environment and users".

        This answers indicate that individuals realized the results caused by the production process of the green products, so it does not support Lim *et al*'s study (2013) that stated that consumers just realized the consequences of the uses of the green products, but ignored the situation and production process. Furthermore, the explanation that understands the green products as the safe products for environment can be shown as follows:

   I.5 : "… products that are environment-friendly, safe toward environment, do not damage environment. Products that can be reduced, reused, recycled".
   I.6 : "… products do not damage environment, can be recycled".
   I.15: "… products are environment-friendly, can be recycled, do not pollute and do not damage environment".

        This exposure is consistent with Durif *et al*'s study (2010) that stated the green products as the products that used the sources that could be recycled that minimalized the environment damage, and reduced the environment impacts, could be reused, and could be recycled. Then the answer related with the green products as the products focused on health can be shown as follows:

   I.3 : "… products are environment-friendly and healthy for environment and users".
   I.4 : "… products are environment-friendly and not harmful for health mainly human beings' health".

This explanation is consistent with Sangkumchaliang and Huang's study (2012) that showed that consumers judged the green products because the hope of becoming healthier and environment-friendly production.

2. Familiar Green Products

The second question was about "what kinds of products that were relatively known by individuals". It was intended to give the researcher insight about the kinds of the green products that were familiar with the consumers in the market. The interview results showed some interviewed individuals were relatively familiar with the green products such as the electronics, food materials, and automotive products. Below is the explanation of the interview results.

I.1 : "…. first, food products; second, electronics (uses of lamps with low voltage), flat televisions with low voltage, refrigerators with no CFC".

I.3 : "…..products of food, vegetables, other food materials, rice, fruits, vitamins, nutrition, include medicines and electronics (such as refrigerators, computers' monitor screens, televisions, lamps)".

I.4 : "….food, vegetables, fruits, low voltage lamps (electronics), LED televisions, lower voltage".

I.6 : "….light steel, energy-saving automotive products, electronics: uses of energy-saving lamps, low voltage LED, but brighter lighting in long time and energy-saving, in offices: paper uses' reduction such as meeting invitations that are replaced with sms".

I.7 : "….food products, electronics' uses of high radiation tubes of high electric waste are shifted into LED, vehicles that avoid emission effects".

I.8 : "….organic rice, electronics with flat screen and lower radiation, usual AC is replaced with AC with eco label".

I.13: "….vegetables with holes/free from pesticides, organic rice (brown rice), watches from wood materials and metal only in machines".

I.15: "….products of bathroom's cleaner that do not use prohibited substances, energy-saving electronics (LED). Low voltage refrigerators. Energy-saving AC".

This explanation indicates that most consumers recognized enough the green food products such as the products with the organic materials. It is supported by Tsakiridou *et al* (2008); Salleh *et al* (2010); Wee *et al* (2014)'s studies that attempts to gain knowledge the organic products and to help marketers develop marketing strategies. A part of the individuals was relative familiar with the saving-energy electronics such as lamps, refrigerators, televisions, and fans. It was because lamps, fans, and televisions could have low voltage until saving energy (*low watt - save energy*). These individuals had the perception that the tools that could save energy included in the green products' category. Furthermore, a part of the other individuals was relative familiar with the LED televisions with the low radiation effect, non CFC refrigerators, and green ACs with *eco labels*. This explanation is supported by Teranggana *et al.*'s study (2013) that indicated that trust influenced individuals' attitudes toward green AC products. But little part of individuals recognized the saving-fuel automotive and fuel with the minimal lead effect as the green products. The interview explanation can be shown as follows:

I.7 : "…vehicles that avoid emission. Expelled smoke does not pollute environment".
I.9 : "…fuel with final waste minimalized from premium to pertamax".

This explanation is consistent with Yusof *et al.*'s study (2013) that stated that consumers' responsibility feeling toward environment influenced consumers' perception on environment-friendly cars.

3. Green Brands' Information

The next explanation is to answer the question of "From which sources does individual know about the green-symbolized brands?". The interview results indicated that individuals knew the information of the brands or green products from various media such as the marketers' promotion through electronic media (such as television), printed media (such as newspaper, magazine), salespersons, and packages. A part of individuals got the green brands' information from the products themselves such as labels and packages. The interview results' explanation can be shown as follows:

I.2 : "…consumers sometimes get information including green products from producers usually from products' suspect".

I.14: "...from writings in packages or products' labels. There are organic plastic packages with triangle symbols for vegetables".

This explanation is consistent with Hartmann and Ibafiez (2006); Schmitt (2012) and Kong *et al* (2014)'s studies that green brands' perception could be strengthened by emotional values in the products by giving green labels (*eco labeling*) and green packages, mainly giving symbols or logos' that characterized green products. Meanwhile a part of participants got the products or green brands' information from the surrounding people such as from the assembly in schools and friends. The interview explanation can be shown as follows.

I.10: "…in schools' events such as writings of go green on t-shirts for *family gathering*, from parents in schools".

I.11: "…packages – triangles, writings on products' manuals, promotions, newspapers' readings, internet, friends' info, billboards".

4. Green Brand Perception

Commonly green products can be known from products' characteristics or green-symbolized brands/products. The next question is related with "how does individual know that a product or brand has green symbol". The interview results indicate that individuals know products or green brands from labels and/or products' packages. Next, the answers' quotation from the participants:

I.4 : "…. from certain logos or labels (such as herbals), electronics with low-energy, low-radiation codes".

I.5 : "…..clear writings of environment-friendly and certain signs/symbols/logos such as triangles in products' packages. Logos, symbols, packaging".

I.6 : "…. little size in packages with big character of people who used products and experienced that products had environment-friendly effects".

I.7 : "…. there is information in packages that can be emerged such as symbols on food".

I.10: "…. in packages. Detergent with green labels. Recycled papers with eco-writings in front. Beautiful food packages or separated organic foods' places".

I.12: "…packages – of arrow triangles showing recycled, writings on products' manual such as low watt".

I.13: "….there is writings in products' packages/labels. There are triangle symbols on organic vegetables/packages. The fresher of the greenness of organics".

This answer is consistent with Kong *et al*'s study (2014) that stated that consumers' perception on environment-friendly labels (*eco labels*) influenced positively consumers' buying decisions. But several participants understood green brands by seeing certain logos or symbols attached on the products; a small part of individuals could explain the logos, such as arrow triangle, *eco in paper, eco labeling,* and *safe energy* logos. It can be explained in the answers as follows.

I.8 : "….there are environment-friendly signs of eco-labeling signs/symbols on electronics in shops. Foods such as organic rice have green signs in their packages".

I.10: "…. recycled paper has *eco in paper* at front".

I.12: "….packages – arrow triangles showing *recycle*, writings on products' manual such as low watt".

I.13: "…there are writings in products' packages/labels. On vegetables' plastics/organic packages, there are triangles symbols. The greenness of organics is fresher".

5. Relationship between Green Brands' Perceptions and Consumers' Attitudes

Based on individuals' understanding on green perceived brands, so the next question was "Do green-perceived brands influence individuals' interest in green brands?". The interview results indicate that the whole participants felt that the green-perceived brands influenced their interest in the green products. It was because individuals realized that the green products did not affect the environmental damage and made the users healthy so the green products were perceived healthier, better, and more qualified. This statement is consistent with Sangkumchaliang and Huang (2012) and Kong *et al.* (2014)'s studies that the greener the products are perceived, the more certain that the products have quality, mainly the products' brands perceived stronger and healthier.

From the explanation of the green brands and their relationship with the individuals' positive attitudes toward the green products, the propositions are proposed as follows:

P1: The higher the consumers' perceptions on the green brands are, the higher the society positive attitudes toward the green products are.

6. Green Price Fairness

The next question was intended to know "how should the green products be appreciated" by individuals. The interview quotations results indicate that most participants hoped that the green products did not have to be expensive so they could be afforded by society. Individuals regarded that in the beginning of the green products' introduction with the relative expensive prices, the prices were still regarded as normal with the assumption that the prices' differences were not much different from the non-green products' prices. But in the following time, the green products known by consumers could be cheaper. The participants' answers' explanation can be shown as follows.

I.1 : "…until today, it is known that green products are relative expensive; if possible, they should not be too expensive to make the society easy to use or afford the products. If not, they will not be bought".

I.3 : "…Green products must not always be expensive. Cosmetic products must not always be expensive because made of local ingredients, not necessary to be imported".

I.4 : "….because our country is still not very developed and not developed country so green products are not too expensive compared with non-organics".

I.12: "….if there are more than one green product, the chosen one is the cheapest".

The explanation shows that individuals wanted the relative cheap green products that could be afforded. It is consistent with Lichtenstein *et al* (1993)'s studies that prices could emerge positive or negative perspective in consumers' buying decisions. If the prices were high, the products' quantity was sold lowly; on the contrary, if the prices were low, the products' quantity was sold highly. It is also supported by Sachdev (2011)'s study that consumers did not buy products if prices were high. But a part of individuals still said that it was normal if the green products were more expensive than the non-green products. It was because of the high technology, imported materials, and different processes from the non-green products' ones, and it needed researches and advertisements. This participants' answers' explanation can be shown as follows.

I.3 : "….with sophisticated technology, products become more expensive; it can be accepted because the more expensive production costs and technology are. Green products are priced in accordance with materials and technology used. Expensive prices will be normal if feeling effects/impacts in not too long time".

I.4: "…It is normal to be more expensive because the different processes from the conventional ones, as long as not too expensive. It is normal if not too different from non-greens".

I.11: "….because of the high cost of technology, it is normal if prices of green products are more expensive, but ways need to be found to make prices cheaper in the future. They produce not too many so prices are more expensive, moreover packages are different, treatments are different".

I.15: "…It is normal because they need advertisements and money for the innovations. At one time, products' mass will decrease by themselves. They need researches and markets' penetration is still low".

The above explanation is consistent with Kahneman *et al* (1986); Ahmat *et al* (2011) and Khandelwal and Bajpai (2012)'s studies that normal-perceived prices by consumers could influence consumers' attitudes and buying decisions. This result is also supported by Laroche *et al* (2001)'s studies that although products were more expensive, they gave additional values; so consumers were still willing to buy.

7. Relationship between Green Price Fairness and Attitudes

Furthermore, after individuals were able to explain the green products' prices, individuals were asked to explain "do prices become the determinant variable in liking the green products". The interview results indicate that most individuals stated prices as the determinant variable that became the consideration before deciding to buy green products, although prices were not the main considerations in buying. It was because most individuals were encouraged to like the green products because they regarded that the prices of the green products were relative normal or regarded not too far different from the non-green products' prices. This statement is supported by Campbell (1999)'s study that the consequences of the abnormal prices could direct to negative behaviors. This explanation is consistent with Khandelwal and Bajpai (2012)'s study that there was the positive influence between the prices' fittingness and consumers' positive attitudes.

Next, a small part of individuals were interested with green products because realizing that green products had better quality than non-green products. It is consistent with Lichtenstein *et al* (1993)'s study that prices influenced buying decisions if prices were identical with products' quality. Although it is belief that green products have the better

quality, a part of individuals still considers prices when facing the other kinds of the green products' alternatives. Individuals like the cheaper green products more. It is consistent with Daskalopoulou and Petrou (2006)'s study that the increase of consumers' expense was related positively with the perception of price fairness. But a small part of individuals are interested with green products because green products' prices are affordable. From the answers, it is shown that individuals still consider prices in liking green products so the proposition can be developed as follows:

P2: The higher the Fairness of the green products' prices is, the higher the society's positive attitudes toward green products are.

8. Relationship between Country of Origin and Attitudes

The next interview quotation was about "is the COC attached to a green product becomes the individual's consideration in liking the green products". The interview results indicated that a part of participants considered the COC in liking the green products. It was shown in certain green products such as automotive and electronics because a part of participants considered certain countries, such as Europe, Japan, South Korea in choosing products. Participants considered the countries as the countries that paid attention to the quality of products' development. This statement is consistent with Agrawal and Kamakura (1999); Balestrini and Gamble (2006); Magnusson *et al* (2011)'s studies that products' COC indicated country's impression that finally influenced consumers' attitude toward a brand or product. The explanation of the interview results can be shown as follows:

I.1 : "….electronic products from Japan must be good, more expensive, more long-lasting, and more trustable. Local products as food products that are more familiar can be made superior green products".

I.2 : "…green products from West European, Japan are still trusted, but from China, Malaysia are still not trusted".

I.4 : "…electronics from Japan are more in the market. From Japan will be chosen more rather than China because of the better quality".

I.9 : "….electronic products from European or Japan have certain qualification because of quality".

But a small part of participants considered to choose the local electronic products or from certain countries in their decisions. The participants were still uncertain with the green products of the certain countries. It was because the less good information accepted by the participants related with the products produced by the countries. This condition is consistent with Chao (2005)'s study that COC was used as the sign to value products and their attributes. Also Kabadayi and Lerman (2011); Chang *et al* (2013)'s studies that stated that COC influenced judgments and consumers' buying intentions toward foreign products. Next, a small part of participants did not consider the COC of the green products. The answers explanation indicates that COC are still considered by consumers in liking green products. Next the explanation:

I.2 : "….West European, Japan green products are still rather trusted, but China, Malaysia ones are still not trusted".

I.5 : "….automotive, electronics are still influenced by origin countries. For foods, local products are still trusted".

I.8 : "…examples of AC products made in China vs Korea vs Japan. With the same green labels, not from China are chosen".

I.11: "…not influencing, but China products still need consideration. It is okay for local brands such as Politron and Maspion".

I.14: "…must be careful in buying products from China. There is bad news of China

products".

9. Country of Origin Image

The last question was intended to know "how does individual's image when seeing product or brand from COC at the first time". The interview results indicate that participants had different impressions on products or green brands produced by certain countries. A part of participants had products or green brands impression from certain countries as more qualified, especially produced by developed countries. It was because developed countries had applied the good quality system control to their products. Several other participants gave the impressions of products' making process of the developed countries with high technology. Also several participants had products or green brands impressions of certain countries as products that were comfortable, reliable, with good performances, low operational costs, and high prices if re-sold. It is consistent with Kaynak *et al* (2000)'s study that electronic products were regarded as advantageous by consumers if the products were from Japan, Germany, and USA. The answers explanation can be shown as follows:

I.1 : "….when knowing that electronic products are from Japan, a large part trust and like products; people know that European's cars are safer, more comfortable, although the problem is the expensive prices".

I.2 : "…still trust developed countries' products because of technology and deep researches about products' protection".

I.3 : "…control facilities of products' quality of developed countries are commonly more qualified; it is different from developing or under-developed countries, because of lower quality, lower guarantee, although it is not right 100%. Good facilities are more possible to exist in developed countries".

I.5 : "…technology, usability, and reliability aspects. But local food products are still more trusted. China products have impressions of easy to damage, not long-lasting, although cheaper. China products, mainly foods, are poisonous".

I.6 : "Brands influence our perception so brands can be perceived good or bad according to experiences. Japan's automotive pays attention to performance in a long time. But several countries have disarrayed automotive".

I.7 : "…Developed countries have good qualities, good images, but certain countries still need considerations. China has impression of bad products' producer".

I.8 : "…China products are less reliable, low durable for electronics. Automotive is less than 1000 cc, although with the same environment-friendly label. Japan or Europeans will be chosen more because of reliability".

I.10: "….products with better quality will influence interest level. Toiletries products will not give influence because the goods are easy to get. Indonesia is still in food level, so food products will be chosen more".

Propositions can be developed from the explanation as follows:

P3: The higher the origin country is perceived by consumers, the stronger the influence of green brand perceptions and society positive attitudes toward green products.

P4: The higher the origin country is perceived by consumers, the stronger the influence of prices' fittingness on society positive attitudes toward green products.

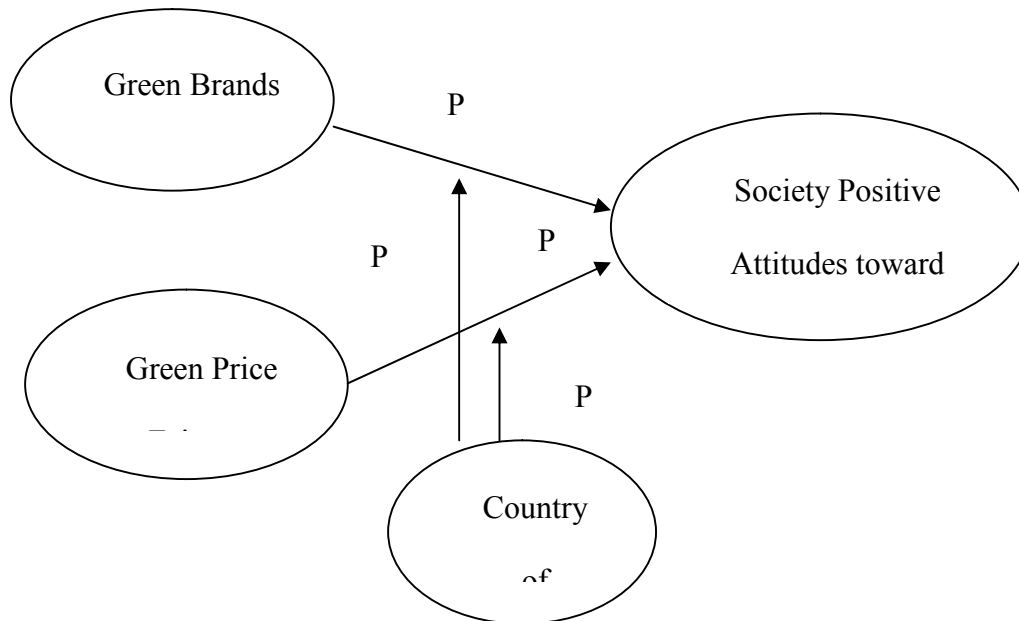
Relationship pattern is developed from 4 propositions and research model is formed.


Figure 1. Developed Model Framework

Conclusions and Implications

The findings of this study give a model framework that form the process of the society positive attitude toward green products. Moreover, three stimuli were included in this model to develop the positive attitude toward green products, those are green brand perception, green price fairness, and country of origin.

Our results indicate that individuals expects the green products as the healthier, not damaging the environment, and not polluting the environment products, and the production process minimalizes the environment damage through the actions of 3R – reduce, reuse and recycle. Furthermore, individuals are relative familiar with green products such as energy-saving electronics, organic food materials, and automotive that minimalizes lead impacts, but individuals still perceive green brands only from labels and packages attached to the products. Individuals who positively perceive green products will like green products.

The study argues that individuals still regard the more expensive prices of green products than non-green products as normal, but still hope the not expensive prices of green products in the future so they can be afforded by much society. Individuals who regard green products' prices as normal or fair will like green products. Nevertheless, individuals consider the COC in liking green products especially electronics and automotive.

Furthermore, the study suggests several implications theoretically and practically, and for the future research(s). Study' implication theoretically suggest that the constructed and explored variables in the study involve green brands perception, green price fairness, country of origin; it is hope that they can explain the phenomenon of the formation of society's positive attitudes toward green products. Study implication practically suggest that this research is expected to be the first study to give insight to the marketers in developing consumers' interest in green products through the stimuli related with variables developed in this research. Finally, study implication in continuation study suggest that this research is expected to be continued in the future research(es) by testing propositions and developed model.

EXPLORATION OF CONCEPT OF FORMATION PROCESS OF INTENTION TO ONLINE TRANSACTION: IN THE CONTEXT OF ONLINE SHOPPING IN INDONESIA

Didik Setyawan, Setia Budi Surakarta University, Indonesia
Budhi Haryanto, Sebelas Maret Surakarta University, Indonesia

Abstract

Online transaction intention is still a topic that is interesting to study because there is still no model in the formation of intention to online shopping that can be applied to various researches settings. So this research aims to explore the formation process of intention to online transaction by using the concept of behavioral theory applied to the information system and to explore media exposure effects of giving the stimuli of cognitive, affective, and conative behavior relationships of explaining online transaction process of youth ages group. The finding results show that the intention to online transaction that is the conative behavior form is influenced by affective behavior that consists of cognitive attitude and behavior those are perceived easy of use and risk perception. The formation of online transaction intention is also influenced by external factor that is media exposure that gives information stimulus to individuals who can give emotional responses and behaviors.

Keywords: *intention to online transaction, attitude, perceived easy of use, risk perception, media exposure*

Introduction

Intention to online transaction is a topic that is still interesting to study. It is because there is no model that forms intention to online shopping that can be applied to various researches settings. It means that the previous researches still produced one model applied to an observed object (Agarwal *et al*., 2004; Lin, 2007). It can be explained that each model was oriented toward problem implicated on variable variety (Probst *et al*., 2006; Green and Pearson, 2011; Hsieh and Lio, 2011). Previous studies showed that the variable variety formed intention to online transaction become the research purpose that had impact on various research results (Grandon and Mykytyn, Jr., 2004; Yang *et al*., 2007; Lin, 2007). The research results' variety of intention to online transaction gives opportunity to the researcher to construct model by putting in the other variables indicated theoretically in explaining the formation of intention to online transaction.

Model development of the formation of intention to online transaction can be explained by behavioral model applied to information system (Compeau *et al*., 1999). It is indicated that there are 3 approaches of behavioral information system that are used to explain online shopping model and still have application's weaknesses. The first model is *Theory of Planned Behavior* TPB developed by Ajzen (1988). But, TPB as a common model has weakness of individuals' cannot explain specifically, especially belief variable related with certain behavior of the application of online transaction research (Sentosa and Mat, 2012). The second model used to explain online shopping is *Technology Acceptance Model* (TAM) developed by Davis *et al*. (1989). The results' inconsistency indicates that there are the other factors that are not contained in TAM (Collerette *et al*., 2003). The research results variety using TAM basic model indicates that the users' behaviors of information technology system of TAM are not controlled by the behavioral control that limits the behavioral intention (Collerette *et al*., 2003; Sun and Zhang, 2006; Probst *et al*., 2006; Hsu and Lin, 2008). And, the joined model of TAM and TPB is the third model that is used to explain the online shopping behavior (Lin, 2007; Yaghoubi and Bahmani, 2010;

Daud *et al.*, 2011; Sentosa and Mat, 2012). But research by joining TPB and TAM still has weakness of variance contribution of the joined models of TPB and TAM that can only explain 57% of forming behavioral intention (Lin, 2007) and the constructions' measurement that is adapted from the previous research(es) that makes the various observed objects cannot be generalized (Daud *et al.*, 2011; Sentosa and Mat, 2012). The re-evaluation is needed in the used constructions' operation (Green and Pearson, 2011) and the used methods in accordance with the research observed objects (Agarwal *et al.*, 2004) in online transaction research.

This research variety of online transaction gives opportunity to make alternative model by the observed phenomenon. The constructed model of this research is the basic model that can be applied in accordance with the problems and observed objects. To construct the formation model of intention to online transaction, the qualitative method needs to be used with the purpose of understanding phenomenon or social indication by emphasizing the complete picture of the observed object that is reviewed to become the related variables (Sarantakos, 2005). It refers to Hsieh and Liao (2011)'s statement that stated that the research of online business could not be generalized in the different object phenomenon, country, and culture with the same approach.

The research with qualitative method in this study is based on the behavioral theory that reveals three structures of consumers' behavioral process in online shopping. Literature review indicates 3 structures that form the behavioral processes those are cognitive, affective, and conative (Ajzen, 1991). Cognitive is the process of knowing and understanding of defining an object's information (Brooks *et al.*, 2013). The variables that build the cognitive behaviors are identified among others are belief (Ajzen, 1991), perceived usefulness and perceived easy of use (Lin, 2007), fittingness (Daud *et al.*, 2011), and risk perception (Almousa, 2011). These cognitive behavior variables are the predecessor stage that can form consumers' affective behavior (Ajzen, 1991; Brooks *et al.*, 2013).

Affective behavior is affected by the social interactions experienced by individuals in the forms of both favorable feelings and *unfavorable feelings* of an object (Ajzen, 1991). Several variables that build the affective behavior among others are belief (Hsieh and Lio, 2011) and online shopping attitude (Pi and Sangruang, 2011). This affective behavior can show the existence of individuals' tendency to behave frankly (Davis *et al.*, 1989; Ajzen, 1991; Hsieh and Lio, 2011) based on the faced object. Based on the behavioral process, it can be proposed that influencing intention to online shopping as the form of individuals' conative behavior is complex because of the many variables that influence it (Wu and Wang, 2005).

Related with the cognitive structure, the perceived easy of use becomes the important variable of forming consumers' attitudes and intentions to online transactions (Kim *et al*, 2005; Schepers and Wetzels, 2007; Ha and Stoel, 2008). But there is still inconsistency of the relationship results between the variables of perceived easy of use, attitudes, and intentions to online transaction (Lin, 2007; Ha and Stoel, 2008: Almousa, 2011). This inconsistency needs the continuation testing of the relationship concept between perceived easy of use, attitudes, and intentions to online transaction, so the results' certainty are produced, so attitudes and intentions to online transaction can be formed effectively.

Risk perception is the other cognitive structure of forming consumers' attitudes and intentions in online transactions (Pi and Sangruang, 2011; Chen *et al.*, 2011; Almousa, 2012). In the research context of online shopping, it is indicated that risk perception influences negatively *e-commerce* adoption (Ahn *et al.*, 2004), online shopping attitudes (Shih, 2004), and intentions to online shopping (Almousa, 2011), in which risk perception

is regarded as a belief in uncertainty potential of negative outcomes of behaviors and disadvantages' attributes' consequences (Pi and Sangruang, 2012). This explanation shows that risk perception can become the buying decision determinant to reduce the occurred disadvantages in online shopping (Li and Huang, 2009).

As the conative behavior, the formation of intention to online transaction is influenced by the predecessor variables those are the easy to use perception (Almousa, 2011; Hsieh and Lio, 2011; Sentosa and Mat, 2012), risk perception (Almousa, 2011; Green and Pearson, 2011; Pi and Sangruang, 2011), and attitudes (Suh and Han, 2003; Schepers and Wetzels, 2006; Hsu and Lin, 2008). Commonly, there are no differences in those three variables in both the information system study and online transaction. But the distinguishing factor in this study is the existence of *media exposure* that can be the key variable that has the role to influence consumers' intentions in online transactions (Agarwal *et al.*, 2004; Jordaan and Ehlers, 2009), that online transaction is the two ways communication in which in getting the information, the different process from traditional marketing channel is needed.

Media has important role in changing internet users' behaviors in online transactions. The continual media exposure effect will tend to improve the people's longing of getting the stimulus of actions (Ruiz and Sicilia, 2004). Effects of this digital media exposure can influence both direct and indirect process of consumers' cognitive (van Raaij *et al.*, 2005), affective (Kim *et al.*, 2002; van Raaij *et al.*, 2005), and conative (van Raaij *et al.*, 2005) behaviors. So, the purpose of this study is to explore media exposure effects of giving the stimulus of the relationship between cognitive behavior (perceived easy of use and risk perception), affective behavior (attitudes), and conative behavior (intentions) in explaining online transaction process of the youth ages group. Therefore this study will focus on how the behaviors are and how online shopping of the youth ages consumers because of the used media exposure is.

Literatures Review

Commonly intention is defined as the longing to behave (Ajzen, 1988). In the concept of TRA, actions by individuals are based on the assumption that individuals tend to behave consciously by considering the available information and also considering the impacts of the established actions (Azjen, 1988). The explanation is strengthened by Ajzen (1991) that described intention as individual's willingness of trying to do certain behavior. This definition indicates that individual's intention to behave or not to behave can become the prediction of the individual's direct determinant to behave.

The intention concept explanation in the context of online shopping is focusing on individual's willingness of doing transactions (Ha and Stoel, 2008). Intention to online transaction is defined as the consumer's willingness to use *website* in the relationship of online exchange and service providers (Sanz-Blas *et al.*, 2008; Green and Pearson, 2011). The form of online exchange relationship among others is business information sharing, business relationship maintenance, and business transactions. Based on business transaction process, e-commerce acceptance requires consumers to use website to get and provide information, and then finish the transactions by buying products or services (Pavlou, 2003). The discussion can explain that the consumers' intentions to decide online shopping need website effectiveness that can facilitate online transactions and services.

The formation of online transaction intentions is not different from consumers' behaviors concept with attitudinal approach, in which consumers' behaviors are built of the contented attitudes of a brand or product (Lichtle dan Plichon, 2008), and intentions to buy are the attitudes' measurement of behaviors. In behavior formation, the attitudinal approach is the behavior prediction that can be used to complete the lack of behavioral

theory in building consumers' motivation with psychological evaluation to create consumers' positive feelings (Lichtle and Plichon, 2008). So the formation of intentions to online transaction with the belief process in a service (cognitive) builds the positive attitude on a service (affective), and willingness to do transactions (conative).

The tendency of online shopping phenomenon in Indonesia in the one last decade influences consumers' behaviors change in the willingness to do transactions mainly by the youth ages group because of the development of online selling and buying forum (Piarna, 2014). Online shopping characteristics that offer the low costs, comfort, and easiness, but also show risks in transactions processes form consumers' attitudes and intentions changes. It indicates that intentions to online transaction are not separated from the existences of the intentions framer variables confirmed by evaluation process and individuals' beliefs in perceiving objects. The previous studies indicated the existences of the variables of the framers of intentions to online transactions among others are online shopping attitudes (Lin, 2007; Ha and Stoel, 2008; Hsu and Lin, 2008), easy to use perceptions (Sun and Zang, 2006; Fang *et al*., 2008; Celik, 2011), and risk perceptions (Wu and Wang, 2005; Tong, 2010; Almousa, 2011). The decisions of doing online transactions are also influenced by the external variables that both directly and indirectly can influence individuals. This research proposes media exposure used as the external variable that both directly and indirectly can influence individuals to do online transactions (Agarwal *et al*., 2004; van Raaij *et al*., 2005).

Media exposure is media use or media acceptance that is defined as individuals' activities of listening, watching, and reading mass media's messages (McQuail, 1994). Media exposure is not only related with individuals physically; it is in mass media reach, but also really touched by messages in the forms of reading, listening, watching activities, or just only watching the media messages. Referring to the statement, online information media is the part of mass media in giving information to the users in the online or virtual form.

Online information media is media construction that changes individuals' behaviors significantly as the new communication tool (Jordan and Ehlers, 2009). So, several studies regarded that online information media as the new media aspects became digital (texts, pictures, and voices combined in two ways channel), interactive (the existence of feedbacks from information receivers), arousing audiences (audiences' capability to contribute), not together (the communication actions that were distributed anytime), multimedia (presentation methods), and focus (communication channel was dedicated to specific audiences) (Nabi and Kremar, 2004; Jordan and Ehlers, 2009). It can be concluded that the internet media contents can encourage mainly the users' emotion and can encourage the buying behaviors because of the watched, listened, and searched information (Marimoto *et al*., 2003).

Methods

This research aims to stimulate individuals' perceptions of online transactions to tell their opinions in group discussion(s) and deep interview(s) of exploring the framer factors of online transactions intentions using the phenomenology paradigm. Phenomenology research gives contribution of proofs' searching of the number of aspects of the research's theories and and practices phenomena reality happened by seeing reality perception and humans perception as the research's objects (Sarantakos, 2005) that can be used to get the familiarity of phenomena or to find the new relationships to be able to formulate the matters to be more exact and to find hypotheses if necessary. The used approach in this research is etnography approach in which the researcher did the research of transaction behavior culture using online shopping website.

Data collection used *Focus Group Discussion* (FGD). FGD aims to explore and clarify the findings of theoretical reviews and phenomena of online transaction practices in Indonesia (McMillan dan Morrison, 2006). FGD in this research was designed for participants group who were used to use information system but did not have experience in online selling and buying transactions yet. So, the participants were university students who took Industry Engineering Study Program and had knowledge of information system.

The further data collection stage was the deep interview. Interview is data collection method of asking something to the respondent by being engaged in face to face conversation (Sarantakos, 2005). The interview participants were the university students of Management Study Program who had taken the subject of Management Information System and were expected to understand information system but did not have experience of online transaction yet.

Qualitative data analysis in this research is constant comparative analysis that is useful for theory development researches (Zoran *et al.*, 2009). There are three main stages of constant comparative analysis; first, the open coding that is classifying data to be put into small units. The second stage is *axial* coding that is coding grouped into categories. Lastly is selective coding with the function of building one or more themes that reveal the content(s) of each codes group. The coding purpose is to organize data, classify them into units that can be managed, synthesize them, search and find pattern(s), and find something important, then deciding to formulate ones that can be formed into themes to be formulated in work hypothesis as suggested by data. The data arrangement and management aims to find the process of individuals' behaviors formations in the use of online shopping website for online selling and buying transactions.

Results
1. Concept of Online Transactions

Theoretical reviews show several term differences on both goods and services selling and buying using internet networks among others are internet e-commerce (Wu and Wang, 2005), internet shopping (Kim *et al.*, 2004), online transactions (Green and Pearson, 2011), and shopping online (Tong, 2010). The differences are caused by the characteristics scope of online users used as samples by the researcher. Wu and Wang (2005) proposed the term of internet e-commerce that included online advertisements, online shopping, online investments, online banking, and the other online services (such as email, information searching) that made possible for everyone to interact by internet in daily life. Meanwhile the term of internet shopping proposed by Kim *et al.* (2004) was given meaning by products shopping via internet that represented easiness, economical efficiency, and entertainment. The meaning of this sense is that the shopping via internet is understood as the easiness of products information searching of the searching freedom for products information, existence of the sale product variety, and also freedom of comparing various products of competitors.

The other term of goods and services' selling and buying using internet network was online transaction proposed by Green and Pearson (2011). According to Green and Pearson (2011) online transaction emphasized the exchange relationship in the way of online that included sharing business information, managing business relationship, and doing business transactions. Based on the online transaction process, consumers are expected to use online retailers' website to get and provide complete information of products or services buying transactions. The meaning giving of the other online shopping term was proposed by Tong (2010) who explained virtual shops' activities that could influence consumers' behavior to search the wanted products and finally do transaction in internet.

In Indonesian society environment the terms related with selling and buying in internet are also developed. It can be seen in the results of *Focus Group Discussion* that revealed the existence of two terms of selling and buying in internet those were online transaction and online shopping. According to participants, the similarity of online transaction and online shopping is their searching of goods in internet network(s), meanwhile the difference is that there is still additional process in online transaction because of the online shopping.

The similarity may be that online shopping and online transaction searches goods, meanwhile the difference is when we do shopping we can buy the searched goods directly but in the transaction there is still one more process because of the online shopping.

(Participant 4 – FGD – September 9th, 2015)

But the term of online shopping is much developed in the society because it is easier to understand. It is because media has the big role of informing online shopping term although the society does not know the real meaning of online shopping.

…..it seems to be easier to use the term of online shopping that is developing in the society because it is easy to understand.

(Participant 2 – FGD – September 9th, 2015)

…..common society may understand more online shopping.

(Participant 1 – FGD – September 9th, 2015)

I understand more this online site; it may be because the site puts very many advertisements into both the printed media and electronic media.

(Participant 1 – FGD – September 9th, 2015)

…..I also know much from media mainly many in social media and sometimes also family informs that the site is good for online shopping.

(Participant 4 – FGD – September 9th, 2015)

Participants agreed to use the term of online transaction in which online transaction did not only look for goods through online site but also there was additional process after goods searching. Besides, online transactions were not only transactions in the forms of goods, but also could be in the forms of service transactions including exchange transactions of both goods and services. Participants also regarded that the term of online transaction was safer because in the process, the steps that consumers must do were informed. Next were the answers revealed by participants about the online transaction understanding.

The difference is it may not be only in the forms of goods in transactions, but it is in the forms of goods in shopping.

(Participant 3 – FGD – 9 September 9th, 2015)

….in transaction, there is still one additional process because of online shopping.

(Participant 4 – FGD – September 9th, 2015)

The easy term to use may be online transaction because we can choose the wanted goods and know the steps.

(Participant 2 – FGD – September 9th, 2015)

….there are safety and comfort in online transaction; the term of online transaction is more exact.

(Participant 1 – FGD – September 9th, 2015)

Based on discussion results with participants, the meaning of online transaction can be concluded as the continuation process of online shopping result of both goods and services transactions through the determined steps by the site manager to improve safety and comfort as the transaction process goes on. This finding strengthens the term of online transaction developed by Green and Pearson (2011), in which online transaction is explained as the online exchange relationship including business information sharing, business relationship management, and doing business transaction that obligates each doer involved in the transaction to give the whole and complete information in the transaction process.

The same explanation of online transaction was also proposed by Jiang *et al.* (2006) who stated that to improve intention to business transaction of the site manager of online selling and buying, the transaction process mechanism should be informed including consumers' private protection, because in online transaction, the information of transaction process mechanism was the important thing as the knowledge for the site manager of online selling and buying oriented to consumers. It can be concluded that in the process of selling and buying by internet, the more exact term uses online transaction that explains the transaction process that can improve consumers' safety and comfort.

The intention concept was commonly defined by Ajzen (1988) as the willingness to behave. The intention's meaning is the individual's willingness to try to do certain behavior (Ajzen, 1991). In its development, intention experiences meaning change based on the used research object. In the context of online transaction, based on the discussion results wth the participants, intention to online transaction occurred if participants had knowledge and understanding of online transaction process. Participants' statement of knowledge and understanding of online transaction process is presented as follows.

….if person is easy in understanding online shopping, person is influenced to tend to buy.

(Participant 2 – FGD – September 9th, 2015)

….buyers will tend to buy products of cheap and easy site.

(Participant 4 – FGD – September 9th, 2015)

The meaning of the discussion results is that intention to online transaction is defined as the individual's willingness to continue the process of online shopping results of both goods and service transactions through the steps determined by the site manager. The definition of intention to online transaction explains that if consumers know and understand the steps of online transaction process, consumers' willingness to continue online transaction can be influenced; but if consumers do not have knowledge of online transaction, it causes the low willingness to do online transaction. This explanation strengthens the meaning of online transaction intention that is defined as consumers' willingness to use website in online exchange relationship with the service providers (Sanz-Blas *et al.*, 2008; Green and Pearson, 2011) that need consumers' knowledge understanding of online transaction process of sharing business information, managing business relationship, and doing business transaction.

2. Intention to Online Transactions

The formation of intention to online transaction is not different from behavioral concept of cognitive, affective, and conative processes (Lichtle and Plichon, 2008). The discussion results with the participants find variables included in the cognitive behavior group that are perceived easy of use, benefits perception, privation, risk perception, service quality, innovativeness, and knowledge. The discussion results of the factors that form intention to online transaction are revealed as follows.

….the easiness to use, because online shopping can be done wherever the place is and whenever the time is as long as there is internet connection.

(Participant 3 – FGD – September 9th, 2015)

….benefits that are gotten. We will also use time more efficiently, while we must come to the goods one by one in shops. If online, we just open HP and search.

(Participant 2 – FGD – September 9th, 2015)

….buyers information privation, in online selling and buying, sellers often ask for information, but buyers are afraid if the information will be mistreated.

(Participant 1 – FGD – September 9th, 2015)

….gotten risks. We often hear deception news of online shopping. For example, we buy A and transfer money, but getting different goods from what we want.

(Participant 1 – FGD – September 9th, 2015)

….service quality of site manager. Quality will affect online shopping factors, because low quality may make many people remove them from site feature.

(Participant 3 – FGD – September 9th, 2015)

….site innovativeness. With innovative site feature, consumers may be willing to try to buy from the online site; for example, what we buy is the same with what we want; it makes consumers trust the online site.

(Participant 6 – FGD – September 9th, 2015)

….according to me, transaction process knowledge, if buyers less understand with the transaction process, they will suffer losses.

(Participant 1 – FGD – September 9th, 2015)

….transaction process concern. If money is transferred but goods are not sent according to the determined date, buyers will worry. Buyers must wonder whether goods are sent or not.

(Participant 4 – FGD – September 9th, 2015)

Based on the discussion results, it is explained that there is the framer variable variety of intention to online transaction of cognitive behavior group that is perceived by the participants. This finding is not different from the theoretical review that shows the existence of the variable variety of the framer of intention to online transaction among others are risk perception (Wu and Wang, 2005), perceived usefulness (Almousa, 2011), perceived easy of use (Lee, 2009), benefits perception (Rao *et al*., 2008), privation (Polychronopoulos *et al*., 2012), website quality perception (Compeau *et al*., 1999), and experiences (Kim *et al*., 2004). The variable variety of the framer of intention to online transaction is caused by observed object variety that has impact on the research purpose (Grandon and Mykytyn, Jr., 2004; Yang *et al*., 2007; Lin, 2007).

3. Relationship between Perceive Easy of Use and Intention to Online Transaction

Referring to the discussion results with the participants, the framer variable of intention to online transaction of cognitive behavior group directs to two variables those are perceived easy of use and risk perception. In which the perceived easy of use is explained as individual level who believes that using online transaction is free from effort (Shih, 2004). In the context of online shopping, the perceived easy of use is defined as

consumers' belief perception of using website to exchange goods and services that are free from effort (Tong, 2010; Green and Pearson, 2011). The variety of giving meaning to the perceived easy of use is also revealed in the interview done with participants presented as follows.

….it just only needs access through gadget or computer wherever we want….

(Participant 1 – Interview – October 27th, 2015)

….doing transaction with chats….

(Participant 1 – Interview – October 27th, 2015)

….payment is done by transfer and goods are sent until buyers' home without buyers' going outside.

(Participant 1 – Interview – October 27th, 2015)

….just needs little time to transfer money.

(Participant 2 – Interview – October 27th, 2015)

….shopping without tired and very tired, we are easy in buying far goods because we just order goods via internet; we do not need to get busy, just order and transfer, goods will be sent home….

(Participant 3 – Interview – October 27th, 2015)

….buying the wanted item fast and easily.

(Participant 4 – Interview – October 27th, 2015)

Can choose various kinds of goods without visiting selling places. More effective and simpler.

(Participant 4 – Interview – 27 October 2015)

The participants' answers found were various in giving meaning to the easiness of online transaction. But the statement revealed by participants such as "access whenever and wherever", "paying by transfer", "without going outside", "not tired and busy", and "fast and easy" are the indications of online transaction easiness. The answers revealed by participants were the individuals' belief in the online transaction easiness that was free from efforts. The answers support the explanation revealed by Tong (2010) who stated that easiness perception focus of online shopping object was the transaction's easiness by *website* that gave contribution to consumers' perception that they were free from effort because of buying in online shops rather than traditional shops. The explanation means that giving meaning to perceived easy of use in online transaction is consumers' rational reaction when using information technology (Gefen *et al.*, 2003).

Participants revealed that intention to online transaction was easy and to improve intention to online transaction, the process easiness was necessary. Next is the presentation of discussion results answers by participants about the easiness that becomes the important factor in online transaction.

….online shopping makes the transaction easy. Sellers and buyers do not have to be face to face and they can have online connection.

(Participant 1 – FGD – September 9th, 2015)

….the easy use is caused by the easy to understand online shopping. It means that if people are easy in understanding online shopping, it will influence them to buy.

(Participant 2 – FGD – September 9th, 2015)

….benefit of online shopping is the easiness, can be used whenever and wherever

(Participant 3 – FGD – September 9th, 2015)

….everything is sophisticated in this era. We can do easy transaction by using smart phone, social media and the other media such as laptop. Just enter the website and we will be able to choose the wanted items directly.

(Participant 4 – FGD – September 9th, 2015)

….online shopping eases us in buying goods transaction.

(Participant 5 – FGD – September 9th, 2015)
….it is easy enough to find the wanted items in online shopping, not like in offline shops.

(Participant 6 – FGD – September 9th, 2015)
In using online site, we do not need to come to shops; just search goods and we can get them easily.

(Participant 7 – FGD – September 9th, 2015)

The discussion results explain that participants perceived that online transaction was easy and giving easiness to the users. It is consistent with Davis (1989)'s idea that mentioned that in the context of information technology, the use easiness was needed to improve individuals' willingness to use it (Ha and Stoel, 2008). It can be concluded that easy to use perception becomes the important factor of online transaction process.

Proposition 1 :   **the higher perceive easy of ease, increasingly the desire of individuals conducting online transactions**

4. Relationship between Risk Perception and Intention to Online Transaction

The other dominant factor of cognitive behavior group that can influence individual's intention to online transaction is risk perception. Participants really did not only reveal risk perception as the framer factor of intention to online transaction, but also gave answer about risk forms in online transaction such as privation and worry. Risk factor of forming online transaction intention was expressed by participants as follows.

….buyers information privation; in online selling and buying, sellers ask information from buyers, but buyers feel afraid if the information is mistreated.

(Participant 1 – FGD – September 9th, 2015)
…transaction process worry; in online shopping, it is usually the payment first and then the item is accepted in different time so there is worry that sellers will lie.

(Participant 1 – FGD – September 9th, 2015)
….transaction process worry. If money is transferred but item is not sent yet in accordance with determined date, it causes buyer's worry. Buyer must wonder whether item is sent or not.

(Participant 4 – FGD – September 9th, 2015)

The study of discussion results from the participants can be meant that online transaction reveals risk caused by participants' not knowing in understanding the transaction process. In the context of consumers' behavior, risk is given meaning as consumers' uncertainty perception and involves the existence of financial loss possibility in each transaction process activity (Grazioli and Jarvenpaa, 2000). Meanwhile in the context of online transaction, risk perception is defined as consumers' subjective belief in the financial loss gotten from intentional payments in online transaction processes (Green and Pearson, 2011). This explanation was revealed in discussion and interview with participants that is presented as follows.

….what we buy, apparently not in accordance with what we hope.

(Participant 2 – FGD – September 9th, 2015)
….there is fear that seller will lie.

(Participant 1 – FGD – September 9th, 2015)
…. Must give worry to buyers.

(Participant 4 – FGD – September 9th, 2015)
….the coming item is too big; we suffer financial loss….

(Participant 7 – FGD – September 9th, 2015)
I have tried to buy online item, but the item is not like expected.

(Participant 4 – Interview – September 9th, 2015)

The expressed answers by participants show that there was fear to do online transaction that was perceived by individuals in doing actions because of not knowing the expected results. The meaning of the answers expresses that risk perceived by participants in online transaction means that there was results' uncertainty as what expected. This explanation is consistent with the statement expressed by Rao *et al*. (2008) who proposed that risk was an action or not an action that would have impact on financial loss possibility. The explanation gives meaning that risk is an individual's behavior form that involves the consequence of negative potential or financial loss caused by an action.

Risk in online transaction occurs because of the existence of the individual's not believing in an object. Trust has an important role to be one of the determinants of individual's seeing the risk (Agarwal *et al*., 2004), in which trust is regarded as the control mechanism that can facilitate exchange relationship characteristic that is the uncertainty in the future (Fang *et al*., 2009). It was expressed in both discussion and interview done with participants that is presented as follows.

….we must really trust the services given by the online site including the goods' choices, not just order.

(Participant 2 – FGD – September 9th, 2015)

To trust online sale is not easy because there are also many deceivers in online sales.

(Participant 2 – Interview – October 27th, 2015)

….according to me, this online business has trust from customers toward businessmen and vice versa as the capitals.

(Participant 4 – Interview – October 27th, 2015)

If we intend to buy online, we must find information whether the online business can be trusted or not.

(Participant 2 – Interview – October 27th, 2015)

The answers of the participants show that in online transaction process, risk as objective reality has impact on consumers' uncertainty that is caused by the limited information that is gotten. This review gives proof that risk of online transaction process is the personal belief that is involved in each online transaction based on the owned limited information (Wu and Wang, 2005). Based on the explanation, it can be concluded that risk perception is defined as consumers' subjective belief in getting financial loss because of getting the wanted outcomes in online transaction process (Green and Pearson, 2011). It means the highness of the not believing and lack of gotten information give impact on the highness of risk perception level in online shopping that can become the cause of consumers' avoiding buying (Harper *et al*., 2004).

Proposition 2 : **the higher of risk perception, lower the desire of people conducting online transactions**

5. Relationship between Perceive Easy of Use, Risk Perception, and Attitude Toward Using Online Transactions

The formation of intention to online transaction in the behavioral process is also influenced by affective behavior. Affective behavior refers to emotional interpretation as an object's evaluation form to get the positive or negative judgment (Nahl, 2001; Huitt and Cain, 2005; Brooks *et al*., 2013). The discussion results with the participants that include the affective behavior are trust and like that are the participants' evaluation results of an object expressed by participants as follows.

….fondness of users themselves. He/she can select and buy item(s) so he/she gets pleasure. Items that he/she can buy in offline shops may not exist but in online shops, they exist so he/she gets pleasure.

(Participant 4 – FGD – September 9th, 2015)

….fondness of users. All people are happy or willing to buy online because the variation kinds and various prices.

(Participant 5 – FGD – September 9th, 2015)

….trust of site manager. Usually the known site will be guaranteed and not be deceptive.

(Participant 3 – FGD – September 9th, 2015)

The discussion results can mean that individual's trust and like or vice versa are the forms of individual's evaluation on an object that can form attitude. Ajzen (1971) gave meaning to attitude as individual's belief evaluation on positive or negative feeling for an object. The discussion of attitude in the affective dimension is focused on individual's feeling in term of like on the observed object and he/she measures the appeal emotional level of the object (Yang and Yoo, 2004). Meanwhile attitude in the context of consumers' behavior is individual's feeling for certain product that causes individual responds well or unwell the certain product (Luque *et al.*, 2009).

The behavioral discussion in the context of online transaction gives the same explanation in giving meaning to attitude. Attitude explains the good or not good consumers' feelings that can direct to the website use decision of online shopping (Lin, 2007). It is assumed that consumers' decisions to do online transactions based on their beliefs in the knowledge of an object's attributes involving internet use experiences that can form attitudes (Hsieh and Liao, 2011). So it is expected that the good attitude eases the online transaction and reduces consumer's obstacles to adopt online shopping website (Hassanein and Head, 2007). It can be concluded that individual's trust and like of online transaction is the attitude directed on the online transaction use.

The attitude formation on online transaction, individual's experiences and knowledge factor have important role in giving the attitude meaning (Hsieh and Liao, 2011). Using his/her knowledge and experiences in giving meaning to the online transaction, individual evaluates object that is felt in the attitude formation on online transaction. It is revealed in interview done with the participants to express the attitude's meaning. The interview results are expressed as follows.

….attitude on online shopping is the technology improvement that eases consumers….

(Participant 1 – Interview – October 27th, 2015)

….must know whether online business is deceptive or not.

(Participant 2 – Interview – October 27th, 2015)

….online business is a trust….

(Participant 3 – Interview – October 27th, 2015)

….according to me, this online business has trust from customers to businessmen and vice versa as the capital.

(Participant 4 – Interview – October 27th, 2015)

….will occur based on others, friends or best friends' experiences who previously did transactions with certain online shops….

(Participant 1 – Interview – October 27th, 2015)

Based on statement expressed from the interview, it is shown that participants' knowledge and experiences could form perceived easy of use and risk perception in online transaction as participants' bases of evaluating online transaction of building motivation directed to attitudes. This statement is consistent with what was expressed by Hsieh and Liao (2011) who assumed that consumers' decision process of doing online transaction based on their beliefs in knowledge of attributes of an object involved internet use experiences that could form attitudes. The discussion means that consumers' knowledge

and experiences of online transactions are expected to form individuals' positive attitudes to ease and reduce obstacles that can influence individuals' online transactions.

Proposition 3 :   the higher perceived ease of use, higher the positive attitude towards online transactions

Proposition 4 :   the higher of risk perception, lower the positive attitude towards online transactions

6. Relationship between Attitude Toward Using and Intention to Online Transactions

Consumers' decisions processes of attitudes formation are influenced by individuals' motivations that are identified to have two motivations of shopping those are hedonic shopping (for pleasure) and utilitarian shopping (with purposes as wanted) (Babin *et al*., 1994). There was motivation variety built by participants in forming attitudes on online transactions. The variety was influenced by the background of participants' characteristics among others are income level, knowledge level, and experience level. The answers variety of participants' motivations of forming attitudes on online transactions is presented as follows.

….young generation today tends to want to be seen the same as the other friends. They want to be cool, although actually what they do and what they need sometimes do not have relationship, just only want to be regarded the same as their environment.

(Participant 2 – FGD – September 9th, 2015)

Items can be chosen and bought, so buyers are happy.

(Participant 4 – FGD – September 9th, 2015)

All people love or want to buy online because of the variations of kind and price.

(Participant 5 – FGD – September 9th, 2015)

….just search the wanted items and we can get them fast.

(Participant 7 – FGD – September 9th, 2015)

….do not need to go outside and easy; just only need to order in accordance with the pictures of online shops….

(Participant 1 – Interview – October 27th, 2015)

Do not need to visit items' selling places but buy directly the wanted items fast and easily.

(Participant 4 – Interview – October 27th, 2015)

From the statements of the participants, it is found that there is individuals' motivation variety of forming attitudes on online transactions. The words "can be cool", "want to be regarded the same", and "give pleasure" show that participants had hedonic motivation that meant that individuals in online transactions just did them for pleasure; it could form attitudes on online transactions. This statement is consistent with what was revealed by Babin *et al*. (1994) who stated that hedonic shopping motivation was the shopping decision of giving pleasure to self that involved internet searching process in shopping site and only visiting his/her pleasure related sites.

Based on participants' answers, it is also revealed that there are words such as "there are variations", "fast to get", and "fast and easy" that means that individuals' motivations in online transactions are rational by buying online products according to their needs. This rational motivations are the forms of utilitarian motivation that is given meaning that the rational shopping motivation of doing shopping process has characteristics of easiness, informativeness, selectors in online shopping, and ability to control the shopping desire by the clear information sources needs before buying (Babin *et al*., 1994). The answers' variety given by participants shows the existence of individuals'

motivations differences of evaluating online transactions in forming attitudes. It means that there is motivation variety of building attitudes of each individual of understanding online transactions that can direct to online transaction intentions. From this explanation, it can be concluded that there is attitude role in online transaction in the formation of intention to online transaction.

Proposition 5 : **the higher positive attitude towards online shopping, increasingly intention to online transactions**

7. Role of Media Exposure

Information becomes the important part of changing individuals' behaviors (Nahl, 2001). The processes of individuals' verbal or visual information can influence individuals' perception from their environment stimuli that can create emotional responses and behaviors (Morimoto *et al*., 2003). The explanation gives meaning that media has the important role for individuals to get information that can improve individuals' capacity to achieve their purposes. So, individuals' decision makings need information gotten from media exposure continuously.

Online media is the part of media that gives information to the users in the online or virtual forms that can be the main triggering factors of the users' emotions and can encourage buying behaviors because of the seen, heard, and searched information (Marimoto *et al*., 2003; Jordan and Ehlers, 2009). Online media role in forming individuals' behaviors, mainly in young generation environment was also revealed in the discussion with the participants who were the parts of individuals.

….has important role because young generation cannot be separated from both social and advertisement media so the site target is young generation.

(Participant 1 – FGD – September 9th, 2015)

….according to me, media role is important enough because young generation or society is commonly not far from the needs to get information of wanted items continuously. So media role helps enough both in the forms of social media and the other information media that give easiness in finding wanted items' information.

(Participant 6 – FGD – September 9th, 2015)

The answers expressed by participants show that online media has become part of living. It is normal because the all nowadays conditions are digital that can be accessed wherever and whenever they are. The explanation concludes that media exposure, mainly online media, can mean as individuals' activities of listening, watching, and reading messages of mass media in online channels (McQuin, 1994). Individuals' change of getting information by using online media with high intensity can influence the users' behaviors. The statement is consistent with what expressed by Jordan and Ehlers (2009) who stated online information media is media construction that change individuals' behaviors significantly as new communication tools. Information and entertainments of website can make consumers useful and more active in watching and reading messages processes (Oh and Xu, 2003). The behavior changes, mainly among the young generation, in getting information from online channels influenced the selections of website services of online shopping by participants. It was revealed in discussion with participants that showed the existence of website variety of shopping online chosen by participants.

OLX.com. Maybe because this online site gives advertisement both in printed media and electronic media more and very many so I know the site more.

(Participant 1 – FGD – September 9th, 2015)

OLX.com. Yes, I know from the advertisement by OLX.

(Participant 5 – FGD – September 9th, 2015)

Berniaga.com. Yes, the same with others, I know much from media, mainly social media information and sometimes family inform that the site is good to use for online shopping.

<div align="right">(Participant 4 – FGD – September 9th, 2015)</div>

Bukalapak.com. I get much information from social media.

<div align="right">(Participant 3 – FGD – September 9th, 2015)</div>

These differences of website selections by participants were caused by the existence of information differences gotten by participants from various sources including social media information. The elements of media messages can predict the memory process; next, positive or negative behaviors' strengthening is done; it can develop or reduce individuals' actions. It explains that essentially information purposes of online shopping web are to create products' awareness, consumers' information of products' attributes, help consumers evaluating various products alternatives, encourage consumers to try products and influence buyings (Sanz-Blas *et al*., 2008). But the manager of online shopping website should also be careful in giving services that may have impact on consumers' knowledge and trust to do online transactions. This explanation was poured in the answers expressed by participants in both discussion and interview who saw information that could increase individuals' willingness to do online transactions.

….according to me, transaction process knowledge, if buyers less understand transaction process, he/she will suffer losses. Sellers should give good information.

<div align="right">(Participant 1 – FGD – September 9th, 2015)</div>

….gotten information, the more information of products of online shops we get, the more increase of buying in online site.

<div align="right">(Participant 5 – FGD – September 9th, 2015)</div>

If we intend to buy online, we must find information whether the online business can be trusted or not.

<div align="right">(Participant 2 – Interview – October 27th, 2015)</div>

The expressed answers of the participants means the risk decrease perceived by individuals and buying decision increase are influenced by the existences of both consumers' searching and getting more information in overcoming uncertainties of the potentials of positive or negative consequences. This statement is consistent with what was expressed by Agarwal *et al*. (2004) who expressed that the existence of the strong role of media exposure effects could improve trust and belief, and reduced consumers' risk beliefs in influencing behavior intentions formation in online shopping. Besides, in accessing information, the internet users get easiness of just using *mouse* to click icons, writings, or pictures in asking results. It means that if compared with the other media formula, internet capability of getting information has relative easier interaction of getting consumers' attention and giving stimulus to individuals to act (Taylor and Todd, 2005). This explanation means that web media of online shopping should give easy services in interaction with the users and give comprehensive information of products to influence individuals' intentions to do online transaction. It can be concluded that the media exposure effects are many more in producing information for consumers about online transaction knowledge that can reduce risks perceived by individuals to improve the decisions of doing intentions to online transaction.

Proposition 6 :	**the higher information obtained from media exposure further strengthening relations positive attitude toward online transactions on intention online transactions**
Proposition 7 :	**the higher information obtained from media exposure further strengthening relations perceived ease of use on positive attitude**

        toward online transactions

Proposition 8 :	**the higher information obtained from media exposure further strengthening relations perceived ease of use on intentions to online transactions**
Proposition 9 :	**the higher information obtained from media exposure further strengthening relations risk perception on attitude toward online transactions**
Proposition 10 :	**the higher information obtained from media exposure further strengthening relationship risk perception on intention to online transactions**

Conclusions

Online transaction intention is a topic that is still interesting to study. It is because there is no model in the formation of intentions to online transaction that can be applied in various research settings, although just only one. The explanation gives opportunity for the researchers to construct models by putting in the other variables indicated theoretically in explaining the formations of intentions to online transactions. To construct the models of the formations of intentions to online transactions, qualitative method needs to be used with the purpose of understanding phenomena or social signs by emphasizing the complete pictures of the observed objects reviewed to become related to each other variables (Sarantakos, 2005). So this research purpose is exploring the formation process of intentions to online transaction using behavioral theory applied to information system. This research also explores media exposure effects of giving stimuli of cognitive behavior (perceived easy of use and risk perception) and affective behavior (attitude), and conative behavior (intention) relationship of explaining online transaction process among young generation.

The first discussion explains the difference between online shopping and online transaction. The discussion is intended to give the same exact understandings of the meanings of the concepts of online shopping and online transaction applied to the real condition. In Indonesian society environment, the terms related with selling and buying are developed in internet among others are *internet e-commerce*, *internet shopping*, online transaction, and online shopping. Participants knew more two terms of internet selling and buying those are online transaction and online shopping. According to participants, the similarity of online transaction and online shopping was looking for goods through internet network, meanwhile the difference was that there was still an additional process in online transaction because of online shopping.

In selling and buying application in internet, participants agreed to use online transaction term, in which online transaction was not only looking for goods through online site but also there was additional process after searching goods. Besides, online transactions did not only consist of online goods transactions but also could be service transactions including exchange transactions of both goods and services. Participants also regarded online transaction term safer because in the process, the steps that must be done by consumers were informed. This explanation strengthens online transaction term developed by Green and Pearson (2011), in which online transaction was explained as online exchange relationship including sharing business information, managing business relationship, and doing business transaction that obligated each doer involved in the transaction giving the whole and complete information in his/her transaction process.

The formation pattern of online transaction intention is not different from behavioral concept of cognitive, affective, and conative processes (Lichtle and Plichon, 2008). Online transaction intention as conative behavior was defined by participants as individuals' willingness to continue processes because of online shopping, both goods and services transactions through the steps determined by the site manager. This explanation strengthens the meaning of intention to online transaction defined as consumers' willingness to use *website* with the service providers in an online exchange relationship (Sanz-Blas *et al.*, 2008; Green and Pearson, 2011) that needs consumers' knowledge understanding of online transaction process of various business information, business relationship management, and online business transaction implementation.

Based on behavioral concept of intention to online transaction, the conative behavior form is influenced by affective and cognitive behaviors. Affective behavior explains emotional interpretation as an evaluation form of an object to get positive or negative judgment (Nahl, 2001; Huitt and Cain, 2005; Brooks *et al.*, 2013). Participants gave meaning to affective behavior that if individuals believed and happy or vice versa, it was the individuals' evaluation realization of an object that could form attitudes. Ajzen (1975) defined attitude as individuals' belief evaluation through positive or negative feeling toward an object. The explanation defines that the good or not good consumers' feelings can direct to the decision of website use of online shopping as consumers' attitudes realization (Lin, 2007) that is influenced by individuals' motivations; two shopping motivations are identified those are hedonic shopping and utilitarian shopping based on consumers' knowledge and experiences (Babin *et al.*, 1994).

Cognitive behavior has role in forming both affective behavior and conative behavior. Cognitive behavior refers to the process of knowing, understanding, and perceiving an object's attributes that can direct the behavior formation (Izard, 1993; Huitt and Cain, 2005). Referring to the discussion results with participants, the variable of the framer of intention to online transaction of cognitive behavior group directs to two variables those are perceived easy of use and risk perception. In the discussion of easy to use perception, participants expressed the statements such as "access whenever and wherever", "pay by transfer", "without going outside", "not tired and busy", and "fast and easy". It is the indication of online transaction easiness. The answers expressed by the participants define easy to use perception as individuals' belief in online transaction easiness that is free from efforts. The discussion of online transaction easiness defines that participants perceived that online transaction was easy and giving easiness to the users. The statement supports the explanation expressed by Tong (2010) who stated that easiness perception focus of online shopping object was transaction easiness in *website* that contributed to consumers' perception of freedom from efforts in buying in online shops rather than traditional shops.

The other dominant factor in the cognitive behavior group that can influence the individuals' intentions to online transaction is risk perception. Participants really did not only express risk perception as the framer factor of intention to online transaction but also gave answers for risk forms in online transactions such as privation, worry, and not knowing the expected results in online transactions that can influence consumers' decisions. The meaning of the answers expresses that risks perceived by participants in online transaction were not certain for the expected results. Based on the explanation, it can be concluded that risk perception is defined as consumers' subjective beliefs in the losses gotten because of getting the wanted outcomes in online transaction processes (Green and Pearson, 2011).

The relationship between risk perception and attitudes and intentions to online transaction is influenced by participants' perceptive level in interpreting online

transactions. Participants saw online transactions had risks; it had impact on the lack of participants that had attitudes on online transactions and intentions to do online transactions. The explanation defines that the higher the risks perceived by consumers, the lower the willingness to do transactions. To reduce risks perceived by consumers to improve the attitudes on online transactions and intentions to do online transactions, consumers' trust improvement toward online transactions is needed by improving consumers' knowledge and experiences. In the improvement of consumers' knowledge and experiences of online transactions, the issues that need attention from consumers such as safety, privation, and risk perception are the important factors that can influence consumers' buying decisions (Teo and Liu, 2007).

The formation of intentions to online transaction is also influenced by external factors that give stimuli to individuals to behave. Information becomes the important part in changing individuals' behaviors (Nahl, 2001). The individuals' processing of verbal or visual information can influence individuals' perception because of the stimuli from their environments that can produce emotional responses and behaviors (Morimoto *et al.*, 2003). The behaviors' change mainly in young generation in getting information through online channels influences website service selections of online shopping chosen by participants among others were OLX.com, Berniaga.com, and Bukalapak.com. The explanation defines that media in giving information has role that can increase buying decision influenced by both consumers' searching and getting more information in overcoming uncertainties of the potential of positive or negative consequence. This statement is consistent with what was expressed by Agarwal *et al.* (2004) who expressed that strong role existence of media exposure effects could improve belief, trust, and reduce consumers' risks belief in influencing behavior intention formation in online shopping.

FACTOR MODEL WITH EARNINGS' YIELD AND ILLIQUIDITY WHICH ONE IS THE BEST TO EXPLAIN STOCK RETURNS?

Arif Budi Satrio, Tanjungpura University and STIE Widya Dharma, Indonesia
Wendy, Tanjungpura University, Indonesia
Mustaruddin, Tanjungpura University, Indonesia

Abstract
Previous research (Satrio, 2015) shows that the CAPM and the Three-Factor Model (TFM) Fama French (1993) is a model that can provide an explanation for the change on stock returns. TFM Fama French (1993) tested in this study involving illiquidity factor and earnings' yield. Testing by modifying the TFM Fama French (1993) to determine the role of illiquidity and earnings' yield factor in explaining excess stock returns based TFM Fama French (1993). The results showed that (1) earnings' yield and illiquidity plays an important role in providing explanations on stock returns, (2) TFM has better explanatory than single factor model, (3) the models is formed based CAPM, TFM Fama French and TFM modified by earnings' yield and illiquidity, as a whole showed no statistically significant difference in error in giving an explanation on stock returns.

Keywords: *Fama French Three-Factor Model, Earnings' Yield, Illiquidity*

Introduction

Measurement of risk and return of stocks in the capital market is an important topic and opportunities in the development of asset pricing models. Single factor models underlying asset pricing model (CAPM) by Sharpe (1964), Lintner (1965), Mossin (1966) and Black (1972) states that the market premium may provide an explanation for the individual stock returns. Asset pricing tests has evolved and provide an explanation to the risk and return. To test the validity of asset pricing models, one of which is the development of three-factor model (TFM) Fama and French (1993). TFM Fama and French (1993), namely size and value factors can provide an explanation for the excess stock returns. TFM Fama French (1993) stated that the excess return (R_i-R_f) can be explained by three factors: excess market return (R_M-R_f), the difference between returns on the stock categorized as small and big stocks (Small Minus Big), as well as differences between stock returns based on the book value to market value (BE/ME) high and low BE/ME portfolio returns (High Minus Low). TFM was then supported by a number of previous researchers (Maio and Santa-Clara (2012), Satrio (2015).

After successfully combines the excess returns by capturing market size and value factors in the explanation of the excess returns, TFM Fama French experienced a number of developments. Although the TFM considered the best model (Maio and Santa-Clara, 2012), but the TFM is not the most perfect model of the explanation for the securities return. Three-factor model is just a model that certainly can not give explanations on all securities and portfolios (Fama and French, 1996). The usefulness of pricing models should be trusted to work in many varied conditions and not only on a limited portfolio (Kothari, Shanken and Sloan, 1995). However, that does not mean a domestic asset pricing model and international models may provide an explanation entirely on stock returns (Fletcher, 2001) because each model has its limitations. Therefore, it's necessary to consider about the relationship between size and other factors in testing the stock returns (Banz, 1980). This requires new approaches to the model in conducting comprehensive test on time series variation in stock returns. Earnings' yield as noted by Basu (1983) and illiquidity proposed by Amihud (2002) plays an important role in providing explanations

on stock returns. Common stock of high earnings price firms (E/P) earn, on average, higher risk-adjusted return than the common stock of low E/P firms (Basu, 1983), common stock of smaller firms earn, on average, higher risk-adjusted return than common of large firms (Banz, 1980). Illiquidity can give better explanation as time series and cross section on stock returns (Amihud, 2002). Both of these factors follow the asset pricing based CAPM can form TFM proposed by Fama and French (1993). The main objective of this study is to compare the accuracy of CAPM and TFM put forward by Fama-French (1993) as modified by involving elements of illiquidity and earnings' yield. The study was conducted using the basic TFM combined with the earnings' yield and illiquidity in order to determine the role of each factor in giving explanations on stock returns.

Review of Literature
 1. **Fama French Three Factor Model**
    TFM Fama French (1993) proposed the excess market returns (R_M-R_f), size factor (SMB) and value factor (HML) in providing explain excess returns. Based on the theoretical model of a single index of Sharpe (1964), the price of a security will fluctuate in line with market price index. The stock price tends to increase if the stock price index has increased and vice versa. Empirically testing related to the premium market has also been performed by a number of researchers. Sarwar, Hussan and Malhi (2013) showed that the market premium confirm positive relationship with stock returns.
H1: Excess market returns factor reflects the movement of excess stock returns in the same direction. The higher the excess market returns, reflects high excess stock returns.

    Sarwar, Hussan and Malhi (2013) by testing at the Karachi Stock Exchange showed the positive relationship between size and stock returns. Results of testing Fama French (1993), three factors (R_M-R_f, SMB, and HML) with the establishment of 25 portfolios indicates that beta consistently have a positive influence on the excess returns, but the big-size stock portfolios category tend to have a negative direction while small and medium stocks category have a positive direction.
H2: SMB reflects the movement of excess returns, dominant in the positive direction.
    Sarwar, Hussan and Malhi (2013) find that the book-to-market is negatively correlated with stock returns in the Karachi Stock Exchange. Auret and Sinclaire (2006) suggest there is a positive relationship between book-to-market and stock return as predictable. Fama French (1993) shows small BE/ME, HML might reflect excess returns in the negative direction, but overall, small to big stocks BE/ME, HML reflect the movement of excess return in the positive direction.
H3: HML reflect stock price volatility, dominant in the positive direction.

 2. **Three Factor Model and Earnings' Yield**
    Research results Basu (1977) shows portfolio with lower P/E, on average, to have higher absolute risk adjusted rates of return. Common stocks in the firm with higher earnings-price (E/P), on average, significantly had higher risk-adjusted return, and the effects of firm size disappear when controlled for risk returns and E/P (Basu, 1983). Based on that description, the following hypothesis can be proposed:
H4: Positive effect Earnings' yield on excess returns. The higher the earnings' yield, reflects high excess stock returns.

 3. **Three Factor Model and Illiquidity**
    Positive illiquidity effect on stock returns (Brennan and Subrahmanyam, 1996). Refers to Amihud (2002), on the NYSE stock, using the average size of all stocks on the

ratio of the daily of stock returns in absolute versus the dollar volume indicates illiquidity has a positive and significant impact on the expected return, and the effect of illiquidity stronger in stocks of small firms. Dey (2005) portfolio liquidity, as measured by using the turnover ratio which is calculated from the value of shares traded throughout the market capitalization shows that generally supports the positive relationship between return and turnover, in which the test indicated significant relationship, especially in emerging markets. Based on these descriptions, the following hypothesis can be proposed:

H5: Illiquidity has positive effect on excess return. The higher the illiquid, reflects high excess stock return.

Measurement Variable

1. Illiquidity

Illiquidity in this study refers to Amihud (2002) which is the simple average of absolute stock returns to trading volumes over the period of observation. Refers to Amihud (2002), the measurement of illiquidity can be done by using the spread between bid and ask prices (quoted or effective), transaction-by-transaction market impact and probability of information-based trading requires data microstructures that are not available in many capital markets and when available, the data does not cover a long period of time.

Stock illiquidity determined by reference to the Amihud (2002) is the ratio of the absolute return on average daily trading volume on the day $|R_{iyd}|/VOL_{iyd}$. R_{iyd} is a stock return (i) on the day (d) of the year (y) and VOL_{iyd} is the daily transaction volume in the Rupiah. This ratio gives the absolute percentage change in the price of a particular currency of daily trading volume, or the daily price impact on the order flow.

2. Earnings' Yield

Earnings' yield measurement refers to Basu (1983) that the earnings to price (E/P). E/P is measured for each firm to then form portfolio of stocks based on earnings' yield. E/P can be seen as a direct proxy for the expected returns (Ball, 1978). Variable E/P is an important factor in providing an explanation of the return (Basu, 1983).

Model Testing Empirical

The study was conducted for the period December 2002 to December 2014, in which the period December 2002 to December 2012 is the estimation period, while the period January 2013 to December 2014 was the testing period. Total 284 firms are used. To be included in the tests, a firm must have minimum initial public offering in 2001. Data that not used in the study are firm data that do not have a daily trading transaction in a month, in order to testing illiquidity criteria as proposed by Amihud (2002). Factor models involved earnings' yield in the tests refers to the implications of the model of Fama and French (1993) with the same pattern. OMU (Over Medium Under) is the difference between simple average of portfolios returns is {(OS+OM+OL)/3-(US+UM+UB)/3} and {(OH+OM+OL)/3-(UH+UM+UL)/3}. Factor models that involve the earnings' yield, namely:

(1) $R_i - R_f = b_i(R_M - R_f) + s_i SMB + o_i OMU + \varepsilon_i$
(2) $R_i - R_f = b_i(R_M - R_f) + h_i HML + o_i OMU + \varepsilon_i$

The establishment of a model involving illiquidity factor in this study also refers to Fama and French model. HML (High$_{illiq}$ Medium$_{illiq}$ Low$_{illiq}$) is the difference between simple average return of the portfolio, namely {(H$_{illiq}$S+H$_{illiq}$M+H$_{illiq}$B)/3-

($L_{illiq}S+L_{illiq}M+L_{illiq}B$)/3) and {($H_{illiq}H+H_{illiq}M+H_{illiq}L$)/3–($L_{illiq}H+L_{illiq}M+L_{illiq}L$)/3}. Factor models involving illiquidity factors, namely:

(3) $R_i - R_f = b_i(R_M - R_f) + s_iSMB + i_iH_{illiq}ML_{illiq} + \varepsilon_i$

(4) $R_i - R_f = b_i(R_M - R_f) + h_iHML + i_iH_{illiq}ML_{illiq} + \varepsilon_i$

Tests on a model error in giving an explanation for the excess stock returns is done by testing the U-Theil. Testing with U-Theil is a good measurement in comparing models (Wilson and Keating, 2007), by the following equation:

$$(5)\ U = \sqrt{\Sigma(A_t - F_t)^2} \div \sqrt{\Sigma(A_t - A_{t-1})^2}$$

Kruskal-Wallis testing conducted to determine significant differences in explaining the stock returns. Determining of the differences of each model in the explaining stock return, can be done by taking the average difference in rank and then calculate the z-value (Ghozali, 2006), by the following equation:

$$(6)\ Z^{\alpha}/_k\ (k-1)\sqrt{\frac{N(N+1)}{12}\left(\frac{1}{nu}+\frac{1}{nv}\right)}$$

Analysis and Discussion

Testing is done by forming 72 portfolios based on size, value, earnings' yield and illiquidity to build four equations that combine earnings' yield and illiquidity into TFM Fama and French (1993). The establishment of a portfolio based SMB, HML, $H_{illiq}M_{illiq}L_{illiq}$ and OMU to capture the stock returns associated with firm size factor, the value of the firm, earnings' yield and illiquidity into the tests. The use of portfolios formed based on the size and value of the firm refers to the TFM Fama French (1993) by incorporating earnings and illiquidity. Table 1 shows the descriptive statistics on a portfolio that is formed on the model. The average value of excess return highest monthly to the portfolio based on value-earnings, earnings-value, size-earnings, earnings-size, value-illiquidity, illiquidity-value, size-illiquidity, illiquidity-size respectively 3.067 percent, 3.420 percent, 2.775 percent, 3.101 percent, 3.757 percent, 3.456 percent, 2.650 percent and 2.512 percent, while the smallest excess return successively 0.119 percent, 0.070 percent, 0.674 percent, 0.451 percent, -0.436 percent, -0.146 percent, -0.393 percent, and 0.010 percent. Results showed that overall portfolio with positive returns, but leaving a negative return on the stock portfolio category with high-value, high-illiquidity and small-size category. Results of descriptive statistics showed that portfolio of stock formed by: (1) categories of big size, has high returns, (2) low value categories, tend to have a higher returns, (3) low earnings categories tend to have low returns, (4) high illiquidity categories for small firm or has high value, has low returns.

Table 1: Descriptive Statistics Excess Return Portfolio Formed on Size, Value, Earnings, and Illiquidity: 2003-2012, 10 years

Summary statistics for 72 portfolios formed on size (ME), value (BE/ME), earnings' yield (E/P) and illiquidity (|R|/VOL). All the stock portfolios is formed on percentage (30:40:30), and conducted reclassifying based on other variables with a similar percentage. For example: a portfolio of Value-Earnings formed from: (1) 30 percent of the stocks that are high BE/ME categories, with over, medium, and under earnings category (HO, HM and HU), (2) 40 percent of the stocks are medium category, with over, medium, and under

earnings category (MO, MM, and MU), and (3) 30 percent categorized as low, with over, medium, and under earnings category (LO, LM, and LU). Excess returns is the return of each stock individually (monthly returns obtained from the average daily returns) that formed the portfolio, after deducting the risk-free return (monthly returns of Bank Indonesia Certificates (SBI).

Tests modeling involves market factors developed in the equation to establish models that provide explanations on stock returns, namely (1) testing with market risk premium (R_M-R_f), (2) testing of excess market returns (R_M-R_f), size (SMB) and earnings' yield (OMU), (3) testing market factor (R_M-R_f), value (HML) and earnings' yield (OMU), (4) testing market factor (R_M-R_f), size (SMB) and illiquidity ($H_{illiq}M_{illiq}L_{illiq}$), (5) testing market factor (R_M-R_f), value (HML) and illiquidity ($H_{illiq}M_{illiq}L_{illiq}$). Table 2 provides an explanation of a market factor in the role of providing explanations on stock returns. From the table it is known that the market factors consistently provide explanations on stock returns in the same direction, for all portfolios are formed. The determination coefficient that is 89.7 percent of the shares with a low illiquidity but big-size category, showing that market factor capture the variation in common stock returns, for all portfolios are formed. In average, the portfolios return is formed by earnings-size, illiquidity-size, earnings-value, and illiquidity-value can be given explanations by market factor are respectively 51.34, 51.64, 52.81, and 54.9 percent. This means that the market factor plays an important role in providing explanations on stock returns, with the explanatory ability of more than 50 percent, while the remainder is equal to 48.66, 48.36, 47.19, and 45.1 percent is explained by other factors. The ability of market factors in giving explanations on stock returns has the lowest value that the coefficient of determination of 18.2 percent on the stock category has illiquidity high however small, which indicates that the market factors still leave a lot of variation in stock returns can be explained by other factors.

Table 2: Testing Market Risk Premium and Stock Excess Return: 2003-2012, 10 years
Tests 36 portfolios formed on the size, value, earnings' yield, and illiquidity. Excess stock returns (R-R_f) is the difference between the monthly returns derived from the average daily return of each individual stock that formed the portfolio, and then minus by the risk-free monthly returns of Bank Indonesia Certificates (SBI). Excess market returns (R_M-R_f) represents the difference between the monthly returns derived from the average daily returns that is reflected in the stock market price of the Composite Stock Price Index (CSPI), the SBI monthly returns.

In Table 3 are shown market factor in the three-factor model involving the firm's size and earnings' yield. Implementation of market factor, size and earnings' yield can capture the higher variation in common stock returns, with a coefficient of determination over 50 percent for all stock portfolios formed on earnings' yield. Application of a alone market factor alone can only capture variation of stock returns of at least 18.2 percents, with the highest explanatory value that is equal to 89.7 percent of that in the portfolio have low illiquidity with a big-size category. The test results involving size and earnings' yield indicate that the application of the factor market size and earnings' yield securities can capture the variation in average stock returns are greater (63.44 percent), compared to the ability of explanatory only involves market factor (52.68 percent). Portfolios formed based on earnings' yield and size indicate market factor have a dominant role in capturing variations in stock returns, with t-value entirely in the top 10 that showed statistically significant. Size of the firms can capture the variations of returns on portfolios of common stocks, especially stocks of small and medium category, with minimum t-value is 3.220. Earnings' yield can capture variations stock returns, especially firm categorized over and under earnings, with the highest t-value is 8.529.

Table 3: Testing the Three Factor Model Based Excess Return Market, Size and Earnings' Yield: 2003-2012, 10 years
Tests conducted with 18 portfolios formed on size and earnings. Excess stock return (R-R$_f$) is the difference between the monthly returns based on the average daily returns of

each stock and monthly risk-free return (SBI). Excess market return (R_M-R_f) is the difference between the monthly returns (obtained by a simple average of the daily returns) stock price index in Indonesia (JCI) with SBI monthly returns. SMB (Small Minus Big) represents the difference between the monthly returns of small-size stocks (SO, SM, SU) and a monthly return of big-size stocks (BO, BM, BU). OMU is the difference between the monthly returns based on over-earnings stocks (OS, OM, OB) and under-earnings stock returns (US, UM, and UB). Monthly return of each stock which formed the stock portfolios is the result of the daily average of each stock.

TFM tested by involving market factor, value and earnings' yield are shown in Table 4. The model can give an explanation at a minimum of 50.2 percent, which is in the portfolio formed based on earnings' yield and high value. The model has the ability to capture the variations in the highest stock returns in stocks that are formed on a high value but has a low earnings' yield, the explanatory capability of 71.3 percent. The value of the firm can capture the largest variations in stock returns, especially in high-value firms, with the lowest t-value 2.685. Overall, the earnings' yield factor can provide an explanation for the variation of stock returns on portfolios formed on earnings' yield. TFM testing involving the earnings' yield may provide an explanation for the average stock returns that is equal to 62.69 percent, higher than the capability involves only a single factor (market factor) in the amount of 52.68 percent. Results of the establishment of a portfolio based on factors value and earnings' show that: (1) stocks formed on low value category tend to have return the opposite direction, and stocks that have medium and high value category tend to have high return, (2) stock of the firm formed on the portfolio that have high earnings tend to have high return.

Table 4: Testing the Three Factor Model Based on Excess Return Market Value and Earnings' Yield: 2003-2012, 10 years

Tests conducted on 18 portfolios formed based on earnings' yield and value. Excess stock returns $(R-R_f)$ represents the difference between the monthly stock returns derived from the average daily return of stock with returns of SBI monthly risk-free. Excess market returns (R_M-R_f) represents the difference between the monthly returns (derived from the average daily return) JCI is based on the average daily return (R_M), the SBI monthly return (R_f). HML (High Minus Low) represents the difference between the monthly returns of the stock firms that have high value (HO and HU) and low value (LO and LU). OMU (Over Minus Under) represents the difference between the monthly returns the stock portfolios categorized over earnings (OH, OM, OL) and under earnings (UH, UM, UL). Monthly stock returns as average daily return of each stock that formed the portfolios.

Table 5 shows the role of three-factor model that involves market factor, value and illiquidity. The model can provide an explanation for the smallest (48.8 percent) in the medium value and high illiquidity of stocks, and provide the greatest explanation (81.8 percent) in the portfolio which was established by medium illiquidity but has a high value factor. The model can provide an explanation to the stock return with t-value on the market factor, value and illiquidity are almost entirely statistically significant in the portfolio formed. The portfolio formed by value and illiquidity show that: (1) stock of the firm that low value tends to give an explanation for the high returns, (2) firms that have a high illiquidity and medium tend to have a high returns.

TFM testing involving illiquidity may provide an explanation to the average market return that is equal to 67.57 percent, 32.43 percent explained by other factors, which in addition to market factors, value, and illiquidity.

Table 5: Testing the Three Factor Model Based on Excess Return Market Factor, Value and Illiquidity: 2003-2012, 10 years

Testing 18 portfolios formed based on the value and illiquidity. Excess stock return ($R-R_f$) is the difference between the monthly stock returns based on daily return (R), the SBI monthly return (R_f). Excess market return (R_M-R_f) is the difference between the monthly returns derived from the average daily return JCI (R_M), the SBI monthly return (R_f). HML is the difference between monthly returns on stocks are categorized by high BE/ME (HH_{illiq} and HL_{illiq}) and the low category (LH_{illiq} and LL_{illiq}). HML_{illiq} represents the differences between the monthly returns on stocks are categorized by $High_{illiq}$ ($H_{illiq}H$, $H_{illiq}M$, and $H_{illiq}L$) with the Low_{illiq} categories ($L_{illiq}H$, $L_{illiq}M$, $L_{illiq}L$). Monthly stocks return that formed the portfolio is the average daily returns of individual stocks that formed the portfolio.

Model based on market factor, size and illiquidity to explaining the stock returns can be seen in Table 6. The results show the model can provide an explanation of the changes in stock returns at a minimum of 46.3 percent i.e. the portfolio formed by small size with low illiquidity. The models may provide an explanation in the portfolio category low illiquidity but medium-sized, which amounted to 82.6 percent. Results of the establishment of a portfolio based on size and illiquidity show that: (1) the firms that have high illiquidity tend to give an explanation for the high returns, (2) firms that have small and medium size tends to have a high return and the firm with a big-size has low returns. TFM testing involving excess market return, size, and illiquidity, on average, can provide

an explanation of 65.98 percent, with the higher explanatory capability compared to the ability of single factor models that only involve market excess return is 52.68 percent.

Table 6: Testing the Three Factor Model Based on Excess Return Market, Size and Illiquidity: 2003-2012, 10 years

Testing 18 portfolios formed based on size and illiquidity factors. Excess return is monthly stock returns based on the average daily stock return (R) with a risk-free monthly return (Rf) of SBI. Excess market return is based on the average monthly return JCI daily return after deducting the risk-free monthly returns (SBI). SMB is the difference between the monthly returns of small stocks (SH_{illiq}, SM_{illiq}, and SL_{illiq}) with large stock return (BH_{illiq}, BM_{illiq}, and BL_{illiq}). HML_{illiq} represents the difference between the monthly returns stocks with high illiquidity ($H_{illiq}H$, $H_{illiq}M$, $H_{illiq}L$) with stock returns with low illiquidity ($L_{illiq}H$, $L_{illiq}M$, $L_{illiq}L$). Portfolios return based on the monthly average of the daily returns of individual stocks that formed the portfolios.

Robustness Test

Testing the ability of each model to provide an explanation on stock returns, conducted with U-Theil test to determine the error in giving an explanation on stock returns. Testing errors in each model provides an explanation of the stock return is done with different test statistic non-parametric Kruskal-Wallis. The use of non-parametric statistics is done because there is a difference in the number of stock portfolios formed based on each model is formed, involving a relatively small test data. The test results of each error in giving the explanatory models on stock returns shown in Table 7. The test results demonstrate the value of Chi-Square is 14.709, with probability 0.023. This value indicates that there are differences in each model in giving explanations on stock returns, i.e. at least there is one model that is significantly different from the others. Based on the value of the U-Theil mean rank error, it is known that the two-factor model that involves the size and value, as well as TFM Fama French is the best model in giving explanations on stock returns (mean rank 58.44 and 58.89 percent). Market factors have a mean rank error 84.87, which shows that only involves the CAPM market excess returns has limited capacity associated with changes in stock returns. Implementation of market factor, value and earnings' yield may provide a better explanation because it has a lower error (mean rank error 78.06) compared with CAPM modeling.

Table 7: Different Test Error Model, Year 2013-2014

Tests conducted for each error in explaining the equation formed by seven equations, i.e. Market Factor, Size and Value, TFM Fama French, TFM with earnings (Market Factor, Size, Earnings and Market Factor, Value, Earnings), TFM with Illiquidity (Market Factor, Value, and Market Illiquidity Factor, Size, and Illiquidity). Initial testing two-factor model (Size and Value), as well as TFM Fama French (Market Factor, Size and Value) to give explanations on stock returns was formed by 18 portfolios, each of which is formed by nine portfolios based Size-Value and Value-Size. Testing errors in providing explanatory models on stock returns, monthly testing is done in the period of 2013 and 2014.

Model	Equation	U-Theil Mean Rank	Chi-Square	Sig.
1	Market Factor	84.87		
2	Size and Value	58.44		
3	Fama French TFM	58.89		
4	Market Factor, Size, Earnings	90.17		
5	Market Factor, Value, Earnings	78.06	14.709	0.023
6	Market Factor, Value, Illiquidity	106.00		
7	Market Factor, Size, Illiquidity	87.33		

Testing was conducted to compare the differences between the models in providing explanations on stock returns, are summarized in Table 8. Comparison between the models is done by comparing the critical value to determine the difference statistically different models.

Table 8: **Absolute Difference 7 Ranking Model**

Testing is done with the involvement of a single factor model (market factor), two-factor model (size and value), TFM Fama French (market factor, size, and value), and TFM

modified by involving earnings' yield and illiquidity. Absolute difference is the difference of the average rank error of each model (R1=Market Factor, R2=Size and Value Factor, R3=Fama French TFM, R4=TFM Market Factor, Size, Earnings, R5=TFM Market Factor, Value, Earnings, R6=TFM Market Factor, Value, Illiquidity, R7=Market Factor, Size, Illiquidity).

	R7	R6	R5	R4	R3	R2
R6	18.667					
R5	9.278	27.944				
R4	2.833	15.833	12.111			
R3	28.444	47.111	19.167	31.278		
R2	28.889	47.556	19.611	31.722	0.444	
R1	2.463	21.130	6.815	5.296	25.981	26.426

Tests using 6 equation shows the real difference is in the size and value factors (the 2nd model) with equations involving market factor, value, and illiquidity (the 6th model), with a value of 47.556. Other equations showed no significant difference, meaning CAPM by Sharpe (1964), Lintner (1965) and Mossin (1966), TFM by Fama and French (1993), and TFM modified by involving factors illiquidity and earnings' yield showed no difference significant. Thus, all factors in general may provide explanatory on stock returns, except in the 2nd model and 6th model that show significant differences. Two models involving market factor and size have a better ability in providing explanations on stock returns (with a mean error 2.604) compared with the 6th model that include market factors, values and illiquidity (with a mean error 8.561).

Conclusion

This study examined the ability of market factor and three-factor modified model to provide an explanation to the stock return in Indonesia. There are numbers of important results: (1) The CAPM can give a prediction of stock returns consistently, with a positive direction, (2) TFM Fama French (1993) and TFM modified by involving earnings' yield and illiquidity is a model that can capture variation on stock returns, (3) statistically, the equations model showed no difference in error in giving an explanation on stock returns. Differences error in giving an explanation on stock returns were significant only in the two-factor model that involves factors of size and value (low mean rank error of 58.44), with TFM involving market factor, value, and illiquidity (high mean rank error of 106.00). Illiquidity and earnings' yield shows significant role in providing an explanation for the return of shares in firms listed on the Indonesia Stock Exchange. The application of single factor model that involves market factor may provide an explanation for the stock returns that is equal to 52.68 percent, but the application of TFM involving earnings and illiquidity able to give an explanation to the average of 67.57 percent.

The test results tend to support the hypothesis that built and supports a number of previous studies. Testing support: (1) CAPM by Sharpe (1964), Lintner (1965), Mossin (1966) and Black (1972) in relation to excess market return in giving explanations on stock returns, with a positive direction, (2) testing the earnings' yield by Basu (1983), firms with high E/P reflects high returns, (3) testing the size effect by Sarwar, Hussan, and Malhi (2013), which confirmed positive relationship with stock returns and Fama French (1993), which confirmed positive relationship to the stock price, but stock with big category tend to have a negative direction, (4) dominant positive value effect on stock returns, which according to Sarwar, Hussan and Malhi (2013), Auret and Sinclaire (2006) and low stock category tend to have negative direction on stock returns (Fama and French,

1993), (5) illiquidity by Brennan and Subrahmanyam (1996), which shows the positive illiquidity effect at the firm that has high illiquidity, and the illiquidity effect is stronger in the stocks of firms with a high level of illiquidity.

INVESTOR PSYCHOLOGY ON BUYING AND SELLING COMMON STOCK DECISION IN EMERGING MARKET: EVIDENCE FROM PALEMBANG, SOUTH SUMATERA, INDONESIA

Yuliani, Sriwijaya University, Indonesia
Isnurhadi, Sriwijaya University, Indonesia

Abstract

Purpose – To analyze the Investor's Psychology in Buying and Selling of Common Stock in the Stock Exchange of Emerging Market. The specific purpose of this research is to provide the simultaneous empirical evidence about the Cognitive and Cognative aspects towards the Confidence and Performance.

Design/methodology/approach –The quantitative research on 100 individual investors in Palembang, South Sumatera, Indonesia. The Data are collected during March-May 2016 by using questionnaire instrument and descriptive and inferential data analysis technique. The evaluation of the Hypothesis uses structural equation model by SmartPLS.

Findings – The findings of this research show that Cognitive is not significant towards the confidence but significantly positive towards performance, cognative is significantly positive towards confidence but not significant towards the performance, while confidence has a significantly positive impact to performance.

Research limitations – This research hasn't fully explained the Investor Psychological aspects, so the additional variable may be needed as the full reflection of Investor Psychology. The further research may use the experimental study, starts from the Buying of stocks, and then the factors that can be considered in Selling stock.

Originality/value –This research has the originality in specific research object in Palembang with a numerous number of respondents so that it can be used as a source of information for Investor in Buying or Selling Stock.

Keywords : *Individual investor psychology, confidence, performance.*

Introduction

Individual investor behavior in The Emerging Market, in this case, well knows as Indonesian Stock Exchange (IDX), makes them gradually turn to be more professional in Stock Investment. The growth of Investor in Indonesia has reached 12 % and reaching 485.000 people per April 2016, in which, 4.573 of them are Palembang Investor with range of 26-30 years in age. It means that more people start doing financial investment in the Capital Market by Buying or Selling Stocks. The Increasing in number of the Investor makes some Group of Individual do Trading in expectation for the improvement on Financial Performance of the Stocksbought, in the future.

Some studies show that Individual Investor is able to Increase the stocks Financial Performance (Kaniel et al. 2008; Kaniel et al. 2012; Wang & Zhang 2014; Wang & Zhang 2015), Individual Investor and Stock Return (Kaniel et al. 2008; Kaniel et al. 2012; Hui & Li 2014; Odean 2015), Investor Psychology(Kahneman & Riepe 1998; Daniel et al. 1998; Hirshleifer 2001)that leads to Investor Behavior(Qawi 2010; Shive 2010; Linnainmaa 2010; Bayar 2013; Iwasawa & Uchiyama 2014; Phan & Zhou 2014).

Investor Psychology on Buying and Selling Common Stock Decision in The Capital Market gets through Cognitive process that includes Physical Condition, Mental Condition, and surrounding environment. Psychological Cognitive is a response that comes from Individual Investor itself such as Mood and Persuasion (Bless et al. 1990; Kodia & Said

2009; Lepori 2015), Investor becomes happy (Merkle et al. 2015) and leads to an increase in the Common Stock Investment Performance(Linnainmaa 2010; Wang & Zhang 2015).

This Paper consists of four parts. The First part will explain about The Background, Secondly, explains about the Literature and Hypothesis Development Third part will be Research Methodology, and The Fourth, about Research Findings that will be ended with Closing.

Literatur Review and Hypothesis Development
1. Investor psychology

Psychology is a study that learns about Mental and Behavioral Process, Including how the processes influenced by Human Physical Condition, Mental Condition, and external environment (Gumanti 2009). Scientific Investigation in acknowledging the human behavior related with the Financial Behavior appears as the way to explain about several Modern Financial Phenomenon by observing Investor behavior in the capital market.

The Investor behavior in the Capital Market is discussed in the Financial Behavior that explains the understanding about the patterns of Investors' reason in making decisions. Cognitive Psychology is a study about the empirical process of information in the Human behavior. The goal of this study is to explore the way Individual looks at its surrounding environment (Kodia & Said 2009). The Process discusses about the Internal Mentality, such as Problem Solving, Perception, short term and long term memory, habit and anxiety (Kumar 2008); (Chandra & Kumar 2012).

Investor's psychological aspects in making decision are related to the three things that contained in Decision Theory(Kahneman & Riepe 1998), that is Normative, Descriptive, and prescriptive analysis. Normative analysis focuses on peoples' habits in making decision, while Prescriptive analysis creates a more rational decision. According to (Daniel et al. 1998); (Subrahmanyam 2007), saying that Investor Psychology such as Mood and Happiness is shown in their behavior in the Capital Market (Bless et al. 1990; Bayar 2013; Stephan & Nitzsch 2013; Phan & Zhou 2014; Lepori 2015; Merkle et al. 2015)

The Research finding from (Phan & Zhou 2014) about the factors that influence the Investor's behavior in the Vietnam Capital Market, shows that Psychological factors such as, Overconfidence, Excess Optimism, and Psychology of risk and herd behavior, have a significant effect on the Individual Attitude towards Investment. The Research by (Bayar 2013) in Borsa Istanbul using the questionnaires to the 234 Investors finds that The effect of the Financial crisis has an impact to the Investor's Psychology and Confidence in the capital market. A research conducted by (Lucey 2005) about the effect of Investor's Feeling to the Equity Price and also develops the Principal theory that is used to understand the appearing findings in this area (feeling). This research studies about the effect of the Environmental factors such as weather, biorhythms of the body, Social Factor and Image that may influence the mood of the Investor and in the end, will impact the decision making of the investment. This research finds that, (1) Investor tends to invest by their feeling, (2) Feeling has an effect to the Equity Price, (3) Weather, body biological cycle, disruption of sleeping pattern, Lunar Phase, Social activity and Image will impact the Mood, and in the end, will impact the Decision Making Process.

Then, The Research Finding from (Worhington 2006) that tests the relation between Weather to the Mood and Feeling of Investor in the Australia Capital Market during 1958-2005. There are eight elements of the Weather used, such as Precipitation, Evaporation, Relative Humidity, Maximum and Minimum Temperature, Average of Daily Temperature, Time the Sun Shines, Maximum Speed and Direction of the Wind, Average of Daily Wind Speed to the return of Real and Nominal Market, using the non parametric correlation

analysis and autoregressive moving average model. And The Finding tells that Weather Factor does not have any effect to the Market Return.

Other Research conducted by (Durand &Sanghani 2008) tests the relation among Personality, Investment Decision, and Portfolio Performance. The samples of this research are 18 individual investors that hold the Australian Equity Portfolio for the financial year that ended 30 June 2005. The Finding of this research include: (1) a more extrovert individual tends to innovate and Less Masculine in achieving a more superior portfolio, (2) Individual with higher negative emotions tends to take a higher risk, and to be more open to the experience of choosing a higher risk portfolio, (3) A higher negative emotion and tendency of taking a higher risk is also related with increasing of Trading behavior, while a more extrovert investor found to have a lower tendency to the Trading Behavior, and (4) The Role of Psychological gender is better than Biological gender in analyzing investor.

2. Confidence

According to the study of the Financial Behavior of (Gumanti 2009), there are four theories about the Financial Behavior, overconfidence theory, financial cognitive theory, regret theory, and prospect theory. The first theory, about the Overconfidence theory shows the tendency to trust and believe on the ability to predict and succeed. The concrete example of overconfidence is the existence of the investor that does trading just as the follower in buying and selling of common stock decision in the capital market without doing deep analysis on the performance of specific stocks. Moreover, the fact that Indonesian capital market that is still in the emerging market that allows the individual to act as follower. A dominant Foreign investor in one of the causes of the phenomenon, but a plan-with investor will not play a follower role because stock investment has a short term and long term goal. For the plan-with investor, they will make some analysis and looking for more information about the stock performance before making any decision.

Researches about The Investor's confidence can be found in some previous researchers such as, (Goel & Thakor 2008; Grinblatt & Keloharju 2001; Barber & Odean 2001; Takeda et al. 2013; Bayar 2013; Burnside et al. 2015). These researches find that Investors have a tendency to be overconfidence in Financial Investment Decision. Even, the impact of Global Financial Crisis has an effect to the overconfidence of Investors in Borsa Istanbul (Bayar 2013). An interesting Finding by Barber &Odean (2001) with a 35.000 household investors as the respondents, shows that Male Investor tends to be more confidence than Female, and the male investors also have more frequent transactions compared to the women, but this condition, in turn, may lead to an incorrect investment and a high transaction cost. The result of high frequency trading by male investors is the lower return earned by the male investors for about 2,5 % compared to the Female Investors that just lose 1,72%.

3. Performance

Stock Performance reflects the Value of a company in the eye of the investors. The better the Stock Performance, it gives a positive signal for the Investors to make a financial investment. Stock Performance shows how individual investor earns the capital gain and receive dividend. Capital gain is a positive difference between buying and selling price of a stock. Price Momentum is a situation in which the price of a specific stock is going to move into a contrast trend from the previous one (Gumanti 2009). In the Price Momentum situation, investors buy stocks without any consideration of basic principal of Economy of Supply and Demand that they must have known about, or usually called as herd behavior.

The Result of the research from (Wang & Zhang 2015) about the Limited Attention did by the individual investors towards Stock Performance in ChiNext stock market, it is found

that Limited Attention has a significant effect on the Performance in the capital market with a positive way, and this condition happens for a short term period. This research also explains that Investors that have non-trading days, have a significant effect to the price gap in the next week opening price. A further research about the Stock Performance from Wang & Zhang (2015) about do Individual investors able to increase the valuation of Company performance ? The source of the data is the Individuals that do trading in NYSE ReTrac EOD from 15 March 2014 till 31 December 2011 for about 8.645 Individuals, and The results show that Individual Investors are able to increase the Value of a company as it is shown by an increasing in The stock price.

Methodology
1. Data Collection

The Data used in this research are primary data by using questionnaire instrument. The Sampling Technique is Purposive sampling with these criteria : (1) The Investors still actively trade the common stock in the capital market, (2) have been involved in capital market as investor for at least two years, (3) The Investors do not directly involved in the government strategic decision making or as government official. The analytical unit of this research is individual investor. The data collection period is three months (March-May 2016). The data collecting technique uses questionnaires, and then make an interview appointment. The number of Valid investors is 100 investors.

2. Variable Measurement
A. Cognitive

The Investor Psychological aspect in other previous researches is cognitive aspect (Kahneman & Riepe 1998); (Kodia & Said 2009);(Burnside et al. 2015). The Cognitive aspect in this research leads to the knowledge about the capital market (Bayar 2013). The variable measurement uses six indicators which are, to understand the terminologies in the Stock Trading, give an opportunity to invest, have an interest to buy stock rather than any other instruments, satisfied with the stock trading system in Indonesia Stock Exchange, keep up with newest information, and keep investing by adding more capital. These variables are measured by using Five Likert Scale from 1 (Strongly Disagree) till 5 (Strongly Agree).

B. Cognitive

Cognative Variable reflects the Target and Risk faced by the Investor. The measurement of this variable uses five indicators, including: Having a relation with capital market, having advantage on easiness of doing transaction, a self-determined Target Return, reading recent news every day to get the newest information to determine the Return, and having an adequate flexibility in managing their own capital. This Variable measurement refers to (Bayar 2013). The level of respondents answer is categorized into five likert scale which means, 1 (Strongly Disagree) till 5 (Strongly Agree).

C. Confidence in stock market

Investor will be more confidence in investing in the capital market by knowing the eagerness of Information collecting. This variable is reflected in three indicators, which is, Accounting and Financial Information, Media Information, and Friend's Recommendation. Confidence shows the Investor Happiness (Merkle et al. 2015). Consistency in the Investor Confidence in the capital market investment is shown by some other researchers in their previous researches (Daniel et al. 1998); (Goel & Thakor 2008); (Bayar 2013); (Lepori 2015)dan(Merkle et al. 2015). The responses will be measured with five likert scale, start from 1 (Strongly Disagree) to 5 (Strongly Agree).

D. Performance

Stock Performance is shown by two things, whether Investor gets the capital gain or Investor receives the Dividend (Bayar 2013). Stock Performance will make Investor to be more happy (Merkle et al. 2015) and the increasing of performances will keep investors in doing trading (Wang et al. 2006) and Investor's behavior in doing trade will show their response towards the Market Performance (Qawi 2010; Linnainmaa 2010). Investor's responses in this variable will be measured with Five Likert Scale, start from 1 (Strongly Disagree) till 5 (Strongly Agree).

3. Data Analysis

The Data are analyzed using descriptive statistic and inferential. The Descriptive gives empirical view of the collected data during the research (Ferdinand 2011). Table 2 shows that the average Cognitive is 3.59 with 0.55 Standard Deviation, a 3.72 Cognitive average shows that The Information about the capital market is an important factor before buying and selling stocks, while Confidence and Performance Variable get a good review from the investors during this research.

[insert table 2 here]

Inferential statistic is used in answering the Hypothesis of the research. The analytical Technique used is Partial Least Squares (PLS), to test the structural equation of Research model. The reasons why PLS is used in this research are (1) a recursive way of relation, (2) The latent research variable, (3) can be used for a smaller sample size (Solimun 2010). The PLS Data analysis includes the measurement and structure model.
[insert table 3 here]

Model Measurement using PLS consists of two things which is, Outer Loading and Outer Model t Statistic. Outer Loading shows that all indicators are valid to be used with critical t 1.96. Cognative variable is shown by dominant indicator of KK5 (Investor follows the newest information from BEI) means that knowledge and news about IDX are monitored by the invcstor. The Cognative that is related with the target return is shown by

Investor psychology about the satisfactory level of investor in reading the most recent information every day (KO4) with the outer loading value of 0.825 meanwhile, Reflected level of trust CF2 is 0.873, it shows that the most valid and quickest information comes from Media. Stock performance variable which is reflected in FM2 is the amount of dividend that should be received by investors.

Evaluation of research instrument in PLS can be seen from Average Variance Extracted (AVE), with the condition, if AVE is bigger than 0.5 (Solimun 2010); (Jogiyanto & Abdillah 2009); (Ghozali 2011). Reliability test which uses Tucker and Lewi's is used to evaluate the reliability of each point that shows Consistency of Respondent's responses. The Composite value of Reliability shows that the Instrument is reliable. Moreover, Cronbach's alpha value with 0.7, even that 0.5 is still can be accepted, then it can be declared that the Research Instrument is reliable.

[insert table 4 here]

The measurement of validity of PLS uses Discriminant validity that shows correlation among variables. The Value of Discriminant validity that can be accepted if correlation among variables is high. Shown in the table 5, the relation among variables is related, so that the research instrument can be declared as valid.

Further, we may use R^2 to know about the specification of model structure, because this model has two dependent variables, which are Confidence and Performance, so it can be computed the Total determination coefficient (Q^2) that shows how this specific research model can be used to predict performance. Table 6 shows the result, and we find that it is 0.481 which means, this model can be categorized and good enough to predict the performance, but doesn't entirely able to be used for prediction, it means, other variable outside the model will impact more in predicting performance.

[insert table 6 here]

Findings

The Result of the research with PLS (see Table 7) shows that the relation between Investor Psychology Cognitive and Confidence is not significant. Based on this findings, so H1 is rejected or it can also be considered that investor cognitive behavior in Palembang City doesn't give any evidence about Confidence in buying and selling stock. This empirical findings are supported by the demography of the respondent that 83% of the Investors have a Bachelor degree, and 77% of them are in the mature age of 31-35 years, so that it will be easier for them to understand about the Trading system.

The Findings of cognitive variable towards the performance is significantly positive (H3 accepted). This research proves that Palembang Investors which have a high cognitive psychology are able to predict the stock which will make a positive return and receive dividend. According to (Barber & Odean 2008), Investors will be limited by logic and rationalization in buying and selling stocks because of limited information. Temporary Limitation creates cognitive psychology in stock transaction. The result also tells that Investor likes the Stock Buying more than Stock Selling (Barber & Odean 2008).

Financial Cognitive Dissonance tells that Human will feel the internal pressure, doubt, and fear when faced with differences in beliefs, so Individual investors will lessen the internal conflict within themselves. This theory can be used in Investors that always try

to rationalize all the available Investment choices. In the end, this theory will lead to individual cognitive psychology which is a study about the empirical process about the information and this thing is related in the Human behavior (Kodia & Said 2009).

Cognitive Psychology shows a significantly positive effect (H2 Accepted). This research is able to give the empirical evidence that Palembang Investors in doing Buying or Selling Stocks have criteria for target return and risk that should be avoided. Cognative Psychology in this research is reflected in five indicators, which is the dominant indicator is Investors regularly read the newest information (see Table 3). The Significantly positive research finding shows that Cognative Psychology that is owned by the Research Respondents is able to increase the confidence level that keeps investor Invests in Stock by adding more capital. This research finding is consistent with the previous research (Bayar 2013; Phan & Zhou 2014), that the psychology factor for determining the target return and risk has a significant impact on the Investor behavior in stock investment.

The next finding for the Hypothesis is the Cognative Psychology towards the Performance that is reflected in dividend paid, doesn't have enough accepted evidence (H4 Rejected). This finding means that The Cognative behavior of individual investor in Palembang doesn't have effect on the capital gain performance and Dividend policy. This finding is possible because of the number of Investors in Palembang which have the strategy in stock investment for a long term, so that the orientation to watch the momentum of Price increasing in stock is not too considered. Some respondents' reasons in stock investment can be seen in Table 1. From the table, we can find that 32 % of the reasons is fund development, so it means that the Cognative psychology orientation for Stock Investment activity is for the long term.

The fifth hypothesis about the Confidence will affect the Performance is significantly positive (see Table 7) so this research is able to deliver a correct evidence that the individual investors in Palembang are confident enough so that the individual performance also arises. Based on Overconfidence theory, Individual investor has a belief that sometimes is exaggerating in predicting the stock performance and the successful tendency. This finding is consistent with the previous research from (Barber & Odean 2001; Barber & Odean 2008). Refers to (Cabrera-Paniagua et al. 2015), there is high correlation between the investors in NYSE that make the Stock investment decision and The Emotional level in decision making.

Conclusion and future studies

Bases on the analysis above, this research finds that Investor Psychology consists of Cognitive and Cognative Psychology that is able to make a contribution towards the Confidence level, in which in the end will step-up the Common Stock Investment performance in IDX. The further research can be done by elaborating the other psychological factors such as mood and happiness, and also tries to evaluate the insignificant finding of the hypothesis. On the analysis about Indonesian Stock Exchange that is categorized as emerging market, it will need to be compared with other emerging market countries.

MEASURING OPTIMALIZATION OF ZAKAT DISTRIBUTION AT LEMBAGA AMIL ZAKAT USING VARIABLE MEASUREMENT OF ECONOMY

Rifzaldi Nasri, Universitas Muhammadiyah Jakarta, Indonesia
Tulus Haryono, Universitas Sebelas Maret, Indonesia

Abstract

The aim of this research conduct is to optimalize the zakat distribution using measurement.of economy variable. **Design / Metodology**. The Quantitiative Research Method is used to analyse financial data, with Optimalize Model as Z variable design, Measuremnet of Economy as Y variable and Obyektive Output as X variable, using AMOS program and SEM as tool analysis to confirm that the model can be used as a measurement tool. **Research result**. Using some indicators to every analyzed variable, obtaining output and objective result, influence optimalization of measurement of ecocomy. **In conclusion**. The measurement of optimalization of zakat distribution using measurement of ecocomy variable, with independent variable / output exogenous and obyective, can be used as a model to measure lembaga amil zakat performance. Furthermore, this reserach is need to have some indicators' development especially in the area of obyective variable.

Key words: *output, objective, measurement of economy, distribution optimalization, Zakat*

Introduction
1. Background

A development in a coutry in general is identified with its economic growth, that seems being pumped-up to meet general national stability, especially in third world countries. Those third world or developing countries usually regarded as poor and weak. Indonesia is in the group of third world or developing countries. Eventhough in Indonesia the economic growth is encouraged, unfortunately its distribution is uneven with a big number of *gini ratio*.

Some obstacles are: (1) development imbalance; (2) Java centrism development; (3) uncontroable foreign investment; (4) low-trust mentality of local Indonesians; (4) the weak of government intervention to control its internal economic stability, regarded as the couse of uneven welfare distribution of Indonesian people so far. Furthermore, the character of Indonesian development by its government is allegedly as never been supporting the sustainable develompemnt as a whole. Very often, Indonesians are indentified as people that are: (1) crashing mentality; (2) less confidence; (3) less discipline; and (4) less responsibility (Arief Budiman; 1995:21)

There are already many supporters from government as well as NGO (non-governemnet organization) to encourage the low society of people to become interpreneuers. Unfortunately, there are still more demands than supply to evercome its problems. Actually, to meet its requirements could be solved by a mechanism named ZIS (zakat, infak, and *adaqah*). There are some Islamic Financial Instrument Models to guarantee its welfare that managed by Islamic Financial Public Organization. Zakat in Islamic financial system is an obligatory, some others like infak, sadaqah, and waqaf are

recomendatory. Many countries in this entire world are already employing the Islamic financial system.

Unfortunatelly in Indonesia, eventhough *zakat, infak, sadaqoh and waqaf* already have its regulation, but for its distribution implementation have not yet been carried.

Indonesia already has amil zakat state agency or BAZNAS (Badan Amil Zakat Nasional) as well as BAZDA (Badan Amil Zakat Daerah), unfortunately its distribution to *ummah* has not yet optimalized.

Since UU No 38 tahun 1999 pertaining to Zakat Management, and collectively enacted in entire Indonesia, extensively establish many OPZ (Organisasi Pengelola Zakat). Until the end of 2009, the number of Indonesia zakat management organizations could be seen at Table 1.1 as follow:

Table. 1.1
Indonesian zakat management organizations

No	Type of Organization	Amount
1	BAZNAS	1
2	BAZDA Province	33
3	BAZDA Regency / City	434
4	BAZDA District	4800
5	BAZDA *Kelurahan*	24000
6	LAZNAS	18
7	LAZNAS Province	16
8	LAZNAS Regency / City	31
9	UPZ	8680
	Total	38013

Source: Kemenag, FOZ, be treated

The numbers of Indonesian OPZ are not the whole amount of Indonesia zakat potency absorbed reflection. Regarding to RAC (2002) the less optimally of Indonesia zakat potency absorbed was on many *Muzakki* perceptions upon distrusted amil zakat availability.

Zakat concept has the capability to empower communities, to meet the requirements to enhance economic distribution of the poor. To meet the social welfare standard, transforming from the low society of people to become middle class families. Allegedly, Islamic community economy empowerment through zakat practice facing some obstacles that come from some other Muslim fellows.

The awareness of zakat implementation among Muslim Indonesians, has not yet followed by level of sufficient understanding toward it. More especially when comparing to other Islamic obligatory worships, such as sholat and Ramadhan fasting. The less understanding toward the obligatory type of zakat and its payment mechanism as guided by the Islamic law causes dependency on every individual worship only. (Lukman Mohammad Baga, 2007).

Regarding to Yusuf Wibisono in his paper-work that delivered on BAZNAS – Dompet Dhuafa FGD (Focus Group Discussion) with "*Tolok Ukur dan Strategi Mengefektifkan* Impact *Pemberdayaan Zakat Menuju Sistem Ekonomi Berkeadilan*", on March 14th, 2007 in Jakarta, uttered that:

Zakat has the potency to empower those poor people from the low society through some distribution network, such as:

a. Poverty Reduction

Zakat alocation specificly has been determined by the Islamic law (QS 9: 60) dedicated to those eight categories or ashnaf only, as follows: (1) *fakir*; (2) the poor; (3) *amil zakat*/zakat manager; (4) *mu'alaf*; (5) slave; those who traped in debt; (6) *jihad fi sabilillah*; (7) *ibnu sabil*. *Jumhur ulama* agreed that others than those categories, are forbiden to get zakat. Zakat inherently has pro-poor and self-targeted character.

b. Income Distribution Improvement

Zakat has only taken from the rich and given to the poor. Therefore, zakat distribute social welfare from the rich to the poor as well. Income distribution has two types, as follows: (i) functional distribution that refer to production factor; and (ii) welfare distribution through payment transfer.

c. Job Field Creation

Islamic moral value supports job field creation through partnership approach that forbid *riba* and support zakat implementation. Islamic financial resources banned fixed rent and support idle financial resources that stricken by zakat penalty.

d. Social Protection Network

In the Islamic moral value, social protection to the poor is layers. First protection come from family and close relatives (Q.S 2:233); second protection come from Muslim fellows collectively (QS 51:19); and third protection come from zakat fund (QS 9: 60).

Unfortunately, national zakat funding is still far from optimal, based on BAZNAS, (IPB) Institut Pertanian Bogor, and IDB (Bank Pembangunan Islam) research, the 2013 national zakat potency was as big as Rp217 trillion,-, comprises of: (1) *maal zakat*; (2) company *zakat*; (3) saving deposit *sharia* banking zakat.

BAZNAS revealed that Indonesian zakat only Rp2.73 trillion - or around one percent of zakat potency only in general had absorbed. BAZNAS projected that from national zakat accumulation through national zakat institution that regulated by constitution could reach Rp3 trillion- in 2013 or grow 42.85% compared to previous years.

2. Objective

Based on some previous study backgrounds and formulation of the problems, the objective of this research are, as follows: To measure the optimization of Zakat funding and lending using Measurement of Economy variable.

Literature Study
1. Zakat
A. The definition of Zakat

Zakat is a must- do activity for all moslems. Every year, they have to spend their income in the form of *zakat* as proof of their faith towards Allah. *Zakat* is not only serve as soul and worth (as in property owned) purifier, but also serve as the form of care to others.

Islam states the minimum limit to someone to spend *zakat*, it's when the property he holds amounts to 20 Dinar (about 85 gr of pure gold) or 200 Dirham (about 672 gr of pure silver) in a year. If we trace it back deeper, actually the essence of *zakat* could serve to elevate the state of economy because *zakat* in only given to the poor and weak, for example: the indigents, man full of debts, and many more. On the other hand, the *zakat* givers are the one who hold wealth and property in their hands. Therefore, the *zakat* which is give to *mustahik* (people who have the rights to receive *zakat*) could be viewed as a support which helps the *mustahik* economically and hope to become more productive so that in the following year, his position could shift to become *muzakki* (People wo gives *zakat*).

The teachings of *zakat* in Islam normatively has a social spirit which is not simple. What was written is *Al-Quran* were god's guide towards the stability of people's welfare. Through distribution in proportional order, *zakat* becomes the solution to share the wealth according the proportional portion.

Allah SWT guide the moslem deeply until the operational section. Who is the main target (According to *At-Taubah: 60* in the *Quran*), how much should a *muzakki* gives to the *mustahik*, everything is being explained completely. *Mustahik*, which is the people who possess rights to receive *zakat*, are divided into 8 category (called *asnaf*): they were indigents, the poor, *amillin*, *muallaf* (as in people who had just become moslem), *riqab*, *gharim*, *fisabilillah*, and *ibnu sabil*.

This stipulation was explained in *Al-Quran* in *At-Taubah: 60*, which is:
"Indeed, the zakat, is only for the indigents, the poor, the cartaker of zakat, the muallaf whose heart is opened, the slaves which got free, men full of debts, in the name of Allah, the travellers, as an order issued by Allah. As Allah the most knowing and the wisest". (*Al-Quran At-Taubah:60*)

Looking at the explanation about *mustahik,* this is where *zakat* serve as a changer and as the elevator of economy and their standard of living. Those who have the potential will find their potential being developed. Those who don't have the potential but still got the skill for work, will even got the resources they need to develop their skill. (Hasan Muhammad, 2011: 73, 87)

Perhaps for these reasons that *zakat* is always the main attention since the times of the prophet Muhammad SAW and his comrade. It was shown in our neighborhood that, at leats for the last 10 years, *zakat* and its institutions have never stopped being the hot topic.

B. Types of *Zakat*

Zakat is divided into 2 categories, which is *zakat fitrah* and *zakat maal* (property and wealth)

1. *Zakat Fitrah*.

Zakat Fitrah is the type of zakat which is spend out by the moslem as the purifier of one self and becomes his responsibility, apart from being the sealer of the fasting skip done in the month of *Ramadhan* (Al-Qaradhawi, 1993).

2. *Zakat Maal* (property and wealth).

According to Al-Qaradhawi (1993, h 167), the definition of *Maal* (wealth) is everything that the humankind desires to have or to possess and keep it. According to *Syar'a*, wealth is everything that can be possesed and used following the *ghalib* (norm).

Zakat Maal is the type of *zakat* which is inflicted upon the wealth possessed by the individual or the institution with prequisitions that have been stated by the law (*syar'a*). *Maal* comes from the Arabic language which means wealth. It includes traded goods, farm goods, mining goods, marine goods, livestock goods, founded treasure, gold and silver, also the salary of a working man, and the *zakat* for market stock and obligations. Each of them have their own calculation to be done.

In detail, *zakat maal* categories are:

a. *Zakat* of Livestocks

Zakat of Livestocks includes the products of stockbreeding of large animals (cows or camels), medium-sized animals (goats or sheeps) and small animals (chickens, etc). The calculation for each type of animal categories differs according to the *nisab* (law) and the quantity, and has multi-layered characteristics. The age restriction, however, must at least reach a year.

b. *Zakat* of Farming Goods

Rice paddy is one of the farming products which is being made for *zakat*. The *Zakat* of Farming includes the plantation products or economical plants like seeds, roots (as in potato, etc.), vegetables, fruits, decoration plants, and leaves (as in medicinal or herbal leaves).

c. *Zakat* of Gold and Silver

A moslem who is in possesion of golds and silvers, has an obligation to spend a *zakat* if he had reached the *nisab* and *haul* according to the statement of *syariah*.

d. *Zakat* of Traded Goods

Zakat of Traded Goods is a *zakat* which is spent as proof of ownership of the goods that are being traded. This *zakat* is inflicted upon both personal trading business and group trading business (CV. PT, Union, etc). The *Hadits* which basing this *zakat* is: "The Prophet Muhammad SAW orders us to spend this *zakat* from all goods that we trade" (HR. Abu Dawud).

e. *Zakat* of Mining Goods

Zakat of Mining Goods is a *zakat* which is spent from all mining goods in which Allah SWT (God) had prepared and it has its worth, for example bronze, iron, etc. The goods of *makdin* (mining) which consist of iron, steel, bronze, brass, copper, oil, charcoal, etc in Indonesia was controlled and regulated by the country itself. On the other hand, the ones if form of stones (mineral stones), gold, and silver, by the regulation of the government, the people can mine it freely.

f. *Zakat* of Founded Treasure

Zakat of Founded Treasure (*Rikaz*) is a must spent *zakat* upon the items found buried underground, usually called treasure. The *Zakat* of Founded Treasure didn't state the *haul* (the duration of burial) and the *nisab* (minimum quantity for it to be inflicted for *zakat*), though the quantity is indeed 1/5 or 20% from the quantity of the founded item(s). So everytime an item is founded, it is must to spend the *zakat* about 1/5 or 20% of the original quantity.

g. *Zakat* of Profession (the salary of a man)

The *Zakat* of Profession is a *zakat* which is spend from the salary of one's work it it already reach the *nisab*. The list of professions includes civil employees, consultants, doctors, notaries, accountants, artsts, and entrepreneurs. Different from the income from farming, breeding, and trading, the income from profession is not much known in the previous generations. That's why the discussion regarding the *Zakat* of Profession cannot be compared with similiar detail with other types of *zakat*. It's because *zakat* is indeed the collection of one's own wealth to be shared with those that needs it.

In details, the calculation of *zakat* in above's explanations can be viewed in the table below:

Table 2.1
Types of *zakat, haul, nisab*, and the quantity

Types of *zakat*	Haul	Nishab	Quantity
Zakat of Livestocks	Every year	40 Goats / 30 Cows	1
Zakat of Farming Goods	Every farming season	About the same as 520 gr of rice	5 -10%
Zakat of Golds	Every year	About the same as 85 gr of gold	2,5%
Zakat of Traded Goods	Every year	About the same as 85 gr of gold	2,5%
Zakat of Mining Goods	Every year	About the same as 85 gr of gold	2,5%
Zakat of Founded Treasure	Every finding	-	10%
Zakat of Profession	Everytime he / she receives	About the same as 85 gr of gold	2,5%

Source: BAZIS

In the practice, the distribution of *zakat* could be consumtive and productive. *Zakat* that is consumtive includes staple food, clothes, etc. On the other hand, the productive *zakat* includes the resources for starting a business. This productive *zakat* is the one that was supposed to push the poor to struggle independently so that they may escaped the poverty line.

The productive *zakat* isn't baseless, seeing this happens in the time of Rasulullah SAW. Taken for the *Hadits* of Imam Muslim from Salim Bin Abdillah Bin Umar and from his father, that Rasulullah had given him *zakat* in hope that it was being developed and then spent as another *zakat*. In realtion to this productive *zakat*, an interesting statement coming from Syekh Yusuf Qardhawi, in his phenomenal book, Fiqh Zakat, taht Islamic government may build factories or companies using money earn through *zakat* as long as the focus is still the poor's welfare. For now, the role of government regarding the regulation of *zakat* had shifted to The Institution of Amil Zakat (BAZ or LAZ) (Amirah 2010, h 4)

According to K.H. Didin Hafidhuddin, M.Sc., BAZ or LAZ, when giving productive *zakat*, it should be accompanied by the guidance to the *mustahik* so that the business could thrive. Apart from giving the proper guidance towards the *mustahik*, BAZ and LAZ also has the role of spiritual guidance so that their religious faith didn't fade.This distribution of productive *zakat* was meant so that the people in Indonesia could become independent and lessen their tendency to depend on others. This could result in the decreasing of the poor families in Indonesia (Amirah 2010, h 4).

C. The Institution of *Amil Zakat*

The optimalization measurement of *zakat* distribution from the Islamic-based organization is important to keep the mutual trust between moslem and the organizations, as said by Abdul Quddus Suhaib (2009), which emphasize that the ideal institutions or organizations of *zakat* must have syncronize with the collection and the distribution of every *zakat* that they received. Shirazi (1996 & 2006) points that the main purpose of *zakat* institutions is to facilitate the moslem to pay and spend *zakat* and distribute them efficiently towards the rightful receiver. However, if these institutions are proved not able to distribute efficiently the *zakat*, it could bring doubts among the moslem especially those who pay the *zakat*.

Therefore, the payers will distribute their *zakat* directly to the receivers without using any institutions that are run by the government. In other words, The *zakat* organizations must give the appropriate example of efficiency to the moslem in any way like the ration of distribution according to the collective, the ability to reduce the poor in Islam, and the efficient handling towards the receivers. So it's important to measure the performance of these institutions by viewing how they work their role. Simply, the measurment of performance through optimalization of *zakat* distribution is the key element in the success of Isalmic Organization to fulfill their role in facilitating the moslem pay their *zakat* (Abdul Halim Mohd Noor, 2012).

A few group gace their negative perception towrads the distribution of *zakat*, so if it doesn't get handled effectively, will have an effect towards the development of these *zakat* institutions (Hairunizam, Sanep & Radiah 2008). *Zakat* organizations have the role to ensure the people that not only the distribution of *zakat* is handled perfectly but the regulation and maintaining is handled professionaly and efficiently (Ismail Ibrahim, 2006). The failures to reach that goal will reduce the public trust and the collecting of *zakat* will went down greatly because they will find another alternative to fulfill their *zakat* payment. The ability of *zakat* organizations to show a good performance is important to maintain the trust. It isn't a choice, it's a requirement for the existency of the organization (Abd. Halim Mohd Noor, 2012).

As was explained before, the performance is about doing the work and the result they reached. Also in Islam-based organizations, the performance is the result of work to form a strongest relation for an organization in accordance with strategic goal (ex. *Syariah* obedience), the satisfaction of customers, and the contribution in economy. In relation with the dimension of economy from *zakat*, this serve to reach the effect which satisfied several dimension like aggregate consumption, savings and investation, the offer of aggregate workers and resources, decreasing the poor, and elevation of economy (Abd Halim Mohd Noor, 2012).

D. Optimalization

There're several definition of optimalization according to the views of experts:

a. Optimum is a condition of quantity, degreen, or something else in which is a favorite, can be reached in a few conditions (Herilarium, wordpress.com). Optimum isn't maximum, because optimum considers the limitaiton factors or constant. Optimum refers to quality not quantity, means the best not the largest.

b. Optimum is struggling to maximize something which is desired (Sisdjiatmo: 1983: 266)

Lastly, the definition of optimalization is a search of the best value from the functions given to a context (octavita.com).

E. Measurement of Optimalization

The Institution of Amil Zakat (LAZ) as the non-profit organization needs effectivity and efficiency in performance. If in profit organization the measurement of effectivity and efficiency can be viewed in the profit (ex. ROI, EPS), then in non-profit organization the numbers that can reflect such things are not present (Joeliani, 1994).

According to Wise (2001), the 3E (*economy, efficiency*, and *effectiveness*) of performance is a useful element in doing assessment for non-profit organization. The relation between organizational goals with the input that are used is a measurement of economy. The relation between input and output is the size of efficiency of organization, but the relation between output and organizational goal is the size of effectivity.

Previous Studies

The result of the survey reveals that there are research which have relevancy with this research, those research are as follows:

- The research of Arief Budi Santoso which titled "*The Management of Zakat PKPU of Central Java in the Perspective of Islamic Law*". Faculty of *Syar'iah*, 2007. This research has two focus of issues to tackle:

1) How is the execution of empowerment of *zakat* in PKPU Central Java?

2) How Islamic law views the execution of empowerment of *zakat* in PKPU Central Java?

The result of this research is first, in empowering of *zakat*, PKPU Central Java enforce the modern management which include the accumulation, regulation, and utilization management of *zakat*. The Utilization of *zakat* in PKPU Central Java brings forward to the effort of building independency of *mustahik* through elevation in work productivity.

The second is the Utilization of *zakat* in PKPU Central Java is proved to have implement the element of *Al-Quran* and *Hadits*. Although, There still need a re-evaluation towards the policy of giving *zakat* in the form of capital resources, like *qrdhul hasan* apart from *hibah*, so it would not be counter-productive with public policy about *zakat*.

- The research of Devi Hidayah Fajar S. Syaban, which titled "*The Utilization of Productive Zakat in the Perspective of Islamic Law (Study of the case in The Institution of Amil Zakat Assalaam, Solo, Central Java)*". Faculty of *Syari'ah*, UMS, 2008. This research has two focus of issues to tackle:

1) How is the management of productive *zakat* in L-ZIS Assalaam?

2) How is the development of economy of the *mustahik* which given the productive *zakat* from L-ZIS Assalaam?

The result of this research is first, discussing about the management of *zakat* but more focus on the regulation which is productive also researching the development level of the people (*mustahik*) guided by L-ZIS Assalaam which are given the productive *zakat*.

The second is enforcing the method of distribution of productive *zakat,* especially towards certain *mustahik* or usually called L_ZIS Assalaam guided people, the *zakat* was given to the rightful ones with *qardhul hasan* as the resources for business, in hope that these guided people might able to have the relation based on *ukhuwah islamiyah* towards other. The method chosen is deductive inductive analysist.

- The research of Arif, which titled *"The Management of Productive Zakat as Means of Reduction of The Poor (Study of a case in management zakat distribution by BAZIS in Tarukan Village, Candi Village, Bandungan District, Semarang District)"*. Faculty of *Syari'ah*, STAIN Salatiga, 2012.

    This research was a qualitative research. The result of this research is a study of a case in management zakat distribution by BAZIS in Tarukan Village, Candi Village, Bandungan District, Semarang District. At first, the collective of *zakat* consist of money and staple food collected by BAZIS in Tarukan Village was distributed to the *mustahik.* The management system was considered to be ineffective to the state of economy of the *mustahik,* until in 2008 there's an idea of productive *zakat*. The distribution of the *zakat* takes the form of a goat as the alternative of reducing the poor. It was considered a success seeing as almost all of the *mustahik* were able to manage the goats and breeding them.

- The research of Mila Sartika, which titled *"The Effect of Utilization Productive Zakat Towards Mustahik Utilization on LAZ, Solo Commitee for Care of Surakarta"* UMS, 2008.

    Mila Sartika stated in her research discussing about the utilization of economy, that the research which explains the effective utilization to reduce the poor was not only used as the fulfilment for productive needs, education support, and the efforts to create more workfield but reducing the rate of jobless people. Mila Sartika's research also explains that *zakat* should not only be consumptive, so the idea is to turn *zakat* as the source of people's income. The use of *zakat* as something consumptive should be done only in times of emergency. Means, that whenever a *mustahik* who is almost impossible to guide or nurtured to have his own business, then the use of consumptive may be done.

- The research of Laila Karimatun Nisa', which titled *"The Analysist Study Towards the Strategy of Dompet Dhuafa Lectures of Republika Papers in Helping To Reduce Semarang Poor People"*, Faculty of Lecture, 2003.

    This research reveals how the strategy and the results of Dompet Dhuafa lecture in helping to reduce Semarang poor people. The strategy used are:
    1. Giving business resources through the way of creditting to the poor people supervised by BMT without any guarantee at all.
    2. Giving the means of business to the family of street kids in collaboration with the boarding home of Semarang.
    3. Giving the help to the people involved in the natural disaster, such as flood, drought, landslide, etc.
    4. Giving the means of education to the students unable to attend elementary up to the middle high.

- The research of Lia Qatifah, which titled *"The Role of Dompet Peduli Umat Daarut Tauhid Through The Program of Microfinance Syari'ah Basing on The Misykat People in Utilizing the Member's Economy (Study of a case of National LAZ DPU-DT, Semarang)"*, Faculty of Lecture, 2009.

    The result of this research is that the program of microfinance *syari'ah* based on Misykat people instilled by DPU-DT have the role of a lecture.

First of all, the building of side character as the *da'i* (lecturer) who has flair of Islamic knowledge and personality. Second, an incentive guidance towards the Misykat people in every role using the means of *halaqah.* Third, the shifting of fund towards the Misykat people based on the principle of borrowing without interest. The principle enforced here was the form of Islamiyah Lecture. Another point is the fund used for the program was taken from *zakat*, *infaq*, and *shadaqah.* Overall, this program was the application of economic lecture, which is part of the method of *al hikmah bil lisan al hal.*

Methodology
1. Data

The source of the data used in this research is the source of primary data and secondary data sources. In this study, researchers conducted a number of ways to get the data including the following:
1. The research literature (library research)
2. Field Research (field research)

2. Operational Variables
A. Output

The output is an products or directly from the findings of program activity and usually in measure to volume of the successful work (Hatry, 1996) . Diverge with prifit organization, Institute Amil Zakat that the measured output is zakat, infaq, shadaqah , and other funds that successful in store to Posted Institute of zakat .

The variables in this research has the operational output variable as a variable Exogenous

B. Objective

Diverged with the others organization that collecting and channeling funds (social organization), the organization of Zakat (LAZ ,BAZ ,OPZ) variables used objective is the poverty alleviation in circle of human/ *umat* called *Mustahik* (entitled to receive *zakat, sodaqoh* or *infak*) in accordance with the basic commands. Zakat specific allocation has been determined by the *Shari'a* (Qur'an 9: 60) where the charity is only for 8 groups, are : (*ashnaf*), namely : *fakir, miskin, amil zakat, mu'allaf,* slaves, those who having a depth , *jihad fi sabilillah,* and *Ibn sabil. Jumhur* scholars agree that in addition to these groups, unclean receive zakat. Thus, charity is inherently pro -poor and self – targeted.

However, in the implementation of distribution, OPZ do it with the through a number of programs that can accommodate the perceived purpose of Zakat itself. The variables in this research as a variable operational objectives has exogenous variables.

Table: 3.1
Variable of Operational Research

Indicators	Symbols	rationalization Indicators	operational Variables

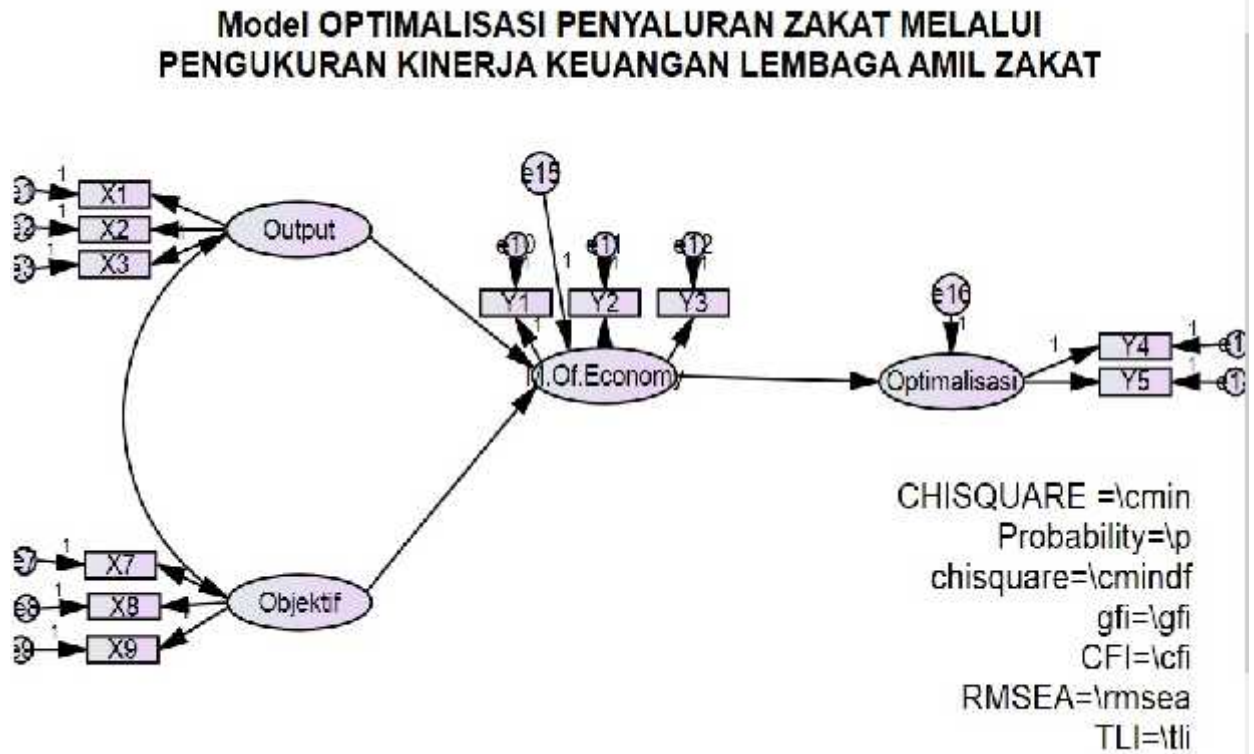
Output :
    The amount of incoming funds from zakat
    The amount coming from donations and sadaqoh
Number of non ZIS funds
	X1
	
	X2
	
	X3
		Overall report measures provide an indication of the results of the program	Latent Variables Exogenous

Objective : The amount of funds distributed into 8 groups, namely *1. Fakir and Miskin* *2. Amil Zakat* *3. Fi sabilillah*	X4 X5 X6	Measure the fit between total Zakat funds collected by the class are eligible to receive zakat	Latent Variables Exogenous
Measurement/sosial Of Economy : <u>Obyective</u> Total output X 100 % 1.Percentage of funds for *Fakir* and *Miskin* 2.Percentage of funds to *amil zakat* 3.Percentage of funds to *fi sabilillah*	Y1 Y2 Y3	An indicator of the size of the economy on OPZ is the collection of zakat (output) has been distributed proportionally in accordance with the purpose of zakat command and presence that OPZ for 8 classes (*asnaf / mustahik*)	Latent Variable endogenous
Optimization Proportion to 3 *asnaf* Proportion	Z1 Z2		

Source: processed

3. Research Model

Based on the operationalization of the variables that shown above in Table 3.1 can be described design research model as follows:

Representation 3.1. The plan of Research Model


Based on the analysis by the research of stripe model that exogenous latent variables are:

Output and Objective. And directly will be affect to endogenous latent variables by Measurement of Economy. Besides that, endogenous latent variables directly are too affect the optimization of endogenous latent variables.

Next in this diagram, the research of stripe model is will be exist an affect between endogenous latent variables are: Measurement Of Economy and Optimization

4. Hypothesis testing

Based on the probability value output with M.Of Economy indicated by the value of 0.024, was under α (5 % = 0.05). It states there is influence with M.Of Economy Output.

Based on the probability value Objective with M.Of Economy indicated by the value of 0.479, was above α (5 % = 0.05). It states there is no influence Objective with M.Of Economy

Based on probability Value M. Of Economy indicated by Optimizing Value 0.032, was under α (5 % = 0.05). It states there is an influences with M. Of Economy by Optimization.

Conclusion and recommendation
1. Conclusion
The optimized measuring of *zakat* distribution using the measurement of economy variable which is independent / exogen both in output and objective, can be used as a media to measure the *amil zakat* institution. However, it is in need of correction in the indicator used in this research, particularly the indicator of objective variable.
2. Recommendation
Ignoring the faults, hopefully this result of this research is able to be the base, which of course needs some improvement, to measure the performance of *amil zakat* institution especially the optimization of *zakat* distribution.

MODEL OF BUILDING MICRO AND SMALL ENTERPRISE'S (MSE) TRUST ON BAITUL MAAL WAT TAMWIL IN INDONESIA

Arizal, Lancang Kuning University, Indonesia
Afred Suci, Lancang Kuning University, Indonesia

Abstract

Abstract: The existence of BMT is one of solutions for micro and small enterprises in Indonesia, who have limited banking access. But in fact, there are still many of those who donor trust either existence or capability of BMT in serving customers' sharia-based financial needs. This study aimed to know affecting factors of MSE's trust on BMT sharia-based financial products. Qualitative approach was used in this study by analyzing several of literatures. Study reveals that role of knowledge, linkage program, technology application and reference group are critical factors that may increase MSE's trust for using BMT financial products.

Keywords: *BMT, Trust, Knowledge, Linkage, Technology and Reference Group*

Introduction

Micro and Small Enterprises' (MSE's) economic role is highly significant in Indonesia. More than 99% Indonesian business players come from MSE's (Gustina, 2013). But the majority of MSE's have not optimally utilized financial institutions (Irmawati, *et. al.,* 2013). As a result, MSE's face obstacles to access banking capital, so many of them then rely on informal financing because of its flexibility and speed (Muhammad & Kusuma, 2014). The weakness is in the lack of MSE's capacity in the financial administration system, the lack of collaterals as well as low competitiveness, so most of MSE's are classified of non-bankable (Irmawati, et. al., 2013). This is very common in developing countries - including Indonesia – so, relatively, the impact of microfinance is more significant in developing countries (Hassan, et. al., 2013).

One of growing microfinance institutions in Indonesia is BMT (Baitul Maal wat Tamwil). BMT have advantages over conventional financial institutions. Collateral flexibility and the speed of administrative process are some of BMT's advantages. Additionally, Islamic-based business principles become its differentiation compared to conventional microfinance institution. Thus, the existence of BMT will be much easier to help the development of MSE's in Indonesia. In addition, not only provides financing, BMT also provides assistance and guidance to its members (Sakai & Marijan, 2008).

Although the quantity of BMT continue to grow throughout Indonesia, but many of them have technically been bankrupt. It is still difficult to obtain accurate data on the growth of BMT in Indonesia, because the data of each BMT association have not been integrated yet. According to PINBUK (Small Business Incubation Centre) estimation, in 2006 alone, there were approximately 3,200 units of BMT (Alma & Priansa, 2009) and served approximately 3 million people. In 2009 it increased slightly to 3,300 units (Muljadi, et. al., 2014). Then at the end of 2010 grew into 5,200 BMT that served 10 million people. Nevertheless, the distribution of BMT in Indonesia is more concentrated in West Java, East Java and Central Java (Sakti, 2013). In most other provinces in Indonesia is relatively less massive growth of BMT, even though Muslim is the majority of the population.

Among those BMT, many of them are now inactive. For instance is what happened in Pekanbaru, which is the center of Melayu culture in Indonesia and Muslim majority. Based on data from the year 2012, PINBUK noted that from 8 listed BMTin Pekanbaru, only 5 were known active, while three others were non-active (Hamzah, et., al., 2013). The similar fact also occurs in many other regions in Indonesia. It reflects a a concerned fact that Indonesia Muslim community is still not fully believing in the existence of BMT as a lawful (halal) solution to overcome MSE's financial problems. This allegation is in line with research findings of Sakai & Marijan (2008), that generally, Indonesian people still do not understand and less trusting Islamic products. Moreover, many microfinance institutions - including BMT - do not apply the marketing orientation in providing services (Insaidoo and Ahiakpor, 2011). Whereas in the financial business, trust is essential for the emergence of loyalty (Asiyah, et. al., 2014) and only by the loyalty, BMT can run its sustainable business.

Therefore, a study to understand the marketing approach model of increasing public trust on BMT is indispensable. Based on this idea, this study was conducted to answer the crucial issue regarding to what factors that could affect the MSE's trust to BMT's Islamic financial products in Indonesia.

Research Gap and Objectives

Most research and existing literature merely discuss about how to increase customer's intention, decision and loyalty to BMT and make trust, therein, as one of the important predictors. But specific study about trust predictors is still rare, particularly in the objects of BMT in Indonesia.

Besides to fill a void of literature so that it can be a reference for stakeholders in order to develop BMT in the future, the existence of this research aimed to find out the factors that can increase MSE's trust in BMT financial products. In addition, the output of the study will yield a proposed model that can be used as a reference for other researchers to conduct empirical testing of MSE's trust predictors.

Methodology

Study was based on literaturestudies, coveringa wide range oftheoretical andempiricalresultsthat relevant toBMT and microfinance operation. Expected outputwasaneffectivemodel of MSE's trust building in BMT financial products based onthe followingdeterminant factorsand their indicators.

Literature Review

1. Brief History and Concept of BMT

Baitul Maal is a financial model based on religion and social which was first introduced in the time of Prophet Muhammad SAW. This institution represented the wealth management (treasury) and served the financial needs of the state and society. Sources of funds came from the zakat collected and distributed for the benefit of the people. Along with the development, these institutions produced many product innovations, where the Baitul Maal was no longer just a religious social institution but also the finance department for the state to collect taxes, state assets management and so forth. In Indonesia, the Baitul Maal termed as Baitul Maal wat Tamwil (BMT) and in line with the modern times, BMT now operate in a different manner and role compared to the time of the Prophet Muhammad and his companions (Hamzah, et., al., 2013).

According to Huda & Heykal (2010), BMT is an institution that consists of two terms, i.e., Baitul Maal and Baitul Tamwil. Baitul Maal is a fund-raising institution and

charitable and social nature of fund distribution such as zakat, *infaq* and *saddaqoh*. While Baitul Tamwil is rather to the collection and disbursement of commercial funds or an intermediary function as commonly applicable in conventional banking but it has a sharia principle.

According to Small Business Incubation Center (PINBUK), BMT is an integrated independent business that basically consists of bay al-mal wa al-tamwil with activities to develop productive ventures and investment in improving the quality of economic activities of MSE, which include encouraging saving and their financial support. It also receives deposits of zakat, infaq, *saddaqoh* (alms) and distributes it in accordance with the rules (Yuningrum, 2012).

2. BMT Business Principles

BMT is part of the Micro Finance Institutions (MFIs) in Indonesia, operates based on Islamic principles. BMT is not merely business-oriented institution, but also a society-based where wealth is evenly and fairly distributed. BMT is operated by the principle of Profit and Loss Sharing (PLS). They are obliged to foster small and micro businesses in defending the interests of poor communities. They were grown on the initiative and start-up capital from local community leaders on the basis of justice (Hosen in Gustina, 2013). Therefore BMT become the community's hope, who is engaged in micro and small business, to have their business financed.

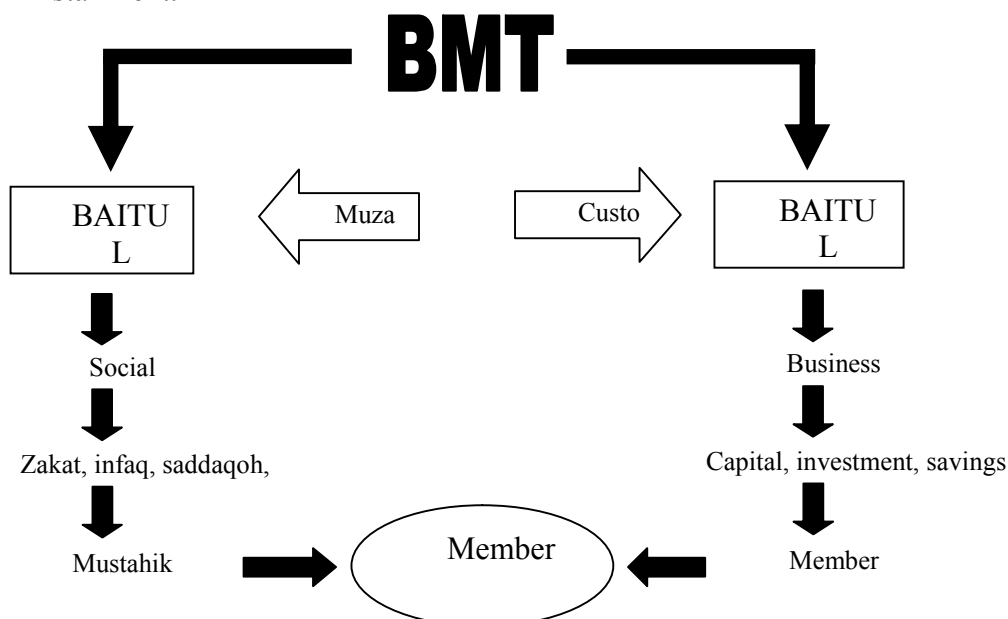
In its operation, BMT has 3 basic principles for each financial product, such as (Gustina, 2013):
a. Profit and Loss Sharing (PLS) Principle
   Is a system that includes procedures for sharing the yield between the fund owner (Shohibul maal) with the fund manager (mudharib). The sharing amount is predetermined result in a contract/*aqad.*
b. Non Profit Principle
   This principle is virtue, more social and not profit oriented. The product form is soft loan for micro / small enterprises. BMT member or partner does not need to share the profits to BMT, but obliged to simply return it on time, so that the fund can be redistributed to the other members who need financing.
c. Selling Plus Margin Principle
   BMT sell goods to customer with cost plus margin terms and it is usually carried out in installment.


Figure 1. Function of Baitul Maal wat Tamwil (Febriana, 2013)

3. BMT's Business Types

Legally, BMT status is a cooperative, which means BMT is subjected to the Act No. 17 Year 2012 About Cooperative and SME's and is specifically stipulated in the Decree of the State Minister of Cooperatives and SMEs No. 91 / Kep. / M.KUKM / IX / 2004 concerning the Implementation Direction of Sharia Financial Service Cooperative (Amalia, 2009).

In its operation, BMT runs various type of business, either financial or non-financial. Types of BMT's business generally consist of (Yusrialis, 2013):

a. *Baitul Maal* fund raising from zakat, *infaq* and *shoddaqoh* and distribute it to *mustahiq* (people are entitled to receive);
b. Fund collection by fund mobilization and developing savings based on *mudharabah* and *wadi'ah* (deposit);
c. Fund distribution by financing MSE in form of *mudharabah* (total financing based on PLS mechanism); *musyarakah* (join financing based on PLS mechanism); *murabahah* (financing of goods based on cost plus margin that should be paid at agreed due date); *bai'* (financing good based on installment mechanism); *bai'assalam* (advance financing given to enterprise due to incoming goods); *bai' al istishna* (financing by installment); *qard al-hasan* (soft loan with no additional return except administration fees).

Discussion

1. Trust on BMT

It is interesting what was written by one of Indonesia sharia expert, Muhammad Shafi Antonio (in Kartajaya & Sula, 2008) that the Islamic financial market is divided into two major segments, namely emotional segments and rational segments. Those who are emotional, highly concern about halal-haram but less concern about price and service quality. While rational ones, otherwise, concern about price, product variety, corporate reputation and of course the service quality. Rational segments will be pragmatic, where they can easily switch to conventional institutions, though they know it is contrary to their religion values.

However, both segments have one thing in common: they must be convinced that the Islamic financial institution is credible. Trusted is to maintain its business in accordance to halal (legitimate by religion) principle. On the other side, it is believable to serve customers satisfactorily and can afford by mainly BMT's target market that is micro and small enterprises. BMT should be able to embrace both these segments. Both large and small businesses to micro, all must implement Sustainable Marketing Enterprise framework where a company - regardless of its size - must be able to survive and succeed not only at present, but also in the future (Kartajaya & Sula, 2008). The key to survive from the high competitive industry is trust. Trust that BMT could be the right solution of Islamic financing but still able to serve its customers satisfactorily by implementing modern management.

Mowen and Minor (in Sangadji & Sopiah, 2013: 201) defines trust as all the consumer's knowledge and all the conclusions made by consumers about objects, attributes and benefits. Consumer's trust has three dimensions include the reliability, credibility and benevolence (Hasan, 2013). In the context of the financial institutions that are run by BMT, then reliability is attributed to the company's expertise - including employees - in providing Islamic financial products needed by consumers; credibility is

associated with expertise in performing job effectively and reliably and; benevolence is associated with sincere intent and motivation in serving consumers in accordance with the values of Islam.

Trust is an important essence of customer's loyalty. And to increase trust, BMT needs to assert its credibility as a financial institution that is able to maintain the purity of Islamic values in business (Asiyah, et al., 2014). For those reasons, BMT needs to understand all needed factors to gain customer's trust. This is very possible to do as Indonesia has wide opportunity since the majority of Indonesian people are Muslims and they are firmly taught that interest money is haram (illegitimate by religion) (Ginting & Sudarjat, 2014).

2. Role of Shariah-based Business Knowledge

Although BMT is engaged in the financial sector, along with banking sector in general, but either principles or concepts of both sectors are certainly different. Managing BMT cannot use a profit oriented paradigm (Sakai & Marijan, 2008). BMT's main principle adheres to Islamic values and run the business based on sharia concept. The profit in the conventional financial institutions, is the main orientation regardless the aspect of justice and religious values therein. While in the Islamic business principles that embraced by BMT, profit is nothing more than a rational attempt to make the business survive so that they could continue helping economy justice and welfare of the people. It can be concluded that BMT is more oriented to the social aspect than the commercial side as applicable in conventional financial institutions. Additionally, it is clear that conventional microfinance is less in line with the belief system of the Muslim community (Hassan, et., al., 2013), especially in Indonesia which has the largest Muslim population around the world.

Because of those differences in business concepts and principles, the knowledge basis also differs fundamentally. Definitively, Sumarwan (in Adawiyah, 2010: 193) defines consumer knowledge as all information held by consumers on a wide range of products and services and other knowledge related to such products and services, and information related to its function. J. Paul Peter and Jerry C. Olson (in Yuliawan 2011) divide knowledge into three dimensions, i.e. knowledge of product/service characteristics or attributes; knowledge about the product/service benefits, and; knowledge about the satisfaction given by the product/service.

Sharia-based business management embraced by BMT certainly need knowledge and skill that specifically segmented to Islamic economy basis. The urgency of such knowledge becomes on consumer's trust predictor (Ferrinadewi, 2008). Unfortunately, here lies the problem. Many of BMT caretakers and employees have no relevant education background of sharia, and consequently they have lack of understanding of conducting sharia business (Muljadi, et al.,2014).

It is ironic that countries with Muslim majority, the knowledge and specific expertise in Islamic finance is minimal, as is also occurs in Yemen where the quality of staff and limited expertise and knowledge of Islamic economics becomes most crucial issue of microfinance institutions (Alshebami & Khandare, 2014). Then, hiring employees who have the skills, knowledge and experience in areas relevant to the sharia-based microfinance is a strategic marketing effort to do (Insaidoo & Ahiakpor, 2011)

Knowledge is one of the main aspects of the intellectual capital that can encourage the creation of products that are needed and desired by the community, and is a competitive tool for microfinance institutions to face the competition in the financial sector with conventional institutions (Puspita, 2014). Thus, it will be a differentiation strategy as well as competitive advantage that possessed by microfinance including BMT

therein. The same thought is also concluded by Hassan, et., al., (2013) that knowledge of human resources and experts on sharia is indispensable as effort to develop Islamic financial products, considering that the innovation of financial sharia products is still become one of the fundamental weaknesses of Islamic micro financial institutions (Hamzah, et., al., 2013). Innovating Islamic products will require a special understanding of the sharia concept considering that many current Islamic financial products are formed by developing one or more Islamic-based transactions in general (Zulkifli, 2007). Consumer knowledge is the main source for the company to offer new products and services (Allameh, et al., 2012).

If the board of caretakers and employees of BMT have the right knowledge of the sharia business concept, then they will be able to provide correct education and guidance to the lower class community, that mostly are the target market of BMT. The success of BMT has to be started from their qualified human resources, the board of caretakers that are free from moral hazard, where the understanding and adherence to Sharia law becomes absolutely necessary (Yusrialis, 2013). Moreover, there are still many of Indonesia people - which is actually Muslim majority - do not comprehend and less trusting Islamic products (Sakai & Marijan, 2008; Hamzah, et. al., 2013). In fact, there are often many cases where people are reluctant to repay their loans because they think such loans are a charitable or religious motif (Sakai & Marijan, 2008).

3. Role of Linkage Program with Islamic Banks

In Islamic micro business empowerment, BMT has been experiencing lots of funding difficulties. Additional capital is a problem faced by many BMT to fulfill the demands from their customer (Sakai & Marijan, 2008; Hamzah, et. al., 2013; Yusrialis, 2013). For the sake of sustainability, BMT should creatively explore other sources of funding other than *zakat*, *waqaf*, *shaddaqoh* and customer deposits (Nasution & Ahmed, 2015). One of the proper solutions is a linkage program with Islamic banking. Not only help increase capital, but the linkage program will be able to lift the BMT reputation up in the community and customers. Additionally, linkage program allows the transfer of knowledge from Islamic banking to BMT as its partner. If this occurs as expected, naturally trust in BMT will increase (Nasution & Ahmed, 2015).

Linkage program is one way of encouraging intermediary function by empowering Micro, Small and Medium Enterprises (SMEs). Linkage program is an effort to improve the competitiveness of financial institutions and at the same time it will enhance the efficiency of the Islamic Bank credit scheme implementation. Linkage program gives a mutual benefit to both Islamic Banking and non-bank microfinance institutions - in terms of lending to micro and small enterprises. The goal is to accelerate the achievement of the Islamic banking business plan to SMEs, as well as to overcome the limited network and human resources in reaching micro businesses directly. Meanwhile, for small and micro-finance institutions, the linkage program can overcome the difficulties of capital required in lending (Tanjung, 2010).

In line with above concepts, then BMT and Islamic banking should not be in competition, because BMT is basically a complementary partner to Islamic banking business (Puspita, 2014). Islamic banking, so far, has been criticized for not being able to finance micro businesses that are categorized as non-bankable. They are bound by prudentiality principle that obliged by Central Bank of Indonesia, so that the role of the customer's characteristic and collateral still become strict consideration that often impede the financing to micro and small businesses. Even many Islamic banks are replacing the sharing system into a sales-based financing schemes, plus the public's understanding on the sharing system is still relatively low (Nasution & Ahmed, 2015). On the contrary, BMT is more flexible in terms of requirements and collaterals as well as having direct access to the small traders.

Method of providing group loan conducted by BMT is a way to bridge the problem of customer's characteristic and collateral, in which the borrower's group or the group leaders will be charged to be the guarantor of their members' loan.

Because of that ideology similarity between Islamic banking and BMT then they should be able to work together through the linkage program. The program has been initiated by Central Bank of Indonesia as an Islamic banking supervisor and the Ministry of Cooperatives and SMEs as supervisor for BMT business. With this program, BMT can be the intermediary between the Islamic banking and customers. Linkages types can be done through executing method, channeling and joint financing (Nasution & Ahmed, 2015). In executing method, the role of Islamic banking only help filling the shortage of BMT funding, where the relationship with the end customer is still fully carried out by BMT alone. In the method of channeling, the role of BMT only receive fee as a mediator between the end customers and the Islamic banking. It means, Islamic banking has direct relationships to end customers. Joint financing method means joint in management and capital in financing certain customers or projects between BMT and Islamic banking (Nasution & Ahmed, 2015).

In Riau Province alone, the linkage programs have already been running by Bank Riau Kepri, Bank Muamalat and Bank Syariah Mandiri, but in fact have not reached all existing BMTs, because those banks merely concentrate to BMTs who have small risk (Nasution & Ahmed, 2015). Challenges are still faced in the linkage program since yet there is no strong support by local government. Many BMTs are still find difficulties accessing additional funding due to constraints of collateral requirements (Nasution & Ahmed, 2015). Central and local government support is needed to strengthen the linkage program in the form of guarantee from the state-owned enterprises or enterprises designated by the government such as Jamkrindo (Credit Guarantee Indonesia) or Jamkrida (Regional Credit Guarantee).

4. Role of Information Technology Implementation

BMT engaged in small-scale and micro with assets of less than Rp 50 million and a maximum sales omzet of less than Rp 300 million per year (Kuncoro, 2010). With such segments, it would be very difficult for BMT to compete with medium-sized and large financial institutions in terms of providing a sophisticated banking technology. Provision of ATM, online banking, mobile banking, integrated banking system and so on, would be very expensive and almost impossible to be met by BMT. It is in fact that the technology implementation is still a major problem for many BMT in Indonesia (Hamzah, et. al., 2013), even Ginting & Sudarjat (2014) concluded that the integrated technology system is the most important weakness in BMT's operation. Meanwhile, it has been widely proven that the use and acceptance of the technology are important factors that could affect the level of customer's trust (Pertiwi & Adhivinna, 2013). The weak handling of business processes and the technology-based sharia administration, according to Mohammed & Kusuma (2014), are needed to be boosted through IT solutions.

According to the Information Technology Association of America (ITAA) (in Pertiwi and Adhivinna, 2013), the definition of information technology is the study, design, development, implementation, support or management of computer-based information systems, particularly software applications and computer hardware, wherein, data are converted, processed, transmitted into information and guard it into protection of the information itself.

Application of information technology in the financial institutions sector includes three phases, namely information services, communications and financial transactions (Pertiwi & Adhivinna, 2013). In assessing the technology, Davis in 1989, introduced the term of Technology Acceptance Model (TAM), which is the theory of information systems that create a model of how users will receive and use technology, including use of

indicators in risk perception, perceived usefulness and perceived ease of using technology, where all three will affect the level of customer's trust (Pertiwi & Adhivinna, 2013).

It must be admitted that very difficult for BMTs to meet the technological requirements with its own capital. Linkage program with Islamic banks is one solution that can be done to solve the problem. Cooperation with Islamic banking is not limited to the capital, but also beneficial for the knowledge transfer and technology sharing on the basis of mutual agreement. Islamic banks have the obligation to help the increase of Moslem community welfare, but obviously they could not directly enter the segment of small and micro enterprises which are non-bankable. At this point, Islamic banks urgently require synergies with BMT, because BMT has the flexibility and capacity to compensate the shortcoming of Islamic banks.

Because of this synergy is based on a noble mission for the sake of Moslem community, then there should be no reason for Islamic banks to refuse to share technology with BMTs to obtaining faster, accurate and comfortable service. Such technology sharing can be done by forming a unified technology platform among Islamic financial institutions (Choir, 2010). This kind of commitment has been actually done by Bank Panin Syariah in 2014 by signing an MoU with Inkosyah (Induk Koperasi Syariah) BMT in Yogyakarta in the form of capital assistance, network expansion, information technology and improving human resources (Anonymous, 2014). The pattern of this cooperation could be adopted more widely in Indonesia.

5. The Role of Group Reference

BMT's reputation as a corporate brand is still less known by the public. This causes Islamic financial products offered by BMT are also unpopular. According to Sakai & Marijan (2008) the condition was caused by the lack of promotion to the community. Whereas the use of marketing approaches and strategies for microfinance institutions in promoting its products, not only will attract new customers, but also will ensure the sustainability of the micro-finance institutions (Insaidoo & Ahiakpor, 2011).

The question then, what kind of promotion is most appropriate to socialize BMT? Using above the line approach such as television, print media and radio will be costly and create a commercial impression. Meanwhile BMT's image tends to religious social patterned that humble in its appearance and lifestyle.

Brand activation of BMT that is most appropriate to raise public confidence that BMT is indeed a financial solution for Moslems is social and religious approach. It is proven by Kapriani, et., al., (2014) that the value of religious and social factors are predictors for customer trust in Islamic financial products. Kotler and Keller (2007) stated that one of the elements of social factors is the reference group.

According to Solomon (in Hafidz, et. al., 2013) reference group is any person or group that is considered as a comparison and reference for someone in shaping the general or specific values. Reference groups are considered to have significant relevance to a person in terms of evaluating and providing aspiration in determining their behavior. In the implementation, according to Hafizet al., (2013), the power of reference is measured from the normative influence, information and expressions of shared value. Normative influence is the power possessed by the group through social norms that must be observed and followed. Power of information is the influence possessed by the reference group because of their knowledge and in-depth information about certain product /service. Influence of value expression occurs when consumers are trying to consume a product/service in order to be seen equal to the reference group.

Hafidz, et al., (2013) proved that the customer's information sources about the existence and BMT's products are mostly derived from acquaintances and also the

scholars. In fact, prevailing culture element in Indonesian society is still providing space for the role of religious leaders into public preference as a source of advice (Yandono, et. al., 2014). Unfortunately, the involvement and understanding of neither BMT nor Islamic financial products among the religious leaders are still low. As the results Hafidz et al. (2013) found that the role of the religious leaders is still less significant in attracting people to use BMT sharia products. Similarly, Hassan et al. (2013) concluded that the role of experts and opinion leaders is an important factor but not yet optimally developed to the benefit of socialization and the development of sharia microfinance products.

Therefore, proper trainings to religious leaders about BMT and sharia-based financial are crucially needed by establishing cooperation between the Islamic financial institutions, universities, and related institutions such as the Ministry of Religious Affairs and the Ministry of Cooperatives and SMEs. If the religious leaders already have a good capacity regarding Islamic financial products, then they can be empowered as a promotional medium or public relation on behalf of BMT to spread out economic Islamic values to larger Moslem community.

Conclusion

Trust in the context of Islamic financial products offered BMT, covers reliability aspects that can be associated with company's expertise - including employees - in providing Islamic financial products that are needed by consumers; credibility is associated with expertise in performing job effectively and reliably and; benevolence is associated with sincere intent and motivation in serving consumers in accordance with the values of Islam. Trust certainly will not come by itself, but requires a number of predictors that can influence it.

The knowledge and expertise at the concept of Islamic finance is needed to bring confidence to the community and the development of financial products that in line with Islamic values. Trust will appear when the BMT's caretakers and employees possess the knowledge of the product or service characteristics or attributes; knowledge about the benefits of the product /service, and; knowledge about the satisfaction provided by Islamic financial products / services for consumers.

Linkage program with Islamic banks is needed to strengthen BMT capital. With the availability of sufficient capital, BMT reputation will be more trusted by the public because by the support of Islamic banks, BMT would be able to meet the financing demand in a larger scale. Linkage programs can be implemented in the form of executing, channeling and joint financing.

Information technology that include information, communication and fast, safe and convenient transactions process will positively increase customer's trust in the performance of BMT. Sharing technology with Islamic banking could be a solution to anticipate the BMT's budget constraints for the provision of technology facilities.

Religious and strong social values on BMT business need the role of religious leaders as the most appropriate reference group to promote Islamic financial products. The group has a normative influence, information and capable of moving the value expression for his followers.

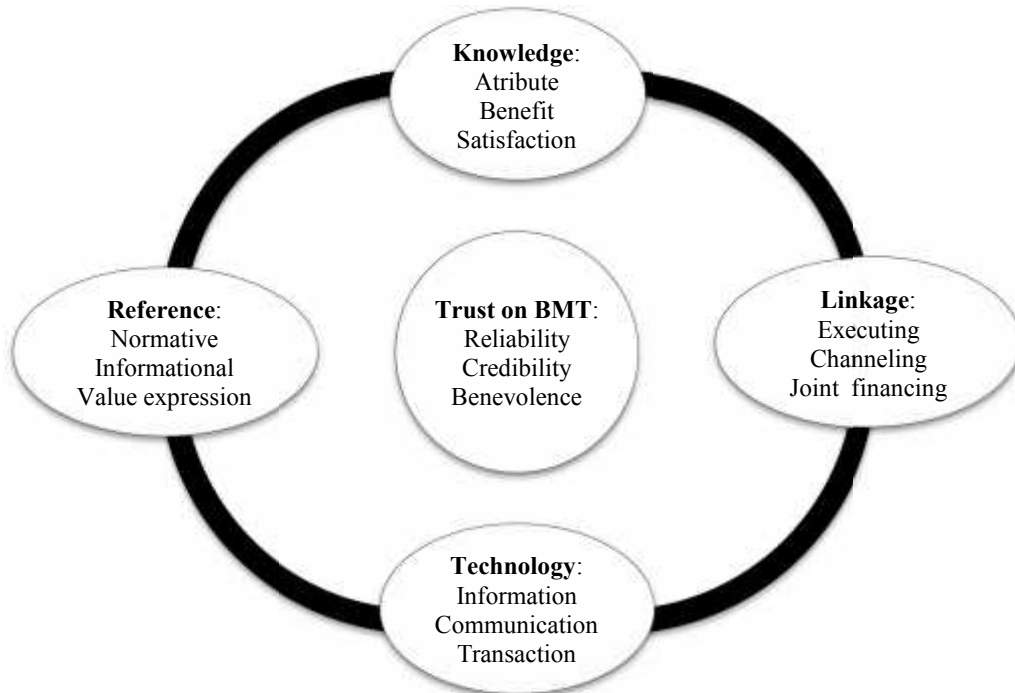
The four predictors turn to be crucial aspects that are needed to build MSE's trust on BMT Islamic financial products. Based on these conclusions, it can be described a proposed model of trust predictors in Islamic financial products BMT as shown below:


Figure 2. Proposed Model of Trust Predictors in BMT

MULTIDIMENSIONAL WORK ETHICS AND TASKS PERFORMANCE: MEDIATING ROLE OF AFFECTIVE COMMITMENT

Amin Wahyudi, Universitas Slamet Riyadi, Indonesia

Abstract

 Education is a conscious and planned effort conducted to form a teaching and learning process, so that the students can develop their good spiritual, self-control, personality, intelligence, morals, and skills that are needed to improve the quality of students. To realize the objectives, lecturers with good work ethic, commitment, and performance are needed. This research aims to analysis the role of affective commitment as mediating variable in the influence of Multidimensional Work Ethic Profile/MWEP (centrality of work, delay of gratification, hard work, leisure, morality, self-reliance and wasted time) on the task performance of College lecturers. The population of this research was College lectures in Central Java. This research was conducted by giving questioners to 400 lecturers. The hypothesis test was conducted with Structural Equation Modeling (SEM) technique. The findings of this research are: 1) just only the hard work dimension has direct influence to task performance, 2) the centrality of work, delay of gratification, leisure and morality dimensions have influence to affective commitment 3) affective commitment has influence to task performance 4) affective commitment mediates the influence of centrality of work, delay of gratification, leisure and morality dimensions to task performance.

Keywords: *multidimensional work ethic, affective commitment, task performance*

Introduction

Lecturer is one of the essential components in a College system. To be able to produce good quality, good character and ethical, a lecturer must have at least two important things. First, a lecturer must have good affective commitment and task performance, because the affective commitment and the task performance of lecturer are a reflection of the quality of the College (Awang 2010 and Shah, 2012). Second, the factors that must be owned by a lecturer are work ethic and professional ethics. Because a lecturer is not only to produce the students who are qualified and competent, but also must be able to build character and ethical of the students (Adenguga, 2013). In reality, there are still many issues regarding the ethics of a lecturer. For example is plagiarism from the student's thesis.Plagiarism cases conducted by the lecturer is unethical behavior happened in many countries including Universities in the USA (Standler, 2012).That condition illustrates the persistence of the gap between ideal condition and reality.

From the results of previous studies, it was found that work ethic, empirically, is very important in an organization (Meglino & Ravlin, 1998).Work ethic will affect various aspects of the behavior of human resources within the organization.The concept of work ethic, generally, based and associated with certain religious values, for example: Protestant Work Ethic/PWE (Furnham, 1982; Cokley et al. 2007); Islamic Work Ethic/IWE (Ali, 1987; Salem & Agil, 2012) and Catholic Work Ethic/CWE (Overell, 1981; Tropman, 1992). Beside the concept of work ethic based on religion, it has also developed the concept of work ethic that is not based on the value of a particular religion. This concept is called as the Multidimensional Work Ethic Profile(MWEP) which firstly introduced by Miller and Woehr in 1997. The concept of MWEP consists of seven dimensions, namely:

(1) centrality of work, (2) delay of gratification,(3) hard work,(4) leisure, (5) morality,(6) self-reliance and (7) wasted time. MWEP is developed by Miller with the premise that the construct of work ethics on the basis of religion presicely describes something that is secularist.Furthermore, according to Miller, work ethic is better if it is seen as an ethical general and universal (Miller et al. 2002). Based on the development of the concept of religion-based work ethic (PWE, IWE and CWE) with a work ethic that is not based on religion (MWEP) there have been theory gaps

Meanwhile, based on the results of investigation from various scientific journals, there have been found differences in the results of the research that explain the effect of the work ethic on the performance with the conclusions that work ethic does not have a significant effect on performance (Attwell,1998), Maglino (1998), Sabir et al (2012). On the other research conducted by Enz (1988) and Amason (1996) in Maglino (1998) explains that there is no relationship between work ethics with employee performance. Besides, there is no research that explain a significant influence of MWEP on task performance. From those findings, it can be concluded that there have been research gaps. The purpose of this study is to develop a model that can explain the role of affective commitment in mediating the effect of Multidimensional Work Ethic Prifile (MWEP) on the task performance of lecturers at the College .While the benefits of this research is to provide input to the leaders of College in establishing a work ethic that can increase affective commitment, which in turn can improve the task performance of lecturers.

Research Model

The model in this study is based on the perspective of theory and previous research used to describe the relationship among Multidimensional Work Ethic Profile (MWEP) dimensions on the task performance, with affective commitment as a mediating variable. The research model presented in the figure below:
Picture. 1
Research Model

Literature Review and Hypothesis
1. Multidimensional Work Ethic and Task Performance

The results of the research conducted by Sparrow et al. (2010) explain that work ethic, which in that study is one of the dimensions of work value, has a significant effect on organizational citizenship behavior (OCB), but there is no significant effect on the task performance. In another study conducted by Meriac (2012), it can be concluded that some dimensions of Multidimensional Work Ethic Profile (MWEP) have an effect on academic performance.

The above description leads to the following hypothesis:

H1: The dimensions of MWEP (centrality of work, delay of gratification, hard work, leisure, morality, self-reliance, wasted time) have direct effect on the task performance of the lecturers at the College.

2. Multidimensional Work Ethics and Affective Commitment

Rokhman (2010) investigates the influence of Islamic work ethic on organizational commitment and employee's movement. In this study, it was found that the Islam work ethic has a positive effect on organizational commitment and does not affect the employee's movement. Meanwhile, Hudspets (2003), finds that parts of MWEP have an effect on organizational commitment. Obalola (2012) conducts a study on the relationship between corporate ethical values on organizational commitment. It is concluded that there is a positive influence on the company ethical values on organizational commitment. Saleem and Agil (2012) conduct a study on the relationship Islamic individual's ethic on organizational commitment. The results confirmed that there is a positive relationship between Islamic individual's ethics and three dimensions of commitment. Specifically,

normative commitment correlates highly with Islamic individuals" ethics than either affective and continuance commitment

The above description leads to the following hypothesis:

H2:   The dimensions of MWEP (centrality of work, delay of gratification, hard work, leisure, morality, self-reliance, wasted time) have an effect on affective commitment of the lecturers at the College.

3. Affective Commitment and Tasks Performance

Organizational commitment is a person's level of strength to identify, to engage, and to adhere the organization (Demirbag et al. 2012). Allen & Meyer (1990) distinguish organizational commitment become three components, namely: affective commitment, continuant commitment and normative commitment.

Angle and Lawson (1993) describe thatAffective commitment is emotional involvement in identifying, involved in the organization, while the normative commitment is employees' obliged feeling to join the organization.

Khan et al. (2010) investigate the influence of organizational commitment on performance. In this study, it was used three components measuring organizational commitment from Allen & Meyer (1990). Those three components have a positive influence on employee performance.

Chen, et al. (2007) in their study mention that affective commitment has positive effect on performance and affective commitment mediates the influence of human resource practices on performance.

Luthans (1996) states that many research results support the hypothesis that there is the influence of organizational commitment on the performance, as well as the negative effect on the organizational commitment the desire to move and work absent.

The above description leads to the following hypothesis:

H3:   Affective commitment has an effect on the task performance of the lecturers at the College.

4. Mediation Role of Affective Commitment

Researches on the role of organizational commitment as mediator variables have been carried out by many researchers. One of them includes organizational commitment which mediates the influence of ethical supervisor leadership on OCB (Anwar, at al. 2012) and Islamic work ethics and attitude toward organizational change (Yousef, 2000c)

Based on Yousef's research (1998); and Rokhman (2010), it are explained that there are influence of work ethic on organizational commitment. While Khan, et al (2010) explain that there is influence of organizational commitment on job performance. Yu Tseng and Shyug Lee's research (2011) shows that organizational commitment mediates the influence of personality characteristics of employees on the task performance.

The above description leads to the following hypothesis:

H4: Affective commitment mediates the effect of the dimensions of MWEP (centrality of work, delay of gratification, hard work, leisure, morality, self-reliance, wasted time) on the task performance of lecturers at the College.

Research Methods

The research was conducted for lecturers at the College in Central Java. In accordance with the purpose of research and formulation of the research problems, this research is the correlational research. It evaluates and reveals the influence of independent variables (MWEP) with the dependent variable (task performance) .

The population in this study was the tenured lecturers at 43 College in Central Java. Samples in this study, based on Likelihood Estimation (MLE) sample size guidelines, maximum is a sample of at least 200 sample respondents. If the response rate estimated at 50%, then the numbers of samples taken and used as respondents were 400 lecturers. From the 400 questionnaires distributed to College lecturers, only 304 lecturers have delivered to return questionnaires .

Working definitions of variables in this study are the following:

1. **The independent variables** are 7 (seven) dimension of MWEP that were developed by Miller et al. (2002) which consists of:

a). Centrality of work

The definition of the centrality of work in this research is the orientation of the lecturers on the task or job. The indicators are as follows: a belief that in the work intended for the benefit of its work, satisfied feeling with the time spent working, the desire to keep working despite being rich, the desire to always keep working. the measurement of centrality of work dimensional measurements used 10 item questions developed by Miller et al. (2002)

b) Delay of gratification

What is meant by delay of gratification in this study is the expectation of rewards or payment which will be acquired by the lecturers in the future as the implementation results of their duties. The indicators are as follows: the desire to realize something that is desired, future orientation in waiting for the payment. Delay of gratification dimensional measurements used 7 item questions developed by Miller et al. (2002).

c). Hard work

The meaning of hard work in this study is a lecturer's sincerity in carrying out their duties. The indicator is the willingness to work hard, the belief that success can be achieved from a result of hard work. Hard work dimensional measurements used 10 items of questions developed by Miller et al. (2002).

d). Leisure

The meaning of leisure in this study is lecturers' sparetime not to conduct their duty. The indicator is their behavior to prefer spare time.Considering important activity which is unrelated to work. Leisure dimensional measurements used 10 item questions developed by Miller et al. (2002).

e). Morality

The definition of morality in this study is a conviction or belief that a teacher can raise awareness of the importance of morals or ethics in carrying out its mission. The indicators are as follows: a sense of responsibility, not taking something that is not their right, not judging before seeing fact, not lying, not stealing, treating others like themselves, fair and honest in interacting with others. Morality dimensional measurements used 10 item questions developed by Miller et al. (2002).

f). Self-reliance

The definition of self-reliance in this study is lecturers' independence in completing the main task. The indicators are self-confidence, not depending on others, and relying on its own capabilities. Self-reliance dimensional measurements used 10 item questions developed by Miller et al. (2002).

g). Wasted time

The definition of wasted time in this study is a lecturer with their willingness using the time to carry out their duties. The indicators are active and productive attitude in the use of time, always busy working and avoid wasted time. Wasted time dimensional measurements used 8 item questions developed by Miller et al. (2002).

2. Mediation variable in this research is affective commitment.

The definition of affective commitment in this study is an attitude that shows the relationship between lecturers psychologically with the College, so a lecturer will be very loyal to the college and will try to involve deeply in the activity of college and professionally as a lecturer at that college. The indicators are as follows: feeling happy to have a career as a lecturer, feeling to be part and becoming a family at work, making the workplace gives importance meaning in his or her life, feeling they own workplace, there is emotional attachment to workplace. Measurement of affective commitment variable used 8 item questions developed by Allen & Meyer (1990).

3. The dependent variable in this study is the task performance

The definition of task performance in this study is the assessment of skills or expertise of a lecturer as an official or as someone who has duty to carry out an activity which is formally known as part of the main task as a lecturer. The indicator is the fulfillment of the criteria of the competence and performance, able to complete the task based on his or her expertise and competence, achievement of the objectives set by his or her superiors, perform his or her duties well, responsible for his or her duties, able to be given a higher role. Task performance variable measurement used seven items of questions developed by Sparrow et al. (2010).

Technique of analysis data was conducted by using validity test with the technique of confirmatory factor analysis (CFA) and reliability tests with Cronbach alpha technique. Level of significance used in this research was 5%. After analysis data was done, assumption model test was conducted in the form of outlier evaluation, normality of the data, and multicolinearity evaluation. Further steps, hypothesis test was conducted using SEM (Structural Equation Modeling) analysis technique in the form of analysis of the conformity and analysis of path coefficients which were done by using software Amos.16.

Results and Discussion
1. **The Research Results of Instruments Test**

From the questionnaires, which were tested of its validity using software Amos.16.0, it was obtained that from 80 items of questions, 42 items declared valid question. The reliability test results show that all the variables declared reliable because it has cronbach alpha values ≥ 0.6.

2. **The Results of Descriptive Analysis**

The descriptive analysis of the results, it was found that viewed from types of gender, the majority of respondents are male. The age of the majority respondents are 34 up to 42 years, the majority of the marital status of the respondents are married and the last education level majority of respondents are Masters .

3. **Hypothesis Test Results**

Hypothesis test results can be seen from the path coefficient analysis which shows the significant scale of regression weight. From the analysis, it is known that from 15 paths analyzed, there are 5 paths show a significant effect. It can be seen from the probability value (ρ) which indicates the significance level of hypothesis test is smaller (<) from 5% (0.05), while 10 other paths show no significant effect due to the probability value (p) which indicates the significance level of hypothesis test isgreater or equal to (≥) 5% (0.05). Path coefficient analysis results in more detail can be seen in Table 3 as follows:

Table 3. Regression Weight

Mediating and Dependent Variable		Independent and Mediating Variable	Estimate	SE	CR	P
Affective Commitment		Centrality of Work	.166	.127	1.313	.189

1. **The result of the hypothesis test 1**: Direct effect of MWEP dimensions on the task performance.

    From the results of hypothesis testing 1, that is direct influence of MWEP dimensions on the task performance can be explained as follows:

a. Centrality of work, delay of gratification, leisure, morality, self-reliance, and wasted time dimensions do not have direct effect on the task performance.

    From the results of hypothesis test, it can be explained as follows:

   1). The lecturer who has centrality of work does not always have a good performance. It can occur that someone who has orientation to work but the performance remains poor. In fact, according to Van Ness et al. (2010) and Meriac et al. (2012), centrality of work is more directly related to the organizational commitment. It is not related to the performance.

   2). When a lecturer hopes to get reward or payment, it does not have direct effect on performance, but it will be preceded by how strongly the attitude of the lecturer's commitment to the institution Meriac et al. (2012)

   3).The leisure dimension has a negative effect on the task performance. It means that the more time that is leisure by a lecturer, then the performance will decrease. Theoretically it can be understood, then according to the value of religious ethics, leisure is bad actions as suggested by Ali (1987). Also according to Miller et al (2002) attitude like leisure indicates that the lecturer does not like the job, so if ones does not like the job so that the task performance will be low.

   4). A lecturer who has good morals and ethics is not always has a good task performance if the lecturer does not have the skills, working capability and good competency. According Meriac et al (2012), morality do not have a direct influence on task performance but have a direct influence on affective commitment and work motivation.

   5). The performance of a teacher can be further increased if the lecturer is working as a team work because they could synergize all potential and capabilities with other lecturers so that it can be able to achieve maximum performance. A lecturer, who works independently, performs well initially but when the job is increasingly heavy so the performance will actually decrease. In contrast, if a lecturer worked as a team, they will motivate each other so as to keep the rhythm of work and performance.

   6). Theoretically, well usage of the time by lecturers will improve their performance. It can happen if the lecturer has a target of achievement and good working capacity. Lecturers should understand design and duties of their job well so that there will not be so many mistakes in carrying out the work. Besides, the lecturer must quickly evaluate and give feedback on their work so that it can immediately improve their performance. This is suitable with Walker's opinion (1992) which calls that performance is as a behavioral view of performance, with the explanation that the performance is determined by four main factors, namely (1) the objectives to be achieved, (2) the capacity of individuals, (3) design work, and (4) feedback.

b. From the results of hypothesis test, hard work dimension has direct and significant effect on the task performance. This result means that increasing the hard work of

lecturers in carrying out the tasks given by the leaders then also increases the task performance of the lecturers. The result of this hypothesis is supported by Furnham (1982) through PWE concept stating that hard work and perseverance is an attitude that must be realized in order to obtain maximum work. This is further reinforced by the concept of hard work in the CWE proposed by Overell (2005) which explains that in the CWE work hard is put as a kindness. In the CWE concept, people who work hard makes them have a high degree. Through hard-working, people can fulfill their rights and obligations. While Ali (1987) further strengthen the concept of IWE by stating that in the Qur'an, humans are recommended to have skills and technology, and will get a reward for anyone who works hard to fulfill their needs. The opinion is emphasized by Meriac, et al. (2012), which states that the hard work reflects a person's attempt to achieve the desired goal.

2. **The results of hypothesis testing 2**: The Effect of MWEP dimensions on affective commitment.

From the test results of hypothesis 2, the influence of MWEP dimensions toward affective commitment can be explained as follows:

Centrality of work, Delay of gratification, Leisure, and Morality dimensions have effect on affective commitment. From the results of hypothesis test, it can be explained as follows:

1). The high orientation at work of lecturers will not necessarily increase their affective commitment.This is in accordance with the opinion expressed by Van Ness et al. (2010) which states that centrality of work not yet showing one's commitment to the place where the individual works. Empirical conditions proves that if a lecturer increasingly focused on his duties as a lecturer, they are still possible out of the College where they work, due to the dissatisfaction income that the lecturers get so that they have many part-time jobs or activities outside their College. This condition illustrates the low commitment of the lecturers.

2). The waiting time will affect the commitment given. Wait for rewards often able to push the affective commitment. It is necessary for the manager of College not to delay too long for compensation financially and non-financially

3). The more time that is owned and used by lecturers for their productive works, they will demonstrate more affective commitment. This is in accordance with the opinion expressed by Meriac, et al. (2012) which states that the choice to keep working or enjoying leisure time indicates the level of one's leisure. A person with a high level of leisure who prefers to relieve themselves from work or come to work without preparation, their achievement result will be bad. Someone who has a high level of leisure will not be satisfied with their jobs and show low commitment.

The results are consistent also with various theories of work ethic, in the concept of PWE proposed by Weber (1958), it is explained that the attitude laziness is a negative attitude. In the concept of IWE, Ali (1987) explaines that Islam is strongly opposed to be lazy .

4). There is an influence of morality dimension on affective commitment. The result is consistent with the results of research conducted by Koh & Boo (2004) which concludesthat there is an influence of organizational ethics on organizational commitment. It is also consistent with the research result of Elizur (1996), Elizur & Koslowsky (2001) which show that there is influence of ethical values on organizational commitment. From the results of this hypothesis, it can be interpreted that the better morality of the lecturers can strength of their affective commitment. Theoretically, it means that someone who has ethical and moral values will show a good attitude and behavior as well. A lecturer who has good morals and ethics would carry out the duties

as a lecturer properly. The lecturer will refrain from unethical behavior, both related to personal and related to his job as a lecturer. Lecturers who want to do plagiarism in scientific papers, or any other ethical violations will result in bad image of the College.

b. Hard work, Self-reliance and Wasted time dimensions do not have effec to affective commitment.

From the results of hypothesis test, it can be explained as follows:

1). Theoretically, the lecturers' hard work can influence affective commitment, but the results of this study indicate different things. It could happen if the lecturer works hard for the benefit of himself and does not think any further for the sake of the College. It could even happen that a lecturer with his status as a faculty member in his College actually takes advantage of their College name for his personal benefit

2). The higher level of a lecturer's self-reliance in duty further demonstrates the high affective commitment of the lecturer. Besides, a lecturer who has high self-reliance demonstrates professionalism and competence in implementing the duties. Result of this analysis is supported by a variety of opinions and the results of a study conducted by (Meriac, et al., 2012) which explains that a person who has high level of self-reliance gives a strong belief that people should not rely on others. This opinion is also reinforced by (Van Ness et al., 2010) which suggests that self-reliance becomes important in individuals

3). Wasted time has two sides of the circumstances as presented by Vannes et al. (2010). Wasted time that refers to a continuum with one hand represent a high commitment in time management to maximize productivity and on the other side characterizes low commitment on the management of time when the time is not used with wisely. The more a person can prepare his time to work on the task at hand, then the person will be more productive and satisfied with the work (Miller et al., 2002). From the theory stated by Miller, then surely more wasted time has correlation with labor productivity and job satisfaction.

3. **The results of hypothesis testing 3:** Influence of affective commitment on the task performance.

Based on the results of hypothesis testing, it can be explained that the affective commitment has an effect on the task performance. From the hypothesis test result, it shows that affective commitment has effect on the task performance of the lecturers. The analysis results is different with the results of the study conducted by (Scotter, 2000), Muse & Stamper (2007) which states that there is no influence of affective commitment on the task performance. However, the hypothesis test results are consistent with the results of research Khan et al. (2010) who find that there is influence of affective commitment on the task performance. This finding is in line with the results of research conducted by Narimawati (2007) to the private College lecturers in Banten and West Java, which concludes that there is influence of organizational commitment on the performance of lecturers.

4. **The Result of hypothesis test 4:** The mediation role of affective commitment in the effect of MWEP dimensions on the task performance.

Theoretically if the independent variables influence on the mediating variables and the mediating variables influence on the dependent variable significantly, it means that the mediating variables can actually mediate the effect of independent variables on the dependent variables. If either not have significant effect, these variables will not mediate the effect of independent variables on the dependent variable (Baron & Kenny.1986; Shaver, 2005).

From the hypothesis test results, it can be obtained that the affective commitment mediates the effect of MWEP dimensions partly on the task performance of the lecturers.

The results are consistent with the results of research conducted by Anwar, et al. (2012) which states that the affective commitment mediates the influence of supervisor's ethical leadership on citizenship behavior. This finding is in line with the results of research conducted by Yeh and Chien (2012) which states that organizational commitment mediates the influence of leadership type on job performance.

Conclusion, Suggestion, Limitation Andrecommendation

1. Conclusion

Lecturers need to continue to hard work in improving their competence in a way to equip themselves in the form of education and training, improve their academic level with follow-up studies, collect credit points for promotion and academic functional office so that it can improve the performance of their duties. Others, the lecturers need to use the time effectively to develop capabilities in the learning process, to conduct research and community service, to write textbooks, to write scientific articles on accredited scientific journals and a variety of activities that can improve competence and professionalism as a lecturer that will have an impact on improving the performance of their duties as a lecturer. The lecturers must prove their affective commitment to improve their task performance in the form of improving the quality of College. The longer the period of employment, it will be more productive in the guiding and teaching students, conducting research and community service.

2. Suggestion

College head has to give the motivation to lecturers to have good work ethics so that can improve the affective commitment the lecturers and able to improve their performance.

3. Limitations and future Research

Similar to any other empirical study, this research has its limitations. The first limitation that attitude measurement using a Likert scale submitted in the form of questionnaires will be possibility of response bias affecting. So that there is a possibility of the happening of diffraction between answer questionnaire and the reality.

4. Recommendations

a. The need for further research on ethical dimensions of work MWEP associated with various behavioral variables in addition to job satisfaction, affective commitment and task performance

b. Need to increase the research intensity on the work ethic of the organization/ institution. This is important because ethical problem is a fundamental problem in the life individually, organizational and social.

DETERMINANT OF INTENTION OF E-COMMERCE ADOPTION AND STRATEGIC ORIENTATIONAS MODERATING VERIABLE IN FAMILY BUSINESS

Muhammad Kholid Arif Rozaq, Universitas Sebelas Maret, Indonesia
Mugi Harsono, Universitas Sebelas Maret, Indonesia

Abstract
 This study examines and analyzes the determinant of intentions of e-commerce adoption, namely relative advantages, organizational readiness, and competitive pressures with strategic orientation as a moderating variable. The sample of this study is the family business Small and Medium-sized Enterprises (SMEs) performer in the Special Region of Yogyakarta (Daerah Istimewa Yogyakarta - DIY) area, which consist of 101 respondents. The sampling method used is nonprobability sampling, while the technique used is purposive sampling. The analysis of data is using moderated regression analysis. Based on the data analysis, the results are: 1) relative advantages, organizational readiness, and competitive pressures affecting on the intention of e-commerce adoption; 2) strategic orientation moderates the effect of competitive pressures toward the intention of e-commerce adoption.
Keywords: *TOE, E-Commerce, family business, SMEs*

Introduction
The development of the technology, including the internet, becomes one of many strategic pathways in the process of industry revolution. This includes electronically business revolution or e-business (Amit and Zott, 2001). Several studies provide evidences that internet is suspected to be revolutionary modifier factor in the traditional small business practice (Daniel et al, 2002; Geiger and Martin 1999; Siu 2002; Levenburg and Magal 2004).

Based on the data obtained from Indonesian Internet Provider Association (APJI - Asosiasi Penyelenggara Jasa Internet Indonesia), on the 2013 the Indonesian internet user in business sector amounted to 66.77% (APJII, 2013). It provides information that more than half of business people have been using the internet technology. The industrial sectors consist of many sectors such as processing industry, hospitality and restaurant industry. Indonesian economic widely supported by the small and medium-sized enterprises (SMEs) which has more than 52 units in the year of 2011 and giving contribution to the Gross Domestic Product (GDP) in the amount of 60% (Syuhada and Gambetta, 2013). The number of contribution of SMEs shows that the developments of SMEs are very fundamental. However, there are many obstacles faced by the SMEs, among other are marketing weakness, pressures from foreign product, the lack of articulation of the existence of such products on the market (Syuhada, 2013)

One example of internet usage in conduction business is e-commerce. The definition of e-commerce has a lot variety, in this study referring to the definition of Turban *et al.*, (2008) e-commerce is a purchasing, selling or exchange of a product, information and services through the computer network, including the internet. It cannot be denied that e-commerce has changed many things in business operation. The changes mentioned are not only in the way of people selling, buying and doing an agreement with the consumer or suppliers, but also changed the perspective of business itself. The changes give a massage that in order to survive in the new business model, business people has to be forced to adopt the technology (Rahayu and Day, 2015).

E-commerce is not a new technology. An adaptation of e-commerce by the business people have been started in the year of 1995 in the very simple form (Moertini, 2012). Based on APJII from the total numbers of companies that used internet, just 18% of them are SMEs, and from that amount there are family businesses. SMEs can be categorized into two types, based on the business type that is family business and non-family business (Gabrielsson and Huse, 2005). Family business is a company which its ownership is fully owned / managed by one or more family members. Meanwhile, non-family businesses are owned by two or more people, where among them there were not any kinship (Grabrilsson and Huse, 2005). Family business often to be criticized for failing to invest in the new business, often to avoid risk, and resisting changes especially in the technology utilization (Eddleston *et al*., 2008). This case shows the need for further study regarding various issues that related with the adoption of the internet technology in the family business. Several researchers (Auger and Gallaugher 1997; Thong and Yap 1995; Zank and Vokurka 2003) revealed that partly of family business are unwilling to do an adoption of e-business, whereas the rests are willing to do the adoption naturally. Then the question arises, why partly of family business choose to adopt e-commerce and the rests of it do not. Even though, they are facing relatively similar market challenge, thus, it still needs to be examined until now (Boumediene and Kawalek, 2008).

Based on the arguments above, this study is conducted with the aim to see the important factors that affect the intention of e-commerce adoption in family business SMEs. SMEs are interesting to be studied because the e-commerce adoption is usually carried out by large-scale enterprises, whereas SMEs are still reluctant to adopt it (Auger and Gallaugher 1997; Thong and Yap 1995; Zank and Vokurka 2003). The benefits of the internet by providing location and time flexibility and ease of communication will help small companies to attain efficiency and cost saving. Previously, this only can be found on large scale enterprises (Iacovou et al. 1995; Longenecker et al. 1997). Therefore, with the existence of e-commerce, SMEs are also alleged to be able to enjoy its benefits.

Research about the adoption of e-commerce can be explained with the framework developed by Tornatzky and Fleischer (1990). The framework is known as Technology-Organization-Environment (TOE). TOE framework considered to be an integrative framework which provides a basic holistic theory and guidance in the study of information technology adoption / diffusion. In this framework, there are three aspects of the company which affect the adoption of technological innovations; technological aspects, organizational aspects, and environmental aspects. Technological aspects are related to technology that is relevant with the company. The organizational aspects are related to the resources of the company, which is indicated by the size of the company and the complexity of the managerial structure of the company. Afterwards, the environmental aspects refer to the other parties around the company, such as competitor, suppliers, and the government (Zhu *et al*., 2002).

TOE theory has also been tested and validated by various studies (such as Ramdani *et al* 2013, Olivera and Martins 2010, Zhu *et al.,* 2003, Premkumar and Robert 1999, Iacovou et al 1995). Moreover, TOE framework is considered as a generic theory from the adoption / diffusion of technology (Zhu *et al.* 2003). The identification of the factors used in the TOE framework shows that there are several inconsistency, thus providing a gap for the further research. This inconsistency are 1) relative advantage effect toward the intention of the technology adoption, several studies showed that relative advantage has an effect towards the intention for technology adoption (Rahayu & Day, 2015; Wang & Ahmed, 2009; Iacovou *et al*., 1995), but the research conducted by Huy *et al.,* (2012) shows that relative advantage has no effect toward the intention of technology adoption; 2) organizational readiness effect toward the intention for technology adoption, the research

conducted by Huy *et al.,* (2012), Ramdani *et al.,* (2013), and the research conducted by Iacovou *et al.,* (1995) shows that organizational readiness has an effect toward the intention for technology adoption, whereas the research conducted by Wang & Ahmed (2009) shows that organizational readiness has no effect toward the intention for technology adoption; 3) competitive pressure effect toward the intention for technology adoption, several researches show that competitive pressure has a significant effect toward the intention for technology adoption (Wang & Ahmed, 2009; Iacovou *et al*., 1995), and several researches also showed an insignificant result (Jeon *et al*., 2006; Ramdani *et al*., 2009).

An argument that can be offered for the inconsistency in result finding is by adding another variable as the moderation (Mathieu & Zajac, 1990). The research conducted by Wang & Ahmed (2009) has found moderation factors in the context of the TOE framework that is the orientation of business strategy used by the person who running a family business. The orientation of strategy becoming a factor that needs to be considered because the characteristic of the family business that is idiosyncratic. The business orientation in the family business shows its uniqueness comparing with the companies that has value maximizing orientation in professional business management (Sharma *et al.,* 1996).

This study will be conducted by using SMEs in the Special Region of Yogyakarta (Daerah Istimewa Yogyakarta - DIY) area as a research object. SMEs in DIY is developing quite well. This is supported by the statement of Baswir (1998) who states that industrial enterprises in Yogyakarta area are mainly SMEs. The DIY Region is one of many cities with creative industries, thus this city is appropriate to be the research object. This business type has a high opportunity to adopt e-commerce.

Literature Review and Hypothesis Development
1. TOE (Technology – Organisation - Environment)

TOE framework that developed by Tornatzy and Fleischer (1990) is considered as an integrative framework that gives holistic basic theory for researches in the adoption or diffusion of Information and Communication Technology (ICT). TOE, typically evaluates the various technology that is related with the organization and environmental factors that will simplify the process of adoption or diffusion (Ramdani *et al*., 2013). TOE has been widely used to describe the process of adoption of several innovation including the organizational system (Mishra *et al*., 2007), and *e-business* (Zhu *et al*., 2006). A meta-analysis of 75 researches that has been done by Tornatzky and Klein (1982) provides 10 of the most frequently used characteristic that is related to adoption process, namely relative advantage, complexity, communicability, divisibility, cost, profitability, compatibility, social approval, triability and observatibility.

TOE framework is consistent with the opinion of Rogers (1983) that discuss about diffusion of innovation (DOI) theory. This theory is also focused on the characteristics of organization both internally and externally, as well as the characteristics of technology as the diffusion stimulant of new technology. Many studies that have been conducted identify technology as an important factor and key to achieve the successful adoption of information system (Crook and Kumar, 1998; Grover, 1993; Zhu et al. 2002; Shaw and Chang, 2005).

The assumption adopted in this study is technology is an adoption driver, thus, the competency of technology will positively affect the intention of e-commerce adoption process. The companies that have high capability will reflect company readiness to apply e-commerce adoption. Factor that identified as inconsistent in technology context is relative advantage. Rogers (1983) defines relative advantage as relative benefit from an

innovation which is considered as a better idea. In relation with technology, Rogers (1983) also provides an explanation that relative advantage is a degree where technological factor is perceived to generate greater benefit for company. The assumption of benefit refers to the return and possible benefits that will be earned from e-commerce adoption in organization (Tiago and Maria, 2010; Iacovou *et al.*, 1995). Several researchers use this variable and get significant result (Premkumar, G and Robert, M, 1999; Looi, 2005; To and Ngai, 2006; Al-qirim, 2007; Sparling et al., 2007; Wang and Ahmed, 2009, Ramdani, *et al.*, 2009; Scupola, 2009; Oliveira and Martin, 2010; Ghobakhlo *et al.*, 2011; Gangwar *et al.*, 2015). From the analysis above, the hypothesis proposed is:

H_1: relative advantage has a significant positive effect on the intention of e-commerce adoption in family business

In organization context, Zhu *et al.*, (2003) measure organizational readinesswith firm scope and firm size. Firm scope strongly linked with company ability to invest in the information technology (Dewan et al., 1998; Teece, 1997). Firm scope will encourage company to adopt e-business. This condition will place firm scope as predictor in the process of e-commerce adoption, with an assumption of, the more comprehensive the firm scope thus the company internal coordination expense will be more expensive (Gurbaxani and Whang, 1991), inventory and material expense also will be more expensive (Chopra and Meindl, 2001). Next assumption is related with e-commerce adoption, company with wider firm scope will have opportunity to get higher benefit with e-commerce adoption, compared to the traditional business process (Levenburg *et al.*, 2006). Company size (firm size) consistently known as a factor that influences e-commerce adoption (Damanpour, 1992). Related with e-commerce adoption, big companies have several benefits or advantages compared with small companies. The advantages are, big companies have more resource to simplify this adoption, more likely to achieve economies of scale, and it has bargaining power with business partner to adopt the technology. This is in line with the argument of Iacovou et al., (1995) who states that organizational readiness is related with financial level and technological resources from company. Both factors are necessary to be considered because small companies tend to get lack and weak resources, which is needed for doing the adoption. This, in turn will restrict the capability to receive benefit from technology. Thus, the next hypothesis is:

H_2: organization readiness has a significant positive effect on the intention of e-commerce adoption in family business

Furthermore in environment context, Zhu *et al.*, (2003) identify company's environmental aspect indicators that can affect e-commerce adoption that are consumer readiness,competitive pressure, and lack of trading partner readiness. In this research, a factor that will be tested is competitive pressure. This is due to the literature review result which shows that the result of previous research on this variable is remains inconsistent. The level of competitive pressure is a condition of the level of competition that acts as the adoption driver (Crook and Kumar, 1998; Grover, 1993; Zhu et al., 2003; Iacovou, et al., 1995). This pressure is derived from competitors or companies' external factor, which drives companies to adopt new technology in order to survive in business. The next indicator is the lack of business partner readiness or trading partner readiness. According to Zhu *et al.*, (2003), company that decides to apply e-commerce adoption must be supported by business partner readiness in companies' value chain to apply such adoption too. Thus, the system that is developed by the companies will be compatible with its business partner's system. This provides a conception that the readiness or unreadiness of business partner will affect companies' e-commerce adoption process. Therefore, the next hypothesis is:

H$_3$: competitive pressure has a significant positive effect on the intention of e-commerce adoption in family business

Family business' strategic orientation

The definition for strategic orientation is a company's strategy that aims for creating appropriate behavior in order to achieve excellent performance (Zhou *et al.*, 2005). Family business often shows idiosyncratic character due to the existence of family relationship and business (Sharma *et al.*, 1996). Idiosyncratic character will give different orientation of family business strategy compared to professionally managed company. Family business basically can be classified based on organizational value such as family-centered business or business-centered families (Singer and Donohu, 1992). Moreover, family business is more conservative and reluctant to change (Hall *et al.*, 2001). The classification of family business is also expressed by Birley *et al.*, (1999), that categorized into 3 different clusters: (1) Family rules group (family oriented business) where business decisions always linked with the existence of family, family possession protection and safeguarding the reputation of family becomes important thing, (2) The Family out group (business oriented company) that is opposite of Family rules group, where the focus of this family business focused on business activities. This type of orientation is concerned about emerging issues such as the adoption of new technology, business strategy growth, even opening up for external investors, and (3) The Family-Business Jugglers (company with balanced orientation), this orientation does not clearly articulate on which side of orientation the business lean on. The characters of these orientations are supposed to be the important factors that affect the decision taken by family business to apply the e-commerce adoption or not.

This company's strategy also gives a framework for decision making and it will affect the behavior that will have an impact on innovation (Miles and Snow, 1978). According to Auger et al., (2003) entrepreneur companies who have a focus on the future, will have a more proactive and aggressive, passionate pursuit toward new opportunities, and more courageous to take a risk to find innovative solution in facing the challenges. In the literatures about SMEs, several study found that companies with the entrepreneur strategy will experience sales growth (Freel, 2000; Shirk, 2003), have more positive attitudes toward the development of internet, and will be a first mover in e-business (Auger *et al.*, 2003).

Strategic orientation on family business provides a probability to moderate relationship between relative advantage and e-commerce adoption intention. This is based on tendency towards companies' orientation. Based on the clustering such as proposed by Birley *et al.*, (1999), business-oriented companies will tend to prioritize some initiative affairs, which is related to the business. That initiative can be in the form of the technology utilization, with awareness that this adoption would give benefit for business. The benefits earned may include the reduction of transaction cost, cash flow improvement, inventory cost reduction, and so forth. Therefore it will create competitive advantage. On the contrary, family-oriented business, tend to prioritize family's welfare, while other problems that arises related to expense and other risk are ignored (Wang and Ahmed, 1999). Such orientation tends to make the adoption activity get delayed, until in a certain point where the owner is convinced about the benefit of technology's adoption.

There is also a probability that strategic orientation could interacts with organizational readiness variable in the adoption process. Business-oriented companies tend to have more support from organizational side. It starts with better employees support from the labor and managerial personnel. This is because right from the recruitment process employees are selected based on their ability and the conformity with the job, instead of family closeness. This orientation will simplify the development of technology.

In contrast, family-oriented companies will hire employee base on closeness of the family and not based on competency. Whereas, according to Grable and Lytton (1999) education level and competence become an important discriminant for business decision making.

Competitive pressure can also interact with the strategic orientation of family business. Orientation that is centered toward family or business affects the ability to receive pressure from the outside party. Orientation that centered on family tends to have limited network and very centered on the owner (Wang et al., 2004). Concentration of ownership creates an information constraint that related with the limited and incomprehensive competitive pressure. Thus, the analysis taken to solve problems tends to be unsatisfied and centralistic toward the owner (Casson, 2005). This condition will create difficulty for the company to adopt new technology, although in fact there is external pressure that creates demand on the technological change. In contrast, company with business as its main orientation will give more priority for the transformation in order to maximize profit (Drozdow and Carrol, 1997).

With the explanations on the above theories' perspective, thus the proposed hypotheses are:

H_4: strategic orientation of family business moderates the effect of relative advantages toward the intention of e-commerce adoption.

H_5: strategic orientation of family business moderates the effect of organization readiness toward intention of e-commerce adoption.

H_6: strategic orientation of family business moderates the effect of competitive pressure toward intention of e-commerce adoption.
Figure 1. Research Design

Research Methods

1.   **Sample**

The sample in this study are the owner of family businesses of Small Medium Enterprises in Yogyakarta, or 101 respondents.

2.   **Variable Measurement**

a.   **Intention to adopt e-commerce adoption**

Intention to adopt e-commerce is measured with 3 statements which are adopted from Ajzen (2006).

b.   **Relative Profit**

The variable relative profit is measured using 4 items, which are adopted from Premkumar and Robert (1999).

c.   **Organization Readiness**

The organization readiness is measured using 9 items, which are adopted from Wang and Ahmed (2009).

d.   **Competitive Pressure**

Competitive Pressure is measured using 4 items which are adopted by Zhuet al. (2003) and Turban (2004).

e.   **Strategic Orientation**

The measurement of Strategic Orientation is adopted from Wang and Ahmed (2009). The variable is measured by providing a simple statement about two companies condition. For example, A-is a Family-Oriented business and B-is a Business-Oriented firm. Respondents were asked to give a value distribution-of 100 points between A and B companies based on respondent's perspective on their company condition compared to the condition of company-A and B that had been described. It's prohibited to give a same value for company A and B. the measurement of Family-oriented business Strategy is performed using dummy, 0 for Family-Oriented business and 1 for Business-oriented firm.

Result

1.   **Research Instrument Test**

Validity testing is performed to four main variables in this research, which are relative profit, organization readiness, competitive pressure, and intention to adopt e-commerce. Meanwhile the strategy orientation variable could not be tested because it is an "observe variable" not a "latent variable" which needs an indicator.

Based on the result of validity testing, there are 6 non-valid items that will be excluded from the analysis, 1 item from relative profit statement, 3 items from organization readiness statements, and 2 items from competitive pressure statements.

From the reliability testing, the results are: the reliability of relative profit is 0.610; the reliability of organization readiness is 0.796, the reliability of competitive pressure is 0.669, and the reliability of intention to adopt e-commerce is 0.707.

Hypothesis Test

This research uses moderated regression analysis method to test the hypotheses 1-6. Table 1 shows three regression models tested. Model 1 examines the influence of independent variable, Relative Profit, Organization Readiness, and competitive pressure on the intention to adopt e-commerce. Therefore, the first, second, and third hypothesis are supported. Model 2 shows the business strategic orientation as moderating variable has no significant effect on the intention adopt e-commerce. Model 3 shows business strategic orientation business only moderate the effect of competitive pressure on the intentions to adopt e-commerce, while the influence of relative advantages and Organization Readiness on the intention to adopt e-commerce is not moderated by business strategic orientation, according to the result the fourth and fifth hypothesis iss not supported and sixth hypothesis is supported.

Table 1. Result of Moderated Regression Analysis Test

	Intention to Adopt E-Commerce Ad		
	Model 1 (t)	Model 2 (t)	Model 3 (t)
Relative Profit (RA)	2.712*	2.638*	3.030*

Organization Readiness (OR)	3.198*	3.298*	2.415*
Competitive Pressure (CP)	2.756*	2.658*	-0.622
Strategic Oriented Business (OSB)		0.989	-0.284

Discussion

The results show Relative Profit affects the intention to adopt e-commerce. Manager's perception regarding the benefits to be gained with the use of technology will enhance their intention to adopt the technology, including e-commerce. This is consistent with the findings of Premkumar, G and Robert, M (1999); Looi (2005); To and Ngai (2006); Al-qirim (2007); Sparling et al. (2007); Wang and Ahmed (2009), Ramdani, et al. (2009); Scupola (2009); Oliveira and Martin (2010); Ghobakhlo et al. (2011); and Gangwar et al. (2015) which shows that the Relative Advantage have a positive influence on the intention to adopt the technology.

The influence of organizational readiness in the adoption of e-commerce is supported in this study. This phenomenon can occur because the company that has sufficient resources, in terms of financial and human resources will be easier to adopt the technology, including e-commerce. Adoption of technologies by companies that have sufficient resources will be more likely to achieve economic scale and improve the bargaining power to the business partner for technology adoption. It supports research conducted by Huy et al., (2012), Ramdani et al., (2013), as well as Iacovou et al., (1995) which show that organization readiness affects the intention to adopt technology. However, this result is contradictory with the result of Wang and Ahmed (2009) study which does not support the influence of organization readiness in adopting e-commerce. This inconsistence in very likely to occur because organization readiness in preparing the appropriate technology and financial sources is different in each company.

The effect of competitive pressure on the intention to adopt e-commerce is supported in this study. This phenomenon takes place due to the existence of pressure from competitors to adopt new technology in order to continue their business. The result of this study support the study performed by Wang & Ahmed (2009) and Iacovou et al. (1995) which show that competitive pressure affects the intention to adopt technology. The fact shows that family business get more pressure from external parties to be able to execute transaction through internet or e-commerce, and the adoption is not performed due to manager's self awarenss. This is in line with the argument of Rogers (1983) who states that family business rarely become an early adopter. Thus, when the pressure from external parties demanded changes and innovation, family business must take a decision whether the technology adoption will provide benefits, which in turn will leads to metamorphic changes.

This study result shows that business strategic orientation does not moderate the effect of relative profit and organization readiness on e-commerce adoption. This shows that business strategic orientation implemented by company, both family oriented or business oriented, do not clarify (strengthen or weaken) the effect of relative profit and organization readiness on the intention to adopt e-commerce.the result of this study also shows that business strategic orientation moderates the effect of competitive pressure on the intention to adopt e-commerce. The moderation effect is positive, which means that the effect of competitive pressure will be greater on the business oriented companies thatn family oriented companies. The family oriented companies tend to have narrower network and is highly centered on the owner (Wang et al., 2004). The concentration of power on the owner may lead to the emergence of information barrier in its relation with competitive pressure, thus the analysis of problem solving tend to be less satisfying and is centralistic in owner (Casson, 2005). This condition will makes company find difficulty in adopting the new technology even if the pressure from external parties demanded company to perform changes. Contrary, business oriented company will prioritized the changes to maximize their profits (Drozdow and Carrol, 1997).

Conclusion, limitation, and suggestion
1.   Conclusion

The conclusion of hypothesis testing result shows that relative profit, organization readiness, and competitive pressure have a significant effect on the intention to adopt e-commerce. The first, second, and third hypothesis is supported. Family-oriented business strategy as moderation variable does not have a significant effect on the intention to adopt e-commerce. Family-oriented business strategy only moderates the effect of competitive pressure in the intention to adopt e-commerce. While the effect of relative profit and organization readiness on the intention to adopt e-commerce is not moderated by business strategic orientation, it means that fourth and fifth hypothesis is not supported and sixth hypothesis is supported.

2.   Limitation and suggestion
a. This research only shows a few inconsistency in variables from the previous research. It is possible to get several factors which could be used for further research and to re-test the moderation factor used.
b. This research only focused in Sleman, Bantul, and Yogyakarta areas. It's rather complicated to make a general conclusion in Yogyakarta province, researcher is suggested to consider about expanding region and distribution of sample research.
c. Future research need to consider industry cluster in family business to generate a more accurate result.

d. In testing the hyphoteses, researchers need to consider the lost predictor items, especially in competitive pressure hypothesis.

PATHOLOGY OF SOCIAL ACCOUNTABILITY IN PARTICIPATORY LOCAL DEVELOPMENT BUDGETING (A CASE STUDY ON KELURAHAN DEVELOPMENT FUND IN SURAKARTA CITY, INDONESIA)

Rutiana Dwi Wahyunengseh, Sebelas Maret University, Indonesia

Abstract

This article explained why the biased-meaning symptom of social accountability practice occurs in Kelurahan Development Fund (thereafter called DPK) management, despite its management procedure through budgeting democratization process and participatory public budgeting. Development fund management by *kelurahan* (administrative village) and society was a manifestation of social accountability given by Surakarta City government. Its procedure was based on democratic elements including society representation, discussion to make decision and community group of village areas as beneficiary. The analysis on case study showed that civil society as the strength of social accountability enforcer was vulnerable to pathological contamination. Behind the apparently democratic procedure, the author found some things biased from substantive democratic value. The bias found in this study pertained to the elitist role composed of community representative. Another form was patron-client embryo incubation between community activist and government. Those two bias forms attenuated the accountee's social power among active citizens. Biased function symptom resulting in the abuse of social accountability substance value is called social accountability pathology. This pathological symptom occurred due to democratic process contaminated by co-modified culture. In this context, the exchange of power had occurred as commodity. This pathology impacted on the society's decreased trust in the active role of citizens and attenuated the public's awareness of public problems.
Keywords: *social accountability, public budgeting, pathology*

Introduction

This article discusses pathological trap found in the role of civil society as the power encouraging the organization of social accountability practice in participatory public budgeting process. Previous case studies proved that civil society can play its decisive role in requiring the public officials to be accountable, but its success is dependent on a number of favorable contexts and institutions (Grimes, 2013). This article shows that in certain context, the role of civil society is always in pathological trap attenuating social accountability substance. The case presented is pathological trap of civil society's role in participatory public budgeting process.

The involvement of citizens in traditional literature is encouraged by competitive external powers. The intended external power includes ruling politician, literate citizen, other governmental institution, legal organization, and professional organization. Previous studies found that the higher the external motivation of citizen participation to ask for budgeting process accountability, the higher is the quality of government's social accountability (Ruben, 2006; Sirker, 2007; Russell, 2011). The larger the number of citizen actors active and sensitive to government performance, the stronger is the demand for social accountability (Clarke and Missingham, 2009).

Public participation in social accountability of budget sector has been initiated since 1980 in Brazil. Activist encouraged an initiative to confront the community and its members (citizen) in the attempt of voting for budget priority. They submitted the result of meeting to government and urged the government inform the priority of public budget policy and its implementation. A study on public budgeting theory shows that public

budgeting is replete with interest contestation and negotiation process between budget actors. For that reason, public budgeting should be associated with a social accountability mechanism in the attempt of escorting the just government governance. Theoretically, the importance of accountability norm and transparency is well-established in public budgeting, but it implementation is often inconsistent (Morgan, 2002; Wildavsky and Caiden, 2012). Franklin and Raadschelders (2004) wrote that the next stage of budgeting approach as budget politics is democratic ethos approach. This approach views that public budgeting builds on equality, justice and constitutional value principles.

Democratic ethos presupposes that budgeting actor should explain budget information transparently to the public to prevent the certain group from coming inappropriate action thereby in contradiction with the democratic principles of determining budget allocation. Democratic ethos aspect of public budgeting explains that public budgeting is not merely figures (numbers), but also political process. There is always a conflict of interest between interest groups in budgeting process, for example, the conflict between efficiency principle and program effectiveness, and political leadership aspiration, and the conflict concerning to which group responsiveness and accountability is prioritized. Interest contestation is inevitable so that a mechanism should be created that replaces this bargaining with arguing habit (Morgan, 2002; Rubin, 2006, Kelly & Rivenbark, 2011).

In certain environment condition, the transparency of budgeting information conditions the society to require more accountability as answerability rather than accountability as responsibility (Robin, 2006; Tembo 2013). This sample case occurs in Dekalp, when public officials give accountability information to citizen. The officials in Delkalb obligatorily explain the reason justifying the government's choice decision in public dialog so that they can support the government's decision. Dialogue space is made using mass media.

The political character of public budgeting results in critical room leading to social accountability pathology. Social accountability pathology means a condition disturbing the functioning of social accountability system substantively. Social accountability system can run procedurally, but substantively the dysfunction occurs, leading to an unaccountable condition. The finding above suggests that information transparency can prevent certain group from committing opportunistic action. This proposition is opposed by Jonathan A. Fox (2015) finding that information transparency alone cannot always activate the public's awareness of requiring social accountability. It leads the community-driven development to be captured frequently and socially by local elites (Mansuri and Rao, 2013). He also found that another trap of participatory program is no actual collective overseeing despite available participative mechanism. In addition, the trap of community's fear of voicing becomes an opportunity to stimulate the infertility of social accountability function.

Pathological trap within civil society results from the actor's opportunistic behavior tendency as suggested by agency theory that both agent and principal have hidden interest potentially resulting in opportunistic behavior (Mitnick, 2013). Civil society variable in social accountability refers to activity density of civil society group and the extent to which the public pressure is to ask for the government's accountability. Social accountability concept assumes that community group acts and is partial to community group it represents so that it can preclude public resource stealing for elite group. The fact shows that community group tends to behave opportunistically and to acts unaccountably (Yang and Callahan, 2005 and Falaschetti, 2009). It is the paradox of civil society that potentially generates social accountability pathology.

A study on civil society shows that the character of relationship between civil society groups and between civil society and government is very decisive by power

interest and it can change any time (Ackman, 2012). Certain group can take anti-democratic stance by committing violence directly or indirectly (uncivilly), domination and marginalizing other groups. Such the activity will harm mutual interest value reciprocally (Chamber and Kopstein, 2001;Fung, 2003; Vitale, 2006; Cornwall and Coelho, 2007; Ackman, 2012; Hoppe and Kondrikova, 2012). The power of society group, in addition to potentially improving accountability, can result in pressure for other society group as well. Thus, such the pressure can reduce other groups' capability of influencing the ruling group. Government tends to refuse input from the suspected group and considers it as a harmful problem. The competition for domination among these society groups are often utilized as the opportunity of participating in political transaction interest in the name of public interest (Yang and Callahan, 2005).

In conclusion, the role of civil society of asking for social accountability (demand driven) and government's decision to involve the public (society) in participatory budgeting, in addition to potentially improving social accountability, likely generates democratic meaning deviation from the social accountability mechanism. What is the form of social accountability pathology in the case of Kelurahan Development Fund (DPK) implementation in Surakarta City, Central Java Province, Indonesia? Why does the pathology occur in the context of participatory public budgeting? The following section will address these problems.

Result

The management of Kelurahan Development Fund or Kelurahan Grant thereafter called DPK represents the society's behavior of being accountable for public resource given to it. The committee of Kelurahan Development, thereafter called PPK, acting as accountor should be accountable socially to citizen and formally to city government. One pillar of social accountability is society's capability of understanding the accountability and acting accountably. The history of DPK policy release is the part of civil society activist's pressure to develop a democratic budgeting planning. This attempt is initiated by IPGI (*Indonesian Partnership on Local Governance Initiative*) in 2001 for *fiscal devolution* trial in the form of blockgrant for kelurahan. DPK is a miniature of social accountability for government budget democratization in the attempt of answering the public's questions: "What can we manage directly in our territory?" The management of DPK fund gives deliberation space within the society to determine budget allocation in its kelurahan scope. The members of society discuss from planning, writing activity proposal, executing the activity to writing responsibility report. Development is planned, implemented and overseen by the society itself. The utilization of DPK fund is facilitated by TP3K (*Tim Pengawal Perencanaan Pembangunan Kelurahan* = Kelurahan Development Planning Escort Team) and monitored by DPK's Monev (Monitoring and Evaluating) Team trained and facilitated by facilitator honorarium by Bappeda (Local Development Planning Agency). The members of TP3K and of Monev Team have legitimate assignment based on the Mayor's Decree.

The story of citizen forum cooptation symptom was obtained from a study on the implementation of DPK during 2009-2011 conducted by *Yayasan Solo Kota Kita* (YSKK) NGO.

The result of study shows the elite-biased implementation of DPK. Bias is indicated with activity inconsistent with planning (*musrenbang* = Development Planning Discussion). The percentage budget use for LMK (Kelurahan Society Institution)'s operation is substantial, more than 45 percents, so that the fund implemented to the society

is very small. Social accountability pathology in DPK case results from government and citizen forum. From the government side, DPK is given to citizen to accommodate some suggestion in *musrenbang kelurahan* that is not accommodated in RKPD (*Rencana Kerja Pemerintah Daerah*/Annually local development planning) as the strategy to reduce the citizen's disappointment. Giving the citizens the space to manage budget directly continuously is expected to make them support the government. The hierarchy of PPK is generally composed of society leaders close to government. It indirectly solidifies the cooptation structure of government over citizen forum. Mayor's regulation contains technical instruction of DPK use to be PPK controller as the government activity executive agency. The procedure of applying for grant proposal and report to government provides the government an administrative control space. In this way, unconsciously, the forum of territory citizen at kelurahan level experiences is co-opted by government. Citizen forum no longer debates the ideological reason of allocation accountability and budget use, but only becomes a routine executor of budget ration.

From society side, the representation of PPK as DPK manager reflects the domination structure of society elite. The citizens' less awareness of and submission to PPK confirms the emergence of elite domination pathology and forum co-modification. Although information on DPK fund amount and its use rule has been published, the transparency of information not always encourages the collective revival to look for social accountability or to act as social accountee. The presence of citizen in PPK becomes a co-modifiable capital when it is needed to support legitimacy of proposed activity. PPK policy to modify the self-help contribution value of society facilitated by DPK is intended to relieve the society's burden of paying self-help money due. Substantively, however, this policy inherits corruption pathology in the form of budget data mark up despite an excuse that it is not forum's fault but it only makes regulation adjustment. This phenomenon reflects on buck passing (throwing the responsibility away) pathology, meaning that PPT states that it cannot be blamed for the policy it develops to relieve the citizen's burden. They only do their responsibility of securing the common duty. In addition, this practice also inherits the culture of dependency on government's gift thereby increasing cooptation opportunity and decreasing the community's critical power. Despite the design for budget democratization practice, in DPK management by PPK in Surakarta City, not all of RT/RWs (Neighborhood Community) hold discussion. Development discussion in environment level, called known *Musling* (*Musyawarah Lingkungan* = Neighbourhood General Meeting), is institutionalized as a social accountability forum. Social accountability principle assumes that this forum is established to debate and to dialogue problems and community need priority. In fact, however, this forum is not functioned as the social accountability confirming forum, but as the forum legitimating the proposal the RT/RWs have developed. Even some RT/RWs do not hold environment discussion; they only fill in the form of activity proposals to be brought into *musrenbang kelurahan*. Thus, the society representative plays its role as elite that dominates and co-opt the voice of society it represents.

The phenomena found in this DPK case confirms the relevance of agency theory's basic principle believed in, in which information and hidden interest between principal and agent bring about opportunistic behavior. Social accountability pathology in DPK case occurs when the link of supply driven and demand driven has been contaminated by personal interest motive tending to be opportunistic. Information asymmetry of budget becomes the source of information co-modification pathology. Community elite group in DPK case is PPK group understanding the budget that use information it has for personal interest or for power negotiation. The interaction of supply and demand driven in social

accountability institution contributes to resulting in a pseudo-social accountability forum, because it has been contaminated by pathology.

This pathology incidence shows that the accountability of budget decision maker is still oriented to the fulfillment of demand (accountability as responsibility). Normatively, the accountability of public budget is the government's and DPRD (Local Legislative Assembly)'s ability of answering/explaining to citizen as accountee (accountability as answerability). The *accountability as answerability* orientation is marginalized because of cooptation pathology and co-modification of social accountability forum.

In conclusion, the form of pathology found in DPK case in Surakarta City includes cooptation, elite domination, buck-passing, and co-modification. The form of pathology results because the power relation environment is dominated by patron-client relationship and co-modification is packaged in the format of formality culture and democratic procedure.

1. Conclusions

General conclusion that can be drawn from this DPK case is formulated in the following propositions. Firstly, pathology occurs due to the interaction between accountability social elements: accountor, accountee, and social accountability forum running in formality culture-oriented bureaucratic environment and co-modification-oriented civil society environment. Secondly, the representation of publics in a social accountability forum, co-opted by a procedural forum mechanism, results in elitist/exclusive/dominative accountability. Thirdly, supply-driven formality of social accountability institution creates forum cooptation thereby resulting in a pseudo-social accountability. Fourthly, contestation of civil society group interest triggers forum co-modification thereby accountee becomes infertile. Fifthly, elite domination, forum cooptation, forum co-modification, and infertile accountee contribute to generating a pseudo-social accountability. Sixthly, the intensity of social accountability mechanism in a democratic value-based budgeting planning process not automatically impacts on the improved accountable budgeting quality when its pathology is not reduced. Seventhly, social accountability pathology can be reduced when the quality of democratic system and bureaucratic environment is improved, from formal procedural-orientation to substantive orientation.

This study's findings recommend further researches to be conducted on the critical variables affecting the accountor and accountee's attitude oriented to accountability as answerability, rather than removing the obligation or co-modification of forum. Practical reformation policy of democratic and bureaucratic system oriented to the ability of answering/explaining argument uses evidence to the public (accountability as answerability). The internalization of accountability as answerability paradigm is recommended as the strategy of reducing the risk of democratic system and bureaucratic practice organization that is biased-responsibility in its patron/client/constituent's need so that the meaning of social accountability is dwarfed.

THE EFFECT OF PERCEIVED ORGANIZATIONAL SUPPORT FOR INNOVATION ON INNOVATIVE WORK BEHAVIOR WITH LEADER-MEMBER EXCHANGE MEDIATION ON THE LECTURER

Anis Eliyana, Universitas Airlangga, Indonesia
Diah Yovita Suryani, Universitas Wijaya Kusuma, Indonesia
Tulus Hariyono, Universitas Sebelas Maret, Indonesia
Ria Mardiana Yusuf, Universitas Hasanuddin, Makassar-Indonesia
Dwijo Waskito, Universitas Airlangga, Indonesia

Abstract
The purpose of this study aimed to find out the effect of Perceived Organizational Support (POS) for innovation on innovative work behavior. Leader-Member Exchange (hereinafter will mention as LMX) role as a mediator in the effect of POS for innovation on innovative work behavior was also investigated. The data analysis in this study used Partial Least Square (PLS). The samples of this study were 31 lecturers from Faculty of Civil and Planning Engineering Institute Teknologi Sepuluh Nopember. Particularly, the samples were taken from Architecture, Interior and Product Design Department. The result showed POS for innovation has significant positive effect on innovative work behavior and LMX. Whereas LMX has positive influence on innovative work behavior but not significant and the influence of POS for innovation on innovative work behavior was not mediated by LMX. Innovative work behavior is influenced by Perceived Organizational Support. The relationship quality between the department head and the lecturers mediate the effect of Perceived organizational Support to Innovation Work Behavior.

Keyword: *Innovative Work Behavior, POS for innovation, LMX*

Introduction

Dynamic environment compel each organization to innovate in order to survive (Cefis & Marsili, 2005). Organizations which are always innovating will have better adaptation abilities in an increasingly tight competition environment since the people in the organization are accustomed to make changes. Generally, the organization fails to assess the innovative level of its member because the assessment was based on the organization's financial capability (Patterson, Kerrin, & Gatto-Roissard, 2009). That kind of appraisal was considered a failure since not all ideas will be implemented and will give financial benefit to the organization, while the unimplemented ideas will not count at all. This can be happened because of the organization will only benefited from its support to the member's innovation if the member's creative ideas can be implemented in the organization.

The innovation itself will never be created without the presence of innovative work behavior. Since the innovative work behavior not only needs analytical ability and creativity but also needs an ability to communicate, to persuade (persuasion), and consistency to create an innovation (Dorner, 2012). Innovative work behavior enables the employees' creative ideas give benefit to the company when the ideas can be realized. Innovative work behavior is considered important to investigate in this study since it can focus on the behavior that support the innovation formation and not only on the result of those innovations. Innovative work behavior construct encourage the organization to appreciate more on each member's participation in order to generate innovation in the organization even though in the end those ideas are not all implemented.

Innovative work behavior can be influenced by the leadership in the organization (Scott & Bruce, 1994). The role of a leader in the organization that can motivate and support the member's ideas is needed in encouraging the emergence of innovative work behavior. That is because in order to be able to innovate, the member of the organization should do actions that benefited organization in which those actions were not include in the job description but still within the scope of the member's role. Leadership in this study focused on LMX since LMX is the only concept in the leadership field that focused on the social reciprocal relationship between the leader and his member (Mapolisha & Kurasha, 2013). The good social reciprocal relationship will facilitate the communication between leader and his member. The easiness in communication can eliminate the gap that usually appeared between the leader and his member due to the differences in hierarchical position so that the member willing to give opinions.

Another factor that driving the emergence innovative work behavior is Perceived Organizational Support (hereinafter will call it POS). According to Jong and Zoetermeer (2007), the function of organization in creating innovations is as a facilitator. The organization can support the innovation formation by developing appropriate organizational and psychological climate (Scott & Bruce, 1994). Based on the research result that has been done by Scott and Bruce (1994) the organizational climate considered to be able to form a transactional relationship and POS for innovation as the only part the climate for innovation that has significant influence on innovative work behavior therefore POS for innovation has been selected as one of the variable in this study.

1. Basic Theory and Hypothesis Development
a. The effect of LMX on Innovative work behavior

Research conducted by Scott and Bruce (1994) showed that there was significant influence of LMX on innovative work behavior. The research result from Scott and Bruce (1994) supported by the research result conducted by Denti (2011). Based on those previous researches the recent study wanted to prove the effect of LMX to innovative work behavior.

b. The effect of POS for Innovation to LMX

The previous research conducted by Wayne, Shore, & Liden (1997) found out that there was relationship that influence reciprocally between POS and LMX. The finding could be used as the basic to develop a theory about the unidirectional influence from the POS to the LMX. The example of this relationship can be seen when there is good mark based on the employees' evaluation on the support given by organization. Hence, the supervisor as the organization representative who most frequently meets the employees will also be considered good so that the employees become more confident and feel free to develop good social relationship with their supervisor.

c. The effect of the POS for Innovation to the Innovative Work Behavior

Pradesa, Setiawan, Djumahir, and Rahayu (2013) in their study found out that POS has positive effect on employees' positive behavior. The research conducted by Pradesa et.al. (2013) examined the effect of POS on employees' positive behavior, affective commitment and felt obligation as intervening variables. The present study tested whether POS has a direct influence to the employees' positive behavior in the workplace or innovative work behavior.

Based on the theoretical basis that has been mentioned above, therefore the hypothesis of present study formulated as below:

H1: The POS for Innovative has direct and significant influence on the LMX.

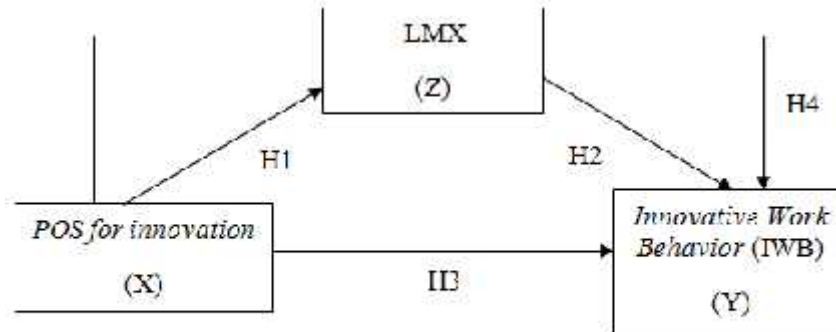
H2: The LMX has direct and significant influence on the innovative work behavior.
H3: The POS for innovation has direct and significant influence on the innovative work behavior.
H4: The POS has significant influence on the innovative work behavior through LMX.


Figure 1
Conceptual Framework

Research Method

This study used quantitative approach that emphasizes in theory testing through the measurement of research variables using statistical procedure. This study aimed to prove the causality relationship between innovative work behavior, LMX and POS for innovation. The data used in this study are primary and secondary data. Primary data were obtained from questionnaire on research respondent which are lecturer of Interior and Product Design and Architecture Department, Faculty of Civil and Planning Engineering Institut Teknologi Sepuluh Nopember. The respondents are permanent lecturers that have at least five years of service. This study population was 74 lecturers with the condition that the respondents should have minimum rank III C; therefore the sample became 40 people. The questionnaires that returned and can be further processed were 31 questionnaires. Secondary data were obtained from books, journals and company documents related to the variables of the study.

There were three variables in this study, which are: POS for Innovation (X), Innovative work behavior (Y), Leader-Member Exchange (LMX) (Z). Indicators that included in Innovative work behavior in this research were the exploration, creation, championing and realization of ideas and new techniques that intentionally done by the lecturers in their roles as educators in order to improve students creativity and facilitate students to understand given lecture materials. This study measured Lecturers innovative work behavior using aspects stated by Jong and Hartog (2010), and then the questions posed in this study to measure the innovative work behavior are:

1. The frequency of the lecturers in caring things that do not belongs to their daily work.
2. The frequency of the lecturers in thinking the ways to improve something in body.
3. The frequency of the lecturers in trying to seek new techniques.
4. The frequency of the lecturers in finding new approach in doing their job.
5. The frequency of the lecturers in enhancing the member's enthusiasm to innovative ideas.

6. The frequency of the lecturers in encouraging the surrounding people to support innovative ideas.
7. The frequency of the lecturers in trying to implement innovative ideas in their work practice.
8. The frequency of the lecturers in contributing to the implementation of new ideas.
9. The frequency of the lecturers in developing new things.

POS for innovation in this research refers to the degree of assessment given by lecturers regarding to what extent faculty support to lecturers' creative ideas related to the improvement of effective teaching technique. The indicators developed by Scott and Bruce (1994) which is support for creativity and tolerance for differences were used to measure POS for innovation. The aspects that were used to measure POS for innovation in this study are:
1. The creativities of lecturers supported by the department.
2. The ability of lecturers to work creatively was appreciated by the department.
3. The lecturers allow solving the existing problems in teaching techniques using different ways.
4. The lecturers assumed that their faculty is flexible and constantly changing.
5. The department responsive to changes.

The definition of LMX in this study refers to the quality of social interrelationship between department head and lecturers which is based on their trust, respect, and professional responsibility. LMX measurements were done by investigating the indicators presented by Graen and Uhl-Bien (1995) in which they were modified. Accordingly, the questions used to measure LMX in this study are:
1. Are the lecturers aware of their position in the presence of each department head?
2. The lecturers' opinion about how likely each department head will provide assurance to their actions regardless of the formal authority differences.
3. The lecturers' opinion about how likely each department head will help them to solve the problem regardless of the formal authority differences.
4. Do the lecturers believe that the department heads know their potential?
5. Do the lecturers know when their department head satisfied with their performance?
6. The lecturers' opinion about to what extent the department head's understanding about lecturers needs to improve the effectiveness of teaching and learning process.

Result and Discussion
1. Respondents Characteristic
The numbers of returned questionnaires were 33 out of 40 distributed questionnaires. Two questionnaires were rejected because the related respondent had less than five years working experience therefore the questionnaire that can be processed would be 31 units.
2. Description of Respondents' Answers.
The lecturers from designated department that has IIIC class in this study were five people (16,12%), III D class were twelve people (38,7%), IV A class were seven people, IV B class were five people (16,12%), and IV D class were two people (6,45%). The majority of the lecturers who became the respondent in this study have lectureship rank with III D class.

3.   **Data Processing Result**

        This section would explain the respondents' answer about POS for innovation (X), LMX (Z), and Innovative Work Behavior (Y). First, the average value of respondents' answer from each question will be calculated and will be categorized based on class interval. Class interval sought by using the class interval formula as follows:

$$\text{Class Interval} = \frac{\text{Highest Score} - \text{Lowest Svore}}{\text{Total Class}} = \frac{5-1}{5} = 0,8$$

        The criteria of the average respondents' answer was made based on class interval 0,8 that were presented in the table below:

Table 4.1 The Criteria of the Average of Respondents' Answers

Interval	Category
4,20 < a =< 5,00	Very High (VH)
3,40 < a =< 4,20	High (H)
2,60 < a =< 3,40	Medium (M)
1,80 < a =< 2,60	Low (L)
1,00 < a =< 1,80	Very Low (VL)

Source: Questionnaire data

a.   **Perceived Organizational Support for Innovation.**

        The average value of respondents' answers regarding POS for innovation is at 3, 61 which is included in high category. This result indicated that the lecturers in the Industrial product design, interior design, and architecture department value the support of their organization to lecturers' innovation is high. The flexibility of the department to their lecturers to conduct lecture in a different techniques from one lecture to another have the highest value which is 4, 22. The lowest value of 2, 64 described the department's expectation to the lecturers use the same teaching techniques.

b.   **Leader Member Exchange**

        The LMX relationship between the lecturers of Interior and Product Design and Architecture Department and their respective department's head was included in high category with a value of 3.72. The respondents' answers regarding LMX got the highest value of 4.09 which means that the LMX relationship between the lecturers and the head departments was dominated by respect. The lowest value was at 3.25 indicates that the department head has low courage to ensure the lecturers' action taken in their department.

c.   **Innovative Work Behavior**

        The innovative work behavior that was owned by the lecturers of Interior and Product Design and Architecture Department belongs to the high category with a value of 3.66. The high level of innovative work behavior that they owned was dominated by the frequency of the lecturers in thinking the ways to improve the effectiveness of the existing teaching techniques at the moment. While the lowest value is at 2.38 showed the low frequency of the lecturers in working on to develop new teaching techniques to be more effective teaching.

d.   **Model Analysis and Hypothesis Testing**

        PLS techniques recognize two types of validity, which are, the convergent validity and the determinant validity. In the first stage, there are some indicators that do not

comply with the provision of outer loading value of more than 0.5. Therefore, the indicators that do not comply the condition should be reduced until generate this following model:
Reliability Te

IWB	0.7485
LMX	0.709
POS for innovation	0.6776

Source: Data Process

Reliability testing can be done by using composite reliability. Based on Henseler, Ringle, and Sinkovics (2009), in order to meet the reliability testing, it should have composite reliability value of more than 0.6. Table 4.2 shows that each variable has composite reliability higher than 0.6. Therefore, it can be concluded that each variable was declared to have construct variable.

R-Square Value

The inner model evaluation is done by looking at the R-Square from endogenous variable. R-Square value indicates that the data variance can be explained by exogenous variable to endogenous variable. The PLS processing display the R-Square that can be seen on the table 4.3 below:

Table 4.3 R-Square Value

	R Square
IWB	0.4042
LMX	0.2079

Source: Data Process

LMX constructs have an R-Square of 0.2, which means that the LMX data variance can be explained by the POS for innovation variable is by 20%. The IWB constructs have an R-Square of 0.4 that means the IWB data variance that can be explained by POS for innovation and LMX is by 40%.

Goodness of fit in PLS was calculated using Q2 by reffering to the table 4.3, Q2 value calculated as follow:

$$Q^2 \text{ Value} = 1 – (1– 0,2) \text{ x } (1 – 0,4) = 0,52 \text{.. (1)}$$

Q2 of 0.52 means that the structural model can explain 52% of the kinds of data in this study.

Hypothesis Testing

Table 4.4. Path Coefficient and T-Calculation

Hipotesis	Path Coefficient	t-calculation
POS *for innovation* -> LMX	0,45	6,3
LMX -> IWB	0,16	1,51
POS *for innovation* -> IWB	0,54	7,46

Source: Data Process

The coefficient path of the influence of POS for innovation to LMX was at 0.45 and the t-test was 6.3 means that POS for innovation has significant positive effect on LMX on lecturers of Design and Architecture department.The better the lecturers perception about departement's supports on innovation, the better the quality in mutual social relationship between lecturers and the department head. Based on the result, the first hypothesis in this studies that presumed that POS for innovation has direct and significant impact on the LMX was acceptable.

The LMX path coefficient of the influence of innovative work behavior was at 0.16 ant t-test was at 1.51 showed that LMX has positive influence on innovative work behavior but it was not significant. It means that the mutual social relationship quality improvement between lecturers and respective departement heads will insignificantly improve the lecturers' innovative behavior. This result showed that the second hypothesis which presumed that LMX has direct and significant impact on the innovative work behavior was not fully accepted.

The path coefficient value of POS for innovation to innovative work behavior was at 0.54 and t-test was at 7.46. It showed that the department support to lecturers innovation has significant positive effect on innovative behavior of the lecturers. The better the lecturers perception about departement's supports on innovation, the better the lecturers' innovative behavior. Based on the result, the third hypothesis which presumed that POS for innovation has direct and significant impact on innovative work behavior was accepted.

Path coefficient value of 0.072 indicates that POS for innovation influence the innovative work behavior through the LMX. Z-test value of 1.6 indicates that this effect was not significant. This is because the lecturers felt that the innovation that was produced comes from within themselves. Lecturers LMX value includes in the high category, however, the communication that was formed in the LMX relationship between the lecturers and their respectives department heads led to the problem solving and resource allocation. The communication that was formed between the lecturers and the department head was not to be as an increase of lecturers confidence in their ability for creativity and innovation.

Conclusion

Based on the result of data processing using Partial Least Square (PLS), the conclusion of this study are as follows. Firstly, POS for innovation has significant positive impact on the LMX of the lecturers of Design and Architecture department. Secondly, LMX has positive impact but not significant to the innovative work behavior of the lecturers of the Design and Architecture department. Thirdly, POS for innovation has significant positive impact on innovative work behavior of the lecturers of Design and Architecture department. Lastly, the effect of POS for innovation to innovative work behavior of the lecturers of the Interior and Product DEsign and Architecture Departement was partially mediate by LMX.

EFFECT OF STOCK BUYBACK TOWARDS FINANCIAL PERFORMANCE AND MARKET REACTION : STUDY OF LISTED COMPANIES IN INDONESIA STOCK EXCHANGE

Etano Garda Ariyan, School of Business and Management, Institut Teknologi Bandung, Indonesia
Ahmad Danu Prasetyo, School of Business and Management, Institut Teknologi Bandung, Indonesia

Abstract

This research aims to obtain empirical evidence about the differentiation in financial performances of the companies listed in Indonesia Stock Exchange before and after conducting stock buyback. The samples were tested using match paired sample t-test to show the differences of several financial ratios before and after stock buyback. In addition, the research is also aimed to understand the effect of stock buyback announcement to the market reaction. The research use market model to find the expected with 61 days of event window period, consisting of 30 days before and after stock buyback announcement. The research samples were 17 different listed companies which perform 22 stock buyback actions from 2001-2014 in Indonesia Stock Exchange. We use sample t-test to analyze the efeect towards financial perfoemance ratios while difference in difference method is used to analyze the effect towards stock return caused by buyback announcement. The result state that there is significant difference in financial performance caused by stock buyback, while on the contratry the effect on stock return was significant.

Keywords : *stock buyback, financial performances, stock return, difference in difference*

Introduction

Background

There is an obligation for corporations which have gone public to open the information regarding capital structure policy, cash dividend, working capital, and other decisions. These information are becoming fundamental equipment for helping the investors to manage their portfolio in order to gain optimum return of their investments; one of these information is corporate actions towards their tradable stock in the secondary market. Corporate action is any event which brings material change to the company and its stakeholders.

A stock buyback is one form of corporate actions. In some parts of the globe; like in the United States for instance, stock buyback is booming (Yallapragada, 2014). It can be seen from the first half of 2011 when S&P 500 companies repurchased about $200 billion of their stock followed by another $ 500 billion stock buyback in the following year; this trend is followed by other contries around the world, including Indonesia. As mentioned by Coleman (2011), it happened because buyback program is often viewed as an efficient way to increase the value of shareholders. When the demand of a certain stock increase, the law of supply and demand go into effect; the price raise instantly. At the time when Indonesia had experienced exchange rate crisis and Jakarta Composite Index fall sharply on 2015 the Minister of State Owned Enterprises, Rini Soemarno decided to issue stock buyback program policy which being revealed on August, 24th 2015. Tthe minister urges state owned enterprises to be more active in managing its stock in the market by conducting stock buyback. She mentioned there

would be 13 state owned enterprises from several sectors that execute buyback program with minimum total transaction of IDR 10 trillion. The Financial Service Agency (FSA) or *Otoritas Jasa Keuangan* in Indonesian language,has supported the stock buyback program policy to restore market condition by issuing circular letter No. 22/SEOJK.04/2015. This letter allow corporates to conduct sspecific amount of stock buyback without a general meeting of shareholders based on another Regulation No. 2/POJK.04/2013 issued by the same body. This action was expected to encourage corporations for conducting stock buyback program immediately.

1.1. Problem Definition

However, they were reacting differently. Despite all supports and deregulations taken for encouraging the buyback action, there were still doubts about how the market would react and the effectiveness of this action to company performance. Deputy Commissioner of Capital Market Supervisory mentioned there were 19 corporates who express their interest in conducting buyback program but only 3 of them managed to implement the program (Kontan, September 2015).

From theorotical point of view, there had been several kind of researches that investigate the impact of stock buyback towards company's financial and stock performances. The result reached by these researches isvarying. According to research conducted by Candra (2009) and Wronska-bukalska (2015), there is no difference of financial and stock performance before and after stock buyback. While Hirtle (2001) suggested that the higher level of share repurchase associated with higher profitability. In addition, Purnomo (2010) conclude that there is no significant difference in average abnormal return before and after buyback. On the other hand, Zunijar (2013) stated buyback announcement has significant influence and there was a difference in cumulative average abnormal return before and after the event.

1.2. Objectives

This research has three objectives. First, to identify whether stock buyback has an impact on company performance. Second, to identify whether stock buyback announcements influence the abnormal return of stock price. Third, to analyze the difference of stock return before and after stock buyback's announcement.

2. Theoretical Foundation
2.1. Stock Buyback

Stock buyback has become a common-yet-important phenomenon in stock market activities. According to Brigham and Ehrhardt (2002), there are 3 principals reasons for a corporation to buy back its stock, those are:

- When it has cash available for distribution to its stockholders, and it distributes this cash by repurchasing shares rather than by paying cash dividends.
- When it concludes that its capital structure is too heavily weighted with equity, and then it sells debt and uses the proceeds to buy back its stock.
- When it has issued options to employees and then uses open market repurchases to obtain stock for use when the options are exercised.

A stock buyback is a signal to investors that the firm's insiders believe their shares are being traded below fair value (McNally, 2002). Then, Rappaport and Mauboussin (2001) explain there are three methods of stock buyback which a corporation could choose. These methods are:

- Open market purchases where the company purchased its share from the open market.
- Dutch auction where management defines the number of shares it intends to buy and at a price range.
- Fixed-price tender offer where the management offers to repurchase a set number of shares at a fixed price.

From these methods, the open market purchase is the one that has been extensively use because it gives the corporations a flexibility to buy its stocks at any amount and time desired. Stonham (2002) explains that open market share repurchases are a blunt instrument by which the repurchasing can be flexible over timing, size and number of 'parcels'. However, the company would have less control over share price. In addition, large open market repurchases may work against the firm as they tend to push up the price simply through its own buying.

In Indonesia, stock buyback policy is being settled under the FSA Regulation. The 4th article on chapter II from this regulation states that the corporation could engage stock buyback without a general meeting of shareholders when market condition fluctuates significantly. Furthermore, the amount of stocks that can be repurchased is restricted by 5th article from the regulation; up to approximately 20% of its paid-up capital.

2.2. Financial Performance

Financial statement analysis is one effective process for reviewing possible risks, performance, financial state, or even future prospects of the company. Drake (2012) defines financial analysis of a company as "a process of selecting, evaluating, and interpreting financial data, along with other pertinent information, in order to formulate an assessment of the company's present and future financial condition and performance". It widely used to measure overall financial condition of a company over a period of time. Financial performance provides sufficient sort of information which declare how well the company conduct its business operation historically. Top managers or executives makeuse the of data stated in financial performancefor reassessing the direction of their company periodically; it helps the company to achieve optimum profit in aggregate. Many businesses have failed because of poor financial management or financial planning.

Financial statement analysis is one effective process for reviewing possible risks, performance, financial state, or even future prospects of the company.

Several methods of financial statement analysis have been developed to accommodate specific need of each stakeholder. Some of these methods to analyze financial data include DuPont analysis, pro forma analysis, horizontal and vertical analysis, and also a method which use various categories of financial ratios. Financial ratios are common analycal tool to perform number of quick analysis on financial statement. Basic data for conducting ratio analysis comes from company's balance sheet and income statement. It involves calculating and interpreing some financial ratios which evantally give better understanding to interest stakeholders regarding how well the company's performance is.

Ratio presents its universal attribute which gives unlimited scope in assessing the financial performace of the company.According to Joe Lan, ratios help link the three financial statements together and offer figures that are comparable between companies and across industries and sectors (2012).

Naga and Tabassum (2013) were evaluating the performance of the selected two banks based on the financial ratios from the perspective of pre and post merger. To analyze the impact of bank's merger, paired t-test was applied to the various financial ratios for before and after merger data. Same approach also had been used by Putra, Lahindah, and Rismadi (2014); paired sample t-test and Wilcoxon signed-rank test were applied to the profitability ratio, liquidy ratio, and market ratio of three companies before and after global financial crisis.

2.3. Abnormal Return

Term of abnormal return has been used to describe the return generated by certain financial asset or portfolio over period of time which is different from expected result. Abnormal return can be triggered by certain events like merger, acquisitions, or announcement. These events usually categorized as the information which has been unknown or predicted by all imvestors in the market; they are not ready for the events. Schweitzer (1989)had explained how to estimate abnormal return coherently through some methods which are mean-adjusted returns, market-adjusted returns, and market model.

Mean-Adjusted Returns

$$AR_{jt} = R_{jt} - \bar{R}_j \quad (1)$$

where AR_{jt} is the abnormal return of securities j in time period t. The result of abnormal return obtained from the difference between observed or actual return of securities j in time period t (R_{jt}) and mean return for securities j over a given sample period ($\bar{R}_j$). This method assumes the expected return is constant and similar with historical average return.

Market-Adjusted Returns

$$AR_{jt} = R_{jt} - R_{mt} \quad (2)$$

Through this method, abnormal return is obtained from the difference between observed or actual return of securities j in time period t (R_{jt}) and the return of market portfolio in time period t (R_{mt}). For this research, market portfolio is Jakarta Composite Index.

Market Model
First, this mehod required analyst to estimate normal return of securities j in time period t (R_{jt}) with the formula as follow:

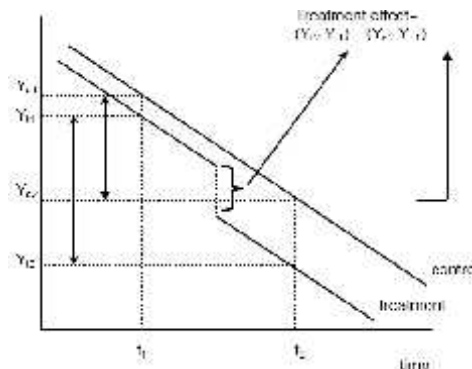
$$\hat{R}_{jt} = \hat{\alpha} + \hat{\beta} R_{mt} + \varepsilon_{jt} \quad (3)$$

where $\hat{\alpha}, \hat{\beta}$ are the estimated regression parameter and ε_{jt} is the error term of securities j in time period t. Then, estimate normal return becomes one of the inputsin followingformula:

$$AR_{jt} = R_{jt} - \hat{R}_{jt} \quad (4)$$

Abnormal return is the difference between observed or actual return of securities j in tume period t and estimate normal return of securities j in time period t. The normal return presents supposed return if the events never occur.

2.4. Difference in Difference Method

The use of Difference in Difference has been widespread used as a tool in econometrics


and quantitative research. It estimates treatment effects by comparing pre- and post-event's outcome differences in both treatment group and control group.

Figure 1. Difference in Difference Graph

Yoshino and Abidhajaef (2015) had examined the nature and magnitude of the effects of railway infrastructure provision on regional economic performance. Difference in difference method linking the changes of growth rate of regional level economic outcome (growth of GDP) in affected area to the new railway connections in southern part of Uzbekistan, conditioned on the region's time-invariant individual effects, time-varying covariates, and evolving economic charateristics.

3. Methodology
3.1. Data Sampling and Collection

The research had identified number of public-listed companies which conduct stock buyback program from 2000 to 2013. The data classified as secondary data and collected from database of Indonesian Stock Exchange and Indonesian Capital Market Electronic Library. List of buyback programs are listed in table.

\

Source : processed from ICaMEL and Indonesia Stock Exchange

3.2. Estimation Method for Ratio Analysis

In this step, four financial profitability ratios such as return on assets, return on equity, operating profit margin, and net profit is analyzed to measure the effect of stock buyback on financial ratios. The sequence of proccess are :

3.2.1. Categorizing the data
   Each ratio data is divided into 2 groups, one is the group consists of the ratio on two years before the event and another is the group consists of the ratio on two years after the event.
3.2.2. Set the hypothesis
   There are four hypotheses in this part of research. The hypothesis has been divided into four categories due to the amount of ratio measurement being used. The four hypothesesare:

H1: using return on equity, financial performace of company which conduct stock buyback one year before and after the event is significantly different.

H2: using return on assets, financial performace of company which conduct stock buyback one year before and after the event is significantly different.

H3: using operating profit margin, financial performace of company which conduct stock buyback one year before and after the event is significantly different.

H4: using net profit margin, financial performace of company which conduct stock buyback one year before and after the event is significantly different,

3.2.3. Processing the data

Following Putra et al. (2014), all categorized data then processed with SPSS software to perform paired sample t-test analysis. Paired sample t-test is used when the data are assuming normal distribution.

3.3. Estimation Method for Difference in Difference

For the next step, we compared the actual and expected daily stock return using difference in difference method to investigate the impact of stock buyback towards stock return. The phases of conducting this method are :

3.2.3. Making assumptions

Several numbersof assumptions assigned to become the base of this research. First, all investors in the market do not anticipated the information of stock buyback announcements before those announcement go public. Since the events are not anticipated, abnormal return is the result of investor reaction. In the period of event window, the return has only affected by the occurance of buyback announcement by eleminating other factors.

3.3.2. Determine estimation period and event window

Estimation period is the period of time which no event has been occured. This period is used to determine the "normal" stock return in the absence of the event. Event window is the relative short period of time which able to measure the impact of an event to stock returns. Election of the event date is crucial in event study. Less accurate prediction of event date results in less powerful result. We follow Ikram & Nugroho (2014) in determining estimation period and event window; -120 days to -31 days before the event had beem chosen as estimation period. Then, period of event window is -30 days before and +30 days after the event date. Figure 2 illustrates estimation period and event window with informative timeline.

Figure 2. Estimation Period and Event Window Timeline
3.3.3. Calculating expected return

The research applied market model to estimate expected return for each stock throughout event window period if the occurance of stock buyback assuming the absence of stock buyback event. The formula of market model. Calculation of the expexted return use following formula :

$$\hat{R}_{jt} = \hat{\alpha} + \hat{\beta} R_{mt} + \varepsilon_{jt} \quad (5)$$

where R_{mt} is the return of market index (IHSG) in time period t and ε_{jt} is the error term of securities j in time period t. In finding intercept alpha α and slop beta β, regression analysis had been conducted using actual return of each stock and corresponding daily return of IHSG during estimation period. Table 2 below shows the calculation result of alpha and beta for each stock using regression analysis.

Table 2. List of alpha and beta for each stock

No	Stock	Alpha	Beta
1	ADHI	-0,009	-0,569
2	BBCA I	-0,003	-0,344
3	BBCA II	0,001	-0,049
4	BHIT	0,019	0,593

Source : Author

3.3.4. Comparing differences by Difference in Difference Method

Before using this method, the data were divided into two groups and separated again by two different time periods. These groups consists of treatment group which use actual return of each stock and control group which use expected return of each stock, resulted from the estimation of previous step. Differences for pre- and post-event of both groups were then examined by difference in difference method. There were 3 calculations of

difference in difference, starting with first week examination which take data from -5 days before the event and 5 days after the event, then followed by data from -10 days before and 10 days after, and at last data from -20 days before and 20 days after. Each of the data represents the result in first, secod, and third week respectively. Difference in Difference estimation used regression model as follow:

$$y = \beta_0 + \beta_1 D^{Time} + \beta_2 D^{Tr} + \beta_3 D^{Time} D^{Tr} + \varepsilon \quad (6)$$

where y is the stock return, D^{Time} is dummy variable for the time period, it captures aggregate factors which cause a change in absence of buyback event (0 for pre-event and 1 for post-event), D^{Tr} is dummy variable for the treatment which captures possible differences between treatment after control group due to buyback influence (0 for control group and 1 for treatment group), while $D^{Time} D^{Tr}$ is a dummy variable indicating two dummy variables equal to one. The implementation result was according to the regression framework below where lower right cell is the DID estimator:

Table 3. DID Regression Framework

Y	$D^{Time} = 0$ before treatment	$D^{Time} = 1$ after treatment
$D^{Tr} = 0$ control group	β_0	$\beta_0 + \beta_1$
$D^{Tr} = 1$ treatment group	$\beta_0 + \beta_2$	$\beta_0 + \beta_1 + \beta_2 + \beta_3$

4. Estimation Result and Data Analysis

4.1. Financial Performance (Paired Sample T-Test)

Table 4. Paired Sample T-Test Result

If we look at Sig. (2-tailed) column from table 3, the calculation of 4 variables was greater than 0.05. ROE, ROA, OPM, and NPM give significance estimation of 0.76, 0.95, 0, 58, and 0.89 respectively. It suggest all four hypothesis are rejected. None of the return on equity, return on assets, operating profit margin, and net profit margin have insignificant change between the data from one year before and one year after the stock buyback occurance. Overall, this result shows stock buyback did not affect the financial performance of a company from its profitability parameter.

4.2. Market Reaction (Difference in Difference)

Table 5. -5th and 5th day Difference in Difference Coefficients Outcome

Source	SS	df	MS		Number of obs =	88

Table 7. -20th and 20th day Difference in Difference Coefficients Outcome

From table above, the difference in difference coefficient of 20 days pre and post event data is -0.089 and the p-value of 0.000. Stock buyback leads to 8.9% fall in stock return and statistically significant at 10% level.

5. Conclusion

This research was inspired by growing attempt of conducting stock buyback in Indonesia. Inevitably, several number of questions are raised like: what are the reasonable motives behind stock buyback, how it affects financial performance of the company, and how investors at the capital market respond to this action. Based on profitability ratio analysis, this study has confirmed no difference on financial performance state signifincantly before and after buyback. In other hand, the market reacts differently compared to the financial performance. In the first week which the data taken from 5 days before and after the event, the stock return respon positively; the return increase around 3.9% but after this period the return start to decline. It shown by table 6 and table 7 which express 2.1% fall on week 2 and 8.9% fall on week 3.

A FORECASTING METHOD FOR INFLUENZA VACCINE DEMAND DURING HAJJ PERIOD
CASE STUDY: A VACCINE MANUFACTURER IN INDONESIA

Muhammad Jundi*, Akbar Adhiutama
School of Business and Management, Institut Teknologi Bandung
E-mail address: muhammad.jundi@sbm-itb.ac.id

Abstract
An influenza vaccine could play a very significant role in reversing the influenza pandemic. For a vaccine to have such an impact, it must be widely available and adopted and taken up rapidly in the countries most affected. A demand forecasting model provides a valuable tool that can guide R&D spending decisions and identify policy actions to help achieve these goals. A vaccine manufacturer in Indonesia did not get their maximum profit because of inadequate demand forecast.The study aim to understand the most suitable demand forecast for the company. There are four demand forecasting method are used in this study, which are Moving Average, Exponential Smoothing, Holt's Model, and Winter's Model. The demand data from third quarter of 2010 until second quarter of 2016 are used in this study. One of those methods which have the lowest errors will be recommended to the company to implement. This study found that from these four methods, winter's Model is the most suitable method for the company because it gives fewer errors than other methods.

Keywords: *influenza vaccine, demand forecasting method, moving average, exponential smoothing, holt's model, winter's model*

1. Introduction

In 1933, virusses (influenza virus type A, B, and rarely C) cause influenza was discovered. Prior to 1933, a bacterium named *Haemophilus Influenza* was thought to cause the flu. In 1938, Jonas Salk and Thomas Francis developed the first vaccine against flu viruses. Vaccines modern world first break through in 1796, when Edward Jenner, a doctor from the UK, examines a journeyman hit smallpox, the cowpox immunized with light. He took some fluid from patients with cowpox sores and scratched on the surface of an 8 year old child's arm. Fourty eight (48) days later Jenner gave the name "vaccine" (Latin from Cow).

A vaccine manufacturer in Indonesia produce an influenza vaccine as one of their product, and Indonesian Hajj people become their main target. Because of that, the demand of influenza vaccine will raise drastically when Hajj nears. But, the company did not get maximum profit from this product because they have too much vaccine on their hand and it is because of inadequate demand forecast, which is personal judgement. There are millions of rupiah are wasted because the company should destroy the unuse vaccine, it is the same like what happened by the France-based pharmaceutical firm SanofiAventis in 2006, they had to destroy nearly 500 kilograms worth of starting material that would have made up more than 10 million tablets of the antimalarial drug artesunate (Dolgin, 2015). Because of that, establishing vaccine demand forecasts is important to facilitate supply and financial planning and to reduce risk of irregular vaccine supply (Zuber, et al., 2009).

Forecasting the demand become important because it gives some benefits for the company, these include enhanced profitability, supply chain improvement, organizational efficiency, and improved business planning (Dillman, 2014). But there is a difficulty to

forecast the demand of drug and vaccine, which is they are often based on unreliable epidemiologic data or expert surveys, rather than on-the-ground hand-outs of medicines (Dolgin, 2015).

The aim of this research is to determine the most suitable demand forecasting method for the company. The demand data from third quarter of 2010 until second quarter of 2016 are used in this study.

This paper is organized as follows: section 2 is concerned with the relevant literature review those about time-series forecasting and its methods. Section 3 illustrate the research methodology. Data analysis and the result is elucidating on section 4. And finally, the conclusion and recommendation will be explained on section 5.

2. Literature Review
2.1. Time Series Forecasting

Time series forecasting is a method that uses a set of historical values to predict a future outcome (Koppikar, et al., 2004), (Russell & Taylor, 2011). In pharmaceutical industry in Singapore, time series forecasting is the most popular than others method, these are market research, personal judgement, quantitative analysis, and pluck a number from the air (Choo, 2000). In this discussions, the demand time series forecasting is focused. A good demand forecasting can minimize cost and maximize profit. In this research, four method are used, these are moving average, exponential smoothing, Holt's Model, and Winter's Model. The things that affect the result are level, trend, and seasonal factor. The table 1 present the things that affect each method.

Table 7 Comparison of Demand Forecasting Method

Method	Level	Trend	Seasonal Factor
Moving Average		-	-
Exponential Smoothing		-	-
Holt's Model			-
Winter's Model			

2.2. Moving Average

Moving Average method is generally employed in a situation in which only level, i.e. deseasonalized demand is present and neither trend nor seasonality is observed (Singh & Das, 2010). Moving average method for forecasting time series is based on the following formula (Chopra & Meindl, 2013):

$$D_{t+1} = D_t$$
$$L_t = \frac{(D_t + D_{t-1} + D_{t-2} + \cdots + D_{t-n+1})}{n}$$

2.3. Exponential Smoothing

Exponential Smoothing Method is a popular scheme to produce smoothed time series (Pyo & Choi, 2009). It is same as moving average which only level observed. However, it attempts to smoothen the fluctuations observed in demand data of different

periods through smoothing constant (alpha) (Singh & Das, 2010). Exponential smoothing method for forecasting time series is based on the following formula (Chopra & Meindl, 2013):

$$L_{t+1} = L_t$$
$$L_{t+1} = \alpha L_{t+1} + (1 - \alpha) L_t$$

2.4. Holt's Model

Trend-corrected exponential smoothing (Holt's model) method is applicable in a situation, in which level and trend are observed in the demand data (Singh & Das, 2010). Holt's model method for forecasting time series is based on the following formula (Chopra & Meindl, 2013):

$$L_{t+1} = L_t + T_t$$
$$L_{t+1} = \alpha L_{t+1} + (1 - \alpha)(L_t + T_t)$$
$$T_{t+1} = \beta (L_{t+1} - L_t) + (1 - \beta) T_t$$

2.5. Winter's Model

Trend-and seasonality-corrected exponential smoothing (Winter's Model) is generally employed in a situation in which all characteristic features of demand data, i.e. level, trend, and seasonality are observed (Singh & Das, 2010). Winter's model method for forecasting time series is based on the following formula (Chopra & Meindl, 2013):

$$L_{t+1} = (L_0 + T_t) S_{t+1}$$
$$L_{t+1} = \alpha \left(\frac{D_{t+1}}{S_{t+1}}\right) + (1 - \alpha)(L_t + T_t)$$
$$T_{t+1} = \beta (L_{t+1} - L_0) + (1 - \beta) T_0$$
$$S_{t+p+1} = \gamma \left(\frac{D_{t+1}}{L_{t+1}}\right) + (1 - \gamma) S_{t+1}$$

2.6. Forecast Error Measurement

The overall accuracy of any forecasting model, which are moving average, exponential smoothing, or other, can be determined by comparing the forecasted values with the actual or observed values (Heizer & Render, 2011). Forecast error for period t is given by E_t, where the following holds (Chopra & Meindl, 2013):

$$E_t = F_t - D_t$$

Several measures are used in practice to calculate the overall forecast error. Three of the most popular measures are mean absolute deviation (MAD), mean squared error (MSE), and mean absolute percent error (MAPE).

Mean absolute deviation (MAD) is computed by taking the sum of the absolute values of the individual forecast errors (deviations) and dividing by the number of periods of data (n):

$$MAD_t = \frac{1}{n} \sum_{t=1}^{n} |E_t|$$

The mean squared error (MSE) is the average of the squared differences between the forecasted and observed values. Its formula is:

$$MSE_t = \frac{1}{n} \sum_{t=1}^{n} E_t^2$$

A problem with both the MAD and MSE is that their valued depend on the magnitude of the item being forecast. If the forecast item is measured in thousands, the MAD and MSE values can be very large. To avoid this problem, we can use the mean absolute percent error (MAPE). This is computed as the average of the absolute difference

between the forecasted and actual values, expressed as a percentage of the actual values. That is, if we have forecasted and actual values for n periods, the MAPE is calculated as:

$$\square\square\square_{\text{t}} = \frac{\sum_{=1}\left|\frac{\square_\square}{\square_\square}\right|100}{\square}$$

3. Methodology

In this research, there are six phases of methodology, which are preliminary survey, problem identification, literature study, data collection, data processing and analysis, and conclusion and recommendation. The first is preliminary survey which is to find out the potential problems occurred in the company by doing interview with marketing, sales, and production division. Second is problem identification and found that the company forecast their influenza vaccine by using personal judgement method, which is cannot give appropriate result. This research used literature study to strengthen the findings and to find out how to solve the problem by take some theoretical basis from books, conference and journal articles, and other online resources. Next collect the data which is the demand data of influenza vaccine from third quarter of 2010 until second quarter 2016. After the data is collected, the next step is analyzing it to find the most suitable demand forecasting method for the company. Four methods are used in this study, these are moving average, exponential smoothing, Holt's Model, and Winter's Model. Finally after analyze it, there will be conclusion which is the most suitable demand forecasting method for the company and also recommendation for the company.

4. Data Analysis

This research uses the influenza vaccine demand of a vaccine manufacturer in Indonesia from third quarter of 2010 until second quarter of 2016. Figure 1 shows the quarterly historical demand for influenza vaccine from third quarter of 2010 until second quarter of 2016. The demand of the vaccine rises every year and increased drastically in the period when Hajj nears.
Figure 2 Historical Demand

The first method is Moving Average. The erros of this method are present by the number of MAD and MAPE, which are 29,229 and 663 %, respectively. The graph comparison between the actual demand and forecast demand based on moving average method is shown in figure 2.
Figure 3 Actual vs Forecast Demand using Moving Average

Second method the used is Exponential Smoothing. This method could give vary result of forecast and also the erros depend on the value of alpha used. In this research, the number of alpha used is 0.1 ($\alpha = 0.1$) because it give the best result which is the smallest errors. Based on the calculation, the resulting MAD and MAPE of influenza vaccine demand forecast using simple exponential smoothing method are 25,421 and 1,991%, respectively. The graph comparison between the actual demand and forecast demand based on simple exponential smoothing method is shown in figure 3.
Figure 4 Actual vs Forecast Demand using Exponential Smoothing

Holt's Model is the third method that used in this research. Same as exponential smoothing, this method could give more than one result, but in this method the result is not only depand on the value alpha, but also the value of beta. The number of alpha and beta used are 0.1 and 0.1 ($\alpha = 0.1$; $\beta = 0.1$). 25,651 and 951% is the result of MAD and MAPE based on this calculation. The graph comparison between the actual demand and forecast demand based on Holt's Model method is shown in figure 4.
Figure 5 Actual vs Forecast Demand using Holt's Model

The fourth method is Winter's Model. The result of this method also depand on the value of alpha and beta, with gama as the additional. The alpha, beta, and gama used are the number which give the less erros ($\alpha = 0.1$; $\beta = 0.1$; $\gamma = 0.9$). The resulting MAD and MAPE of influenza vaccine demand forecast using Winter's Model 12,886 and 2,271%, respectively. The graph comparison between the actual demand and forecast demand based on Winter's Model method is shown in figure 5.
Figure 6 Actual vs Forecast Demand using Winter's Model

After the result of all method are got, now the MAD and MAPE which used to measure the errors are compared. The purpose of this comparison is to find the most suitable method, which based on the historical demand data. The method which has the smallest MAD and MAPE is chosen as the most suitable method for influenza vaccine in the company. The smallest error means there is only a small difference between the actual demand and forecast demand.

Figure 6 shows the comparison of MAD. As shown in the chart, Moving Average has the highest MAD while Winter's Model has the lowest MAD. The result shows that Winter's Model is the most suitable approach for the influenza vaccine forecasting.
Figure 7 MAD Comparison of Demand Forecasting

Figure 7 shows the comparison of MAPE. As shown in the chart, Exponential Smoothing has the highest MAPE while Winter's Model has the lowest MAPE. Based on the comparison, it shows that Winter's Model is the most suitable approach for the influenza vaccine forecasting.
Figure 8 MAPE Comparison of Demand Forecasting

5. Conclusion

The present study has attempted to find out the most suitable demand forecasting method for influenza vaccine, the product from a vaccine manufacturer in Indonesia, by employing the four forecasting method, these are moving average, exponential smoothing, Holt's Model, and Winter's Model. The method which givesfewer errors, which is the lowest MAD and MAPE, is chosen as the most suitable method for the company.

This study found that Winter's Model provides the best result in terms of MAD and MAPE because it has the lowest MAD and MAPE than the others demand forecasting method that chosen in this research. The lowest MAD and MAPE mean that Winter's Model method has less errors and become most suitable demand forecasting method to the company.

The similar study, which also compares these four methods in forecasting the passenger traffic movement in Lufthansa Airlines, also found that Winter's Model gives best result (Singh & Das, 2010).

Abstract: This study fills a gap in research that has been missed by the previous studies about factors that influence trust in connection with one's intentions to purchase. Research on the experience in the network associated with the purchase intention among other research says that trust in the network and purchase intentions is significantly affected by the experience in searching information through the Internet. The search process is repeated information that will foster a sense of trust for the site. With the difference in the results obtained, then it is the background of this study to examine the effect of experience as a variable in trust and purchase intentions. Second: empirical gap, trust is influenced by the perceived quality of the site and is endorsed by the brand personality of the site. This study will reveal whether brand personality can strengthen or weaken the relationship between the quality of sites that are perceived by the trust and know the brand personality as what will strengthen the relationship between the two variables. This study design uses quantitative methods to test the effect of independent variables on the dependent variable either no influence or no influence of moderator variables moderator variables. The variables that will be tested include the perceived quality of the website, the network experience, propensity to trust, purchase intention, and brand personality. This study proves the hypothesis being tested in seven items, five accepted items and two cannot be accepted. This study found different results with a previous study that the brand personality who serves as moderator weakens the relationship between perceived quality sites and trust. The experience and knowledge of a person in the use of shopping sites have a big impact as it can minimize the uncertainty and unfortunate events that happens in the purchase through shopping sites. While a sense of trust alone is not sufficient to make a purchase decision through the shopping site because there are the uncertainty factor that creates a feeling of doubt on the shopping site. Overall it can be concluded that the quality of the sites, experience, and propensity to trust have a direct impact on confidence in shopping sites and person's purchase intention on shopping sites.

Keywords: *Reaction Action Theory (TRA), e-trust, purchase intention*

Introduction

The Central Bureau of Statistics (2016) says that the number of Internet users has increased about 32% in 2016. The number of Internet users in Indonesia in 2014 reached 27 million, in 2015 to 37 million (CBS, 2015) and in 2016 increased to 82 million people. These put Indonesia ranked the eighth country in the world's largest Internet user. This means that every year in Indonesia there is significant increase in the number of internet users. Penetration increase in the number of Internet users reached 32%.

The intensity of buying and selling in a large network with an average growth of around 17-20%, making Indonesia the country with the largest growth network based store

and become the world business goals for the business development in the network (Koran Sindo; Markplus Insight; Marketeers, 2014). Businesses within the network can grow rapidly in Indonesia due to the lifestyle of a consumer society and the increasing number of per capita income to about $ 3,000 per month in 2013, so that the average income of 3-5 million per month will increase the purchasing power of buying and selling within the network (Koran Sindo, 2014). The higher the amount of income received it will make people find the desired item in a way that is easy, fast, and efficient.

Trust becomes a critical component in building relationships between sellers and buyers (Speier et al., 1998). Trust is the main capital for buyers in the network (Cox, 1999; Levin, 2000; Westin and Maurici, 1998). Without it there will not be many transactions in the network (Cheskin and Sapient, 1999; Head and Hassanein, 2002). Anyone committing a transaction in the network must have a risk of uncertainty over something unexpected and unfavorable throughout the transaction process. To reduce the risk of uncertainty then there are 2 strategies of trust (McKnight et al., 2002), the association of the portal and customer testimonials. The strategy is a strategy associated portal confidence by seeing the site's reputation, while the strategy of customer testimonials done by testimonials from customers about the experience of buying and selling transactions on the site.

The lack of a sense of trust in a company that is doing business of buying and selling in the network will lead to no transaction (Dolatabadi and Ebrahimi, 2010). The importance of the trust that is built in a transaction in the underlying network of many studies about the factors influences trust. According to Mohammed (2014), trust in the network is affected by risks and experience. The risk in question is a risk to security, privacy and fraud crimes, as well as product quality expectations.

With that experience accessible goods and services can be varied (Hargittai, 2010). In contrast to the opinion of Habibi et al. (2014), influenced by the trust on the electronic sites perceived quality and personality of the brand itself. The quality of the site in question is a form of design and usability attributes of the site (Aladwani and Palvia, 2002). While the brand personality associated with products and services that affect consumer behavior.

According Dolatabadi and Ebrahimi (2010), an electronic trust is influenced by a company's reputation, security and privacy of the site as well as the risks and benefits of the site. In addition to the risks and perceived quality of the site, trust is influenced by the amount of inclination to believe (Teo and Liu, 2007). In the transaction within the network, the trust can be built through the display on the site (Lohse and Spiller, 1998).

If someone has a good experience of the transaction in the network and are confident then transaction will be made, that someone will have a higher intention to conduct transactions in the network (Mohammed, 2014). In addition, if a person has had a good experience and high confidence against the seller in the network, usually he would recommend to the nearby such as family, friends, and others.

This study fills a gap in research that has been missed by the previous studies about factors that influence trust in connection with one's intentions to purchase. First: an empirical gap; research on the experience in the network associated with the purchase intention among other research Smith (1997); George (2002); Hargittai (2010) says that trust in the network and purchase intentions is significantly affected by the experience in searching information through the Internet. The search process is repeated information that will foster a sense of trust for the site. Mohammed (2014) examined the experience and risk variables as independent variables that affect the trust and intent to purchase. The results showed that the experience have no significant effect on trust and intent to purchase. With the difference in the results obtained, then it is the background of this study to examine the effect of experience as a variable in trust and purchase intentions.

Second: empirical gap, Research Habibi et al. (2014) says that trust is influenced by the perceived quality of the site and is endorsed by the brand personality of the site. Thus, this study will reveal whether brand personality can strengthen or weaken the relationship between the quality of sites that are perceived by the trust and know the brand personality as what will strengthen the relationship between the two variables.

Theory of reasoned action defines the relationship between beliefs, attitudes, norms, intentions, and behavior of individuals. The theory describe the behavior of a person is determined by behavioral intention to perform the behavior. Intention itself is determined by the attitude of the people towards behavior and subjective norms.

In this study specifically addresses the belief that with trust as a confidence buyer on Internet sites, although there is the possibility of errors in the transaction but remains hopeful that the site can make transactions on the desired product (Mayer et al., 1995; Lim et al., 2006), there are 2 of beliefs and intentions in electronic trust (McKnight et al., 1998; Lim et al., 2006). The concept of a confident is confident that the store in the network is correct, competent, honest, or predictable. While the intention means the buyer is willing to expose himself about the possibility of failures and errors in a transaction in the network.

Research Design

This study design uses quantitative methods to test the effect of independent variables on the dependent variable either no influence or no influence of moderator variables. The variables that will be tested include the perceived quality of the website, the network experience, trust, intentions to purchase, propensity to buy, and brand personality.

Operational Definition

Trust is a positive belief, personal nature, action, situational features, and social structures on something (Hosmer, 1995; Sitkin and Roth, 1993 in Das and Teng, 2004). A list of question items about trust is adopted from research by Doney and Cannon (1997); Gefen (2000); Gefen and Straub (2004); Jarvenpaa et al. (2000); Jarvenpaa and Tractinsky (1999); Macintosh and Lockshin (1997).

Quality sites are perceived is how do you view someone on shopping sites according to specific criteria such as the details of the products and services offered, how the rules of privacy in such sites, and any other specific information given (Aladwani and Palvia 2002 in Habibi et al ., 2014; Kim and Lennon, 2013). A list of the question items of perceived quality sites adopted from research by Gregg and Walczak (2010); Kim and Lennon (2013); Aladwani and Palvia (2002).

Experience is the activity of customers in evaluating product information, payment methods, services, navigation, a personalized shopping site (Ling et al., 2010). A list of question items about the experience adopted from research by Dholakia et al. (2000); van Dolen and Ruyter (2002); Johnson and Mathews (1997); Ling et al. (2010).

Propensity to buy is the tendency of individuals to believe in someone, especially in important decisions and something new related to shopping sites (Gefen, 2000). A list of question items about the tendency to believe adopted from research by Gefen (2000) in Teo and Liu (2007).

Brand personality is the identification of potential products or services that influence consumer behavior (and Lombart Louis, 2010). A list of question items about the brand personality adopted from research by Kim et al (2001); Muller and Chandon (2003).

Purchase intention is the desire of consumers to buy a product at a particular shopping site is reliable. Behavioral intentions are considered direct antecedents of the actual behavior (Ajzen, 1991). The list of questions related to the intention of the

transaction referred to a study by Habibi et.al (2014); Teo and Liu (2007); and Gregg and Walczak (2010).

Population And Design Decision Sampel

Samples are respondents who have the following characteristics: (1) never do a search on information related to goods bought and sold on a shopping site. (2) Knowing one of the most popular shopping sites is used as research objects. Samples used amounted to 180.

Hypothesis Testing

To get the data in a preliminary test (pilot test), researchers distribute questionnaires to fifty respondents, consisting of students, and professionals. Distribution of questionnaires carried out directly in Yogyakarta in October 2015

The whole construct has Cronbach alpha values above 0.7, which means the entire construct reliable. In a preliminary test the validity is more focused on the value factor loading of each item statement and not on any item mengumpulnya statement in the same construct in the same matrix. Thus, in this preliminary test matrix layout statement items are ignored. KMO value is generated by 0.527 and the significance resulting from Bartlett's Test of Sphericity 0,000. Values are already eligible to be> 0.5 with a significance of 0.05. So from the reliability and validity of test results above, it can be said that the construct and the sample used to allow for further analysis.

Discussion

Hypothesis 1 states that "The quality of the sites perceived positive effect on trust". Can be seen the value of probability and critical ratio of variable quality at variable sites perceived trust of 0.007 and 2.706,. It can be interpreted that the influence of variable quality at variable sites perceived trust and significant positive so HA1 accepted. First impressions were seen consumers on shopping sites are the quality that includes the display contents, information, and others. That's the impression that over time will form a perception that foster a sense of trust in the shopping sites. The increasing perception of the quality of the sites also contributes in increasing confidence in the site although the effect is very small. Differences may occur because of one study with other studies that have different research settings. Background residence, cultural, social, and others created the perception of a person's thinking. The similarity of the results obtained in the study Habibi et al. (2014) and this study is the similarity in setting the respondents, Malaysia and Indonesia. The two countries have similar cultural and social backgrounds. Besides the perception that each person have is different with others.

Hypothesis 2 states that "brand personality moderate the relationship between perceived quality sites with confidence" can be seen the value of probability and critical ratio of 0,960 and -, 050. This may imply that the HA2 not approved. That the brand personality variables do not moderate the relationship between perceived quality variable sites with variable confidence. Because the t-statistic was negative and insignificant with their brand personality variables will weaken the relationship between perceived quality variable sites with confidence variable. Weaken Moderation can be described if the shopping site has a display that is less imaginative, simple, less attractive, less unique, even to strengthen a sense of trust and confidence in shopping sites. So with a specific brand personality will actually decrease the sense of trust and confidence in one's shopping site.

Muller and Chandon (2003) in Habibi et al. (2014) suggested that the effects of brand personality can strengthen or weaken the relationship between perception of quality

shopping sites and trust. It can also be affected by the type of items to be purchased on the shopping site. If the goods to be purchased are luxury goods, clothing, food, cleaning products, the brand personality of the shopping sites will strengthening the relationship. But if the goods to be purchased include functional items and household items such as household appliances, the electricity appliance brand personality is not important. This is because consumers typically prefer the functionality and usability of goods compared with the characteristics of the shopping site. In the context of Indonesian society, they are more trusting to standard shopping site with good the quality than shopping sites that feature different character. In addition the average purchase goods through shopping sites in Indonesia are mostly functional items, so that the results of this study found that brand personality trait moderation weaken the relationship between perceived quality sites with confidence. In addition Ferrandi et al. (1999) in the Habibi et al. (2014) say that the specific character of a site will be a strong influence on trust. It can be interpreted that if the character of a shopping site specific enough in the eyes of consumers, it will not reduce the influence on confidence in shopping sites.

Hypothesis 3 states that "The propensity to trust moderate the relationship between perceived quality sites with trust" can be seen the value of probability and critical ratio of 0.209 and -1.256. This means there is no moderating influence in tendency to believe variable with the relationship between perceived sites quality variable in the trust variable, indicated by the value of t-statistic of negative and insignificant. That is HA3 not accepted. This shows that with the moderation of propensity to trust variable in the relationship between perceived sites quality variable with variable trust is weakening. In other words those by their sense of trust in others and trust on other people's views on a shopping site it will affect the perception of the quality of the site and would probably weaken a sense of confidence in the site.

Hypothesis 4 states that "The propensity to trust the positive effect on trust" can be seen the value of probability and critical ratio of 0.150 and 1.441. Meaning no variables influence the propensity to trust in the positive trust variable and not significant, so HA4 accepted. Inclination to trust usually associated with the selection of goods that have a long economic time and used for the long term. It is also due on individual experience and perception or view a trusted person about the goods. In the end it is to build a trust (Teo and Liu, 2007).

Hypothesis 5 states that "Experience has a positive effect on trust" can be seen by the value of probability and critical ratio of 0.003 and 2.924 which means that the effect of variables on the trust variable and experience is positive and significant, so HA5 is accepted. In other words, the more experience user related to internet use and knowledge of the shopping sites then trust in these sites are also getting bigger. Experience in the use of internet information search significantly affects a person's trust to the shopping sites in the network.

Hypothesis 6 states that "Trust has positive influence on purchase intention" to see the value of probability and critical ratio of 0.000 and 4.218. This means that the effect on the variable trust and purchase intentions are positive and significant, so HA6 is accepted. In other words that it is not always the higher sense of confidence in the shopping site will be followed by the intention to make purchases on shopping sites. Trust is a very important factor in order to get and keep customers (Mohammed, 2014). Trust also needed in generating the intention or desire to buy on unknown sites (Gregg and Walczak, 2010).

Hypothesis 7 states that experience have a positive influence on purchase intention" to see the value of probability and critical ratio of 0.010 and 2.590. This means that the effect of variables in the experiences variable is positive and have a significant correlation with purchase intention, so HA7 is accepted, in other words the more

experience related to internet use and knowledge of the shopping sites then it is likely to have the intention of making a purchase through shopping sites are also getting bigger. With their previous experience on shopping sites or in search of information will strengthen the desire or intention to make a purchase of goods on the trusted site. With the experience to minimize uncertainty and unfortunate things that happen related to the purchase through shopping sites.

Conclusion

This study proves the hypothesis being tested in seven items, five accepted items and two cannot be accepted. This study found different results with a previous study that the brand personality who serves as moderator weakens the relationship between perceived quality sites and trust. The experience and knowledge of a person in the use of shopping sites have a big impact as it can minimize the uncertainty and unfortunate events that happens in the purchase through shopping sites. While a sense of trust alone is not sufficient to make a purchase decision through the shopping site because there are the uncertainty factor that creates a feeling of doubt on the shopping site. Overall it can be concluded that the quality of the sites, experience, and a propensity to trust have a direct impact on confidence in shopping sites and person's purchase intention on shopping sites.

Future Research And Research Limitations

There are time limitations to the study, so the measurement process for brand personality variables in this study only using survey methods. Perceptions of quality shopping sites and a person's experience associated with the existing shopping sites based on the process takes time. Most research on trust in the network is only done in countries with many Internet users. The study only focused on the perception of the shopping site in general, does not classify the types of shopping sites based on traded goods as well as any items commonly purchased by consumers in the network. For future research can be carried out in a sustainable environment because of perceptions about quality shopping sites and a person's experiences takes time. In regards to digging deeper into the perception of the quality of the shopping site and brand personality other than using survey methods experimental methods can be use. The focus of this research is only in the perception of the shopping site in general, does not classify the types of shopping sites based on traded goods as well as what items commonly purchased by consumers in the network, then for further research, researcher are expected to be more specific to research shopping sites by classifying each shopping site based on the type of goods bought and sold, or based on the goods purchased by consumers.

INNOVATION OF THE SALAM FINANCING PRODUCT (A CASE STUDY IN BUMI RINJANI PROBOLINGGO SRB)

Siti Maria Wardayati, Ahmad Roziq, Wiwik Fitria Ningsih
University of Jember, Indonesia

Abstract

This paper aims to analyze how the system of salam financing at Bumi Rinjani Probolinggo SRB, studying the factors of salam financing distribution's problems; exploring what innovations are needed to increase the implementation of the salam contract; and examining the innovation applied on salam accounting. This type of research is qualitative constructive. The unit of analysis in this study is Bumi Rinjani Probolinggo SRB as the sharia rural bank that provides salam financing. The results showed that Bumi Rinjani SRB are motivated to implement salam financing due to the needs of farmers to purchase the production's needs and the short financing period, so that salam financing is the correct type of financing. The financing applied is a single salam contract. Because the items purchased by the SRB are items such as rice, potatoes, maize, with no intention to make such items as inventory, then the SRB entrust the goods to the bai salam customer for resellig by wakalah. There are several factors that become obstacles for SRB related with salam financing, are; 1) The bad character of bai salam customers; 2) Failed harvests; 3) The fluctuative market prices; 4) The provisions of supervisors that the SRB should have a Warehouse. The comprehensive eforts to resolve the problems are; 1) Salam bil wakalah financing; 2) Salam bil Mudharabah financing.

Keyword: *salam financing, salam accounting, product innovation, wakalah, mudharabah*

1.Introduction

Islamic bank is a solution to obtain capital without any loan interest. It seemed to be a fresh idea in breaking the impasse among the entrepreneurs in Indonesia to obtain capital without having to engage in usury. The moves of customers from conventional banks to Islamic banks develops Islamic banking and motivates to improve the types of the transactions. These transactions become facilitator between Islamic banks and customers to avoid the elements of riba. In relation to this case, a transaction used is definitely following the rules of Islamic principles.

Islamic banking industry is an industry that is now growing rapidly in the world. In Indonesia, the Islamic banking industry has developed quite well (Wardayati and Wulandari, 2014). The growth rapid increasing of Islamic banking should also be followed by the development of products and the variation of the contract in accordance with Islamic principles. Based on statistical data of Islamic Banking, since 2002 until early 2015, in the last 13 years, financing with contract salam in Islamic Banks as well as Sharia does not exist at all. as we know salam contract with the down payment purchase system is good to be applied as one of banking products in the sectors of agriculture industries and other industrial sectors e.g. garment, by this contract, the two parties are able to get profits without elements of usury, deception or gharar (speculation) (Antonio, 2015).
Figure 1. Composition of the financing provided Shariah Rural Bank (In Million Rupiah)
Obtained and processed from source: Islamic Banking Statistical Data 2008 - April 2015, the FSA

In other case, Shariah Rural Bank (SRB) implements salam financing with salam contract. There are SRB that implement financing with salam contract such as PT. Dana Mulia Surakarta in 2010 and PT. Syariah BPR Bumi Rinjani Probolinggo in 2012. PT. Probolinggo Syariah BPR Bumi Rinjani is one of the banks where the operational activities are based on Islamic principles. In Figure 1 we can see that the trend of salam financing under salam contract as one of the contract with sale and purchase principle continues to decline. From Figure 1 it can be concluded that financing with murabaha is a contract with the principle of trading that dominates. In 2008 salam financing agreement is Rp. 38 million, these numbers fluctuate every year. In April 2015 the composition of financing with salam contract decreased about 58% i.e. to Rp. 16 million, -. However, it must be appreciated because microfinance institutions are still willing to distribute financing with salam contract.

The factor that causes the failure and boost the success of salam financing contract lies in the difficulty of the crop marketing (Roziq, 2014). Another factor that led to the avoidance of salam contract implementation is a lack of understanding of banking practitioners about the application of salam contract (Devi, 2009; Affandi, 2013), the lack of socialization to the public concerning the financing of salam contract (Roziq, 2014; Devi, 2009; Affandi, 2013), high cost (Devi, 2009; Adams and Fitchett, 1992 in Kaleem and Wajid, 2009; Muneeza, et al, 2011) as well as the risk inherent in financing under the salam contract (Roziq, 2014; Adi, 2012; Devi, 2009; Ashari, 2005; Affandi, 2013; Adams and Fitchett, 1992 in Kaleem and Wajid, 2009; Muneeza, et al, 2011).

The reason to conduct this research at PT. BPR Bumi Rinjani Probolinggo with salam financing topics among 162 SRB in Indonesia, is due to the fact that SRB Bumi Rinjani Probolinggo is the last SRB that applied salam financing contract and among the products applied, the trend of financing products with salam contract continues to decline. Based on these background, this study analyze the system of salam financing contract at the SRB Bumi Rinjani Probolinggo, investigate the factors that become obstacles in the distribution of salam financing contract at SRB Bumi Rinjani Probolinggo; explore what innovation efforts that are needed to improve the application of salam contract at the SRB Bumi Rinjani Probolinggo; and examine how the implications of the funding system inovation with salam contract to the salam accounting treatment.

2. Literature Review
2 .1 Definition of the Salam Contract
Definition of salam in the PSAK 103 is a contract of sale of ordered goods (muslam fiih) with the later day delivery by the seller (muslam illaihi) and the repayment made by the buyer at the time the contract was made in accordance with certain

conditions. Salam definition in the DSN No. 05 / DSN-MUI / IV / 2000, stated that the sale of goods by way of reservation with payment in advanced with certain conditions, called as salam.

Definition of Salam by Muhammad Ibn Ahmad Ibn Muhammad Ibn Rushd (1988), namely Bai 'As-Salam means the purchase of the goods delivered in the future, whereas the payment made in advanced (Antonio, 2015). Bai 'as-salam is the type of transaction which the payment made at the time of the contract, but the goods are given later with a predetermined time (Roziq, 2014). Salam s a transaction which deliver of ordered good is deferred while the payment is paid in cash at the begining of the transaction by obtaining certain condition (Ningsih, Wiwik F., dan Wardayati, Siti M., 2016)

2.2 Legal Basis of Salam Purchase

Salam transaction is allowed in Islam, it is based on the theorem of al-Quran and al-Hadith including:

a. Al-Qur'an

The theorem that explains the permission of salam financing is in Surah al-Baqarah verse282:

يـــا أيهــا الـــذين آمنـــوا إذا تـــداينتم بـــدين إلـــى أجـــل مســـمى فـــاكتبوه

In accordance with the Sura al-Baqarah verse 282, Ibn Abbas explain the relevance of that paragraph to the transaction of bai 'as-salam. It is clearly understood from his statement that, "I testify that the Salaf (salam) that is guaranteed for a specified period has made lawful by Allah in His Book and is allowed by Him." He then read the preceding verse (Antonio, 2015).

b. Al-Hadith

Ibn Abbas narrated that the Messenger of Allah, Muhammad, Comes to Medina where the residents do Salaf (salam) in fruits (for a period) one, two and three years. He said, "Whoever did the Salaf (salam), should he do with a clear measurement and clear scales anyway, for the knowm period of time." Suhaib ra, that the Messenger of Allah. said, "Three things which have blessing: tough buying and selling, muqaradhah (mudaraba), and mixing wheat flour for domestic use and not for sale." (Reported by Ibn Majah)

2.3 Pillars and provisions of Bai 'As-Salam

Bai 'as-salam requirements should meet a number of pillars and the provisions of sharia (Wasilah, 2011). Below are the pillar along with conditions that must be met in each pillar:

1) doer (performer)

Performers consists of the seller (muslam illaihi) and buyers (al muslam). Sharia provisions for contract actors are capable of law and mature. Trading activities done with people who are in common sense disorder becomes invalid and trading with children is considered valid as long as it goes with the permission of their guardians.

2) The object of the contract

The object of the contract is in the form of goods that will be delivered (muslam fiih) and capital salam (salam maalis ra'su). Sharia provisions related to the goods of salam (Al-Muslam feehi) are; The identified goods, have clear specifications and characteristics such as quality, type, size, and others; The goods must be quantified or weighed; time of delivery of the goods must be clear and there should be at a predetermined time; if the goods did not delivered at the specified time the contract becomes fasakh / damaged and the buyer can choose whether to wait until the goods are available or cancel the contract; if the goods ordered are defective or not in accordance with that agreed in the contract, then

the buyer should undertake Khiar (choose to accept or reject); place of delivery, the contracting parties must assign it to an agreed place where the goods must be submitted, if both parties do not specify the place of delivery, the goods must be sent to a place that became a habit, for example, the warehouse of the seller .; the scholars prohibit muslam feehi to be replaced with other goods. Exchange or replacement of goods as-salam is not allowed, because although it has not been submitted, the goods are no longer owned by the muslam (fidz-dzimah). If the goods have the same specifications and quality, although the source is different from the scholars allow it.

Sharia provisions related to capital transactions bai 'as-salam including; capital needs to know the type and amount; salam capital in the form of money, goods or benefits. The scholars differ in the permission of payment in the form of trading assets. Some scholars allow it; capital salam is delivered at the time the contract took place. This is to prevent the practice of usury through the mechanism of salam.

3)   Areement / sighat

Sighat is statements and expressions of one another's pleasure or willingness between the parties done verbally, written, correspondence or using means of modern communication.

2.4 Type of Salam Contract

There are two types of salam contract, namely salam and and paralle salam. Here is a scheme and the explanation of the two types of contract.

1)   Salam
Figure 2. Schematic Salam

Source: Wasilah 2011

Caption:
1.   Buyer and seller agree on the salam contract
2.   The buyer pays to the seller
3.   The seller delivers the goods

Once the buyer and seller agree on buying and selling ordered goods with a condition that has been set in advance by using salam contract, then the buyer pay in full cash amount of money as the price has been agreed. After ordered goods are processed and completed then the seller delivers the goods to the buyer where the location has been set at the beginning. According DSN No. 05 / DSN-MUI / IV / 2000 cancellation of the salam contract is basically permissible, as long as it does not harm both parties. If there found a dispute between two parties, then the problem is solved through Sharia Arbitration Board after no agreement was reached by consensus.

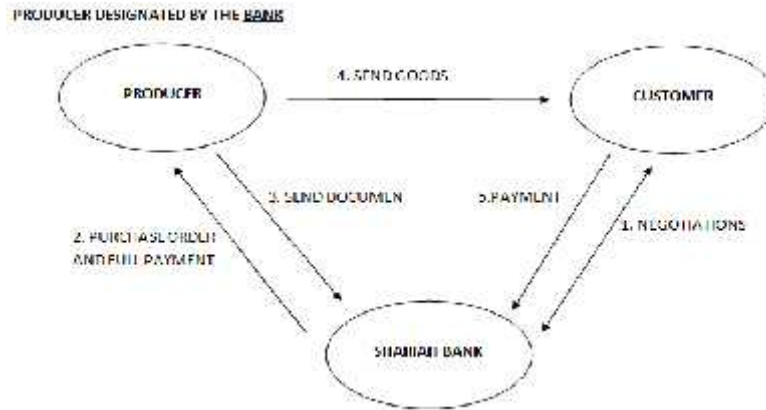
2)   Parallel Salam


Figure 3. Schematic Parallel Salam

Source: Antonio, 2015

Caption:
1. Customer and Bank negotiate concerning the criteria of the ordered goods.
2. Bank ordered customers to the producer and pay in full in advance.
3. Producer send documents to the bank
4. Producer send the goods to the bank
5. Customers pay to the bank

Procedures of parallel salam is similar with salam contract, but the differences is the involvement of a third party (Wasilah, 2011). Parallel salam in AAOIFI (1999) means executing two bai 'as-salam transactions between banks and customers, and between banks and suppliers or other third parties simultaneously. This happens because the seller does not have the ordered goods and make an order to others to provide ordered goods (Antonio, 2015). According to Ziauddin (1985) The supervisory board of sharia Rajhi Banking & investment corporation has set a fatwa that allows the practice of paralle salam with one condition that the implementation of the second salam does not depend on the implementation of the first contract. Interdependent or ta'alluq will result in non-fulfillment of the pillars (Wasilah, 2011). According to Ziauddin Ahmad (1985) some contemporary scholars leave a note on the transaction of parallel salam, especially if trade and transactions are performed continuously. Such thing is expected to lead to riba (Antonio, 2015).

Parallel Salam is the salam that run simultaneously. For example the first transaction between the buyer and Islamic banks (as sellers), and the second transaction between Islamic banks (as the buyer) with the producer as the seller (Antonio, 2015). The implementation of Parallel salam in banking can be illustrated as follows:
1) Customers require an item to be manufactured in advance
2) Customers contacted the bank
3) Bank undertakes to pay for the goods reservations
4) Bank ordered goods to the manufacturer as what customer demand
5) The selling price of goods is agreed in advance and is not changed until the goods made
6) The length of time for producing goods is agreed by banks, manufacturers and customers
7) Customer promised to buy goods after completion
8) Customers can pay most of the selling price of goods at the beginning of the contract and repay the remainder of the sale price before the goods are received
9) After the goods are made, then it is delivered to the customer

2.5 Application of Bai'Al-Salam financing in Islamic Banking in Indonesia

Bay 'al salam (usually used in financing for farmers with a relatively short period of time, ie 2-6 months. Because of what is purchased by the bank are items such as rice, corn, and peppers and the bank does not intend to make such items as deposits or inventory, then do the second contract bay 'ss-salam, for example, to Bulog, the market traders and wholesalers. This is what is known in Islamic banking as parallelsalam (Antonio, 2015). To ensure conformity sharia minimum standards by banks to launch an Islamic banking activities. Bank Indonesia issued a regulation that aims to standardize contract of Islamic banks that are commonly used in Indonesia. The standardized contracts becomes the guidlines for Islamic banks in Indonesia as the principle of its operations (Ascarya, 2006).

The table below is salam and parallel salam financing Stages that have been standardized by Bank Indonesia

Table 1. Stages of salam and the salam parallel financing

No.	Stages
1	Notice the product to the customer thoroughly
2	Transactions / contract
3	Full payment in advance
Followed by second salam (parallel)	
4	Transactions / contract
5	Full payment in advance
6	Delivery of ordered items

Source: Ascarya 2006

Explanantion:
1. The first stage, the bank at least get the information about salam's products and parallel salan banks including the essence of salam and parallel salam, definitions, terminology, typical conditions of bank, object of salam's characteristic, payment methods, and terms and conditions.
2. In the second stage (and stage 4, if it is parallel), particularly in the agreement contract at least contained the type of contract that is being conducted; the parties involved in the transaction; salam object; objects salam prices; the rights and obligations of the parties; and other agreements.

2.6 Application of Bai' Al-Salam in Pakistan Islamic Banking

Pakistan is a republic state with Muslim majority that is 96.4% (Indrawan, 2015). Pakistan is a country that wants to implement Islamic economic system completely. At present, Pakistan is still at the stage of dual financial system (dual financial and banking system). With this system Sharia financial institution operates alongside conventional financial institutions. Islamic financial institutions are expected to become more dominant and become major financial institutions to the community in providing banking products and services (Ascarya, 2006).

Islamic banking in Pakistan apply various covenant for Islamic financial products and instruments offered to customers. The contract provided include wadiah and mudaraba are contract for funding; mudaraba, permanent musharaka, decreasing Musharaka, murabaha, salam, istishna, Ijara, IMBT, akad- Istijrar are contract for financing; kafalah contract, wakalah, Ijara, Sharf, Ujr, Mudharabah muqayyadah are contract offered for banking services. But financing with salam and istishna is less used in Islamic banking in Pakistan (Ascarya, 2006).

Bai Salam covenent is a contract of trade or sale. Bai salam contract provide advantages in agricultural finance. Bai salam give cash at the beginning when needed (eg during sowing, fertilizing, or before harvest). Bai salam contract are fully accepted by the Islamic banking and underused (Ascarya, 2006). There are doubts that banks would prefer to deal with money rather than commodities. So there is no financial institution in Pakistan that offer agricultural loans under the principles of Islam (Kaleem and Wajid, 2009).

Here is an operational basis of Salam financing in Pakistan which has been standardized by the Commission for Transformation of Financial System (CTFs) and approved by the SBP Shariah Board (State Bank's Shariah Board) (Ascarya,2006);

1) Salam (payment in advance with delivery of goods) is a form of selling when the seller carry out the supply of certain goods to the buyer at the time that will come with the full payment paid at the time the contract made.

2) Buyers must pay the full amount to the seller at the time of purchase contracts executed. If not so, this would be similar to the sale of debt with debt, which is clearly prohibited in Shariah.

3) Specification, quality, and quantity of the commodity to be set to avoid the confusion that can be a source of dispute.

4) Date and place of delivery must be agreed by the two parties, but it can be changed with the agreement of both parties.

5) Salam can be done to the goods "Dhawatul-Amthal" or "Fungible goods" that reflects a commodity with a unit that has the characteristics of homogeneous and traded with the count, size, or weight per the usage and commercial custom. Therefore, items such as precious stones, cattle, and so can not be sold through salam contract, for any rock or any individual animals are generally different from each other.

6) Commodity that becomes the object of salam contracts are generally expected to be available at the time of delivery.

7) Salam is not possible for goods that is delivered on the spot. For example the exchange between gold with silver; Among flour with wheat, in sharia the exchange of both should be performed simultaneously.

8) Salam can not be attributed to the production of the rice field, or a particular tree.

9) In salam transactions, the buyer can not bind the seller to buy back the commodity to be delivered by the seller to the buyer. However, after the handover is done, the seller and the buyer can buy and sell independently on the basis of their own accord.

10) In salam transaction, the buyer is not allowed, before gaining control of (actual or constructive) of the goods, to sell or transfer ownership of the goods to another person.

11) Bank (Purchaser in salam) can perform parallel salam contract without any requirement or contractual relationship with the first salam.

12) In order to make sure that the seller will deliver a commodity at the agreed date, the bank may ask for a security guarantee to the seller.

13) In the case of more than one commodity, quantity and delivery period for each time should be set differently.

14) Fines can be agreed ab initio in the salam contract to the delays in delivery of goods by the client or the seller. In that case, the client shall be liable to pay a penalty calculated as a percent per day / year agreed. However, these funds should be used for charity. Banks also can go to court for compensation of damage, at the discretion of the court, which should be established under the direct and indirect

costs incurred, in addition to the opportunity cost (opportunity cost). Also, the guarantee can be sold by the bank (buyer) without itervensi of court.

2.7 Accounting Treatment For Transaction Salam

As mentioned in SFAS No.103, that salam is a contract of sale of goods with the suspension order delivery by the seller and the repayment is done immediately by the buyer before the ordered goods are received with certain conditions.The following is the recognition, measurement, presentation and disclosure of related to salam transactions both the buyer and for the seller.

2.7.1 Recognition and Measurement

Accounting for buyer

Receivables are recognized when salam business capital are paid or transferred to the seller.salam Capital can be cash and non-cash assets.Salam capital in the form of cash are measured with the amount paid, while salam capital in the form of non-cash assets are measured at fair value.The difference between the fair value and the carrying value of non-cash working capital transferred is recognized as a gain or loss upon the transfer of the business capital.

Acceptance of the ordered goods are recognized and measured as follows:If ordered goods are in accordance with the contract, then is assessed in accordance with the agreed value;If the ordered goods are different in quality, then received ordered goods is measured according to the value of the contract, if the fair value of the received ordered goods' value are equal to or higher than the value of goods specified in the contract;received ordered goods is measured in acordance with the fair value when it is received and the difference is recognized as a loss, if the fair value of received ordered goods are lower than the value of ordered goods listed in the contract;If the buyer does not receive some or all of the items ordered by the due date of delivery, then:If the delivery date is extended, then the value is taken as salam receivable as much as that have not been fulfilled in accordance with the value specified in the contract;If the salam contract is canceled wholly or partly, then receivable salam turned into a salam receivable accounts that should be paid by the seller as a part that can not be met;andIf the salam contract is canceled partly or wholly and buyers have the guarantee of the ordered goods as well as the results of collateral is less than the value of the receivables salam, then the difference between the carrying amount of receivable accounts and the sale of salam is recognized as a guarantee of receivables to the seller.Conversely, if the result of collateral is greater than the carrying value of receivables salam then the difference ias the right of the salam's seller.

Fines received by the buyer are recognized as part of the charity fund.Buyers can impose a fine to the seller, penalties can only be imposed on sellers who are able to complete the obligations, but deliberately did not do it.This does not apply to sellers who are not able to fulfill the obligations due toforce majeure.Fines are applied if the seller fails in performing the obligations under the contract, and the penalty is recognized as part of the charity fund.

Received ordered goods are recognized as inventory.At the end of the financial reporting period, inventories acquired through salam transaction measured at the lower of cost or net realizable value.If the net realizable value is lower than acquisition cost, the difference is recognized as a loss.

Accounting for sellers

Salam obligations are recognized when the seller receives salam venture capital as much as received salam venture capital.Received salam venture capital can be in form of cash and non-cash assets.Capital salam in the form of cash measured by the number of items received, while salam venture capital in the form of non-cash assets are measured at fair value. The liabilities of salam is derecognized when the goods sent to the buyer.If the seller does parallel salam transaction, the difference between the amount paid by the last buyer and the acquisition cost of the ordered goods is recognized as a gain or loss on the delivery of ordered goods by the seller to the final buyer.

2.7.2 Presentation

Statement of financial accounting standards No. 103 concerning the presentation related to salam transactions disclosed that the buyer presents salam venture capital given as salam receivables. Receivables which must be repaid because the seller can not fulfill its obligations in salam transactions are presented separately from the receivables salam. Sellers serves received salam venture capital as salam liability.

2.7.3 Disclosure

Buyer in the salam transaction reveals the amout of salam venture capital, either self-financed or group financed; type and quantity of ordered items; and Other disclosures in accordance with SFAS 101: Presentation of Sharia Financial Statements. Seller in salam transaction express salam receivable account to the manufacturer (in parallel salam), which has a special relationship; Type and quantity of ordered items; and other disclosures in accordance with SFAS 101: Presentation of Sharia. Financial Statements.

3.Research Method

This type of research is constructive qualitative. Constructive qualitative approach used to build the statement of knowledge based on constructive perspective (eg meanings derived from individual experiences) (Creswell, 2003). Constructive qualitative approach is used to explain how the financing system of salam contract that has been applied by the SRB Bumi Rinjani Probolinggo, factors that causes obstacles in the distribution of funding by the salam contract at the SRB Bumi Rinjani Probolinggo, to build innovation systems is necessary in financing of salam and explain how implications for the salam financing innovation to the accounting treatment of salam. The unit of analysis is the source of information about the variables processed in the data analysis. The unit of analysis may be individuals, groups, or organizations. The unit of analysis in this study is the SRB Bumi Rinjani Probolinggo as one of the banks that implement salam financing.

Data analysis techniques used in this research is to follow the concept given by Miles and Huberman. The steps performed in the process of data analysis as follows: 1) Data collection is data that has been obtained through interview and documentation techniques collected to credible data, 2) Data reduction is the electoral process, focusing on the simplification of the raw data from the records obtained. By summarizing, classifying, directing the data, and discard irrelevant data to get conclusion. If problems are found to be growing the coding for any iforrmation obtained will be done. 3) Presentation of data is the process when the required data has been ready to use. The form of the data presentation can be a narrative text, charts, graphs or matrices. 4) Efforts of conclusion is done continuously. The more data is acquired and processed the conclusions obtained will be more detailed and strong.

4.Results

4.1 Implementation of Salam financing system on SRB Bumi Rinjani Probolinggo

SRB Bumi Rinjani is motivated to implement salam financing because the needs of farmers for the purchase of the business production needs and due to the short financing period, in accordance with the needs of production process which takes two to six months, so that salam financin agreement is the appropriate that of financing. The kind of salam financing applied by the SRB is a single salam contract. Bai salam is used in financing with the principle of trading, especially for farmers with a relatively short period of time, the period given by the SRB is six months. Because the items purchased by the SRB are items such as rice, potatoes, and maize, while the SRB does not plan to make such items as a inventory, then the SRB entrust the goods to the bai salam customer for resaling along with the crops of bai salam clients. The storage process of goods for resaling is done with wakalah system. where Bai salam customers are willing to sell the goods belonging to SRB with competitive prices following the markets.
Figure 4. Composition of Financing Salam given SRB Bumi Rinjani Probolinggo (In Thousand Rupiah)
Source: Financial reports quarterly publication SRB Bumi Rinjani Probolinggo on2011-2015 years

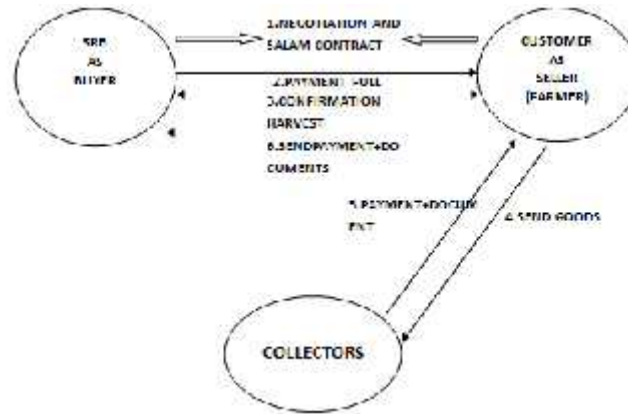
In 2012, SRB Bumi Rinjani Probolinggo implements salan financing. As in Figure 2, which gives an idea of the composition of salam financing given by the SRB. Salam financing dictribution iis done in 2012, on March 2013 and on June 2013 the data is not available. The composition of the highest salam financing distribution occurred in June 2012, amounting IDR 585.350.000, -But the distribution of salam financing contract is terminated due to the request of supervision regulation (Supervisory Board of the FSA) asking the SRB to make the place / warehouse as a place of supplies. The final composition of salam financing in December 2015 amounted to IDR 15.000.000, -. Below is a scheme of salam financing implementation on the SRB Bumi Rinjani Probolinggo;


Figure 5 . Financing Scheme Salam on the SRB

Source: processed data (2016)

Explanation:

1. SRB and customers negotiate and agreed the salam contract
2. SRB pays in full payment to customers
3. Customers confirm the harvest
4. Customers send their harvest to collectors
5. Collectors pay in full payment to farmers
6. Farmers handed over the selling reults to the SRB

Figure 5 is an overview of alam financing on SRB Bumi Rinjani Probolinggo based on the interviews with Mr. Catur Ariyanto as Directors. So after the proposed salan is approved by the SRB, then SRB hand over amounts of money as previously agreed. The funds are used by farmers to cultivate their fields. After harvest, farmers contacted SRB by phone or come directly to the office of the SRB to confirm that the farmer, as the customer, has harvested. After the harvest mets the agreement, salam financing ended and the goods belonging to SRB are entrusted to farmers for resaling by using wakalah system. After selling the goods, the farmer should transfer the selling output completed with the sellng bills to the SRB.

As noticed by Mr. Edy Supriyantoni as Head. Marketing and Mr. Catur Ariyanto as the Board of Directors of SRB Bumi Rinjani Probolinggo that salam financing is actually more effective to meet to the needs of society, especially farmers and still able to protect the SRB in the process of buying and selling, so that inovation is necessary related to received goods as repayment process in salam financing. In this case the SRB does not have to make the inventory, but should present a clear record of the stock inventory and sales reports completed with evidence of the bill of sale. The received goods as payment of financing salam is recorded in the inventory account, but the goods are entrusted tobai salam customers using wakalah system.

The goods belonging to SRB are entrusted to bai salam customers for reselling to the collectors or rice mill using wakalah system which means the handover of power by one party to another in the represented thing, in this case the bank gives over the goods (assets salam) to bai salam customers for resale. With this kind of system, SRB parties can avoid the costs for example transportation costs, labor costs, maintenance costs, and others. In addition, obtained goods in salam financing is a type of perishable goods that should be sold quickly for the safety of the goods. After the item is sold, then the bai salam customer collect the money from the sale completed with the bill of sale. So the SRB can confirm the price of the goods to the buyer.

4.2 Factors of the obstacles in salam financing distribution on SRB Bumi Rinjani probolinggo

There are several factors that become obstacles for SRB associated with salam financing. These factors are;

1) Default or bad character of bai salam customers

Not all customers and prospective customers have good faith in applying for financing. Bad faith is difficult to be known and analyzed by the bank, because it concerns with the matter of morals or character of customer. Salam financing is given by the maximum allotted time of six months to bai Salam customers especially to farmers without knowing what type of crops are grown, for example Salam financing of the corn farmers. If at harvest time, the market prices is high and or the quality of crops is beyond expectation, then there will be possibilities for farmers to sell their crops to corn collectors to reap maximum benefit and ignore the repayment process on the SRB immediately.

2) Crop failure

Crop failure is not desirable and could be the challenge for both farmers and the SRB. There are some things that cause crop failures, including the treatment process and the incorrect way of farming, the high price of fertilizer, lack of subsidized and non-subsidized fertilizer supply, water shortage, imprecision in choosing the growing season, pests, wind factor and extreme weather, natural disasters, and so on. Crop failures that occur due to natural disasters (force majeure) is given the extension of financing. It has ever happened because the eruption of Mount Bromo in the year 2010 - 2012, the impact of the eruption of Mount Bromo is harmful to farming so that farmers experience crop failure at that time.

3) Fluctuating market prices

Production factors influenced by the weather causes the rising price of rice and other agricultural products such as rice, the harvest usually starts from February to May, but due to raining the harvest is taking longer time about 30 to 45 days, a retreated period of plant makes the harvest retreated so that the supply of rice decreases and affect the increasing of price. Decreasing of supply while the demand of goods are stable, it will lead to the price rising, whereas when supply is plentiful and the demand stands still, it results in the decreasing of price.

4) The rule of the Supervisory Board that the SRB should have a warehouse / storage of goods

One of the factors that becomes a constraint related to the financing of salam is the regulatory oversight (i.e. the Supervisory Board of the FSA) require that the SRB which implements financing with Salam contract needs to have a place / warehouse to store the inventory. Whereas to build a warehouse costs much fund, therefore SRB stop the application of financing with Salam contract. Owning a warehouse gives impact to funding e.g. transportation, employee, maintenance, and so on.

4.3 Innovation Products of Salam Financing at SRB Bumi Rinjani Probolinggo

Based on the research results, to overcome the problems of salam contract financing, a comprehensive innovation of Salam financing can be made, such as; salam financing bil wakalah and salam financing bil mudaraba . Both innovations of Salam financing focuses on the treatment of salam assets after the expiration of salam contract. In the implementation of this contract, the bank acts as buyer without taking the goods to be inventory, therefore the bank needs a strategy to resell the Salam assets.

1) Salam Bil Wakalah Financing

Salam bil wakalah financing is financing where reselling Salam assets uses wakalah system. In this salam financing, customers who contacted the bank is the customer whose profession is farmer / producer. Therefore, in this case the bank acts as a buyer, if the banks agreed to finance it. But the bank's goals in buying asset of salam is not

to be used as inventory, then the banks resell the assets salam using wakalah system by giving the authority over assets of Salam to the bai salam customer for resale. The implementation of Salam bil wakalah financing is guided in the DSN No.05/DSN-MUI/IV/2000 about the terms of buying and selling of salam and DSN No. 10 / DSN-MUI / IV / 2000 about wakalah. The following is salam bil wakalah financing scheme;

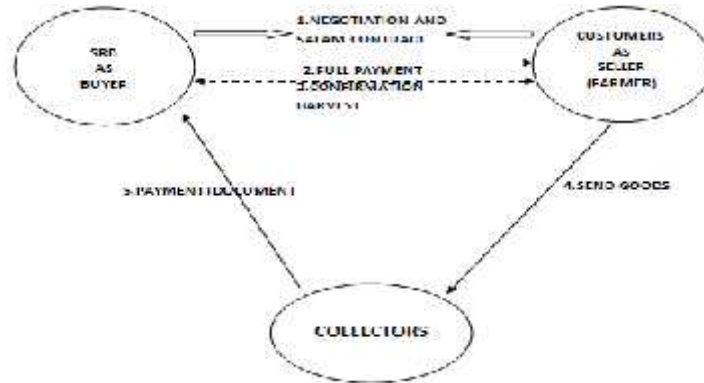

Figure 6. Scheme financing salam bil wakalah

Source: Researcher, processed data (2016)

Explanation:
1. SRB and customers negotiate and agreed the salam contract
2. SRB pays in full payment to customers
3. Customers confirm the harvest
4. Customers send their harvest to collectors
5. Collectors pay in full payment to farmers

Figure 6 shows Salam bil wakalah financing scheme implemented by SRB Bumi Rinjani Probolinggo (see Figure 5). However salam bil wakalah financing meant is different from salam bil wakalah applied by SRB Bumi Rinjani Probolinggo. The difference is in the process of delivery of money and documents of the sale belonging to SRB. So, the payment of salam assets is made directly between buyers / collectors with the SRB.

The end of the salam ccontract is when bai salam customers harvest and the crop is in accordance with the agreement. After harvesting bai salam customers have to contact the bank for repayment process in accordance with the agreement at the beginning. If the goods met the agreement, then harvests owned by the bank entrusted to bai salam customers for reselling using wakalah system. In addition, the bank should have a clear record of the assets completed with the bil of the sale. After the assets are successfully sold the bai salam customer confirms to the bank about the buyer. The money rom the sale of assets completed with the bil of sale of buyer and handed over directly to the SRB in certain place and time. By this way, the banks do not have to own a warehouse or storage salam assets.

The most important thing to consider in salam bil wakalah financing is a point of agreement should be separated, but should be reinforced with wa'd. This wa'd is in accordance with DSN No.85 / DSN-MUI / XII / 2012 that promise (wa'd) is often used in financial transactions and business that are single, parallel and / or in a multi-contract transactions (al- 'Uqud al-murakkabah). As has been stated by Mr. Achmad Zaky as Chairman of Islamic Finance and Accounting Studies (IFAS), University of Brawijaya that salam bil wakalah financing model is vulnerable or at risk for ta'alluq or hielah, the vulnerability is where salam contract took place, for example, the beginning of contract

starts when the salam contract is happening. Therefore, those contracts should be separated and wa'ad is needed as other solutions. Though Mr. Achmad Zaky noted that the appearance of the DSN No.85 might cause 'chaos' and lead to the practice of ta'alluq, this case is related to Fiqh and Ijtihad, Mr. Achmad Zaky assumes that DSN has been announced and it is halal.

The advantage of using salam bil wakalah financing is that the bank do not need to have warehouse or storage for salam assets so the banks can avoid the some costs, e.g. labor costs, transportations, maintenance, and so on. The bank does not need to have a warehouse or storage assets salam, so the banks can avoid the costs, eg labor costs, transportation costs for transporting goods, maintenance costs, and others. The weakness is the default or negligence, the customer is negligent in keeping salam assets deposited by the bank, that affect the decreasing of salam assets value; side streaming that is bai salam customer uses salam capital different from the mentioned contract result in those salam asset value falls; side stream that customers using the bai salam salam capital is not as mentioned in contact.

2) Salam Bil Mudharabah Financing

Financing of salam bil mudaraba is salam funding system,which the asset of salam salam are delivered to a dealer who has been appointed by the bank, where the contract used between the agent and the bank is mudharabah. So before their salam financing transaction, the bank has been working with the supplier in the Mudharabah contract. By using mudharabah means the owner of the funds in this case is the bank who is doing a partnership contract with the agency to carry out business activities, the profit is divided based on nisbah, sharing profits for the agreement of both parties.

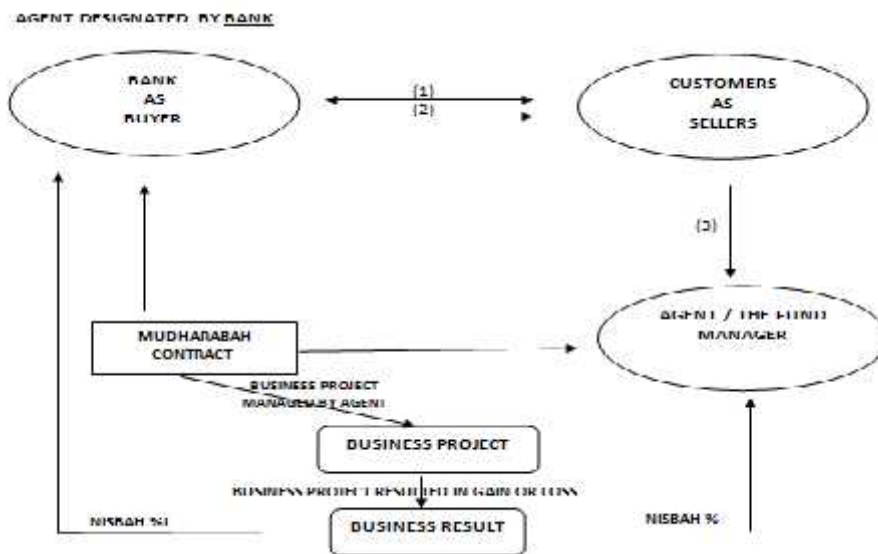
While, the financial loss would be taken by the fund owner unless caused by misconduct, negligence, or violation by the fund manager. Financing of salam bil mudharabah are two separate contracts. Where financing of salam bil mudharabah referred in this concept is implemented in accordance with the DSN No. 05 / DSN-MUI / IV / 2000, which contains the terms of buying and selling salam and DSN No. 07 / DSN-MUI / IV / 2000 on the financing is (Qiradh). in simple terms, financing of salam bil mudharabah can be illustrated as the following scheme:


Figure 7. Scheme Financing Salam Bil Mudharabah
Source: processed data (2016)
Caption:

1. The bank and the customer agreed to have salam contract.
2. Bank pay in full payment to customers
3. Customers submit their products to an agent who has been appointed by the bank

Figure 7 shows the scheme of in which the bank salam bil mudharabah financing where banks do mudharabah contract with salam assets manager who acted as sales agent. The sales agent acts as the mediator, which resells the assets of salam to merchants or consumers directly. If the projects generate profits then the profits are divided according to a predetermined ratio, e.g. bank and the agent with a ratio of 60:40. If it experiences financial loss then it is taken by the owner of the funds (ie bank). Furthermore, if a customer submits salam financing, the bank performs salam contract to customers, and the bank handed salam capital in full at the beginning with the terms of price, quality, clear quantity, where the price is lower than the market price (the price of collectors). After bai salam customers will complete the payment, if the goods mets the criteria agreed at the beginning, then the bai salam customer transfer their production to sales agents who had been appointed earlier by the bank.

Salam bil mudharabah financing is two separated contract that should be free from ta'alluq. As what has been stated by Mr. Achmad Zaky that if salam bil mudharabah financing acts as one complete contract (concurrent transaction point) it does not meet the characteristic of the Islamic transactions provisions on KDPPLKS related to their gharar (uncertainty). So in salam bil mudaraba financing, the two contracts should be separated and should certainly avoid ta'alluq.

The advantage of using salam bil mudharabah is that the bank does not have to have a warehouse or storage of salam assets. therefore the banks can avoid the high costs, e.g labor costs, transportation, maintenance costs, and others; banks will get higher sharing when agent's sale profits increases; The weakness is the default or deliberate negligence by agents and customers of bai salam; side streaming that the customers use is different from what previously mentioned in the agreement; concealment of profits by the sales agent.

Salam financing product innovation is a product of Islamic banking which implement the Islamic law. According to researchers, globally both salam financing innovations, salam bil wakalah financing and salam bil mudharabah financing, fulfilled the Islamic principle. There are some good points in the Islamic principle, these are prohibiting the commercial elements of which the goods are proscribed; interest; gambling and deliberate speculation; vagueness and manipulative in the transaction (Antonio, 2001).

Similarly, according to Mr Abdul Wadud Nafis stated that the concept of salam bil wakalah and salam bil mudaraba is legal under the law of Islamic principle. Al-Imrani in the book Al-Ukud AL-Maliyah Al-Murakkabah define Hybird Contract is an agreement of two parties to carry out a contract that includes two or more contracts, such as buying and selling of grants, wakalah, qardh, muzara'ah, sahraf, shirkah , mudaraba, and others. The majority of scholars Hanafiyah, Malikiyah Shafi'iyah, and Hanbali argue that Hybird Contract is valid and permissible according to Islamic Shari'a. Scholars who argued that the agreement is permissible and legitimate due to the the origin of the law is permissible and there found no law that forbids or cancel it. The most popular term of Hybird contract is al-ukud al-murakkabah and al-ukud al mutjami'ah.

Yet in another case, Mr. MN.Hosen, as treasurer of the National Islamic Council opine that in order to determine whether such innovation is in accordance with the Islamic principles or not, not globally, it needs to be dissected in detail about the scheme and any steps before or after the contract agreement, so if it is different from salam standard

contract set by the DSN of MU, it must be dissected one by one, whether or not there will be found an element of usury, gharar, maysir, and so on.

4.4 Implications for innovation of salam financing system toward its accounting treatment
        Salam financing product is the right solution for farmers who need capital to buy inputs to cultivate their fields, as salam financing products offered uses the principles of sharia and the beauty of sharia principles is felt by farmers to avoid elements of usury. However, based on research results, innovation on salam financing products as mentioned above is needed such salam bil wakalah and salam bil mudharabah.
        According to some researchers, financing of salam bil wakalah is financing where the resale of salam assets with wakalah system has no implications on salam accounting treatment of how the recognition, measurement, presentation and disclosure are appropriate with what have been stated in SFAS No. 103. The difference of Salam financing and salam bil wakalah are in the process of full payment. Salam assets are resold by bai salam costumers' help which usually does not take a long time, because farmers have partnership of the agricultural production. Similarly, Mr. Achmad Zaky stated that Salam contract is more dominant than Salam financing bil wakalah at the transaction of Salam assets. In the transaction process, when Salam contract is used then it is called parallel Salam. But, in this case the transaction uses wakalah system and does not affect anything, due to its operational technique, exchange of ownership does not occur.
        There are not found implication toward Salam accounting treatment in the product innovation of Salam bil mudharabah financing. Received Salam asset is resold by the agent determined by the bank (a bank and the agents previously do mudharabah contract) in this case the ownership exchanged, but had no implication for Salam accounting treatment (SFAS 103) according to Mr. Achmad Zaky, the payment of Salam bil mudharabah is two different contracts, so that the accounting treatment is also separated. At the time of assets transaction using Salam, the accounting treatment is regulated on SFAS No. 103, and owned Salam assets will be used as muharabah investment (non cash), therefore mudharabah contract uses noncash investment model whose acconting treatment regulated in SFAS No. 105. Here's an idea if the current salam assets received by the sales agent, if the goods is in accordance with the agreement, the SRB as buyers make a record of the transactions as follows;
(D) Salam Assets   xxx
                (K) salam accounts receivable   xxx
        Since the Salam asset is in accordance with the contract, it is then measured in accordance with the agreed value. Salam assets are invested and measured at fair value, so if the fair value is higher than the value of the salam assets, then are recorded as a credit side profits, and vice versa.
  -    a journal to record the mudharabah investment
        (D) mudharabah investment   xxx
                (K) salam assets   xxx
        Mudharabah investments are measured at the fair value of salam assets. Mudharbah nvestment occur when the salam assets handed over by the bai salam customer to the agent pointed by the bank. Mudaraba investments are recorded under the provisions of SFAS 105.

5. Closing
        From the discussion described is based on the problem and research objectives, it can be concluded as follows: 1) SRB Bumi Rinjani is motivated to implement salam financing for the needs of farmers to fulfill the production needs the business and the

relatively short financing period, in accordance with the need of production processes which takes two to six months, so that salam financing contract is the appropriate way. The salam financing implemented is a single salam contract. Since the goods purchased by the SRB are items such as rice, potatoes, and maize while the SRB does not plan to make such items as deposit. Therefore, the SRB entrusted those items to the bai salam customers to be resold using wakalah system 2) there are some factors that become the obstacle for SRB on salam financing, these are; a). Default or bad character of bai salam customers; b) Crop failure; c) Fluctuating market prices; d) The rule of the Supervisory Board that the SRB should have a warehouse/ storage of goods. To resolve the problems, some comprehensive innovations on Salam financing can be made, such as 1). Salam bil wakalah financing and 2) Salam bil mudharabah financing. Both innovations focus on Salam asssets treatment after salam contract ends. In this Salam financing, the bank acts as the buyer and does not plan make Salam assets as inventory. Therefore, the bank needs strategy to resell Salam assets. Salam bil wakalah and Salam bil mudharabah financing do not implicate on the accounting treatment, since these two contracts are separatedand so is the accounting treatment. The study identifies the obstacles in salam financing faced by SRB. Whereas the problems faced by bai Salam customers are not identified.

Based on the conclusions, the researchers provides and advice on some important matters as follows: 1) Development of Science. Development of salam financing products influenced by the dynamics of bai salam customers, where the customers' needs can be completed, so that a new model of salam financning to facilitate the changeable needs of customers is needed. Building model of Salam financing product is suggested for the development of science, especiallly in economic and Islamic finance for improving salam financing products better to meet the customers' needs. 2) the regulators and Nasional Sharia Council. The regulators (Bank Indoneisa and the director of the Islamic Financial Institution in the FSA), or DSN is expected to consider the innovation of this product, and to understand it well since it is associated with hybrid contract. The Errors in making regulations will hinder the development of Islamic Financial Institutions. 3) Drafting of Sharia Financial Accounting Standards. Innovation of salam financing products proposed in this study is related to hybird contract. Because there is more than one contract in a financial product. The composer of IAS Syariah is expected to analyze whether the innovation of financial products requires new more relevant SFAS. 4) The Islamic Banking, in particular the SRB. Salam bil wakalah and Salam bil Mudharabah financing are innovation concepts of Salam financing product that is expected to meet customers' needs, especially farmers. The product innovation is closely related to hybird contract. The Islamic banks should understand the theory of hybird contract to be superior and to compete with conventional banks. 5) Further Researchers. Further researchers are expected to identify the constraints faced by bai Salam customers, so that salam financing concept can meet the needs of its customers. Further researchers can dissect the concept of salam bil wakalah and salam bil mudharabah financing about the scheme and any steps before or after the contract, if it is different from the standard contract of salam regulated in DSN fatwa MUI then it must be dissected one by one, if there found the element of usury, gharar, maysir, and so on the concepts of salam financing products can be implemented.

ROLE OF STRATEGIC MANAGEMENT ACCOUNTING
AND INTEGRATED PERFORMANCE IN HOTEL INDUSTRY

Antonius Singgih Setiawan, Universitas Sebelas Maret, Indonesia
Rahmawati, Universitas Sebelas Maret, Indonesia

Abstract

This study examines the effect of role of accountants on the use of strategic management accounting, and the effect of role of accountants, use of strategic management accounting on integrated performance. This study uses primary data through surveys of General Manager (Leader of Hotel) star hotels in the region of Southern Sumatera. 134 questionnaires were submitted to the General Manager (Leader of Hotel). The questionnaire used in this study a number of 118 (88.06 %). Data were analyzed by Structural Equation Modeling (SEM) Partial Least Squares (PLS), using WarpPLS software version 5.0. The results indicate thatthe role of accountants has a positive effect on the use of strategic management accounting, the role of accountants and the use of strategic management accounting has a positive affects on integrated performance.

Keywords: Role of Accountants, Use of Strategic Management Accounting, Integrated Performance, Hotel Industry, Region of Southern Sumatera

Introduction

Performance is the objective summary of organizational unity (March and Sutton, 1997). This means that the performance is a reflection of how the alignment of interest between management and employee groups are in a visible organization.According to management accounting, performance is a form of corporate accountability to stakeholders. Micheli and Mari (2014) stated that the organization was asked to conduct and communicate their achievements to key stakeholders. Performance as a reflection of the importance of the successful management of an organization led to the literature and practice of business performance measurement have develop (Hoque, 2004). In its development, the performance seen in two aspects, financial and non-financial aspects (Kaplan and Norton, 1996). Performance that integrates financial and non-financial aspects of directing the attention of managers to think and act long term (Chenhall, 2005)

The implementation of the integrated system performance can not be separated from the development of management accounting practices continously. The development of practice follows the evolution of accounting role in businessworld. Colemen (1949) expresses that accounting practice has developed to respond the change in business economics. The evolution process of management accounting role in the business life turn out to have a relationship with the development of theory which becomes the basis of perspective of literature and research in the field of management accounting. Waweru (2010) shows the framework of the theory of management accounting development. The framework consists of four stages. The first stage, conventional policy, the second stage, Agency Theory, the third stage, Contingency Theory, the fourth stage, strategic management accounting.

The research in the contingency theory perspective has seen the relationship between the utilization of strategic management accounting and the performance. The utilization of strategic management accounting can be seen in the content of information supply (Choe, 2004), the system of performance measuring (Hynoven, 2007; Kholbacher and Gruenwald, 2011; Sakka *et al.* 2013). Macinati and Pessina (2014) concluded that the use of management accounting are positively related to performance. In general the result

of research can be conclude that the utilization of strategic management accounting can have a positive impact on business performance.

Based on several literature references of previous research, there is an interesting phenomenon that the research and practice in the field of especially in the theme of business integrated performance directing to strategic factors related to the management accounting involvement in the making of strategic decisions. The concept of strategic management accounting according to Cadez and Guilding (2008) tends to the understanding of strategic orientation on the accounting techniques and emphasis on the role of accountants in the business strategic decision making.

However concerning the relationship between the accountant's role in strategic decision making on corporate performance is still providing great results do not support. At least it is shown by the invention of Cadez and Guilding (2008). According to the reference of Cadez and Guilding (2008), when the strategic management accounting literature has got a lot of development, the research tending to the implementation of strategic management accounting is still rare. Therefore, this research will see how the role of strategic management accounting influence in achievement of integrated performance in the business contextin Indonesia. Especially the business of hotel management in region of Southern Sumatera.

The choice of hotel business in region of Southern Sumatera is caused by the developed hotel industry, especially star hotelin South Sumatera, the data show that the growth of star hotel industry from year 2009 – 2014 or in the last five years, there has been an increase almost 100%, it is also relatively related with the degree of hotel occupancy in South Sumatera (Hutapea, 2015). These conditions will have an impact on competition in the hotel industry has become very dynamic region.To that end, the role of accounting management becomes very important, it is based on the conclusion of Collier and Gregory (1995) stating that finansial fuction in the groups of hotel industry becomes more involved in the strategic management accounting both in the planning and in the evaluation of market conditions in analyzing the competition. Therefore, the research will be examines the effect of role of accountants on the use of strategic management accounting, and the effect of role of accountants, use of strategic management accounting on integrated performance, in hotel industry especially star hotel in region of Southern Sumatera.

Integrated Performance

Kaplan and Norton (1996) has introduced the system of integrated performance measuring Balanced Scorecard integrating financial and non financial measurement. Integrated measurement directs the business to focus on external conditions and to produce wide information in connection with the business activities (Scott and Tiesen, 1999; kaplan and Norton, 2011). This is related to the purpose of performance measurement system, which is to help allocate the company's resources, assess and communicate the company's progress toward strategic goals, and to evaluate managerial performance(Ittner and Larcker, 2003). The concept of measuring process of performance also enables the business to trace the present performance process and therefore the performance measuring process can support the improvement identification for the business (Siemieniuch and Sinclair, 2002). To achieve these goals, organizations can adopt performance measurement that includes the causal links that may exist between strategic goals, actions and results expected by the organization (Lee and Yang, 2011).

Further Lee and Yang (2011) explained that the combination of financial and non financial measurements allow the various functional departments to have a broad understanding of performance information in their units and help communicate the company's strategic objectives and control of operations on each layer. As a result of

integrated performance measuring, Itener and Larcker (2003) explain that either non financial performance or financial performance one is used to get comprehensive view for the organisation to see the performance. Some of these descriptions it is clear that the performance of the company is an important thing to comprehensively assess the success of the company. So the integrated performance either from financial or non financial aspect becomes the main objective that must be considered firm, comprehensive and integrated performance measurement is an important means to view it.

Strategic Management Accounting

The early 1980 wan an important period either in strategic management or in strategic management accounting (Nixon and Burns, 2012). Furthermore, Nixon and Burns (2012) explain that the concepts of strategic management accounting is introduced by Simmonds and it is defined as a determination and data analysis of management accounting about the business and the competitors, to be used to develop and monitor the business strategy. While traditionally, the management accounting is only used as a support for the process of financial decision making in organisational (Feeney and Pierce, 2007). Because of the weekness of traditional management accounting, it is suggested that the strategic management accounting be applied to the business operating in the competitive area by adopting sophisticated management accounting techniques (Shank 1989; Roslender 1995).

Based on the perspective of strategic management, Brouthers and Roozen (1999) shows that the strategic function of the accounting system ideally be seen within six points of view, namely as a tool for environmental analysis, generation of strategic alternatives, the selection of strategic alternatives, planning strategic implementation, the implementation of strategic plans, as well as strategic management control process. As a consequances, Brouthers and Roozen (1999) state that the neccesary information to support the strategic system focuses on most of non financial information, focuses on either internal or external good future and information based on reliable projections about the future. To fulfil the strategic objectives and improve performance, organization designs more sophisticated accounting information system (Gil, 2004).

Cadez and Guilding (2008) states that there are two perspectives in the strategic management accounting, first as a set of accounting orienting on strategic technique and second, strategic management accounting which can be seen as the involvement of accountants in business in the process of taking strategic decision. Related to the role of accountants, Palmer (1992) expresses that in strategic management process accountants have a bigger and bigger role. This shows the important role of management accountants to give information to take decision and strategic control (Bromwich 1996). This supports the think that management accountantshave been playing various double role for a long time. They are depicted as value guards, direct the attention in problem solving (Simon *et al.*, 1955). Friedman and Lyne (1997) revealed that, the fundamental reason of the changing role of the accountant relating to the innovation of management accounting oriented businesses, including also associated with strategic management accounting.

Scott and Tiessen (1999) state that strategic accountants are integral parts of the process of taking strategic decisions. Accountants also play an important role in cost characteristics and attribute possessed by production in strategic planning and structure modelling of competition cost (Bromwich, 1996). Based on the above description, it is clear that strategic mangement accounting is the result of the shift of accounting role in the competitive areas. Strategic management accounting can not be seen in the context of accounting techniques, but also need to look at the role of accountants in implementing strategic techniques for strategic decision making

The role of accountants in making strategic decisions affect the use of strategic management accounting systems

Cadez and Guiding (2008) have succeeded in proving that the higher the participation of accountants in making strategic decisions will bring the more positive impacts to the use of strategic management accounting in business. This invention supports Oliver (1991) who states that there is a positive relation between participation and the taking of strategic decisions and the use of management accounting; therefore it appears natural when a bigger participation can be seen as a good motive for accountants to give more value inthe process of making strategic decisions, so it can give influence to the design and implementation of strategic management accounting system of business. Therefore the hypothesis that can be formulated :

> H1 : The role of accountants in making strategic decisions affects positively to the use of strategic management accounting system.

The role of accountans in making strategic decisions and the use of strategic management accounting system affects business integrated performance

Hoque (2004) proves that the use of financial and non financial performance measuring is connected positively with the organisation performance. Choe (2004) finds out that the system of management accounting information can increase the production performance. Spencer *et al.* (2009) conclude that performance measuring system has connection with the increase of business performance. Haque (2011) conclude that the change of accounting and control system brings a relation between competition intensity and organisational. Cadez and Guilding (2008) find that the use of strategic management accounting has a positive connection with performance.

Baines and Langfiled-Smith (2003), Rowe *et al.,* (2008) and Scott and Tiessen (1999) conclude that the increase of competition and the context of market uncertainly creates the team of inter departements to increase the velocity of organisation reaction to build the atmosphere to increase performance. Fowler (1999) finds out that the majority of management accountants has got a role in implementing the quality concept into area of business accounting. Wooldridge and Floyd (1990), de Haas and Kleingeld (1999) state that the increase of participative facility which is more effective on the managerial decision leads to the organisational performance increase.

From the above description, it appears that strategic management accounting has a role in the achievement of business perfomance, management accounting as medium of information and control has a role to assure the achievement of performance. While accountants has a more strategic role because they can be involved participatively in taking the strategic decisions. Based on the above facts, a hypothesis can be made in research :

> H2a : The role of accountants in making strategic decisions affects positively on the increase of business integrated performance.
>
> H2b : The use of strategic management accounting affects positively on the increase of business integrated performances

Figure. 1
Research Model
Research method
Sampling
The sample in this research is business management, *i.e* General Manager (Leader of Hotel) of star hotel in region of Southern Sumatera. The design of the researchsampling is using the techniques of nonprobability sampling convenience sample.

Variable Measurement
Integrated Performance
Integrated performance is business performance which is measured from the financial and non financial aspect comprehensively. Integrated performance is measured using an instrument used by Cadez and Guilding (2008) which was modified by Hoque and James (2000). There are 7 points of performance demension. The respondents are required to identify their relative performance compered with the competitor's performance on the scale 6 point (1 under average, 6 over average). (Appendix 1).

The role of accountants
The role of accountans is an active role of accountant in their contribution to produce business strategic desicions. The measuring of accountans' participation uses 5 intruments used by Cadez and Guilding (2008) which is adopted from Wooldrige and Floyd's (1990). The answers use scale 6 points (1 has no role at all, 6 has a full role). (Appendix 2).

The use of strategic management accounting system
The use of strategic management accounting system is the use of sophiscicated management accounting techiques to support the business operation activity. The use of strategic management accounting system uses 11 instrument used Cinquini and Tenueci (2008) adopted from Cades and Guilding (2008); Cravens and Guilding (2011); Guilding and McManus (2002). The respondent are required to give check list (√) of the management accounting implemented by the business, then to be given score. (Appendix 3).

The technique of data collection
This research uses the type of primary data. Data are colected using survey techniques by giving questionaires as aresearch instrument directly to the research respondents General Manager (the head of the hotel business) hotel affairs in region of Southern Sumatera.

Data analysis
Descriptive statistics
　　　　The use of descriptive statistics is to give a illustration about the demography of respondent including age, level of education, working experience, gender, and description about the research variabels.
Test of data quality
　　　　The lest of data quality is carried ot by using the lest of realibility and validity.
Test of hypothesis
　　　　The testing of hypothesis is done by useing analysis of Structural Equation Modeling (SEM) Partial Least Squares (PLS). Analysis SEM-PLS uses Warp PLS sofeware version 5.0 whit stage (1) The testing of model quality, (2) the testing of research hyphotesis.

Results
Descriptive statistics
　　　　The survey was done at 134 hotels in region of Southern Sumatera, 12 hotels refused to be surveyed by giving vwith the research requirements various reasons, four hotels didn't give complete data accorduce. 118 hotels gave complete data. So this research is done based on the 118 questionaire.From the aspect of gender, the Leaders involved as respondents are 87 men (73,7%), and 31 women (26,3%). It show that the role of men still dominant in the management and decision making in 2 business organisation especially in hotel affairs in region of Southern Sumatera.Respondents profile in their high level eduction. Respondents with the Diploma dominate the position as Leaders. There are 59 people (50%). There are 55 people with Strata 1 (46,6%) and four people (3,4%) with the Senior High School certificate. Based on the age, the average of them is 39,4 years old. The youngest is 32 years and the oldest is 65 yesras old. The average respondents have been involved in managing the hotels at least five years. The newest position is one year and the longest is 30 years.

Table. 1 Variable Data Statistic

Variabel	Theoritical Range	Actual Range	Mean	Deviation Standar
Integrated Performance	7 – 42	18 – 42	33,68	5,58
The Role of Accountans	5 – 30	5 – 30	23,66	5,44
The Use of SMA	1 – 11	3 – 11	9,04	1,8

Source: Primary data processing, 2015
　　　　The Tabel. 1 shows that the integrated performance average data of the hotels operating in region of Southern Sumatera are on the level of 33,68. The integrated performance data are seen in accordance with the conviction the hotel leaders in the achievement of financial and non financial performance. The average of integrated performance at 33,68 shows that the average integrated performance of hotel industry in the region of Southern Sumatera can be classified relatively high enough.
　　　　The data of accountans' role in the activity of hotel management in region of Shoutern Sumatera show the average 33,66. Based on theoritical range between 5 to 30, it can be concluded that the role of accountans in the activity of hotel management in region of SouthernSumateracan be classified in a high enough level. And so is the use of strategic management accounting. Acording to the theoritical range between 1 to 11, the average use of strategic management accounting by the hotels in region of Southern Sumatera is 9,04. It can also be concluded that the level of strategic management accounting use in region Southern Sumatera is high enough.

Testof data quality

The research data are collected throught the survays using questionaires. There are two research variables measured by using several indicators of measuring tool, namely integrated performance variable and the role of accountans. To make sure that each indicators of measuring tool is valid and reliable to explain research variable, the testing of validity and realibility of data quality needs to be done. The following is the testing result of research data quality.

Table 2 Testing Result of Data Validity

Variables	r statistic	r table	Conclusion
Integrated Performance			
Return on investment	0,827	0,1809	Valid
Margin on sales	0,859	0,1809	Valid
Capacity utilization	0,806	0,1809	Valid
Customer satisfaction	0,799	0,1809	Valid
Product quality	0,838	0,1809	Valid
Development of new products	0,752	0,1809	Valid
Market share	0,798	0,1809	Valid
Accountans' Role			
Identifying problems and proposing objectives	0,902	0,1809	Valid
Generating options	0,965	0,1809	Valid
Evaluating options	0,963	0,1809	Valid
Developing details about options	0,960	0,1809	Valid
Taking the necessary actions to put changes into place	0,958	0,1809	Valid

Source: processed primary data, 2015

Table 2 shows the testing result of reserach data validity. Validity test is based on the value of corrected item total corelation (r statistic value). Based on the 118 samples, the criterion of critical r value is at degree of freedom n: $118 - 2 = 116$ at 5% two tail showing 0,1809. Therefore, all indicators of integrated performance variable and role of accountans are valid. It has been proved that all values of r statistic value of each variable indicators has a bigger numeral than r table 0,1809.

Table 3 Test of Data Reliability

Variable	Crombach Alpha	Critical Value	Conclusion
Integrated Performance	0,942	0,6	Reliabel
Role of accountans	0,983	0,6	Reliabel

Source: Processed primary data, 2015

Table 3 shows the testing result of reliability data research. Data reliability is based on the crombach alpha value of each research variable datum. The testing result of crombach alpha shows that all the tested variables, including integrated performance variable and role of accountans show the numeral above the required critical value (0,6). Therefore, it can be concluded that all of the tested variable data show reliable result, so that the data are proper for next research process.

Test of Hypothesis

Table 4 *Model Fit* and *Quality Indices*

Item Model Fit	Value	Creteria	Conclusion
Average path coefficient (APC)	0,493 P<0,001	P < 0,05	fit
Average R-squared (ARS)	0,487 P<0,001	P < 0,05	fit
Average block VIF (AVIF)	1,585	AVIF < 5	fit

Source: Processed primary data, 2015

Based on table 4 model fit and quality indices the value of APC, ARS and AVIF, each of them shows proper values with the creteria. The significant value of APC < 0,001, and that of ARS < 0,001 is on the criteria under 5% (Sholihin and Ratmono, 2013). Value of AVIF 1,585 is on criteria under 5 (Sholihin and Ratmono, 2013). So it can be concluded that this research model is fit, so that this research model is fit to be used to do the next testing.

Figure 2 Research Struktural Model
The role of accountants influences the use of strategic management accounting

This part will prove wheter H1 indicating the role of accountants in making strategic decisions influences the use of strategic management accountaning system positively. From the testing result SEM-PLS on figure 1 it can be seen coefficient βvariable the role of accountans to the use of strategic management accounting 0,67 with *p* value <0.01 or under value a 5%. It can be concluded that the hypothesis stating the role of accountans in making decisions influences the use of the strategic management accounting is supported.

The role of accountans and the use of strategic management accounting influence the business integrated performance

This part will prove whether H2a stating the role of accountans making strategic decisions influences the increase of business integrated performance positively. H2b stating the use of strategic managemen accounting influences the increase of the supported business bisiness integrated performance. From the tasting result SEM-PLS on figure 2 it can be seen that the variable of accountans' role has a coefficient β 0,40 with *p* value < 0,01, or less than value a 5%, and so does the variable of strategic management accounting having coefficient β 0,41 with *p* value < 0,01 or less than a 5%. It proves that the role of accountans and the use of strategic management accounting influencess the business integrated performance increase.

Discussion

The role of accountants in making strategic decisions influences the use of strategic management accounting system

This research has also succeeded in proving that the level of the use of strategic management accounting techniques is much influenced by the high utilization of

accountant's role in a business. This research shows that most of hotel affairs in the region of South Sumatera has utilized the role of accountants in making decision maximally. The most hotel in the region of Southern Sumatera has also used more strategic management accounting techniques. The applied accounting techniques are not only used to get financial information but also to identify non financial information.

The result of this research at least has supported several previous research inventions among them Cadez and Guiding (2008); Oliver (1991); Chenhall and Langfield-Smith (1998), which conclude that the highes the role and participation of accountants in making strategic decisions the higher the effect of the innovation and utilization of the needed accounting techniques. It is done to get important information to support the creation of strategic decisions.

The result of this research also makes the fuction of management accounting in a business organisation clearer. It has been explained in the previous part that the function of accounting has been strategic nowadays. The function of accounting plays a great role in producing the choices of strategic decisions. The function of accounting plays a role in giving inputs and eveluation of strategic decisions and action carried out by the business. It is reasonable if the utilization of strategic accounting techniques become relevant to do. Sophisticated accounting tools will be very helpful for accountants n participating and playing a role in presenting useful information for management in making business strategic decisions. This has been the reason of this research invention that the more the role of accountants in making business strategic decisions, the higher the effect of utilization and use of strategic management accounting in a business.

The role of accountants in making strategic decisions and the use of strategic management accounting system influences the integrated performance

Based on the testing result of hypothesis which has been done before the role of accountants influences business integrated performances positively. The result of this research supports the hypothesis of the role of accountants having a positive influence on achievement of business integrated performance in accordance with some inventions which one of them was done by Fowler (1999) who concluded that the majority of management accountants has played a role in implenting the concept of quality into the area of business accounting. And the invention is the same as the opinion of Wooldridge and Floyd (1990), De Haas and Kleingeld (1999)states that the increase of participative facility which is more effective on managerial decisionscan have the effect on the organisational performance increase.

This is reasonable because in the competitive situation of industry, great ability to analyze and manage information is needed. Accountants as central function in managing information have become an important function in their contributions to make strategic decisions. The strategic decisions which are relevant to the need of creating superiority will cause the creation and market power to a business.

The support for the hypothesis stating that the use of strategic management accounting has a positive influence to the achievement of intergated performance also agrees with several previous inventions indicated by Haque (2011); Cadez and Guilding (2008) whch essentially stating that the use of management accounting system can give positive contributions to the creation of business performance. This evention clarifies that the effectivity of the use of comprehensive accounting medium will contribute to the fulfilment of important information in taking strategic decision. The business facing strong competition atmosphere needs accurate and quick information very much. And this research shows the facts that the majority of hotel affairs in region of Southern Sumatera has utilized the level of strategic management accounting use which is relatively high.

And it is reasonable in the more a business utilized the use of strategic management accounting, the higher the effect on the performance creation will be.

Conclusion

The result of research about the strategic managemet accounting and integrated performance at hotel industry in the region of Southern Sumatera concludes that the role of accountant give positive influence on the level of strategic management use. It means that the more of accountants play a role in making stratgic decisions, the more requirements should be implemented to use strategic management accounting.

In connection with the decisive factor of integrated performance on hotel industry in the region of Southern Sumatera, the research concludes that the factor of accountant's role in making strategic decisions and the use of strategic management accounting become an important factor which can influence the performance achievement positively. It means that the qualitative aspect of the accountant's role can influence the strategic decision making of the business which can have an effect on the increase of the business performance. While the use of strategic management accounting will be the key in collecting resulting strategic information which is useful to direct the achievement of integrated performance. And it gives effect on more optimal performance achievement.

Implication

The result of this research is expected to beneficial for various parties, among other things this research has empirically proved that the strategic management accounting has a positive connection with the integrated performance. The implementation of strategic management accounting role give effects on the creation of business integrated performance. It is clear that the implementation of strategic managament accounting has an important role in increasing business integrated performance. The result of this research also brings an implication to the hotel practitioners in region of Southern Sumatera. Hotel practitioners need to benefit the role of strategic management accounting optimally to support the integrated performance achievement.

Research Limitedness

This research certainly still has limitedness with the hope can be improved and can be completed in the next research. This research was only done in the region of Southern Sumatera where this region has characteristics and aims of consumer which can be different from the characteristics of hotel industry in other regions. So this result of research can't be generalized for hotel industry in other region.Furtherresearch can be do in different regions were possible to have a different characteristic to refine the findings.

COMPREHENSIVE INTELLECTUAL CAPITAL MANAGEMENT (CICM) AND THE OPPORTUNITY FOR THE STRATEGIC MANAGEMENT ACCOUNTING (SMA)

Sigit Hermawan
University of Muhammadiyah Sidoarjo
Email : sigithermawan@umsida.ac.id

Abstract
This research developed a new model of Comprehensive Intellectual Capital Management as an opportunity for the Strategic Management Accounting. The research was conducted qualitatively by applying interpretive accounting research (IAR) or interpretive research (IR) in management accounting. The informants were managers of pharmaceutical companies, former heads of the financial sections, and administration staff of pharmaceutical companies, intellectual capital (IC) researchers, and observers of pharmaceutical industry. The validity of the data was assured by conducting the credibility, transferability, dependent ability, and conformability tests. Data was analyzed by several phases, including data collection, data reduction, data display, and conclusion. The output of this study is a new model of CICM, that is the CICM plus (CICM +), which is the integration of CICM and ICM (Intellectual Capital Management). The other result of the study showed that CICM + can be used as a SMA technique because it fulfilled several SMA functions requirements, as stated by Lord (1996).

Keywords: *Comprehensive Intellectual Capital Management, Strategic Management Accounting, Interpretive Accounting Research.*

Introduction

Comprehensive Intellectual Capital Management (CICM) is a developed concept of *Intellectual Capital (IC)*. Introduced for the first time by Ali (2003), the difference of CICM and other IC management concepts lies on the words *"Comprehensive"* (Hermawan, 2015). It is because CICM has three stages in IC management, they are knowledge management, innovation management, and intellectual property management. Each stage of CICM are also connected to three IC components, i.e. human capital (HC), structural capital (SC), and relational capital (RC) (Bontis et el. 2000). Operationally, IC can be defined as intellectual material which is formalized, gained, and managed to generate high valued assets (Brooking, 1997).

IC as intangible asset for the company has been proven to be able to improve performance and competitive advantage of the company, as well as welfare (Hermawan and Herlina, 2013; Hermawandkk, 2012; Mageza, 2004). However, Sampoerno (2007) said thatIndonesian pharmaceutical companies have not been able to perform IC management and utilize it. It is proven by the fact that only 17 percent of pharmaceutical companies in Indonesia can compete in South East Asian export market. The other fact, which was proven by Hermawan et al (2012),was that managers of pharmaceutical companies have not sufficiently known, understood, known to measure and manage, their own IC components, either individually or in integrated way. Whereas, IC management is undoubtedly needed by Indonesian pharmaceutical companies. PT. Kimia Farma, Tbk, for example,acknowledged that their intangible assets have not been maintained and maximized to improve performance. There are a lot of hidden values that have not been

optimized. Their book value is still about 20 to 30 percent, while the remaining 70 percentwas intangible value. In 2010, it is recorded that book value of PT. Kimia Farma,Tbk. was only Rp 3 trillion. In fact, the market value (because added with intangible value) could have reached Rp 9 Trillion. Intangible value management in the form of IC is believed to be able to improve performance and reach profit up to Rp 300 billion from Rp150 billion targeted in 2011 (Gema KAEF, 2011a). Thus, the IC management in pharmaceutical companies is an nonnegotiable requirement (Gema KAEF, 2011b). The need for IC management is not only felt by PT. Kimia Farma,Tbk but also by PT. Indofarma,Tbk (Oasis, 2009).

The evidence showed that IC management such as CICM is required, but instead of only by CICM, Intellectual Capital Management (ICM) produced by The MERITUM (2001) can be applied as well. The concept of ICM consists of three steps, they are intangible assets identification, measurement, and monitoring. It will be an absolutely interesting research review if both IC management concepts are integrated.

The other thing should be considered is Hermawan's (2013) recommendation, which stated that non-financial IC research will be very helpful for management accounting review and strategy management. If they are integrated, it will be strategic management accounting (SMA), which has started to grow since 1980. Nevertheless, Soljakova (2012) stated that SMA development is stagnant, so that there is not much change starts from the early development to the present, so the continuous and deep assessment are required to develop the SMA concept. Thus, the research questions are how the new model of CICM as a result of concept integration of CICM and ICM is, and how the development possibility of SMA is based on the new model of CICM. Based on those research questions, the purpose of this research is to arrange the new model of CICM and possibility for SMA development.

Theoretical Reviews

As the basic theories, this research applied The Resource Based Theory (RBT) (Wernerfelt, 1984; Barney 1991) and The Intangible Perspective (Andriessen, 2004). The use of RBT as basic theory in IC research is commonly used for non-financial IC research (Hermawan, 2013). Meanwhile, the use of the intangible perspective as basic theory was because this research revealed and dug many intangible assets related to the activity and development of IC components, namely human capital (HC), structural capital (SC), and relational capital (RC).

RBT states that a company will obtain competitive advantage and superior financial performance when it is able to obtain, acquire, and uses its strategic resources, both tangible and intangible. But with the development of intangible resources in the era of "knowledge economy", the role of intangible assets becomes greater, not to mention the IC (Herman, 2015). Meanwhile, the "intangible perspective" is based on the resources that viewed economic or the individual company as a combination of "stocks, flows, and the transformation of resources". Perspectives of intangible resources focus on material resources and highlight the importance of "hidden wealth" in the economy and companies Hermawan (2014). It corresponds to the research, which explored and linked intangible resources and intangible activities with the company's strategic objectives and the development of IC in the framework of the Comprehensive Intellectual Capital Management (CICM).

Comprehensive Intellectual Capital Management (CICM)

Comprehensive Intellectual Capital Management (CICM), which was floored for the first time by Ali (2003), is the development of IC containing three activity stages, namely knowledge management, innovation management, and intellectual property management, as shown in Figure 1.

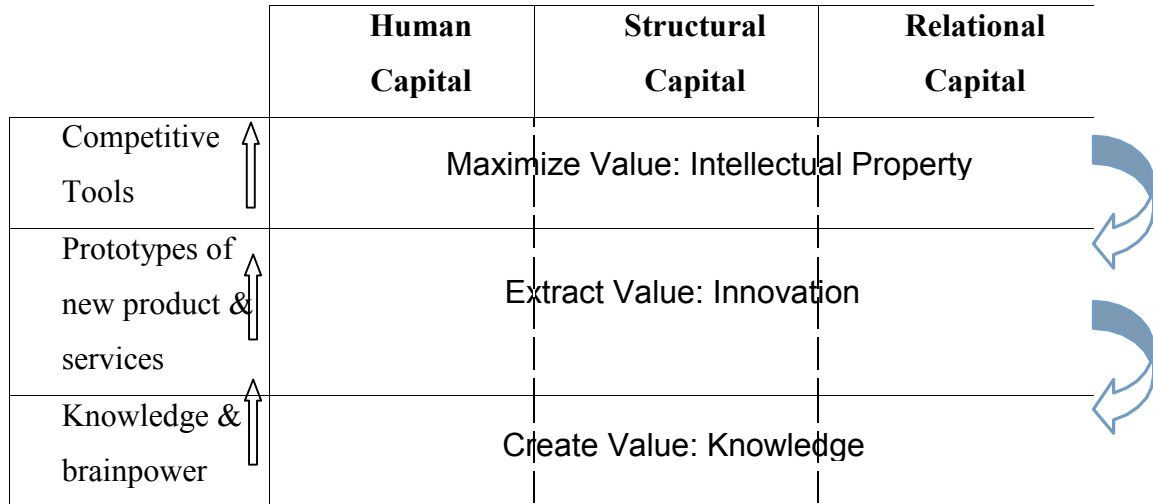
	Human Capital	**Structural Capital**	**Relational Capital**
Competitive Tools	Maximize Value: Intellectual Property		
Prototypes of new product & services	Extract Value: Innovation		
Knowledge & brainpower	Create Value: Knowledge		


Figure 1.*CICM* MODEL (Modified by the writer)
(Source: Ali, 2003)

Based on Figure 1, it can be seen that CICM model consists of three stages starts from the bottom to top. The first stage is creating value in the stage of knowledge management upon knowledge and brainpower. This first stage will support the second stage, it is extract value, in the stage of innovation management uponprototypes of new products or services. The third stage is maximizing value in intellectual property management upon competitive tools (Hermawan, 2015).

Next, Table 1 gives an illustration in more details about CICM stages and existing resources in each stage and each component of HC, SC and RC.

Table 1. Type and Stage of CICM Model-Based IC

IC Stage of Development	Human Capital	Customer Capital*	Structural Capital
Intellectual Property Management Stage	Know-how, know-why	Brand identity, reputation, strategic alliances	Patents, trademark, copyrights, trade secrets
Innovation Stage	Ideas, product, concept, skills	Ideas, product, concept, feedback, relationship	Work systems, business processes
Knowledge Management Stage	Tacit knowledge, experience, brainpower, vision	Experience, knowledge, relations, networks	IT database, knowledge base, best practices, culture

*In this writing, Customer Capital has the same meaning as Relational Capital
Source: Ali (2003) (Modified by the writer)

Table 1 showsthe existing resources in every stage of CICM and in every component, in HC, SC, and RC. Each of the components may own the same resources, but they are different in the context of its provision and development. Based on Figure 1 and Table 1, the writer will integrate between CICM with ICM (The MERITUM, 2001) to obtain new modelof CICM.

Intellectual Capital Management (ICM)

There are many different ways of managing the IC from various literatures produced by experts. Apart from the CICM developed by Ali (2003), there is Intellectual Capital Management (ICM) developed by The MERITUS Project (2001). MERITUS stands for Measuring Intangibles to Understand and Improve Innovation Management (MERITUM). According to The MERITUM project (2001), ICM can be done in three stages, namely 1) identification of intangibles; 2) measurement; and 3) monitoring. When linked to the development of the IC through CICM models, each stages, including knowledge management, innovation management, or intellectual property management, should follow the steps namely identification of critical intangibles, measurement, and monitoring. Intangible referred by The MERITUM Guidelines is IC components namely HC, SC, and RC.

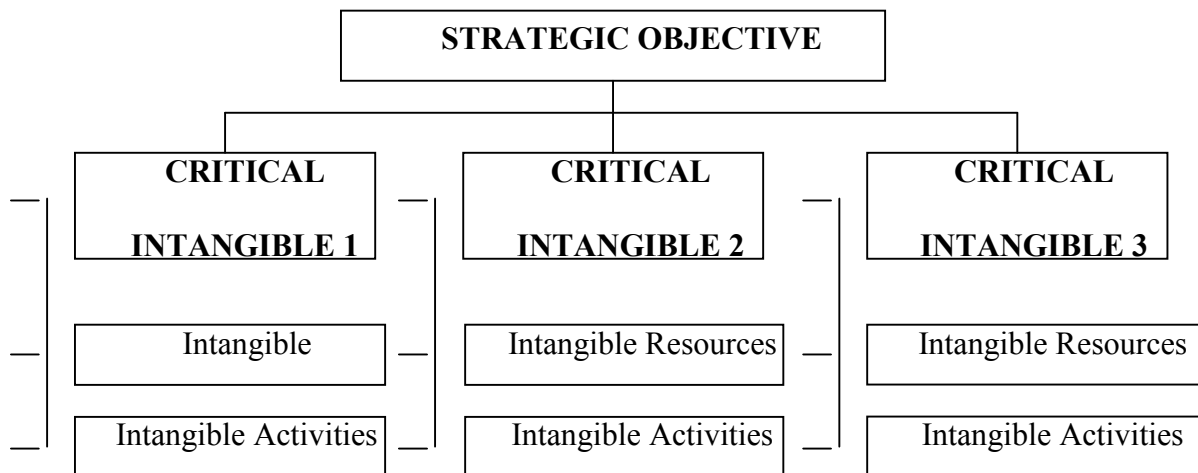
The first step is the identification of critical intangibles or the identification of the company's strategic objective, which is certainly related to the vision, mission, and strategic objectives of the company. If it has been set, the step is then followed by the identification of the related intangible resources and defining supporting activities that have an impact on these resources. As a final stage, the company must define the supporting activities that allow for monitoring and follow-up the activities and their impact on the intangible resources. To give a clearer illustration, the following diagram shows the network of intangibles, which gives an overview of the strategic objectives with the critical intangible, intangible resources and intangible activities.


Figure 2 *Networks of Intangibles*
(The MERIUM Project, 2001)

The second step is the measurement, in which companies need to identify specific indicators that serve as a tool to measure the intangible activities. In general, performance measurement is based on achieving between the targets and realization. Determination of the initial target will certainly be compared to the final achievements of each activity

program for the components HC, SC, and RC. If there is any slack between the target and the realization, there will be a thorough evaluation of all components of the IC existing in the company. Measurements can also be made on measures of financial or non-financial. For example, the satisfaction of the customer on the company's products is the measure of non-financial or total cost of training per employee per year, which can be used as a measurement for intangible activities and intangible resources.

The third step is monitoring, in which an evaluation of impact of initial investment of intangible against the position of intangible in the company will be conducted. The monitoring result can be in the form of new intangible activity that can be developed and implemented. In this stage, the company shall evaluate the impact of intangible activities both by internal or external users.

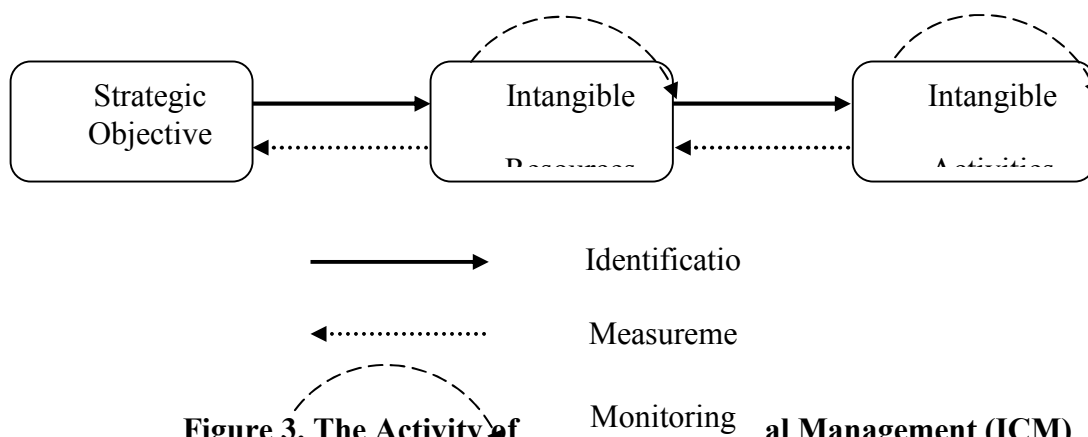
The three types of intellectual capital management (ICM) activities can be summarized as Figure 3 as follows.


Figure 3. The Activity of Intellectual Capital Management (ICM)
(Source: The MERITUM Project, 2001)

Strategic Management Accounting (SMA)

As stated by Hermawan (2013), the non-financial IC research will make a major contribution to the field of management accounting and strategicmanagement since they are related to management of IC, digging for hidden assets, the flow of knowledge, and also helpful to improve performance and gain the competitive advantage of the companies. Thus there is a correlation between non-financial IC with management accounting and strategic management so that according to the writer, the Strategic Management Accounting (SMA) is a combination between management accounting activity and the strategic management. It is similar with Roslender and Hart's (2003) statement, that SMA is associated to the way of making management accounting more strategic. The more complete definition is delivered by Simmonds (1981), that SMA is a provision and data analysis of management accounting related to business and competition in order to develop and monitor business strategies, especially related to the level and trend of actual cost and price, volume, market share, the current cash, and the demand proportion of total resource of companies. Meanwhile Certified Institute for Management Accounting or CIMA (2005) explains that SMA is a form of management accounting emphasizing on information related to the entity external factors, as well as non-financial information and information generated internally.

Some experts and writers have tried to classify "SMA tools" that can assist in decision making and monitoring the strategic program. For example Alnawaiseh (2013) states that there are 12 "SMA tools", namely 1) Activity Based Costing (ABC); 2) Benchmarking; 3) Competitor Analysis; 4) Valuing Customers as An Assets; 5) Integrated

Performance Measurement (IPM); 6) Life Cycle Costing; 7) Cost of Quality; 8) Brand Value Monitoring, Managing, and Budgeting; 9) Strategic Price; 10) Target Costing; 11) Value Chain Costing; 12) Balanced ScoreCard (BSC). Meanwhile, Esmaily et al (2015) stated that the main focus of SMA is value creating or value creation. Thus with regard to value creating there are some issues that can be associated with SMA, namely 1) Intellectual Capital; 2) Human Capital; 2a) Structural Capital (organizational); 2b) Customer Capital (communicative); 3) Intellectual Capital Measuring and Reporting; 3a) Methods of Direct Intellectual Capital; 3b) Methods of Markets Investment; 3c) Methods of Assets Return; 3d) ScoreCard Methods; 4) Performance Evaluation; 4a) Performance Evaluation; 4b) Performance Evaluation Systems; 4c) Performance Indexes; 5) Balances ScoreCard (BSC).

Research Method

Based on research objectives and activities, this research is a qualitative one (Cresswell et al, 2007) with the interpretive paradigm (Smith and Osborn, 2007). In particular, this interpretive qualitative research is included in the interpretive accounting research (IAR) (Lehman, 2011) or an interpretive research (IR) in management accounting (Lukka and Modell, 2010). This research is expressed as interpretive qualitative research because conducted more in-depth interviews, focus group discussion (FGD), interpreting the opinions of informants, and revealed the phenomenon of arranging development model of CICM associated with the company's strategic objectives as well as provide suggestions for SMA. Meanwhile, if associated with IAR in management accounting, this IC research is more related to the management of HC, SC, RC, evaluation and optimization of hidden assets develop strategies to improve non-financial performance of the companies that will ultimately improve the financial performance (Hermawan, 2013).

The focus of this research is to arrange development model of CICM related to the companies' strategic objectives and give development possibility suggestion for SMA. The arrangement of referred CICM development model is to integrate CICM concept (Ali, 2003) with ICM concept (The MERITUM, 2001) so that it can be a new CICM model or CICM plus. Meanwhile, giving the referred suggestion to SMA is based on the new CICM model, the researcher gives development suggestion for SMA.

This research was conducted on the companies included in the high IC intensive, i.e. pharmaceutical companies (Woodcock and Whiting (2009). Sharabati et al. (2010) and Chen et al. (2004) also recommended the same, that to study the IC better done at manufacturing solid knowledge level high research and innovation compared to other companies. This is consistent with the statement from Daum (2005), Boekestein (2006), Bramhandkar et al. (2007), and Kamath (2008) that the company pharmaceutical company that is suitable for IC research because they are knowledge-based, have lots of researches, sustainable innovation, knowledge, interaction between humans and technology, and relies on the IC as a source of renewal.

The unit of analysis of this research is the key informant's opinion about the development CICM model which is rooted from the CICM and ICM integration when linked with the strategic objectives of the company. CICM development model would then become a foothold to make a proposal for the development of the SMA. The key informant of this study is the manager of a pharmaceutical company (informant AP, KK, ER, IVP), former Head of finance at the pharmaceuticalcompany (informant DDOR), administrative staff in pharmaceutical companies (informant RFA, YE), researcher IC (informant WH), and the pharmaceutical industry observers (informant DH). The use of key informant from various parties is for the holistic meaning of this qualitative study.

Determination of informants conducted with judgment and snowball both before and after being in the research object (Marshall, 1996).

The process of data collection in this study was conducted by in-depth interviews, focus groups (FGD), and documentation (Marshall, 1996). In depth interviews were conducted with the entire key informants. FGD conducted with several key informants chosen with a specific purpose (purposive sampling). Documentation was done by collecting data both in the documentation of pharmaceutical companies, GFPI East Java, and from internet sources. Meanwhile, the data validity was checked in four ways, namely test credibility, transferability, dependent ability, and test confirms ability (Senton, 2004). Credibility test was conducted by triangulation method, source triangulation, theory triangulation, and triangulation between researchers (Rahardjo, 2010; Hussien, 2009). Transferability was conducted by arranging a research report by parsimony, clear, detailed, systematic, and trustworthy so that readers understand the research process which is expected to transfer itself into the research that will be done. The dependentability test or auditability test was also conducted via examination by external parties. In this study, examinations were carried out during the research process by an independent party, they were Prof. TS, Prof SS, and Dr. BP. Meanwhile for confirmability test was conducted to confirm the results of research on another IC researchers, namely IU, SLWI, MBW, and SH. With the confirmability test is expected, the results will be more objective.

The process of data analysis was performed during the data collection process (Miles and Huberman, 1984) as a characteristic in qualitative research. The stages of data analysis in this study consisted of four stages, namely the data collection, data reduction, data display, and conclusion. Data was collected from a variety of data from the process of in-depth interviews, focus group discussions, and documentation, regardless of the data obtained in the process. The next step is the data reduction. At this stage, the data is grouped by themes and concepts. Irrelevant data had been discarded and so that the data really fit with the theme and purpose of the study. At this stage, the process of data coding was conducted. The results of the data reduction phase are data display. At the stage of the display data that researchers will present the results of research in the form of the same theme or concept and also quotations from the key informant interviews. This is to show the naturalness of qualitative research. The last stage was a conclusion, which means that the researcher drew conclusions from a variety of existing data.

Results And Discussion

The researcher conducted several stages of research to get the results of research in accordance with its purpose. The first stage was gathering data and incorporating as well as to test the validity of research data, namely the credibility test with triangulation methods and sources triangulation. In this process, the writer collected data by using in-depth interviews, focus group discussions, and documentation. The process of cross-checking by triangulation was conducted by asking opinions on each other's interview result (asking opinion from source B about interview result of source A, then asking informant C's opinion, and vice versa). Likewise, the triangulation method is conducted by verifying the interview results truth through documentation check and also through the FGD. It is very possible for the researcher as a research instrument, as the peculiarities of qualitative research. In the process, the researchers also conducted triangulation theory by comparing the results with the resource-based theory (Wernerfelt, 1984; Barney,1991) and the intangible perspective (Andriessen, 2004). The second stage is codification or coding based on the results of the first stage.This coding process was also a process of data analysis thatis in the process of data reduction or decrease of data in accordance with the theme and purpose of the study. The results of the coding process is the same theme or

concept or relevant to the purpose of research. The research results of the same themes and concepts of the data analysis are as follow:

A. IC Development when associated by Company Strategic Objectives

IC development steps were required at the time the IC is associated with the company strategic objectives. IC as a company's strategic asset is associated with the intangibles assetby the MERITUM (2001). To gain this conclusion, the researchers conducted an analysis during the processof data collection, coding, data reduction, analysis, and interpretation associated with supporting theory, namely the resource based theory (Wernerfelt,1984; Barney, 1991) and the intangible perspective (Andriessen, 2004). It is also intended as an attempt to test the credibility, especially on triangulation theory. Theory and this perspective focus on resources that are not material, and highlighting the growing importance of "hidden assets" within the company. When linked with this research, the resources based theory and the intangible perspective is in accordance with the measures for the linkages between IC empowerment with the strategic objectives of the company, which is critical intangible assets. This means that pharmaceutical companies should be able to identify their "hidden wealth" or intangible assets, including intangible resources and also intangible activities. The following are the steps of the linkages between IC development and the strategic objectives of the company.

Referring to the Intellectual Capital Management (ICM) developed by MERITUM (2003), there is a three-step operation of the company's strategic objectives, if it is associated with IC component. The first step is the identification of intangibles assets, second is the measurement, and the third is monitoring.Operational measures have also become the covered material during the in-depth interviews with key informants and the FGD.

The first step was conducted by identifying intangible assets. It means that the company should be able to do the identification of the essential components of HC, SC, and RC. Determination of the company's strategic objectives has to be followed by the identification of what important components should be prepared on HC, SC and RC aspects. This identification will be subdivided into several stages, namely critical intangibles, intangibles resources to create or to develop, intangibles activities to improve resources, and intangible activities to assess results. The first step is then discussed with the FGD participants. In general, these things have become accustomed done by informants in a pharmaceutical company that is when the company has a strategic goal to be achieved, the company will take steps ranging strategic to the technical implementation. This critical intangible is understood by informants as the establishment

of key performance indicator. Informants KK argue about the critical intangible such as KPI. This is the following opinion of informants KK:

"So, the critical intangible determination is similar to KPI (key performance indicator) sir. Every year, the company has the corporate goal. This year what do we want. From that desires or goals, each of them has the departments. There is director of marketing, the director of finance, director of human resources and so on. From that target each will count, which one we lack. Let's say an increase of 10% or 20% of that now exists. Then all will be counted whether its human resources are sufficient, whether the engine is sufficient, whether the marketing is also sufficient. It can already count them respectively. Marketing, for example, he would see about my team is not enough to reach targets like that, do I have to add a team member or its sales force or add its strategy, also include bonuses. If you can achieve the particular target then this is the bonus, this target can get this bonus. It is the same way in other division, sir, down to the lowest level. All will perform according to the target that has been set in accordance with the company's strategic objectives. So from the bottom moving up that ended up going towards goal or company's strategic objectives that has been set before"*(Opinion of KK at FGD)*

When being asked to explain more technical things associated withintangible resources and activities, informants KK argued as follows:

"Yes sir, starting from the top, is what the chairman wants to. Then, the level of director should be gathered, discussing the problem of companies. After the meeting, it is usually not too detailed, just about the want of the sales to be arisen, at the time so and so. Just like that. Then, it was passed to each department. If I want this, what do you want? So that subordinates also like that, if my boss want this then I have to do this, this, and this. For example, if the HR is less than it is conducted new recruitment. If the engine is less then I have to add to the machine, or so the shift-work system are changed. It also includes marketing strategies need to reform, that is it sir"(Opinion KK at FGD)

The second step of operationalization of strategic goals when associated with IC component is to perform the measurement on intangible resources and intangible activities. Here are the opinions of the informants about measurement which is usually conducted in pharmaceutical companies:

"We usually use Mr. Erwin's SMART, namely Specific, Measurable, Accountable, Reliable and Timeable" *(Opinion KK at FGD)*

Likewise with the opinion of the informant AP related to measurement is conducted for the marketing department. AP opinion is as follow:

"The marketing department is easy to measure, sir, just about they reach any target or not. How many percent can be achieved are clearly the consequences of each of them"*(Opinion AP at FGD)*

Almost the same opinions are submitted by DDOR, that the measurements were conducted by comparing between the target and realization. Here the DDOR opinion:

"Yes sir, so much more is measured from the target and realization. If from the financial side is almost the same. Usually we measure monthly, quarterly, semiannual, and annual. Each product can be known to their respective

contributions. On these data will be evaluated and what they should do what *"(an excerpt of an interview with DDOR)*

The third step in the operationalization of the strategic objectives with IC component is monitoring. Monitoring activity is done when activities are going or when the intangible activities are working in order to achieve the strategic goals of the company. According to the informant KK, monitoring was done based on the timeline.

> *"A*ny specified target, though, has its timeline. For example the first year or the first six months have to meet this target, this and this. The next six months should meet this target and this. How a company like that just to monitor this pack. So during the first quarter it was no problem between target and the realization in the quarter will be boosted what the problem is then solved together. Maybe its HRD need to recruit new employees." *(Opinion KK at FGD)*

Monitoring activity can also be done through the company database, such as the monitoring of consumer dissatisfaction which was measured by looking at the number of complaints from time to time. The following is ER's opinion:

> "Yes for measurement or monitoring can be seen from two things Sir, namely from the sales or financial performance. If for non-financial consumer satisfaction, we normally see from the number of complaints that go on our products, Sir. Usually in the data already exists, remains to be seen over the years as to what, so pack *(ER's Opinion at FGD)*

Based on the comments and opinions of the FGD participants, the company's strategic objectives setting is commonly conducted and is strongly associated with the resources and activities that go with it. It means that the concept of the development of the IC can be accepted and have become usual routine performed by the company when associated with the strategic objectives of the company.Only the names and terms are different between the practice in the field and the theoretical study suggested by the researchers.

Similarly, the combining two existing theories, i.e., CICM by Ali (2003) with the concept of ICM by The MERITUM Project (2001) are acceptable. Merging the two theories would be very useful for pharmaceutical companies. CICM Theory which produces IC development at each stage (knowledge management, innovation management, and intellectual property management) will benefit, namely 1) the company can determine its position on the stage CICM which for the time being and 2) after knowing the position of the company will be able to develop HC, SC, and RC according to the stages CICM. By knowing the IC in accordance with the development stages that exist in theory CICM it will be easier to connect with the company's strategic objectives in accordance with ICM theory put forward by The MERITUM Project (2001).

B. CICM and ICM Integration as New CICM Model

To gain the results of research related to the new model of CICM, there were several stages needed. The first phase was associating the IC with the company's strategic objectives. There were three steps needed concerning IC development with the strategic objectives of the company. The first step was the identification of intangibles assets, the second was the measurement, and the third was monitoring. The first step was the identification of intangible assets associated with the company's strategic objectives. At this stage, the company's strategic objectives determined in advance. Next, each department will review and analyze the company's strategic goal setting with the resources

that are owned by their respective departments. If the resource is already known to exist, each department will determine the critical intangible assets that support the company's strategic goals. Determination of critical intangible assets is interpreted as well as key performance indicator (KPI), which has been done in several pharmaceutical companies. Determination of critical intangible assets can be performed on all components of the IC, both for HC, SC, and RC. When linked with the CICM, intangible assets critical determination can be done for a good three stages for knowledge management, innovation management, and intellectual property management. The critical determination of intangible assets will be followed by intangible resources and intangible activities.

The second step is operationalization of strategic goals. If it is associated with IC component, it is needed to perform the measurement on intangible resources and intangible activities. In general, the measurement is done by comparing the target and realization. The departmentsthat clearly use such measurement are the marketing and sales. Performance measurement was also done on financial and non-financial aspects. To finance, for example due to strong sales of the company, while for non-financial is customer satisfaction survey or drug users. This measurement was conducted at the end of the work period or program.

The third step in the operationalization of the strategic objectives with IC component is monitoring. Activity monitoring is done when activities are ongoing or when the intangible activities areunderway in order to achieve the strategic goals of the company. Monitoring can be done based on the database of the company, periodically. For example, the sales target must be achieved within six months, and then the monitoring can be done in a bi-monthly or monthly basis. At the time of monitoring strategic steps can be taken when reality does not show the results that being targeted.

Based on these results, the concept for the IC development is connected with the company's strategic objectives using THE MERITUM project (2001) recommendations. This means that this research combined the two existing theories, i.e., CICM by Ali (2003) with the concept of ICM by The MERITUM project (2001). Merging the two theories generate new CICM model or CICM plus (CICM+).

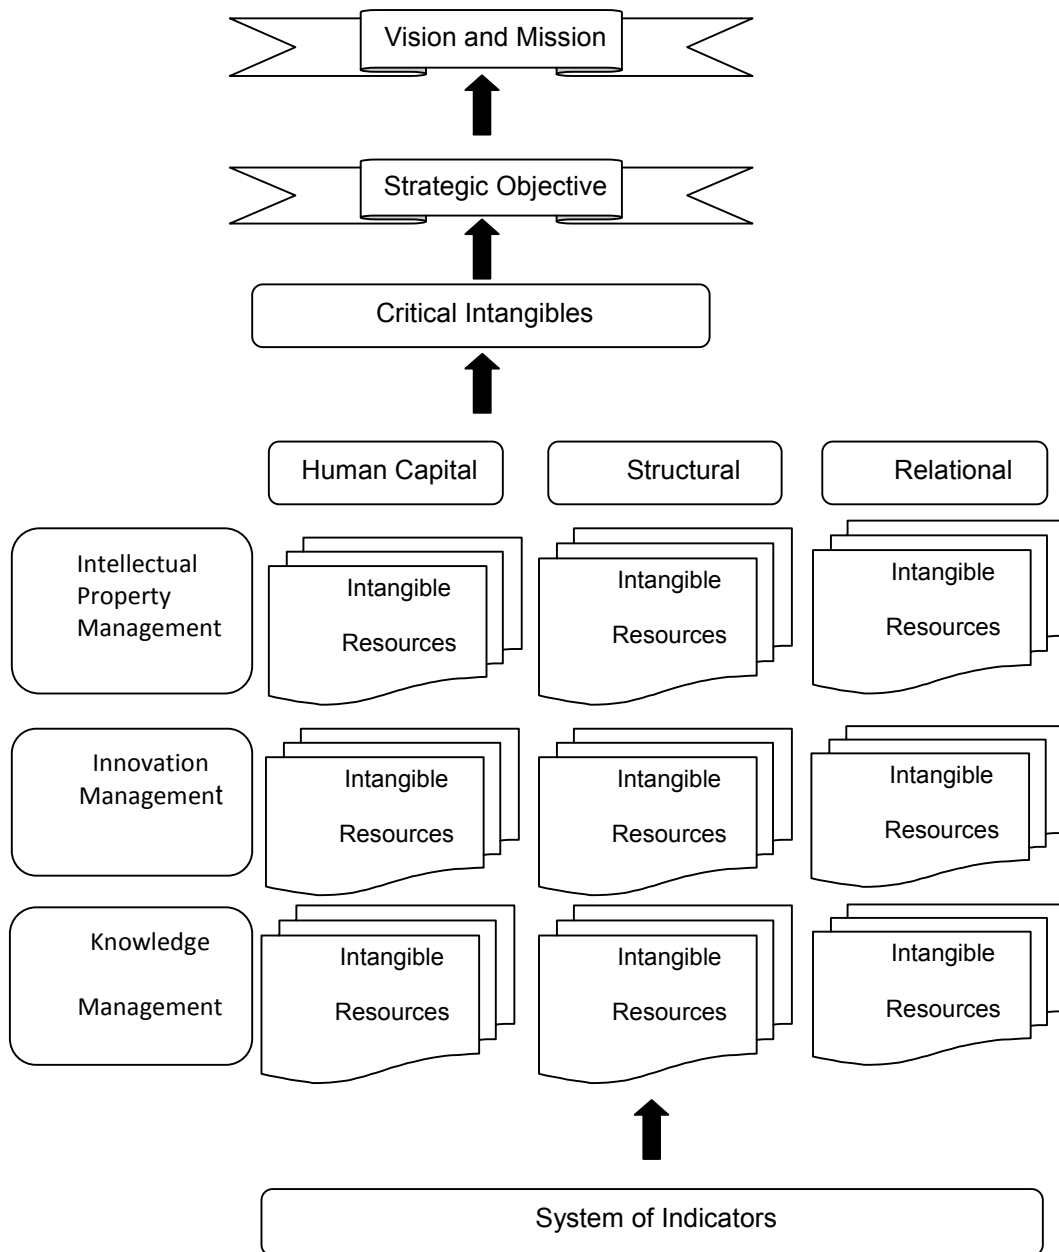
CICM Plus Model (CICM+) as Figure 4, begins with determining the indicator system or forming a key component of HC, SC, and RC. Next is the development of HC, SC, and RC components at every stages of CICM, namely knowledge management, innovation management, and intellectual property management. It means that in this CICM stage, pharmaceutical companies must recognize at what stage the company is located. Based on the characteristics that exist in every stage, the development of components HC, SC, and RC can be done. The IC development course should pay attention to intangible resources that exist and then manifested in the form of intangible activities which are effective in accordance critical intangible assets and corporate objectives that have been set. In the end, critical intangible assets and strategic objective is to be able to realize the vision and mission of the company. Figure 4 shows the CICM Plus models (CICM+)


Figure 4
CICM **Model** *Plus (CICM+)*
(Source: Developed by researchers)

Meanwhile, the development of the research related to the development of the IC with the strategic objectives of the company is the emphasized on each step in the pharmaceutical companies due to the fact that these measures have been implemented and are commonly used as part of the monitoring and evaluation work program. For example, in the first step, it is becoming the emphasis is critical determination intangible assets that must be conducted properly and appropriately. To do that, a complete data base that supports strategic decision making is needed, and so with the intangible resources and activities that follow the critical intangible assets. The accuracy in determining these three things and also how to run activities program becomes an important part in order to achieve the company strategic objectives. The second step is also important because it is associated with measurements carried out on a work program that has been set. Based on the research results, measurements made by pharmaceutical companies until now is

conducted by comparing the target and realization. Measurements are also more on financial measures, but there are also non-financial measures should also be considered by pharmaceutical companies. The third step, monitoring, is important to get attention from pharmaceutical companies as it relates to investments made in intangible resources and intangible activities. The results of this monitoring could be a new activity that will improve intangible resource is new one, and so on. These monitoring activities are carried out in internal intangible resource and also in internal intangible activities.

When linked with the theory, the results of this study correspond to the resource-based theory (Wernerfelt, 1984; Barney, 1991) and the intangible perspective (Andriessen, 2002). According to the resource-based theory, both tangible and intangible assets are the potential strategic assets. Therefore, companies must be able to obtain, acquire, and use those assets to improve performance and competitive advantage. In this study, the CICM plus (CICM+) model proved to be associated with the company's strategic objectives, vision and mission of the company and can explore the hidden activity in the form of intangible resources and activities. This makes the performance and increase competitive advantage if pharmaceutical companies can manage the IC because the IC qualification as a strategic asset lies in the potential relationship between IC with firm performance (Belkaoui, 2003).

Meanwhile, according to the intangible perspective, the IC owned by company is a huge intangible assets and financial contribution to the economy of the company. Company's IC,which consist of HC, SC, RC, is the main capital of the company in the management of intangible assets. When linked these results with the intangible perspective, it can be seen that IC owned by pharmaceutical company as a resource that can contribute to the economic and financial for the pharmaceutical companies. Thus, pharmaceutical companies must empower IC with digging more intangible resources of the company and do the intangible activities in order to support the achievement of strategic objectives company.

C. CICM Plus (CICM+) and Opportunities for Strategic Management Accounting (SMA).

The new CICM model or CICM Plus (CICM+) is the result of a value creation process starting from the identification of intangible assets owned by the company. Further, it is necessary that the critical intangible assets be adjusted to the company's strategic objectives. The critical determination of intangible assets will be followed by intangible resources and intangible activities. The determination of the first step with a key indicator system of HC, SC, and RC components is also an important part of the CICM+ model. Similarly, the determination of intangible resources and activity in each stage of knowledge management, innovation management, and intellectual property management should also be adjusted with the HC, SC, and RC components. So we can say that at this stage, it is really a process that explores the hidden assets, the flow of knowledge, establishing targets, market share, and determine the other non-financial activity including financial activities such as determining the cost, volume, price, cash flow, and determining the adequacy of resources owned by company. Next, all the non-financial and financial activities that must be in accordance with the company's strategic objectiveswhich must also be adapted to the vision of company. The latter two activities (strategic objective and vision and mission) are included as strategic activity that should take company's external factors consideration including competitor or competitor companies. Thus CICM+ model is a combination of internal activity (non-financial and financial) and external activities which also focuses how companies can compete with competitors.

By viewing and considering the CICM+ models, the opportunity for developing the SMA is opened. Within a period of 30 years since its emergence in the 1980s, SMA is still searching for its form (Soljakova, 2012). SMA development referred above is the opportunity of CICM+ model as SMA techniques. The purpose of SMA techniques is to provide for strategic decision making based on the information on the financial implications of business strategies based alternative (Juras, 2014). The use of CICM+ as SMA techniques is reasonable for several reasons:

1. CICM+ contains non-financial activities and financial activities including cost efficiency in taking decision.
2. CICM+ set routine activities and the development of business strategy and vision of company
3. CICM+ also set about customers, competitors, brand and relationship with the external
4. CICM+ identifies intangible assets, measurement, and monitoring.
5. CICM+ improves performance and competitive advantaget hrough the identification of intangible resources and activities on the stage of knowledge management, innovation management, and intellectual property management.

The use of CICM+ as SMA is justified because the techniques are supported by Lord (1996) which states that the functions of SMA relates to 1) collecting information related to the competitors. 2) using accounting for strategic decision; 3) cutting costs on the basis of strategic decisions; 4) and, gaining competitive advantage through it.

Conclusions, Implications, And Limitations Of Research

The conclusion of this study is that CICM as part of the development of the IC can be developed into a new model, the CICM plus (CICM+) which is the integration between the CICM with ICM. CICM+ contains a number of activities both financial and non-financial and strategic activities of the company. Identification activities of critical intangible assets, measurement, and monitoring are the activity of CICM+ in addition to the stages of knowledge management, innovation management, and intellectual property management. Having regard to the activity are such that the CICM+ is then very feasible if CICM+ is part of the development of SMA, namely the SMA techniques. This CICM+ will contribute to the development of SMA because it meets the SMA functional criteria, which is capable of collecting information about competitors, using accounting as a decision taking, using the load as a base of strategic decisions, and gain a competitive advantage through it.

The practical implications of this research are the company will gain more benefit by using CICM+ because not only the internal activities,the external activities of a strategic nature can also be obtained. Meanwhile, the theoretical implications derived from research is that CICM+ will further strengthen the role of the Resource Based Theory (RBT) in particular on the role of intangible assets and also in the intangible perspective. Another implication is that CICM+ develop further the concept of SMA and in particular on the subject of management accounting and management strategies.

The limitations of this study were that I did not using data collection techniques by participating observation that became part of the lives of informants at pharmaceutical companies. It was caused by the intensity of the preoccupations of the manager and also because the presence of the researcher will be disturbing for the company. However, further research by considering participating observation that became part of the lives of informants is still needed. Another limitation was that the study did not consider the origin of the informants (managers), whether the managers of large pharmaceutical companies,

medium, or small. Further studies need to involve the managers of several levels of the company.

Lastly, from this research, it is suggested that the organization develop its assets primarily on intangible assets or intangible assets by adopting various concepts IC management as well as models of CICM+. For other researchers focusing on the research of IC, there is still a wide-opened area to examine IC non-financial such as research and also developed various models of IC management as well as the CICM. For accounting courses, it is necessary to combine the two subjects between management accounting and management strategies into the management accounting course strategy.

Amila Azka Rachmayani, Universitas Padjadjaran, Indonesia

Abstract

Previous research about the existence of market discipline in Indonesia using third party's fund as the proxy concluded that Indonesia has the symptoms of market discipline although the effectiveness is still questionable. Therefore, the development of market discipline theory in U.S. said that market discipline can be achieved by subordinated debt investors as an alternative to enhance bank's supervision and prevent moral hazard. This study aims to prove the presence of the symptoms of market discipline performed by subordinated debt investors in relation to liquidity risk in bond and the reformation of deposit insurance policy from blanket guarantee to limited guarantee. Market discipline is proxied by the spread of the secondary price of subordinated debt, while liquidity risk is influenced by two factors; the bank's funding decision to issue subordinated debt (endogenous) and the bond market liquidity itself (exogenous).

Result showed that there are symptoms of market discipline on the subordinated bond investors in Indonesia through the bond market liquidity, while funding decisions and changes in deposit assurance do not have any significant effect. It can be caused by the funding decision models which cannot be fully implemented in Indonesia as well as the different assumptions of investors in assessing the risks of a deposit assurance.

Keywords: *Deposit Insurance, Market Discipline, Financing, Liquidity, Subordinated Bonds*

Introduction

The domination of commercial banks in Indonesia in the banking industry influences their behavior in making decisions including financing decisions related to excessive risk taking. Risks faced by the banks along with the emergence of more complex product innovations supported by advances in technology become new challenges for the regulator and supervisor of the financial system (Mardanugraha and Hadad, 2006). The role of Pillar 1 (minimum capital requirements) and Pillar 2 (the process of reviewing surveillance) in the framework of Basel II seemed necessary to include the involvement of the market to assess and control the tendency of banks in excessive risk taking which could lead to moral hazard behaviors that can adverse the market. Therefore, Pillar 3 (market discipline) is expected to be effective to optimize the function of bank as a publicly trusted institution.

Several previous studies about market discipline in Indonesia is commonly measured by Third Party Fund (DPK) and interest rate. Until now, researchers have not agreed yet whether the depositor's role as the owner of DPK has been effective in running the discipline of the market in Indonesia. The concept of universal banking which the practice started in U.S. after the Gramm - Leach - Bliley Act (1999) makes the level of bank risk supervision needs to be improved, particularly those involving the market as part of bank supervisors. The Fed discovered the power of subordinated bonds as an instrument

that can play such role. These instruments have been selected for investors who are genuinely sensitive to risk considering that its existence is not guaranteed if the bank failure happened, yet with a limited return on the coupon.

In Indonesia, research on this area has not been conducted even though the bond market has developed quite rapidly after the merger of the Jakarta Stock Exchange and Surabaya Stock Exchange. Thus, many investors are now able to monitor their investment activities easily. Up to now, the role of the subordinated bond investors in Indonesian discipline market is still questionable.

Subordinated bond investors have limited information in assessing risk. So, they forced to use available common information only, such as bonds' price, coupons, financial statements, market and industry conditions and general economic conditions. These limitations can reduce the accuracy of risk assessments performed. Bichler and Hancock (2003) denied the claim and said that investors are already more sophisticated, some even have been able to access private information so that the price of the bond is no longer only influenced by financial risk. It triggered the writing of Covitz et al (2002) to consider the liquidity risk in bond prices, including the funding decisions as a variable which proxy the endogenous factors, and the liquidity of the bond market as an exogenous factor.

The behavior of banks in taking risks can also be intervened by government policies, such changes limit the deposit assurance. The greater the government guarantees customers' deposits, the further both banks and customers will lower the guard. In the long term and critical condition, this phenomenon will lead to bank failures systematically.

This study is aimed at finding out: (1) whether there is an effect of funding decisions through the issuance of subordinated bonds on market discipline as measured by the spread of the secondary price of the subordinated bonds in conventional commercial banks listed on the Indonesia Stock Exchange during the period 2003-2014; (2) whether there is an effect of the bond market liquidity on the market discipline as measured by the spread of the secondary price of the subordinated bonds in conventional commercial banks during the period 2003-2014; (3) whether there are significant changes in the deposit insurance from blanket guarantee to limited guarantee on the market discipline as measured by the spread of the secondary price of subordinated bonds in conventional commercial banks in 2003-2014.

Literature Review
   1. Market Discipline
   Market discipline is generally understood as a situation where the other party (in this case is individuals as consumers) bears the costs associated positively with the risk of the bank's activities and reacts in accordance with the fee (Berger, 1991). For example, if the banks took excessive risks in their business activities, depositors would respond by withdrawing funds they saved there to avoid the impact of bank failure as a result of the excessively high risks, while investors and creditors will move or resell their instrument.

Conventionally, the potential presence of market discipline is measured by using the movement of the Third Party Funds' (DPK) volume compared to other variable factors, indicating that they could change market's behavior in assessing bank risk. The most common tools are deposit insurance or ratios depicting bank risks' profile such as Non Performing Loan (NPL), Capital Adequacy Ratio (CAR), Loan to Deposit ratio (LDR) and other ratios. In development, there are studies using other instruments as indicators of the occurrence of market discipline. One of them is subordinated debt/bond. Subordinated bonds have unique characteristics, namely the position (after the equity) is not guaranteed and will be lost if the bank fails, but the potential profit is limited to coupon agreed only,

as characteristics of debt in general. Therefore, Covitz, et al. (2002) stated that the investor's incentives for subordinated bond in keeping an eye on risk-taking banks are similar to the motives of the bank supervisors, but very different from the motives of equity investors in general.

Two spreads are intended in this study. First, Covitz, et al. (2002) used a derivative of each bond yield which is measured by the iteration method Newton - Ralphson with yields' interpolation on government bonds that have the same maturities. Whilst, Esho, et al. (2005) stated specifically that the spread is the difference between the yield to maturity of bank bonds and the interpolation of the return of the two risk-free assets in a country. Research conducted by Bichler and Hancock (2003) takes precedence why market discipline model using spread of subordinated bond cannot be seen directly using the default risk in general. Therefore, referring to the research of Covitz, et al. (2002), the spread model used is as follows:

$$SPREAD_{it} = f(E[FC_{it}], BC_{it}, OF_{it}, FD_{it}, IC_{it})$$

Where FC (financial condition) is a measurement of the companies' condition represented by the bank risk's ratios, BC (business and the bond market condition) is general business conditions such as macroeconomic condition in a country and the condition of the bond market as bond trading place, OF (organization specific factors) is the condition of banks that may affect the overall activity of the bank such as bank size as measured by the natural logarithm of total assets, and FD (financial decision) is the probability of funding decisions by banks to issue subordinated bonds. FD is particularly created through a model which was converted into probability form by using the Inverse Mills Ratio from the probit estimation. IC (Instrument Characteristic) issued will also affect the liquidity, for instance: maturities, coupon frequency, call right and the issue size.

2. Financing Decision

The funding decision is strongly influenced by current financial condition and future prospect. Covitz et al. (2002) suggested the probability model of financing decision to issue companies' subordinated bonds is created through probit model by considering the financial condition of the banking organization, organization/banking specific factors, business and bond market conditions, and supervisory pressure.

3. Liquidity of Bond Market

Liquidity shows the ability to buy or sell certain securities quickly (marketability) and at a price that is not too different from the previous price (Sharpe, Alexander and Bailey, 2005:359). Liquidity is an important consideration for investors and public firm, because the illiquid market will cause the securities sold at a higher price to cover the liquidity premium. The price difference of the illiquid securities is called a liquidity premium, which is a premium of a security that is added in the selling price for such securities not easily converted. Therefore, Covitz, et al. (2002) concluded that the liquidity of the bond market had negative effect on bond spreads.

4. Deposit Insurance

Deposit insurance is one of the government's efforts to restore depositors' confidence in the banking system by guaranteeing some or whole deposits in the bank. Deposit insurance in Indonesia was first applied when public confidence in the domestic banking system decreased after the liquidation of 16 banks and difficult macroeconomic conditions in 1998's monetary crisis. Indonesia experienced bank runs, investment funds massively went out the country. To overcome this, the government issued a number of policies, one

of which is the whole deposits of bank's customers were being guaranteed, known as the blanket guarantee system. On the one hand, this system will quickly restore public confidence in the banking system, but on the other hand will lead to the presence of moral hazard in the behavior of banks in taking excessive risks (Binh, 2014).

Hypothesis

H_1: The funding decisions by issuing subordinated bonds negatively affect the spread of the secondary price of subordinated bonds.

H_2: Bond market liquidity negatively affects the spread of the secondary price of subordinated bonds.

H_3: Changes of deposit insurance from the blanket guarantee to limited guarantee positively affect the spread of the secondary price of subordinated bonds.

Research Methods

The research method used a descriptive and verification method. The object of this research is the market discipline of commercial banks listed on the Indonesia Stock Exchange and operates during the period 2003 to 2014. This study used spread of secondary prices that represent subordinated bonds market discipline as the dependent variable. The independent variables in this study are funding decisions, the liquidity of the bond market, and deposit insurance (backlog) as a dummy variable. In addition, this study also includes control variables such as the financial condition of the bank, the size of the bank, the amount of subordinated bonds, and excess return of the stock market.

Data processing techniques performed in this study is the use of Heckman Selection Model on a panel data set, the second phase using dummy variables for the backlog of the blanket guarantee and a limited guarantee period, with additional control variables that will enhance the model.

This study uses population of all banks operating in Indonesia. By using purposive sampling techniques, 14 commercial banks are acquired as sample. Criteria for the sample used in this study are:

1. The banking company registered in Bank Indonesia and the Financial Services Authority
2. The bank issuing continual quarterly financial statements in the period 2003 to 2014
3. Not Regional Development Banks
4. Not Rural Banks
5. Bank registered as participants in the Deposit Insurance Agency (LPS) since 2006
6. Bank which had issued bonds at least once between 2003 and 2014.

Findings

Selection of the model estimation through Chow Test and Hausman - Lagrange Multiplier test indicates that it was done by the estimated regression common effect, or Pooled Ordinary Least Square (OLS). Data have passed the test classic assumptions of normality and multicollinearity. The problem of heteroscedasticity in the data will be handled using White's robust standard errors in the regression.

Hypothesis testing was performed by using the model of Heckman, the Two - Stage Model Selection is also called Type II Tobit. This model was chosen to suit the type of data that is censored, the variable Y (SPREAD) which, if done using the usual linear regression (OLS) will give biased results. When the bank decided not to issue subordinated bonds, SPREAD value will be 0, and this observation should not be included in the regression analysis. This indicates that the sample selection is not random, but through certain criteria, namely the time of bank issuing subordinated bonds.

This study has a total number of 168 observations (n =14, T = 12), but not all observations were considered as a value of 0 which is on SPREAD is not a real value, but it is a missing value. Heckit Model provides a solution for types of data which sets like this, namely through a two-stage regression. The first stage is a probit regression to generate the probability of banks in issuing subordinated bonds, then the second stage is Pooled OLS regression to include Inverse Mills ratio (MILLS) as independent variables representing funding decisions in the regression of the SPREAD.

Probit Regression

Based on the research results, the financing decision model initiated by Covitz et al. (2002) could not be fully implemented in Indonesia, pictured from the goodness of fit stating that the factors affecting funding decisions in Indonesia are not likely for the five factors mentioned above. It can be influenced by different regulations, industry conditions and prevailing banking system with U.S., the original research took place. However, eight of the 11 variables indicate a match against the expected sign. Only LDR, ROA, ROA and TETA are not in accordance with the expected sign.

The second table on testing this hypothesis is Pooled Ordinary Least Squares regression, with the addition of Inverse Mills ratio (MILLS) as independent variables. MILLS was obtained from the calculation already integrated with statistical software, and is used as a proxy for the financing decision. Beside being the new independent variable, MILLS also takes a role as a filter for uncensored variables. Thus, the number of observation decreased from 168 to 34 observations. Even with barely significant variables, through multiple correlation analysis, this model can be said to fit R^2 values of 76.47 %. This result can be caused by the small numbers of eligible sample yet the high numbers of variables in this Covitz's replication model. Sometimes, too many variables could also distort the real model fitness.

Variable in bold is the independent variable in the study, while the other is a control variable. The use of control variables is consistent with research Covitz et al. (2002), Caldwell (2005) and Esho et al. (2005), to reduce the distortion in the results of the regression. Simultaneous test on the regression (F-Test) reject H0, meaning that there is at least one independent variable which has a significant influence on the dependent variable.

The independent variable LNFREKUENSI which is the proxy of the market liquidity of bonds to yield significant results with signs of regression coefficients corresponding to the expected sign, while MILLS as the proxy of the funding decision also has signs in accordance with the expected sign, but the level of significance is so weak that H0 of the hypothesis is may not be rejected.

Dummy variable value equals to 1 in the period limited guarantee and 0 in the blanket guarantee. This regression has a positive coefficients and in accordance with the expected sign with a very weak significance. It means that the change of guarantee regime from blanket guarantee to a limited guarantee does not significantly increase market discipline (proxied by spread of the secondary price of subordinated bonds) so that the H3 is rejected.

Four of the eight control variables produce the appropriate sign with the expected sign, but nothing significant at the level of 10 %. According to previous similar studies, this may happen simply because it has been concluded by Bichler and Hancock (2003) that the spread of the secondary price of subordinated bonds is not directly affected by the financial ratios of banks.

Discussions

In this study, the financing decision variables are represented by the ratio of Inverse Mills producing a negative regression coefficient, in accordance with the expected sign despite the very weak level of significance. The weak level of significance can be caused by the unfitness of this probit model in Indonesian research. Models that do not fit the funding decision is most likely caused by proxy selection factors. Most of the entire press release on the bank's official website that issued the subordinated bonds stated that the main factors why the manager funding issues this type of bond is to strengthen and maintain the capital structure of banks without increasing the risk for these types of bonds including unsecured assets. The benefit was for the bank as in accordance with Bank Indonesia Circular Letter No.26 / I / BPPP dated May 29, 1993, the sale of these bonds may be included in the calculation of lower level of supplementary capital (lower tier 2 capital) related to the Capital Adequacy Ratio (CAR). This ratio needs to be managed for being one of the requirements for business expansion, which is specifically performed by accelerating credit growth and optimizing lending nominal to customers.

Contrary to the logic of this study, that a large or small value of CAR does not trigger funding managers to issue subordinated bonds, but bond issuance is expected to strengthen the CAR of the bank. Moreover, the standard deviation value of the variable CAR indicatingthe number is relatively small, so statistically the value is quite dense. This causes the regression results on the research showed that the CAR had no effect on subordinated bonds.

In addition, funding manager is also likely to assess the condition of the economy in different ways. This study is only limited to use Unemployment Rate and the excess return of the stock market as a proxy for economic conditions. Those two things may indeed not affect the issuance of subordinated bonds because there are many other macroeconomic factors that may be used as alternative references, namely the value of the rupiah against the dollar, balance of payments, and others. Therefore, the new bond is not seen as an asset that is free from liquidity risk by investor and the consideration of purchase prorated the bonds previously published. Unattractiveness of these bonds causes no change of the frequency of bond trading, with prices and spreads which are also not affected by the issuance decisions.

Regression analysis states that the liquidity of the bond market significantly influences the spread of secondary price of subordinated bonds. Thus, investors are very careful in considering bond market conditions in deciding their investment strategy, thus the decrease of market liquidity will jack the liquidity premium up (liquidity risk) on the bonds. As previously explained, that the greater the liquidity premium, the more likely the spread increases.

In fact, the regression results of this study show that the decrease in the deposit insurance led to an increase in market discipline, albeit in a very weak level of significance. No significant results could be due to factors that influence investors' decision to buy or hold the bonds does not apply in general circumstances. On the opposite, investors can assume that the reduction in the backlog will increase awareness of the bank, so the bank is considered to improve the effectiveness of its internal risk management. Risk management would maintain or even improve the bank's ability to pay its liability to the bond investors. Moreover, the subordinated bond investors do not feel the benefits of this guarantee. It is directly due to the subordinated bonds which are unsecured instruments so that the effect of the changes does not make investors more cautious in bank supervision. The weakness of this correlation supports Taswan (2013)'s statement that there was no statistically significant difference in the change in backlog prevailing in Indonesia to market discipline. In many countries, several researches had been conducted to prove the same point, such as Forssbæck (2011), Demirgüç-Kunt and Huizinga (2004) and Imai (2006) in Japan. This study however has a particular aim to focus on the market discipline run by bond investors in Indonesia.

Conclusion

From these results, it can be concluded that the funding decision to issue subordinated bonds did not significantly affect the subordinated bond spreads. That is, the newly issued bond investors are not seen as an asset that is free from liquidity risk and consideration of purchase prorated to the bonds previously published. Unattractiveness of these bonds causes no significant change of frequency trading, with prices and spreads which are also not affected by the issuance decisions.

In addition, the liquidity of the bond market significantly influence the price of secondary spread of subordinated bonds. In other words, investors are very careful in deciding their investment strategy by supervising bond's market conditions. Thus,

decreasing market liquidity will improve liquidity premium (liquidity risk) of the bonds, and spreads will increase.

While the decline in backlog does not increase market discipline. No significant results could be due to factors that influence investors' decision to buy or hold the bonds which does not apply in general. Moreover, the subordinated bond investors do not feel the benefits of this guarantee. It is directly due to the subordinated bonds which are unsecured instruments so that the effect of the changes did not make investors more cautious in supervising bank.

Although the results of this study stated symptoms discipline of the market in Indonesia which is still weak, these symptoms can be a reference for frequency trends bonds trading in the secondary market that is still and will continue to grow. U.S. and Mexico have taken advantage of this symptom as an academic support to submit proposals regarding the obligation of banks to issue subordinated bonds each year in a certain minimum amount, and has been implemented up to now. Development of this research is expected to be conducted primarily on the enhancement of financing decision model to submit a similar proposal in order to improve the discipline of the Indonesian banking market.

ANALYSIS OF FACTORS AFFECTING AUDITOR SWITCHING

Bertilia Lina Kusrina, Gunadarma University, Indonesia
Prima Yulivani, Gunadarma University, Indonesia

Abstract

This study aims to determine the factors that affect the auditor switching, i.e. management turnover, the size of firm, financial distress, the size of company, audit fee, and ROA. By using purposive sampling, there are 17 samples of 85 banking companies listed in the Indonesia Stock Exchange with the observation period of 2009-2013. Data Processing and Hypothesis Testing in this study use logistic regression analysis. Partial test results show that only the turnover of management that significantly influences the auditor switching, while the size of the firm, financial distress, the size of the company, the audit fee and ROA do not significantly affect on the auditor switching. Simultaneous testing results show that all independent variables simultaneously affect the auditor switching.
Keywords: *Auditor Switching*

Introduction

Company management has a responsibility to present the financial statements which are an overview of the performance achieved by the company in a particular accounting period. The financial statements prepared by the management of the company could potentially be influenced by personal interests (management). Therefore, it requires the services of an auditor as a third party of the company management that connects with parties outside the company and is responsible for providing assurance about the fairness of the financial statements presented by the company management. An auditor should be able to maintain the independence, integrity and objectivity in conducting the audit. Definition of independence is a mental attitude that is free from influence, not controlled by the other party and does not depend on others. The independence also means that the auditor must be honest in considering the facts as reality. It means that if the auditor finds fraud in the client's financial statements, the auditor shall dare to express an opinion free from client pressure or other parties who have interest to the financial statements (Aprilia, 2013).

Today, it begins to appear doubts about the independence of the auditor due to the emergence of cases of Eron and Arthur Anderson accounting firm in December 2001. One of the causes of the problem is the future independence of the audit engagement (audit tenure) between the client and the Certified Public Accountant (CPA). In Indonesia, the regulation of audit firm rotation is stipulated in the Regulation of Minister of Finance of the Republic of Indonesia Number 17/PMK 01/2008 on "Public Accountant Services". The changes made include the provision of audit services to six years in a row by the CPA to the same client and CPA may receive back an assignment after one year of closing book not providing audit services to clients.

But in reality there are still many companies that perform voluntary switch of auditors. Though the switch of auditors which too often can cause the cost higher, because the auditor requires higher start-up costs that can ultimately increase the audit fee. Start-up costs are high because the auditor who first conducts an audit of a client needs to understand the client's business environment and the risk of the client audit. In addition, the first assignment is proven to have high possibility of errors (Nasser et al, 2006).

Research Framework

Figure 1 below presents the research framework. This figure shows the relationship between the independent variables of management turnover, the size of firm, financial distress, the size of company, audit fee, and ROA to auditor switching as dependent variable.

Companies tend to select the auditor of CPA with better quality to improve the quality of financial statements to enhance the company reputation. The big CPA (Big 4) is considered to be capable to produce higher quality audits than the small CPA. The bigger CPA or Big 4 is also considered to be more independent than the smaller CPA in terms of withstanding pressure from management. Therefore, for the first hypothesis is stated as follows:

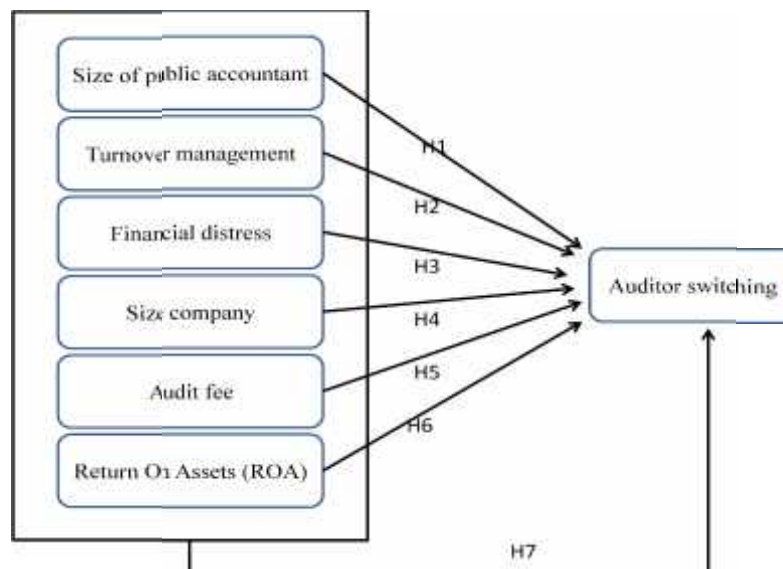
H$_1$: Size of CPA affects the auditor switching


Figure 1. Research framework

Turnover of company management happens when the company changes the board of directors. Damayanti and Sudarma (2008) claimed that a change of management is the turn of the directors of the company that can be caused by a decision of general meeting of shareholders or the directors quit because of their own will. If a company changes its board of directors, the new directors or commissioners will lead to changes in company policy. Every management has leadership style and different purpose. Management turnover directly or indirectly encourages the auditor switching because the new management company will tend to seek the CPA which is in accordance with management policies. Therefore, the second hypothesis is stated as follows:

H$_2$: The turnover management affects the auditor switching

The financial condition of the client company may have a significant impact on the decision to retain or switch the CPA. Companies threatened with bankruptcy are more often switching CPA than the companies that are not threatened with bankruptcy. Uncertainty in the business of firms that are threatened with bankruptcy (financial trouble)

namely financial distress will tend to switch the CPA than the companies with good financial state. The third hypothesis is stated as follows:

H$_3$: Financial distress affects the auditor switching

Selection of CPA can be attributed to the size of the client company and the type of service required. The greater the auditee faces the problem which is more complex, the more it requires a CPA that can reduce the agency cost (Watts and Zimmerman, 1986) in Nasser et al., (2006). Large sized companies make the principals difficult to monitor the actions of the agent that may tend to maximize personal gain rather than principal profit (Juliantari and Rasmini, 2013). Therefore, for the fourth hypothesis is stated as follows:

H$_4$: Size of company affects the auditor switching

Audit fee is one consideration in choosing a CPA. When the audit fee exceed the tolerance limits set by the company, the company will seek CPA bidding lower audit fee even though they have to switch the auditor who usually audit the company's financial statements. They will try to do the auditor switching so that they can find better deals with the audit fee they offer. Therefore, for the fifth hypothesis is stated as follows:

H$_5$: Fee audit affects the auditor switching

ROA (Return on Assets) is a proxy of the client reputation (Mardiyah, 2002). In addition ROA changes can also be used as an indicator of the company's financial condition to see the business prospects of the company. The higher the ROA value means the more effective management of assets owned by the company and the better the business prospects (Damayanti and Sudarma, 2008). Companies that have lower value of ROA tend to switch auditors because of decreased performance so that business prospects decline. In this case it means the company's financial condition declines resulting in management to tend to look for new auditors who are able to hide the state of the company. Therefore, for the sixth hypothesis is stated as follows:

H$_6$: ROA affects the auditor switching

Together the independent variables of management turnover, the size of firm, financial distress, the size of company, audit fee, and ROA affect on auditor switching. Therefore, for the seventh hypothesis is stated as follows:

H$_7$. Management turnover, the size of firm, financial distress, the size of company, audit fee, and ROA simultanously affect on auditor switching.

Research Methodology

The research data is the data of financial statements of banking companies listing on the Stock Exchange in 2008-2013 (www.idx.co.id.) using purposive sampling of a total population of 85 banking company, it is acquired only 17 banking companies eligible to condition predetermined that is being registered before 2008 and publishing the complete financial statements. Data analysis tools use logistic regression analysis with SPSS assistance.

Operational variables in this study consist of one dependent variable (Y) is the auditor switching and six independent variables (X) which is a size of CPA, management turnover, financial distress, the size of the company, the audit fee and ROA.

- Auditor switching referred to in this research is the switching of CPA conducted by the company voluntarily. Variables of auditor switching use dummy variables. Code 1 is given if the company switches CPA while the code 0 is given if it does not switch CPA.
- Company size was measured with a dummy. Code 1 is given if the company uses the Big Four accounting firm while the code 0 is given if it does not use the Big Four accounting firm.
- Financial distress was measured using:
  DER (Debt to Equity Ratio) = (Total Debt) / (Total equity) x 100%
- Company size is measured using the natural logarithm of total assets.
- Audit Fee is measured using the natural logarithm of professional fees
- ROA is measured using

$$: Percentage\ change\ of\ ROA = \frac{ROA_t - ROA_{t-1}}{ROA_{t-1}}$$

Roa_t = Return On Assets Period t
Roa_{t-1} = Return On Assets Period t-1

Results and Discussion

1. Result

The coefficient of determination used to determine how much the independent variables are able to explain the dependent variables. The coefficient of determination on the logistic regression can be seen in the value of Nugelkerke R Square. Value of Nugelkerke R Square can be interpreted as the value of R Square on multiple regressions (Ghozali, 2013).

Table 1 Coefficient of determination (*Nagelkerke R Square*) Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	71,149[a]	,178	,276

Source: data processing

Table 1 shows the value Nagelkerke R Square is 0.276, which means the dependent variable explained by the independent variable is 27.6% while the remaining 72.4% is explained by other variables outside the research.
Partial test in this study is to examine the effect between the independent variables which are size of CPA, management turnover, financial distress, the size of company, audit fee and ROA to auditor switching. In a logistic regression such influence can be seen in the table of variable in the equation. Wald value in the table can be analogized as t, while column B is the coefficients and constants. Using α = 5%, it is known that the management turnover (CEO) is the only variable that significantly affect the auditor switching (Table 2).

The regression model is obtained as follows:

$SWITCH = 0,035 - 0,614KAP + 1,339CEO - 0,004DER - 0,223ASET + 0,225FEE + 0,759ROA$

Table 2
Partial Test

Variables in the Equation

		B	S.E.	Wald	df	Sig.	Exp(B)
Step 1ᵃ	KAP	-,614	,791	,602	1	,438	,541
	CEO	1,339	,656	4,169	1	,041	3,817
	DER	-,004	,058	,005	1	,942	,996
	ASET	-,223	,387	,332	1	,565	,800
	FEE	,225	,314	,515	1	,473	1,253
	ROA	,759	,452	2,820	1	,093	2,136
	Constant	,035	7,197	,000	1	,996	1,035

Table 3
Simultaneously Test
Omnibus Tests of Model Coefficients

		Chi-square	df	Sig.
Step 1	Step	16,619	6	,011
	Block	16,619	6	,011
	Model	16,619	6	,011

Source: data processing

Onimbus test results obtained by Chi-Square coefficient of 16.619 with a significant level of 0,011 is smaller than alpha by 5% (0.05). It can be concluded that there is a significant relationship between size of CPA, management turnover, financial distress, the size of company, audit fee and ROA simultaneously (together) against the auditor switching.

2. **Discussion**
a. **The affect of size CPA on the auditor switching**

The affect of size CPA on the auditor switching show that the negative regression coefficient -0,614 with significant value of 0.438 is greater than α = 5% (0.05). This means that the size of CPA does not affect auditor switching. This study supports research conducted by Damayanti and Sudarman (2008) and Wijayanti (2010). But this research is contrary to research conducted by Nasser et al., (2006) and Sinarwati (2010).
Big Four CPA tends to have better skills in auditing and generate audit quality higher than non-Big Four CPA. So as to enhance the credibility of financial statements and to attract investors, the company will use the audit services of the big four CPA. This is the reason of companies who already used the big four CPA to not move to non big four CPA. While the companies that do not use the big four not to switch to the big four is more because of cozy relationship between the company and a CPA who already know the ins and outs of the company.

b. The Affect of Management Turnover on The Auditor Switching

The affect of management turnover on the auditor switching show that the positive regression coefficient of 1.339 with significant value of 0.041 is smaller than α = 5% (0.05). This means management turnover affects the auditor switching. This study supports the research conducted by Sinarwati (2010) and Susan and Estralita (2011). But this research is contrary to research conducted by Damayati and Sudarman (2008) and Prahartati (2013). Management turnover will directly or indirectly encourage the auditor switching because the new management of the company will likely seek CPA in harmony or in accordance with the desire of companies either in reporting or in accounting policies.

c. The Affect of Financial Distress on The Auditor Switching

The affect of Financial Distress on the auditor switching show that the negative regression coefficient of -0.004 with a significant value of 0.942 is greater than α = 5% (0.05). This means that financial distress does not affect the auditor switching. This study supports the research conducted by Sinarwati (2010) and Nasser et al., (2006). But this research is contrary to research conducted by Damayati and Sudarman (2008) and Susan and Estralita (2011).
Financial distress or financial hardship is not a barometer of a company's auditor to perform switching, because allegedly there are several factors: first, the company will consider seriously about switch of auditor as auditor issues for which they are using already know and understand the condition of the company. Second, the conflict of interest to auditors in performing audit tasks and provides consulting services. Conflicts of interests can interfere with the independence of auditors that will affect the audit opinion. The company feels it can give you an advantage, so companies are reluctant to do auditor switching.

d. The Affect of Company Size on The Auditor Switching

The affect of Company Size on the auditor switching show that the negative regression coefficient of -0.223 with significant value of 0.565 is greater than α = 5% (0.05). This means the size of the company does not affect the auditor switching. This study supports the research conducted by Prahartati (2013) and Rizkilah (2012). But this research is contrary to the research conducted by the Rev and Fatchan Vita (2014) and Wijayanti (2010). Large companies that use large-scale CPA likely will not switch CPA that describes compatibility between the size of CPA and the size of the company. Most of the samples in this study are companies with relatively large in total assets, which mean the size of the company is a company with a large scale. A large part of them have used the Big 4 CPA so that there is no tendency for the auditor switching.

e. The Affect of Audit Fee on The Auditor Switching

The affect of Audit Fee on the auditor switching show that the positive regression coefficient of 0.225 with significant value of 0,473 is greater than α = 5% (0.05). This means that the size of the audit fee does not affect the auditor switching. This study supports the research conducted by Damayanti and Sudarman (2008) and Wijayanti (2010). But it is contrary to the research conducted by Prihartati (2013) and Rizkilah (2012). If companies switched auditors, they would usually need a relatively high audit fee because new auditors at the time of initial assignment will carry a higher risk. In addition, the new auditors need to learn more about the new clients, thereby increasing the audit fee.

f. The Affect of ROA on The Auditor Switching

The affect of ROA on the auditor switching show that the positive regression coefficient of 0.759 with significant value of 0.093 is greater than α = 5% (0.05). This means that ROA does not affect the auditor switching. This study supports the research conducted by Susan and Estralita (2011) and Damayanti and Sudarman (2008).

The results of this study do not show that the change in the rise and fall of the percentage change of Return on Assets (ROA) which is a measure of the company's ability to use its assets to make profits is not followed by changes in company policy to conduct auditor switching. When the percentage of ROA declines, it indicates the company's performance deteriorates so the company has trouble paying for the new CPA that is costly. Therefore, the company retains the old CPA. Another reason is due to consideration of the management to maintain the company's reputation with regard to the size of the CPA in the eyes of shareholders.

g. The effect of variables simultaneously

The effect of variables simultaneously indicated by Chi-Square coefficient of 16.619 with a significant level of 0.011 is smaller than alpha of 5% (0.05). There is a significant relationship between the size of the CPA, turnover management, financial distress, the size of the company, audit fee and ROA simultaneously (together) against switching auditors.

Conclusions, Implications And Limitations

The conclusion that can be drawn from the partial test results shows that the management turnover significantly influences the auditor switching on banking companies listed on the Stock Exchanges of Indonesia in 2008-2013, while the size of firm, financial distress, the size of company, audit fee and ROA have no significant effect to the auditor switching. Simultaneous testing results show that all independent variables simultaneously affect the auditor switching.

The implications of this study suggest that the management turnover will be able to make decision to continue or switch the CPA. The company should follow the rules of auditor switching to maintain the credibility of the company in order not to harm the management and shareholders.

Limitation of this study is only using the samples of banking companies. It is less representative to the total population of companies in Indonesia. Based on this limitation, the authors suggest adding the objects of researchs or comparing with companies other than banks to reflect the influence of the factors mentioned above to the auditor switching.

INNOVATION STRATEGY IN INDUSTRIAL CITY: STRATEGIC PATH MEDIATES FOR COMPETITIVE ADVANTAGE

Sri Sarjana, Padjadjaran University, Indonesia
Nur Khayati, SMAN 1 Cikarang Utara, Indonesia

Abstracts

Innovation strategy isa ways in which to achieve the goal through a set of new ideas and findings from a business as a proactive, reactive and defensive. Innovation strategy created value of product or service that has uniqueness and differentiation so beneficial for customers if compared to competitors. This study empirically investigates whether knowledge resources, dynamic capabilities, environmental turbulence have effects on innovation strategy and competitive advantage. The authors conducted a survey to test the hypotheses and design a SEM to analyze them. The results showed that dynamic capabilities have significant effect on innovation strategy. Knowledge resources and environmental turbulence have positive and direct effect on competitive advantage. Moreover, this study demonstrated that the effect of competitive advantage is mediated by innovation strategy. This finding integrates insights in innovation strategy framework into a generalization of the competitive advantage in industrial city. Furthermore, this research is expected to provide for management at industrial city have valuable suggestions for management practices to increase innovation strategyand achieved the manufacturing goals especially in competitive advantage.

Keywords: *competitive advantage innovation strategy; knowledge resources; dynamic capability; environmental turbulence; Indonesia.*

Introduction

Competitive advantage and innovation are important forces in the global industrial competition for survival and continuity (Angelmar, 1990). Firms may gain a sustainable competitive advantage if they choose the right innovation strategy (Kuratko et al., 2005). In today's highly competitive environment, to be successful and to achieve world class manufacturing so organizations must possess effective manufacturing strategies (Jain &Ahuja, 2012). Competitive pressures in the global manufacturing environment are forcing manufacturing organizations to reengineer in order to become more competitive in the marketplace (Gomes et al., 2004). Function as organizational units for the integration of knowledge and innovative activities, providing continuous input for organizations involved in actual environmental protection work, and strengthening the effectiveness of the overall environmental protection system (Chao, 2014). Akman&Yilmaz (2008) believed that new activities of firms require a continual analysis activity because, today's business environment changes rapidly and continually. It is a main assumption in the resources-based view of the firm that only firms with certain resources, network links and characteristics will achieve competitive advantages through innovation and therefore achieve superior performance (Camisón&Villar-Lopéz, 2014). Principles of certain knowledge about how to do things better than the existing state of the art (Teece, 1986). Akman&Yilmaz (2008) said that firms must be prepared in advance for situations, opportunities and threats in the future and firms must have a long-term view to be successful and develop their capabilities in the future.

As today's dynamic and turbulent environment is maintained, the technical infrastructure as well as people's knowledge and experience in many different fields, intimate

conversations in the hallways of most people and staff in their knowledge of their exchange after a period of time that may be desired are not achieved, and technical or administrative units or design engineers as well as experts in other units may solve a specific problem or issue in relation to the roles they have assumed (Kaveh et al., 2015). Internal firm capabilities and resources have not been dynamic enough in the past to warrant the use of transient that too might change in the new business environment (Wang, 2014). There must be a focus on creating a competitive advantage by emphasizing cost, quality and on-time delivery (Chamsuk et al.,2015). Important implications for the managers of manufacturing can be drawn from the findings to help them to understand their environments as they move through the different stages in a cross country business context (Elbeltagiet al., 2016). Business to business provides many growth opportunities and benefits for firms, such as cost reductions, efficiency improvements, better supplier relationships, access to global markets, new customers and suppliers, productivity improvements, increased profits, and gains in competitive advantage (Fauska et al., 2013). The strategy aims to achieve best performance in manufacturing is therefore on sustaining the process of improving human well-being (Sarjana, 2015). The resources based view implies that such innovations can only contribute to competitive advantage when they cannot be easily duplicated by competitors who have access to the factor markets (Schroeder et al., 2002). The industrial policy implications for cities are subsequently explored in terms of building new industrial districts to developing high skill ecosystems and fostering multinational webs of cities, all with the aim of ensuring the conditions exist in cities for creativity and development to flourish, notably a diverse and democratic economic system (Bailey & Cowling, 2011).The city is emerging as the leader of transformation in terms of service sector development and attracting foreign direct investment (Drobniak&Skowronski, 2012). City development is related to industrial development, and industrial development is related to city development (Bailey & Cowling, 2011). The city has received an important contribution to its identity and improved its quality of life (Ertas&Ozdemir, 2013).

Literature Review
  1. Innovation Strategy
Lendel& Varmus (2011) defined the innovation strategy as an innovative guide for firms in order to select objectives, methods and ways to fully utilization and development of innovative capacity of the enterprise. Innovation strategy is the basis of success in innovation and performance improvement (Akhlagh et al., 2013). Innovation strategy is fundamental to the success of innovation in manufacturing industries and related firms (Guan et al., 2009). Innovation strategy isthe extent to which a firm values and promotes innovation across the organization (Wei & Wang, 2011). Innovation strategy determines to what degree and in what way a firm attempts to use innovation to execute its business strategy and improve its performance (Gilbert, 1994). Innovation strategies could result in new technologies, products or processes that are intended to minimize the costs of the environmental impact of business activities and improve the efficiency in the usage of materials and energy (Mariadosset al., 2011).Complex innovation strategies affect the future productivity significantly and the results may trigger the attention of innovation policy toward more complex strategies, rather than commonly pursued simple ones (Karlsson&Tavassoli, 2015).
Innovation strategy could enhance business performance or reduce performance gap merging from changes in the market environment (Wei & Wang, 2011). Innovation strategy is a basic tool that determines the innovation direction of the business. Innovation strategy helps industries and firms to find new opportunities for their development and

growth (Lendel& Varmus, 2011; 2012). Creation, achievement, conversion and applying the knowledge are effective for the innovation process (Teymournazhad et al., 2013). The effects of innovation strategies such as aggressive, analyzer, futuristic, proactive, risk taking and defensive strategies on performance diversity and development were investigated andit was determined that the effects of these strategies on construction industry performance are very strong (Akhlagh et al., 2013). Adapting, integrating and reorienting their technological capabilities to gained, maintain and improve sustainable competitive advantages (Guan et al., 2009). Innovation strategy reflects industry's tendency to engage and support the new ideas, novelty, experimentation and creative processes that may result in new products, services or technological processes and finally performance improvement (Tamayo-Torres et al., 2010).

Innovation from a firm perspective be conceived as a complex process involving the development, transformation and application of new combinations of ideas, knowledge, technologies, capabilities and resources with the objective to develop a new idea or behavior with the potential to increase the profitability of a firm, reduce its production and distribution costs, and increasing the willingness of customers to buy and pay for their products (Therrien, et al., 2011). The firm's innovation process are guided by an explicit or implicit innovation strategy which provides direction toward specific resources and help focus the efforts of the entire organization on common innovation goals (Oke, 2007). Both theoretical and empirical studies have devoted minor attention to other innovation strategies than those related to technological innovation (Haned et al., 2014). Local environmental protection organizations are typically faced with inadequate innovative knowledge and techniques as well as a lack of external resources creating obstacles to organizational development (Chao, 2014). The capability to drive innovation processes depends on historical and current investments in several complementary factors including the knowledge and skills of the employees, R&D, management methods, firm culture, and internal & external networks (Feeny& Rogers, 2003). Various innovation strategy of firms on their future performance measured by labor productivity (Karlsson&Tavassoli, 2015).

Dimension of innovation strategy by Gilbert (1994) is reactive and proactive strategy, however Miles & Snow (1978) have description as prospector, defender, analyzer and reactor. More complex innovation strategies are more demanding in terms of firm capabilities and argue that firms that are capable of implementing complex innovation strategies also will achieve a better performance (Gera &Gu, 2004). This will provide a much richer understanding of firms' choices of innovation strategies as well as of the effects of different simple and complex innovation strategies on firm performance (Le-Bas et al., 2015). Organizational innovations can contribute to productivity via a more rational organization of production but it can also contribute to improve the customers' perception of the firm's products for example by the way and where services related to the products are organized (Karlsson&Tavassoli, 2015). Innovation strategy is company's strategy to create value of product or service that has uniqueness and differentiation if compared to competitors. A ways in which to achieve the goal through a set of new ideas and findings from a business as a proactive, reactive and defensive is a definition of innovation strategy.

2. Competitive Advantage

Competitive advantages about how the company practices generic strategy included cost leadership or differentiation in their daily actions (Porter, 1985). Competitive advantages broadly covered in the literature in terms of cost reductions, differentiation, growth, and quality (Elbeltagiet al., 2016).Competitive advantage is obtained when an organization develops or acquires a set of attributes that allow it to outperform its competitors (Wang, 2014). Competitive advantage means that the firm can produce goods or services that their

customers are more valuable than the goods or services produced as a result of their competitors (Saloner et al., 2001). Roger (2010) describes the sources of the competitive advantage such as cost advantage, differentiation advantage and marketing advantage. Competitive advantage consists of capabilities that enable organizations to differentiate itself from its competitors and is the result of important management decisions (Daghfous, 2004).The greatest impact on competitive advantages a component of knowledge acquisition (Kavehet al., 2015). Quality as one of the components of competitive advantage, could be achieved in different areas of the organization, such as product and service quality, information quality, quality of relations with business partners (N`Da et al., 2008).Companies should strengthen their developmental and rational culture to attain and sustain competitive advantage(Adriansah&Afiff, 2015).

Competitive advantage to a firm's performance develops when it is higher than normal finds and which is more worth than the expected value resources (Barney, 1997). Sources of competitive advantage are cost advantage and the advantage of differences (Porter, 1985). A firm is said to have a sustained competitive advantage when it is implementing a value creating strategy not simultaneously being implemented by any current of potential competitor and when these other firms are unable to duplicate the benefits of this strategy (Barney, 1991). Dimension competitive advantage include cost, quality and delivery (Chamsuket al., 2015).Competitive advantage is universally accepted in strategic management courses and textbooks as an essential concept in strategy (Barney, 1997). Competitive advantages theories help explain competitive advantage has occupied the attention of the management community for the better part of half a century (Wang, 2014). Company can create and deliver more economic value than its competitors simultaneously by increasing the profit and offering the higher benefit to the consumers rather than to the competitors as following condition of competitive advantage (Reniati, 2016). Creating competitive advantage ex ante produces sustained superior performance (Powell, 2001).

Ambitious companies should always be concerned with how to achieve and sustain a competitive advantage(Elbeltagi et al., 2016).Knowledge can be considered as a competitive advantage that organizations can hardly imitate its competitors (Kaveh et al., 2015).Product innovation and service innovation affect competitive advantage with competition in in foreign countries and needs to be a lifting capacity of supporting industries that can produce parts with quality, at a low cost which are delivered on time (Chamsuk et al., 2015).The way for current business environment has evolved, opportunities for leveraging competitive advantage are transient (Wang, 2014).Culture can only affect competitive advantage through absorptive capacity and innovation (Adriansah&Afiff, 2015). Competitive advantage defined is company's strategy to create value of product or service that has uniqueness and differentiation if compared to competitors.

3. Dynamic Capabilities

Dynamic capabilities is crucial for an enterprise to be able to cope with changes in the environment by delivering the right knowledge at the right time to the right person, as well as encourage knowledge sharing in order to achieve organizational goals and enhancing organizational performance (Quinn, 1999). Dynamic capabilities as a process related to organizations ability to reconfigure the basis of its resources in order to respond to more efficiently changes in a field of its activity (Masteika&Cepinskis, 2015). Dynamic capabilities are creating and utilizing organizational embedded resources for achieving a sustainable competitive advantage (Tseng & Lee, 2014). Dynamic capabilities are the ability of a firm to deploy new configurations of operational competencies relative to the competition by effectively sensing the environment, as well as absorptive, integrating, innovative activities (Hou, 2008). Dynamic capability is defined as an ability to create and

reconfigure the resources to adapt rapidly changing markets (Wang & Ahmad, 2007). Dynamic capabilities represent the ability of a firm to create new manufacturing processes and new products and services in order to rapidly respond to changing environments (Helfat et al., 2007). Dynamic capabilities also refer to a firm's ability to integrate, establish, and redeploy internal and external resources into the best configuration in order to be able to create and develop new capabilities and create new market opportunities (Eisenhardt& Martin, 2000;Wu, 2007). According to Pavlou& El-Sawy (2011), dynamic capabilities are usually embedded in organizational processes and routines that allow an enterprise to adapt to the changing market conditions in order to reconfigure its source base, enable morphing and adaptation, and eventually achieve an edge over competitors. Wu (2006) further found that dynamic capabilities is a crucial intervening variable that transforms resources into performance, which means that if enterprises can utilize dynamic capabilities, it is possible to manage internal and external resources to enhance organizational performance and gain high competitive advantage. Dynamic capabilities view is the latest perspective trying to explain and guide firms on how can achieve and sustain competitive advantage (Breznik&Lahovnik, 2014).

Wang & Ahmad (2007) defined dynamic capabilities as the firm orientation stable behavior to renew, integrate, recreate and reconfigure their capabilities and resources. Reconstructing and upgrading their core capabilities in response to the dynamic market are considered essential to sustain competitive advantage. If a firm with highly dynamic capabilities is able to quickly cope with the dramatic changes in the external environment, it can establish competitive advantage and increase their market value. However, it is difficult to build a new capability as it demands effective organizational processes for new learning (Liu & Hsu, 2011).Dynamic capabilities is defined as the orientation stable behavior of firms to renew and integrate their capabilities and resources upgrade their core capabilities in response to the dynamic market to sustain competitive advantage is used as moderating variable (Dadashinasab&Sofian, 2014).Pavlou& El-Sawy (2011) explain dynamic capabilities such as sensing, learning, integrating, and coordinating capabilities, as a sequential logic to reconfigure existing operational capabilities. Sensing capability is the ability to identify, interpret, and pursue opportunities in the environment, while learning capability is the ability to enhance existing operational capabilities with new knowledge. Integrating capability is the ability to assimilate individual knowledge with the unit's new operational capabilities, and coordinating capability is the ability to orchestrate and deploy tasks, resources, and activities in the new operational capabilities. There are three critical components of dynamic capabilities, which are capability possession that are having distinctive resources, capability deployment included allocating distinctive resources and capability upgrading included dynamic learning and building new capability (Luo, 2000).

The primary premise of the dynamic capabilities framework is that a firm has operational capabilities and resources that are directly involved in enterprise performance by converting inputs into outputs and dynamic capabilities that influence enterprise performance indirectly by updating, integrating and reconfiguring a firm's existing operational capabilities and resources (Teece et al., 1997).Dynamic capabilities emphasize the transforming of environmental characteristics and how the firms manage to adapt, integrate, and reconfigure the internal and external organizational resources to compete with the dynamic environmental conditions (Teece, 2007). Some capabilities act as both dynamic and operational capabilities and they are used to renew operational capabilities to simultaneously maintain a firm's current operations and to positively influence overall firm performance (Helfat& Winter, 2011).Dynamic capabilities creation processes are directly related with research and development (Hsu & Wang 2012). Manager's

perceptions of one particular situation are wrong this will trigger the wrong dynamic capabilities and the consequences could be fatal for a firm (Breznik&Lahovnik, 2016).

A firm that understands how a given dynamic capabilities is linked to its existing operational capabilities will be more successful at renewing its operational capabilities and gaining a competitive advantage than firms that lack such understanding (Gao&Tian, 2014). Two premises of the valuable dynamic capabilities are necessity and feasibility. Dynamic capabilities as a kind of organizational routine are source of transformation and stability which are consistent with organizational routine duality viewpoint. Based on the necessity of implement of dynamic capabilities, the adjustment time of the changes is needed (Tiantian et al., 2014). Firms should renew their resource base upon dynamic capabilities approach and which deploy relevant capabilities as dynamic capabilities hold the potential for a sustained competitive advantage especially in a turbulent environment (Breznik&Lahovnik, 2016).Dynamic capabilitiesdefined is the ability and competence of the company to utilize its resources through the process of scanning, sensing, learning, integration and coordination in the face of global environmental change rapidly in order to create a competitive advantage.

4. Environmental Turbulence

Environmental turbulenceis defined as a combined measure of the changeability and predictability of the firm's environment (Ansoff, 1990). Environmental turbulence is one in which frequent and unpredictable market and or technical changes within the industry increase risk and uncertainty in the new product development strategic planning process (Calantone et al, 2003). Environmental turbulence is a dynamic, unpredictable, expanding, fluctuating environment. It is an environment in which the components are marked by change (Volberda& Van-Bruggen, 1997). A new approach to the division of the environment and divided the environment into five levels of turbulence: stable, reactive, anticipatory, exploring, and creative based on attributes such as the novelty, speed of change, complexity, and predictability of change in the business environment (Ansoff, 1979).

Environmental turbulence by itself does not lead to scanning activities unless the external events are perceived to be salient to decision makers (Liao, et. al, 2008). In specifically on environmental turbulence such as dynamism like anintensity of changes and frequency of changes, complexity that is number and relatedness of elements and predictability such as availability of information and predictability of changes as well as entrepreneurial orientation and innovation performance (Volberda& Van-Bruggen, 1997). Environmental turbulence in the context of innovation has the potential to extend the threat-rigidity thesis into the entrepreneurship domain (Ko& Tan, 2012). In general under turbulent environments the importance of social capital as a factor affecting firm innovative capability is lowered (Dutta& Paul, 2013). The higher the level of environmental turbulence the more firms turned to platform product design (Thomas, 2014).

A turbulent environment introduces an inability to forecast accurately, even within contingencies (Calantone et al, 2003). High levels of environmental turbulence arise not only due to the pace of actual change in objective characteristics of the environment but also due to differing levels of competitive action initiated (Smart &Vertinsky, 1984). In manufacturing industry, as market or technology turbulence increases so too does the level of platform design. The more turbulent the environment, the more manufacturing firms turn to platform-based product designs (Thomas, 2014). Non-linear relationship between social capital and innovative capability is further affected by the nature of the firm's environment, specifically the prevailing level of environmental turbulence. Environmental turbulence would further accentuate the already non-linear effect of social capital on firm innovative capability (Dutta& Paul, 2013). Declining firms are located in a more turbulent

environment, high level of demand instability (Abebe, 2010). Managers of the various subsections of the global business can be advised to align their functional strategies to their organizations global business environmental turbulence level to achieve maximum success (Johannesson&Palona, 2010). In the complex or turbulent environment, aggressive sales promotions and word of mouth advertising are effective, while in simple/stable environments image advertising and personal selling are more effective. In both environments public relations and sales promotions can be effective, but applied in different ways (Mason, 2014).Environmental turbulence defined is situation and condition of an environmental organization that is dynamic, complex and uncertainty in the face of global change.

5. Knowledge Resources

A knowledge resource is characterized by completeness it contains all the necessary information elements, interpretations, connections, procedures, and sequences for effective application without further manipulation or analysis (Griffith, 2012). Knowledge resources enable an organization to understand what to do, how to do, and why things work the way they do (Davenport &Prusak, 2000). As a resource, knowledge can be accumulated, manipulated, disseminated, aggregated, and leveraged to achieve a variety of distinct purposes including either replication or creating increases in the general knowledge stock of an organization (Lengnick-Hall & Griffith, 2005). Knowledge is defined as an intangible resource that consists of interpreted information useful for creating strategic capability. Knowledge is a much richer construct than data or information (Davenport &Prusak, 2000). Intangible resources are non-physical resources that are typically embedded in routines and practices and have intrinsic productive value that has evolved over time to create distinctive organizational capabilities (Barney, 1995).

Knowledge resources are considered malleable if it is readily customized, interpreted, blended, analyzed, and manipulated to be useful for a variety of different applications. Knowledge resources have catalytic capacity if it triggers creativity, innovation, resourcefulness, and new insights (Griffith, 2012). Increasingly the business world's attention is migrating to resources and more specifically to knowledge resources (Grant & Baden-Fuller, 2004). Resource-based view of knowledge begins with an understanding of knowledge as a particular kind of asset and with a clear expectation of what we intend to do with that knowledge (Lengnick-Hall & Griffith, 2011). Knowledge resources vary in the extent to which they are valuable, rare, difficulty to imitate, hard to substitute, and require deliberate and specific actions to exploit effectively (Coyte et al, 2012).

Type of knowledge resources consists of knowledge about something (know-what) or how to do something (know-how) or an understanding of relationships (know-why) that is based on sound logic, repeated observation, and consistent results from careful implementation (Pfeffer& Sutton, 2006). To understand how knowledge can be a strategic resource it is important first to distinguish knowledge from data and information. Data comprise the discrete, objective facts about events that reveal very little about their importance or relevance (Davenport &Prusak, 2000). The firm's knowledge resources were developed in the active interactions between human capital in external and internal relationships and harvested to achieve additional sales, new product development and improvements in the efficiency of operational processes (Coyte et al, 2012). From a resource based view, knowledge resources can be simple or complex, tacit or explicit, codified or un-codified in varying combinations of the traditional ways that knowledge has been characterized conventionally (Lengnick-Hall & Griffith, 2005). Knowledge resources can be gained through the data, information and experiences through the process of accumulation, dissemination and utilization to achieve organizational goals and increase welfare.

6. Theoretical Framework & Hypotheses

Innovations involve to a varying degree and in varying combinations of scientific, technological, organizational, financial and commercial activities. When implemented they influence the behavior of economic agents and lead to the expansion of market segments as well as the introduction of new market segments (Karlsson&Tavassoli, 2015).Dynamic capabilities influence enterprise performance by renewing operational capabilities (Gao&Tian, 2014). Dynamic capability increases organizational performance and provides competitive advantages (Tseng & Lee, 2014). Wang & Ahmed (2007) explained that dynamic capabilities help enhance corporate performance, particularly when an enterprise has a synchronized development capacity and corporate strategy, which can lead to superior performance. The primary premise of the dynamic capabilities framework is that a firm has operational capabilities and resources (Teece et al., 1997). Firms with a stronger commitment to deploying dynamic capabilities are more successful and hold the potential for a sustained competitive advantage (Breznik&Lahovnik, 2014). The management of knowledge resources was partly governed by an explicit but informally managed organizational strategy (Coyte et al, 2012).Zheng et al. (2011) explained that a firm can continually renew their knowledge base through its dynamic capabilities so that it is possible to respond to changing environments. Know how, learning process, business secret, and reputation are examples of capabilities that create advantage to the firms as these capabilities are difficult to acquire from external business environments (Chen & Lee, 2009). Dynamic capabilities concept is extended from the resource base perspective. It is built based on the firm's ability to renew the resource base in form of intangible resources such as processes, skills, routines (Zaidi& Othman, 2014).

H_1: Dynamic capabilities have positive direct effect on innovation strategy
H_2: Knowledge resources have positive direct effect on competitive advantage

When operating in a turbulent environment, improving new product development can be achieved in several ways (Calantone et al., 2003). Their relationship is always changing together with continuous change of the environment that creates gaps between the firm current capabilities and the market needs (Grobler, 2007). Dynamic capabilities are focusing on modifying the firms' resources to match the changing environment (Bowman &Ambrosini, 2003).A right innovation strategy can help firms to overcome the problems they encounter concerning striving for a sustainable competitive advantage (Kuratko, et al., 2005).An innovation strategy guides decisions on how resources are to be used to meet a firm's objectives for innovation and, thereby deliver value and build competitive advantage (Dodgson et al., 2008).The relationship of industrial city on innovation strategy and competitive advantage has been theoretically proposed. The importance of knowing if such influence exists in practice and determining its magnitude is because of the fact that this effect would provide empirical support for the idea that sustainability is an important source of competitive advantage (Fombrun, 1996).

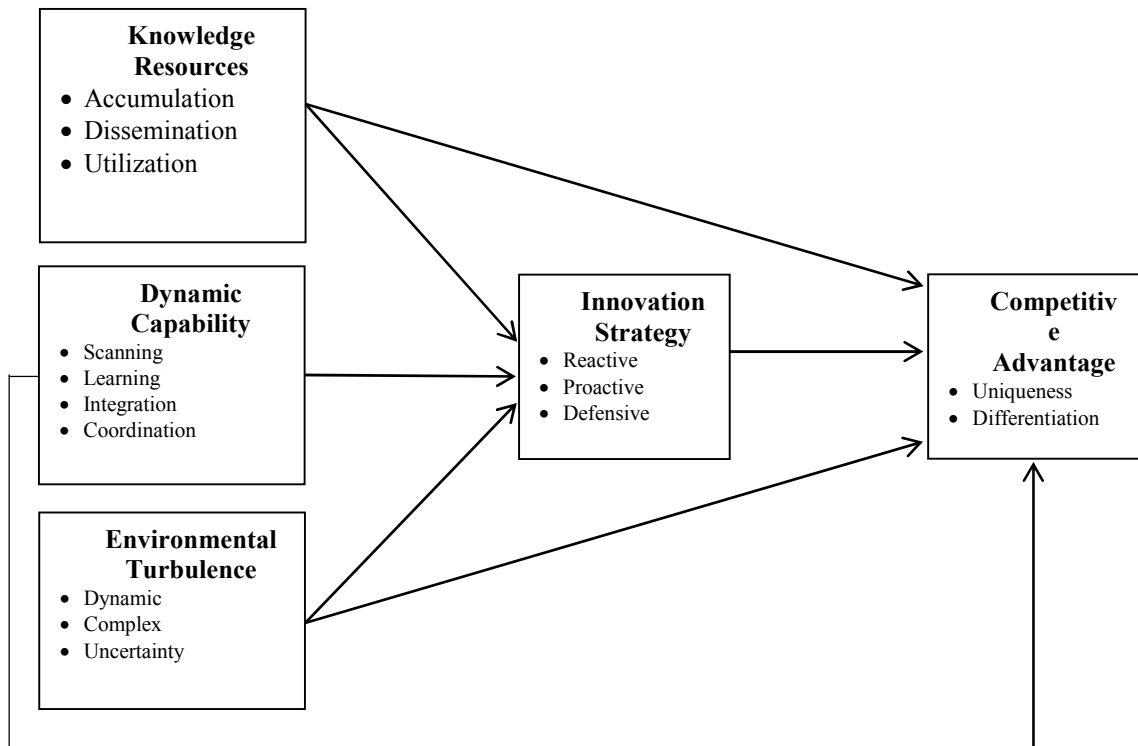
H_3: Environmental turbulence has positive direct effect on competitive advantage
H_4: Innovation strategy has positive direct effect on competitive advantage


Figure 1 Research paradigm

Methodology

The main objective of this research was to investigate the influence of knowledge resources, dynamic capability and environmental turbulence toward innovation strategy and implication on competitive advantage in industrial cities.This study was aimed in Indonesia that have implemented innovation strategy as a sampling frame. Researches have taken places in various industries such as manufacturing (Kylaheiko&Sandstrom, 2007). Data analysis for the research was conducted using Lisrel to assist in the analysis of the variables as well as the application of the structural equation modeling analysis of the causal relationship between variables.

Hair et al. (2010) has said that the size of the sample has to be large enough to be used in the data analysis by the application of the model equations with the structure and the distribution of data. Data was therefore collected from 200 manufacture engaged in industrial city by use of stratified sampling. Subsequently, simple random sampling was applied for each stratified random sample to the data collected from the surveyed population. Population consists of two industrial cities in Indonesia. The data was collected from manufacture managers through mailed questionnaires distributed through email and face to face conversations. From the target sample of questioners, 250 questioners were submitted, 50 were discarded as incomplete. Hence, the final response rate was 80 percent. Data were gathered during the month of April 2016 in the Bekasi&Karawang as an industrial city in Indonesia. The statistical results obtained from the questionnaire were analyzed. The final questionnaire comprised five parts included knowledge resources, dynamic capability, environmental turbulence, innovation strategy and competitive advantage. Finally, we decided to conduct our research more specifically in industries manufacturing sectors, for several reasons. First, it is a sector in which industrially responsible initiatives are developed and second, this research field helps us avoid the limitation of industrial experiments, since data are obtained in real condition of

use. The analyzed problems were solved with the use of mainly quantitative research methods.

Analysis and Result

Table 1 shows that profile of respondents, the result reveals that 54.5% of the respondents have over than 10 years of existence. That implies that the majority of the respondents are long in operation. Based on location, Bekasi is majority respondent have 75% in research survey. In terms of ownership structure, 51% of respondents are joint venture manufacture and 38 % are partnerships business. That means that foreign investment very active in this business. With regard to the number of employee, 65.5% have big employee around 101-1000. Furthermore, 48% respondents have business background of automotive manufacturing as the most of respondents and have effect in survey.

Table 1 Demographic respondents

Demographics profile %	Category	No. of respondent	
Years of existence	Less 5 years	32	16
	5 – 10 years	59	29.5
	Over 10 years	109	54.5
Location	Bekasi	152	76
	Karawang	48	24
Ownership	Individual	19	9.5
	Partnerships	76	38
	Joint venture	102	51
	Others	3	1.5
No. of employees	Less 20	2	1
	21 – 100	48	24
	101 – 1000	131	65.5
	Over 1000	19	9.5
Background activities			
	Automotive	96	48
	Electronics	72	36
	Food & Beverages	16	8
	Logistics	13	6.5
	Others	3	1.5

Analysis model shows that research model fits the data. Further, testing the hypothesis indicates an analysis knowledge resources, dynamic capability, environmental turbulence have effect on innovation strategy and competitive advantage. Figure 2 shows the standardized coefficients for the structural relations tested. As can be seen, the goodness of fit indices for the structural model show a good fit and therefore it is feasible to test the proposed hypotheses. H_1 is supported $\beta_1 = 1.02$, as dynamic capability dimension in industrial city on innovation strategy. Dynamic capability has a positive direct effect on innovation strategy. H_2 and H_3 are confirmed ($\beta_2 = 0.47$; $\beta_3 = 0.96$) as the knowledge resources and environmental turbulence domain in industrial city. Knowledge resources and environmental turbulence has a positive direct effect on competitive advantage. These results give empirical support to the idea that the efforts made by manufacturing on industrial city will be rewarded by the projection of a positive innovation strategy that will

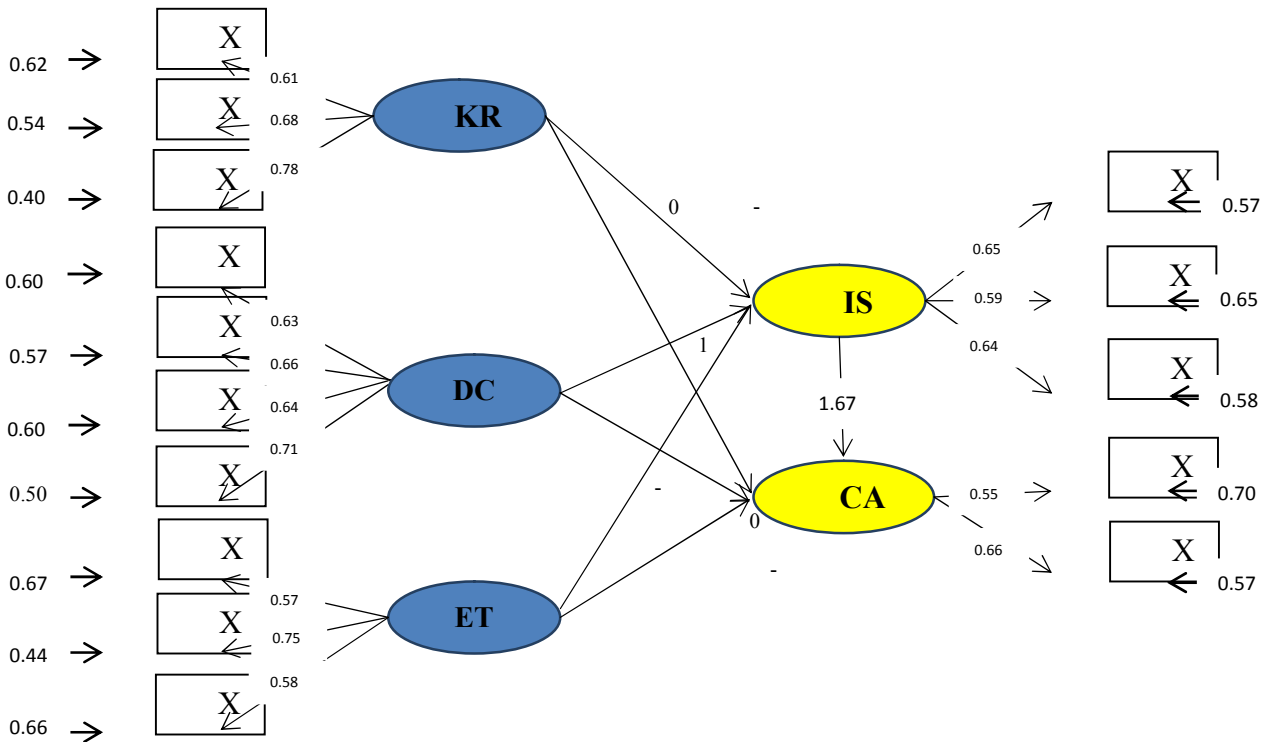
lead to increasing competitive advantage. Finally, H_4 expected that innovation strategy will have a positive direct effect on competitive advantage where is β_4= 1.67is supported. Therefore, the proposed model is totally supported by the results.


Figure 2 Structural model estimation

The arrows from the factors to the variables represent linear regression coefficients or factor loadings (Awang, 2012). The model indicated a confirmatory factor analysis procedure to access all constructs involved in the study. The data are the score of 200 managers in industrial city on construct activities. The structural model result shows the achieved stable model fit estimation. The indicators of fit: Cmin/df = 1.868 (Cmin = 149.45, df = 80); GFI = 0.91; RMR = 0.22; NFI = 0.91; CFI = 0.96; RMSEA = 0.066. Figure 2 empirically shows that innovation strategy has significant effect (ß=1.67, p=.0000) on competitive advantage. These indices suggested that the structural model provided a good fit to the data at hand and yielded a corroborating value for the good model fit.

Table 2 SEM Result

Hypotheses Structural Relationship Contrast	Standard	Coefficient
H_1 Dynamic capability $\rightarrow$ innovation strategy	1.02	Accepted
H_2 Knowledge resources$\rightarrow$ competitive advantage	0.047	Accepted
H_3 Environmental turbulence $\rightarrow$ competitive advantage Accepted	0.96	
H_4 Innovation strategy $\rightarrow$ competitive advantage Accepted	1.67	
NFI = 0.91; NNFI= 0.95; CFI= 0.96 IFI= 0.96		
χ^2= 143.91, df= 80, p=0.000 RMSEA= 0.066		

Significant at $p< 0.05$

Discussions and Conclusions

Following the theoretical debate on the importance of industrial city when developing a competitive advantage, this study empirically investigates whether knowledge resource, dynamic capabilities, environmental turbulence have significant effect on innovation strategy and competitive advantage. The hypotheses suggest that dynamic capabilities have significant effect on innovation strategy. Hypotheses propose that knowledge resources and environmental turbulence are effective and direct effect on competitive advantage. Our empirical evidence supports all the proposed hypotheses. Moreover, this study demonstrated that effect of competitive advantage is mediated by innovation strategy. Innovation is one of the key factors for the success, sustainable competitive advantage and survival of firms (Jimenez &Sanz-Valle, 2011).Such findings are relevant since they add several contributions to the existing strategic management literature. First of all, they provide empirical evidence of industrial city effect on innovation strategy and competitive advantage. Since previous works have essentially focused on the role of sustainable manufacturing, this study adds to our understanding of the effect innovation strategy and competitive advantage. By providing relevant information to stakeholder about the industrial city, the identity of the city based on innovation strategy and competitive advantage. Second, we show that the principles of the differentiated industrial city of thought regarding the effect innovation strategy on competitive advantage are met in the research supporting recent studies.

The present study has a number of implications for strategic management practitioners. The most important implication for practitioners is that dynamic capabilities direct and positive effect on innovation strategy. Knowledge resources and environmental turbulence have direct and positive effect on competitive advantage. This should give industrial cities where need to justify the policy that are associated with sustainable city issues. However, industrial cities must become much more interested in the strategic management implications of their sustainable city policy and action, including knowledge resources, dynamic capabilities and environmental turbulence issues since this research demonstrated have effect of these aspects of innovation strategy or competitive advantage. The industrial cities are encouraged to explore how knowledge resources, dynamic capabilities, environmental turbulence, innovation strategy and competitive advantage activities could positively be managed jointly, since manufactures may manage these concepts in business. Finally, by involving stakeholders in defining the cities activities, it would be possible to

add legitimacy of how the notion of industrial city can be defined, measured and implemented within the region.

Finally, to refine the findings of this study, some limitation of this work are outlined below. Our findings suggest that knowledge resources, dynamic capabilities and environmental turbulence aspects are key components, richer, and in-depth views of this concepts between innovation strategy and competitive advantage. Dynamic capabilities influence firm performance indirectly by helping the firm renew its existing operations by updating, recombining and reconfiguring its existing operational capabilities (Gao&Tian, 2014).Entrialgo et al. (2000) believed that analysis is not only crucial to the performance development, but also a firm in a turbulent environment must continually be innovative and apply various methods to remain competitive, which requires extensive analysis to recognize and exploit environmental change. Innovation strategy could enhance firm performance (Talke et al., 2010).

Including this variable in our model, future studies would contribute to a superior explanatory power and to better understanding of the nature of innovation strategy and competitive advantage. In this sense, previous studies show that to have a more coherent and stable innovation strategy. Moreover, the current study has been conducted with consumers of industrial city in Indonesia and it is not clear in how far the findings can be generalized to other sectors, stakeholders or countries. Future research could extend this research by including different stakeholder expectations of another variable. Therefore, it would be interesting to replicate this study but considering various stakeholders to ensure that our results are extrapolated to all target cities such as arts, cultures, histories, commerce, religious, and agriculture.

AN ANALYSIS OF RECRUITMENT AND JOB TRAINING METHOD EFFECTIVENESS TO EMPLOYEE ENGAGEMENT IN BANDUNG CULINARY START-UP

Keke Genio, Institut Teknologi Bandung, Indonesia
Bambang Rudito, Institut Teknologi Bandung, Indonesia

Abstract
Employee engagement is one of the way to improve the startup performance in creating revenue growth. **Nonetheless, it seems difficult to be thought out since the fact tends to show the high number of employee turnover in culinary startup especially in Bandung.** Therefore, it's important to build the employee engagement **before they are an employee to avoid the employee turnover trend continuously happen which then impact to the startup growth stagnancy. The emotional attachment and commitment among the employee and the company will be determined since the very first interaction with startup representative. Therefore, effective recruitment and job training method should be developed to enhance the employee engagement through the company first impression.** The study will be conducted based on qualitative method in collecting and abstracting data. The general orientation and job-specific orientation as the employee initial basic knowledge would be the variables in predicting the employee engagement existence and developing the related effective method in human resource practice.

Keywords: *Recruitment; General Orientation, Job Specific Orientation; Employee Engagement*

Introduction
In scaling up its business, a culinary startup should be able to formulate strategies to increase the company performance. There will be hundred ways and perspectives in exceeding the startup performance; one of them is by generating the employee engagement. Studies conducted by Markos (2010) have found positive relationship between employee engagement and organizational performance outcomes: employee retention, productivity, profitability, customer loyalty and safety. He also interpret the employee engagement existence will give positive impact into the company revenue growth since it is frequently found in double-digit companies. **In culinary startup case, the employee performance can be shown through specific competencies in its employee, however those requirements can be simply adjusted except the employee engagement; a startup must be needs the one who engage to the company, to it's up and down stage in running and scaling startup business with commitment, dedica**tion, and willingness to learn. **The fact tends to show the reverse condition; the high number of employee turnover in culinary startup especially in Bandung is proven to be true. From a research conducted by Universitas Pendidikan Indonesia (2013), the data shows the significant employee turnover happen in most restaurants located in Bandung.**
Related to the previous research, it is believed that the high employee turnover in culinary startup somehow result in the business growth stagnancy because of company disabilities in delegate another person in empty position which take crucial part in the startup daily operational. Gallup organization defines employee engagement

as the involvement with and enthusiasm for work. Gallup as cited by Dernovsek (2008) likens employee engagement to a positive employees' emotional attachment and employees' commitment. **The 'linkage' supposed to be built since the very beginning; employee engagement starts before they are an employee. According to Baker (2013), the employee engagement would be initiated in the very beginning interaction with company representative. It starts when the candidate hears about the company profile, its track record, the news article and also the job opening. Baker stated that even the company keep in do everything right from the start, since the employee already has a negative impression of the company, the owner might have no chance to fix it. However, the first impressions are hard to manipulate even it seems simply arranged. Any negative experiences during the recruiting process so do the job training would hamper the employee engagement.**

Hereafter the recruitment and job training method as the very first interaction bridging are predicted to have impact on building employee engagement. The effective recruitment and job training method should be developed to enhance the employee engagement. This article limits itself to discuss about the employee engagement creation through developing the effective method of recruitment and job training based on general orientation and job-specific orientation variables. It explains and discuss about the employee engagement concept and human resource management practice.

Employee Engagement and Its Conceptual Concept
  A. **Definition of Employee Engagement**
The employee engagement concept is still on research stage and ongoing exploration since there is no conscientious research has been done yet on this topic. So then below definitions were forwarded by some well-known researchers in human resource area. Below are the definitions:

Kahn (1990) focus on finding the engagement and disengagement behaviour differences based on the psychological experiences of self-in-role. Through inductive analysis, Kahn defined the experimental conditions which influenced the engagement and its absence by three psychological conditions emerged: meaningfulness, safety, and availability. These three conditions shaped how someone settled his or her roles. Reflecting to the real condition, the answer for these three conditions will determine whether someone desire to get engage or vice versa. Kahn mentioned definitely about the understanding in these three conditions: "Psychological meaningfulness was associated with work elements that created incentives or disincentives to personally engage. Psychological safety was associated with elements of social systems that created more or less nonthreatening, predictable, and consistent social situations in which to engage. Psychological availability was associated with individual distractions that preoccupied people to various degrees and left them more or fewer resources with which to engage in role performances."

The Kahn theories strongly relate to this article discussion, especially the used of three defined psychological conditions determining whether the employee engage or disengage to the company. Moreover, he applied the observation techniques and interviews to accomplish a qualitative research of individual engagements and disengagement at work of 16 counselors of a summer camp and 16 employees of an architectural firm. Aside this article also provides the similar approach in conducting its research.

Gallup Organization (2005) further defines employee engagement as the involvement with and enthusiasm for work. Demovsek (2008) enhance the Gallup definition by linking the employee engagement to a positive employees' emotional attachment and employees' commitment. Moreover, Gallup stated that employees will have its involvement and

enthusiasm in their workplaces since they have gain their basic needs met, given opportunity to contribute, sense of belonging, and opportunity to learn and grow. Gallup's Human Sigma website (2005) also likens employee engagement to the concept of customer engagement, which has the dimensions of confidence, integrity, pride and passion. Similar to Gallup's opinion, Harter et all stated that "the term employee engagement refers to the individual's involvement and satisfaction with as well as enthusiasm for work" (Harter *et al.*, 2002).

In addition, what Saks stated on his research support the acknowledgement about initial basic knowledge in initial human resource practice which strongly needed in this research. Saks (2006) addressed the employee engagement by incorporating the two types of employee engagement which are "Job Engagement, which is the level of employee's commitment and dedication to his job role and Organizational Engagement, which is the level of employee commitment and loyalty to their organization". The result of his study diverse clearly between job and organization engagements that connect the relationships between the antecedents and job satisfaction, organizational commitment, intentions to quit, and organizational citizenship behaviour.

B. Employee Engagement Strategies

Employee engagement is crucial for any organization especially in startup case since the engaged employees contribute to the foundation line of any business which are operational matter and their engagement will be shown through their services to clients and customers. In the other words, engaged employees are helping to generate more customer's loyalty, then a highly engaged customer buys more products and services which impact to the company a huge profitability. Its strongly connected to what Markos (2010) stated in his research findings that "the more engaged employees are, the more likely their employer is to exceed the industry average in its revenue growth. Employee engagement is found to be higher in double-digit growth companies."

"In pursuing the employee engagement existence, effective recruitment and job training programs are becoming the first building blocks to be laid on the first day of the new employee. Furthermore, the newly hired employee should be given both **general orientation** which is related to the company mission, vision, values, policies and procedures and **job-specific orientation** such as his/her job duties, and responsibilities, goals and current priorities of the department to which the employee belongs in order to enable him/her to develop realistic job expectations and reduce role conflict that might arise in the future. After the hiring decision is made, the manager has to ensure role-talent fit when placing an employee in a certain position and exert all managerial efforts needed to retain that talent in the organization." (Markos, 2013).

Methodology

The study will be conducted based on qualitative research method both in collecting and data abstraction. Qualitative method defined as "such findings are analyses of the social world that seek to preserve the natural form and dynamic state of social life studied" (Glaser & Strauss, 1967).

The general idea of this research is to measure the level of understanding in every the determined variables owned by the engaged employee. The general orientation and job-specific orientation as the employee initial basic knowledge would be the main variables in predict the employee engagement existence starts from the very first stage of hiring new employee. After the previous literature review, we found that the newly hired employee should be given both general orientation which is related to the company mission, vision, values, policies and procedures and job-specific orientation such as his/her job duties, and responsibilities, goals and current priorities of the department to which the employee

belongs in order to enable him/her to develop realistic job expectations and reduce role conflict that might arise in the future (Markos, 2013).

The engaged employee category will be determined by a preliminary study which would be an semi-structured interview among some culinary startup owners. In semi-structured interviews the researcher will have a list of themes and questions to be covered, although these may vary from interview to interview (Saunders, M.; Lewis, P.; Thornhill, A., 2007). This means that researcher may omit some questions in particular interviews, given a specific organisational context that is encountered in relation to the research topic. The order of questions may also be varied depending on the flow of the conversation. On the other hand, additional questions may be required to explore the research question and objectives given the nature of events within particular organisations. The culinary start-up owner will be chosen through non probability sampling which is purposive sampling or specifically use judgment sampling. "Judgment sampling is a non-probability sampling method and it occurs when "elements selected for the sample are chosen by the judgment of the researcher" (Black, 2010). The interview will mainly explore the engaged employee indicator according to the participant experience as the start-up owner. There will be 5 respondents for this preliminary study.

The indicator(s) found from this preliminary research would become the standard in collecting the respondent which are engaged employees. The informant number used for this research will be 10 engaged employees from diverse culinary startup. Purposive sampling method will be also used in this following phase of data collection to collect the informant. Purposive sampling represents a **group** of different **non-probability sampling techniques**. Also known as **judgmental, selective** or **subjective** sampling, purposive sampling relies on the **judgment** of the researcher when it comes to selecting the **units. The researcher consider to frequently used this method since t**he main goal of purposive sampling is to focus on particular characteristics of a population that are of interest, which will best enable researcher to answer the research questions. The sample being studied is not representative of the population, but for researchers pursuing **qualitative research designs**, this is not considered to be a weakness.

The data collection approach will be semi-structured interview which the question lists will be arranged based on general orientation and job-specific orientation variables to those engaged employee informants. The semi-structured interviews will be used once again to measure different constructs (Huffcutt, Conway, Roth, & Stone, 2001) and predict different criteria (e.g., ethical behaviors, Hollwitz & Pawlowski, 1997; maximum and typical performance, Klehe & Latham, 2006). The nature of the questions and the ensuing discussion mean that data will be recorded by audio-recording the conversation or note taking. Moreover, the most dominant variable found later will be the study focus in developing the effective recruitment and job training method to enhance the employee engagement.

Result

The qualititative research in semi-structured interview have been conducted among culinary startup owner had result in the facts discovery about the engaged employee criteria. However, the data found possibly similar to another industry beside the culinary industry; the difference might be found in the details and the application ways. Information about the acceptance requirement and the employee maintenance method have also found during the research. The way they recruit and train the candidates can be vary, but good attitude and passion in working for startup become the major consideration in choosing employee among available candidates. Moreover, the discussion moved to the

main topic of the preliminary research which is the culinary startup owner's version about engaged employee criteria, here they are:

- High initiative during work time
- Enjoy and comfort to their job and the owner itself
- Sense of belonging to the startup
- Honest

In addition, the discussion about how to maintain the engaged employee in culinary startup become another crucial topic after the previous discussion of having engaged employee. The ways can be vary one to another company, but mostly the startup owners do these following strategy:

- Provide favorable working condition
- Give wider space for their 'moves'
- Fulfill their needs well

After determining the engagement criteria, the researcher used them to predict the possible engaged employee and have them for the research informant. We successfully found enough number of informant and doing a semi-structured interview to know how deep their understanding about the general orientation and job-specific orientation. Research found that most employees in every culinary startup involved in this research have good understanding in:

- Job duties
- Employee's goals, and
- Current priorities of the department to which the employee belongs in order to enable him/her to develop realistic job expectations and reduce role conflict that might arise in the future.

Discussion

The purpose of this research are to finding the effective method for recruitment and job training in culinary startup. The effectiveness itself would be strongly affected by the succession of the startup owner in running an effective organization. It can be predicted that the company who's the engaged employee mostly belong to is the company that attempt the organization effectiveness even not in the perfect way. The engagement criteria found in this research related to the organizational effectiveness model developed by Daniel Denison (1990).

The Denison model is based on four cultural traits of effective organizations that are described below;

- ***Involvement***.   *"Effective organizations empower their people, build their organizations around teams, and develop human capability at all levels". The engaged employee starts from the one who are actively contribute to the company growth without frequently asking for additional compensation.*

- ***Consistency.*** *Organizations also tend to be effective because they have "strong" cultures that are highly consistent, well-coordinated, and well integrated (Davenport, 1993; Saffold, 1988). The culture 'stability' in the company is connected to the employee engagement maintenance way which is providing favorable working condition. The consistency does not simply related to the strict policy implementation, develop the smaller number of procedure and policy will create more favorable condition for employee.*

- ***Adaptability.*** *"The companies are continuously changing the system so that they are improving the organizations' collective abilities to provide value for their customers" (Stalk, 1988). The engaged employee mostly can adapt the change*

happen in the company since they have sense of belonging to the up and down stages in the company. They are should be supported to develop creatively by their own in the determined limitation.

- ***Mission.*** *Successful organizations have a clear sense of purpose and direction that defines organizational goals and strategic objectives and expresses a vision of how the organization will look in the future (Mintzberg, 1987; 1994; Ohmae, 1982; Hamel & Prahalad, 1994). In the startup culinary case, the exact development probably more difficult to be predicted since it just in the beginning stage of business cycle. However, the goals itself should be determined already and communicate to the employee.*

As mentioned in the previous part of this paper, most of the engaged employee in the culinary start up have similar deeper understanding in these following orientation variables; job duties, employee's goals, and their employee's current priorities related to the job expectation. The impression about the job detail and the future career related to their personal life goals are have strongest impact in creating the employee engagement start from the very beginning of the employee entrance.

The results are strongly connected into what Gill (2007) found through his research with similar topics. The idea of Gill's was to establish the link between human resources practices which are employee recruitment and selection methods with an employee engagement model using Realistic Job Previews (RJP) and Role Play Assessments. The use of an RJP, in essence, improves the fit between the individual and the organization (Philips, 1998). In the other hand, the role play assessments will give the candidate an opportunity to experience the job through simulated environment so that they have insight about the job tasks itself.

The clear explanation about some variables in RJP or in this research case the Job Specific Orientation; which mostly discuss about their impressions of the selection system and recruitment process, whether they felt the information they were provided about the job and the company was accurate and if the selection method accurately represented the position; was proven had significant impact to the work engagement. In the other hand, the role play assessment or job training did not have direct connection into employee engagement.

Conclusion

In conclusion, the research provides knowledge about the human resource practice in the culinary startup case which focused about its employee engagement creation through recruitment and job training method effectiveness. It's known that at first, the methods succession would be determined by the succession of the startup owner in running effective organization. Furthermore, the effective recruitment and job training method can be developed based on impression creation in Job Specific Orientation which are the job detail and the possible future career related to the employee personal life goals.

Recommendation

The effective recruitment and job training method suggestions which can be developed by the startup culinary owner based on these research findings are:
- The media used to collect the employee candidates can be diverse based on which people segmentation needed
- Requirement of standard competency is the first, but not the priority for startup case. Prefer someone's attitude match to the startup culture to create better performance of effective organization
- Create nice impression by focusing the interaction into the job specification

discussion. Clearly describe everything to be worked for by the employee and the possible involvement created during their work. Exploring the reason of their working motivation will make it easier to meet the needs of employee and gain their respect. Explaining the possible future career path in the startup will also strengthen the employee intention for work.

Basically those recruitment and job training strategy can be applied for every startup ultimately in culinary industry. The way of human resource representative in communicating those points adapted to the candidate's personality will also contribute to the employee engagement creation succession.

CONCEPT OF EMPOWERMENT IN CORRELATION WITH QUALITY-BASED UNIVERSITY GOVERNANCE CHANGE

Anuar Sanusi, Institut Bisnis & Informatika (IBI) Darmajaya,Indonesia
M. Ariza Eka Yusendra Institut Bisnis & Informatika (IBI) Darmajaya,Indonesia

Abstract
Human resource of a university is one of essential components of educational systems in quality-based universities. It will surely work well if the empowerment is correct.
This study was aimed at examining how much the empowerment of human resource influenced the performance of governance at private universities in Wilayah Kopertis Wilayah II, including Bandar Lampung City, Palembang, Bengkulu and Bangka Belitung the southern part of Sumatera. The approach used in the study was qualitative using *survey* method. The population of the study was heads of 130 private universities in the Southern part of Sumatera –rev Sumbagsel. The subject of the study was head, lecturers and students. The data needed in the study was primary rev2 data obtained from closed questionnaire with already tested validity and reliability. The collected data was then analysed with descriptive analysis, while the hypothetical test used contingency coefficient analysis and *Chi-square*.
The result of the study showed that there was a positive and significant correlation between concept of empowerment and performance of governance in private universities. Therefore, it can be concluded that the empowerment of human resources is strategic factores to realize the governance of professional qualified human resources. The rev-3 suggestion is if head of faculty is willing to establish a good governance effect on the performance of professional human resources, he has to determine a correct model about empowerment and governance optimization change model.

Key words : *Empowerment, Governance, Contingency, Chi-Squire*

Introduction

Empowerment is the process of building high dedication and commitment, so an organization will be very effective in achieving the goals with high quality (Margo no Slammed, 2009).

The empowerment of human resources is a crucial key to obtain the organizational quality. In high education human resources including lecturers, technicians, laboratory assistants, librarians, officials and employees, are key elements of the university that may improve or damage the quality og the university.

The empowerment of human resources is also a process intended to maintain and increase the competence, attitude, understanding, and performance as the manager and academic people at present and in the future. The empowerment is needed to improve the quality of the university's performance to cope with ever-changing challenges in establishing the mission of the university. Successful empowerment will promote competitive power of faculty in varied fields of study, technology and arts. It is also intended to accommodate interests to do self-development and improve career quality; therefore, personal interest is at least taken into planning and empowering implementation.

Qualified Human Resources will become the main capital of a nation if they have quality education. From the statement above, it can be said that it is very strategic and determining to set up a solid base to yield qualified human resources in the years of 2015-2035.

Quality-based university management basically includes three main aspects, namely: *(*1) *process, (2) content,* and *(3) resources.* If those aspects work integrated they will be able to reach the quality of the university optimally and independently. The **Process** aspect of the university is the process to do in accordance with the function of the university through Tri Dharma Perguruan Tinggi and it consists of 3 supporting elements, namely process connected to business function such as administration, finance, human resources, and marketing. The **Content** aspect of the university is an important activity, namely: curriculum, learning, researches, and scientific development; and the **Resources** aspect includes management of the whole human resources owned by the university, from human resources, structure and infra-structure, and funding.

If these aspects of management work integrated, it will reflect superior quality and competitive power of a university. It is connected to the achievement of those aspects of management as strategic management concept of outstanding university and competitiveness reflected on product types (service) fully yielded by the university, namely: Jasa Kurikuler (Curricular Service), Jasa Penelitian (Research Service), Jasa Pengabdian pada Masyarakat (Communitiy Service), Jasa Adiministrasi (Administration service and Jasa Ekstrakurikuler (Extra-curricular Service, reflecting superiority and competition of the university. Referring to the integrated management toward the aspects mentioned before, universities in the era of globalization are demanded to adapt and respond to the challenges of civilization by designing, making and implementing the quality. It must be in accordance with the Standard of the National Higher Education as stated in the government regulation (Permendikbud no 49 tahun 2014)-rev-4.

It is along with the quality of universities in Indonesia stated in the national policy through Peraturan Pemerintah (government regulation) No. 19 in the year of 2005 about the National Educational Standard aimed at guarantying the quality if national education to brighten the people of the nation and form high civilization of the nation. In manifestation the role universities through their capabilities are demanded to make an adaptation in responding the civilization in the era of globalization through various methods, namely: designing, inspiring, and implementing the quality. A number of universities in Indonesia have formed a quality assurance agency institution. However, the roles of this institution in establishing the tasks and responsibility are not optimal, yet. In contrast, a university can determine its own policy in accordance with the guide and mission of the national education.

There are several concepts suggested for universities to give contribution optimally, namely pattern zing competence concepts of academic education program as responses of civilization challenges in line with the challenges of globalization era such as: (1) optimizing performances of university management; (2) determining quality policy; (3) establishing strategies to obtain the quality; (4) designing the quality policy; and (5) realizing the concepts of human resource empowerment at university.

One of the concepts, in this era of globalization, in line with the optimization of university's roles as the main focus is by organizing a concept of management's performance and realizing the improvement of quality-based human resource empowerment in a university. Optimizing the roles of a university through management performance by formulating the competence concept of academic education program as a reference of knowledge dimension expected to be able to apply the knowledge in productive activities in community service, to understand the roles and activities of knowledge development through researches,

And to anticipate any problems of expertise, to quickly adapt to the existing scientific environment, to improve community service through researches and development; to play the role in knowledge development activities through researches, to solve problems in

similar kinds of knowledge, to work independently without being reliant to the knowledge environment, to create a new concept in a specific field through researches, to lead a knowledge development through researches, to solve problems through inter-disciple approach; and to change the knowledge environment through the developed concepts as CONCEPT. This concept is led to activities of university to yield competence of graduates reflect on the element achievement of the graduate competition.

Optimization of roles of university will certainly be realized if there are good concepts of management changes as the human resources are fully employed (*full employment*). Therefore, a university, of kinds of organization, needs a concept of an effective human resources empowerment. A very fundamental change in distribution of management authority relying on commitments to give trusts to the Quality Assurance Institution at all levels in a university. Whereas, the change at level of formulation is determined by the performance of quality control department that plays the role in bridging the university and the faculties and majors or study programs. The Quality Assurance Agency as Quality Control cannot be relied to be the main determiner of the quality policy success due to limitation. This limitation becomes a new challenge to the new structure existence and cannot be known how big the competence of both Quality Assurance Institutions and Quality Control to support the achievement of quality increase to be reached.

Another obstacle in the Quality Assurance Unit is being unable to handle the problem quickly because all procedure and decisions must be acknowledged by the top management, and it also happens in allocating human resources (fund and human resources). The answer to how to overcome the obstacle is **empowerment.** As the most fundamental unit directly engaged with the main customers (students), the Quality Control and the Quality Assurance Agent get strengthening or empowerment.

The subject and the object of the research were private universities that belonged to Kopertis Wilayah II, including Palembang, Bengkulu, and Bangka Belitung. The choice of private universities in Kopertis Wilayah II was because it was urgent where its contribution to the national educational system especially as the representative of Sumatera was high enough. At present, the contribution to the education is reflected on the high quality of institution and human resources, as 208 private universities, 691 study programs; 12.630 lecturers (full time lecturers) and 173.396 students.

The subject and the object of the research were private universities within the region of Kopertis Wilayah II including Palembang, Bengkulu and Bangka Belitung. The reason for choosing private universities in Kopertis Wilayah II is because it gives a very urgent contribution to the national education system representing the regions of the southern part of Sumatera. At present, the contribution to the education was reflected on high quantity of institution and human resources where there were 208 private universities, 691 Study Programs, 12.630 lecturers (7.754 full time lecturers) and 173.396 students.

One of human resources of universities gets strengthening or empowerment is lecturers. Basically, lecturers are one of essential components of an educational system in universities. Roles and responsibly of lecturers are important to realize high quality human resources. Therefore, a lecturer is demanded to work optimally so that it can create a professional and high qualified lecturer. This lecturer plays a very strategic role in the advancement of the university. Lecturer is an professional educator that is able to make a decision for the students' needs based on his professional consideration, so it becomes a main determinant in maintaining and quarantining conducive condition for the institution.

In fact, the existence of lecturers determines the quality of the education and the graduates. If the performance and quality of the lecturers is good, the quality of the university will be good, too and vise versa. How high the quality is planned for will not make any sense

unless it is supported by the good performance of the lecturers and the lecturers' quality. Therefore, to establish a good education program it is urgent to have qualified lecturers.

By having professional and high qiuality lecturers, universities can formulate programs and modern curriculum to guarantee and produce the superb and distinctively qualified graduates. Basically, the roles of the lecturers are very complex; it does not merely include Tri Dharma Perguruan Tinggi , further it may include more than it. This fact is supported by Tampubolon Tampublon (2001:174), stating that: the role of lecturers is multidimensional and graded into levels of education. Those multidimensional roles are: (1) educators/parents (2) educators/teachers (3) director/manager (4) producer/server (5) guide/facilitator (6) motivator/stimulator, and (7) researcher/resource. Begin 'graded' means the role is likely to decrease, increase or stays steady according to the level of the demand. The fact of the field proves that the performance of the lecturers as the spearhead to increase intelligence of nation life does not indicate an optimal performance. The key word is empowering the human resources as the solution. Based on several meanings, through the empowerment the management can give authority to others, so they will be able to act independently to accomplish the duties or tasks that will be discussed in the following chapter.

Based on the explanation above, in this research there will be found a concept of human resource empowermen in optimizing a quality-based human resources empowerment concept entitled, "Concept **of Empowerment in Correlation with the Change of Private Univeristy Governance in Southern Regions of Sumatera."**

Theoretical Framework
   A. Quality Policy
Referring to some Laws on higher education, namely: (1)Law No. 30/1990 about higher education, (2) PP No. 60/1999 regarding perguruan tinggi, 3) UU No. 25/2000 regarding program pembangunan Nasional, dan UU No. 20/2003 regarding sistem Pendidikan Nasional, (4) Government Regulations (PP) No.19 in the year of 2005 on National Education Standard No. 20 in the year of 2003 article no. 60 on accreditation and article no. 61 about certification directly connected to quality assurance, accreditation and certification as important parts of community   accountability in the educational field, and Law No. 12 in the year of 2012 about Higher Education.

Badan Akreditasi Nasional Perguruan Tinggi (BAN-PT) is a accreditation institution acknowledged by the government of the Recommunity of Indonesia (Ministry of Education and Culture). The main duties of this institution are: (1) increasing the quality of higher education, (2) introducing and expanding "New Paradigm in University Governance", and (3) increasing relevance, academic atmosphere, institutional governance, efficiency and university continuity (Tadjudin, 2000).

BAN-PT was established in 1994, based on the Law Number 2 in the year of 1999 about National Educational System. BAN-PT as the sole accreditation institution acknowledged by the government BAN-PT has an authority to implement the accreditation system at higher education. It also involves in establishing accreditation to all higher education (either State universities, Private Universities, Religious Universities or Official Colleges; long-distant programs, collaboration programs with other domestic universities, which are offered by overseas universities (but foreign universities are legally not allowed to operate in Indonesia nowadays). In the Government Regulation No. 60 in the year of 1989 mentions that BAN-PT is an independent institution which is appointed and reports its duties to the minister of Education and Culture. The Government Regulation No. 59 in the year of 2005 about the National Education Standard. In the Government Regulation Article No. 4 states that the National Education Standard aimed at guaranteeing the quality

of National Education. Therefore, the fulfilment of the National Education Standard by a university means that the university guarantees the quality of the university and to become the quality standard in Indonesia that has to be fulfilled by every university. The Government Regulation No.19 in the year of 2005 about National Education Standard mandating that the minister of National Education revises and assists universities applying quality control.

The recent Lawas take as the reference is Pemendikbud No. 49 in the year of 2014 about the National Higher Education Standard.

B. Quality Achievement Standard

In an approach Sharafat Khan (2007) offers an empowerment model to be developed by an organization to guarantee the success of the empowerment. According to Giersch & Davis (1997:174), quoted by Daulat in the book 'Perguruan Tinggi Bermutu' unites the meaning of participation (involvement} that is total *Employee Involvement and Empowerment* (*TELE*), meaning that the empowerment of employees happens only when they actively participate in the thinking process and activities at every level of organization. Besides using Sharafat Khan and Giersch & Daviskita, we can also use participation model.

C. Empowerment

Edwen P. Hollander dan Lynn R. Offermann defined empowerment as authority share, authority delegation with subordinates in an organization. Further, it is defined as giving authority to others, so they can act more independently to accomplish their duties/jobs. In addition, Daft adds that efforts to share authority in the context of empowerment are common matters, either in an organization with organic structure, work-team structure, or culture-oriented structure.

Empowerment, further, is cited by three experts: Bowen and Lawler III, Tannenbaum and Cooke, and Cameron and Ulrich. Bowen and Lawler III, as quoted by Daft, stating that there are two reasons employees need empowerment. First, it becomes a strategy required in increasing the work result, and second, it is used to establish an organization with excellent performance.

Tannenbaum and Cooke, quoted by Daft, elaborating that empowerment will increase total amount of empowerment in the organization. It is right to give the authority to subordinates because it will reduce the authority of the leader. On the contrast, if a leader shares some of his authority, there will be more authorities in the organization because everyone has his own authority. It is obvious that the real leader authority is derived from the subordinates who have commitment.

According to Cameron and Ulrich, the concept of empowerment is strongly linked to the efforts of changes. Both organizational experts define that the concept of empowerment is a part of principles that can promote to changes in universities. Those changes connected to the principles are: (1) promoting participation and disseminating information; (2) nurturing independency and awareness; (3) providing supports to the structure; (4) promoting team involvement; and (5) establish problem solving while handling conflicts.

According to **Sharafat Khan, empowerment** is an approach in building an organizational quality including these phases: *desire, trust, confidence, credibility, accountability*, and *communication.* **The first phase**, *desire* in the *empowerment* model is the desire from the management implementation to delegate and involve the employees. *Desire* includes the employees given opportunities to identify the developing problem, minimize *directive personality* and extend the insolvents of the employees, promoting a new perspective and considering working strategies, and developing team competence and train the employees about self-control. **The second phase, *trust* is desire of management to do empowerment.

The next step is to build trust between the management and the employees. Trust within the organization members will yield a good condition to the exchange of information and opinions without any worry/ fear. *Thus* includes giving chances to employees to participate in policy making, making time and proper human resources to supporting employees to accomplish their jobs, providing sufficient training for the sake of job needs, and appreciating differences of point of view and respecting to success made by the employees, and providing sufficient information access. **The third phase, *Confident*** is about bringing about confidence among each other, delegating important tasks to employees, digging up ideas and suggestion from employees, extending tasks and building network between departments, and providing job instruction schedule and promoting a good problem solving. **The fourth phase, *Credibility*** involves: taking employees as strategic partners, increasing targets in every job field, introducing individual initiative to make changes through participation, helping to solve differences in determining the goal and priority. **The fifth phase, *Accountability*** involves: making use of training in evaluating employee's performance, giving clear tasks with clear measure, getting the employees involved in determining standard and measure, giving suggestions and assistance to employees in handling job burden, and providing period and time for feedback, and **the sixth phase, *Communication*** involves: deciding open-door policies, providing time to gain information and discussing problems openly, and creating opportunities for cross-training.

D. Good Governance

Good governance will run well if it is supported by academic atmosphere and conducive organizational culture, all gradually created. Academic atmosphere and conducive culture must be created by promoting *awareness* and high commitment from all doers in university. The paradigm of good university governance, today, becomes reliable choice to reach the success of an organization.

In general. Good governance is connected to the aspects of transparency, accountability, leadership, commitment and others. However, it seems to become a complicated problem if the demand of the good governance insists on changes and innovation of the system in reaching the vision and mission of a university. Good governance is a condition that guarantees the process of alignment, similarity, cohesion, and balance of role, and inter-control by related components.

Sutiono, (2004) describes that in the concept of good governance there are 6 indicators for the success of good governance, namely: (1) getting all involved; (2) being transparant and responsible; (3) being effective and fair; (4) guarantying law supremacy; (5) guaranteeing political, social and economical priority based on community consensus; (6) paying attention to the weakest in making a decision. To gain a good governance, it is sometimes required a movement of simultaneous organizational culture changes, changing weaknesses and organization powerlessness to more reliable and productive. Thus, it is sometimes needed to do reorganization. Therefore, with good governance it will reach the success of the organization as expected.

Hypotheses:

H_1 : The Quality-based governance in university is differ significantly before and after the implementation of human resource empowerment model (HRM).

H_2 : Empowerment concept has a positive relationship with quality based performance concept in private university. In number, if the computation result shows that $H_o : CC \leq 0$; and $H_a : CC > 0$.

Research method
This is a quantitative research using *survey* method. To keep validity of the data, the writer administered validity test and reliability test obtaining that the writer conducted triangulations: (1) comparing the observation result data to the data gained from the interview and the data mentioned in the document; (2) resource triangulation, comparing what was said by a resource about a similar thing mentioned by another resource and (3) material triangulation, comparing the interview result to the material mentioned in a relevant material.

Data Collection and Sample Taking
The research population was the managers of university management as 208 private universities, connected to the governance in producing education service situated in the Southern Part of Sumatena. The selection of those managers and service production was based on the reason that those educational managers played an important role in making a decision, and had both superiors and subordinates. The sample as an analytical unit of the research was 130 private universities based on the data gained from Kopertis Wilayah II Southern regions of Sumatera. The number of sample was gained using Isaac & Michael's formula (Sukardi, 2008:49).

The sample data collection was done by sending questionnaire via mail (*mail survey*) to the educational managers in the regions of Bandar Lampung, Palembang, Bengkulu, and Bangka Belitung. Then, this survey was done to gain the data related to the observational focus on empowerment and governance variables. The data needed was primary data and secondary data gained from closed questionnaire that had validity and reliability tested. The subject of the research was universities leaders. To complete the additional data through questionnaire obtained from educational managers, lecturers, and students.

The data gained from the research result through survey method used *liker* scale-based questionnaire where it was sorted out according to the criteria determined by the researcher to become an ordinal data scale, which caused the contingency coefficient correlation technique to be not effective to implement. Therefore, to make the Contingency Coefficient correlation model remain effective to implement, it requires a data transformation from ordinal to interval. The data transformation procedure process that was selected or tabulated was transformed using Internal Succession Method or Acuan Angka Normal Baku Z.

Data Analysis Metode:
To test the hypothesis in the research is used a linear analysis using Contingency Coefficient (CC). Besides, **Chi Square** is an integrated approach between data analysis and empowerment concept construction. The computing process was established by using SPSS 17.0 software. The **Chi-Square** formula is

$$x^2 = \sum_{i=1}^{k} \frac{(fo - fe)^2}{fe}$$

Note:
X^2 = Chi Square; fo= frequency not observed; and fe= expected frequency. The formula for computing the expected frequency is:

$$f_e = \frac{(Total\ lines)\ (Total\ colums)}{Total\ Observation\ Score}$$

Contingency Coefficient Formula:

$$CC = \sqrt{\frac{X^2}{X^2 + N}}$$

Procedure to do Contingency Coefficient:
(a) Make a tabulation in the form of line (r) and a column; (b) count the total of column score (Σr_i); (c) count the total of column score (Σk_j); and (d) count frequency score expected at every cell using ($\Sigma r_i/n$)x(Σ_j). After obtaining the expected score, continue to count *Chi-square* value,:(a) Transform X2 into contingency coefficient; (b) Compare *Chi-square* using *Chi-square* table with df = (α,K-1); and (c) decision taking based on criteria: (1) H$_o$ cannot be rejected if *Chi-square* count $\leq$ *Chi-square* table; and (2) H$_o$ is rejected if *Chi-square* count>*Chi-square* table.

Analysis Result and Discussion
The result of the research consists of two main parts, namely: (1) the test result through *Chi-square count* approach > the value of *Chi-square* table or the level of significane < alpha, therefore there was a difference between governance changes before and after the implementation of human resources empowerment concept in private universities, and (2) there was a positive empowerment concept toward the governance changes toward the private university governance.
Below is the research observation result implementing the empowerment concept correlated with the performance of University governance. Based on table 2 it shows that of 130 university informeR there were 25 informer with a high empowerment concept category towards the very high governance performance and the low empowerment concept toward an moderate governance performance.

Table 1. Research Observation Result Data

Empowerment Concept Category	Governance Performance			
	Very Good	Good	Enough	Total
High	25	15	6	46
Average	8	20	10	38
Low	7	14	25	46
Total	40	49	41	130

Source   : processed Data

$$f_e = \frac{(Total\ lines)\ (Total\ colums)}{Total\ Observation\ Score}$$

Here is a comparison between the research observation result data and the research value result expected to the empowerment concept category and the quality-based university governance performance

Table 2. Expected Research Value Result Data

Empowerment Concept Category	Governance Performance			
	Very Good	Good	Enough	Total
High	11,08	13,57	11,35	36
Average	11,69	14,32	11,98	37,99
Low	14,15	17,34	14,51	46
Total	36,92	45,23	37,84	119,99

Source: Processed data

Based on the computation result showed in table 2, it is clear that each obtained expected frequency score (fe)= 11,08; 13,57; 11,35; 11,69; 14,32; 11,98; 14,15; 17,34 dan 14,51. While total of the expected research data was 119,99.

Test Criteria:
H_o cannot be rejected, if X^2 count $\leq X^2$ table, or Sig. > 0,05. While Ha is accepted, if X^{2count} >X^2 table, or Sig. $\leq$ 0,05

Result of Hypothetical Test and Analysis
There is a difference between quality-based university governance performance before and after the implementation of the empowerment concept.

A. Result of Hypothetical Test
The test result after the simulation result gained shows that the parameter classification of model difference conformity measure used computation of *Chi-square* value was fully obtained:

$$X^2 = \sum \frac{(f_o - f_e)^2}{f_e}$$

$$X^2 = \frac{(25-11,08)^2}{11,08} + \frac{(15-13,57)^2}{13,57} + ... + \frac{(6-13,35)^2}{13,35} = 35,93$$

Based on a manual analysis result, it was obtained ***Chi-square*** count = 35,93 and ***Chi-Square*** tabel with Df=(α; (k-1)(r-1) or 0,05;4 as 9,488, while the significance level as 0,000. because ***Chi-square*** count 35,93 > ***Chi-square*** table (9,488) or the significance ;evel (0,000) < alpha (0,05), so the null hypothesis was rejected, so the hypothesis saying "there is a positive correlation between the Empowerment concept and the Private University Governance Changes" was **accepted**, while the computation result using SPSS program obtaining the *Chi Square* score as 35,93; *Likelihood Ratio* as 13,277; and *Linear-by-linear Association* as 6,635 where *N of Valid Cases* 130 (appendices: 1 dan 2).

B. Correlation between Empowerment Concept and University Governance Performance

Contingency Coefficient is used to test the correlation between two variables, nominal data and category. The method used to count the contingency coefficient. Firstly count the ***chi- square*** K test sample to examine differences K sample inter-independent. After transforming X2 value, count **35.93** into contingency coefficient formula obtained the correlation between human resource empowerment concept and quality-based private university governance performance:

$$CC = \sqrt{\frac{X^2}{X^2 + N}}$$

$$CC = \sqrt{\frac{35,93^2}{35,93^2 + 130}}$$

So CC = 0,4647 (0,46) or 64%.

Based on the computation there was a correlation between the empowerment concepts toward the governance changes. This correlation shows the dependence between the empowerment factor and the governance at private universities is strong enough as 0,46 (64%). Referring to the research result it shows that the governance factor really depends on the empowerment factor of private universities. It can be concluded that from the research finding, to realize the good governance requires: (1) strong commitment from the management elements; (2) for other elements at middle managerial level and low level managers and low level employees require consistent character building.

Discussion

The result of the research shows that there is a correlation between empowerment concept and quality-based private university governance changes. The implication from these variables are reflected by the changes of performance of the Research Foundation and Community Service reflected by the level increase ot a group of university research increase in Kopertis Wilayah II in the year of 2013 where all private universities were entitled 'Binaan' and after the empowerment of institution status in the year of 2014 increased to become a Madya group. The analysis to realize the good governance of a university needs a strong commitment from all elements especially educational managers, whereas, for other elements it requires consistent character building. Referring to the analysis above, the writer elaborates the analysis result from the empowerment concept implementation in order to support the quality-based university governance. The empowerment increase models at universities have three forms of empowerment toward

capability at a university, which is educational field empowerment & teaching, research, and community   service. The three forms of the empowerment will be elaborated as follow. The head of faculty is hoped to help lecturers to increase their capability in the educational field. The lecturers have to master their field of science and follow the development in order to teach/ deliver the material well, correctly and shophisticatedly to the students. Therefor, they need to increase their knowledge in the specific science and relevant sciences continuously. The lecturers have to follow the development of sciences. These lecturers have to be able to transfer sciences /technology interestingly to the students and arouse their motivation to study the mastery of lecturers in learning techniques, including observation and learning result evaluation. The improvement of lecturers competence in educational management such as: program planning, observation, and evaluation. The extention of lecturers' insight in establishing education was done especially in their specific science such as by communicating/visiting to other universities, the lecturers' knowledge on rules and regulations on educational execution, either in faculty/university or national. The change of the empowerment in the effective governance changes had to be done by the educational managers to the outstanding human resource (lecturers) in the educational activity. The concept of empowerment to increase the total number of authority in an organization to the subordinates was considered not to decrease the authority of the leader, even vice versa, if the leader shared parts of his authority, there would be more authorities in that organization, because everyone has his own authority. Consequently, the authority of the leader is derived from subordinates who have commitment (***Tannenbaum and Cooke).***

This concept becomes a guidance for higher education managers especially for heads of faculties to support and help lecturers in these processes: (1) increasing knowledge of lecturers and relevant knowledge as reference to do researches, (2) increasing experiences in researches such as through training, training apprenticeship, active research activities , independent researches, (3) seeking information from varied sources about research opportunities, research proposal procedures, fund aids and facilities, (4) following current community action of the science to provide scientific journals by the faculties, (5) issuing the results of the research in the scientific journals, (6) actively participating in a seminar activity on research results in specific fields of science, scientific meeting, etc. (7) pioneering and nurturing cooperation with different parties in research activities, (8) communicating with researchers in the field, either in university scope or outside of the university, and (9) rewarding the outstanding lecturers in researcher activities.

Community Service is one of Tridharma Perguruan Tinggi, head of faculty necessarily support lecturers to be active in this activity: (1) explanation to all lecturers on the duty of university in community service and the reasons to accomplish by faculties/lecturers, (2) training for lecturers in the field of community service, (3) the information dissemination to lecturers on policy, rules/ regulations on community service and also about proposal procedure of this activity, and (4) rewarding outstanding lecturers/ students in community service.

The mechanism of human resource empowerment at universities through lecturer development on initiative and efforts of each lecturer supported and assisted by faculty/university; (1) new experiences;(2) improvement of academic competence; (3) improvement in teaching competence; 4) Competence improvement in community service; (5) improvement in governance competence; (6) knowledge on students affairs, and (7) expansion of association and general knowledge.

Planning and strategies in higher education human resource empowerment program have commitment to the continuous governance at least including these two aspects: (1) human resource empowerment planning, (2) strategies in human resource empowerment program

relevant to be empower connected to quality-based university change management. The empowerment planning has to be suited to the needs projection of lecturers, especially in varied kinds of competency required to carry out the mission of the faculty. For each lecturer it is needed to make an individual training plan relevant to the faculty development plan and to potential and interest. The individual development plan of the lecturers is directed to the specialization needed, then reviewed periodically according to the development of the faculty and the success and benefits of development efforts of former individual development. The empowerment of lecturers is needed to be connected to the development priority and the performance quality improvement of the faculty, and the empowerment strategies are: in empowerment program of lecturers relevant to be empowered connected to the changes of universities based on quality, namely: (1) program with, (2) big target, but starting from the small, (3) involving all lecturers in – planning empowerment activities, and (4) using varied methods, and (5) observing and evaluating the human resource empowerment activities

Empowerment in the quality-based university governance refers to the changes connected to the principles, namely: (1) promoting participation and dissemination of information; (2) nurturing independency and awareness; (3) providing supports to the structure; (4) supporting group involvement; and (5) establishing completion while avoiding conflicts. Concerning with efforts to overcome obstacles faced by new structure of Quality Control through empowerment can be said that the empowerment to the faculty/institution will be more optimal because their position is very important.

- **Governance Empowerment Changes Before and After Human Resource Empowerment**

Based on the result of the research there were differences before and after the implementation of empowerment concept and the differences of quality-based private university governance. One of the indicators of the differences in institutional areas through Lembga Penelitian dan Pengabdian Masyarakat (LPPM) reflected on the increase of grade or members of university research institution in the region of Kopertis Wilayah II in the year of 2013 where all private universities belonged to Binaan Group and after the implementation of the institution status empowerment in 2014 it increased to be Madya Group The increase of the status occurred significantly from 0 (no universities) to become 4 private universities (IBI Darmajaya, Bandar Lampung University, Binadarma University Palembang). Based on the result of the research there was a positive correlation and difference before and after the implementation of empowerment concept and quality-base governance changes at private universities in the year of 2016, predicted to be increasing. This impact of the increase was the quality and quantity of research result and community service of university human resources also got increased, followed by the publication of the research result and manual journal management into e-journals as well.

- **Parties ready to share values on quality**

The parties ready to share values on quality in universities toward quality-based management changes based on these main factors: prior to the implementation of quality policy (a) Shared Vision about low quality, having tendency to take the quality according to their own interpretation, and (b) having tendency to prioritize individual interest. After the implementation of the quality policy referring to the Shared Vision about the same quality and quality indicator, and directed and leading to cohesive attitude and synergic in the team work in teamwork of expertise.

Technology before the implementation of quality policy is based on information technology based system implemented for Academic Information System, Human Resource/Employees and asset information and finance; while after the implementation of the quality policy the information resource unit plays a role in strengthening and promoting the development as the centre of knowledge and knowledge community based on information technology.

It also happens to the main factor in changes of technological policy based-management changes before the implementation of quality policy without updated computation of *website,* while after the implementation the quality policy about service quality management based on information and communication technologies (ICT) or information technology and communication well related to the process, usage of aids, manipulation in value service, financial access, research access and community service, new student registration and library service and public service, and information management as well. Before the implementation of the quality policy the quality changes were directed to continuous quality improvement strategy through Plan-Do-Check-Act (PDCA). Before the implementation of system quality policy based on information technology to the academic information system, the Human resources/employee affairs and asset information and finance. The main factor in the quality-based management changes are technology. Referring to the Decree about quality policy, about university regulation after the implementation of quality policy the direction of the changes becomes; (a) Information Human Resource Unit playing more important role in strengthening and helping the development as the centre of knowledge and knowledge community based on information technology; (b) the service quality management based on information and communication technologies (ICT) in value service, financial access, research access, research and community service, new student registration and library service as well as community service.

Conclusion

The result of the research shows that there is a positive and significant correlation between the concept of empowement and the private university governance change in the southern regions of Sumatera.

This research was established based on a strategy model realizing human resource empowerment in order to support a good governance. Theoretically, this research completed the former research examining the strategic empowerment on the governance. Besides, it also answers the challenge from Sabherwal and Chan (2001) and Camponovo and Pigneur (2004) in Yugianto stating that a research on a different object and time is still really required. There was a positive correlation between Human Resource Empowerment and the private university governance change before and after the implementation of the concept of human resource empowerment at private universities.

Limitation and Suggestion

This research has some limitation assumed to cause obstacles to the obtained result of the research. This research assumed that the respondents had conducted the process of human resource empowerment at the reasonable level to be examined empirically. Ideally, the level and the phases of empowerment were gained from a research observation, but not from a perception gained from respondents.

The next research is hopefully able to develop a greater sample in order that the reliability score and the empowerment model can be improved. *Site visit* is also suggested since it enables the researcher to obtain in-depth information. *Site visit* done to the study

object using a quantitative approach is strongly recommended. The following research can also include the contingency factors such as attachment, trust, environmental and surrounding environmental factors, and using a qualitative approach such as a case study. The extension and development of the theory is hoped to give contribution to the theory or a practical contribution obtained more greatly and more beneficially.

Implication

Based on the conducted research, it can be concluded that the decision on the concept of empowerment and the model of quality-based university governance should be taken carefully and thoughtfully, considering its unique characteristics, such as: strategic excellence and competitive excellence dare to be made quantitative, the benefit obtained in indirect, inseparable from other factors, and the available theories and techniques are not always in line with the comprehension and insight about the harmony of relevance model to be implemented at different conditions.

The decision on the concept of empowerment should be viewed as *hard-look* and *soft-look*. Even though empowerment is the core of varied education businesses, it should not be taken merely as a *cost centre*. The well managed empowerment of human resource will give competitive excellence. Otherwise, it will cause *liability* thorough cost escalation when it is not managed well. The resource investment should not be seen as *cost-focused* because the company will lose a great opportunity.

On the other side, executive education managers are also demanded to focus and commit to the human resource empowerment. When education managers (executives) have a strong focus and commitment, the payoff obtained will be greater. As a result, the alignment of the empowerment concept will give better contribution to the improvement of private university governance. Last but not least, the executives have to be ready to do *joint responsibility* with senior executives from other fields, considering the alignment of empowerment concept is to realize the governance gives a positive influence on the improvement of the human resource performance.

THE CHANGE OF SCHOOL ORGANIZATION TOWARD ICT DEVELOPMENT: A REVIEW FROM LEWIS'S THEORETICAL PERSPECTIVE

Wisnu Wibisono, Sebelas Maret University, Surakarta, Indonesia
Ismi Dwi Asuti Nurhaeni, Sebelas Maret University, Surakarta, Indonesia
Chairul Huda Sebelas Maret University, Surakarta, Indonesia,
Arif Wahyu, Sebelas Maret University, Surakarta, Indonesia

Abstract
An organization should transform toward the development of ICT in this era. The problem existing is that to transform is not easy because organization will be faced with pros and cons. Organizational Change model theory used is Lewis's theory. This theory is used because it has some advantages compared with other theories. The objective of article was to evaluate whether or not school organization has transformed as Lewis suggested. In addition, this article aimed to identify the constraints the school encountered in transforming its organization. Finally, this article would recommend the school to transform organization effectively. Techniques of collecting data used were interview and observation. Technique of analysing data used was descriptive method with qualitative approach. The result of observation on article showed that considering the current condition of school, the school organization had not made change yet according to Lewis's theory. The constraints included human resource quality, infrastructure facility, and low desire to transform, so that the solutions were needed to make change according to Lewis's theory.

Introduction
Recently, the development of ICT has expanded more widely and has implication to the organization's advance, one of which is school organization (Bertil Vilhelmson and Eva Thulin 2001, Kozma, Robert B 2005, Liaquat Hossainand Rolf T.Wigand 2004). For example, administration registration, admission test, learning media, learning outcome evaluation and job application after graduation can be done online thereby facilitating the students following teaching-learning process. The utilization of ICT development at school results in a very tight competition between schools in both obtaining student' input and producing graduates (alumni). In other words, school that can utilize technology advance will be more developed and developing than those cannot.

The problem is to transform is not easy because organization will be faced with pros and cons. Cons against the change may be due to organization accustomed with former condition thereby it is not easy to transform because it has felt comfortable. In addition, change also encounters cons because of human resource and infrastructure less supporting the change. The organization's ability of managing pros and cons will contribute to the organization ability of transforming (changing) itself corresponding to the existing development (Liaquat Hossainand Rolf T.Wigand 2004). To manage such the condition, a good mediation is required from the organization (Panos Constantinides and Michael Barrett 2006). Otherwise, when organization cannot manage pros and cons, it will not develop even will die later.

In rapid development condition of ICT, when the organization cannot follow the change it would be abandoned by the society, because ICT is very important for both administration and teaching-learning activity purposes (Lazarus Makewa, Jackson Meremo, Elizabeth Role and Jesse Role2013). It is true particularly for the organization constituting a public service such as school. School organization will lose the students' interest in studying in such the organization because of its ICT left behind other organization. It is because ICT

plays a very decisive role for an organization's quality (Yusuf Musibau Adeoye*, Afolabi Festus Oluwole, Loto Antonia Blessing 2013). There are a variety of theories about organization change, including big 3 model, Mintzberg, Lewis, KooterSneider and Beatty, and Robbins's theories (1999:326 in Kusdi, 2009:207). Individual models offer the change an organization should make. This article uses Lewis' perspective because it is easies to do and appropriate to be applied to the organization to be observed. In addition, although Lewis's theory has been applied since 1950 and belongs to earlier theory, it is still relevant to organizational change in modern era (Bernard Burnes: 2004). Lewis' theory is the one used in planned way, in which change made should pass through 3 specified stages. The well-planned change will result in effective change (Edgar H. Schein; 1996) (the advantage of Lewis change).

The objective of research is to evaluate whether or not school organization has made organizational change as Lewis suggests. In addition, identifying the constraints the school encounters in making organizational change. Finally, this article will recommend the school to make organizational change effectively.

Method

This research was taken place in Sukoharjo Regency including 2 SMK (Vocational Middle Schools) as the representation of SMKs existing in suburban and urban areas. In this research SMKs were selected because the development of SMK runs more rapidly than that of SMA (Senior High School) does, because SMK follows the development of work realm. The SMKs selected included SMK Saraswati Grogol for urban area and SMK Muhammadiyah Weru for suburban area. The author chose this location because the school had use ICT less optimally in both urban and suburban areas. Techniques of collecting data used were interview and observation. Techniques of analyzing data used were descriptive one with qualitative approach. In this article, organizational change (change) is defined as a discussion about why, when, and how organization makes change (Hatch, 1997: 350 in Kusdi, 2009:204). The procedure of organizational change, according to Lewis, is represented as involving 3 stages: firstly, the process of thawing from previous condition of organization; secondly, making the necessary change, and thirdly, refreezing it after the positive change has occurred.

Results

The result of observation in this article shows that both schools becoming the representative have not made significant change according to Lewis's theory to follow the very rapid development of ICT. Such the organization has not developed yet. In Lewis's theory there are some factors affecting the organizational change. Organizational change does not occur so that school organization has not developed yet according to ICT development. The administrative service system is still manual, so is the learning process, as indicated with learning media and learning set still using old model. The two representative schools still have different reasons of why they have not developed yet and have not followed the existing ICT development. The representative school existing in urban area has not developed yet following the ICT development due to some factors. They are: human resource comfortable with previous condition, the one in which ICT development has not been maximized yet. Such the condition occurs in either administrative or teaching-learning process division. Administrative division has not made development yet because administrative human resource has been too long stagnant so that they are very comfortable with current condition and do not master the existing technology. Such the condition inhibits the organization development to adjust ICT development because human resources are not interested in changing and there should be a

good mediation or HR management. Teaching-learning process or educator division has not been able to follow the ICT development currently. It can be seen from non ICT-based learning media, learning model and learning set. This condition occurs because educators are less motivated to make development. In addition, such the condition occurs because there is no evaluation and reorganization within organization, so that organization tends to not developing and be monotonous. In addition, educators' ability of utilizing or using ICT is low, only some educators master some of ICT uses or utilization. The schools existing in urban area should be able to follow the ICT's rapid development because urban people of course really need ICT-based service to facilitate and to accelerate any administrative and teaching processes in school.

The condition of the second representative school shows no development in ICT area to follow the very rapid development of ICT. The second representative school is the one existing in suburban area. The school organization existing has not been able to follow ICT development in both administrative and teaching divisions. In administrative division, it can be seen that the service used has not been based on ICT. It is because of the same factor as that in urban area. Generally, the problems occurring concern the less supporting HR for development and the organization too comfortable with prior condition and its objection to change. The condition of learning or educator is the same as that in school organization in urban area. Generally, the problem concerns educator human resource comfortable with prior condition and inadequate evaluation on educators in relation to ICT development so that the educators are less motivated to change. One factor differentiating the suburban school from the urban school is infrastructure existing in the school. In urban school, the infrastructure has been adequate. So the problem remaining concern how the quality of HR in its utilization, while the infrastructure of organization in suburban area is still inadequate so that the infrastructure should be developed to follow the very rapid development of ICT. In addition, the factor differentiating the condition of urban school from that suburban one is different motivation. The urban organization is more motivated because its community wants ICT-based service that is of course better than non ICT-based service. There have been several ICT-based schools in urban area so that this organization should be motivated to develop in order to catch its retardation. Meanwhile, the school in suburban area is less motivated because they consider that the community they serve is urban community mastering poorly the technology use. The organization assumes that suburban community prefers usual service because it is easier.

The result shows that the school organization has not been able yet to make change corresponding Lewis' theory. The constraints encountered include human resource quality, infrastructure facility, and low desire to transform, so that the solutions were needed to make change according to Lewis's theory. Lewis's theory includes some stages. The first stage is thawing the previous condition of organization, this stage can be carried out through mediation and evaluation so that it can be found which part needs improvement. The second stage is making change after the thawing process has been completed and all divisions of organization agreed to change, the changing process is carried out referring to the evaluation made in thawing process, for example, by conducting organization education. The final one is refreezing stage, here after having been sure with the change made, it should be refroze, to make the organization no longer changing after the good change within organization, so that the organization can experience development toward ICT development.

Discussion

The result of observation shows that organization has not been able to change yet because of some constraints. Those constraints are, among others: human resource quality, facility,

and low willingness to change. This finding is in line with Alekande J.O and Sofowora O.A's journal. The journal stated that the factors causing the low interest in following the development of ICT are low HR quality and inadequate facility.

Those constraints result in pros and cons to make change. The pros and cons lead to imbalance in making organizational change; it can support the organizational change using Lewis' theory (Kusdi, 2009). This imbalance condition can be anticipated with thawing process in Lewis' theory. It is in line with Alicia Kritsonis (2005). She stated that the first stage in making change according to Lewis' theory is to establish the balance between those agreeing for changing and those not agreeing. This balancing can be made by strengthening those agreeing and by weakening those not agreeing, for example by socializing the change made (Kusdi, 2009).

The result of observation shows that after the thawing process and organization having agreed to change, the changing process is carried out referring to result of evaluation in thawing stage. This change can be done by giving training or new management pattern (Kusdi, 2009). The training can be provided to administrative officers and educators. It is in line with Michael Barrett, David Grant, and Nick Wailes' study (2006). This study stated that individual change can occur in the presence of education or individual training. Organizational change will occur after the second stage has been conducted well. The next stage is freezing stage. This stage is the one to restore the existing condition corresponding to the change occurring. It is consistent with the journal written by Bahsar H.S. et al in 2013. The journal stated that freezing stage is the stage stabilizing the group in new balance pattern aiming to ensure that all individuals within group can follow the existing change.

Conclusion

The conclusion of paper is that the two representative school organizations have not change toward the development of ICT with Lewis's change theory. Organization cannot change because of many factors. The constraints the urban organization encountered are human resource and management factors existing. Meanwhile, the factors inhibiting the suburban organization in making change are HR, management, infrastructure, and motivation factors. For the organization to be able to change based on Lewis' theory, three stages are needed: thawing, changing, and freezing. Thawing stage can be carried out by means of mediating and evaluating organization. Then, the changing process can be done consistent with the existing result of evaluation so that the change can be done appropriately. The third stage is freezing stage conducted to refreeze the condition of organization that has made change, so that it can experience the change toward ICT development based on Lewis' changing theory.

THE EFFECT OF ENTREPRENEURIAL MARKETING ON SMES PERFORMANCES

Salman Faris Insani, Veteran Bangun Nusantara University, Indonesia
Ariyani Wahyu Wijayanti, Veteran Bangun Nusantara University, Indonesia
Wahyu Trinarningsih, Sebelas Maret University, Indonesia[2]

Abstract

This paper examines the effect of entrepreneurial marketing dimensions (pro activeness, opportunity focus, calculated risk taking, innovativeness, customer intensity, resource leveraging, and value creation) on the performance of SMEs. This research uses 201 samples of SMEs in Solo Raya, Central Java Indonesia. The hypothesis testing is carried out using multiple regressions linier. The result shows that pro activeness, calculated risk taking, innovativeness, customer intensity, resource leveraging, and value creation has a positive effect toward SMEs performance.

Key Words: *Entrepreneurial Marketing, SMEs Performance, SME*

Introduction

Entrepreneurial marketing is a concept that was developed nearly thirty years ago between the science of marketing and entrepreneurship. Entrepreneurial marketing concept emerged as a response to several studies that show the discrepancy between traditional marketing theory and practice of marketing in small and medium enterprises - SMEs (Ioniţă, 2012). Marketing plays a significant role in SMEs, which the loss or gain of a single customer can often determine firm survival (Becherer et al., 2012). Morris et al., (2002) defines the concept of entrepreneurial marketing is the proactive identification and exploitation of opportunities for acquiring and retaining profitable customer through innovative approaches to risk management, resource leveraging and value creation. Entrepreneurial marketing has seven dimensions, namely pro activeness, opportunity focus, calculated risk taking, innovativeness, customer intensity, resource leveraging, and value creation (Morris et al., 2002). Based on the idea that entrepreneurial marketing suitable for SMEs, the purpose of this study was to analyse the influence of entrepreneurial marketing dimensions on the performance of SMEs batik and furniture industries in Solo Raya.

Literature Review and Hypothesis

Kraus *et al.,* (2010) has describe the concept of "Entrepreneurial Marketing" (EM) as the marketing activities on small and new ventures. EM represents an exploration of ways in which entrepreneurial attitudes and behaviours can be applied to the development of marketing strategy and tactics (Kurgun *et al.*, 2011). Morris *et al*., (2002) study can be considered the first attempt to link between EM and performance outcomes, where EM practices are expected to affect both financial and non-financial outcomes. Miles and Darroch (2006) suggested that, markets which have enough freedom entrepreneurial marketing processes can be strategically employed to create superior value for the firm's customers and owners.

A. The Effect of the Proactiveness toward SMEs Performance

According to hamali (2015), business performance can be achieved from increased proactiveness. Analyses results revealed that proactiveness dimensions of entrepreneurial marketing are positively related with innovative performance (Hacioglu *et al*., 2012).

Proactive as a part of EO conception is positively related to firm performance (Arief *et al.*, 2013). Sole (2013) stated by stressing proactiveness (along with creativity and innovation) to give marketing the push that it needs, it will help firms to capitalise on business opportunities to grow faster than their competitors. Based on the description above, the hypothesis can be stated as follows:

H_1: Proactiveness has a positive effect towards SMEs performance.

B. The Effect of the Opportunity Focus toward SMEs Performance

Opportunity driven is a sources of sustainable competitive advantage based on Fiore *et al.*, (2013). Opportunity oriented is an important part of Entrepreneurial decision making, and has a positive effect towards Entrepreneurial Marketing Outcome, such as performance (Hills & Hultman, 2011). The recognition and pursuit of opportunity is fundamental to entrepreneurship, and is a core dimension of EM because the marketer strives to expand the opportunity horizon beyond that dictated by current customers, products and business boundaries, in the process "escaping the tyranny of the served market" (Morris *et al.*, 2002). Based on the description above, the hypothesis can be stated as follows:

H_2: Opportunity focus has a positive effect towards SMEs performance.

a. The Effect of Calculated Risk Taking toward SMEs Performance

According to Becherer, *et al.*, (2012), risk taking as dimensions Entrepreneurial Marketing related to outcomes, such as: financial success. Arief *et al.*, (2013) stated take risks as a part of EO conception is positively related to firm performance. Based on the description above, the hypothesis can be stated as follows:

H_3: Calculated risk taking has a positive effect towards SMEs performance

b. The Effect of Innovativeness toward SMEs Performance

The potential for innovation, are factors that provide the conditions necessary for developing processes entrepreneurial marketing and increase business performance (Christina, 2011). Analyses results revealed that innovativeness, dimensions of entrepreneurial marketing are positively related with innovative performance. (Hacioglua *et al.,* 2012) by stressing innovation (along with creativity and proactiveness) to give marketing the push that it needs, it will help firms to capitalise on business opportunities; consequently, they are expected to grow faster than their competitors (Sole, 2013). Iinnovative as a part of EO conception is positively related to firm performance (Arief *et al.*, 2013). Based on the description above, the hypothesis can be stated as follows:

H_4: Innovativeness has a positive effect towards SMEs performance

c. The Effect of Customer Intensity toward SMEs Performance

Customer intensity relating to customer success, and being innovative and leveraging resources to building a strong company. (Becherer, *et al.*, 2012). Customer intensity have significant relationship to business performance, in other words, business performance can be achieved from increased customer intensity (Hamali, 2015). Analyses results revealed that customer intensity, as a part of entrepreneurial marketing dimension are positively related with innovative performance (Hacioglua *et al.*, 2012). Based on the description above, the hypothesis can be stated as follows:

H_5: Customer intensity has a positive effect towards SMEs performance

d. The Effect of Resource Leveraging toward SMEs Performance

Resource leveraging have significant relationship to business performance in small garment industry in Bandung (Hamali, 2015). Analyses results revealed that resource leveraging dimensions of entrepreneurial marketing are positively related with innovative performance (Hacioglua *et al.*, 2012). Based on the description above, the hypothesis can be stated as follows:

H$_6$: Resource leveraging has a positive effect towards SMEs performance

e.   The Effect of Value Creation toward SMEs Performance
     The value-creation dimension stands out as an aspect of entrepreneurial marketing that affects not only financial performance but also growth, customer success, and generally building a strong sustainable company (Becherer, *et al*., 2012). The results of test taken by Hamali (2015) show that value creation have significant relationship to business performance. Value creation encompasses the utilization of firm resources to incorporate strategies that better serve a firm's niche and develop sustained competitive advantage (Morris *et al*., 2002). Based on the description above, the hypothesis can be stated as follows:
H$_7$: Value creation has a positive effect towards SMEs performance

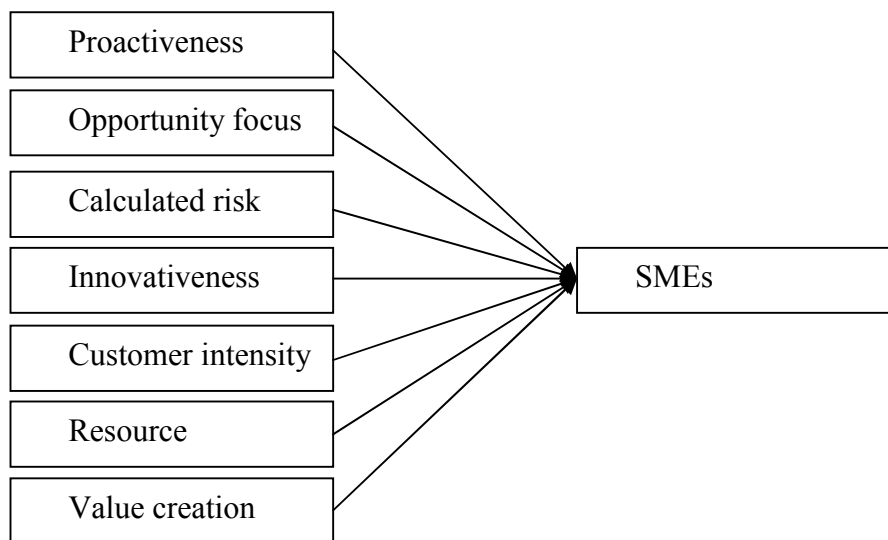
Based on the hypothesis established, we propose the conceptual research model as specified in Figure 1.


Figure1. Research model

Research method
A. **Population and sample**
The population for this research is all SMEs batik and furniture industries in Solo Raya, Central Java Indonesia. Thus, the sample of this research is SMEs batik and furniture industries in Solo Raya that has been established for at least 3 years, and the respondents for this research are SMEs' owners of batik and furniture industries in Solo Raya. A survey instrument was developed to collect the quantitative data needed for our conceptual model and hypotheses testing. A total of 300 questionnaires were distributed directly, 201 surveys were collected and used for analysis. Sample Characteristics are shown in Table 1.

Table 1. Sample Characteristics

	Characteristics	Sample (N=201)	%
Industry	Furniture	107	41
	Batik	94	3 7
Companie s age (years)	3 – 13	113	56,2
	14 – 24	57	28,4
	25 – 35	18	8,9
	36 – 46	13	6,5
Companies size	Small	136	67,7
	Medium	65	32,3

B. **Operational definition and variable measurement**

All variables were measured on a 5-point Likert scale, ranging from ''strongly disagree'' to ''strongly agree'', unless otherwise noted.

1. Entrepreneurial Marketing

Entrepreneurial marketing is divided into seven dimensions: proactiveness, opportunity focus, calculated risk taking, innovativeness, customer intensity, resource leveraging, dan value creation (Morris et al., 2002).

2. *Proactiveness*

Proactiveness is a business operator's tendency to demonstrate leadership by initiating actions with the goal of affecting change in marketing practices. The measurement of proactiveness variable is carried out using 3 items statements based on Fiore et al., (2013).

3. *Opportunity focus*

Opportunity focus is a business operator's tendency to identify unmet market needs and sources of sustainable competitive advantage. The measurement of opportunity focus variable is carried out using 3 items statements based on Fiore et al., (2013).

4. *Calculated risk taking*

Calculated risk taking is a business operator's tendency to demonstrate a creative approach to mitigating risks that surround bold, new actions. The measurement of calculated risk taking variable is carried out using 3 items statements based on Fiore et al., (2013).

5. *Innovativeness*

Innovativeness is a business operator's tendency to seek new marketing ideas from both within the firm and through external firm activities. The measurement of innovativeness variable is carried out using 3 items statements based on Fiore et al., (2013).

6. *Customer intensity*

Customer intensity is a business operator's tendency to establish marketing relationships that address individual customer needs/desires/preferences and relate to customers on a more personal level. The measurement of customer intensity variable is carried out using 3 items statements based on Fiore et al., (2013).

7. *Resource leveraging*

Resource leveraging is a creative synergistic process to access resources so more can be done with less, often mitigating risk through a greater use of leveraging. The measurement of resource leveraging variable is carried out using 3 items statements based on Becheler et al., (2012).

8. *Value creation*

Value creation is a business operator's tendency to use marketing efforts and resources to discover and deliver untapped sources of value for the customer. The measurement of

resource leveraging variable is carried out using 3 items statements based on Fiore et al., (2013).

9. *SMEs performance*

SMEs performance is measured by 3 items statements: respondents were asked to compare the return on capital employed, earnings per share, and sales growth of their own firm with those of their main competitors in the past three years; that are based on Wang (2008). Each item is measured by Likert scale with 5 alternative choices that are ranked from worse until better.

Results

A. Research instrument test

Validity test is conducted towards 8 main variables that are entrepreneurial marketing dimensions (proactiveness, opportunity focus, calculated risk taking, innovativeness, customer intensity, resource leveraging, and value creation) and SMEs performance. The result of validity test shows that all items are valid.

Reliability test results show that the amount for proactiveness is 0.789; opportunity focus is 0.735; calculated risk taking is 0.730; innovativeness is 0.785; customer intensity is 0.901; resource leveraging is 0.799; value creation is 0.707; and SMEs performance is 0.895.

B. Hypothesis test

In this study, multiple regression analysis is conducted to test the hypotheses. As seen in the Table 2, the adjusted R^2 is 44.6%, it means entrepreneurial marketing explains the 44.6% of the variance of the SMEs performance and also the six dimensions of the entrepreneurial marketing have significant effect on SMEs performance. Multiple regression analysis results support H_1, H_3, H_4, H_5, H_6, and H_7. On the other hand H_2 is not supported.

Table 2. Result of Multiple Regression Analysis

	SMEs Performance (ß)
Proactiveness	0.384*
Opportunity focus	0.096
Calculated risk taking	0.162*
Innovativeness	0.126*
Customer intensity	0.126*
Resource leveraging	0.137*
Value creation	0.143*
R^2	0.465
Adj.R^2	0.446
F	23.970*

*p<0.05

Discussion

Based on the analysis of the result using multiple regressions linier, we can conclude that: first, Six dimensions of entrepreneurial marketing (proactiveness, calculated risk taking, innovativeness, customer intensity, resource leveraging, and value creation) has an effect toward the SMEs performance. It's supported research from Hacioglua *et al.*, (2012); Becherer, *et al.*, (2012); and Hamali (2015). Second, Opportunity focus does not have an effect on SMEs performance. According to Schmid (2012), Research results from recent studies have revealed that more than just recognizing the opportunities and possibilities in the

market is necessary. In fact, a change in market structure and behavior of market participants must be created in order to permanently influence the market (Stolper, 2007). In addition, recognizing market opportunities before the competitors do, leads customers into a new direction (Kraus *et al*., 2008).

Based on these findings, both SMEs (both furniture and batik) is expected not only to rely on emerging opportunities in the market, but also capable of being proactive by creating their own business opportunities in the market. Both of SMEs can take advantage of the internet to draw inspiration developments related to the manufacture of product design (in context of batik design and the latest furniture models) to produce a new design with a strong differentiation and high value.

For furniture SMEs, is expected to create market opportunities in terms of product diversification. For example: bag-making by utilizing left over raw materials from furniture production. It's profitable, because the material needed is not too much compared to the full-production of furniture. It only takes the material that is needed is not too much compared to the production of furniture.

For batik SMEs, they can work together with other parties concerned to establish clusters or centers of batik artisans as a promotional event directly to the public and at the same time, to making educational tours to the public.

Further research is expected to specify the variable performance to become more specific performance measures as a form of achieving corporate goals. According to Becherer, *et al*., (2012), there are a number of ways to measure goal achievement of the firm. One measure is how well a business performs in terms of goals related to growth in sales revenue, profit, or market share, as well as financial returns, goals relative to capital investment, or equity (Becherer, *et al*., 2012). Even though traditional profit-motive outcomes are valid for entrepreneurs, there are a host of other reasons for starting a business that include being their own boss, pursuing their own ideas, and pursuing opportunities without regard to their current resources (Barringer & Ireland, 2010). Entrepreneurs also measure their success in ways other than pure goal achievement. They can focus on building a company that attains success in many ways, such as: a solid customer base or a strong company that can sustain itself and company employees for many years (Becherer, *et al*., 2012).

IMPROVEMENT MODEL SELF-HELP GROUPS PERFORMANCE IN PERSPECTIVE PRODUCT VALUE AND FIRM VALUE (CASE STUDY OF SHG'S BATIK SURABAYA)

Nur Fadjrih Asyik, Indonesia
Bambang Suryono, Indonesia
Lilis Ardini, Indonesia

Abstract

This research is aim to increase the batik artisan in Self-Help Group (SHG's) Surabaya welfare through empowerment strategy. However, batik Surabaya generally have constraints in terms of the sustainability of the production process, the lack of available human resources, marketing and distribution that has not been created properly. This condition can be helped by empowering the SHG's Batik trough performance model based on the value of the company and the value of the products is the goal of this research in the effort to float SHG's batik Surabaya. This research used observation and in-depth interview method with total sample is 28 Self-Help Groups in Surabaya. The result found that in perspective product value obtained excellence product that is unique motifs and colors have a special series of Surabaya and a solid match between the colors, motifs and attractive packaging and in perspective firm value are selling rate, structure organization, book keeping and accounting.

Keywords: *Self-Help Groups, Batik Creative, Product Value, Firm Value*

Background

Batik is one of the flagship products of every city including in Surabaya, which are mostly managed by SHG's. Batik has been known since the seventeenth century, and in 2009 has received recognition from the United Nations agency that is UNESCO as world heritage. Recognition of batik will add additional value to the development of batik in Indonesia. It is characterized by the increasing use of and demand for batik products. Such conditions make batik artisans gain to make them capable of improving economic conditions. One type of batik which is currently favored by consumers is batik Surabaya. Batik Surabaya believed to have uniqueness and distinctiveness that are not owned by the batik products from other regions in Indonesia.

Based on the preliminary survey of the craft of batik Surabaya generally have constraints in terms of the sustainability of the production process, the lack of available human resources, marketing and distribution that has not been created properly. Empowerment has been done so far has not been effectively implemented. Empowerment is still focused on the excavation of new crafters with counseling and training to make.
But after the training is done, the artisans are no longer continues his efforts. This resulted in low productivity. On the other hand, batik Surabaya have limited access to market information, market reach, networking, and access to strategic business location. The craftsmen mostly only sell around Surabaya, and even then not in strategic locations, so that not many people of Surabaya know batik Surabaya well. In terms of capital as well as the problems facing SMEs in general Semarang batik makers are also facing the same problem. This can be demonstrated with the business scale is still relatively small with its own capital is relatively small. The linkage of production and business performance has not been made by craftsmen who will continuously the inefficient production and distributions are less good. Thus the need for assessment studies on the empowerment of SHG's Batik Surabaya so that the aim of promoting the dignity Surabaya batik art and

culture can be realized, so as to align batik Surabaya with other known and welfare for batik artisans Surabaya.

Welfare for batik artisans through empowerment strategy with a performance model based on the value of the company and the value of the products is the goal of this research in the effort to float SHG's batik Surabaya. Without the support of the right strategy, the company will be difficult to survive in the competitive (Knight, 2000). Start from here, the emerging demands of the company to be able to formulate a good strategy. Research on the performance of SMEs and SME programs creativity began to innovation, marketing and resource conjunction with the company's performance is not a new thing. The results of the study Frese et al (2002, p. 276) show that entrepreneurial orientation is key to improve the performance of the company. Companies whose leadership oriented entrepreneurial have clear vision and courage to face the risks so as to create a better performance.

Based on the background above, the problem in this research is to determine the performance model based on the value of the company and the value of the product, especially on SHG'S Batik Surabaya. In this study, the criteria of company value and the value of the product on SHG'S differ slightly with SMEs and even companies. Criteria value of the company at the top of SHG's in sales growth, organizational structure, bookkeeping, regular meetings, member savings and partnerships. Value of products consists of product excellence, ease of getting the product, purchase incentives and product modifications (Bapemas Surabaya, 2015).

Theoretical Framework and Design Model
Firm Value

The company's goal generally is to maximize the value of the company (firm value). High firm value reflects a positive reflection on the performance of the company so as to attract investors to invest in the company. The company's value can be measured by the value defined by the market share price at the end of the year (Chen et al, 2011). The firm value is the price of a company that is willing to be paid by investors when sold (Husnan, 2005; Wiagustini, 2010). Furthermore Chandra (2003) provides an understanding of the company's value (value of the firm) is the measure of success in the management of a company running a business in the past operations and business prospects in the future to convince shareholders.

Criteria of firm value in SHG's consists of sales growth, organizational structure, bookkeeping, regular meetings, members' savings and partnership. Furthermore researchers described each of these criteria in this paper.

Sales Growth

Sales have more influence strategically for a company, sales made by the asset or assets and when sales increased then assets should be added (Weston and Brigham, 1998). Sales from a year earlier, the company can optimize its resources. Sales growth has an important role in the management of working capital. By knowing how big the sales growth is, the company can predict how much profit is obtained. Sales growth of SHG's creative batik Surabaya supported by the promotion of access to aid distribution Bapemas Surabaya city in the form of exhibitions in shopping malls, bazaars and in villages in the district.

Average sales growth of each SHG's since its stand quite a significant increase, in this study made the following formulation:

(Sales in period n + 1 – Sales in period n) / Sales in period n) x 100 %

Table 1.
Average Sales Growth

Average Sales Growth	Score
Between 51-60%	7
Between 41-50 %	6
Between 31-40 %	5
Between 21-30 %	3
Between 20 %	2
Between 10%	1

Organization Structure
The organization is a collaboration tool used by some people who have the same vision and mission in order to achieve the same purpose. Understanding the organizational structure is the arrangement components units within the organization. The organizational structure shows the division of labor and show how the functions or activities that vary are integrated (coordination). Beside, the organizational structure also shows specializations jobs, command line and the submission of the report. So in the absence of an organizational structure and appropriate management the organization will be chaotic and will not run properly even these organizations can disband because there is no division in management (Alhamidi, 2013).
According to Tambunan (2009), medium-sized enterprises most of the business owners have been well educated, have access to government programs, and already employs professional managers. While SHG's Batik target should have a chairperson, treasurer and members, and each board have the duty and authority to manage the group in accordance with the vision and mission of SHG's.

Accounting
One of the main challenges faced by SHG's is associated with the management of funds. Good management of the funds is a key factor that can lead to the success or failure of SHG's. Although many other factors can affect SHG's but at SHG's issues typically arise from failure to manage the funds.
According Kurniawati (2012), a practical and effective method in the management of the fund is to implement accounting SHG's well. Thus, accounting makes SHG's can obtain a wide range of financial information that is important in business. The financial information that can be obtained SHG'S include enterprise performance information, calculating tax information, the position information of the company's funds, the information changes in owners' equity, cash income and expenditure information.
SHG's Batik book keeping was conducted on the sales, purchasing, inventory, cash-in, cash-out, fees and salaries. Accounting reporting is done merely for the sake of

business management. Most of the reports made by the manager of the business are sales reports, purchasing reports, inventory reports.

Routine Meeting and Member Saving

SHG'S regular meetings is how many meetings do SHG's, the meetings to discuss the activities of SHG'S in connection with products such as batik motif planned to be created, the marketing and sale of batik, bookkeeping of SHG's and development plans for the group. The more often the meeting showed the level of activity and productivity in the Batik group.

Savings member's shows how much savings of their members, including capital and cash held because when the founding group SHG's, most venture capital is the joint capital or capital grants should be accounted for together. The savings member's also indicate the productivity of the group in accordance with the mission and vision of SHG'S.

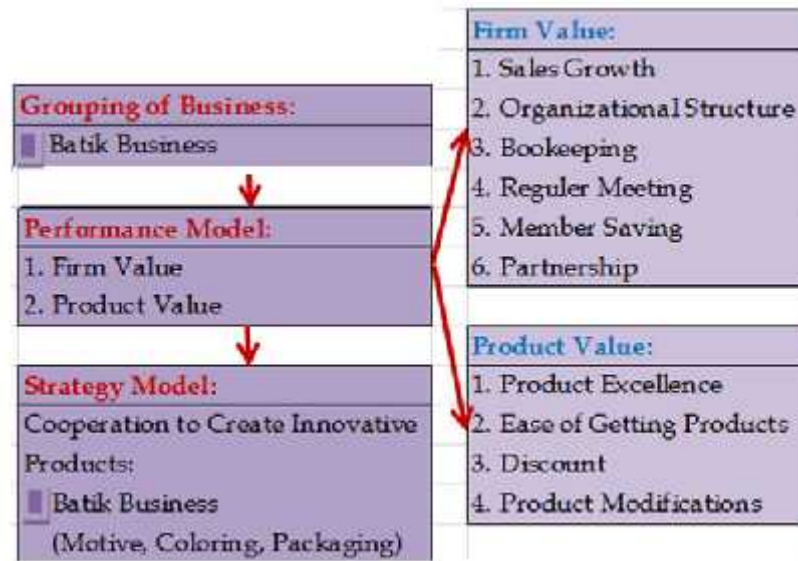
Partnership

Kuncoro et al (2003) said that developing partnership program can be reached by Father-Son Adopted system, upstream-downstream linkages (forward linkage), the downstream-upstream (backward linkage), venture capital, or subcontract. The partners who really want to help in developing a business SHG's stained with the seizure of partnerships or build new partnerships but also SHG's not interested in a partnership (Frank.2010; Purnomo, 2013).

Research methods

This research was conducted in the city of Surabaya. The data collection is done by in-depth interviews and observation. SHG'S is closely linked to the development of the batik industry in the city of Surabaya, batik artisans and entrepreneurs in the city of Surabaya, batik observer communities, officials from relevant agencies such as, Bapemas Surabaya and Surabaya Dekranasda board. Data analysis was conducted using qualitative methods.

Operational Method
Flowchart Research

This study was conducted over three years. The first year has been identifying the internal factors that affect the performance of SHG's and have identified external factors that affect performance SHG's. The second-year research effort designed to grouping SHG'S, the determination of the performance model based on standard firm value and the value of the product.


Picture 1.
Flowchart Research

Research sites

Research was conducted on SHG's Batik Surabaya are spread across several areas, among others: West Demak, Babadan, Kalimas Baru, Sidotopo, Medokan Utara, Banyu Urip, Kapas Baru, Ploso, Banjar Sugihan, Tenggilis, Krukah, Gunung Sari, Karangrejo, Pagesangan, Benowo, Wisma Tengger, Dukuh Kupang, Kedurus, Kedung Ruken dan Babatan.

Population and Samples

The population and sample of this research are total amount 28 SHG's in Surabaya.

Types and Sources of Data

The data used in this study are primary data. Primary data refers to information obtained first hand by researchers associated with the variable interest for the specific purpose of study (Sekaran, 2006). Primary data collected include: (1) The identity of the respondent and the characteristics of business owners, include: name, address, gender, age, education, household size, number of family members who work, education, family members, spending an average families to groups of food and non food, (2) aspects of business / production, (3) Aspects of distribution / marketing, (4) Aspects of market demand.

Collecting Data method

Data collection methods used in this research is the method: In-depth Interviews and observation activities SHG's Batik.

1. In-depth interviews is the process of obtaining information for research purposes by way of question and answer face to face between the interviewer with the informant or the person being interviewed, with or without using a guide interview, where the interviewer and the informant involved in the life social relatively long. Keypersons depth interviews were conducted with competent, composed of the chairman of SHG's, namely Bapemas Kasie Community Empowerment, Dekranasda Surabaya.

2. Observation, a research technique in the search for a picture of social life that is difficult to resolve with other methods so that the observations were made to explore the function of exploitation. From the observations we found a clear picture of the problem and possible clues on how to solve them. Thus, it is clear that the purpose of the observation is to obtain a variety of concrete data directly in the field or place of study. This observation is the non-participation observation, instrument used in performing observation of checklists, rating scales, anecdotal records, records periodically, and mechanical devices.
   a. Check list, a list that contains the names of respondents and the factors that is observed.
   b. Rating scale is an instrument to record symptoms according to the level.
   c. Anecdotal record, the notes made by researchers on the remarkable behavior-behavior that is displayed by the respondents.
   d. Mechanical device, a mechanical device that is used to photograph certain events displayed by the respondents.

Result and Discussion

Surabaya is one cosmopolitan city, where residents come from various regions as a newcomer to the mix of cultures metropolis with indigenous cultures that make Surabaya Surabaya rich in culture. This is also reflected in the motif produced by SHG's batik in Surabaya, most of batik craftsmen from different regions. Batik Surabaya is not like batik from other coastal areas which traces its history can be traced. Batik Surabaya tend to be difficult because once the transit area of trade. Motif rose also about Surabaya. At first glance looks no different batik Surabaya with Madura batik or Batik Jetis Sidoarjo origin

which was the star at the end and beginning of 1900 and is the market big enough batik there and then, but if observed in detail it was look the difference. Batik Surabaya has a concept of strong colors and bold. Besides batik Surabaya also had a motive - the typical motifs such, clover flowers, rooster in Sawunggaling legend, a boat typical of Surabaya, as well as advertisements shark (javanese: sura) and crocodiles (javanese: baya) are also an icon of the city of Surabaya.

Performance Model for Firm Value on SHG's Creative Batik Surabaya

Based on interviews with SHG's and observations in connection with the selling rate was 90% SHG'S Batik increased 30% to 40% after training and assisted on the creation motif, coloring and packing. The organizational structure of the group run in accordance with the duties and responsibilities, which means that each member is directly involved in the activities to make batik.

Bookkeeping at SHG's previously recorded has been recorded and accounted for using the method of accounting as simple as noted cash-in, cash-out, supply, sales, purchasing, and other costs. Results of regular group meetings marked by the attendance list of each meeting in the archive by the secretary of the group and almost 75% of members in each group SHG'S has always been active in regular meetings.

Another factor of the value of the company are managed by SHG'S Batik is member savings. SHG'S Batik classified in this study 100% have savings of members, these savings are the result of the sale of batik in a given period and distributed as profits, in addition to the savings members can use the group as additional capital when booking sales more than usual, for example if there is an order the uniform of an institution or family wedding uniform and orders the PKK. Factor latter is a partnership, 70% SHG'S Batik partnership in business development and marketing network, but some are not due to the distribution of profits or bought breaking price does not correspond with those offered SHG'S.

Table 3
Transaction and Accounting of SHG's

N	Book keeping Transaction	Respondent				Number of respondent	
		Reported		Unreported			
		Total	Percen-tage	Total	Percen-tage	Total	Percen-tage
1	Cash flow in	28	100%	-	-	28	100%
2	Cash flow out	20	74,07 %	8	25,93%	28	100%
3	Sales	28	100%	-	-	28	100%
4	Buy	28	100%	-	-	28	100%
5	Supply	28	100%	-	-	28	100%
6	Other	22	78,5%	6	21,5%	28	100%

Source: analyzed data

Performance Model for Product Value of SHG's Creative Batik in Surabaya

Based on observations and interviews with SHG's batik, obtained excellence product that is unique motifs and colors have a special series of Surabaya and a solid match between the colors, motifs and attractive packaging makes the product batik Surabaya interesting local buyer in Surabaya and outside Surabaya, because the motive Surabaya cultural show like a rooster, clover flowers, fish and shark and crocodile. Ease of getting a product that is already marketed through the SHG's Batik exhibitions in malls and

exhibitions held Dekranasda at national and international level. Likewise with the packaging already placed the identity of batik such us address and phone number.

Another factor in the products value that purchase incentives given to members who can sell and market more outside than the benefits to be obtained from SHG'S members. As a form of work more on marketing and sales of the members who sell outside the SHG's program received the incentive. As for product modifications not 100% because if batik modified it in any mixture of batik and machine. The resultwas different and of course, the time it takes much longer. Packaging modifications have been started by SHG's with unique packaging and elegant yet the prices remain affordable.

Conclusion

Batik that produced by SHG's creative reflect cultural values and characteristics of the city of Surabaya. Increase productivity in Surabaya batik craftsmen formed the performance models based on the perspective of product value and firm value. Criteria of the firm value at the top of SHG'S are sales growth, organizational structure, bookkeeping, regular meetings, member savings and partnerships. Value of products consists of product excellence, ease of getting the product, purchase incentives and product modifications.

In the perspective of firm value was found that an increase in sales growth after training. The jam clear divisions of job descriptions also help improve the organizational structure of SHG's. In the process of bookkeeping SHG's mostly been doing the bookkeeping that allows them to calculate the cash inflows, cash, and other expenses. SHG's coordination was created when they often conduct regular meetings between members. In order to manage the finances of each member of SHG's also have savings and cooperate with other groups such as the PKK.

In the perspective of product value obtained product excellence that reflect the cultural characteristics of the city of Surabaya and Surabaya like motifs and bold colors. Besides the implementation of incentive for each member of SHG's to market its products is a positive point in order to increase product sales.

SUPPLIERS STRUCTURE AND PERFORMANCE EVALUATION SUPPLIER NETWORK STAGEIN THE SUPPLY CHAIN MANAGEMENT OF RICE IN SOUTH SUMATRA

Agustina Bidarti, Gadjah Mada University, Indonesia
Slamet Hartono, Gadjah Mada University, Indonesia

Abstract

This study aimed to identify the mapping patterns emerge and supply chain structure in stages supplier of rice supply chain management network in South Sumatra and the analysis of the problems in the structure. In addition, this study tried to measure the performance of the supply chain network supplier stages of the rice supply chain management in South Sumatra. Furthermore, the results of this research are used as the basis for consideration of supply chain performance improvement, especially phase network supplying the rice supply chain management in South Sumatra on indicators that have problems.Data collection is done by direct interview, questionnaire, and observation. Analysis of data using qualitative descriptive and analytical tools Supply Chain Operations Reference (SCOR).Based on these results, the first, Based on interviews, the fundamental problems of farmers as a major producer of rice supply chain in South Sumatra are limited in the information when they harvest grain prices on the supply chain network supplier this stage.Second, based on the results weighted scoring system OMAX obtained total index value of 7.67, so the TLS are in the yellow category which indicates that the company's performance in South Sumatra rice agro-industry in the rice supply chain as a whole has not reached the expected performance although the result is close to the target set.Third, there needs to be improvement, particularly in the five KPIs that need to get immediate corrective action, ie deviation actual demand with demand forecasting results, the amount of raw materials that can be met by the supplier, the amount of raw materials that do not match the quality and specifications are determined, the number of complaints from suppliers, as well as the number of production planning.

Keywords: *Suppliers Structure, Performance Evaluation, Suppliers, Suplly Chain of Rise*

1. Introduction

At the level of supply chain management recognized three stages of the supplier network, integrated enterprise, and distributive network. These three stages together with the opinion of Anatan (2008) which divides the supply chain management in three parts, namely, first, the upstream supply chain, which includes suppliers firsttier section of organizations and suppliers in it has nurtured a relationship. Second, the internal supply chain, part of which includes all the processes used by organizations in transforming inputs into outputs delivered by the supplier, from the time the material is entered in the company until the product is distributed outside the company. Third, the downstream supply chain, part melingkup all the processes involved in the delivery of the product at the customer end.

Supplier network stage or part of upstream supply chain is no less important in the next two stages in the supply chain management for businesses agrondustri rice. Because of good practice in stages supplier network in supply chain management is a necessity in the development of agribusiness rice in South Sumatra. Phase supplier network in supply chain management are demanding an increase would care quality and coordination across the organization as well as the need for the smooth flow of products and capital flows in the complete cycle of production processes of farmers as producers of raw materials once

the supplier, who followed the actor chain of suppliers in the supply chain of rice company to the rice industry in South Sumatra.That is why, in the stage of supplier networks in the rice supply chain management in South Sumatra is not limited to purely transactional relationship, but rather a collaboration with institutions and actors as well as the rice agrindustri company later stage, should be mutually beneficial enterprise integration.

The process of evaluation and selection according to Sarkis and Talluri (2002), is needed in finding and determining the right suppliers, especially those that are able to provide quality products at a time proper service, satisfying and the price is right by the number and exact time of receipt.This paper focuses the discussion on the structure of the supplier and the supplier network performance evaluation stage in solving problems in the agro-industry supplier of rice in South Sumatra. An increase in market demand led to participate bertambahannya raw material needs while also increasing the percentage of material costs of production.

Based on the background of the problems mentioned above, there are some problems studied in this paper, namely: What is the pattern of supply chain structure in stages supplier of rice supply chain management network in South Sumatra? How is the performance of the supply chain network supplier stages of the rice supply chain management in South Sumatra? What recommendations can be given in supply chain performance improvement phase network supplying the rice supply chain management in South Sumatra?

This study aimed to identify the mapping patterns emerge and supply chain structure in stages supplier of rice supply chain management network in South Sumatra and the analysis of the problems in the structure. In addition, this study tried to measure the performance of the supply chain network supplier stages of the rice supply chain management in South Sumatra. Furthermore, the results of this research are used as the basis for consideration of supply chain performance improvement, especially phase network supplying the rice supply chain management in South Sumatra on indicators that have problems.An improvement in the performance stage of supplier network, is needed, especially in the five KPI that need to get immediate corrective action, is deviation actual demand with demand forecasting results, the amount of raw materials that can be met by the supplier, the amount of raw materials that do not match the quality and specifications specified , the number of complaints from suppliers, as well as the number of production planning.

There are no similar research, the rice supply chain management is done in South Sumatra. Though this research is very important, considering the South Sumatra province declared as National Food Barn. Therefore, research on the rice supply chain management is a form kritisisasi, evaluative, and to provide an alternative for the province as the national food, especially the issue of equity and distribution of rice among the district rice production and non-production of rice in the South Sumatra.

2. Literature Review

Rice is the main source of calories for some communities in Indonesia, so that the current share of rice in total calorie consumption reached 54.3%. This means that more than half of their calorie intake comes from rice. According Harianto (2001) there are two main parameters of demand for rice in Indonesia, namely rice demand is strongly influenced revenues and rising rice price fluctuations largely determine consumer attitudes to the amount of rice consumed. Interestingly, according to Khudori (2005), the government's task to formulate a rice policy that could benefit all parties, obviously not be easy. When the price of rice soaring, the government should be able to halt the price. Conversely, when the price of rice plummeted, the government should be able to lift

prices. The success of balancing the pendulum motion "braked and raised" the price of rice is at stake the credibility of the government. While on the other hand, the issue of rising and falling prices of rice, will bring in a dilemma among people in rural areas who plays as a consumer and producer of rice. The fall in the price of rice would benefit subsistence farmers who were net buyers, by contrast, farmers are net sellers consumers will be harmed if the price of rice declined.

South Sumatra, which proclaimed itself as one of the provinces nationwide barns are not independent of the availability of potential land resources are quite varied, ranging from irrigated land, rainfed, tidal marsh, lowland and upland. In addition also has other excellent commodities such as corn, peanuts, cassava, sweet potato, vegetable crops and fruits. Therefore, the Government of South Sumatra Province are trying to optimize and improve the business of food security (Food Security Agency of South Sumatra Province, 2011).

Supply Chain Operations Reference (SCOR) is a reference model of supply chain operations. SCOR is able to map the parts supply chain. According Pujawan (2005), basically SCOR is a model-based process. Under SCOR, Supply Chain Management is defined as the process of planning (plan), procurement (source), manufacturing (make), delivery (deliver), and return (return).Weighting method used is Analytical Hierarchy Process (AHP). Analytical Hierarchy Process (AHP) is used to rank alternatives based on several criteria laid out in SCOR. This model has three hierarchy process shows that SCOR perform the decomposition process from the general to the detail. The first level, defining the number, scope, and content of the supply chain and how performance is measured.The second level where each of the above processes is further illustrated by the type of process. The third level contains the definition of business processes used for the transaction of sales orders, purchase orders, work orders, the right of return and forecasting.

This study is based on research Sidarto (2008) on the measurement of activities in supply chain management that can be done by combining a model of performance measurement SCOR and the POA, which include cost, time, capasity, productivity, utility, out-come, reliability, responsiveness, flexibility, cost, and assets. While Ervil Rico (2010) conducted research on the design of performance measurement systems that can be done by developing the Balanced Scorecard model that generates supply chain performance indicators derived from the development of performance indicators of the company. Both studies produce a picture of the internal condition of the company in the position of best in class. Meanwhile, research Wiyono and Sutopo (2009), inspired associated with the provision and distribution of information distribution post-harvest rice commodities by building a distribution model based on SCM.

3. Method

This research was conducted in the province of South Sumatra with a focus on three areas namely rice industry Ogan Komering Ilir(OKI) Regency, Ogan Komering Ulu Timur (OKUT) Regency, and Banyuasin Regency, as well as the city of Palembang. The location was chosen on the basis of purposive sampling in analyzing the supply chain process at the stage manajemem supplier network. The data collection was conducted over seven months, October 2015- May 2016 in collecting secondary and primary data.Data collection is done by direct interview, questionnaire, and observation.Analysis of data using qualitative descriptive and analytical tools SCOR. SCOR method used in measuring the performance of the supply chain management, especially the phase of supplier network that requires criteria performance attributes such as reliability and responsiveness with respect to stage supplier network.

4. Findings
4. 1. Mapping the Supply Chain At Level Supply Chain Supplier Network

This study examines the performance of each of the supply chain involved in the processing of the supply chain of rice at stages Supplier network in the province of South Sumatra. To determine the best performance will be benchmarking against rice agro-industry enterprises in South Sumatra, as table 1 below:

Table. 1. Rice Agroindustrial Company's Name in Palembang

No	Company's Name	Address	Production Capacity/Year	Product Type	Status
1	PT. Karya Jaya Mandiri Perkasa	Jl. Muara Kelingi RT 10 Kelurahan Karya Jaya Kertapati Subdistrict Telp. (0711) 7037829	6.000 Ton	Rice Packaging	Active
2	CV. Sukses Karya Mandiri	Jl. Brigjend Yusuf No. 22 RT 23 Musi II Karya Jaya Subdistrict Kertapati district Telp: 081278528888	3.600 Ton	Rice Packaging	Active

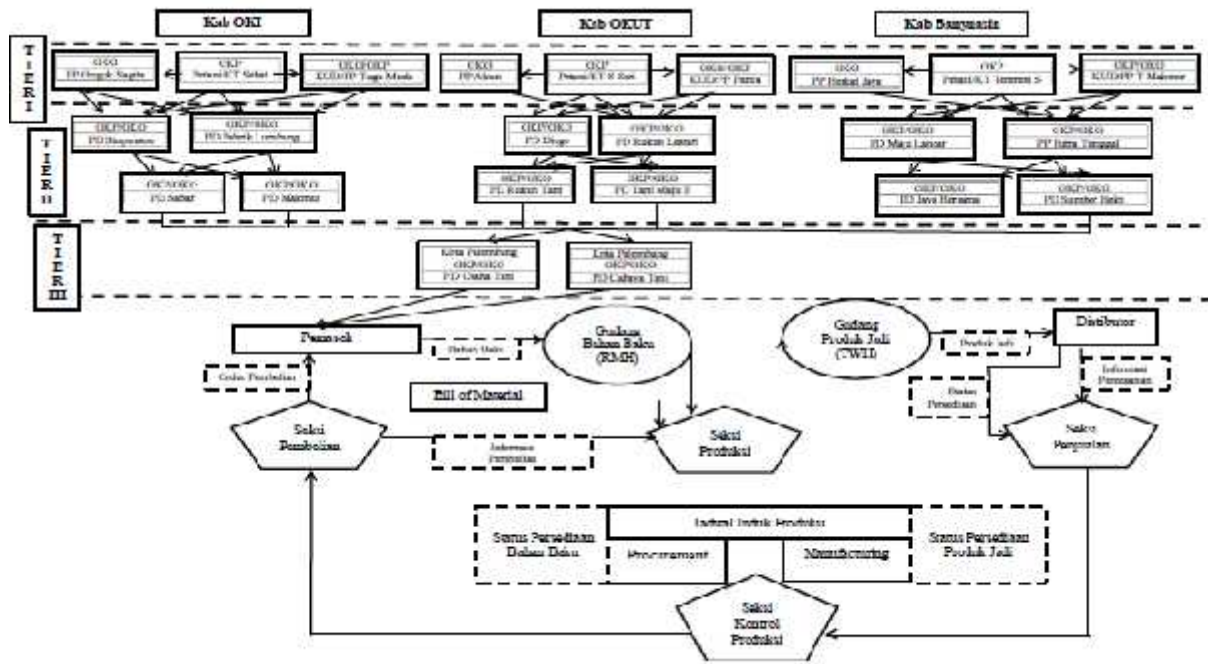
		Sei Selincah Kalidoni District			

Source: Disperindag South Sumatra Province, 2014

Based on these data, do benchmarking against the companies which will be selected as the sample the researchers used multi-stage sampling to see the rice supply chain mapping in South Sumatra. Selection of the supply chain mapping samples be two stages, according to the stage of network supplier in the rice supply chain management, namely:First, Stage I determine the starting point of the supply chain of rice in South Sumatra. Using purposive sampling method, from the four companies of the rice industry in South Sumatra, and then acquired the company PT. Karya Jaya Mandiri Perkasa as samples. Selection of the rice company in consideration of rice products packaging as a product of secondary processing of the products taken from local raw materials of South Sumatra Province, namely Ogan Komering Ilir Regency, Ogan Komering Ulu East (OKUT) Regency and Banyuasin Regency. In addition, PT. Karya Jaya Mandiri Perkasa is an agroindustrial active until the time of the study. Agroindustrial company PT. Karya Jaya Mandiri Perkasa is elected will be measured performance.

Secondly, Stage II is the determination of institutions associated with the supply chain. Once elected agro-industry supply chain used as a starting point, then proceed with the snowball technique in selecting the rare characteristic unit and additional units indicated by the respondents before (Sarwono, 2006). That is the determination of the institutions involved in a supply chain flow of rice in South Sumatra can be known based on information supplied by another institution.

The use of a snowball technique was conducted to determine the flow of product, financial and supply chain information from suppliers of rice and rice agro-industry companies that have been previously and the supply chain of raw material origin agro-industries. The supply chain is observed as farmers, farmers' groups, cooperatives and Farmers Group Association, as well as rice mills, traders sub-district and district capitals and major traders in the city of Palembang who became suppliers to the rice agro-industry company PT. Karya Jaya Mandiri Perkasa.Based on interview data, for submission being a supplier to the PT. Karya Jaya Mandiri Perkasa, first prospective suppliers deliver raw materials in accordance with the specifications demand, price quotes, and ask for the complete sample with quality analyzer. After the approval of PT. Karya Jaya Mandiri Perkasa, the supplier can already receive PO.

Based on data from the supplier of rice on the system behavior should be seen in the rice supply chain PT. Karya Jaya Mandiri Perkasa. Overall, you need to know in advance the flow of data and material in a clear and detailed. Therefore, it is necessary mapping data and material flow in several levels. The first level illustrates the flow of data and material in the system in general. The second level illustrates the flow of a more detailed, and so on until the flow can no longer be specified.


Based on Figure 1 above, the flow of the commodity supply chain of grain and rice in South Sumatra found four aliram rice supply chain in South Sumatra, namely: First, farmers> millers> small traders> Wholesalers> companies; Second, farmers> small traders> millers> wholesaler> companies; Third; farmer> mills> Wholesalers> companies. And fourth, the farmer> traders> Wholesalers> companies. For more details the structure of the flow of grain and rice supply chain can be described as follows:

Based on questionnaire data, flow data obtained rice supply chain centers in three districts of South Sumatra rice, as follows, namely: At first the rice supply chain flow, farmers (46%) sell grain to millers. At the beginning of the process, in grain rice mills grouped and undergo special treatment include the drying process into milled rice (GKG), milling, and packaging are still tentative. The rice that has been packed in the meantime, further distributed to wholesalers central district and city.Furthermore, from wholesalers, rice distributed to rice agro-industrial company, PT. Karya Jaya Mandiri Perkasa for further processing. Many farmers sell their produce directly to millers by the kilogram system (Per Kg) on the flow of the supply chain of rice in South Sumatra caused a few, namely: first, generally there is a new trend in which rice mills also builds storage and drying of rice near the area of rice fields , so that farmers find it easy to make the process of selling the harvest. Second, prices received by farmers in the rice mills to sell grain was higher when compared to slash system generally performed in the second stream supply chain in South Sumatra. The selling price to millers Rp. 4500, / Kg dry grain harvest (GKP).

The flow pattern of the second supply chain, farmers (24%) drain the rice to traders who also berposisiri as small traders accomplice millers. This small traders, usually consisting of farmer groups or individual traders themselves, they distribute the grain to millers. Based on the interview, generally the flow of the supply chain have both lower because farmers sell their crops to traders conducted with a slash. Apparently, the sales system with a single stroke, according to the respondents regarded as purchases are not transparent, where farmers sell their crops in the field without knowing the amount of grain production of the crop gets. In this case the farmer not to harvest because the harvest is done by traders after the purchase price was agreed. If in the average sales price of grain received by farmers to slash system that is Rp. 4220, - / Kg of dry grain harvest (GKP).

In the third stream supply chain, farmers (18%) sell grain directly to millers in the form of dry grain harvest (GKP). In the rice milling grain in the process of becoming the next rice distributed to wholesalers. From a wholesaler and then the rice distributed to PT. Karya Jaya Mandiri Perkasa. Next the flow of the supply chain is actually almost equal fourth with three channels, namely the farmers (12%), doing stream supply chain to sell their crops, dried grain harvest, through intermediate traders in the capital city district or regency.

According to the interview data, the lack of treatment of the flow of the supply chain the third and fourth than the first and second flow, due to the tendency of farmers are easier to sell dry grain harvest (GKP) than dry grain store (GKS). Based on the interview, the difficulties of farmers in producing dry grain store (GKS) due to two things.First, the difficulty in managing indirect sales for direct sales dominate the supply chain. Secondly, often the urgent need for farmers so they prefer to sell directly from the store the harvest. Third, the lack of storage facilities at the same time adequate grain drying in the farmhouse. These three things, which often puts the crops these farmers in a weak bargaining position, in addition to falling prices is hard to avoid.

Interestingly, according to the interviews, the lack of involvement of the Village Unit Cooperatives (KUD) in the flow of the supply chain of rice is based on data from interviews and observations in the field due, namely: first, KUD rarely take part in the trade sector of commodity grain and rice in the supply chain in South Sumatra the. This, it turned out in line with the opinion of Surono (1998), that the Village Unit Cooperatives in Indonesia, including farmer groups, not many have a role in the marketing sector, including in commodity grain and rice.

Second, the role of covert, where KUD also act as millers.As KUD Tugumulyo in Tugu Muda village, OKI Regency or KUD Makmur Telang in Muara Telang, Banyuasin Regency. Third, KUD in its operations, including farmer groups in it, based on data from interviews benyak have a significant role in the technical field, good cultivation, and distribution of agricultural inputs.The interview data, have in common with research Purnomo and Sidik (1991) in Karawang Regency. According to the study, less involvement of Village Unit Cooperatives, Farmers Group and Logistics Agency, Bulog, due to the tendency of the price of grain in the market is higher than the price set by the government. These conditions make KUD or Bulog reduce role in the purchase of grain and rice to farmers, including in the rice supply chain in South Sumatra.

Based on interview data, it turns out the map of the rice supply chain flow in the South Sumatra, mostly farmers still face some problems in memasaran crops. The main problem is commonly found on the farmers as primary producers in the supply chain of rice in South Sumatra are keterbatas them in knowing the information when they harvest grain prices in financial flows in the supply chain network supplier this stage.

4.2. Stage Performance Evaluation of Supply Chain Supplier Network Rice

The initial stage performance evaluation of supply chain network supplier of rice in South Sumatra, is done by submitting the initial questionnaire containing 37 indicators of performance based on the Key Performance Indicator (KPI). The questionnaire was given to the management of PT. Karya Jaya Mandiri Perkasa who know the problems and conditions in the supply chain management company to do the validation. KPI made by SCOR approach based on the perspective of the major supply chain plan, source, make, delivery, and return. Once indicators specified in KPI then performed the validation of the indicators in the KPI that are expected to represent the supply chain performance of PT. Karya Jaya Mandiri Perkasa in supply chain management, especially the phase of supplier network.

Further weighted using Analytical Hierarchy Process (AHP) and the calculation of scoring system using Objective Matrix (OMAX) and analysis Traffic Light System (TSL). Analysis of Traffic Light System (TSL) was conducted to determine the performance indicators KPI entered categorized in green, yellow or red. If there is a performance indicator in the category of yellow and red, then it should be given remedial actions, for the achievement of its performance is still below target.

Based on data from the questionnaire KPI performance indicators in the calculation of weighted first weighted perspective. The first calculation, the weighting perspective performed at level 1 based on five perspectives Supply Chain Operations Reference (SCOR), the plan, source, make, deliver, and return. From the data obtained, the results of weighting perspective can be seen in Table 3 below, namely:

Table 3. Weighting Perspective

Perspective	Weight
Plan	0,220
Source	0,326
Make	0,228
Deliver	0,144
Return	0,082
Jumlah	1
Inconsistncy Ratio	0,05

Based on Table 3 can be seen that for weighting the five perspectives in SCOR showed inconsistency has a weight ratio of 0.05. Weight value weighted inconsistency ratio in five perspectives in SCOR is acceptable because it has met the maximum limit of inconsistency ratio, which is equal to 0.1.

After making the weighting of each dimension within each KPI, then calculate the scoring system. Calculation scoring system using Objective Matrix (OMAX) combining the criteria of productivity into a form that is integrated and related to each other. This model involves all levels in the company, ranging from subordinates to superiors on rice agroindustrial company PT. Karya Jaya Mandiri Perkasa. Results scoring system for each perspective plan in the first dimension of SCOR can be seen in Table 4 below:

Table 4. Results Weighting Dimensions

Perspective	Dimensions	Weight
Plan	*Reliability*	0,700
	Responsiveness	0,300
	Total	1
	Inconsistency	0

	Ratio	
Source	Reliability	0,550
	Responsiveness	0,450
	Total	1
	Inconsistency Ratio	0
Make	Reliability	0,750
	Responsiveness	0,250
	Total	1
	Inconsistency Ratio	0
Deliver	Reliability	0,500
	Responsiveness	0,500
	Total	1
	Inconsistency Ratio	1
Return	Reliability	0,650
	Responsiveness	0,350
	Total	1
	Inconsistency Ratio	0

In Table 4 it can be seen that the value of the lowest scoring system currently on the achievement of KPI P1B with a score of 3.48 and KPI achievement P1e with a score of 3.52. Because the overall rate is far below the target and are in the red category, then the KPI should be given remedial action to improve its performance.

After a weighted scoring system on a five perspectives in the rice supply chain in South Sumatra, then the result of supply chain performance measurement rice supplier

network management phase PT, Karya Jaya Mandiri Perkasa. For the rice supply chain performance measurement phase of the company's overall network supplier can be seen in Table 5 below, namely:

Table 11. Performance measurement stage supply chain network supplier rice agroindustrial company PT. Karya Jaya Mandiri Perkasa

No.	Perspective (A)	Dimensions (B)	KPI	Value	VxB (C)	AxB (D)
1.	Plan (0,220)	Reliability (0,700)	P1b, P1c, P1e, P1f, P1g	7,40	5,18	2,41
		Responsiveness (0,300)	P2a	10	3,00	
2.	Source (0,326)	Reliability (0,550)	S1a, S1b, S1c, S1d, S1e, S1f, S1g, S1h, S1i, S1j	6,18	3,39	2,03
		Responsiveness (0,450)	S2a, S2b	8,72	3,65	
3.	Make	Reliability	M1b,	7,25	5,64	1,67

(0,228)	(0,750)	M1d, M1e, M1f, M1h, M11			
	Responsiveness (0,250)	M2a, M2b	8,32	2,08	
4.	*Deliver* (0,144)	*Reliability* (0,500)	D1a, D1b, D1c, D1d	7,64	3,82	1,20
		Responsiveness (0,500)	D2a, D2b	8,02	4,01	
5.	*Return* (0,082)	*Reliability* (0,650)	R1a, R1b, R1c, R1d	9,12	5,92	0,26
		Responsiveness (0,350)	R2a	10	3,50	
Index Total					7,67

Based on data from Table 5 above and after the measurement of the performance of the supply chain as a whole nerwork supplier stages in PT. Karya Jaya Mandiri Perkasa, then obtained a total Index score of 7.67. Based Traffic Light System (TLS), then the total value of the Index are in the yellow category. This means that the rice supply chain performance at PT. Karya Jaya Mandiri Perkasa still showing supply chain performance of companies as a whole has not reached the expected performance although the result is close to the target set. Therefore, it is expected the management of PT. Karya Jaya Mandiri Perkasa have to be careful with their various possibilities that can degrade the

performance of supply chain companies and should keep doing improve performance on an ongoing basis.

Based on the data and the calculation result scoring system by using OMAX on five perspective of supply chain at the stage of supplier network, known from 37 KPIs, there are 25 KPIs included in the green category, 7 KPI that fall into the category of yellow, and 5 KPI are in the category red. Based on this, the green category KPI indicates performance has already reached the target set by the company, so it should be maintained and even improved.However, to KPIs that have not reached the target, the KPI on a red and yellow categories should be given remedial action to improve the supply chain performance of the company. But that needs to be given priority is the improvement of KPI on the red category for the overall rate is far below the target. If the KPI is not immediately given remedial actions, then the rice supply chain performance in the company will decrease and also adversely affect the production activities that take place in the company of PT. Karya Jaya Mandiri Perkasa.

KPIs need to get immediate remedial actions are, among others: first, KPI deviation of actual demand with demand forecasting results. Second, KPI amount of raw materials that can be met by the supplier. Third, KPI amount of raw materials that are not in accordance with defined specifications, and Fourth, KPI number of complaints from manufacturers and fifth, KPI amount of production planning. Based on several KPIs that should be corrected, then given several recommendations that should be undertaken by rice agroindustrial company in South Sumatra in line with the results of the analysis Traffic Light System (TLS) that supply chain performance indicators networknya supplier stage is still in the red category.

First, the KPI deviation of actual demand with demand forecasting results, considered the problem arises because the rice agro-industrial company in South Sumatra generally do not have and apply forecasting methods to forecast the demand for rice supply supply chain flow. If there is any forecast made more use of the institution's top management on request periodic supply data earlier. Techniques like these perceived result is still less accurate and precise in fulfilling the raw materials for the production company.In addition, demand for each type of rice products for raw materials actually processed each month always fluctuated due to weather factors. During the rainy season the product demand tends to decrease while the dry season increased demand.

Recommended fixes to this problem, companies need to have employees who are trained at the same time be able to apply appropriate methods of forecasting, appropriate and accurate to demand for raw materials based on the data in the previous period. The pattern of seasonal demand data categorized companies and has the trend, so that the method can be applied in forecasting demand is the method of Winter.

Second, the KPI amount of raw materials that can be met by the supplier, is considered to still have a problem because most suppliers in the supply chain of rice has limitations and can not meet the amount of supply of raw materials in accordance with the number of orders the company.Constraints rice supply of raw material due to factors unforeseen at the time of producing the raw material suppliers, such as damage to production machines in pinggilingan in tier 1 and declining labor productivity in the secondary distributors. Furthermore, some recommendations for improvement is the need to improve and reinforce the memorandum of understanding (MOU) with the supplier companies, suppliers, such as the sanctions and penalties for suppliers who do not meet the amount of raw material supply orders.

Thirdly, the KPI amount of raw materials that do not fit the specified quality specifications from suppliers, such as defects in materials or their fleas rice. For this issue recommended their information written documentation provided to all suppliers. In

addition, the company should also provide rewards for pamasok who meet demand expectations. For example, by rewarding the price a little expensive for good quality rice.Fourth, KPI's indicators number of complaints from suppliers, suppliers generally give a complaint to carelessness of employees in the company in charge of the rice industry to reconsider the rice supplied to the company. Therefore, there needs to be caution employees to reconsider the rice supplied. Fifth, to KPI amount of production planning also affect the flow of the existing supply chain. Because this often happens stocked memicuh supply coming out. One of the reasons such as the need to season rice production is likely to increase over the Eid seasons of the other. Recommendation, the necessary historical data that takes into account seasonal factors.

5. Closing

Based on the results of research and discussion, there are some conclusions drawn.

First, based on the mapping of the rice supply chain structure in stages of supply chain management network supplier of rice South Sumatra, there are four structures rice supply chain flow. (1) farmers (46%)> millers> traders> Wholesalers> companies; (2) Farmer (24%)> traders> millers> wholesaler> companies; (3) Farmer (18%)> mills> Wholesalers> companies; (4) Farmer (12%)> traders> Wholesalers> companies. Based on interviews, the fundamental problems of farmers as a major producer of rice supply chain in South Sumatra are limited in the information when they harvest grain prices on the supply chain network supplier this stage.

Second, the result of supply chain performance measurement phase network supplying the rice supply chain management in South Sumatra with SCOR method shows that there are 25 KPI categorized as green, yellow category 7 and 5 red category. For the green category needs to be maintained, even improved continuously. While the category of yellow, red and even necessary repairs as soon as possible. Based on the results weighted scoring system OMAX obtained total index value of 7.67, so the TLS are in the yellow category which indicates that the company's performance in South Sumatra rice agro-industry in the rice supply chain as a whole has not reached the expected performance although the result is close to the target set.

Third, there needs to be improvement, particularly in the five KPIs, namely deviation actual demand with demand forecasting results, the amount of raw materials that can be met by the supplier, the amount of raw materials that do not match the quality and specifications are determined, the number of complaints from suppliers, as well as the number of production planning.

LOCAL GOVERNMENT FINANCIAL PERFORMANCE FACTORS: DECENTRALIZATION IMPACT IN INDONESIA

Citra Etika,STIE Prabumulih, Indonesia
Hasni Yusrianti, Diponegoro University, Indonesia
Azwardi, Sriwijaya University, Indonesia

Abstract

This study aims to determine factors that effecting Financial Performance of local government (regional autonomy and parent regions) in South Sumatera province, Indonesia. Budget Realization Report from 2009 to 2013 that inspected and audited by BPK used in this research as secondary data. Data collected from 8 (eight) regional autonomy and 6 (six) parent regions. The analysis technique is multiple linear regression models estimated by ordinary least squares (OLS) with fixed effect model. Result shows that Local own-source revenue (PAD), Capital Capital Expenditure, Operational Expenditure simultaneously significant effect on Independence Ratio and Effectiveness Ratio of Regional autonomy and Parent Regions. Furthermore, they also simultaneously significant effect on Development Expenditure Activity Ratio and Operational Expenditure Activity Ratio of Regional Autonomy and Parent Regions in South Sumatra.

Keyword: *Autonomy, Parent regions, Independence Ratio, Effectiveness Ratio, Activity ratio.*

Introduction

In the late 1990s, decentralization in Indonesia became more of a political imperative. Establishment of regional autonomy in Indonesia is one of implementation decentralization in Indonesia. The formation of regional autonomy carried out in order to accelerate the economic growth of the region to empower local potential based on economy. Based on Law No. 22 of 1999 that changed to Law No. 32 of 2004, the establishment of autonomy region can be incorporated of some regions or part of a region into two regions or more. The two laws drastically altered the national-subnational relations by transferring powers, taxes, funds, and personnel to the regions. As a result of such massive decentralization, the deconcentrated agencies of central government have, for the most part, been abolished, but provinces continue to represent the center in certain instances (Widodo, 2009).

According to Brodjonegoro and Asanuma (2000), there are some regulations in the new laws; first, under the new laws, the central government's power is substantially to be devolved to the second level local governments, whose administrative, managerial and planning capabilities are inadequate. Secondly, a major part of local governments' revenue would rely on the sharing of natural resources taxes, which would aggravate horizontal imbalances. Thirdly, there would be thus a need for large-scale fiscal transfers, which would strain the central government's budget. Lastly, given the enormity of the tasks ahead, a more gradualist approach is preferable. The region that could be implement autonomy has some characteristics. Halim (2008: 167) explains that the main characteristic of a region that is capable of implementing autonomy, namely (1) financial capacity that means the area should have authority and ability to explore the financial source, manage and use sufficient finances to finance the government implementation, and (2) the dependence on central assistance

should be as minimal as possible, so the local own-source revenue (PAD) should be part of the largest financial resources so the government's role has become even greater.

The regulations has consequence to the change in local government fiscal management so financial performance measurement is important to assess transparency and Accountability (accountability) of realization report of local government budgets. The financial performance of local governments is the ability of regions to manage financial their own resources to meet their needs to support the government system, community service and local development by not depend entirely on the central government and have flexibility in using funds for the benefit of local communities within the limits prescribed legislation (Susantih, 2009: 6). Analysis of the financial performance of local governments is not only useful as an evaluation, but also to help understand and interpret the financial statements of the local governments.

Analysis of financial performance and the factors affecting financial performance becomes the important points. Koen et al (2004) tensions between different levels of autonomy appear in practice, indicating the need for an combined and integrated study of the effects of the different dimensions of autonomy on performance. Groves et al (2001), indicated that variables that affect the financial performance of local governments are financial indicators of local governments affected by both financial factors, environmental factors and organizational factors. Moreover, Steven and McGowen (1983) indicated that financial factors (financial factors) consists of revenue, expenditure, operating position, debt structure, unfunded liabilities, and the condition of capital fund and the financial trend is influenced by many factors such as population and income sources for local governments. Furthermore, Hari (2006) stated there is significantly influences both regional economics growth and regional own revenue. It also finds that the government's decision to allocate the greater capital expenditure to the supported economic growth infrastructures will brings more regional own revenue.

Moreover, Stine (1994) The local government revenue response to federal aid was found to be asymmetric. The reduction in federal aid induced a reduction in own-source revenue. The results support the notion that taxpayers prefer fiscal restraint when permanent loss of aid occurs. Furhetmore, Rondinelli et al (1989) An integrated political-economy framework that draws from the most useful aspects of each set of approaches can provide policy analysts with a more powerful set of concepts and methods for designing and implementing decentralization policies more effectively. Finally, Nick Devas (1989) stated that in order local governments have optimal ability to levy local taxes in region, it would need to consider regional taxes that are own-sources of income to create efficiency and effectiveness in tax collection.

Furthermore, Lewis (2003) stated that revenue generated by new taxes and charges would appear to be negligible; even under the most optimistic of assumptions, any increase in regional own-source revenues that may have resulted from the creation of new taxes and charges would be very small relative to overall budgets. Moreover, Research result in some áreas in Indonesia have different result. Financial performance of Malang (a city in Western Java) is basically good, when it is viewed from PAD Effectiveness Ratio, Effectiveness of Local Taxes and Expenditure Efficiency Ratio, however ratio of Regional Financial Independence, Degree Contributions enterprises and Analysis of Expenditure Growth has not shown in the maximum performance (Sidharta, 2008). Moreover, Yanuar (2009) conducted a

study Bangka Belitung (a province in Sumatera) has mixed result; good, moderate, and not good financial performace.

Implementation of autonomy has brought impact of expansion in one of high income provinces in Indonesia, South Sumatra. It locates in the southern part of Sumatra Island, spans 91,592.43 km2 and had population more than 8 million people. After implementation autonomy regulation, from 2001 to 2013, South Sumatra became to 17 districts/municipalities from 10 municipalities/regencies. The new regional autonomy are Pagar Alam, Prabumulih, Lubuk Linggau, Banyuasin, Ogan Ilir, South OKU, East OKU, Empat Lawang, Penukal Abab Lematang Ilir Regency (PALI), Musi Rawas North. While the parent regions is Lahat, Muara Enim, Musi Rawas, Musi Banyuasin, Ogan Komering Ulu (OKU), Ogan Ilir (OKI) (BPK RI, 2013). The comparison revenue between autonomy and parent regions as can be seen as follows:

Table 1: **PAD Realization on Total Revenue (%)**
Regional Autonomy and Parent Regions
(South Sumatera, 2009-2013)
(in thousand IDR)

Parent Regency (R)/ Municipality (M)	Ave rage	Autonomy (Regency(R) / Municipality (M)	Ave rage
Lahat (R)	5,42	Pagaralam (M)	4,38
Muara Enim (R)	6,79	Prabumulih (M)	5,20
Musi Rawas (R)	4,53	Lubuk linggau (R)	4,77
Musi Banyuasin (R)	2,84	Banyuasin (R)	3,00
Ogan Komering Ilir(R)	4,09	Ogan Ilir (R)	2,85
Ogan Komering	5,69	OKU Selatan (R)	2,47

Ulu(R)			
		OKU Timur (R)	2,81
		Empat Lawang (R)	2,67
Average	4,89		3,51

Source : BPK RI Prov. Sumatera Selatan.

Based on the tables above, it can be seen the comparison of percentage of local own-source revenues to total revenues is South Sumatra, with an average of 4.89 percent for Parent regions and 3.51 percent for regional autonomy. This means that the level of financial dependence of parent regions to central government aid is lower than the regional autonomy but it is still in very poor category.

The high dependence of regional finance of regional autonomy especially in South Sumatra province to the central government, as well as the pressure in collection of local own-source revenue in South Sumatra are some problems of autonomy in this province. Optimally, the fiscal balance transfer funds that obtained local government finance in South Sumatra Province should be allocated to expenditures which will increase local own-source revenues. However, in reality it indicates, local government finance and its Parent regions tend to ignore the excavation Local own-sources as the main base of local revenue and making the balance transfer funds as substitutes. Based on the motivation above, this study aims to determine factors that effecting financial performance of regional autonomy and parent regions in South Sumatera to accelerate the economic growth of the region to empower local potential based economy.

Literature Review
1. Agency theory

Jansen and Meckling (1976) defines the agency theory as the relationship between the agent (management of a business) and Principal (business owners). In the agency relationship there is a contract in which one or more persons (the principal) govern another person (the agent) to perform a service on behalf of the principal and authorized agent to make the best decisions for the principal.In public sector organizations, especially local government, agency relationship arises between the local government as an agent and Parliament as a principal. If explored further, then the parliament is itself an agent of the public / citizens in the area. In this agency relationship, the public / citizens apply as principal authorizing Parliament (agent) to monitor the performance of local governments. Accountability becomes a logical consequence of the relationship between the agent and the principal.

2. Regional Expansion

Implementation of the autonomous regional government, according to Law No. 32 of 2004 on Regional Government aims to accelerate the realization of people's welfare through

improvement, service, empowerment, and community participation, as well as increased competitiveness of the region with regard to principles of democracy, equity, justice, privilege and specificity of a region within the Unitary State of the Republic of Indonesia. The objectives of the expansion under PP 129 of 2000 are; increase in service to the community, accelerating the growth of democratic life, acceleratingimplementation of regional economic development, acceleration of region management potential, improvement of harmonious relations between the central and local regions.

3. Regional Financial Accounting and Local Government Budget

According to Halim (2008: 42), Regional Financial Accounting is process of identifying, measuring, recognition, and reporting of economic transactions (financial) of local government entities-governments (countries, municipalities, or provinces) which serve as information for economic decision making that required by external parties entity (country, city, or province). Moreover, Local government budgets is prepared to improve local empowerment and welfare of the community. Through budget, an area can maximize local owm-source revenue, and spend those funds in appropriate programs and activities that have been specified in the regulations. According to Halim (2008: 23), form of a new budget revenue sources are also divided into three categories: local own-source revenues, fiscal balance transfer funds, and other legitimate revenues.

4. Financial performance

Financial Performance of local governments is the ability of an area to dig and manage financial own-resoure to meet their needs to support the passage of the government system, the public service and regional development by not depend entirely on the central government and have flexibility in using funds for the benefit of local community within the limits prescribed legislation (Syamsi, 1989: 199).PAD is a local own-source revenues in a given period, the increasing of revenue hope meet the obligations of government in providing public community services. Operational expenditure is expenditure that benefits only one fiscal year and add an asset to the area. Development expenditure is expenditure that benefits tends to exceed one fiscal year and add to regional assets.

5. Financial Performance Factors

This study uses the expenditure and revenue factors, namely: (1) revenue which is the amount of local revenue by local governments in period, Halim (2008: 52), that compose of local taxes, retribution area, result of separated owned wealth management, other legitimate PAD. (2) Operational Expenditure, according to Halim (2008: 54) is the expenditure that benefits only for one fiscal year and add to asset / wealth for the region. It consists of personnel, good expenditure, interest expenditure, subsidy expenditure, grant expenditures, social assistance expenditure, financial aid expenditures. Finally (3) Development Expenditure, according to Halim (2008: 55) is the expenditure that benefits tend to exceed one fiscal year and will add to asset / wealth of the region, and will further add to the regular budget. It consists of land expenditure, expenditures on equipment, capital expenditure for building, capital expenditures for roads, irrigation, and networks, other fixed asset expenditures, and other assets expenditures.

6. Financial Ratio Analysis

Financial ratio analysis is the core of performance measurement as well as concept to ensure the management of government organizations doing public accountability to the public.The results of the analysis of financial ratios can be used to measure the performance (Halim, 2008: 126). According to Halim (2008: 230) to evaluate the financial statements, it can be used financial ratio analysis of the posts in the financial statements. Financial ratio analysis of the budget that has been used as benchmarks to: assess the local financial independence in finance decentralized governance, measure effectiveness and efficiency in the realization of regional revenue, measures the extent to which the local government activities in expenditure the revenue, measure the contribution of each revenue source to form local revenue, see revenue and expenditures growth or development incurred during a specific time period.

7. Various Financial Ratios

Independence Ratio of Regional Financial

Local financial independence ratio or what is often referred to as fiscal autonomy in the regions demonstrate the ability of self-finance government activities, construction, and services to the people who have paid taxes and levies as a source of revenue.

$$Independence\ Ratio = \frac{PAD}{Government\ Transfer\ +\ Provision\ \&\ Liability} \times 100\%.$$

Effectiveness Ratio

Effectiveness ratio aims to measure the extent to which the government's ability to mobilize the revenue receipts in accordance with the target. Effectiveness ratio of revenue is calculated by comparing revenue with revenue budgeted revenue target (Halim 2008:234). This ratio is defined as follows:

$$Effectiveness\ Ratio = \frac{PAD\ Revenue\ Realization}{PAD\ Revenue\ TArget} \times 100\%$$

Activity Ratios

There are two type of activity ratio, operasional expenditure ratio and development expenditure ratio. The formula can be seen as follows:

* Operational Expenditure Ratio $= \frac{Total\ Operational\ Expenditure}{Total\ Local\ Expenditure} \times 100\%$

* Development Expenditure Ratio $= \frac{Total\ Development\ Expenditure}{Total\ Local\ Expenditure} \times 100\%$

Previous Research and Hypotheses Development

Analysis of financial performance and the factors affecting financial performance becomes the important points. Cohen (2006) stated five variables that affect financial performance are:*gross domestic product, citizen population, real estate, tourist andcapital.* These affect expressed in nine financial ratio that consists of: *return on equity, return on assets, profit margin, current ratio, debt/equity, long term liabilities/ total assets, assets turnover, operating revenues/ total revenues and operating revenues/ operating expense.* However, factors that have higher influence are the number of people and capital.

Furthermore, study by Groves et al (2001), indicated that variables that affect the financial performance of local governments are financial indicators of local governments affected by both financial factors, environmental factors and organizational factors that could be monitoring through *Financial Trend Monitoring System* (FTMS). Moreover, reseach in local government by Steven and McGowen (1983) indicated that financial factors (financial factors) consists of revenue, expenditure, operating position, debt structure, unfunded liabilities, and the condition of capital fund and the financial trend is influenced by many factors such as population and income sources for local governments. While Suyono (2010) the revenue variable positively significant effects on financial performance.

Local Own-source revenue (PAD) Influence on Performance of Local Government Finance.

Nick Devas (1989) stated that in order local governments have optimal ability to levy local taxes in region, it would need to consider regional taxes that are own-sources of income to create efficiency and effectiveness in tax collection. Furthermore, Hari (2006) stated there is significantly influences both regional economics growth and regional own revenue. Moreover, Steven and McGowen (1983) indicated that financial factors (financial factors) consists of revenue, expenditure, operating position, debt structure, unfunded liabilities, and the condition of capital fund and the financial trend is influenced by many factors such as population and income sources for local governments.

Development Expenditure and Operational Expenditure Influence on Local Government Finance Performance

Stine (1994) The local government revenue response to federal aid was found to be asymmetric. Stine (1994) Own source revenue response also may be asymmetrical if revenue maximizing agencies or special interest group resist program reductions. Revenue will be less responsive if the institutional features of representative government lead to excess spending. Moreover Hari (2006) also found that the government's decision to allocate the greater capital expenditure to the supported economic growth infrastructures will brings more regional own revenue.

Effect of new regional autonomy and Parent regions on the Performance of Local Government Finance

Koen et al (2004) tensions between different levels of autonomy appear in practice, indicating the need for an combined and integrated study of the effects of the different dimensions of autonomy on performance. Moreover, Groves et al (2001), indicated that variables that affect the financial performance of local governments are financial indicators of local governments affected by both financial factors, environmental factors and organizational factors.Furthermore, Wihardja (2010) Extreme heterogeneity in endowments, factor immobility, and the endogenous deterioration of local governance institutions can each undermine the supposed development-enhancing promises of decentralized government in emerging economies such as Indonesia.

Then, Stine (1994) The local government revenue response to federal aid was found to be asymmetric. The reduction in federal aid induced a reduction in own-source revenue. The results support the notion that taxpayers prefer fiscal restraint when permanent loss of aid occurs. Rondinelli et al (1989) also stated that an integrated political-economy framework that draws from the most useful aspects of each set of approaches can provide policy analysts with a more powerful set of concepts and methods for designing and implementing decentralization policies more effectively. Finally, Lewis (2003) stated that revenue generated by new taxes and charges would appear to be negligible; even under the most optimistic of

assumptions, any increase in regional own-source revenues that may have resulted from the creation of new taxes and charges would be very small relative to overall budgets. Without access to more substantial tax bases, regional governments will remain unsuccessful in realizing significant own-source revenues and fiscal decentralization in Indonesia will continue to be an unbalanced affair.

Based on motivation above, the hypothesis in this study are explained as follows:

- Hypothesis 1 : PAD, Development Expenditure and Operational Expenditure is significant influence on independence ratio regional autonomy and Parent regions in South Sumatra.
- Hypothesis 2 : PAD, Development Expenditure and Operational Expenditure is significant influence on the effectiveness ratio regional autonomy and Parent regions in South Sumatra.
- Hypothesis 3: PAD, Development Expenditure and Operational Expenditure is significant influence on development expenditure activities ratio of regional autonomy and Parent regions in South Sumatra.
- Hypothesis 4: PAD, Development Expenditure and Operational Expenditure is significant influence on operational expenditure activity ratio regional autonomy and Parent regions in South Sumatra.

Research Methods

1. The scope of research

This study is focused to analyze the factors that influence performance of Autonomous Government Finance and Parent regions in South Sumatra about PAD, Operational Expenditures, capital expenditures, total revenue and total expenditure contained in Budget Realization Report (LRA) during the 2009-2013 period. Data used in this study only from 2009 till 2013. It is based on consideration in South Sumatera that in 2014 there are some new regional autonomy appear that they still manage new regions. It is not balance if compares new regional autonomy and old regional autonomy.

2. Data Sources

It is a quantitative research using secondary data such as report of budget realization in 2009 to 2013 that have been examined / audited by BPK. Data collected from 8 (eight) regional autonomy and 6 (six) parent regions. The Municipalities of Expansion/autonomy are; Pagar Alam, Prabumulih, Lubuk Linggau, and the regencies are Banyuasin, Empat Lawang, Ogan Ilir, Ogan Komering Ulu Selatan, Ogan Komering Ulu Timur. Furthermore the Regional Parent regions are Lahat, Muara Enim, Musi Banyuasin, Musi Rawas, Ogan komering Ilir, and Ogan Komering Ulu.

3. Data analysis technique

Collecting data in this study with documentation method and analysis using multiple regression techniques with Eviews software using panel data and fixed effect model.

Equation Mode :

$LnK = \beta_0 + \beta_1 \, LnPAD + \beta_2 \, LnBP + \beta_3 \, LnBR + dummy + e$

$LnE = \beta_0 + \beta_1 \, LnPAD + \beta_2 \, LnBP + \beta_3 \, LnBR + dummy + e$

$LnABP = \beta_0 + \beta_1 \, LnPAD + \beta_2 \, LnBP + \beta_3 \, LnBR + dummy + e$

LnABR = β0 + β1 LnPAD + β2 LnBP + β3 LnBR+ dummy + e
Description:
Dependent Variable :
LnK = Financial Performance Local Government (Independence Ratio)
LnE = Financial Performance Local Government (Independence Ratio)
LnABP = Financial Performance Local Government (Development Expenditure Activity Ratio)
LnABR = Financial Performance Local Government (Operational Expenditure Activity Ratio)

Independen Variables :
PAD = Local Own-Source Revenue
BR = Operational Expenditure,
BP = Development Expenditure,
Dummy (R) = Autonomy / Parent Regions
β 0 = constanta,
β 1 – β 3 = regression coefficient,
e = *residual term.*

Results And Discussion
1. Financial Independence of Autonomy and Parent Regions
Prabumulih city has the highest independence value among other regions of autonomous government in South Sumatra. Consistently from 2009 to 2013 with an average value of independence ratio of 5.75%. Although it still classified much less, but it is the greatest independence ratio compare to other regions in South Sumatra. Moreover, for Parent Region, Muara Enim regency has the highest value independence value among other divisions of local government in South Sumatra. Consistently from 2009 to 2013 with an average value of independence ratio of 7.01%. Although it still classified less but if compare to the autonomy expansion that is equal to 5.57%, it is better.

2. Financial Effectiveness ofAutonomy and Parent regions
Banyuasin, South OKU, and Empat Lawang regencies are theareas that are very effective which are 149.39%, 143.07%, and 135.36% respectively for managing local revenue. They have localown-source revenue realization (PAD) are higher than PAD target revenue predetermined. Moreover, for Parent Region, Muara Enim regency is an area that is very effective in managing local own-source revenue, with realization (PAD) is higher than thetarget revenue of PAD predetermined. It can be seen from the magnitude-effectiveness ratio is 109.78%.

3. Operational Expenditure Activities and Financial Development Expenditure
OKU Timur has operational expenditure ratio level of regional autonomy during 2009-2013 with the highest average of 77.22% and the lowest ratio of autonomous regional development expenditure during 2009-2013 with an average of 22.78%. Moreover, for parent region, Lahat regency has the highest level of Operational Expenditure Activity ratio of Parent regions during 2009-2013 with an average of 76.64% and ratio of the lowest of regional development expenditure during 2009-2013 with an average of 23.37%. It shows

high percentage of funds allocated to operational expenditure of Parent regions so the fund is used to provide regional development expenditure is getting low. As a result of facilities and infrastructure of economic community will be accepted tend to be smaller.

4. Regression Analysis Model Equations

The following data is output by regression results EViews 6.0 program to regression model are:

Equation 1
$\ln K = 1872,342 - 0,120628 \ln PAD + 1,053073 \ln BP + 1,581585 \ln BR + 9,3775191 \, dummy + e$

Equation 2
$\ln E = 1873,289 - 0,339578 \ln PAD + 1,102295 \ln BP + 1,511915 \ln BR + 9,417816 \, dummy + e$

Equation 3
$\ln ABP = 1872,214 - 1,641080 \ln PAD + 1,021500 \ln BP + 4,061335 \ln BR + 7,451566 \, dummy + e$

Equation 4
$\ln ABR = 1874,173 + 0,000119 \ln PAD + 0,958814 \ln BP + 1,546970 \ln BR + 9,302844 \, dummy + e$

5. Hypothesis testing

Simultaneous Test (Test F)

Simultaneously, F test of this research can be seen in table below:

Table 2: F Statistics Test Result

MODEL	F-Statistik	F tabel	Probabilitas F	Ho
MODEL I	25,45862	1,980	0.0000< 0,05	Rejected
MODEL II	26,07850	1,980	0.0001< 0,05	Rejected

As can be seen above, all models are significant simultaneously.

Partial testing (t test)

T test aims to see the significance of the influence of the independent variable on the dependent variable individually. The variables have a significant influence when the value t count> t table. Partial test of this research can be seen in table below:

Table 3: t-statistics Test Result

Model	Variable	t-statistics	T table	Probabilitas t	Ho
Model I	Ln PAD	-	1.99714	0.7654>0.05	Accepted
	Ln BP	0.299904		0.0693>0.05	Accepetd
	Ln BR	1.854924		0.0010<0.05	Rejected

Source: output E-views 6.0 (proceed)

As can be seen above, partially only model III is significant, however the others are either significant or insignificant result.

The coefficient of determination (R2)

In Model I and II, based on a linear regression calculation, R2 value of 0.892 and 0.895 respectively , it means that 89.2 and 89.5 per cent of Independence ratio and effectiveness ratio can be explained by local own-source revenue variable (PAD), Development Expenditure (BP), Operational Expenditure (BR). However, other percent are explained by other variables that is not included in the model estimation.

Moreover, in Model III and IV, R2 value of 0.905 and 0.893 respectively, it means that 90.5 and 89.3 per cent of Development Expenditure Activity Ratio and Operational Expenditure Activity Ratio can be explained by local own-source revenue variable (PAD), Development Expenditure (BP), Operational Expenditure (BR), dummy. While other percent is explained by other variables that not included in the model estimation.

Local Own-source revenue (PAD) Influence on Performance of Local Government Finance.

In Model 1, it can be seen PAD has t-count less than t-table, it means that PAD does not significantly influence the ratio of independence. This insignificant effect due to it has not been able to finance its own activities of governance, development and public service who have paid taxes and levies as a source of revenue (Halim, 2008: 232). PAD has negative effect that means it has a low level of public participation in paying taxes and levies that would describe the low level of social welfare (Halim, 2008: 232). Furthermore, in model 2, it can be seen revenue PAD does not significant and negatively affect Effectiveness ratio. The insignificant effect due to the regency / city governments have not been able to mobilize the revenue receipts in accordance with the target (Halim, 2008: 234).

Moreover, in Model 3, it can be seen that PAD significantly and negatively affect to ratio of Development Expenditure Activity. This means revenue (PAD) are funds allocated to development expenditure of local government district / municipality, while the negative effect means that a high percentage of revenue (PAD) that is allocated will reduce development expenditure used to provide economic infrastructure of society (Halim, 2008: 236). Finally, in Model 4, it can be seen that revenue (PAD) to ratio of operational expenditure Activity variable has t-count less than t-table, it means that the variable revenue (PAD) has no significant effect and negatively affect effectiveness ratio. This insignificant effect due to revenue (PAD) cannot be given as priority in the allocation of operational funds expenditure (Halim, 2008: 236).

This result supports research by Nick Devas (1989), Steven and McGowen (1983), Hari (2006), Lewis (2003). Nick Devas (1989) stated that in order local governments have optimal ability to levy local taxes in region, it would need to consider regional taxes that are

own-sources of income to create efficiency and effectiveness in tax collection.Moreover, Steven and McGowen (1983) indicated that financial factors (financial factors) consists of revenue, expenditure, operating position, debt structure, unfunded liabilities, and the condition of capital fund and the financial trend is influenced by many factors such as population and income sources for local governments. Furthermore, Hari (2006) stated there is significantly influences both regional economics growth and regional own revenue and Lewis (2003) revenue generated by new taxes and charges would appear to be negligible; even under the most optimistic of assumptions, any increase in regional own-source revenues that may have resulted from the creation of new taxes and charges would be very small relative to overall budgets.

Development Expenditure Influence on Local Government Finance Performance.

In Model 1, it can be shown that Development Expenditure on independence ratio has t-count less than t-table, it means that Development Expenditure does not significantly influence the independence ratio. This situation because city or regency government still depends on central government. The Independence that relatively small ratio means, it is not able to change the composition of budget expenditure in of city/regency. Moreover, in Model 2, it can be seen the Effectiveness ratio of Development Expenditure has t-count greater than t-table that means the Development Expenditure significantly influence the effectiveness ratio. This condition can be concluded that the realization of PAD outweigh targets. This indicates that if a regional financial is effective, it has assumptions that the region realize its development budget is quite high, especially for public interest.

Furthermore, in Model 3, it can be seen Development Expenditure on development expenditure activity ratio has t-count greater than t-table, it means that the Development Expenditure variable significantly influence the activity ratio of development expenditure. This significant influence means the increasing ratio of the activities of development expenditure, the increasing development expenditure. Finally, in Model 4, it can be seen the Development Expenditure on operational expenditure activity ratio that does not significantly affect the activity ratio of expenditures. It means that the higher the percentage of funds allocated for operational expenditure, the expenditure percentages used for the development community is getting smaller, so the ratio of operational expenditure is relatively low activity caused no percentage of development expenditure.

This result supports research by Hari (2006) and Stice (1994). Hari (2006) found that the government's decision to allocate the greater capital expenditure to the supported economic growth infrastructures will brings more regional own revenue. Moreover, Stine (1994) The local government revenue response to federal aid was found to be asymmetric. He also stated that Own source revenue response also may be asymmetrical if revenue maximizing agencies or special interest group resist program reductions. Revenue will be less responsive if the institutional features of representative government lead to excess spending.

Operational Expenditure Influence on Performance of Local Government Finance

In Model 1, it can be seen that Operational Expenditure on independence ratio has t-count greater than t-table, it means that variable operational expenditure has significant effect on independence ratio. It means that the independence ratio of Regency / City that is relatively high will be able to change the composition of operational expenditure in budgets of Regency / City.

Moreover, in Model 2, it can be seen that Operational   Expenditure on effectiveness ratio has significantly influence. This condition can be concluded that the realization of PAD outweigh targets. This indicates that if a regional financial is effective, it means there is assumptions that that region realize highly enough its regular budget. Furthermore, in Model 3, it can be shown Operational Expenditure variables has significantly influence the activity ratio of operational expenditures. Finally, in Model 4, it shown the Development Expenditure significantly influence the activity ratio of operational expenditures.

This result supports research by Stine (1994) and Hari (2006). Stice stated that the local government revenue response to federal aid was found to be asymmetric. He also stated that Own source revenue response also may be asymmetrical if revenue maximizing agencies or special interest group resist program reductions. Revenue will be less responsive if the institutional features of representative government lead to excess spending. Moreover Hari (2006) also found that the government's decision to allocate the greater capital expenditure to the supported economic growth infrastructures will brings more regional own revenue.

Effect of new regional autonomy and Parent regions on the Performance of Local Government Finance

Model 1 shown that dummy (regional autonomy and Parent regions) on the independence ratio. The dummy variable (regional autonomy and Parent regions) has t-count greater than t-table, it means that regional autonomy and Parent regions variable significantly influence the independence ratio. It means that the Government of Regency/City has ability to finance their own regional government activity. Furthermore, in Model 2, it can be viewed dummy (regional autonomy and Parent regions) on the effectiveness ratio. The dummy variable (regional autonomy and Parent regions) has t-count greater than t-table, it means that the dummy variables significantly influence the effectiveness ratio. This significant influence means that Government of Regencies / Municipalities can measure the ability of to mobilize realization according to the target.

Furthermore, in Model 3, it can be viewed that dummy (regional autonomy and Parent regions) on ratio of development expenditure activity which is the dummy variable (regional autonomy and Parent regions) has t-count greater than t-table, it means that the variables significantly influence the ratio of development expenditure activity. It means that local governments prioritize the allocation of funds to the optimal development expenditure. Finally, in Model 4, it shown that dummy (regional autonomy and Parent regions) on independence ratio which is the dummy variable (regional autonomy and Parent regions) has t-count greater than t table that means that the dummy variables significantly influence the operational expenditure activity ratio. This indicates that local governments prioritize the allocation of funds on a regular expenditure optimally.

This result supports research by Koen et al (2004), Groves et al (2001), Wihardja (2010), Stine (1994), Rondinelli et al (1989). Koen et al (2004) tensions between different levels of autonomy appear in practice, indicating the need for an combined and integrated study of the effects of the different dimensions of autonomy on performance. Moreover, Groves et al (2001), indicated that variables that affect the financial performance of local governments are financial indicators of local governments affected by both financial factors, environmental factors and organizational factors. Furthermore, Pepinsky and Wiharja (2010) Extreme heterogeneity in endowments, factor immobility, and the endogenous deterioration

of local governance institutions can each undermine the supposed development-enhancing promises of decentralized government in emerging economies such as Indonesia.

Then, Stine (1994) The local government revenue response to federal aid was found to be asymmetric. The reduction in federal aid induced a reduction in own-source revenue. The results support the notion that taxpayers prefer fiscal restraint when permanent loss of aid occurs. Rondinelli et al (1989) also stated that an integrated political-economy framework that draws from the most useful aspects of each set of approaches can provide policy analysts with a more powerful set of concepts and methods for designing and implementing decentralization policies more effectively. Finally, Lewis (2003) Revenue generated by new taxes and charges would appear to be negligible; even under the most optimistic of assumptions, any increase in regional own-source revenues that may have resulted from the creation of new taxes and charges would be very small relative to overall budgets. Without access to more substantial tax bases, regional governments will remain unsuccessful in realizing significant own-source revenues and fiscal decentralization in Indonesia will continue to be an unbalanced affair.

Conclusion

Based on the results of multiple linear regression equation, it can be explained as follows:

- Local Own-source Revenue (PAD), Development Expenditure, Operational Expenditure are simultaneously significant effect on Independence Ratio and Effectiveness Ratio of Regional autonomy and Parent Regions in South Sumatra.
- Local Own-Source Revenue (PAD), Capital Expenditure, Operational Expenditure are simultaneously significant effect on Development Expenditure Activity Ratio and Operational Expenditure Activity of Regional autonomy and Parent Regions in South Sumatra.

Limitation and Future Research

This research has limitation which is data used in this study only from 2009 till 2013. This period is based on situation in South Sumatera when 2014 there are some new regional autonomy appear and they still implemented new management. It is not balance if compares new regional autonomy and old regional autonomy. For further research, it is better to cover all new autonomy in Indonesia with long period year analysis.

DESIGNING SUB-CONTRACT MODEL AS STRATEGY
TO INCREASE INCOME OF SELF-HELP GROUPS IN SURABAYA

Nur Handayani
Lilis Ardini

Abstract

Self-Help groups (SHG's) are a population of people who unite voluntarily in groups due to help each other to build a source of financial services in order to encourage and develop productive activities. Although Surabaya has amount of SHG's but there is still hard to reach their sustainability due to some problem such us lack of entrepreneurship, creativity, and marketing. The aim of this research is to build sub-contract model with business partnership in order to increase the efficiency and affectivity of SHG's performance, develop the SHG's business performance, and increase high income. This research uses an exploratory research with focus group discussion method. The population subject in this research is total amount of 20 SHG's which include in the moderate and high category of performance and entrepreneur orientation. The result of this study is sub-contract model between the SHG's and business partnership that can be implemented for gaining the regional market and even international market.

Keywords: *Self-Help groups, sub-contract model, performance, entrepreneurship*

Introduction

One of Surabaya city government's efforts to increase the incomes of the poor is deceived by providing training and development through self-help groups. Training and guidance provided in the form of vocational training and management training in cooperation with instructors and institution of educators as a form of concern for economic growth, social and environmental conditions in the city of Surabaya. Cultivate the entrepreneurial spirit in previous research SHG's has break down into three categories based on the performance. They are strong performance (20 SHG's or 54, 28%), moderate performance (11 SHG's or 31,43%) and low performance (5 SHG's or 14 , 29%) (Handayani and Ardini, 2015).

Furthermore, to increase revenue at SHG'S can be done by partnership program that aims to improve the ability of SHG'S to be resilient and self-reliant through support for the capital, facilities, and human resources professionals and skilled in order to support marketing and business continuity in the future. SHG'S empowerment in the midst of globalization and high competition makes SMEs should be able to face global challenges, such as improving product and service innovation, human resource development and technology, as well as the expansion of the area of marketing. This needs to be done to add value to SME itself, mainly in order to compete with foreign products are increasingly flooding the industrial centers and manufacturing in Indonesia, considering that SMEs are the economic sectors that can create jobs in Indonesia (Sudaryanto, 2011).

The research activities can't be separated from cultivate the entrepreneurial spirit in the SHG's, the first step to do if interested plunge into the entrepreneurial world is fostering the entrepreneurial spirit in ourselves SHG'S. Much can be done for example (1) through formal education. Now, various educational institutions both medium and high present a variety of programs, or at least of entrepreneurship courses, (2) through entrepreneurship

seminars. Entrepreneurship seminars are often held with invited experts and practitioners in entrepreneurship so that through this medium we will build the entrepreneurial spirit in ourselves, through training. Various simulation effort is usually given through a good training is done indoors (indoor) and outdoor (outdoor), (3) through this training, courage and responsiveness us to the changing dynamics of environment be tested and constantly improved and developed Self-taught, (4) through various media, we can foster the spirit of entrepreneurship. For example through the biographies of successful entrepreneurs (success story), the medium of television, radio, newspapers and magazines of various media that we can access to cultivate the entrepreneurial spirit that is in us (Suryana, 2003).

In order to raising revenue of SHG's, it is required cooperation with partners as a means of SHG'S grow the business through the draft sub-contracts/partnerships between businesses that have a market share, in this study the researchers will design a model that suits the needs of SHG'S. Based on the background problems, it would require the development of a model of partnership between SHG'S with partners as a means of business development and facilitate in decision-making SHG'S marketing, product, price, and improve the effectiveness and efficiency of SHG'S. The goal is to increase income and sustainability of SHG's in order to become empowered and independent innovation.

Theoretical framework
Self-Help Groups

Self-Help groups (SHG's) is a population of people who unite voluntarily in groups due to help each other and work together to build a source of financial services in order to encourage and develop productive activities and improve the living standards of its members and their families. Additionally SHG's has a unifying bond, namely the vision, interests and needs are the same, so that these groups have a common goal to be achieved together. SHG's in the city of Surabaya is formed in each village and has built by Bapemas Surabaya. SHG's was given skills training in groups and develop their business in groups.

Definition of interest in entrepreneurship is a sense of attraction of a person to conduct business as an independent with the courage to take risks. High interest means the realization that entrepreneurial individuals attached to him so that more attention and get more pleasure out of entrepreneurial activity. According Susatyo in Sukardi (2008), self-employment has six characteristic that are self-confidence, originality, people oriented, result oriented task, future oriented, and risk taking. Littunen (2000) mentions two characteristics of entrepreneurs, i.e. their creativity and courage in taking risks.

While Marbun (in Alma, 2000) mentions the seven characteristics, namely confidence, task-oriented and results, risk-taking, leadership ability, originality of ideas, vision on the future clearly, and creativity in their work. The same thing also conveyed by Ardini and Respatia (2011), they said that poor families in the city of Surabaya is more effective and efficient after being given vocational training in terms of increasing the income of the poor family.

According to Siswoyo (2009), the development of the entrepreneurial spirit has become important in the future. Entrepreneurship has become an important role. Through entrepreneurship will create employment opportunities for the community. This is mainly to develop people. The activity of SHG's is not only need a capital but also an intention and social interaction that called humanism capital and social capital (Khoirrini dan Kartika, 2014)

This article will explain developing entrepreneurship for students and faculty. They have a position strategic role in developing entrepreneurial attitudes. Entrepreneurship program especially in the practice of entrepreneurship, the entrepreneurial job training; seek business opportunities through the activities of lecturers; using industrial cooperation agreement.

According to Mutaqin (2010), the independence is something very necessary within the framework of the era of strong competition in getting jobs. One effort that can be done in them is by giving a briefing on the SHG's form of activity or training on entrepreneurship. This entrepreneurial activity in order to improve the spirit of entrepreneurship, which is done through regular learning activities contained in entrepreneurship curriculum. The entrepreneurship education developed customized education and vocational technology, which technology entrepreneurship education. The concept of implanting technology entrepreneurship education and encourage students early constantly thinking and developing creative ideas, design, create and develop a business based on lecture material had ever learned.

Partnership

The Partnership is a collaboration of small and medium businesses or large businesses with coaching and development by medium sized businesses or large enterprises with regard to principles require, mutually reinforcing and mutually beneficial (Saparudin, 2012). The pattern of the partnership is a partnership that is set in Act N0 9 Year 1995 on small businesses.

The concept of partnership has various meanings in the light of the behavior, attitudes, values and technical cooperation for the many people, organizations or institutions. In addition to the attributes attached to the partnership between the others is trust, same vision, long-term commitment, dedication to goal together, and cultivate the hope of building (McGregor& Palmer 1997; Bresnen& Marshall 2000).

Sub-Contract Models

In this study, featuring several models of sub-contracting, which can then be selected as a model of subcontracting SHG'S and business players, some models of partnerships, among others:

a. The core of plasma model is a partnership relationship between small businesses with a medium or large business, which includes medium or large businesses to act as the core and small businesses as plasma. The Company acts as the core enterprise partner, who are incommoding, purchase of production, provide counseling services to SHG's group of partners as plasma.

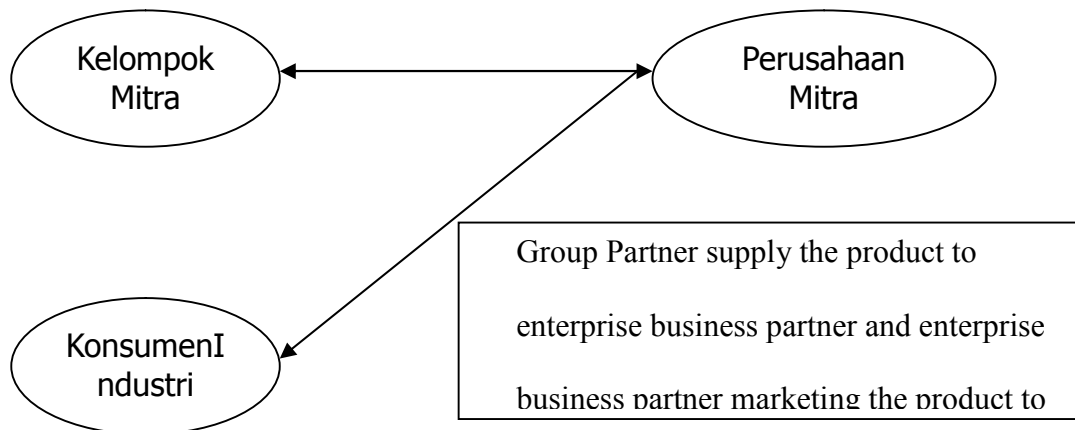
b. Buy Contract Model

At this partnership model, going cooperative relationships between groups of small scale with a medium or large scale companies are contained in an agreement written sales contract for a certain period witnessed by Government Agencies. Self-Help Group is a forum to coordinate its members in a production setting, the collection and sorting of production that will be purchased by the group, do the packaging production according to demand corporate buyers and represent its members in relation to corporate buyers. In this model the government is not directly involved, function only as moderator and facilitator.
c. Sub-Contract Model

Sub-Contract Model is a partnership between small businesses with a medium or large business in which small businesses produce components or services that are part of the production of medium or large businesses. This partnership model resembles a partnership contract SHG'S group but this pattern did not contract directly with the company's processor (processor) but through an agent or trader.

d. General Trade Model

General Trade Model is a partnership relationship between small companies with medium or large or medium-sized business market the production from small businesses Development of general trade pattern can be done by requiring a medium or large enterprise that its business partners to market the production of small business, or a small business supplying the medium or large businesses. Give small businesses the opportunity to work on production based on the expertise of small businesses sell their products intended and the corresponding expertise small business and sell its products meant that the medium or large efforts are not business partners.

Give small businesses the opportunity to market the production of large enterprises.


Picture 2
General Trade Model

e. Operational Cooperation Model of SHG's

Is a partnership that includes partner groups providing services and labor, while the partner companies provide a cost or capital or the means to cultivate or produce business SHG's

Characteristics of Entrepreneurship

According Izedonmi and Okafor (2007), the individual characteristics of entrepreneurs has the ability to identify opportunities and mobilize resources to achieve entrepreneurial goal. Characteristic is identified as the main core of the behavior and performance of an entrepreneur. Characteristics possessed by entrepreneurs, as follows (1). Needs (motivation) achievement, (2). Locus of control, (3).Risk-making, (3) Proactive, (4).Tolerance to uncertainty, (5).Creativity.

Peggy A Lambing & Charles R Kuehl (in Hendro and Chandra, 2006) states that every entrepreneur (entrepreneur) who are successful have four basic elements, namely: the ability (to do with IQ and skill), courage (to do with Emotional Quotient and mental), courage (to do with self-motivation), creativity requires an inspiration as a forerunner to the idea of finding opportunities based on intuition (to do with experience).

Methods

This research uses an exploratory research that aims to understand more deeply and establish a model sub-contract between SHG's with a business partner. The method used in this research is a focus group discussion (FGD) to find problems and solutions together in order to construct a model contract. The population of this study was 20 SHG'S incorporated into the category of medium and high performance and entrepreneurial orientation of the 15 districts in Surabaya.

Table 1.Self-help Groups and the Products

NO	SHG's	DISTRICT	PRODUCT	BUSINESS PARTNER
1	Teduh Jumput	Bubutan	Handycraft/IkatCelup	Alsier Ari
2	Gundih Berseri	Bubutan	Handycraft/IkatCelup	Tiara Handycraft

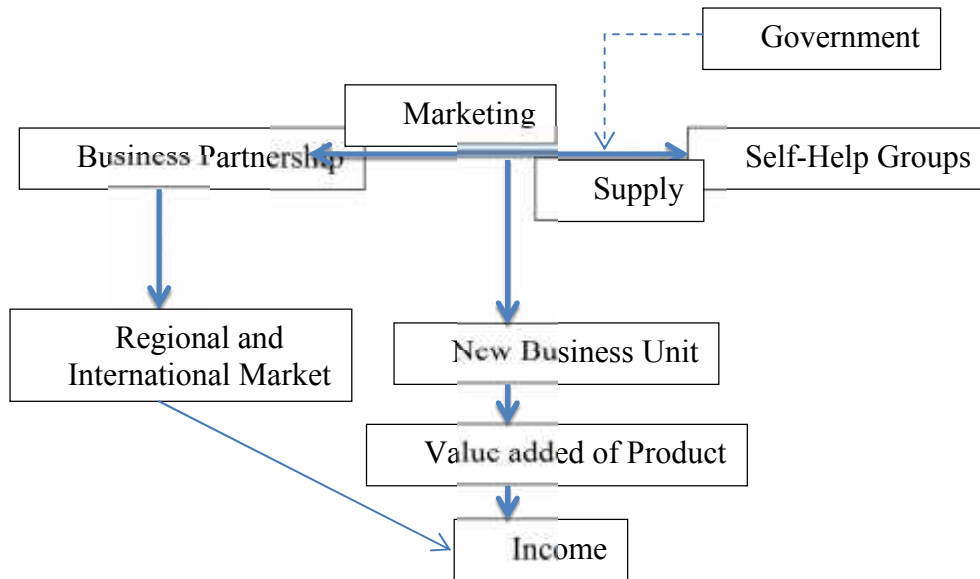
Result and discussion

SHG's in the city of Surabaya is formed by the city government through community empowerment Bapemas in the framework of the community, especially women with low levels of family income. Those who joined in SHG's given training and initial capital by the government with the hope can be developed independently. Training includes skills training, managerial, economic calculations in computing earnings. During one year of technical support and training SHG's mapped into three categories based on performance and entrepreneurship orientation (performance low, moderate performance, and high performance). They are classified as low performance group will be given more in-depth training again and they were included into the medium and high performance to the next stage of the development model of sub-contracts with business partners.

Some 20 SHG's given technical assistance to design a model of entrepreneurship through new business unit sub-contract, for marketing and quality improvement skills possessed SHG's. This model of collaboration designed is a model sub-contracts involving groups of partners, the company's core, and the government as a facilitator but without any direct contract within a specified period.

Sub-contract model design makes SHG's position as a partner group that is producing, collecting, and filtering production. An important point in the formation of this model is to make SHG's independent entrepreneurs by increasing interest shown by the confidence, creativity, courage, and future oriented. Business partnership in the design of this model as the

company that manages the work of SHG's products to further marketed to regional and international markets. An important point business partners in this regard is how to market and maintain product position in the market so that the SHG's business remains sustainable. Government in sub-contract model design is as a facilitator who is not directly involved in the contract activity. Despite the government's position as a moderator does not mean the government does not contribute to the success of this cooperation. Moreover, the government is a bridge between the two businesses.


Picture 3.
Design Sub-Contract Model between SHG's and business partner

Based on the design sub-contracts models, SHG's will be facilitated to expand its business through collaboration with partners to penetrate the national and even international markets. Access marketing will be more efficient and effective when together with experience that given before and development of human resources will strengthen marketing strategies, as well as access to capital and business relationship management and business groups on the performance of financial and business performance of non financial. This is supported by research Saparuddin and Bado (2011), that access to marketing, training and human resource development, access to capital and relationship management of businesses and organizations significant positive effect on the business performance of the financial and business performance of nonfinancial on small and medium enterprises and cooperatives in Jeneponto city.

SHG's internal factor is support for the successful sub contract for this activity required cooperation with other members because it fits with the vision and mission and managing the business together. Performance is determined by SHG's itself well to an increase in marketing and other innovations as a form of performance SHG's. Cooperative relationships with partners must work in harmony and in line, meaning that the internal and external factors KSM must be considered as the sustainability of these activities. The same is done by Sulistyo and Adiatma (2011), that the internal and external factors both sides between SMEs and Cooperatives are determined the success of SMEs.

Additionally in the model subcontract this decision becomes the main thing because when KSM took the decision to accept or reject this order indicates that the Group is able to cooperate with partners as giving orders and it becomes full responsibility KSM. In line with Jamila and Hartati (2011), one of the alternatives in solving problems in the company's subcontracting election for policy makers is to build a decision support system for choosing subcontract model. Decision support systems are able to evaluate some of the criteria in the

assessment through the calculation process, which in the end of the alternative will provide the output of choice which is best subcontract to production activity.

Conclusion

In order to make the SHG's an Independent and sustainable cooperation is needed between the government and the community. One attempt to improve SHG's revenue is through the establishment of cooperation with business partners that have regional and international market share. SHG's easier in determining the decisions relating to marketing, product, and price and improve the effectiveness and efficiency of SHG's performance.

The design of the proposed cooperation model is a model sub-contracts which involve SHG's, business partners, and governments with their respective roles. This model is proposed because it matched SHG's condition as a prospective business unit that require a business partner in order to market their products and the government as a facilitator and early movers. Without the cooperation SHG's third goal made as an independent business unit will be difficult to achieve.

CORPORATE SUSTAINABILITY DISCLOSURE AND FINANCIAL PERFORMANCE EFFECT ON COST OF CAPITAL IN ASEAN BANKING SECTOR

Fattiya Maharani Pusparida' Diponegoro University, Semarang, Indonesia
Puji Harto, Diponegoro University, Semarang, Indonesia

Abstract

This study aims to investigate the effect of sustainability disclosure to corporate cost of capital, and also examine the moderating effect of banks financial performance on the relationship. The sustainability disclosure; which consists of economic; environmental; and social aspects, measured by GRI G3.1 and FSSS index. While the cost of capital was calculated by weighting all source of cost of capital in WACC method. Banks financial performance is measured based on profitability and capitalization, which calculated by three proxies; CAR, ROA, and NIM. The result showed that banks with more sustainability disclosure attracts lower cost of capital. However, if it examined partially, instead of lowering cost of capital, the economic aspects tend to have opposing effects compared to environmental and social aspects. High economic disclosure tends to increase the cost of capital. Further examination showed that sustainability disclosure is successfully lower cost of capital in banking sector for banks that have high profitability.

Keywords: *sustainability disclosure; cost of capital; WACC;financial performance*

Introduction

One factor influencing company's strategy in facing the global competition is the disclosure of the company's non-financial activities through sustainability reports. Companies all around the world have extensively published CSR (Corporate Social Responsibilities) or sustainability reports as their response to global attention on sustainability development issue. The sustainability reporting practice has grown gradually over the years and has been taken as a corporate behaviour (KPMG, 2013). This practice rose as the result of business sustainability failure cases, such as Enron in 2001 and WorldCom in 2002, which resulted in stakeholders' skepticism in business activity (White, 2006). Fry et.al. (1982) stated that this behaviour is also motivated by the corporate strategy to be more competitive in global market.[i]

[1]The disclosure of sustainability information is considered the key to reduce the financing costs or the cost of capital in company's financing strategy. Dhaliwal et.al. (2011) reported that firms are able to develop better relationship with their stakeholders, including the capital suppliers, by disclosing more sustainability information as they convey positive messages in their sustainability reports. Companies can reduce their risks then consecutively get an ease of capital attainment and cheaper financing costs by showing their values (El Ghoul et al., 2011; Bassen et al., 2006). Accordingly, Sharfman and Fernando (2008) and Feldman et al. (1997) found that investors perceive a company's risk more favorable if the company pays attention to sustainability. This enhanced perception can finally cause the lower cost of capital (Sharfman and Fernando, 2008).

Some prior studies found optimistic evidence that corporate sustainability disclosure can actually draw a better financing opportunities for companies. For example, the disclosure of sustainability information is successfully proved to be able to reduce asymmetric information between managers and investors, then consequently lower the cost of capital in US companies (Dhaliwal et al., 2011; El Ghoul et al., 2011; Sharfman and Fernando, 2008). CSR or sustainability information based on Global Reporting Initiatives (GRI) guidance is also confirmed to able to decrease asymmetric information and raise market value for Finland firms (Schadewitz & Niskala, 2010). Accordingly, in the UK firms, research conducted by Murray et al. (2006) found that firms with greater sustainability disclosure obtain high returns on their investments. In other words, the disclosure of sustainability information helps companies to get better financing prospects.

However, some researchers debate the effect of sustainability disclosure to corporate financing activity. For example, Reverte (2009) claimed that there is no significant effect of CSR disclosures to corporate financing activity in Spanish firms. Moreover, unlike the findings reported in western countries, some research conducted in Asian companies have been empirically shown to have quite different results; the sustainability disclosure did not affect corporate financial performance or corporate capital. Feng et al. (2014) found that firms with higher disclosure of CSR enjoying lower cost of equity capital in North America and Europe, but not in Asian. Lasmin and Nuzula (2012) also indicated that environmental or social disclosure did not impress investors in Japanese companies. Similarly, Xu and Yang (2010) claimed that sustainability issue in Chinese companies had no effect on their corporate activity because of the low level of CSR value awareness in the country. Likewise, Muirhead et al. (2002) reported that 60% of Asian managers presume CSR or sustainability issue as a useless tool to rise financing performance or opportunities. In brief, the evidence shows that the effect of corporate sustainability on financing opportunity is remain ambiguous.

Understanding the findings of previous studies, this research is focused on fulfilling the research gap and provide an empirical study related to sustainability disclosure effect on the cost of capital by focusing the research on one sector in developing countries. The sample of this study is the banking sector in south-east Asian region. Banks are chosen to be the sample of research because this sector has a wide range of stakeholders; for example, the multinational companies, SMEs (small and medium enterprises), individual citizens, governments and many more stakeholders that will highlight the sustainability of banking sector. Jeucken and Bouma (1999) stated that as intermediary organizations, banking sector holds a unique position in sustainable development issue.

---

[1]

This research will not only examine the effect of sustainability disclosure to the future cost of capital (next year's cost of capital) but also examines the moderating effect of banks financial performance on the relationship between sustainability disclosure and cost of capital. According to Botosan (1997), the higher the financial information delivered to the stakeholders, the lower the company's cost of capital. Moreover, Dhaliwal (2014) indicated that firms with better financial performance have more resources to do social or environmental activities in order to get better prospects in the future. Francis et al. (2004) concluded that firms with good performance tend to have lower cost of capital. Thus, it is interesting to find the interaction of financial performance on the relationship of sustainability disclosure and cost of capital.

The remainder of this paper is organized as follows: in section 2, we review the sustainability concepts formed from the basic, some relevant studies underlying this research, and development of hypotheses. In section 3, we describe research design, variables and method to do data analysis. Section 4 reports the result of analysis using software Eviews 9.0, while section 5 presents the research' conclusions.

Prior research and hypotheses
Underlying theories and previous studies
The stakeholder theory appears to be the prevailing theory of company's decision regarding its sustainability. The stakeholder theory posits that companies sustainability related activities could improve their long-term value and reputation by reporting corporate social and environmental responsibilities(Feng et al., 2015). Unlike the traditional financial reportingthat generally provides information only for fulfilling shareholder needs, the sustainability reporting presents information to a wider range of stakeholders and therefore helps the companies to respond the societal and environmental issues for sustainable business.Additionally, the signaling theory also justifies the urgency of company in disclosing information. A company discloses its sustainability information with the intention of providing additional data associated with company's activity. Lys et al. (2015) indicated that the proper sustainability disclosure, which meets the expectation of the stakeholders, is believed to signal them that the company has a good prospect in the future by creating a sustainable development. Not only signaling through sustainability information, Francis et al. (2004) and Ogneva et al. (2007) indicated that showing a good financial performance also found to be the way to signal the stakeholders. The stakeholder, especially the investors, are expected to response this signal positively; sothat the company can improve its fund and lower its business risks and costs.

The relationship of sustainability disclosure and cost of capital has been previously investigated by some researchers. Botosan (1997) examined the relationship between disclosure level and company's cost of equity capital. The finding shows that there's a negative relationship between voluntary disclosure and cost of equity capital. Moreover, Botosan (1997) divided the sample into two subcategories, firms that attract more analysts and firms that attract less analysts. By dividing the sample, Botosan (1997) intended to find the significance of the relationship on two sub sample. The research resulted that the relationship between disclosure and cost of equity is less significant for the companies that attract more analysts.

Additionally, research conducted by Feng et al. (2015), that investigate the impact of CSR disclosure to the cost of equity capital, showed that the higher the CSR disclosure, the

lower the cost of capital. Feng et al. (2015) examined this effect on 10,803 firm-year observations of 25 countries. However, the effect shown to be significant only to the firms in North America and Europe.

Furthermore, Ng and Rezaee (2015) explored the relationship between sustainability disclosure and cost of equity capital. Ng and Rezaee (2015) divided sustainability disclosure into two main aspects; the ESG (Economic, Social, and Governance) and ECON (Economic). Using more than 20 years of observations, the study found that sustainability disclosure affects cost of equity capital negatively. However, only growth and research dimensions from ECON, and environmental and governance dimension from ESG, that influence significantly on the relationship. Ng and Rezaee (2015) also examined the interaction of ESG on the relationship between ECON and cost of equity capital which indicated that the strong ESG moderated the relationship.

Dhaliwal et al. (2014) investigated the benefit of CSR disclosure to firms financing activity. Dividing the samples into more and less stakeholder-oriented, Dhaliwal et al. (2014) using proxies such as labor protection status, disclosure requirements, and public awareness towards CSR impacts. The findings showed that CSR disclosure is successfully attract investor and lowering company's cost of capital in firms that are in more stakeholder-oriented countries.

In addition, Feldman et al. (1997) examined sustainability effect to shareholder value that reflected by its stock price. Feldman et al. (1997) specifically examined the environmental sustainability performance. The result of this study found that firms with environmental initiatives beyond the regulation enjoy higher valuation of its stock price. Firms get more opportunities in financial performance by conducting more environmental activity.

In financial point of view, Ognevaet al. (2007) examined the financial performance effect to the cost of capital. Ognevaet al. (2007) used proxies of internal control weakness to assess firms' financial performance. The result showed that firms with poor financial performance tend to have more expensive cost of equity capital than firms with better internal control and financially well performed. Accordingly, Francis et al. (2004) examined the relationship between earnings attribute and cost of equity capital. The earnings attributes were measured using seven points, namely earnings quality, persistence, predictability, smoothness, value relevance, timeliness, and conservatism. The result showed that cost of equity capital is successfully reduced on firms that has good financial performance, especially shown by earnings quality and value relevance.

Hypotheses development

We proposed two main hypotheses that will be explained, and for each hypotheses are broken down into three sub hypotheses in order to find better understanding regarding with the topic.

According to signaling theory, voluntary disclosures are able to reduce information asymmetry between managers and investors. Botosan (1997) revealed that corporate executives believe a mechanism that if company discloses information voluntarily, it can lower the cost of capital. This mechanism applies as far as the information is considered value-relevant (Botosan, 1997). Prior research has shown that voluntary disclosures are able to give relevant information to investor investment's decision and successfully lower company's cost of capital afterwards. A proper sustainability disclosure deliver signal to

investors that the company has a good prospect for sustainability development and finally attract the ease of capital attainment. Dhaliwal et al. (2011), Feng et al. (2014), and Ng and Rezaee (2014) find that sustainability disclosures can actually enhance organizations financing through the lower cost of capital. Specifically, Feldman et al. (1997) stated that initiatives in environmental aspects are able to lower the perceived risk and higher valuation of the firms, which means environmental activity lead to easier attain capital attainment. The Global Reporting Initiatives (GRI) classified this sustainability disclosure into three main dimensions; economic, environmental, and social. For these reasons, it is hypothesized that:

Hypothesis 1. The sustainability disclosure has a negative effect on cost of capital

To find further explanation about how each aspects of sustainability information affect corporate cost of capital, the first hypothesis is extended into:

H1a : The sustainability disclosure on economic category have a negative effect on cost of capital

H1b : The sustainability disclosure on environmental category have a negative effect on cost of capital

H1c : The sustainability disclosure on social category have a negative effect on cost of capital

Stakeholder theory revealed that the companies must be responsible to all of the users of financial and non-financial reports. The method used to communicate their responsibilities is usually through corporate disclosures. A company's disclosure is aimed to convince the stakeholders that the companies is credible, performed well, and sustainable. In financing activity, the capital suppliers, such as investors and creditors are mainly assessing the bank's performance in order to ascertain their credibility. Ognevaet al. (2007) indicated that firms that have bad internal control, which are poorly performed, tend to get the higher cost of capital. Francis et al. (2004) showed that firms that financially well-performed has the ability to attract lower cost of capital. Moreover, Ng and Rezaee (2015) explained that firms with good sustainability performance will have difficulties in signaling their values to the investors if their financial performance is poor.

Firms that pay attention to both sustainability and financial performance create more opportunities in increasing investors' trust and reduce cost of capital. Dhaliwal (2014) stated that by having a good financial performance, companies will have more resources to do sustainable development. So, the effect of sustainability disclosure in lowering the cost of capital can be strengthened for the banks that performed well. In order to understand how well banks are doing, some indicators must be assessed before concluding the performance of the banks. Prior financial literatures have mainly explain two factors to consider in determining banks performance, which are the profitability and capitalization of the banks. Athanasoglou (2008) stated that profitability of banks can be assessed through return on asset (ROA) and net interest margin (NIM) ratio. According to Goddard et al (2004)and Liu and Wilson (2010), banks capitalization also represent its performance for banks that maintain high level of capital have lower risk of bankruptcy and are performing well. Therefore, it can be hypothesized that:

Hypothesis 2. Banks financial performance strengthens the negative effect of sustainability disclosure to cost of capital

In order to find further evidence of the moderating effect of financial performance in the relationship between sustainability disclosure and cost of capital, this study breakdown the second hypothesis into:

H2a : Higher level of NIM strengthen the negative effect of sustainability disclosure to cost of capital

H2b : Higher level of ROA strengthen the negative effect of sustainability disclosure to cost of capital

H2c : Higher level of CAR strengthen the negative effect of sustainability disclosure to cost of capital

Data and research model

Data and sample

The data used in this study is secondary data taken from some sources. The sustainability data were taken from each company's websites in the form of separated or integrated sustainability reports. The data for the financial performance were measured and calculated from each company's publication form of annual financial statements. While the data for cost of capital were calculated from financial statements. Moreover, the historical data of companies' stock returns and market returns for cost of equity capital calculation, were obtained from Yahoo! Finance website (http://www.finance.yahoo.com/).

The sample chosen for this study were the commercial banks which operate in four countries of South-East Asia: Indonesia, Malaysia, Thailand, and Philippine for the year of 2011-2015. The sample of this study used unbalanced panel data. The purposive sampling method used to select sample for this study by using criteria such as; banks that go public and listed on the stock market of each country, banks that publish their financial statements and annual report, and also produce the sustainability report during the period. This sampling method yields final sample of 78 samples for this study.

Analysis method

Method of data analysis in this study using descriptive statistics, multiple regression analysis, and moderating regression analysis with computerized statistic tools Eviews 9.0. The descriptive statistics describes the value of mean, standard deviation, variance, maximum, minimum, sum, and skewness value of data. Multiple regression analysis and moderating regression analysis were conducted to find the relationship among variables observed. The regression equation for hypotheses 1 and hypotheses 2 expressed in terms as follows:

$COC_{it} = \beta_0 + \beta_1 Econ_{it} + \beta_2 Envi_{it} + \beta_3 Soc_{it} + \varepsilon$

$COC_{it} = \beta_0 + \beta_1 TotalDisclosure_{it} + \beta_2 TotalDisclosure_{it}*NIM_{it} + \beta_3 TotalDisclosure_{it}*ROA_{it} + \beta_4 TotalDisclosure_{it}*CAR_{it} + \varepsilon$

Variable definition

Cost of Capital (COC). The dependent variable in this study is company's cost of capital. Brealey et al. (2011) described cost of capital as the cost of funds intended for financing a business. A company's cost of capital consist of cost of equity and cost of debt. The best measurement of cost of capital is derived from a weighted average of all sources of capital, commonly known as Weighted Average Cost of Capital (WACC). Referring El Ghoul et al. (2011), the effect of information disclosure in year t is examined to the cost of capital in

year t+1. According to Brigham and Houston (2006) and Grüninger and Kind (2013), WACC was calculated as follow:

$$WACC = \frac{D}{D+E} x \, Kd \, (1-T) + \frac{E}{D+E} x \, Ke$$

Where:
WACC= Weighted Average Cost of Capital
D   =Total Debt
E   =Total Equity
T   = Corporate Tax Rate
Kd = cost of debt; calculated by $\frac{Interest\ Expense}{Total\ Debt} x \, 100\%$
Ke = cost of equity; calculated by CAPM method

The CAPM method was chosen to be the measurement of cost of equity capital for the reason of this research focus is to examine the effect of sustainability disclosure to the cost of capital in listed banks, which the equity capital is mainly acquired from capital market. Thus, CAPM is believed to be the best measurement since it considers the market risk (beta). According to Campbell et al. (1997) and Pettengill et al. (1995), the cost of equity in CAPM is calculated by:

$$Ke = rf + \beta(rm - rf)$$

According to Brealey et al. (2011), the market return (Rm) and systematic risk are calculated by:

$$Rm = \frac{Pm_t - Pm_{t-1}}{Pm_{t-1}}$$

$$\beta = \frac{Cov\,(Ri, Rm)}{Var\,(Rm)}$$

Rf   = risk-free rate based on short term treasury bill rate on each country
Rm = the mean return of market in a year.
Pm_t =historical market price on month t
Pm_{t-1} =historical market price on month t-1
Ri   = historical stock return

Banks Performance. This study used bank's financial performance as the moderating variable to find the deeper relationship between sustainability disclosure and cost of capital. In order to understand how well banks are doing, some indicators must be assessed before concluding the performance of the banks. Prior financial literatures have mainly explain factors to consider in determining banks performance, which are the profitability, capitalization, and efficiency of the banks. Referred to Liu and Wilson (2010), Goddard et al (2004), and Athanasoglou et al (2008), the bank's financial performance measured by 3 (three) indicators, which are:

1.   Return on Asset (ROA) measures how efficient bank assets are managed by the management in order to generate profit. ROA is calculated by:

$$ROA = \frac{earnings\ after\ tax}{total\ asset}$$

2.   Capital Adequacy Ratio (CAR) shows the ability of banks to maintain sufficient capital and the ability to identify, measure, monitor, and control the possible risks related to capital management. CAR is calculated by:

$$CAR = \frac{total\ capital}{weighted\ risk\ asset}$$

3.   Net Interest Margin (NIM) reflects the ability of banks to earn interest income based on earnings assets. NIM is calculated by:

$$NIM = \frac{net\ interest\ income}{earnings\ asset}$$

Sustainability Disclosure (SD). Independent variable for this study is the sustainability disclosure. To measure the sustainability disclosure, this research used Sustainability Disclosure Index based on GRI indicators. The GRI G3.1 index divides sustainability indicators into three main categories; economic, environmental, and social category. The social category is divided further into four sub-categories; labor practices and decent work, human rights, society, and product responsibility. Additionally, according to the research samples that are companies in financial service sector, the GRI FSSS (Financial Service Sector Supplement) was added to the index in order to complete the indicator of sustainability disclosure. As seen on **Table 1,** this research combined the GRI 3.1 and GRI FSSS to measure the disclosure level of sustainability reports. The method of index measurement used content analysis of sustainability report based on the dichotomy approach. The dichotomy approach is conducted by giving score 1 to item disclosed, and 0 to items that are not disclosed. Next, the scores were summed up to get total score for each company. The calculation of Sustainability Disclosure was conducted as follow:

$$disclosure = \frac{item\ disclosed}{total\ item\ on\ index}$$

Table 1.
Sustainability indicator based on GRI 3.0 index

Sustainability Categories	GRI-G3.1	GRI Financial Service Sector Supplement	Total items
Economic	9		9
Environmental	30		30
Social			
Labor practices and decent work	15		15
	11		11
Human rights	10	2	12
Society	9	14	23
Product responsibility			**100**
TOTAL ITEM			

Empirical Result
Descriptive statistics

The descriptive statistic is used to define a research data from the average (mean), maximum, minimum, and standard deviation value. According to **Table 2**, sustainability disclosure on economic dimension variable (ECON) has the widest range of values between 0-100 percent because it has the least item to disclosed, the disclosure on environmental dimension variable (ENVI) has a range value of 6.7-76.7 percent, while the social dimension of sustainability disclosure variable (SOC) has a range value of 11.5-86.9 percent. The values of STDEV show that there are deviations from the average or mean value of economic, environmental, and social disclosure variable in the amount of 25.8%, 17%, and 18% consecutively. Overall sustainability disclosure (TOTAL_DISCLOSURE) data spread between 10-81 percent, the mean value and standard deviation was 46.4% and 16.5% respectively. Thus, among three aspects of sustainability, the environmental aspect has the lowest disclosure rate.

Table 2.
Descriptive statistics of samples

Variables	N	Min	Max	Mean	STDEV
ECON	78	0.0000	1.0000	0.578137	0.2276
ENVI	78	0.0667	0.7667	0.349383	0.1527
SOC	78	0.1147	0.8688	0.499167	0.1551
TOTAL_DISCLOSURE	78	0.1000	0.8100	0.461339	0.1434
NIM	78	0.0231	0.1010	0.046954	0.0211
ROA	78	0.0400	0.0515	0.019965	0.0109
CAR	78	0.0900	0.2060	0.15692	0.0224
COC	78	-0.03345	0.0880	0.022198	0.0178

The variable of bank's performance is defined by NIM, ROA, and CAR. Net interest margin (NIM) of the sample has a minimum value of 2.3% and a maximum value of 10.1%. The average value of bank's financial performance measurement is 4.7, 1.9 and 15.7 percent respectively for NIM, ROE, and CAR. The STDEV value indicates the deviation or diversion data from mean value of each of NIM, ROE, and CAR variable in the following order of 2.1, 1.09, and 2.2 percent. While the cost of capital (COC) measured by weighted-average cost of capital has the minimum value of 0.6%. The maximum value of WACC is 4.6%. The average or mean value of cost of capital is 1.9%, while the deviation from the mean value is 0.9% shown by STDEV.

Eviews Result
Classical Assumption Test

Before testing the hypotheses, it is necessary to test the classical assumptions first in order to get unbias estimator for the study. According to Ghozali (2011), the classical

2585

assumption includes normality test, autocorrelation test, multicollinearity test, and heteroskedasticity test. Since this study has two regression equations, the classical assumption test had been conducted for each equations.

**Fig.1 Normality test of Hypotheses 1**   **Fig.2 Normality test of Hypotheses 2**

The normality test aimed to determine the data distribution of variables that are used in the study. Normal distributed data should have probability value greater than 0.05. The result of normality test using Eviews 9 showed that the data for this study (both for regresion equation 1 and 2) have probability value lower than 0.05. It means the data for this study did not pass the normality test. However, one of normality theory, The Central Limit Theorem, provide justification for this condition. It explained that larger data would be eventually normal distributed than fewer data. Gujarati (1994) classified that data with sample >25 is categorized as large data. This study use 78 samples, therefore the data would be normal eventually.

Table 3. Multicollinearity Test of Hypotheses 1

	ECON	ENVI	SOC
ECON	1.000000	0.509656	0.698313
ENVI	0.509656	1.000000	0.625720
SOC	0.698313	0.625720	1.000000

According to **Table 3**, none of the independent variable has tolerance value greater than 0.8. So, it can be concluded that equation for hypotheses 1 has no multicollinearity problem. The multicollinearity test was only conducted to regression equation 1 for the second equation is a moderated regression that don't need multicollinearity test.

Autocorrelation problem was tested using Durbin-Watson (DW). For both regression equations have no autocorrelation problem because they have DW value between dU and 4-dU. The first and the second equation have value of 2.064 and 2.030 respectively, they are greater than 1.7129 and lower than 2.2871. Therefore, the equations for this study has no autocorrelation problem.

Heteroskedasticity test for this study conducted using Heteroskedasticity White Test. All of the equations have probability value of Obs*R-squared greater than 0.05. Thus, this study has no heteroskedasticity problem.

Hypotheses Test Result

The first hypotheses was tested based on the equation:

$$COC_{it} = \beta_0 + \beta_1 Econ_{it} + \beta_2 Envi_{it} + \beta_3 Soc_{it} + \varepsilon$$

The significance level to test the hypotheses for this study is 5%. The result of the first hypotheses test showed that economic disclosure (ECON), environmental disclosure (ENVI), and social disclosure (SOC) are able to explain the dependent variable (COC) as much as 15.56%. The relationship of independent and dependent variables for hypotheses 1 are shown in **Table 4.**

The effects of sustainability disclosure to the cost of capital varies among each dimensions. According to **Table 4**, the effect of economic dimension disclosure to the cost of capital is significant at 0.0014 (P value < 0.05). This relationship has a positive parameter coefficient value which means that sustainability disclosure on economic dimension has a positive effect to the cost of capital. This result is contrary to H1a: The sustainability on economic dimensions have a negative effect to cost of capital. Therefore, **H1a is rejected.**

Next, the effect of environmental dimension of sustainability disclosure to cost of capital is insignificant. The insignificance is proved by P value of 0.2748. This relationship has a negative parameter coefficient value. So, the more environmental dimensions disclosed, the less the cost of capital. The result is matching to H1b: The sustainability on environmental dimensions have a negative effect to cost of capital. However, due to the insignificant probability value, this result cannot support hypotheses 1b. Thus, **H1b is rejected.**

Furthermore, the result on **Table 4** shows that of social dimension of disclosure affects the cost of capital significantly, which shown by P value of 0.0153. The parameter coefficient value is negative. So, it can be concluded that the relationship between social disclosure and cost of capital is negative. The result is corresponding to H1c. Thus, **H1c is accepted.**

Table 4. Summary of the First Hypotheses Test Result

Independent Variables	Coefficient		Prob.	Note
ECON		posit	0.001	H1a rejected
ENVI	ive	4		H1b rejected
SOC		nega	0.274	H1c accepted
	tive	8		
		nega	0.015	
	tive	3		

The second hypotheses was tested based on the equation:

$$COC_{it}=\beta_0+\beta_1 TotalDisclosure_{it}+\beta_2 TotalDisclosure_{it}*NIM_{it}+\beta_3 TotalDisclosure_{it}*ROA_{it}+\beta_4 TotalDisclosure_{it}*CAR_{it}+\varepsilon$$

The second regression has R squared value of 22.78%. It showed that total disclosure and the interaction between total disclosure and banks performance explains cost of capital as much as 22.78%. The relationship of independent and moderating variables for hypotheses 2 are shown in **Table 5.**

According to Table 5, the total sustainability disclosure has significant effects to the cost of capital/ as shown in the table, this effect is significant on P value of 0.0032. The coefficient value shows a negative parameter coefficient which means the higher the sustainability disclosure, the lower the cost of capital.

To examine the moderating effect of banks' performance on the relationship between sustainability disclosures to the cost of capital, this study uses some financial ratios as the

proxy of banks performance. **Table 5** shows that NIM has a positive moderating effect on the relationship between total disclosure and cost of capital. This effect is significant because the statistic result shows P value 0.0049. Therefore, it can be concluded that higher value the NIM weaken the negative relationship of total disclosure and cost of capital. In other words, high value of the NIM turn the relationship between total disclosure and cost of capital into a positive effect. This result is contrary toH2a. Thus, **H2a is rejected.**

In the relationship between total disclosure and cost of capital, the result shows that ROA significantly moderates the relationship to a negative effect. This role is statistically significant, it is proved by P value of 0.0278. It means that high value of ROA can strengthen the negative effect of total disclosure to the cost of capital. This result is supporting H2b. Therefore, **H2b is accepted.**

Nevertheless, instead of strengthen the negative effect of total disclosure to cost of capital, the moderating role of CAR is shown to change the effect of total disclosure to be positive. This is proven by the result of **Table 5**, that TOTALDISCLOSURE*CAR has a significant P value of 0.0298, and a positive coefficient parameter. It means that the higher CAR, the effect of total sustainability disclosure to the cost of capital is weakened. This result is contrary to H2c. So, it can be concluded that **H2c is rejected.**

Table 5. Summary of The Second Hypotheses Test result

Independent Variables	Coefficient	Prob.	Note
TOTALDISCLOSURE	negative	0.0032	
TOTALDISCLOSURE*NIM	positive	0.0049	H2a rejected
TOTALDISCLOSURE*ROA	negative	0.0278	H2b accepted
TOTAL DISCLOSURE*CAR	positive	0.0298	H2c rejected

Interpretation and Conclusion

The Effect of Sustainability Disclosure to the Cost of Capital

Based on the hypotheses test result on Table 5, the effect overall sustainability disclosure is significantly negative to the company's cost of capital. This finding is consistent with previous studies which stated that firms with more voluntary information disclosure is facing a cheaper cost of capital (Botosan, 1997; Dhaliwal, 2014; Ng and Rezaee, 2015). However, the result from Table 4 proves that each dimensions of sustainability disclosure has different impacts on cost of capital. The sustainability on economic dimension has a positive effect on companies' cost of capital. Based on Global Reporting Initiative Guidelines (GRI G3.1), the sustainability disclosure of economic dimension mainly illustrates the organizations' impacts on the economic condition of their stakeholders (i.e. compensation to employees, payment to government, and community investment) through three aspects, namely economic performance, market presence, and indirect economic impacts. This dimension highlights the monetary contributions of organizations to sustainable development. As prior work of Reverte (2009) found that some industries perceived to have a higher level of risk by the investor, especially industries with high consumer visibility. By doing disclosure of economic contributions, the visibility of company and risks will increase. According to Feng et al. (2015) and Lasmin and Nuzula (2012) most investors in Asian or developing countries see social contributions as a risky and worthless expenditure which is able to reduce company's

profit. Thus, the investors' response is negative, shown by high level of cost of capital. Therefore, economic dimension of sustainability, is possible to increase the cost of capital.

On the other side, the environmental and social dimension of sustainability disclosure are possible to lower a firm's cost of capital. These findings are supported by signaling theory, which explains that information disclosed by companies is a signal to their capital providers, especially the investors. The sustainability information of environmental and social is considered as a positive signal by the capital providers, which triggers the ease of capital attainment and lower cost of capital. These findings are in line with Feldman et al. (1997) and Ng and Rezaee (2015) that conclude the firms that disclose more environmental performance are perceived as a less risky firm by investor and further lowering it cost of capital. Stakeholders respond positively to the banks that produce more environmentally products and concern to environmental activity. Thus, companies with more environmental disclosure get lower cost of capital. The findings also confirm Dhaliwal et al. (2011) and El Ghoul (2011) that report firms with high social performance enhance their firm value and exhibit cheaper financing cost.

The Effect of Banks Financial Performance on the Relationship between Sustainability Disclosure and Cost of Capital

According to the hypotheses test result, financial performance of banks has variety of effects in moderating the relationship between overall sustainability disclosure and cost of capital. The effect of total sustainability disclosure to the cost of capital is strengthened by ROA. As Dhaliwal (2014) stated that firms with better performance have more resource to conduct social activities and tend to disclose their sustainability. This tendency can support the arguments that firms with high profitability that disclose their sustainability to their stakeholders are able to enjoy a lower cost of capital. Accordingly, Ng and Rezaee (2015) stated that firms are able to produce sustainable performance when they keep profitable in the long run.

However, the result proved that level of NIM and CAR weaken the negative effect of overall sustainability to the cost of capital. NIM is the ratio of profitability that measure the interest income generated by the banks compared to interest paid to the lenders, relative to their interest-earning assets. High level of NIM shows high level of profitability for banks, but it also shows inefficiency. By charging huge rates of interest to their debtors, banks will get higher NIM. It will burdens the debtors as one of the capital supplier. Therefore, cost of capital can increase even though the bank has good sustainability performance. The same way applies for CAR. Capital Adequacy Ratio reflects the adequacy level of banks capital in bearing risk-asset. High level of CAR shows high level of healthy banks, but if the value is too high it reflects that bank has too much idle fund. This shows a poor management and performance. Thus, it cause CAR change the effect of disclosure and cost of capital.

Conclusions

This study examines the relationship between corporate sustainability disclosure and the cost of capital, and also the effect of banks performance on the relationship between corporate sustainability disclosures to the cost of capital. Using 78 samples of listed banking sector in 4 ASEAN countries; Malaysia, Indonesia, Thailand, and Philippines, this study was analyzed using multiple and moderated regression analysis with Eviews 9.0. According to the test, the result of this study can be summarized as follow:

1. The total sustainability disclosure is significantly lowering firm's cost of capital. Specifically, the sustainability on environmental and social dimension are the factor that contribute on this effect. However, the environmental disclosure effect is insignificant. While the disclosure on economic dimension, however, shown to increase cost of capital.
2. The banks performance that moderate the relationship between sustainability disclosure and cost of capital is ROA. Partial examination showed that ROA strengthens the negative effect of social disclosure to the cost of capital. While the moderating effect of NIM and CAR on the relationship between sustainability disclosure and cost of capital are found to turn the effect into positive.

Therefore, it can be concluded that the sustainability disclosure is successfully lower cost of capital in banking sector. However, high economic disclosure tends to increase the cost of capital. Specifically, banks with excellent sustainability disclosure on social aspects (labor practices and decent works, human rights, society, and product responsibility) are able to get cheaper cost of capital. Furthermore, by having high profitability, banks are able to reduce the cost of capital.

BOARD OF DIRECTOR OWNERSHIP, LEVERAGE, AND PERFORMANCE: THE ROLE OF R&D INTENSITY

Hessy Erlisa Frasti, Universitas Sebelas Maret, Indonesia
Y Anni Aryani, Universitas Sebelas Maret, Indonesia
Doddy Setiawan, Universitas Sebelas Maret, Indonesia

Abstract

This research aims to examine the effect of board of director ownership and leverage on R&D intensity; also the effect of board of director ownership and leverage on performance with R&D intensity as moderating variable. The sample of this research are 221 listed companies in Indonesia Stock Exchange (IDX), which is selected by purposive sampling method. The data used in this research is secondary data collected from IDX website (http://idx.co.id). This research uses random effect panel data regression and Moderated Regression Analysis (MRA) for the moderating test. The results show that only leverage that has negative effect on companies' performance, while board of director ownership do not have effect on companies' performance. Moreover, there is no indirect effect found between board of director ownership and leverage on performance with R&D intensity as moderating variable.
Keywords: *board of director ownership, leverage, R&D intensity, performance.*

Introduction

The advancement in economic theories shows that board of directors are having an important role within companies' managements (Fama& Jensen, 1983; Williamson, 1983), especially in public companies that tend to have problems on the company ownership and monitoring (Fauzi & Locke, 2012). Board of directors have a monitoring function – which means they have a responsibility in monitoring the managers over the name of the shareholders (Hillman & Dalzien, 2003). In operating an effective management, the board of directors are having a responsibility in giving suggestions and applying the main strategy of the company (Nath et al., 2015). However, shareholders are not always agreed with the strategy, which later it tends to cause an agency problem (Fauzi & Locke, 2012).

Research and Development (R&D) is one of companies' strategic decision that can be a subject of companies' conflict of interest between the manager and shareholders (Baysinger et al., 1991). In this case, board of directors had a power to end the conflict of interest – which will reduce the agency cost (Baysinger & Butler, 1985). In line with Baysinger & Butler (1985), Fauzi & Locke (2012) argues that board of directors is one of corporate governance mechanism that can reduce the conflict of interest in a public company. Board of directors also have a direct access to the company resource (Kor, 2006), which means it plays an important role over theapplication ofa company main strategy (Nath et al., 2015).

Agency theory saw the primary function of board of director as the monitoring agent (the managers) to protect the principal's behalf (the owner) (Eisenhardt, 1989; Jensen & Meckling, 1976). Based on the agency theory perspective, conflict of interest between the

shareholders as the owner and manager can be reduced if the managerial ownership increased (Jensen & Meckling, 1976). Managerial ownership is referring to the ownership of board of directors, CEO, and managers (Omar et al., 2014). This research only focused on theboard of director ownership. Moreover, board of directors isexpected to reduce the agency cost by monitoring the management (Eisenhardt, 1989; Fauzi & Locke, 2012).

Based on the agency theory, agency cost is not only arises from the conflict of interest thatinvolvingshareholders, but also bondholders (debtholders). Different with shareholders whowant the distribution of top level company performance result, bondholders tends to relate with the distribution of bottom level company performance result, which is associated with the repayment of principal and interest. Therefore,bondholdersdo notlike a risky project which will threaten the availability of corporate funds in paying the principal and interest (Balakrishnan & Fox, 1993).As a high-risk projects, R&D isinteresting for shareholders who want the top distribution of the performance results, but bondholders do not consider it interesting (Baysinger and Butler, 1985).

Anincrease in debt financingwill decrease managers' willingness to invest in a hi-risk, but more profitable project (Balakrishnan & Fox, 1993). However,R&D is part of intangible asset investments and there is no guarantee it will bring good output(Vincente-Lorente, 2001). O'Brien (2003) argues that a company which competes on innovation should prioritizing low leverage, because it isrelated with R&D continuity and company's funding.

Jensen & Meckling (1976) claims that the amount of leverage in the capital structure will effect manager's operational decision, thus it will also affect companies' performance. Therefore, few researchers areinterested to examinethe effect of leverage on companies' performance. Previous researches on the effect of leverage onthe performanceshow inconsistent result. Jeremias (2008), Shaheen (2014), and Vithessonthi & Tongurai (2015) findthat leverage has a negative effect oncompanies'performance. Other researches, Ofek (1993) and Ho &Hsu (2010) finds a contrary result, whereleverage has a positive effect oncompanies'performance. While, aresearch by Fachrudin (2011) findsthat leverage does not have an effect on companies'performance.

Similar to many researches on leverage and companies' performance, researches on the effect of board of directors on companies' performance provide various findings (Pearce II & Zahra, 1991; Dalton et al., 1998; Hillman &Dalziel, 2003; Uadiale, 2010; Horvath & Spirollari, 2012, Priya & Nimalathasan, 2013; Meyer & Wet, 2013; Nath et al, 2015). Most studies find that the level of board of director ownership has a positive effect on the company's performance (Pearce II & Zahra, 1991; Dalton et al., 1998; Horvath & Spirollari, 2012; Priya & Nimalathasan, 2013). However, Hillman &Dalziel (2003) finds that board of director ownership is affecting company's performance and being moderated by monitoring and provision of resources. In contrast to other studies, Uadiale (2010) and Meyer & Wet (2013) find that the board of directors' ownership is negatively affecting company's performance. While Nath et al. (2015) findst hat board of director ownership does not have a significant effect on companies' performance.

These inconsistencies in the previous researches have motivated the researcher to do a research on the effect of board of director ownership and leverage on companies 'performance. Furthermore R&D intensity is added as a moderating variable. R&D intensity chosen because it is one of a company main strategy which tends to rise the conflict of interest, whether between the manager and shareholders or the manager and bonds holders.

Bondholders tend to dislike a hi-risk project such as R&D because it is threatening the company funding in paying their debt and interest, while shareholders areinterested in R&D (Balakrishnan & Fox, 1993). Even though it will create higher risk, but R&D can be considered as an investment over a new technology which could be transformed to an efficient productivity method (Tuna et al., 2015). Companies 'performance might be increased using the new technology resulted from the R&D

Hypothesis development and research method
Board of Directors' Ownership and Performance

Based on agency theory perspective, the conflict of interest between the shareholders as the owner and the manager can be reduced when the managerial ownership increase (Jensen & Meckling, 1976). Most researches on similar topics also find that the level of board of directors' ownershiphasa positive effect oncompany performance (Pearce II & Zahra, 1991; Dalton et al., 1998; Horvath &Spirollari, 2012; Priya &Nimalathasan, 2013). When board of director members also have shares in the company it can reduce the agency problem. It is expected that company's performance can be increased by board of directors who act as principal and agent who will perform their functions more properly. Based onthe discussion, the third hypothesis is as follow.

H$_1$: Board of directors' ownership has a positive effect on company performance.

Leverage and Perfomance

Jensen &Meckling (1976) claims that the amount of leverage in the capital structure will have an effect toward the manager operational activities decision as well asoncompany performance. The amount of leverage will cause a higher interest expense (Brigham &Gapenski, 1997). The high of interest expense that isnot followed with a high operational profit will makes the company suffer a financial problems.This will make the company performance decreased (Fachrudin, 2011). Previous researches by Jeremias (2008), Shaheen (2014), and Vinthessonthi &Tongurai (2015) findthat leverage has a negative effect on performance. Based onthe discussion, the fourth hypothesis in this research isas follow.

H$_2$: Leverage has a negative effect on performance.

Board of Director Ownership, Leverage, R&D intensity, and Performance

Intangible investments become essential for intensive business competition in contemporary economics (Anagnostopoulou, 2008). R&D activities as an intangible investments should be a subject of concern (Chan et al., 2001). However, R&D is themain strategy of a company which can risethe conflict ofinterest, whether between the shareholders or the bondholders (Baysinger et al., 1991). Bondholders tends to not liking a risky project like R&D because it will threaten the company funding in paying their debt and interest, while the shareholders were more interested with the R&D (Balakrishnan& Fox, 1993). Even thought it'd be risky, but R&D serves as an investment in new technology and knowledge base, which can be transformed into a more efficient production method for the resources available (Tuna et al., 2015).Therefore, the writer argue that performance will be increased by anew technology resulted from the R&D. Based onthe discussion, the sixth hypothesis in this research is as follow.

H$_3$: R&D intensity moderate the effect of board of director ownership on performance.

H$_4$: R&D intensity moderate the effect of leverage on performance.

Research method

The population of this research is all of public companies listed in IDX within the year of 2010-2015. Purposive sampling method is used in selecting the sample – the selection isbased on the researcher subjective considerations, where dataareenteredto the sample when it reach some criteria specified by the researcher. The criteria used in determining the research sample of this research are: (1) company thatuploaded their financial report in the website of IDX (idx.co.id) in the period of 31st December in year of 2010-2015and has been audited by a public accountant office; (2) company thatattachingcomplete data needed in this research; (3) and company thathaspositive equity.

This research is designed to collect an empirical evidence onthe effect of board of director ownership and leverage on performance with R&D as the intervening variable. Data used in this research is a panel data – the data collectedare consisted of cross-section and time series data. The data is testedusing the panel data regression with supports of EViews 8.1 software. To test the effect of intervening variableSobel test is carried out. Before the analysis of panel data regression, the estimation method and statistic descriptive should be determined.

The regression model used in this research is.

$$PERF = \alpha + \beta1\,BOD + \beta2\,LEV + \beta3\,RD + \beta3\,INS + \beta4\,SIZE + \varepsilon \quad (1)$$

$$PERF = \alpha + \beta1\,BOD + \beta2\,LEV + \beta3\,RD + \beta3\,INS + \beta4\,SIZE + \beta5\,BOD*RD + \beta6\,LEV*RD + \varepsilon$$

(2)

Notes:

PERF = Performance(multiplication of stock market prices and number of shares outstanding divided by the book value of assets)

RD = R&D intensity (amount of R&D cost divided by total asset)

BOD = Board of Director (BoD)Ownership (number of ordinary shares owned by BoD divided by the number of outstanding ordinary shares)

LEV = Leverage (total liability divided by total asset)

INS = Institutional Ownership(number of ordinary shares held by domestic institutions divided by the number of outstanding ordinary shares)

SIZE = Company Size (Ln(Total Asset))

Analysis and Discussion

The results show that the adjusted R-squared for regression equation (1) and (2) are 0.0781and 0.0739 consecutively, which means that in regression equation (1) 7.81% R&D intensity can be explained by board of director ownership and leverage, while the remaining 92.19% are explained by other variables outside the equations. While for regression equation (2) the adjusted R-Square is 0.0739, which means that 7.39% firm performance can be explained by board of director ownership, leverage, and interaction of board of director ownership and leverage on R&D intensity, while the remaining 92.61% are explained by other variables outside the equation. The result shows that adjusted R square of direct effect >adjusted R square of indirect effect model. It means that generally, R&D intensity cannot moderate the effect of board of director ownership and leverage on performance.

Table 1 Regression Test Result

Variable	Model 1 Direct Effect	Model 2 Moderating Effect
C	1.835119** (0.0141)	2.196585*** (0.0064)

INS=Institutional Ownership; SIZE= Company Size; RD= R&D Intensity

The results of t-test in Table 1 show that board of director ownership does not affect firms' performance (PERF) directly, which means that the **first hypothesis is not supported**. This result is consistent with Nath et al. (2015) who find that board of director ownership is not significantly affect the performance of a firm. It might be because of low percentage Indonesian board of director ownership, which is only account for 1.73% of the total outstanding shares, in average. Jensen &Meckling (1976) argue that managerial ownership can reduce conflict of interest. However, the low board of director ownership in Indonesia may lead to the inability of board of director ownership to reduce conflict of interest.

Leverage is negatively affecting firms' performance with the regression coefficient of -2.1553 (p<1%), which means that **second hypothesis is supported**. This result is consistent with Jeremias (2008), Shaheen (2014), and Vithessonthi &Tongurai (2015) who find that leverage is negatively affecting performance. Jensen &Meckling (1976) state that the amount of leverage in capital structure will affect manager in selecting the activities in company operation and thus, it will affect firm's performance. Higher leverage will lead to the higher interest expense in firm (Brigham &Gapenski, 1997). If it is not accompanied by higher net income, firm's performance will decline (Fachrudin, 2011).

Moderated Regression Analysis (MRA) is used to test the moderating effect in this research. The result shows that there is no indirect effect in the board of director ownership and leverage on performance with R&D intensity as moderating variable with p>5%. This shows that the **third and fourth hypothesis is not supported,** or there is no indirect effect of board of director ownership and leverage on performance with R&D intensity as moderating variable.

The reason behind the absence of such relationship may be caused by the relatively low R&D activities in Indonesia, which result in the inability of R&D to moderate board of director ownership and leverage on firm's performance. Also, Indonesian R&D intensity has not produce new patented finding, so that there is no obvious result of R&D activities. It is different with China, in which according to Choi et al. (2011), the average patent as an output of R&D is 5.67 patent, while in Indonesia it is difficult to find firm with patented R&D result. Yet undefined output of R&D may also be the cause of R&D intensity that does not affect company's performance.

Conclusion and suggestion

This research aims to examine the effect of board of director ownership and leverage on firm's performance; the indirect effect of board of director ownership and leverage on firm's performance with and R&D intensity as the moderating variable. The findings show that only leverage has a negative effect on company performance, while board of director ownership and the R&D intensity does not have effect on company performance. The findings support previous research - that leverage has a negative effect on performance (Jeremias 2008; Shaheen, 2014; and Vithessonthi & Tongurai, 2015) and support the finding of Nath et al. (2015) that board of director ownership has no effect on companies' performance. MRAl test results show that there is no indirect effect of board of director ownership and leverage on the performance with R&D intensity as an moderating variable. Similar to board of director ownership, the low intensity of R&D is also suspected to be the cause of the absence of R&D intensity to moderate the effect of board of director ownership and leverage on performance.

This research has a few limitations – using the sample from all of industry sectors, including the financial sector and non-financial sector. Thus, it may cause a bias in the research result because the financial sector has different regulations. However, due to the sample limitation, this research combined the companies in the financial and non-financial sector as research sample. The suggestion for future research is to separate the two sectors by expanding the research period to fulfill the sample requirement. This research has not considered another variable that may also affect R&D intensity – such as internal cash flow and business group. Hall (2005) and Lee (2012) find that internal cash flow, measured using operational cash flow divided by total asset, has an effect on R&D intensity, with R&D intensity as (t+1). The future research can add another variable which may affect R&D intensity such as internal cash flow and business group.

FISCAL DECENTRALIZATION EFFECT ON FINANCIAL PERFORMANCE:
MEDIATED BY SIZE AND MODERATED BY AUDIT OPINION
IN LAMPUNG PROVINCE

Eka Ningsih Puji Rahayu, Akademi Akuntansi Lampung
Rudy Badrudin, YKPN School of Business

Abstract

This research aims to examine the effect of fiscal decentralization on financial performance by adding government size as the mediator variable and audit opinion as the moderator variable of counties and cities in Lampung Province. Lampung Province is the center of economic mobility in South of Sumatera Island so it can impact well to regional autonomy implementation and has the best financial statements (an unqualified opinion) in Sumatra Island (47.5%). This research was conducted in 13 counties and 2 cities in 2010-2013 for the objective to see the regional autonomy implementation started in one decade. The examination of hypothesis used to Partial Least Square with the significant of decision-making <0.10. The results show that fiscal decentralization gives the positive and significant effect to financial performance but non-significant effect to government size; government size gives the positive and non-significant effect to finance performance; and fiscal decentralization gives the positive and non-significant effect to finance performance with the audit opinion as the moderator variable.

Keyword: *decentralization, financial performance, audit opinion*

Introduction
Background Research

      Regional autonomy implemented since 2001. Speaking about regional autonomy, then do not forget to speak of fiscal decentralization that is used as the basis for the implementation of regional autonomy. The local government through fiscal decentralization is given discretion in managing local revenue to meet the needs of the autonomous region.

      The magnitude of what the central government on fiscal decentralization to be properly budgeted and realized well that the financial independence of a region can be realized so that all shopping needs will be met in the area also has become a common thing for some it is an indicator of financial performance area. In fact, fiscal decentralization remains a serious problem in all counties/cities in Lampung Province after a decade in the implementation of regional autonomy. During 2010-2013, fiscal decentralization in the counties/cities in Lampung Province has a pattern of relationships instructive, whereas fiscal decentralization is an important thing that is used to determine the financial dependence on the central government. Small fiscal decentralization will greatly affect the local financial performance (effectiveness) because the form of fiscal decentralization in Indonesia focused on fiscal decentralization expenditures.

      It is also fueled by a growing number of people in an area that would be a financial burden, whereas the population is an asset for the region as well, which if fulfilled needs will have a positive impact on the economy. The need for the central government to intervene in

providing additional revenue by considering the amount of income each region and the many of the population will be a solution for the region because of the big size of local government will help fiscal decentralization in realizing the financial performance of quality. In addition, decentralization also make the government vulnerable to misuse of regional wealth. The need for transparency and accountability its performance will be better, so the selection of audit opinion variables can be used to strengthen the influence of fiscal decentralization on local financial performance.

Research Purposes

On the basis of research background, the purposes of this study to evaluate the implementation of regional autonomy in counties/city Lampung Province. The evaluation implementation of regional autonomy in counties/city Lampung Province through testing 1). the positive effect of fiscal decentralization on financial performance of the counties/city in Lampung Province, 2). the positive effect of fiscal decentralization on local governance size counties/cities in Lampung Province, 3). the positive effect of local government size on financial performance of the counties/cities in Lampung Province, and 4) the positive effect of fiscal decentralization on financial performance of the audit opinion as moderating variable in the counties/cities in Lampung Province.

Research Contributions

The findings of the research will be the input for the counties/city government in Lampung Province in formulating budget policy. Based on that, the construction activity is expected to be smooth and supports the achievement of good governance government so as to improve budget managing in counties/city Lampung Province. In addition, research findings will be useful in contributing to the development of public sector finance theory.

Literature study and hypothesis development

Literature Study

According to Halim and Abdullah (2006), implementation decentralization attaches agency theory as a result of devolution, then automatically there will be parties to delegate powers (the principal) and no authorized parties (agent). Executives in the public sector is an agent for the legislature and the public (dual accountability) and the legislative is agent for the public. Natural thing in the agent and the principal is the discrepancy between the information. More information will be owned by the agency rather than by the principal. According to Basrie *et al.* (2012), the government's performance in Bandar Lampung is not maximized due to a lack of responsibility for human resources. This is evident from the achievements of the amount of expenditure which only amounted to 96.69% of the target and the amount of cash flow decline.

According to Kusumawardani (2012), the size of government and the size of the legislature affect the financial performance of local governments. It can be used as a justification of a large size can help the operations of local authorities accompanied by increased financial performance of local governments. Legislative size affect the financial performance of local governments, because the increasing number of qualified members of the legislature, the more lightweight and easy to carry out the task of their functions and roles in the supervision of the local government. Leverage does not affect the financial performance of local governments for external financing of local government not only through debt but also from the Fund Balance.

According to Dwijayanti and Rusherlistyanti (2013), there were differences in the degree of independence, effectiveness, and activity between routine and development expenditure in the provincial government's financial performance in Indonesia 2008-2010. However, there are differences in the level of efficiency and revenue growth rates on the financial performance of the provincial government in Indonesia 2008-2010. According to Fidelius (2013), the ratio of the effectiveness of the financial management performance of Manado is quite effective. This is demonstrated by the effectiveness of financial management performance reached 104.26% of the local budget in 2012. However, for the performance of financial management Manado City based financial self-sufficiency ratio is still very low. That is, the relatively small contribution of revenue in the budget.

According to Manik (2013), prosperity and the size of local government a significant effect on human development. According to Sianturi *et al* (2013), the level of fiscal decentralization below 10%. It can be seen from the ratio of revenue to the budget which in 2008 amounted to 4.56%, in 2009 by 4.71%, 2010 was 4.32%, 2011 was 6.78%, and 2012 by 7.82%. This indicates that the degree of fiscal decentralization in Batu City is still lacking. According to Sularso and Restianto (2011), the financial performance APBD counties/cities in West Java Province has not been optimal. That is, the counties/cities in West Java Province have not been effective and precise in using the budget. Therefore, budgets counties/cities in West Java Province has not resulted in increased social welfare.

According to Susanto and Badrudin (2016), the allocation of the budget so that more priority alignments for public purposes (capital expenditure) rather than the interests of personnel (personnel expenditure). In allocating the capital expenditure component must consider several things: direct capital expenditure for the construction of supporting infrastructure investment in the region in promoting economic growth in the region; an evaluation and assessment of the inventory items are available both from the state and its economic life so that the procurement of inventory items can be selectively carried out according to the needs of each Local Government Unit (SKPD); and make capital expenditures for the purchase price/ wake fixed assets plus all expenditures associated with procurement of fixed assets until ready to use.

Routine problems that always arise in the management of the budget is the proportion of capital spending and the rate of absorption of low capital expenditure budget. This relates to the politics of local government budgets in managing the budget. Budgets are policy instruments owned by the local government to describe a comprehensive statement about the priorities of the region and also shows the estimated performance of local governments that will be achieved during a certain period. Many counties/cities in Indonesia, which has a large portion of the budget with the allocation of indirect expenditures (personnel expenditures), while the allocation of direct expenditure (capital expenditure) is relatively low. This affects the success of development as measured by the Human Development Index. Therefore, the principle of budget management should as much as possible for the prosperity of society (Badrudin and Siregar, 2015 and Badrudin, 2015).

Hypothesis Development

Fiscal decentralization provides an opportunity for the region to explore and manage revenue. The local government will be more flexible in determining the budget of local revenue for local governments more aware of the condition of the autonomous region, so that the realization is more easily achieved (Halim and Abdullah, 2006). The participation of

district Own Source Revenues are very important in the success of fiscal decentralization (Sianturi *et al.* 2013). After realization can be achieved, the government will reduce its dependence on the central government which is characterized by local financial independence. Fiscal decentralization also makes it easier to regulate the proportion/conformity expenditure (the proportion of recurrent and development expenditure), so that the greater is fiscal decentralization will be the greater local financial performance (Smeru, 2002: 41 and Susanto and Badrudin, 2016). Based on these explanations, it can be arranged hypothesis:

> H1: Fiscal decentralization has positive effect on local financial performance of the counties/cities in Lampung Province

Fiscal decentralization will provide flexibility for regions to dig own resource revenue, so that own resource revenue will increase and revenue of sharing fund tax and non-tax be the main source to finance the interest of the population/ public. The implication revenue (central and local) will be greater than the total population. This means that fiscal decentralization will increasingly contribute positively to the size of local government. Dwijayanti and Rusherlistyanti (2013) show that fiscal decentralization is measured using indicators of revenue and expenditure decentralization have a positive impact or increasing the size of local government at the local counties/cities. Based on these explanations, it can be arranged hypothesis:

> H2: Fiscal decentralization has positive effect on local government size of the counties/cities in Lampung Province

The regional government large size will provide added value to the area because it would be optimal in providing services to the needs of the autonomous regions, especially financial needs. It is expected that the size of the local government will have implications on the region's financial performance. It can be seen from the optimal management of potential areas in order to achieve independence, conformity and effectiveness of the underlying financial performance of a regional framework (Badrudin, 2015). So that the larger the size of local government, the greater the financial performance of the region. According Kusumawardani (2012), Fidelius (2013), and Malik (2013), the regional government large size be able to help the operations of the local government, accompanied by improved financial performance of local governments. Based on these explanations, it can be arranged hypothesis:

> H3: Local government size has positive effect on local financial performance of the counties/cities in the Lampung Province

Fiscal decentralization in certain situations was not able to guarantee the high performance of the local government finance, because there is no transparency and accountability of the local government finance report. Basically, the calculation of fiscal decentralization and regional financial performance using ratios from local government finance report. if the numbers are expressed in local government financial report is not a number that should be. It is certain that the financial performance of the calculation results become inaccurate. The audit opinion from Badan Pemeriksa Keuangan (BPK) can prove through accountability and transparency local government financial report (Basrie *et al*., 2012). The audit opinion is expected to strengthen the effect of fiscal decentralization on local financial performance, so the better the audit opinion (unqualified opinion) will have good implications and strengthen the effect of fiscal decentralization on local financial performance. Based on these explanations, it can be arranged hypothesis:

H4: Fiscal decentralization has positive effect on local financial performance of counties/cities in Lampung Province with audit opinion as moderating variables.

Research methods

Research Design

The design of this research is explanatory, the research was designed through the stages of collecting the necessary data, the determination of the analytical tools used, and the analysis of the data used

Research Samples

The population selected in this study were all counties/cities in Lampung Province during the period 2010-2013 which amounted to 13 counties and 2 cities. The sample used in this study is the counties/cities that has full terms of data to be sampled. Pesisir Barat Counties does not qualify as samples, because formed in 2012, so that the sample used in this study were 12 counties and 2 cities in Lampung Province.

Data Collection Technique

Secondary data in this study is financial data and data non-financial. The financial data is data regional government budget and the realization of the regional government budget that displays data is fiscal decentralization, local financial performance, local revenue and income that comes from the center. Non-financial data is data of the population and the audit opinion given BPK. The sampling technique used is purposive sampling (samples using criteria). The criteria in question, namely the availability of financial data, audit opinion data, and total population. Methods of data collection in this study is a documentation done by collecting data from books and publications, both online and offline.

Research Model

This study uses the one exogenous variables is fiscal decentralization, that is the authority and responsibility in the preparation, implementation and monitoring regional government budget by local governments. Measure of the degree of authority and responsibility given by central government to local government in exploring and managing income. Measurement of fiscal decentralization variables in this study using a ratio indicator between Own Source Revenue and tax revenues and non-tax with total regional expenditure (Badrudin, 2012: 49).

This study also used the endogenous intervening variable local government size, that is local government size is a nominal to describe the magnitude of a local governance (Kusumawardani, 2012). According to Manik (2013), local government size variable was measured by using a formula of revenue (central and regional) with total population. The dependent variable in this research is the local financial performance that is measure of performance using financial indicators (Sularso and Restianto, 2011). The local financial performance can be measured by several ratios, among them effectiveness ratio, local financial independence ratio, and conformity ratio.

This study also uses a moderating variable is audit opinion, according to Law No. 15 Of 2004 on Management and Financial Responsibility State article 1 paragraph (11) opinion is a statement professional as conclusion examiner's regarding the level of fairness of the information presented in the financial statements. The results measurement audit opinion variable expressed in quantitative form in the following order: (1) Unqualified Opinion (UO),

(2) Unqualified Opinion with Explanatory Language (UO-EL), (3) Qualified Opinion (QO), (4) Adverse Opinion (AO), and (5) Disclaimer Opinion (DO). The following research models:

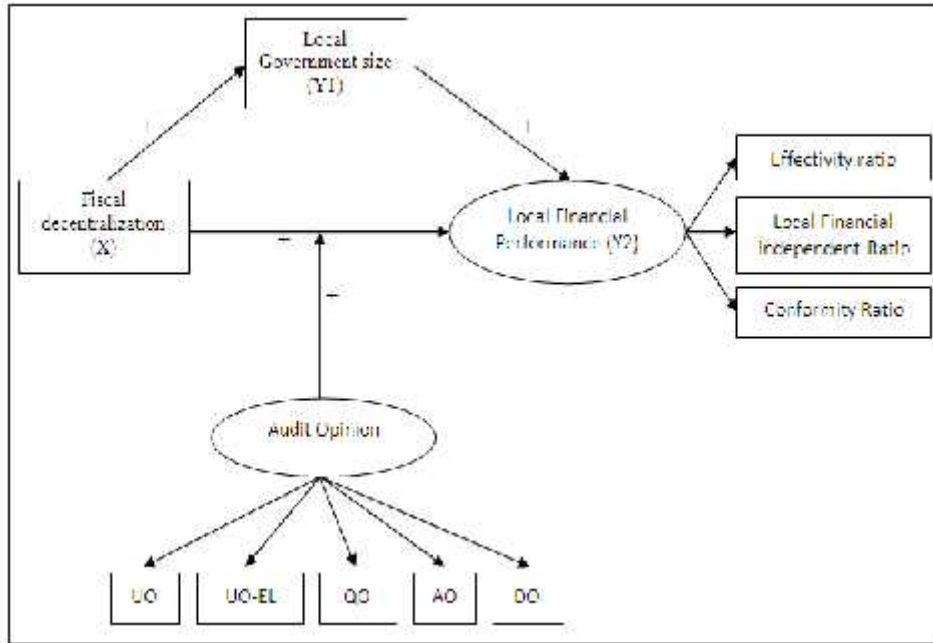

Figure 1. Path Diagram

Analysis Techniques

The data analysis technique in this study use descriptive and inferential statistics analysis. Descriptive analysis is used to reveal a descriptive overview of the field data in a way to interpret the results of processing through the tabulation to describe the tendency of empirical data and descriptive as the average value. Inferential statistics analysis used to Partial Least Square (PLS) especially WarpPLS because WarpPLS also directly display the significant value of making it easier for researchers to immediately know the results. WarpPLS can give a warning if there multicolinearity fairly high and the availability of the value output of the indirect/mediation (Solihin dan Dwi, 2013: 32-35). As the panel regression approach in the research is the simplest because it combines data time series and cross section (Winarno, 2015:10-1). Decision-making hypothesis test used in this study is, if the significance value <0.10, then the hypothesis is accepted.

Results and discussion
Descriptive Statistics Analysis

Table 1 below describes the characteristics of variables such minimum, maximum, and mean.

Table 1. Variable Description

Variable	Minimum	Maximum	Mean
Fiscal Decentralization	0.0759	0.8837	0.1367
Effectiveness Ratio	0.5505	54.8299	2.3796

Ratio Local Financial Independence	0.0100	0.5911	0.0556
Conformity Ratio	0.0867	0.5051	0.2458
Local Government Size	0.8234	4.0271	1.6679
Audit Opinion	1	5	2.52

Source: Obtained from data processing.

Based on Table 1 seemed variable fiscal decentralization at counties/cities in Lampung Province in 2010-2013 had an average of 0.1367, meaning that the numbers of fiscal decentralization at counties/cities in Lampung Province is very low. Fiscal decentralization low of 0.0759 occurred in Tanggamus in 2013 because local revenues and revenue sharing of tax and non-tax are not comparable with the expenditure area. Consequently Tanggamus have a high dependence on the central government in order to earn additional income that regional spending needs can be met. Fiscal decentralization high of 0.8837 occurred in Mesuji in 2010. It is supported by the high local revenues and other income were legitimate.

Effectiveness ratio on the budget at counties/cities in Lampung Province in 2010-2013 by an average of 2.3796 with effectiveness ratio was lowest in Way Kanan amounted to 55.05% in 2011. Way Kanan not managed to realize a local revenue. Effectiveness ratio was highest in Mesuji amounted to 5,483% in 2010 because it can exceed 100 percent. The ratio of local financial independence on the budget at counties/cities in Lampung Province in 2010-2013 by an average of 0.0556 with local financial independence lowest in Tulang Bawang Barat amounted to 0.0100 in 2010. That is, Tulang Bawang Barat in 2010 was not able to finance all the needs of the region. The ratio of local financial independence was highest in Mesuji amounted to 0.5911 in 2010.

The ratio harmony public expenditures at the budget counties/cities in Lampung Province in 2010-2013 by an average of 0.2458. That is, the counties/ cities government to allocate funds for development expenditures amounted to only 24.58% of the total budget. Harmony ratio was lowest in Lampung Tengah amounted to 0.0867 in 2010 and this ensures Lampung Tengah many concentrate on expenditures. The ratio of the highest harmony in Tulang Bawang amounted to 0.5051 in 2013. That is, Tulang Bawang in 2013 more priority to development expenditures.

The size of local government describes the large and the small size at the counties/cities in Lampung Province. The larger the size of the government and thus further strengthen the counties/cities, because of the activities and responsibilities in the counties/cities will be more credible and reliable to meet the needs of the autonomous region. Variable size of the counties/cities in Lampung Province in 2010-2013 by an average of 1.6679. The size of government was lowest in Lampung Selatan amounted to 0.0867 in 2010 and the size of government was highest occurred in Kota Metro amounted to 4.0271 in 2013. The situation in the two regions affected by PAD and population.

The audit opinion illustrates both the poor level of transparency and accountability in the financial statements of local government counties/cities in Lampung Province based on the results from BPK granting audit opinion. There are five audit opinion that is used by BPK to express an opinion, which is unqualified (WTP), unqualified with an explanatory paragraph, a qualified, the opinion is not fair, and Not Giving Opinions (TMP). Variable audit opinion on counties/cities in Lampung Province in 2010-2013 had an average of 2.52. That is, the audit opinion of the counties/cities in Lampung Province is still in a bad zone. The audit

opinion be one way to measure the success of the counties/cities governments in managing local finance based on provisions of existing law.

Inferential Statistics Analysis

Evaluate the value of goodness of fit model serves to determine the suitability of a model used in this study by using a fiscal decentralization variable, local financial performance, local government size, and audit opinion. Results of testing the goodness of fit model can be seen in Table 2 below:

Table 2. Goodness of Fit Model Value

The Criteria	Goodness of Fit Model
APC=0.289, P<0.001	Good if P< 0.05
ARS=0.494, P=0.095	Good if P< 0.05
AVIF=31.402	Good if < 5

Source: Obtained from data processing.

Based on the test results, the Average R-squared value (ARS) obtained the results of 0.494 with a value of p = 0,095. This means the value of the ARS is not significant because it can be called significant if the p-value of <0.05. Value 0.494 shows that the variables in this study are only able to affect the dependent variable amounted to 49.4% and 50.6% owned by other variables outside the model. Average Path Coefficient (APC) values of 0.289 with a value of p <0.001. This means a significant APC values (<0.05). The significant value of APC can prove that endogenous and exogenous variables have a cause and effect relationship either directly or indirectly. In addition, the high multicollinearity for the model in this study proved the high value of Average Variance Inflation Factor (AVIF) amounted to 31.402. Testing AVIF moderation should be the main focus for the WarpPLS using interactions between variables can occur multicollinearity (Sholihin and Dwi, 2013: 61). Multicollinearity on research is not caused by the moderating variable, because after deletion of data outliers, AVIF value of <0.05. So it can be further analyzed.

The impact arising from non-fulfillment of the criteria of the value of goodness of fit model is a model be considered good, and the solution can be done by adding either an endogenous variable endogenous dependent or intervening. In addition, the lack of samples in this study can also make the cause of the poor value of goodness of fit model. The need for additional data, will be but this cannot be done. This study uses data years 2010-2013, when adding data before the year 2010 there will be three districts which cannot be excluded from the sample because of the newly-formed in 2008 and financial statement data become available each complete in 2010. The principal purpose of research this is to see the implementation of regional autonomy under decentralization (there are three new districts in the era of regional autonomy), so the solution is to add the data in 2014, but such data are not available at this time, which should be obtained from early July in accordance with the mandate Law No. 17 of 2003 on State Finance of article 31.

According Solihin and Dwi (2013: 61), interpretation of indicator depending on the model fit SEM analysis purposes. If the aim is only testing the hypothesized relationship among other variables, the indicator model fit is becoming less important. The main objective

in this study was not to compare some of the best models, just test the hypothesis only, then no replacement models.

Table 3. Results of Hypotheses Testing

No	Relationship Variable	Path Coefficient	P-Value	Explanation
1	Fiscal ---> Perform	0.93	0.08	Significant
2	Fiscal ---> Size	-0.13	0.35	No Significant
3	Size ---> Perform	0.05	0.43	No Significant
4	Fiscal*AO ---> Perform	0.05	0.40	No Significant

Source: Obtained from data processing.

Based on the results of statistical tests fiscal decentralization on regional financial performance showed that the value of the path coefficient have positive value 0.93 and a p-value of 0.08 or less than the standard specified p-value (<0.10). Based on these test results can be concluded that the first hypothesis in this study received, fiscal decentralization significant positive effect on the financial performance of the counties/cities in Lampung Province. This suggests that increasing fiscal decentralization proxied with counties own source revenue and revenue sharing fund and non-tax to local expenditure total will take effect good on more increasing local financial performance for budgeting counties own source revenue at once the realization that, so will affect financial independence local on the countiess/cities in Lampung Province which will ultimately impact both on the conformity expenditure local. Compatibility setting shopping area, because the role of fiscal decentralization improve reception area, so that local governments will be more easily manage the realization of counties/cities own source revenue and expenditure arrangements. These findings support the results of a study Halim and Abdullah (2006), Sianturi *et al*. (2013), and Susanto and Badrudin (2016).

This research is evidence that the implementation of regional autonomy, especially in the fiscal sector was able to improve the financial performance of the counties/cities in Lampung Province, especially the success in realizing counties/cities own source revenue. Budgeting strategy that do the counties/cities in Lampung Province be a sign of that countiess/cities in Lampung Province not arbitrarily in predicting the realization of counties/cities own source revenue based on the real potential that exists. Although the counties/cities in Lampung Province have not managed to achieve financial independence that led to dependence on the central government is still very high. In addition to the counties/cities governments have not managed to organize and prioritize portion routine expenditure and development expenditure.

Based on the statistical test fiscal decentralization on local government size, shows that the value of the path coefficients have are negative values of -0.13 and a p-value of 0.35 or greater than the standard specified p-value (<0.10). The coefficient negative sign indicates that if the implementation of fiscal decentralization has been optimal it will have a bad impact

on local government size. Based on these test results can be concluded that the second hypothesis in this study was rejected, namely fiscal decentralization significant negative effect on the local government size in the countiess/cities in Lampung Province. These findings does not support the study results Dwijayanti and Rusherlistyanti (2013).

This suggests that fiscal decentralization is proxied with counties own source revenue and revenue sharing fund tax and non-tax to expenditure local total expenditures would bring the negative effect on the size of local government proxied with revenue (central and local) of the total population. This is caused by the entire delegation of authority to local government, but local government have has not been able to carry it. Evident from the pattern of relationships instructive owned by the counties/cities in Lampung Province, so that the greater fiscal decentralization that would make the size of local government becomes increasingly lower. In addition, greater fiscal decentralization are becoming much chance for diversion of funds as more and more funds become increasingly unmanageable, as well as the demand meet the needs of growth population accompanied by a growing total population.

Based on the results of statistical tests the government local size on local financial performance, shows that the value of the path coefficient is positive value 0.05 and a p-value of 0.43 or greater than the standard specified p-value (<0.10). Marked positive coefficient indicates that increasing the local government size will the higher the local financial performance. Based on these test results can be concluded that the third hypothesis in this study was rejected, local government size is not a significant positive effect on the local financial performance the counties/cities in Lampung Province. These findings does not support the study results Kusumawardani (2012), Fidelius (2013), Malik (2013), and Badrudin (2015).

This shows that the local government size proxied by revenue (central and local) population has not been able to provide a positive contribution to improving the financial local financial performance. Although local government size in the countiess/cities were small because of the imbalance of population increase should be financed with a total income of less than optimal. Though the size of a large regional government can have a positive impact also for budgeting and the realization counties own source revenue and counties own source revenue higher would be capital to regional financial independence that will create the physical development of the area which will indirectly help boost economic growth, because the large size of local government likely to encourage local financial performance. Meaning that more funds can be used to meet the needs of the public (Smeru, 2002:41).

Based on the results of statistical tests fiscal decentralization on regional financial performance with the audit opinion as moderating variables showed that the value of the path coefficient is positive value 0.05 and a p-value of 0.40 or greater than the standard specified p-value (< 0:05). Marked positive coefficient indicates that the better the audit opinion (unqualified opinion) obtained an area it will reinforce the positive effects of fiscal decentralization on the local financial performance the counties/cities in Lampung Province. Based on these test results can be concluded that the fourth hypothesis in this study was rejected, namely fiscal decentralization is not a significant positive effect to the local financial performance with audit opinion as moderating variable in the countiess/cities in Lampung Province. This is evident from not optimal financial management in local government at the counties/cities in Lampung Province so many countiess/cities in Lampung Province in the year 2010-2013 were getting bad audit opinion (unqualified opinion with explanatory

language, qualified opinion, adverse opinion, and disclaimer opinion) from BPK. These findings does not support the study results Basrie *et al.* (2012).

Conclusion and suggestions
Conclusions

Fiscal decentralization has significant positive effect on regional financial performance. Although still low of fiscal decentralization value and still shows the relations that instructive, but the fiscal decentralization low can be categorized on target, because through the delegation of authority fiscal made the government is able to perform financial management although there is not yet local financial independence full and the setting local expenditure proportion not yet inadequate. Fiscal decentralization has significant negative effect on local governance size, because regional autonomy is a sign that the local government is not only given confidence to dig and manage potentials in the autonomous region but also to be fully able to finance all the public interest, while acquired is not optimal to finance the interest of the population in the autonomous region although there are additional revenues from the center so as to make the size of government becomes increasingly lower. Local government size is not a significant positive effect on the regional financial performance. This means the size of a small government is not able to increase local financial performance. The small effects the local government size to local financial performance due to the increasingly rapid population growth is not matched by the rapid amount of income, especially local income, so causing the local government size has little influence. The countiess/cities that have small counties/cities own source revenue and the much as total population will cause the local government size cannot as much expected due to a restriction of transfer funds given by the central government. As a result, government size is not the maximum would also hamper the local financial performance. Fiscal decentralization has not significant positive effect on the local financial performance with audit opinion as moderating variables. It is meaningful audit opinion has not been able to strengthen positive effect fiscal decentralization on local financial performance. The small effect of audit opinions on the positive effects of fiscal decentralization on regional financial performance is consequence from still bad from BPK audit opinion received by the counties/cities in Lampung Province. So can be ascertained most of the number in the financial statements is not the actual number. Still need to evaluate the performance of human resources in each counties/cities is also a consideration for the government that the implementation of regional autonomy may also running as it should, because it will feel useless if the result of hard work in earned income that will be used to finance the autonomous region abused by the parties are not responsible.

This research has evidence that audit opinion does not make fiscal decentralization stronger in counties/cities Lampung Province. There are several factors that cause. The institutional structure of the government counties/cities and province in Lampung Province requires further evaluation due to low quality and quantity of employees and there are overlapping authority between counties/cities and province. Routine expenditures (personnel expenditure) in the counties/cities Lampung Province tends to increase while capital expenditure tends to decrease. This results in low capital expenditure for infrastructure development. The size of fiscal decentralization in counties/cities Lampung Province low due to the local revenue and tax revenue-sharing and non-tax low while the relatively high budget. This is due to lack of personnel able to be creative in raising local revenue due to limited

human resources. In fact, the balance of funds from the central government also allocated for routine expenditure (personnel expenditure). The size of the fiscal decentralization in cities is higher than counties have an impact on the ability to build infrastructure so that infrastructure development in cities is relatively more developed than counties. In addition, the cities government budget financial performance was also better than the counties in Lampung Province.

Research Limitations

The variables this study have not been up to affect the financial performance of it is known from the low value of R-Square, so need to add another variable that can improve local financial performance such as economic growth because economic growth is an important factor also in support to improve of local financial performance. The higher and faster economic growth it will be easier for a counties/cities in improving local financial performance. In addition, it can add a asset variable because the large asset will be easier for the government in the realization of postal counties own source revenue. The law is to earn a great income, necessary facilities must complete/good too and the need to provide necessary facilities as well as adequate cost. This research is aim to know the implementation of regional autonomy overall in Lampung Province, so unknown among counties/cities are capable of implementing regional autonomy. So if this research be distinguished the economic strength of each counties/city in Lampung Province, the research result is robust.

Suggestions

Based on the conclusions generated in this study, it submitted several suggestions are expected to be useful for practical purposes and further research. The government needs to pay attention to financial governance, for example pay attention to the routine and development expenditure for the acceleration of economic growth of Lampung Province is a province that is strategically located as a gateway to the island of Sumatra, so user facilities such as cross road Sumatera be convenient. Maximizing counties/cities own source revenue so that can to manage and improve the resources that already exist or excellence of each region like the beach, the harbor and the hills that can be used as a tourism needs to be given a public facility that will provide comfort for visitors in the end will also be able to add local retribution, increase the size of the postal levies, as well as improving economic growth in the surrounding community, so it will be able to help the welfare of society. Based on the results of the audit opinion received on counties/cities in Lampung Province, the government needs to make audit opinion improvements as evidence that the local government financial statements have been presented in a transparent and accountable. For further research, should include Klassen typology analysis to distinguish the economic strength of each counties/city in Lampung Province so will result robust research.

TECHNOLOGY TRANSFER AND COMMERCIALISATION PATTERN: A CASE STUDY OF LIPI

Yovita Isnasari, Indonesian Institute of Sciences
V. Susirani Kusumaputri, Indonesian Institute of Sciences
yovita.isnasari@gmail.com

Abstract

Innovation has nominated as the driver of economic growth. Technology transfer has emphasized as a challenging task and important driver in innovation and the creation of sustainable growth. Center for Innovation LIPI as Technology Transfer Office (TTO) of LIPI has conducted technology transfer from research results LIPI to start up company. Need to be mapped patterns of development start-up company, starting from the invention until an initial public offering of the business that Adopted the technology.This study will map out the stages of the pattern of technology transfer and commercialization, using qualitative research methodology to approach the study of literature to collect data and information related to the topic of study. It was done with interviews and searching for information related to the themes and issues from a variety of sources in writing, in the form of books, journals, articles or writings of other experts.There are three stages in the development of tenant or start-up company, namely: Establishment Start Up New Company, and Business Development. Center for Innovation LIPI as TTO until now have been carrying out these stages until the first stage. For the next stage should be strengthened so as to enlarge the field of promotion of the company's scale and obtain additional funds through angel investors.

Keywords: *commercialisation, innovation, start-up company, technology transfer, technology transfer office (TTO)*

Introduction

The growth of competition force determines the importance of innovation and technology transfer. Carlsson and Stankiewicz (1991) state innovation is not just an invention or research and development, but a series of processes as a whole must consider as a system. Furthermore, Markard and Truffer (2008) suggested a technology innovation system is a set of network actors and institutions which together interact in a particular field of technology and contribute to the generation, diffusion and use of a variant of the new technologies and new products. Research that produces the right technology at the right time is critical for competitive success in many industries.

Innovation has been recognized as one of the driversof economic growth (Todaro& Smith, 2014). In determining the index of global competitiveness, innovation is one of the important pillars that counts (Fig. 1). In this regard, Indonesia is still in phase two, namely efficiency driven, and has not yet reached the stage of innovation driven. Technology transfer has emphasized as a challenging task and important driver in innovation and the creation of

sustainable growth. The growing number of innovation and technology transfer studies followed by different kinds of theories and concepts developed, typologies and taxonomies proposed, forming reviews these variousrelationships between concepts.

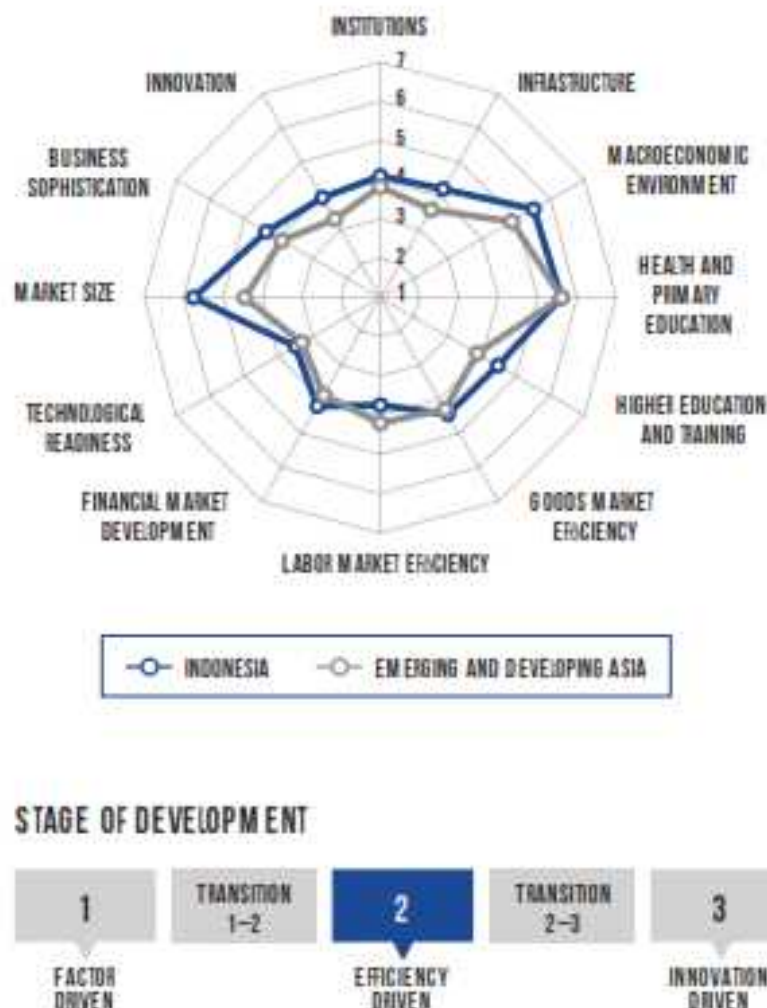
The technology transfer has become a very effective way to disseminate innovation and knowledge. It is an alternative to competitive for a work unit to search not only for the exploration of internal resources to take advantage of intellectual property as well as the results of research and development activities. It is also a way for external partners to getting an increase in new technology to make it a new business opportunity in the form of the start-up company.


Figure 1. Global Competitiveness Index 2015: 12 Pillars of Competition
Source:http://reports.weforum.org/global-competitiveness-report-2015-
2016/economies/#indexId=GCI&economy=IDN

The concept and technology transfer activities spearheaded by the United States, until 1980 there wasonly a few patent licensing in the United States. In that year also raised Bayh-Dole Act regarding uniformity patent policy for federally funded research, the protection and licensing of another company or the sale of intellectual property rights through universities, and the development of technology transfer.

In the early 1990s focused on the establishment of technology transfer spin-offs, and European countries began to recognize the importance of technology transfer. Japan and Taiwan started to adopt the Bayh-Dole Act in the late 1990s, and then followed the global interest in the transfer of technology. In 2004 Switzerland began setting the legal basis for the transfer of technology and followed by Indonesia in 2005 appears the Government Regulation on Transfer of Technology. In the Indonesian Government, Regulation No. 20 in 2005 formally technology transfer is defined as the transfer of the ability to utilize and master of science and technology among institutions, bodies or persons, whether they are in a domestic environment likewhatever comes from abroad into the country or vice versa.

Center for Innovation LIPI as Technology Transfer Office (TTO) aim to see to that intellectual property as well as the results of research and development activities couldharness into a knowledge-based business / economic value of technology that hasa significant impact on the growth of business starters. The impact of the growth of new venture based on this technology isexpected to empower the skills of local resources to increase local economic growth.

This study will map out the stages of the pattern of technology transfer and commercialization. It will start from the inventionuntil an initial public offering of the company that adopted the technology. Also, this study will look at the development stage of the transfer of technology in LIPI to produce recommendations to support future activities.

Conceptual background

   1. Technology Transfer

Technology transfer is defined as an effort to disseminate the technology of research results into a form that can be utilized. Technology transfer describes the process ofwhich the knowledge of technology share, or moves from creator to user. The research institute is a source of technology that will be utilized. Technology transfer is the process by which commercial technology is distributed by taking the form of technology transfer transactions, which may or may not be covered by a legally binding contract (Blakeney, 1989), but which involves the communication of relevant knowledge by the transferor (the owner of the technology) to the recipient.

Process and an understanding of technology transfer will not be the same for each institution. Universities, corporations, federal labs, and developing countries have different roles and interests in technology transfer (Choi, 2009). Differences models tend to be influenced by the tendency of a system or technology that will be transformed to each institution. There are many widely used models of technology transfer; examples include the appropriated models, the dissemination of models, the knowledge utilization patterns, the contextual collaboration models, the material transfer patterns, the design transfer patterns, and the capacity transfer patterns(Choi, 2009).

Frey (1987) could be considered the most typical advocator of this approach, and technology ischaracterized as four elements: object, process, knowledge, and volition. Moreover,Markert

(1993) defined technology transfer as the transfer of technology once developed in a different setting. Furthermore, Johnson, Gatz, and Hicks (1997) moved further by taking into account both the movement of the original location and acceptance and use by the final user. Technology transfer is regarded as a way to obtain competitive advantages through performance improvements in corporations that are the recipients of this technology (Choi, 2009). The three most important aspects of technology practice are cultural, organizational, and technical (Pacey, 1986).

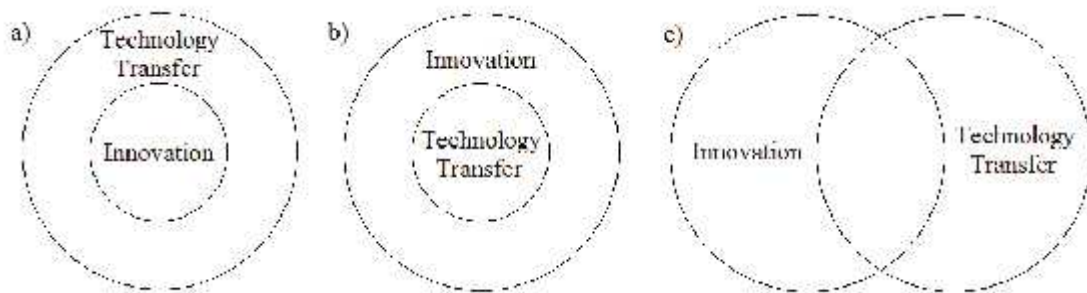
According to Dubickis and Sarkane (2015),different kind of relationships between innovation and technology transfer appear from the review of definitions, results of the first focus group discussion and classifications provided by the regular search show. The graphical model of these relationships is presentedin the Fig. 2.


Figure 2. Relationships Between Innovation and Technology Transfer
Source: Dubickis and Sarkane (2015)

Relationships between innovation and technology transfer unveil a different kind of perspectives on innovation and technology transfer: a) technology transfer includes innovation; b) innovation includes technology transfer and c) innovation and technology transfer overlap. The results of the second focus group discussion confirm the discovered relationships. The focus group also estimates that the perspective where innovation and technology transfer overlap is dominant and recommends future research on a global level. Also, there is still a question how high is the overlap of innovation and technology transfer and which are the points of the contact.

2. Funding in New Company

Creating a new company will be affected by its funding source. The commercial source will also affect the ability of the new company in business developing. Garson (2011) classified investors by the willingness to invest (buy the business) and the calculation of high and low risk will be accepted into three, such as:

a. Angel Investors. These investors are usually a relatively new company and are willing to bear the relatively large risk. Entrepreneurs who become angel is demand still will be directly involved in running the business

b. Venture Capitalists.These investors will provide funds with greater than nominal from angel investors. These investors will be the supervisor in managing a business, and not directly involved. The risk borne by investors is also not as big as that taken by angel investors.

c. Private Equity/Investment Companies. These types of investors will provide funds in large numbers. Forms of involvement of investors in the form of acquisitions. Usually,

the companies that will receive funds from the investment companies are companies that are already well underway and already earn a higher profit.

The relationship between entrepreneurship, angel investors and venture capital According to Hellman and Thiele (2013) are interconnected and continuous (Fig. 3). Entrepreneurship will need angel investors to start creating a business and as an investor in the early stage. While venture capital will be required in the new company will expand its business to increase production capacity.

Figure 3: Financing Stages – Angel and VC Markets
Source: (Hellmann and Thielez, 2013)

Inderst and Müller (2004) point out that bargaining power between entrepreneurs and VCs, as reflected in equity shares, for example, varies with technological and economic conditions. There are two primary reasons why entrepreneurs choose venture capital as a source of finance. The first based on the observation that in addition to funding, VCs provide assistance and advice which adds value to entrepreneurs' investment projects (monitoring, professionalizing ventures, and certification). The second reason is that equity finance is the optimal financial contract for some entrepreneurs, which VCs specialize in offering. (Parker, 2009. p.239),

Venture Capital is a business financing in the form of equity in a private company as a business partner (investee-company) that wants to expand its activities for a period (temporary). Venture capital business profile characterized as a high-risk business due to there is no guaranteed return of capital or a successful future for the company that has been invested (Carvalho, Calomiris, Matos, 2007).

Moreover, the University of Oxford classifies investors into four groups based on its funding source, namely venture capitalist (£ 0,5 m upwards), business angels (£50,000 to £250,000), private investors (friends and family), and Bank, universities, government award funds (usually <£50,000).

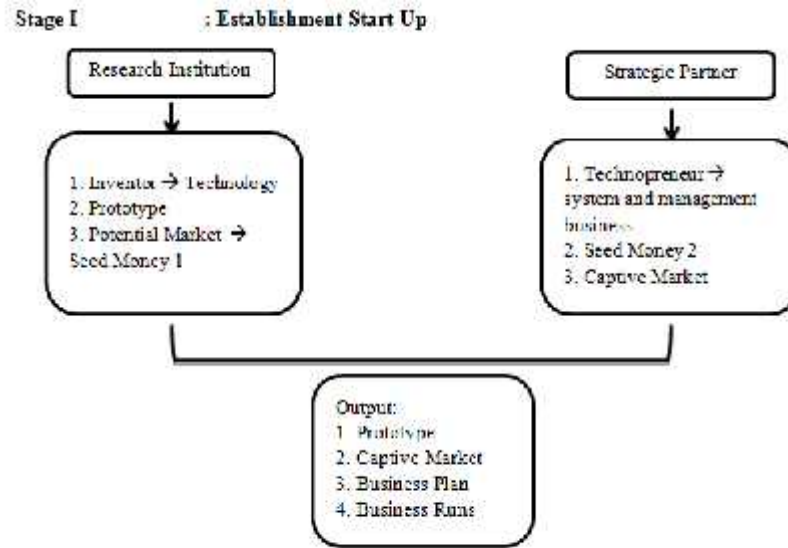
The fact that angels' average deal sizes are so much smaller than those of VCs suggests that they serve a different part of the entrepreneurial finance market. Business angels tend to concentrate on early-stage financing in younger companies. Their role usually declines at later stages when more substantial funding is needed. (Parker, 2009. p.249). Thus, 45 percent of US angel deals in 2004 focused on seed and early-stage projects, compared with just 6 percent among VCs (Amatucci and Sohl, 2007).

Methodology
This study uses qualitative research methodology to approach the study of literature to collect data and information related to the topic of study. A desk review and interviews were done to collect information related to the themesand issues from a variety of sources in writing, in the form of books, journals, articles or writings of other experts.These were sourced mainly from the Center for Innovation of LIPI, government and private institutions, and other online sources.

Result and discussion
Technology transfer is the final process of research and development activities. Trends that exist today require research institutes also have a working unit or a separate division that has tasks and functions in the transfer of technology. Technology Transfer Office has a significant role in the technology transfer process. Technology Transfer Office can be defined as a bridge between technology suppliers and technology receiver (Mitasiunas, 2013). Technology Transfer Office serves to ensure the level of preparedness of the resulting technology research institute was ready to be brought to the industry.The technology transfer process has been studied in various parts of the world, in one literature explained that there are six stages in the process of technology transfer, namely technology innovation, technology confirmation, targetingtechnology consumers, technology marketing, technology application, technology evaluation (Risdon, 1992). Recent research shows that to be able to run the stages of technology transfer is effectively required knowledge management that includes: socialization, combination, internalization, externalization (Khadem, et al. 2014).

The technology transfer process will begin when technology derived from research results have to meet the standard needs of the market (public). The results of the research that have been made in the form of the prototype will do a feasibility study to map out the response from potential users. If the technology were judged to have the appropriate circuitry needs of the community, it would be the determination of the model of technology transfer. One example of technology transfer is the establishment of a Start-up Company.

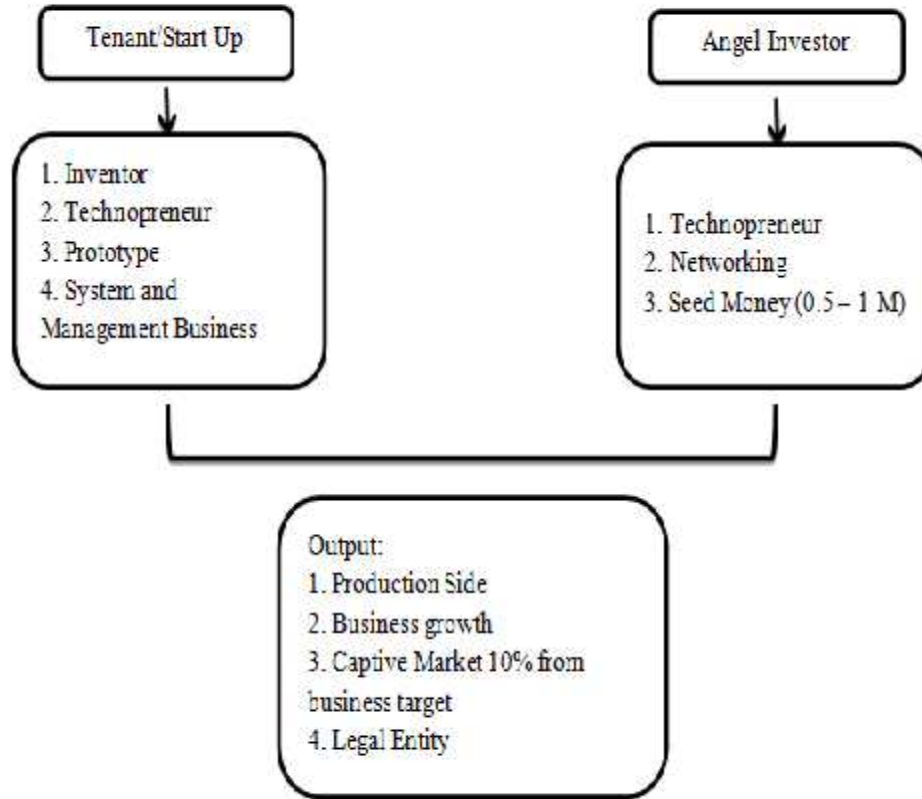
Based on qualitative research methodology that has been done, in the development of tenant or start-up company in the context of the technology transfer obtained the following patterns.

Stage I   : Establishment Start Up


The stages of technology commercialization start from its existing Research and

The stages of technology commercialization start from its existing Research and Development (R & D) institutions and strategic partner. R & D institutions are institutions that have technology research and development activities. The central element of R & D institutions is inventors or researchers with technology that can be applied by the society. Characteristic of this stage is the technology has been made in the prototype form for a market test. The market test conductedto obtain potential market and the public interest level in the product. At this stage, TTO of R & D institutions are still providing funds or seed money to create a prototype.

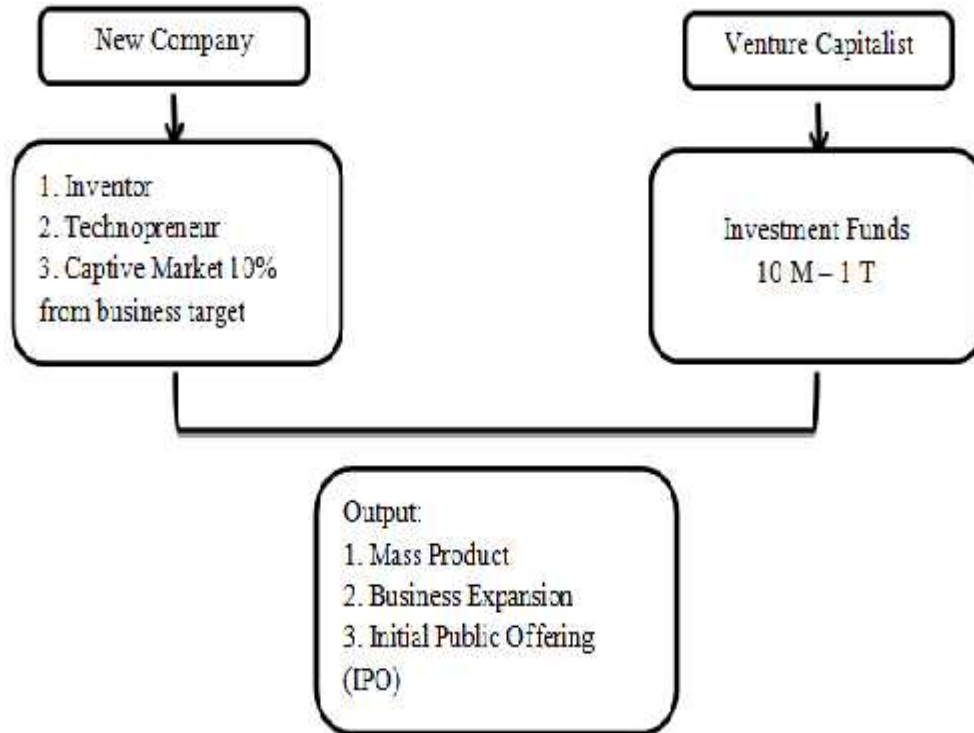
The other party involved at this stage is the Strategic Partner. A strategic partner is a Small Medium Enterprise (SME's) who have knowledge about system and management business. SME's also having their seed money as the initial capital start-up formation. At this stage, the resulting output is a prototype used to market test, captive market, business plan as a guide to running the business and the business runs through the micro level.

Stage II   : New Company


The second stage in the process of technology commercialization is a continuation of the previous stage. In this stage start-up company has to have an element of technology inventors, technopreneurship, a prototype to market test, also a good system and management business to run the business. The other party involved in this stage is the angel iInvestor. The idea about the relationship of entrepreneurs (especially start-ups) and angel investors when viewed from the perspective of social capital can be lifted from Janney and Dess (2006) research. They stated that an entrepreneur tied into the network of relationships that can offset the risk of entering new businesses.

The role of anangel investor is the ability to provide funding and expand the new company network to be formed. Angel investors already have a fairly extensive network in business development Angel investor also can provide seed funding or initial capital of 0.5 to 1 Billion Rupiah.

The resulting output at this stage exists production side in larger scale, business growth, captive market about 10 percent of business targets, and their legal entity. The final result of this second stage is companies that ready to be developed.

Stage III   : Business Development


The last stage of technology commercialization is the development of enterprises to become bigger. The new company established in the second stage is considered to have a captive market of 10 percent, but still need the support of a larger fund. At this stage, the new company will be looking for a venture capitalist, which can provide funds between 10 Billion to 1 Trillion Rupiah. Venture Capitals would eventually receive compensation in stock share. If this stage has been successfully implemented, these companies will have the ability to do mass production, business expansion and able to sells stock in publics.

Center for Innovation is one of the organizations that facilitates technology transfer and has well developed over the years. Similarly, the technology transfer process conducted by the Center for Innovation, a significantdevelopment occurred when the Center for Innovation incubator have any buildings and workshops in 2013. Until this year, there are at least 18 adopted by the discovery of a strategic partner which are start-up companies that became tenants at the Innovation Center LIPI to get assistance.

Mentoring conducted by TTO aims to produce products/prototypes are ready for market, scale-up enterprise, capture the market potential and public interest, and including providing funds or seed money. Strategic partners are adopting the invention expected to have a knowledge ofthe system and management of business, and also having reviewed their seed money as the initial

start-up capital formation. The resulting output of this stage is prototype products are ready for market, and the business is running on the stage of small-medium enterprises.

Through observation and in-depth interviews with the actors of technology transfer at the Center for Innovation and several colleagues Involved, then the schema concept of transfer of technology in the Center for Innovation is the first stage of commercialization. Thus, there is still the need for support for the next phase, in particular by promoting the inventions, the company, and the resulting product, for example with a business meeting, exposure, and others, with the goal of getting more funding through Angel Investors.

Conclusions

There are three stages in the development of tenant or start-up company, namely: Establishment Start Up, New Company, and Business Development. The Center for Innovation LIPI as TTO until now have been carrying out these stages until the first stage. For the next stage should be strengthened so as to enlarge the field of promotion of the company's scale and obtain additional funds through angel investors.

THE INFLUENCE OF TRANFORMATIONAL AND TRANSACTIONAL LEADERSHIP TO SOCIAL CAPITAL AND ITS INFLUENCE TO PERFORMANCE

Wisnu Prajogo, YKPN School of Business, Indonesia

Abstract

This research examines transformational and transactional leadership influence to social capital (measured by structural and relational dimension) and social capital influence to performance measured by in role and extra role performance. Participants of this research are administration staffs (non production) with more than 1 year work tenure from 9 big manufacturing companies located in Yogyakarta, Semarang, and Solo. Data was processed with structural equation modeling that enables simultaneous data processing with mediating variable. There are several important results. First, transformational leadership has positive influence to relational dimension of social capital. Second, transactional leadership has negative influence to structural dimension of social capital. Third, relational dimension of social capital has positive influence to extra role performance. Fourth, structural dimension of social capital has positive influence to in role performance. Fifth, extra role performance has positive influence to in role performance.

Keywords: *Social capital, leadership, in-role performance, extra-role performance*

Social capital is an employee asset that will result in employee's performance, which in turn will result in better organizational performance (Akdere, 2005). Basically there are a few research gap related in social capital research. First, the non-comprehensive social capital measurement, since most social capital researches focus on interactional aspect of social capital. Second, lack of research examining social capital's antecedents.Third, performance measurement only to in-role performance.

This research focus on interactional and relational dimension of social capital. This research also uses transactional and transformational leadership as antecedents of social capital. This research will use in-role and extra role performance as employee performance indicator.

Main Text

Social capital concept was first introduced by Hanifan (1916) who defines social capital as the goodwill, fellowship, sympathy, and social intercourse among the individuals and families who make up a social unit (Farr, 2004). Adler and Kwon (2002) than concluded from several sources and defined social capital as the goodwill available to individuals or groups. Its source lies in the structure and content of the actor's social relations. Its effects flow from the information, influence, and solidarity it makes available to the actor.

Social capital will influence employee performance because it has three usefulness (Adler & Kwon, 2002). First, social capital facilitates access to information sources so it will increase the quality, relevance, and timeliness of information needed to support performance. Second, social capital will build control and power, which enables someone to get support in his/her work. Third, social capital will increase solidarity which will create better teamwork.

Nahapiet and Ghoshal (1998) stated that there are three dimensions of social capital: cognitive, relational, and structural. Cognitive dimension of social capital are shared languages (codes), shared narratives, and shared vision which facilitates the understanding about collective goal and the how to act in a social system. The relational dimension is the personal relationship and trust

among employees which come from the interaction. Structural dimension is the impersonal configuration of linkages among people which means that someone's position in interaction, will give him/her certain advantages. This research has its focus on structural and relational dimension, since many companies has no clear and internalized vision. Since social capital is so important, it is necessary to understand the antecedents of social capital, which this research focus on leadership and personality.

Leadership and social capital

Social capital does not exist by itself (Baker & Obstfelt, 2000). One of external factors influencing social capital is leader's behavior (Jung & Avolio, 2000; MacKenzie et al., 2001). This research examines the influence of leadership to social capital using transformational and transactional terminology (Bass, 1985) and Nahapiet and Ghoshal's (1998) definition of social capital.

Transformational leadership is a leader behavior which enables employees to reach higher motivation and make them achieve performance beyond expectation. Employees who try to work beyond expectation will build relationship with their fellow co worker, because they realize that the interaction will enable them to reach good performance. Related to transformational leadership and social capital, we develop hypothesis concerning the influence of leadership to social capital:

H1: Leader's transformational leadership has positive influence to employee's relational dimension of social capital.

Transactional leadership has to do with giving reward and punishment to employees to achieve organizational goals. In order to creating high level of social capital, leader can use incentives to ensure that employees will work together. This implies that transactional leadership can increase the structural dimension of social capital, so we define the second hypotheses as follows:

H2: Leader's transactional leadership has positive influence to employee's structural dimension of social capital

Social capital and employee performance

Social capital will support employee's performance since it has three benefits (Adler & Kwon, 2002; Coleman, 1988). First, social capital facilitates access to wider information sources so it will increase the quality, relevance, and timeliness of information needed to support performance. Second, social capital creates influence, control, and power for someone who has strong social capital. Third, social capital creates solidarity among employees.

There are two kind of employee performance: in role performance and extra role performance. In role performance is an employee's performance related to his/her job description. Extra role performance is employee's performance that is not related to job description. Extra role performance includes several things such as: helping coworker, doing more than what is expected, etc.

Related to the influence of social capital to performance, this research argues that structural dimension of social capital will influence employee's in role performance. Structural dimension of social capital is an employee's position in the network of relationship. When an employee has so many friends around him/her, the employee will get many benefit from the relationship, such as he/she can get access to resources he/she need to complete his/her job. So having good interaction will make him/her work well.

When employee has good relationship dimension of social capital, which means that the employee is trusted by his/her coworkers, this relationship will result in helping behavior among employees. Since helping behavior is sometimes outside job description, it is defined as extra role performance. The higher the relationship dimension of social capital, the higher the extra role will be. So, this research develops several hypotheses concerning the influence of social capital to performance:

H3: Structural dimension of employee's social capital has positive influence to employee's in-role performance.

H4: Relational dimension of employee's social capital has positive influence to employee's extra-role performance.

In role and extra role performance

In role performance is an employee's performance related to his/her job description. Extra role performance is employee's performance that is not related to job description. Extra role performance includes several things such as: helping coworker, doing more than what is expected, etc. This research argues that when an employee extra role performance is higher; this will increase employee's in-role performance. This due to higher extra role performance will create a good helping behavior climate, so employee will get support from co workers. So we define the fifth hypotheses as follows:

H5: Extra role performance has positive influence to in role performance.

Research Model
Research Method

Research participants are administration staff (non production) with more than one year work tenure from several big manufacturing companies located in Yogyakarta, Semarang, and Solo. Data was collected using questionnaires and there were 504 questionnaires remaining for further analysis.

Table 1
Participants Demographic

		Count	%
Gender	Male	296	58.7
	Female	208	41.3
Age	Until 25 Year	66	13.1
	26 – 30 Year	131	26
	31 – 35 Year	106	21.2

	36 – 40 Year	88	17.5
	41 – 45 Year	71	14.1
	46 – 50 Year	29	5.8
	>50 Year	12	2.4
Marriage Status	Married	371	73.6
	Not Married	133	26.4
Work Tenure	Until 5 Year	157	31.2
	6 – 10 Year	135	26.8
	11 – 15 Year	108	21.4
	16 – 20 Year	54	10.7
	21 – 25 Year	34	6.7
	26 – 30 Year	14	2.8
	>30 Year	2	0.4

Variables and measurement

Transformational and transactional leadership was measured with Multifactor Leadership Questionnaire 5X (Bass, 1985). Relational dimension of social capital was measured by combining items of interpersonal trust at work developed by Cook and Wall (1980) and one item of employee togetherness developed by Chua (2002). Structural dimension of social capital was measured by self-developed instrument.

In-role performance was measured by using instrument developed by Williams and Anderson (1991). Extra-role performance was measured by using instrument developed by MacKenzie et al. (1999). Instruments for measuring transformational leadership (Multifactor Leadership Questionnaire), relational dimension of social capital (interpersonal trust at work), in-role performance, and extra-role performance were developed using back-translation process.

Validity and reliability tests

Factor analysis was used to test the validity of instrument items, followed by computation of Cronbach's Alpha as reliability measure. Analysis factor was operated separately for performance variables, social capital variables, leadership variables, and personality variables. Analysis factor procedure was based on procedures done by Antoni et al. (2002) which is analysis factor is operated repeatedly until there is no factor that can be dropped based on stated criteria.

An item will be remained if its factor loading was equal or more than 0,5 based on Comrey and Lee's (1992) guidance as quoted by Tabachnick and Fidell (1996) which stated that 0,5 criteria will explain around 30% of variance. Items will also be dropped if there were factor loading values fulfilling criteria in more than one factor (Peck, 1994). Analysis factor was operated with principle component analysis method using varimax rotation to get better factor separation (Tabachnick & Fidell, 1996). The final result of validity and reliability test is presented in table 2.

Table 2
Summary of Validity and Reliability test

VARIABLE		RELIBILITY AND ITEMS VALID

In-role performance	alpha	0,83
	item	KIR1, KIR2, KIR3, KIR4
Extra-role performance	alpha	0,83
	item	KER1, KER2, KER5, KER6, KER7, KER8
Relational dimension of social capital	alpha	0,76
item		MSR1, MSR2, MSR3, MSR4
Structural dimension of social capital	alpha	0,83
item		MSS1, MSS2, MSS3, MSS4, MSS5
Transformational leadership	alpha	0,90
Item		TF2, TF3, TF4, TF6, TF8, TF10, TF12, TF13, TF14, TF15, TF16, TF17, TF20
Transactional leadership	alpha	0,65
	item	TS9, TS10, TS12

Result and Discussion

The fit values (Table 3) shows that basically the model has an acceptable goodness of fit, so hypothesis testing can be done with the model.

Table 3
Model Fit Testing

ABSOLUTE FIT	CRITERIA	FIT VALUES	
Chi square; df; probability	Not significant (Hair et al., 1998)	157, p<0,01	Not quite good
GFI	>0,9 (Hair et al., 1998)	0,911	Good
RMR	<0,08; upper limit <0,1 (Arbuckle, 2005)	0,049	Good
RMSEA	<0,08; upper limit <0,1 (Arbuckle, 2005)	0,184	Not quite Good
INCREMENTAL FIT			
AGFI	>0,8 (Sharma, 1996)	0,792	Good
CFI	>0,9 (Hair et al., 1998)	0,642	Not quite Good
PARSIMONIOUS FIT			
CMIN/DF	1 – 2 over fit 2-5 liberal limit (Arbuckle, 2005)	17,1	Not quite good

Hypothesis testing about the influence of leadership to social capital and the influence of social capital to performance is based on the existence of significant path in the research model. If there is a significant path, the related hypothesis is supported.

Table 4
Hypothesis Testing Result

		STATEMENT	β	SE	CR	p	Description
H1		Leader's transformational leadership has positive influence to employee's relational dimension of social capital	0.291	0.05	5.854	< 0,01	Supported
H2		Leader's transactional leadership has positive influence to employee's structural dimension of social capital	-0.266	0.057	-4.68	< 0,01	Not Supported
H3		Structural dimension of employee's social capital has positive influence to employee's in-role performance.	0.376	0.049	7.701	< 0,01	Supported
H4		Relational dimension of employee's social capital has positive influence to employee's extra-role performance.	0.333	0.059	5.696	< 0,01	Supported
H5		Extra role performance has positive influence to in role performance	0.299	0.047	6.294	< 0,01	Supported

Discussion
1. Leadership and social capital
This research found that transformational leadership has positive influence to relational dimension of social capital. It means the higher the transformational leadership, the higher the relational dimension of social capital. Leader's transformational behavior will be able to make employees to trust one to another. It happens because a transformational leader gives a shared vision, so each employee will have the same purpose and togetherness, which will raise inter-employee trust (Pillai et al., 1999).

Contrary to hypotheses, this research found negative relationship of transactional leadership to structural dimension of social capital. It means, when the leaders stresses on reward and punishment, this may ruin employee's structural dimension of social capital.

2. Social capital and performance
This research found that structural dimension of social capital has positive influence to in-role. Employee with high structural dimension of social capital will have good social interaction with his/her co-workers. The social interaction will enable the employee to share access to wider

information sources, so it will increase the quality, relevance, and accuracy for information needed to support employee's performance (Nahapiet & Ghoshal, 1998). This finding consistent with Wayne et al. (1997) who found that employee interaction will enable him/her support each other, give feedback, and share resources, so he/she have the chance to work better, besides they can support their co-workers.

This research found that relational dimension of social capital has positive influence to extra-role performance. So, this finding supports previous research in this field. This research finding supports social resource theory (Lin, 1982 as quoted by Lin, 1999) which states that there are resources available in a social network. Employee who has good relation with his/her co-workers will be able to use those resources, so he/she will achieve higher in-role performance. This happens since everyone has certain limitations, so he/she will need support from co-workers to support him/her. Besides that, the network owned by an employee also enable him/her help one to another, so his/her extra-role performance will also be good.

This research found that extra role performance has positive influence to in-role performance. When employees are willing to work with his/her friends, there will be a helping behavior climate which will enable every employee to do his/her work better.

Conclusion

This research found several findings. First, transformational leadership has positive influence to relational dimension of social capital. Second, transactional leadership has negative influence to structural dimension of social capital. Third, relational dimension of social capital has positive influence to extra role performance. Fourth, structural dimension of social capital has positive influence to in role performance. Fifth, extra role performance has positive influence to in role performance.

REPLICATING HOFSTEDE'S CULTURAL FRAMEWORK ON INDONESIA'S FIVE MAJOR ETHNIC GROUPS

Suharnomo, Universitas Diponegoro, Indonesia

Abstract

This study aims to investigate in-country cultural differences and similarities by implementing Hofstede's four dimensions of national culture. Indonesia, the fourth most populated country in the world, consists of thousands of ethnic groups and hundreds of local languages that influence the cultural variations within the country. To understand Indonesia's cultural values, the varieties of culture among ethnic groups must be acknowledged. This research used survey method comprising 699 respondents from five major ethnic groups: Javanese, Sundanese, Batak, Minangkabau, and Chinese-Indonesian. The findings of this study showed that there were differences among the observed ethnic groups, which can be traced by the socio-cultural factors of each group. In this regard, future research should be conducted with cultural variations in mind.

Keywords: *cultural differences, cultural values, cultural variations, ethnic groups, national culture*

Introduction

1. Background

Understanding cultural differences is essential for persons working in a multicultural environment to improve intercultural competence (Matveev & Milter, 2004). This is particularly true to the case of Indonesia. As a country that consists of 31 major ethnic groups, there are cultural variations that need to be acknowledged.

In an attempt to compare one culture to another, prior studies proposed many analytical frameworks on cultural differences (Hofstede, 1980; Trompenaars & Hampden-Turner, 1998). Of most-used available frameworks, Hofstede's (1980) four dimensions of national culture performed the most comprehensive in describing differences among countries (Schuler & Rogovsky, 1998; Shackleton & Ali, 1990; Triandis, 1982).

According to Hofstede (1980; 2010), Indonesia is a country in which the society upholds great tolerance toward inequality of a power (large power distance). It tends to accept uncertainty (weak uncertainty avoidance), preference not to chase career, money and assertiveness (low masculine), and collectivist value.

The Hofstede's findings are seemingly accurate in describing typical Indonesian's values. However, it does not fully reflect all 31 Indonesian major ethnic groups (from thousands of smaller ethnic groups) and hundreds of local languages and traditions. On the other hand, there is also a tendency from Hofstede to present Javanese culture and values as Indonesia in general. The evidence can be observed in his publications in Hofstede (1982) and Hofstede, Hofstede, & Minkov (2010).

Based on this consideration, this study argued that careful approach was needed to understand Indonesia's vast cultural variations. By focusing on utilizing Hofstede's four main dimensions on the indigenous group level in Indonesia, this study is to answer the following questions: (1) how ethnic groups will differ from one another? (2) to what extent did the national cultural framework meaningfully describe in-country values differences?

The study seeks to answer the questions by implementing Hofstede's national culture dimensions on five major Indonesian ethnic groups, namely Javanese, Sundanese, Bataknese, Minangkabau, and Chinese-Indonesian.

Javanese

The Javanese is one of the largest ethnics who lived in Indonesia with a population about 40.22 percent of the Indonesian population. They lived in an environment that had strong culture. It starts from pregnancy until death. Although they do not reside in Java Island, they still hold the culture as "ugeman" or reference in that life. Many literatures that explained the Javanese have diversity of characteristics, cultures, and traditions such as Jong (1976), Koentjaraningrat (1984), Magnis (2001), and Mulder (1983).

The Javanese well known with politeness, shy, likes to hide feelings, and keep on ethics. As revealed by Magnis (2001) in his book entitled Ethics of Java, the uniqueness of the values in the culture of Java is its plastic without reduction from the value of authenticity. In marketing activities, there is the concept that in attaining victory without demeaning others and to achieve something not necessarily with exceptional strength or the completeness of the facility.

Now, philosophies of Javanese often overlooked, whereas it could be developed and disseminated in business institutions included in the work ethic. As another example, in the puppet *Semar* there are lessons that can be drawn to the science of services. *Semar* could serve the boss well and respected by his opponents. *Semar* is not high-minded, despite having a tremendous weapon. As a god who has great strength, he still has the values of a good serve (Setyodarmodjo, 2007).

Sundanese

Sundanese is the second largest ethnic group in Indonesia after the Javanese, about 15.5 percent of the total population in Indonesia. Sundanese has some similarities with the Javanese. They respect older people, have a collectivist character, and comfort in stable and predictable conditions. However, there is something that distinguishes them from the Javanese, especially in the religious activities, the Sundanese generally can be said as more devout.

Minangkabau

Minangkabau ethnic have matriarchate characteristics, which means the woman is someone who plays an important role within the family. Therefore, Minangkabau people are also known as matrilineal ones. The majority of Minangkabau people is from West Sumatra, about 2.73 percent of the overall population in Indonesia. The men are used to leave the home, go to another city after they graduate from the college or high school, in order to search for a better life. In another city, most of them become entrepreneurs. Although these men are happy to go to another city, they will not forget his hometown and the family.

Batak

Differ to the ethnic of Minangkabau, Batak known as Patriarchal ethnic. Men play an important role within the family. A small family should have at least one man to carry the family names. The majority of Batak ethnic is located in North Sumatra which has the population about 3.58 percent of the overall population in Indonesia. Batak is also known as indigenous that often go to another city to find out the better life.

Chinese-Indonesian

Chinese-Indonesian people are Chinese's migrants who initially entered via trade and have been recognized to be part of ethnic groups in Indonesia according to act number 12/2006 on Republic of Indonesia. The ethnic of Chinese is known to have a tendency like trade or become entrepreneurs. The proof is that, although few in number, only about 1.2% of the total population of Indonesia, Chinese dominate the top of the richest persons in Indonesia (Forbes, 2011).

Chinese-Indonesian has a tendency to do entrepreneurial or trade activities. In conducting its business, they help each other. For example, if a store does not have the items that requested by the customer, the store owner will try to find items in another store, so that customers do not feel disappointed. If impossible, then the store owner will provide a reference to customer to go to another store from the same ethnic. Chinese-Indonesians are recognized to have a tendency to look for material success.

Hofstede's Four Dimensions of National Culture

1. Power Distance

Power distance is defined as the degree to which people with less power or social status expect and accept that power is distributed unequally (Hofstede, 1980; Hofstede et al., 2010). This dimension refers deals with the fact that all individuals in societies are not equal – it expresses the attitude of the culture towards these inequalities among people.

In countries with large power distance, the relationship between bosses and subordinates is like a family. Boss plays a role as a father figure for his or her subordinates. In this society, decisions are made centrally from top management. To maintain the harmony in the workplace, disagreements and arguments is avoided.

2. Individualism vs. Collectivism

Individualism vs. Collectivism deals with the degree of interdependence a society maintains among its members. It has to do with whether people's self-image is defined in terms of "I" or "We." In Individualist societies, people are supposed to look after themselves and their direct family only. In Collectivist societies people belong to 'in groups' that take care of them in exchange for loyalty (Hofstede et al., 2010).

3. Masculinity vs. Femininity

A high score (Masculine) on this dimension indicates that the society will be driven by competition, achievement and success, with success being defined by the winner / best in field – a value system that starts in school and continues throughout organizational life.

A low score (Feminine) on the dimension means that the dominant values in society are caring for others and quality of life. A Feminine society is one where quality of life is the sign of success and standing out from the crowd is not admirable.

In Feminine countries the focus is on "working in order to live", managers strive for consensus, people value equality, solidarity and quality in their working lives. Conflicts are resolved by compromise and negotiation. Incentives such as free time and flexibility are favored. Focus is on well-being; status is not shown. An effective manager is a supportive one, and decision making is achieved through involvement. In contrast, Masculine countries and to an extent lower Masculine countries that do not score too low on the scale to be called Feminine countries, display the traits of the Masculine societies but in a lesser degree.

4. Uncertainty Avoidance

Uncertainty Avoidance is defined as "the extent which the members of institutions and organizations within a society feel threatened by uncertain, unknown, ambiguous, or unstructured situations" (Hofstede et al., 2010).

The dimension Uncertainty Avoidance has to do with the way that a society deals with the fact that the future can never be known. This ambiguity creates anxiety and different cultures have learnt to deal with this anxiety in different ways.

The extent to which the members of a culture feel threatened by ambiguous or unknown situations and have created beliefs and institutions that try to avoid these is reflected in the score on Uncertainty Avoidance.

Materials and Methods

1. Materials

The present study employed Hofstede's Value Survey Module 1982 (VSM 82). VSM 82 measures four dimensions, namely Power Distance, Individualism vs. Collectivism, Masculinity vs. Femininity, and Uncertainty Avoidance. Responses were made through 5-point scale and calculated using VSM 82's formulas as follows:

$$PDI = 135 - a + b - 25c \quad UAI = 300 - 40d - 30e - f \quad IDV = 76*m4 - 43*m1 + 30*m8 - 27*m13 - 29$$

$$UAI = 60*m8 - 66*m11 + 30*m6 - 39*m14 + 76$$

Information:

PDI = Power Distance Index
UAI = Uncertainty Avoidance Index
IDV = Individualism Index
MAS = Masculinity Index

2. Respondents

The respondents of this research consist of entrepreneurs and employees from five major ethnic groups in Indonesia, totaling 699 respondents residing in Central Java Province. The ethnic groups are Javanese ($n = 200$), Sundanese ($n = 149$), Padang ($n = 100$), Batak ($n = 100$), and Chinese Indonesian ($n = 150$).

Census technique was employed in the selection of the samples of this study in which members of the populations had the same opportunity as the unit of analysis. Cooper & Schindler (2001) explains that samples are elements of population, which could provide conclusions about the entire populations.

This research investigated the cultural values of 5 major ethnic groups in Indonesia using Hofstede's Value Survey Module.

Table 1
Number of Respondents by Ethnicity

Ethnic Group	N	%
Javanese	200	28.61
Sundanese	149	21.32
Batak	100	14.31
Minangkabau	100	14.31
Chinese-	150	21.46

Indonesian		
Total	699	100.00

Results and Discussions

Table 2
Cultural Values of Indonesia – Hofstede's findings

Dimensions	Score	Category
Power Distance	78	Large Power Distance
Individualism vs. Collectivism	14	Collectivist
Masculinity vs. Femininity	46	Low Masculine
Uncertainty Avoidance	48	Weak Uncertainty Avoidance

Table 3
Cultural Values of Indonesia (Averaged from Each Ethnicities)

Dimensions	Score	Category
Power Distance	64	Large Power Distance
Individualism vs. Collectivism	35	Collectivist
Masculinity vs. Femininity	54	Low Masculine
Uncertainty Avoidance	47	Weak Uncertainty Avoidance

Indonesia Scores Comparison
Exhibit 1: Comparison between Indonesia Score and Hofstede's Score

Table 2 shows Indonesia in Hofstede's findings, whilst Table 3 shows the average score of this study. Looking into Exhibit 1, it can be seen that in this study, Indonesia is a country that is large on power distance (64), collectivist (35), low in masculine (54), and has preference toward avoiding uncertainty (47).

Closer Investigation on Ethnicity Level
On this section, analysis on each ethnic group will be discussed. It will also discuss each ethnic groups' scores in relation to socio-cultural factors that is experienced by each of the ethnic groups. To contrast the scores of each ethnic group, comparison to the average score of this study is also conducted.

Table 4
Cultural Values by Ethnicity

Ethnic Group	Dimensions			
	PDI	**IDV**	**MAS**	**UAI**
Javanese	61	28	42	44
Sundanese	**54**	32	53	42
Batak	**74**	**27**	**72**	**21**
Minangkabau	66	**52**	**39**	61
Chinese-Indonesian	64	38	63	**68**
Indonesia (Average)	**64**	**35**	**54**	**47**
Indonesia (Hofstede's Version)	**78**	**14**	**46**	**48**

Table 4 shows the cultural values of each ethnic group. From the table, it can be seen that each ethnic groups demonstrate some similarities with Hofstede's score.

Javanese

Table 5
Javanese Cultural Values

Dimensions	Javanese		Indonesia	
	Score	**Category**	**Score**	**Category**
Power Distance	61	Large PD	64	Large PD
Individualism vs. Collectivism	28	Collectivist	35	Collectivist
Masculinity vs. Femininity	42	Low Mas	54	Low Mas
Uncertainty Avoidance	44	Weak UA	47	Weak UA

Table 5 shows the cultural values of Javanese ethnic group. From the table, it can be seen that Javanese is categorized as having large power distance (62), collectivist (28), low masculine (42), and weak uncertainty avoidance. Compared to the average score of this study, Javanese has similar results and is in the same categories on every dimension.

Sundanese

Table 6
Sundanese Cultural Values

Dimensions	Sundanese		Indonesia	
	Score	**Category**	**Score**	**Category**
Power Distance	**54**	**Intermediate**	64	Large PD
Individualism vs. Collectivism	32	Collectivist	35	Collectivist
Masculinity vs. Femininity	53	Low Mas	54	Low Mas
Uncertainty Avoidance	42	Weak UA	47	Weak UA

Table 6 shows the cultural values of Sundanese ethnic group. From the table, it can be seen that Sundanese is categorized as a society which is in intermediate level of power distance (54), collectivist (32), low masculine (53), and weak uncertainty avoidance (42). Compared to the average score of this study (Indonesia), Sundanese has very similar scores on three dimensions: Individualism vs. Collectivism, Masculinity vs. Femininity, and Uncertainty Avoidance. With slightly lower score on Power Distance, Sundanese people tend to be more equal. The need to respect elderly and people with social status is still there but it is not as strong as the other ethnicities. The result also indicates that Sundanese almost shares the same category as the average score of Indonesia with only Power Distance dimension that differs.

Batak

Table 7
Batak Cultural Values

Dimensions	Batak		Indonesia	
	Score	**Category**	**Score**	**Category**
Power Distance	74	Large PD	64	Large PD
Individualism vs. Collectivism	27	Collectivist	35	Collectivist
Masculinity vs. Femininity	**72**	**Masculine**	54	Feminine
Uncertainty Avoidance	21	Weak UA	47	Weak UA

Table 7 shows the cultural values of Batak ethnic group. As can be seen on the table, Batak is characterized as a society which is large on power distance (74), collectivist (27), masculine (72), and weak uncertainty avoidance (21). Power Distance score of 74 indicates that Batak is a more hierarchical society compared to the average score of Indonesia. It is also in the category of masculine society compared to low masculine on the average score, meaning Batak people tend to be more open to competition and strive for the best. Compared to the average score of Indonesia, Batak is more masculine than any other Indonesians.

Minangkabau

Table 8
Minangkabau Cultural Values

Dimensions	Minangkabau		Indonesia	
	Score	Category	Score	Category
Power Distance	66	Large PD	64	Large PD
Individualism vs. Collectivism	**52**	**Intermediate**	35	Collectivist
Masculinity vs. Femininity	**39**	**Feminine**	54	Low Mas
Uncertainty Avoidance	**61**	**Strong UA**	47	Weak UA

Table 8 shows the cultural values of Minangkabau ethnic group. Minangkabau's score on Power Distance (66) is a high score, meaning that Minangkabau has a hierarchical society, very much the same as any other ethnic groups. On Individualism vs. Collectivism dimension, Minangkabau scored 52 which is in the intermediate level. Moreover, Minangkabau is categorized as Feminine (39) and having strong Uncertainty Avoidance. Compared to the average score of Indonesia, Minangkabau differs in most dimensions with only one similarity (PDI).

Chinese-Indonesian

Table 9
Chinese-Indonesian Cultural Values

Dimensions	Chinese-Indonesian		Indonesia	
	Score	Category	Score	Category
Power Distance	64	Large PD	64	Large PD
Individualism vs. Collectivism	38	Collectivist	35	Collectivist
Masculinity vs. Femininity	**63**	**Masculine**	54	Low Mas
Uncertainty Avoidance	**68**	**Strong UA**	47	Weak UA

Table 9 shows the cultural values of Chinese-Indonesian ethnic group. From the table, it can be seen that Chinese-Indonesian is categorized as a society that is large on power distance (64), collectivist (34), masculine (63), and strong uncertainty avoidance (68). Compared to the average score, Chinese-Indonesian is more masculine and has strong uncertainty avoidance.

Discussion
The results of this study indicated interesting facts to be discussed. Firstly, the average score of this study show similarity on all dimensions as Hofstede's findings. Hofstede argues that culture tends to remain the same over time. At the same time, the similarities were also found in the results of Javanese. These findings provide support to the allegation made by Perdhana (2015) stating that Hofstede used Javanese to describe Indonesia.

Secondly, the results varied when the analysis was on the ethnic group level. On Power Distance dimension, almost all ethnic groups are categorized as having large power distance. Only Sundanese scored on an intermediate level. This means in most culture in Indonesia, respect for parents and older relatives is a basic and lifelong virtue.

On Individualism vs. Collectivism dimension, almost all ethnic groups are categorized as collectivist societies. The scores, however, are higher compared to Hofstede's version (14). This might indicate that Indonesians are not as collectivist as they were 35 years ago when Hofstede obtained the result. What is interesting is Minangkabau with score 52. This score indicates that Minangkabau is an individualist society. The tendency to go outside homegrown perhaps makes Minangkabau people have more individualistic nature to be successful in their new place.

On Masculinity vs. Femininity dimension, the results varied. Two ethnic groups are categorized as low masculine: Javanese (42) and Sundanese (53); two ethnic groups are categorized as masculine: Batak (72) and Chinese-Indonesian (63); and Minangkabau is categorized as feminine. The varieties of results showed that there are different preferences among the ethnic groups.

Lastly, Uncertainty Avoidance dimension. The results also varied. Two ethnic groups are categorized as having weak uncertainty avoidance: Javanese (44) and Sundanese (42); two ethnic groups are categorized as having strong uncertainty avoidance: Minangkabau (61) and Chinese-Indonesian (68); and Batak is categorized as low uncertainty avoidance. Chinese-Indonesian is the most uncertainty avoiding culture compared to the rest. This is often attributed to the long history of discrimination that Chinese-Indonesian has had to endure. Under these circumstances, Chinese-Indonesians learned to avoid the discrimination by being entrepreneurs or work for themselves rather than work for someone else.

Conclusions

This study was conducted to answer the following questions:

- How ethnic groups will differ from one another?
- To what extent did the national cultural framework meaningfully describe in-country cultural differences?

The present study employed Hofstede's VSM 82 in order to make cultural comparisons among ethnic groups in Indonesia. The results of the study indicated that there are cultural differences among ethnic groups in Indonesia. These differences create distinctive characteristics among them, which can be traced from their past historical experiences they have endured. In this regard, we argue that Hofstede's cultural framework can meaningfully describe in-country cultural differences. Attention should be paid on the cultural variations within a country to avoid generalizations.

THE EFFECT OF LOCALLY-GENERATED REVENUE AND FISCAL TRANSFER FROM CENTRAL TO REGION FUNDS ON POVERTY WITH INTERVENING VARIABLES CAPITAL EXPENDITURES AND ECONOMIC GROWTH OF REGENCY/CITY IN THE EAST KALIMANTAN PROVINCE

Dody Hapsoro, STIE YKPN, Indonesia
Muhammad Jibril Al-Rasyid, STIE YKPN, Indonesia

Abstract

This study aimed to examine the effect of locally generated revenue and fiscal transfer from central to region fund on poverty with intervening variable capital expenditure and economic growth of the regency/city in East Kalimantan Province. Data source used are secondary data from reports on realization of local government budget, which contains data on the realization of locally generated revenue, fiscal transfer from central to region funds, capital expenditure budget, economic growth and poverty that was obtained from Central Bureau of Statistics in Yogyakarta from 2006 up to the year 2012. The data analysis technique used is Partial Least Square (PLS). The research results showed that 1) Locally generated revenue negative and no significant effect on capital expenditures regency/city in East Kalimantan Province; 2) Revenue-sharing fund is positive and significant effect on capital expenditures regency/city in East Kalimantan Province; 3) The general allocation fund doesn't have any significant positive effect on capital expenditures regency/city in East Kalimantan Province; 4) The special allocation fund also doesn't have any significant positive effect on capital expenditures regency/city in East Kalimantan Province; 5) The capital expenditure significantly had positive effect on the economic growth of the regency/city in East Kalimantan Province; 6) Economic growth also has a negative and significant effect on poverty regency/city in East Kalimantan Province.

Introduction

The reforms implemented since 1998 in Indonesia has made political and administrative changes. One form of such reform is the change in the government bureaucracy that previously centralized to decentralized government bureaucracy. Based on these changes issued Act No. 22 of 1999 on Regional Government (Pemerintahan Daerah) and Act No. 25 of 1999 on Fiscal Balance between Central Government and Local Government (Perimbangan Keuangan antara Pemerintah Pusat dan Daerah) which subsequently converted into Act No. 32 of 2004 on Regional Government and Act No. 33 of 2004 on Fiscal Balance between Central Government and Local Government. Then Act No. 32 of 2004 on Regional Government replaced by Act No. 23 of 2014. Based on these Acts, regions were given broad authority to manage their own household with a little help from the central government. The local government has the broad right and authority to use the financial resources of its accordance with the needs and aspirations of societies that flourished in the region.

In Act No. 33 of 2004 on Fiscal Balance between Central Government and Local Government stated that one of the local revenue is Fiscal Transfer from Central to Region Fund (Dana Perimbangan/DP) which consists of Revenue-Sharing Fund (Dana Bagi Hasil/DBH), General Allocation Fund (Dana Alokasi Umum/DAU), and Special Allocation Fund (Dana Alokasi Khusus/DAK). DBH is divided into two, namely the tax DBH and non-tax DBH/resources DBH. DAU aims to equalize fiscal capacity among regions that are intended to reduce imbalances financial capabilities between the regions through the application of a formula that takes into

account the needs and potential of the region. DAK is intended to help finance specific activities in specific regions that are regional affairs and in accordance with national priorities, specifically to finance infrastructure and basic public services that have not reached a certain standard to accelerate regional development. DBH is a fund sourced from State Budget (Anggaran Pendapatan dan Belanja Negara/APBN) allocated to regions based on the certain percentage to finance the needs of the region in the implementation of decentralization.

Theoretical Basis

Agency theory has been widely used, both in the private sector and the public sector. Agency theory is used to analyze the relationship between principal and agent in relation to public sector budgeting (Abdullah, 2012). Agency theory analyzing the contractual arrangement between two or more individuals, groups or organizations. Principals make a contract, either implicitly or explicitly with the agent in the hope that the agency will act/perform the work as desired by principal (Jensen and Meckling, 1976).

Accounting theory has a close connection with financial accounting, especially financial reporting to external parties. A theory needs to be supported by a variety of research in which there are hypotheses verifiable. According to Mardiasmo (2004), the theory has three basic characteristics, namely: (1) The ability to describe or explain the phenomena, (2) The ability to predict the phenomena, (3) The ability to control the phenomena.

According to Badrudin (2011), most regencies/cities in Indonesia depend on the source of regional income from DP that come from APBN allocated to the regions to finance the needs of the region in the implementation of decentralization. DP as stipulated in Act No. 33 of 2004 includes DBH, DAU, and DAK. The three component of DP is a trilogy that can not be separated from one another because all three objectives are complementary or the so-called DP trilogy (Badrudin, 2013).

According to Halim (2002: 4), capital expenditure (Belanja Modal/BM) is a form of investment in the form of BM that benefit more than one year. As a form of public sector investment, BM focused on government policies with varying time dimension.

According to Todaro and Smith (2006), the development process has at least three core objectives: 1) Increase the availability of and expansion of the distribution of basic necessities of life, 2) Improvement of living standards, and 3) Expansion of choices economically and socially.

According to Todaro and Smith (2006), economic growth (pertumbuhan ekonomi/PE) is the increase in long-term capacity of countries to provide a wide range of economic goods to its citizens. The increase in capacity is determined by the progress or technological adjustment, institutional, and ideological to the demands of the existing situation.

According to Suharto (2006: 3), the welfare of society, including as a process or a concerted effort undertaken by individuals, social institutions, communities and government agencies to improve the quality of life through the provision of social services and social security benefits.

According to Suud (2006: 5), the welfare of society is prosperous condition of a society. Public welfare includes health, economic situation, happiness and quality of life of the people.

Todaro and Smith (2006: 61) states that the poverty level in a country is determined by two main things: 1) The level of the average national income and 2) Wide-narrow gap in income distribution. So, however high levels of per capita national income of a country, as long as the uneven distribution of income, poverty levels in the country remains poor.

Hypothesis Development
The authority of local governments to carry out its policies as an autonomous region is strongly influenced by the region's ability to generate local revenue. The greater the locally generated revenue (PAD) is received, the greater the authority of the local governments in implementing the policy of autonomy. Research conducted by Darwanto and Yustikasari (2007) succeeded in proving that the PAD variable positively effect on BM budget allocation. If the local government wants to increase BM for public services and the welfare of the community, the local government should dig PAD profusely. Based on the above explanation, can be formulated the following hypotheses:

H1: The locally generated revenue positively effect on regency/city capital expenditures in East Kalimantan Province.

In Act No. 33 of 2004 on Fiscal Balance between Central Government and Local Government mentioned that DBH consists of Tax-DBH and Non-Tax DBH (Natural Resources). DBH is a fund sourced from APBN allocated to regions based on the certain percentage to finance the needs of the region in the implementation of decentralization. Research results of Siregar (2013) further strengthen the empirical evidence that DBH positively effect on BM. Based on the above explanation, can be formulated the following hypotheses:

H2: The revenue-sharing fund positively effect on regency/city capital expenditures in East Kalimantan Province.

The DAU is fund derived from the APBN allocated for the purpose of financial equalization between regions to finance expenditure needs in the context of decentralization. The DAU is a consequence of the transfer of power from central government to local governments. Research conducted by Darwanto and Yustikasari (2007) succeeded in proving that the DAU variable positively effect on BM budget allocation. This provides strong indications that the region expenditure behavior of particular regions of BM will be greatly influenced by the source of the DAU. This is due to an area that has a large amount of DAU, the allocation for regional budget (BM) will also increase. Based on the above explanation, can be formulated the following hypotheses:

H3: The general allocation fund positively effect on regency/city capital expenditures in East Kalimantan Province.

DP is the embodiment of the financial relationship between central and local government. One form/type of DP is a DAK. DAK is a fund sourced from APBN and allocated to local governments to finance the special activities of regional affairs and national priorities. Research conducted by Situngkir (2009) indicate that the DAK positively and significant effect on the BM budget. This indicates that there is a relationship between the DAK with a budget allocation of regional spending through BM. Based on the above explanation, can be formulated the following hypotheses:

H4: The special allocation fund positively effect on the regency/city capital expenditure in East Kalimantan Province.

Government spending in the form of BM is based on facilities and infrastructure needs, both for the smooth implementation of the tasks for the government and public facilities such as land, equipment and machinery, buildings, roads, irrigation, networks and other fixed assets. Sularso and Restianto (2011) showed that BM has positive effect on PE, so that the allocated budget can

be a stimulus to the economy. Based on the above explanation, can be formulated the following hypotheses:

H5: The capital expenditures positively effect on the regency/city economic growth in East Kalimantan Province.

Sukirno (2012) explains that PE is the development of the activity in the economy that led to the goods and services produced in the community increases. The main factors affecting the growth and development of a country is a wealth of natural resources and land, the quantity and quality of labor, capital goods available, the technology used, the social system and community attitudes. Suparmoko (2004) suggests that the relationship between poverty and 5
PE showed a negative relationship. PE without being followed by the equalization of income will not be able to reduce the number of poor people. For that there needs to be an increase in PE is accompanied by equitable distribution of income so as to the welfare of society. Based on the above explanation, can be formulated the following hypotheses:

H6: Economic growth negatively affects the regency/city poverty in East Kalimantan Province.

Research Methods
In this study, the region that became the object of research is the whole regency/city in East Kalimantan Province. The population used in this research is the entire regency/city local government in East Kalimantan Province with a population of 11 districts and four cities in the period of 2006 to 2012. The population in this study is the district of Berau, Bulungan, Kutai Barat, Kutai Kartanegara, Kutai Timur, Mahakam Ulu, Malinau, Nunukan, Paser, Penajam Paser Utara, Tana Tidung, the city of Balikpapan, Bontang, Samarinda and Tarakan.

Sources and Research Data
The data used in this research is secondary data. The research data was sourced from the report documents the realization of local government budget (APBD) obtained from the Directorate General of Fiscal Balance Indonesian Ministry of Finance (Direktorat Jendral Perimbangan Keuangan Kementrian Keuangan Republik Indonesia) through www.djpk.depkeu.go.id period from 2006 until 2012 and the Central Bureau of Statistic (BPS) through www.bps.go.id
Local government budget

Table 1
Research Variable

No.	Variable	Variable Name	Operational Definition	Measurement
1	Exogenous	PAD	PAD is revenue earned by the county levied based on local regulations in accordance with the legislation	PAD= Local tax + Local retribution + The results of the local wealth management separated + Other legitimate PAD.

2	Exogenous	DP	DP is a fund sourced from APBN allocated to regions to fund the needs of the region in the implementation of decentralization	DP = DBH + DAU + DAK.
3	Endogenous Intervening	BM	BM is a form of investment in the form of capital expenditure as expenditure/cost/ expense for the benefit of more than one year.	Data taken from the realization of the local government budget (APBD)
4	Intervening Endogenous	PE	PE can be defined as the increase in production capacity of an economy that is realized in the form of increase in national income	The difference between the gross regional domestic product (PDRB) at present time with the PDRB at previous time divided by the PDRB at previous time.
5	Depending endogenous	Poverty	Poverty is the inability of the individual to meet minimum basic needs for a decent life.	Data taken from BPS

Data Analysis
An Overview of Research Object

East Kalimantan Province is a province that is an integral part of the Unitary State of the Republic of Indonesia (NKRI). The location of this province is on the island of Kalimantan. East Kalimantan Province is the second largest province in Indonesia with an area of 245,237.80 km2. The capital city of East Kalimantan Province is located in the city of Samarinda.

Table 2
Descriptive Analysis

	Locally Generated Revenue (in millions)	Revenue Sharing Fund (in millions)	General Allocation Fund (in millions)	Special Allocation Funds (in millions)	Capital Expenditure (in millions)	Economic Growth (%)	Poverty (%)
Mean	86.147	990.144	203.989	22.864	572.972	73,29	11,05
Minimum	12.334	325.690	1.365	1.241	67.845	1,83	3,3
Maximum	352.034	5.097.976	557.697	91.576	1.817.067	253,98	24,57

Based on Table 4.1 it appears that the PAD variable had an average for all regencies/cities in East Kalimantan Province per six years of Rp86.147.976.358. Lowest PAD shown by the Kutai Timur Regency in 2006 amounted Rp12.334.740.000 and the number of PAD was highest in Balikpapan City in 2012 amounted Rp352.034.256.557. PAD describes the ability of the regency/city in East Kalimantan Province to explore the available potencies to increase local revenue to realize the PAD planned to finance the needs of the region in order to achieve the welfare of society.

Based on Table 4.1 it appears that the DBH variable had an average for all regencies/cities in East Kalimantan Province per six years of Rp990.144.547.032. Lowest DBH shown by Tana Tidung Regency in 2009 amounted Rp325.690.420.426 and DBH number is highest in Kutai Regency in 2012 amounted Rp5.097.976.867.896.

Based on Table 4.1 it appears that the DAU variable has average for all regencies/cities in East Kalimantan Province per six years of Rp203.989.353.620. Lowest DAU shown by Kutai Regency in 2011 amounted Rp1.365.820.000 and DAU number is highest in Malinau in 2012 amounted Rp557.697.933.000.

Based on Table 4.1 it appears that the DAK variable has average for all regencies/cities in East Kalimantan Province per six years of Rp22.864.523.611. Lowest DAK shown by Penajam Paser Utara Regency in 2012 amounted Rp1.241.022.000 and the DAK number is highest in Nunukan in 2007 amounted Rp91.576.892.000.

Based on Table 4.1 it appears that the BM variable had average for all regencies/cities in East Kalimantan Province per six years of Rp572.972.025.560. Lowest BM shown by Tana Tidung Regency in 2009 amounted Rp67.845.468.210 and amount of BM was highest in Kutai Regency in 2012 amounted Rp1.817.067.377.318.

Based on Table 4.1 it appears that economic growth variable has average for all regencies/cities in East Kalimantan Province per six-year high of 73.29%. Lowest economic growth shown by Tana Tidung Regency in 2009 was 1.83% and total economic growth was highest in Bontang City in 2006 amounted to 253.98%.

Based on Table 4.1 it appears that poverty variables had an average for all regencies/cities in East Kalimantan Province per six-year high of 73.29%. Lowest poverty shown by the City of Samarinda in 2012 amounted to 3.3% and the number of poverty is highest in Malinau Regency in 2008 amounted to 24.57%.

Inductive Analysis with Partial Least Square (PLS)
In this study was not done testing outer models covering validity test and reliability test because the data used in this study was measured data. Goodness of fit inner models in PLS analysis using size Stone-Geisser Q-Square test in the form of Q-Square predictive relevance value 8

which is calculated based on the value of R2 each endogenous variable, that is BM variable obtained RBM2 value of 0.64; economic growth variables obtained RPE2 value of 0.03; and public welfare variables obtained RK2 value of 0.31. Thus, the value of the Q-Square predictive relevance is:

Q2 = 1 - (1 - RBM2) (1 - RPE2) (1 - RK2)
= 1 - (1 - 0.64) (1 - 0.03) (1 - 0.31)
= 1 - (0.36) (0.97) (0.69)
= 1 – 0,24
= 0.76

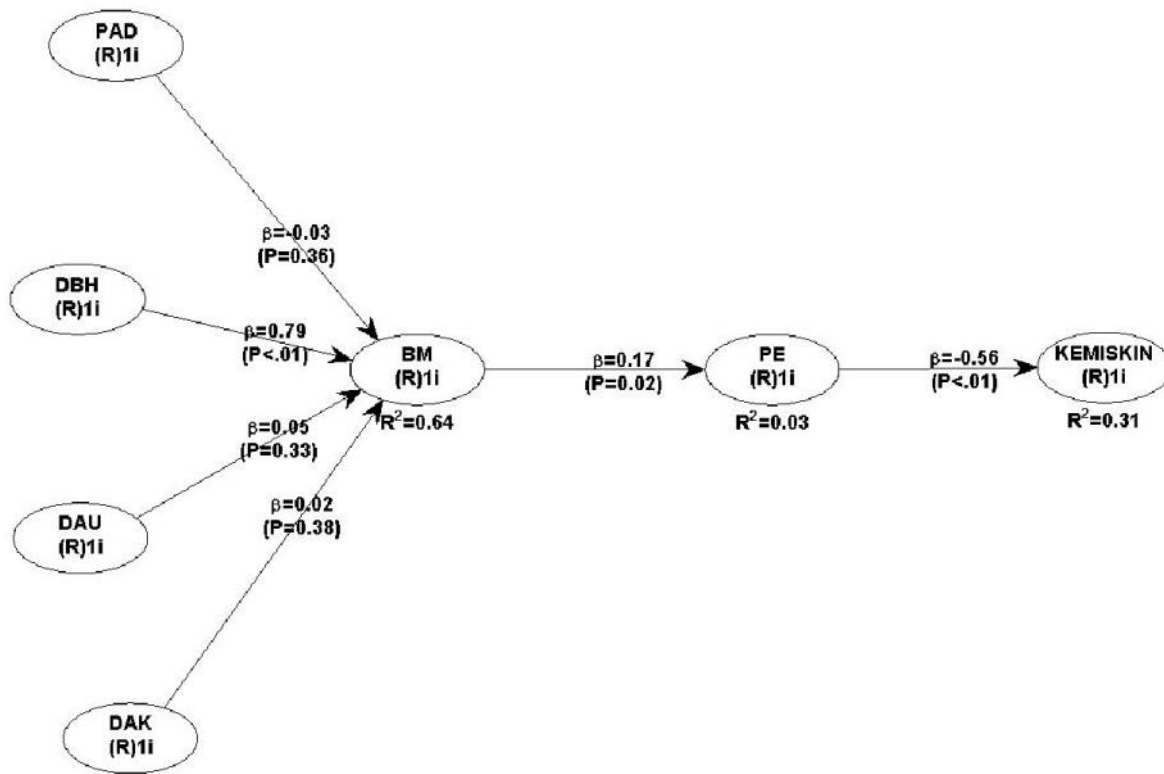
Based on these calculations, obtained the value of the Q-Square predictive relevance of 0.76 or 76%, so the model is said to have a strong predictive value because variables in the model that includes PAD, DP, and economic growth variables was able to explain the poverty variable by 76 %, while the remaining 24% is a variation of other variables outside the model.


Figure 1. Output Results of the PLS Hypothesis Testing

Results And Discussion
1. PAD positively effect on regency/city capital expenditures in East Kalimantan Province
The analysis showed that the PAD is not positively effect on regency/city BM in East Kalimantan Province (β = -0.03; p > 0.05). The first hypothesis in this study is the PAD positively effect on the regency/city BM in East Kalimantan Province. The results showed that PAD negative and no significant effect on regency/city BM in East Kalimantan Province, so that the hypothesis is not supported. This was due to PAD in East Kalimantan Province not only for BM allocation but also used for operational expenditures and expenditures for goods and services so that local governments have not been able to allocate PAD on BM effectively. Halim (2002) states that when the local government respond more BM comes from central government transfers than PAD owned by local government, so-called phenomenon of flypaper.

2. Revenue-sharing fund positively effect on regency/city capital expenditures in East Kalimantan Province
The analysis showed that the DBH positively effect on regency/city BM in East Kalimantan Province (β = 0.79; p < 0.05). The second hypothesis in this study is DBH positively effect on the regency/city BM in East Kalimantan Province. The results showed that DBH positively and significant effect on regency/city BM in East Kalimantan Province, so the hypothesis is supported. This is because when the DBH is divided into regions evenly increased, then the government's BM incurred for development also increased. The central government had divided DBH on target to regions in need.

The second hypothesis test results in this study support the results of research Wandira (2013) which showed that DBH has a significant positive effect on BM. The other study was conducted by Siregar (2013) also concluded the same thing, namely DBH positively effect on BM. 10

3. The general allocation fund positively effect on regency/city capital expenditures in East Kalimantan Province

The analysis showed that the DAU positively and not significant effect on regency/city BM in East Kalimantan Province ($\beta = 0.05$; $p > 0.05$). The third hypothesis in this study is the DAU positively effect on regency/city BM in East Kalimantan Province. The results showed that the DAU positively effect and not significant to regency/city BM in East Kalimantan Province, so that the hypothesis is not supported. This is due to the increased DAU is not accompanied by an increase in BM in the government of East Kalimantan Province. In addition, it also caused the nominal amount of DAU received from the central government is smaller than the nominal DBH. Nominal DAU only amounted Rp203.989.353.620 compared with a nominal DBH reached Rp990.144.547.032. DAU in East Kalimantan Province not only for BM, but also used for personnel expenditure. The third hypothesis test results in this study support the results of Syafitri research (2009) which shows that the DAU does not affect the allocation of BM.

4. The special allocation fund positively effect on regency/city capital expenditure in East Kalimantan Province

The analysis showed that the DAK no positively effect on regency/city BM in East Kalimantan Province ($\beta = 0.02$; $p > 0.05$). The fourth hypothesis in this study is DAK positively effect on regency/city BM in East Kalimantan Province. The results showed that the DAK positively and not significant effect on regency/city BM in East Kalimantan Province, so that the hypothesis is not supported. This is due to the increased of DAK not accompanied by an increase in BM in the government of East Kalimantan Province. This is because the DAK in the East Kalimantan Province not necessarily exist in every year or unsustainable. For example, this year local governments have funds from the central government to repair roads damaged, but in the following year the local government does not necessarily have the funds from the central government to continue the improvement of roads are damaged. Therefore, the local government has not been able to allocate DAK for BM evenly.

The fourth hypothesis test results in this study supports the results of Santosa and Rofiq research (2013) which shows that DAK has no significant effect on BM. 11

5. The capital expenditure positively effect on the regency/city economic growth in East Kalimantan Province

The analysis showed that BM positively effect on the regency/city economic growth in East Kalimantan Province ($\beta = 0.17$; $p < 0.05$). The fifth hypothesis of this study is BM positively effect on the regency/city economic growth in East Kalimantan Province. The study results showed that BM positively significant effect on the regency/city economic growth in East Kalimantan Province, so the hypothesis is supported. In other words, the increase in BM will be followed by an increase in economic growth.

The results of the fifth hypothesis testing in this study supports the results of Sularso and Restianto research (2011) which showed that BM positively effect on economic growth. The other study was conducted by Zasriati (2015) also concluded the same thing, that is BM positively significant effect on economic growth.

6. Economic growth negatively affect the regencies/cities poverty in East Kalimantan Province

The analysis showed that the economic growth negatively effect on the regency/city poverty in East Kalimantan Province (β = -0.56; $p < 0.05$). The sixth hypothesis in this study is the economic growth negatively effect on the regency/city poverty in East Kalimantan Province. The results showed that the economic growth negatively effect on the regency/city poverty in East Kalimantan Province, so the hypothesis is supported. It shows that economic growth results in poverty reduction. Economic growth also resulted in an increase in the welfare of society. This is because the economic growth effect on increasing the availability of field jobs that the unemployment rate declined.

The results of the sixth hypothesis testing in this study correspond to Suparmoko statement (2004) that poverty is negatively correlated with economic growth. However, economic growth without being followed by the equalization of income will not be able to reduce the number of poor people. Therefore, it is necessary to increase economic growth at the same time accompanied by equal distribution of income, so as to improve the welfare of the community. 12

Conclusion

The conclusions that can be drawn from this study are:

1. The PAD is negative and not significant effect on the BM of the regency/city in East Kalimantan Province. This indicates that the PAD has not been able to affect BM in East Kalimantan Province, as local governments have not been able to allocate PAD on BM effectively.

2. The DBH is positive and significant effect on the BM of the regency/city in East Kalimantan Province. This indicates that the DBH affect BM in East Kalimantan Province because when DBH is divided into areas evenly increased, then the BM incurred for the development of local governments also increased. The central government has divided DBH appropriately targeted to regions in need.

3. The DAU is positive and not significant effect on the BM of the regency/city in East Kalimantan Province. This shows that the DAU has not been able to affect BM in East Kalimantan Province, due to increased DAU is not accompanied by an increase in BM in East Kalimantan Province.

4. The DAK is positive and not significant effect on the BM of the regency/city in East Kalimantan Province. This shows that DAK has not been able to affect BM in East Kalimantan Province, due to increased DAK is not accompanied by an increase in BM in East Kalimantan Province.

5. BM is positive and significant effect on the economic growth of the regency/city in East Kalimantan Province. This suggests that BM may affect economic growth in East Kalimantan Province. It also suggests that the increase in BM will increase economic growth, including through the construction of roads, building hospitals, and other public facilities.

6. Economic growth is negative and significant effect on poverty of the regency/city in East Kalimantan Province. This suggests that increasing economic growth will reduce poverty.

Limitations

This study has several limitations as follows:

1. This study only uses research area in East Kalimantan province. In other words, this study is limited to the region. This led the research applies only to regencies/cities were selected as

sample, so it has not been able to generalized to the regencies/cities in Indonesia, except in areas that have similar region and economic conditions to East Kalimantan Province.

2. The period of analysis is 2006-2012 year, so the discussion of the results is limited by the conditions that occurred during the period. Therefore, in future research needs to be extended period of time in order to obtain an overview analysis on the latest conditions that occurred in the East Kalimantan Province.

Suggestion

Suggestions for the subsequent studies are:

1. In a subsequent study is expected to add other variables which can influence the allocation of spending by the government, in order to further develop this study and its scope becomes more widespread, such as indirect spending variable.

2. This study only uses secondary data within a period of six years. Future studies are expected to increase the period of time that is longer than this study.

3. Further study is expected to develop into a larger scale, for example by adding North Kalimantan, West Kalimantan, and South Kalimantan to compare economic growth in the respective regencies/cities in each province.

THE INFLUENCE OF CITY MARKETING PERFORMANCE, AND MAYOR PERSONAL BRANDING TOWARDS TOURIST REVISIT INTENTION: THE CASE OF BANDUNG

Raden Rifqi Dwisanto, Padjadjaran University, Indonesia
Popy Rufaidah, Padjadjaran University, Indonesia

Abstract

Tourism taking important part of the city. Due to this reason, every city in the world are racing to attract more tourist to come, and revisit intention become the key for succession in this competition. Tourist revisit intention of a city determined by its city marketing performance. And someone who responsible for this activity is obviously the mayor. This study proposed that city marketing and mayor personal branding are influencing tourist revisit intention. The aim of this study is to reveal the casual relationship between city marketing performances, and mayor personal branding, towards tourist revisit invention. Based on the theoretical model, hypotheses were formulated. The primary data were collected from the respondents which consist of 250 visitors. Structural Equation Model were used to test the study hypotheses. The study result reveals that city marketing performance and mayor personal branding are influenced revisit intention. The outcomes of the study have significant managerial implications for city government.

Introduction

Tourism sector is obviously crucial in a city (Bunnag, 2014, cited in Hurriyani et al. 2015 p.19). By showing off the city's potential, each of the tourism destination within a city could improve its local economic, social and cultural aspect. In 2014, tourism sector has contribute 4,01% of the national GDP, and providing job opportunity for 10,32 million people in Indonesia (KEMENPAR, 2015, p.32). City marketing is used to alter the external perceptions of a city in order to encourage tourism, attract inward migration of residents, or enable business relocation (Balencourt and Zafra, 2012, p. 8). And nowadays every city in the world are competing to attract more tourist to come.

One of favorite city to visit by domestic and international tourist in Indonesia is Bandung (Tanjung, 2016). City marketing performance of Bandung has successfully promoting not only within domestic tourist, but also international tourist. More tourist destination and attraction in Bandung has successfully attract more than 5.877.162 domestic tourist and 183.932 international tourist. It has make this sector growth 5.87% annually (DISBUDPAR, 2015). This also have made competition in tourism more intense.

City marketing performance is also one of the parameter of successful mayor. Previous study shows that there are positive correlation between employee performance and employee personal branding (Amoako and Adjaison, 2012). It drives the mayor of Bandung, Ridwan Kamil to gain positive personal brand trough his achievement for Bandung. The current mayor personal brand also help Ridwan Kamil to be consider as someone who is able to surpass the current Jakarta Governor Basuki Tjahaja Purnama on Jakarta governor election in 2017 despite some scandalous news involving him (Perdana, 2016). Other study also found that a person who has a good personal could help a product to develop a brand by associating it with them and lead the customer to repurchase the brand or in this case, revisit the city. (Zahaf & Anderson, 2008; Shafiq *et al.,* 2011).

The combination of city marketing performance and mayor personal branding could be the key to win the tourist attention to visit. But, it is important for the tourists not only visit the city of Bandung, but intend to revisit and recommended to others (Luo et al, 2013, p. 3639) as the revisit intention is considered as a key to Defensive Marketing strategies and business success in general.

From an academic point-of-view, the current study contributes to the tourism literature by developing a Structural Equation Modeling using Partial Least Squares (SEM-PLS) to analyze the hypothesized relationships between city marketing performance, mayor personal branding, and tourist revisit intention in Bandung. It was assumed that the city marketing performance and mayor personal branding will affect tourist intention to revisit. In addition the tourist's perception about current city marketing performance of Bandung, mayor's personal branding and their revisit intention to Bandung also tested to add the existing knowledge by providing city government with a further understanding of tourist perceptions and the behaviors associated with revisit intention.

Theoretical Background
1. City Marketing
In his book Kotler and Keller explain there are 10 main types of marketers market entities which are goods, services, events, experiences, properties, organizations, information, ideas, persons, and places. (2016, p. 27). Place marketing involves regarding places as a collection of products, with their planning and marketing being guided by a strategic vision and related goals (Bramwell, 1998 cited in Metaxas, 2005 p. 49). This marketing process whereby local activities relate as closely as possible to the demands of target customers and aim to maximize the efficient social and economic functioning of the area concerned (Ashworth, 2008, p. 8).

Nowadays cities around the world has taking place marketing in bigger scale to gain strategic advantage among others cities. City marketing is different with traditional place marketing. Usually, a city do not have a marketing division to conduct the city marketing activity. City marketing is a long term process of instrument including all those different, related activities, managing policy, and city's resources (Lombarts, 2008, p. 15). To conduct city marketing activity, various stakeholders are needed to collaborate in order to create economic sustainability, social sustainability, and environmental sustainability (Rufaidah, 2007). In other research she also explain the dimension of city marketing which are Investability, city's ability to optimized its potensial and attract investor, Livability, city's ability to create opportunity so its citizen could reach their potential, and Visitability, the city ability to optimize local optimism and provide hospitality to attract more tourist (Noviana and Rufaidah, 2012, p.1278) A survey was conducted to measure mayor performance also include the city marketing performance in its indicator (BAPPEDA Kota Bandung, 2015). And other studies found positive relationship between individual performance and personal branding (Amoako and Adjaison, 2012)

2. Personal Branding
Almost everything could be branded (Keller, 2013, p.36). A brand could be a name, term, design, symbol, or any other feature that represent a product or seller (AMA, 2016) including a person. It mean that a human or personal brand could be defined as being a person, name, term, sign, symbol or design, or a combination of these, intended to identify the goods or services of one seller, or group of sellers, and to differentiate them from those of competitors (Hughes, 2008). Personal branding is about creating the externally facing identity that you as a business project (Montoya, 2002, p.14). Personal branding also reflected in every action we take and stimulates

perceptions not only our but also in audience about the values and qualities that a person stands for (Lang, 2007; Gad, 2001 cited in Ratman, 2009, p.18). In his research, Hughes had develop dimension to measure a person personal branding which are attribute, benefit, personality, and value (2008, p. 2)

A person who maintain his personal brand are likely doing great in his work performance (Amoako and Adjaison, 2012). To gain competitive edge and achieve success, an organizations needs to give top priority to the personal performance. When an individual brands himself strategically, organizational success is achieved thereby leading to career success (Amoako and Adjaison, 2012, p. 121). Other researchalso found that if a product could successfully associated with someone who has good personal brand, it would helped the product to transferring its meaning and value toward the customer and lead to repurchase behavior (Zahaf & Anderson, 2008; Shafiq *et al.,* 2011) (Zahaf & Anderson, 2008; Shafiq *et al.,* 2011)

3. Revisit Intention

Understanding the concept of revisit intention is fundamental for destination managers because some argue that the degree of tourists' loyalty to a destination is reflected in their intentions to revisit the destination. (Chi & Qu 2008, p.625). Revisit intention is the willingness to recommend, in the sense that the tourists express willingness to revisit a destination and make recommendation to their friends because they have satisfactory travel experience and this satisfactory experience brings about word-of-mouth marketing and customer loyally (Ajzen and Driver, 1992, pp.209-210; Robertson and Regula, 1994, p. 175). Past research also found that revisit intention come from evaluating past experience traveling the tourists would like to go back to the recreation area again willingly (Baker and Crompton, 2000, p.799). In their research Ajzen and Driver measured tourist's revisit intention by their willingness to revisit a destination and their willingness to recommend that destination (1992, p 212)

Past research found that the key of tourist revisit intention is not only by the attraction that a destination provide, but also the promotion activity that conducted by that destination such as rebranding, repositioning, and restructuring a destination to keep the destination performance quality and tourist satisfaction (Baker & Crompton, 2000; Reid & Reid, 1993).

Hypotheses Development

Based on the literature review above we could develop a theoretical model and the hypothesis of this study:

*Figure 1.*Theoretical Model of the research

Where city marketing and personal branding as independent variable and revisit intention as dependent variable.

And the hypotheses of this study were:

H1 : City Marketing have has a positive effect on Mayor Personal Branding

H2 : City marketing have has a positive effect on revisit intention

H3 : Mayor personal branding have has a positive effect on revisit intention. 5

Research Methodology

1. Sample

The population of this study are domestic tourist who visited Bandung. This study was not include international tourist as a sample because the writer and supervisor were agreed that international tourist would not have enough knowledge and information about the current mayor. The determination of sample number are proposed by Hair et al., (2010, p.102) who determine

the sample by number of parameter (question) times 5 due to large number and uncertain of the tourist who visit Bandung. The number of question that was used in this research are 44 question, then the number of minimal sample required are $Number of Parameter \times 5 = 44 \times 5 = 220 \approx 250$

2. Sampling and procedure

The data collection was in 19th-26th September 2016 right after long holiday of *Idul Adha* and was using online survey to reach respondents outside Bandung. All respondents are approached personally by the researchers within two months in the holiday destination area. All questionnaires were completed and returned.

This research was use both descriptive and verivicative analysis to understand tourist perception about those factors and how strong is the relationship between those factors.

Descriptive analysis pf this study was done by calculating the total score percentage of each question and compare it to ideal score as proposed by Riduwan *et al.*, 2008, cited in Nurrahmat (2015, pp. 66-67). This study used Structural Equation Model Partial Leas Square method proposed by Urbach and Ahlemann (2010) for verivicative analysis. This method was selected because SEM-PLS allowed the small number of sample compare to regular SEM. This method also allowed random sampling, and provide the structural model for the readers to understand.

3. Instrument

The instrument of the survey consist of four parts. First part consist the question about respondents profile, the second part consist of 22 questions about city marketing performance, third part consist of 14 questions about mayor personal branding, and last part consist of 6 question about tourist revisit intention.

This questioner used Likert scale from 1 to 5 as proposed by Aaker *et al.* (2011, p.259) and Malhotra (2009, p.276) in order to help the writer transform the answer into measureable data for this study. 6

Research Findings

1. Respondents Profile

Characteristic	Frequency	Percentage
Gender		
Man	104	41,60%
Woman	146	58,40%
Total	250	100,00%
Age		
15-20 Years Old	30	12,00%
21-25 Years Old	138	55,20%
26-30 Years Old	17	6,80%
31-35 Years Old	15	6,00%
36 - 40 Years Old	10	4,00%
41 - 45	7	2,80%

Years Old		
46-50 Years Old	33	13,20%
Total	250	100,00%
Occupation		
College Students	107	42,80%
Private Employee	62	24,80%
Entrepreneur	14	5,60%
Others	28	11,20%
PNS / BUMN / TNI	31	12,40%
Students	8	3,20%
Total	250	100,00%

The table above shows that comparison of the male and female respondents are almost the same (41,6% : 58.4%). Most of the respondents are 21-25 years old (55,2%) followed by 46-50 years old (13,2%) and 15-20 years old (12%). The occupation of the respondents are mostly Collage students (42,8%) followed by private employee (24,8) and public employee (12,4%)

2. Descriptive Analysis of Questionnaire

The result of the questionnaires shows that the domestic tourist still think that the local business in Bandung are growing rapidly and agreed that Bandung is a profitable market to open new business. Tourists also agreed that the number of unemployment is less than employment due to the rapid growth of business activity. The tourist think that the human resources from Bandung are creative and the main industry of Bandung are still dominated by fashion industry and they also agreed that in this industry, Bandung could follow the latest trend.

Tourist explains that when the first time they visited Bandung, it was a fun experience and they feel happy, and to they are looking forward to revisit Bandung. The architecture and museum from Bandung are amazing and must be visited while in Bandung. Tourist also thinks that the event that held in Bandung is interesting and they not feeling boring while visited it.

According to the result of questionnaire, tourists are aware that the best collage and school in Indonesia are located in Bandung, but that's not enough to consider that Bandung is "Education City". Tourist thinksthat job available in Bandung is very limited and also tend to decreasing. The tourist also consider to live in Bandung and think that to spent more time in Bandung is delightful for them.

Tourist of Bandung also think that Mayor Ridwan Kamil is a figure who has a lot of achievement and an experience leader. That make tourist think that he has a reputation of a god leader. Tourist also believes that Ridwan Kamil are accountable and competent for his job, he also could give happiness to citizen of Bandung.

When tourist see Ridwan Kamil, they believe that he is authoritative, honest and someone whose smart and have wide knowledge. They don't believe that Ridwan Kamil has lack of communication skill. For the tourist perspective, Ridwan Kamil is a modest figure, he also

faithful to his religion. Tourist disagree that Ridwan Kamil is not very assertive when leading the city.

From the result we could see that the tourist wanted to revisit Bandung, they also would not mind to revisit same destination. And the also preferred to visit Bandung rather than other cities in Indonesia. When interacted to other tourist, they willing to give positive testimony about their previous experience while visited Bandung and even willing to recommends to others when asked about holiday destination.

3. Verivicative Analysis of the Questionnaire

The result of the questionnaire was then proceed to verivicative analysis using SmartPLS software. This method begins with validity and reliability test to know that whether the respondents understand the question and whether that this research could be used in further research.

A. Validity and Reliability Test
1. Validity Test

Model validation denotes the process of systematically evaluating whether the hypotheses expressed by the structural model are supported by the data or not. In general, the model validation is an attempt to determine whether the measurement models as well as the structural model fulfill the quality criteria for empirical work (Urbach and Ahlemann, 2010, p.18).

According to Urbach and Ahlemann (2010, p.18) formulating from Gefen and Straub, unidimensional refers that the loading factor should have a value above 0.500 is valid, above 0.600 is high, below 0.400 is low. Attempts to measure the amount of variance that latent variable component captures from its indicators relative to the amount due to measurement error. Proposed threshold value: AVE > 0.500, Urbach and Ahlemann (2010 p.19).

The following output is PLS loading factor:

Table 2 The Output of Loading Factor from SmartPLS Software Calculation

Variable	Indicators	Factor loadings
City Marketing	X11	0.73
	X12	0.79
	X13	0.79
Personal Branding	X21	0.87
	X22	0.88
	X23	0.83
	X24	0.66
Revisit Intention	Y11	0.86
	Y21	0.84

The table above shows that the result has a value above 0.5 for all construct, therefore, these variables are valid.

Further on, the value of square root of average variance extracted (AVE) are as follow:

Table 3 Result for AVE

Variable	AVE
City Marketing	0.599
Personal Branding	0.662
Revisit Intention	0.722

The table above shows that the result has a value above 0.5 for all construct, therefore, these variables are valid.

2. Reliability Test

According to Urbach and Ahlemann (2010, p.18), there are several assessment tests for reliability test, such as: internal consistency reliability and indicator reliability. Formulating from Cronbach, the traditional criterion for assessing internal consistency reliability is Cronbach's alpha (CA), whereas a high alpha value assumes that the scores of all items with one construct have the same range and meaning, it has to have a value above 0.600, composite Reliability above 0.7.

Reliability test is conducted using composite reliability from the indicator block that measure construct. The result of composite reliability as follow:

Table 4 Result for Composite Reliability

Variable	Composite Reliability
City Marketing	0.818
Personal Branding	0.885
Revisit Intention	0.839

The table above shows that the result has a value above 0.7 for all constructs, therefore, these variables are reliable.

Formulating from Werts *et al*., and Nunally and Bernstein, internal consistency reliability has a composite reliability for their criterion, attempts to measure the sum of an LV's factor loadings relative to the sum of the factor loadings plus error variance (Urbach and Ahlemann, 2010, p.19). It leads to values between 0 (completely unreliable) and 1 (perfectly reliable). Alternative to Cronbach's Alpha, allows indicators to not be equally weighted. Proposed threshold value for confirmative (explorative) research: CA > 0.800 or 0.900 (0.700). Values must not be lower than 0.600.

Table 5 Result for Croanbach's Alpha

Variable	Cronbach's Alpha
City Marketing	0.667
Personal Branding	0.824
Revisit Intention	0.616

The table above shows that the result has a value above 0.6 for all construct, therefore, these variables are reliable. 9

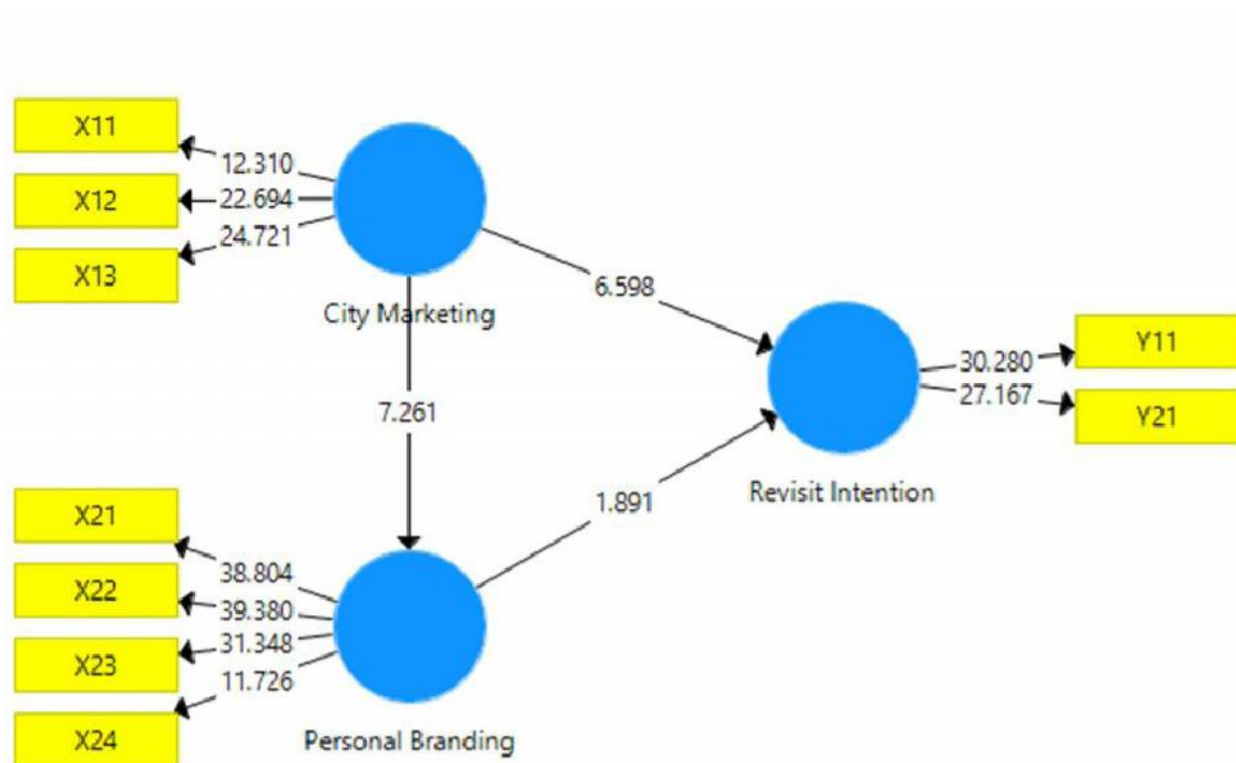
4. The Relationship between City Marketing, Personal Branding, and Revisit Intention


Figure 2 Output Bootsraping using SmartPLS Software

From the figure above we could see that City Marketing has the highest T-statistics value towards the Personal Branding, follow by City Marketing towards the Revisit Intention, and the lowest one is T-statistics Personal Branding towards the Revisit Intention. Further about figure 4.x will be explained in hypothesis test result.

Table 6 Result of Hypothesis Test

	Variable	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P-Values
H1	City Marketing -> Personal Branding	0.479	0.484	0.067	7.169	0.000
H2	City Marketing -> Revisit Intention	0.458	0.458	0.070	6.576	0.000
H3	Personal Branding -> Revisit Intention	0.126	0.128	0.066	1.915	0.028

H1, City Marketing have has a significant and positive effect on Mayor Personal Branding
Analysis of the data revealed that City Marketing and Personal Branding is positive and significant with T-statistic is 7.169(>1.69) and original sample estimate is positive which has value 0.479. The City Marketing performance significantly has influence towards mayor personal brand. This result also support Amoako and Adjaison study (2012) who explain that the performance of every individual is influencing one way or the other with their personal branding. This result also supports Rampersad, H. K. (2008) study about the blue print to create authentic personal branding. Rampersad, H. K. (2008) explains that one of the key to create authentic personal branding is through their performance.

H2 : City marketing have has a significant and positive effect on revisit intention
The relation between City Marketing and Revisit Intention is positive and significant with T-statistic is 6.576 (>1.69) and original sample estimate is positive which has value 0.458. That mean city marketing significantly has influence towards revisit intention This result also support study form Baker and Crompton (2000) who explain that various destination marketing activity including events, new attraction, and destination performance quality will engaged tourist loyalty behavior such as intention to revisit and giving positive feedback to others tourist.

H3 : Mayor personal branding have has a significant and positive effect on revisit intention.
The relation between Personal Branding and Revisit Intention is positive and significant with T-statistic 1.915 and original sample estimate is positive which has value 0.126. From this result we can conclude that mayor personal brand significantly has influence towards revisit intention. This result support the study from Zahaf and Anderson (2008) and Shafiq *et al.* (2011) who reveal that a public figure who has powerful personal branding based on their attractiveness, experience and credibility could engage the customer intention to repurchase (in this case, revisit) of a product if a product could successfully associated with that person and lead the customer to become loyal.

Conclusion
This research was intended to investigate the casual relationship between city marketing performance, mayor personal branding and tourist revisit intention. This research also provide the structural model of the relationship between variable and tourist perception for each variable. The key findings of this study include the acceptance of proposed model and hypotheses. Based on findings, city marketing performance and mayor personal branding has positive influence to tourist revisit intention. And city marketing performance has higher influence than mayor personal branding toward the tourist revisit intention. This research also supported previous

theory about relationship between the variables. The local government also the mayor should take a note of this findings and considering this result of this study before creating the policy about city marketing and the dimension therein.

The result revealed that Bandung city's marketing performance is doing well to attract both tourist and investor. Bandung also has succeeded to create a comfortable atmosphere to live by tourists and local citizen. The tourist perception of the mayor Ridwan Kamil personal brand is also positive. And it leads to behavior of tourist revisit intention to Bandung. The results can be used as valuable information of the marketing strategies to attract both tourist and investors. These strategies could then be implemented to develop new activity, attraction and policy for the needs of the tourists and investors. 11

EXPLORING CREDIBILITY OF FULL-FLEDGED ISLAMIC BANK IN INDONESIA: AN EXPLORATORY FACTOR ANALYSIS (EFA) APPROACH

Naufal Bachri, Malikussaleh University, Indonesia
Abdul Rahman Lubis, Syiah Kuala University, Indonesia
Muslim Amin, King Saud University, Saudi Arabia

Abstract

This study attempts to explore the antecedents of credibility of full-fledgedIslamic banks in Indonesia. The sampling technique in the study is purposiverandom sampling with criteria; each respondent has a bank account in fullfledgedIslamic bank for at least one year. The data were collected fromrespondent using the structured questionnaires. A total of 250 questionnaireswere distributed in different of six major Islamic banks (PT. Bank MuamalatIndonesia, PT. Bank BRI Syariah, PT. Bank BNI Syariah, PT. Bank SyariahMandiri, PT. Bank Mega Syariah, PT. Bank Maybank Syariah Indonesia,and PT. Bank Tabungan Pensiunan Nasional Syariah) operating in AcehProvince, Indonesia. The result showed that credibility refers to amultidimensional construct composed of three factors: reliability, concernand knowledge. A scale of overall credibility in Islamic Bank was obtained,composed of three factors and represented by 21 indicators that aresignificant for their measurement. The factor of concern refers the key toestablishing and maintaining long-term relationships between companies andcustomers. In addition, knowledge can increase responsiveness to customers;improve work efficiency and ability to innovate. However concern andknowledge are new factors in the theory of credibility that can be applied inIslamic Banking.

Keywords: *Credibility, Reliability, Concern, Knowledge, Islamic Banks*

Introduction

Credibility is the key driver of company reputation, which refers to the consumer to believe thatthe company can create and deliver products and services that satisfy consumer desires. One ofthe marketing purposes is to influence consumer perception and attitude toward the company.Therefore, companies must have high credibility. Creating and maintaining the companycredibility can improve long-term business relationships, sales, financial performance and thecompany's success widely.

The concept of the Islamic Banks is the financial concept fully embraces Sharia law. The Law thatinvests a business of the partnership program, sharing risks and profits without interests*(Usury)*. Islamic banking system has rapidly become a worldwide concern. This fame not only inthe Islamic Bank but on conventional banks has shown interest in Islamic Banking system. Asevidence, there are 180 Islamic banks with branches more than 8,000 units in Asia, Africa,Europe and America (Rizwan *et al.*, 2014).

Indonesia has 88.1 percent Muslim population, who conducts transaction with both conventionaland Islamic banks. In 2015, it has 12 units of full-fledged Islamic bank, 22 units of dual windowIslamic bank and 161 units of Islamic rural bank. The financial performance of Islamic bankexperienced decreasing. *Capital Adequate Ratio* (CAR) is 14.09 percent compared with 15.74percent in 2014. *Return On Asset* (ROA) is 0.89 percent compared with 0.79 percent in 2014 and*Return On Equity* (ROE) is 7.97 percent compared with 5.85 percent (Islamic Banking Statistics,2015). Meanwhile, Otoritas Jasa Keuangan (2015) reported that market share

of Islamic bankachieved 4.78 percent of the total of the national banking. It is still stand at minimal target of 5percent.

Koesen (2012) added that there is negative opinion of Indonesian toward Islamic bank, namely;(1) system of Islamic and conventional bank is the same, (2) for dual window system, capitalsource of Islamic bank is from conventional bank, (3) costs of Islamic bank is more expensivethan conventional bank, (4) the achieved profit is uncertainty. (5) the perceived service bycustomers are still stiff, less friendly, less sophisticated technology, less knowledgeable aboutIslamic products and complicated procedure. This indicates that the Indonesian people are lesstrusting of Islamic banks.

The purpose of this paper
This study attempts to explore the antecedents of credibility of Islamic bank in Indonesia byadapting and modifying corporate credibility model (Haley, 1996 & Eisend, 2006). This researchis important to find the special dimensions of corporate credibility in sector of Islamic banking.The dimensions are useful for Islamic Bank in creating and maintaining consumer behavior forloyal and also increasing corporate performance.

Literature Review
 1. Definition of Credibility
Keller and Aaker (1998) say that credibility is the consumer to believe that the company candesign and deliver products and services that satisfy the needs and desires of consumers. Newelland Goldsmith (2001) defines the company's credibility is the extent to which consumers feelthat companies have the knowledge or ability to meet claims and whether the company can betrusted to tell the truth. Maathuis (2004) says that credibility is a fundamental asset for a person,organization, political party, or media products to achieve their goals.

Company credibility has studied as a variable of the predictor in marketing (Ballentine, 2006;Goldsmith, 2006) and a key to maintaining the long-term relationship in the businessenvironment (Ghorban and Tahernejad (2012). Credibility reflects a company's reputation(Kotler and Keller, 2013), is a portion of the concept of trust and the sub-processes of acompany's reputation (Adams *et al.,* 2010). Goldsmith *et al.* (2000) say that credibility as apredictor of consumer desire to buy.

 2. Effects of Credibility
There are several references that explain the internal and external impact of credibility.Internally, credibility can increase the growth and profit for the company. While externally,credibility impacts on consumer value, satisfaction, commitment and loyalty (table I).

<p align="center">Table I: effects of credibility</p>

No.	Sources	The effects
1	Fomburn (1996)	Credibility is company reputation that influence the company success
2	Keller & Aaker (1998)	Consumers trust that the company can design and deliver products and services that satisfy the needs and desires of consumers
3	Newell (2000)	Credibility can positively influence on company performance
4	Goldsmith *et al.* (2000)	If the company increases the credibility it will increase

		customer satisfaction
5	Erdem *et al.* (2002)	The credibility of the company is consumer trust in all products and services produced, definitely, can satisfy the needs and desires of consumers
6	Belch & Belch (2003)	Credible information can influence the beliefs, opinions, attitudes, behavior of the recipient of the information
7	Cretu & Brodie (2009)	There is a strong relationship between the reputation and image of the company to the value and loyalty of consumers
8	Zhang dan Rezaee (2009)	Credibility has direct correlation on performance of company
9	Alam (2012)	The credibility of the brand has a positive and significant impact on customer loyalty
10	Ghobran (2012)	Credibility positively correlates with commitment and sustained commitment loyal customers
11	Ghorban & Tahernejad (2012)	The credibility of the company has a positive influence on customer satisfaction
12	Amin *et al.* (2013)	Image and trust can increase consumer loyalty
13	Careras *et al.* (2013)	Credibility can influence behavior and increase the value for stakeholders
14	Sallam (2014)	Companies that pay attention to the credibility of the commitment can improve and enhance the satisfaction and word of mouth communication
15	Bachri *et al.* (2016)	The credibility will be the trend for future study in Islamic Bank.

From few references above shows that there is a direct and indirect relationship between thecredibility, consumer value, satisfaction, commitment, loyalty and performance of company.Variable credibility is also an important element in creating customer value, satisfaction andloyalty and also increasing performance.

3. Factors of Credibility

Variable credibility not comes about easily but is formed from several sub-variables. For moredetails can be seen in the following table.

Table II: Factors of Credibility

No.	Sources	Factors
1	Belch & Belch (1994); Newell & Goldsmith (2001); Erdem *et al.* (2002); Sweeney & Swait (2008)	Expertise & Trustworthiness
2	Riel (1995); Keller & Aaker (1998)	Reliability, expertise & attractive
3	Haley (1996)	Trustworthiness, expertise, attractive & relevance
4	Goldsmith *et al.* (2000)	Expertise, attractiveness, power & trustworthiness
5	Eisend (2006)	Trustworthiness, competence & dynamism
6	Kotler & Keller (2013)	Trustworthiness, expertise, & likability

There are several types of antecedents to form variables credibility, namely: reliability, expertise,attractiveness, power, trust, likability, and relevance. From the study of some of the abovereferences indicate that credibility has two main dimensions, namely expertise andtrustworthiness.

Methodology
The aim of this study is to understand how customer measure credibility of full-fledged Islamicbanks in Indonesia. The sampling technique in the study is purposive random sampling withcriteria; each respondent has a bank account in full-fledged Islamic bank for at least one year.The data were collected from respondent using the structured questionnaires. A total of 173questionnaires were distributed in different of six major Islamic banks (PT. Bank MuamalatIndonesia, PT. Bank BRIsyariah, PT. Bank BNI Syariah, PT. Bank Syariah Mandiri, PT. Bank MegaSyariah, PT. Bank Maybank Syariah Indonesia, PT. Bank Tabungan Pensiunan Nasional Syariah)operating in Aceh Province, Indonesia.

A five-point Likert scale was used to measure perception of Islamic bank credibility, ranging from"strongly disagree" (1) to "strongly agree" (5). Credibility was measured by adapting indicatorsas suggested by Haley (1996) and Eisend (2006). To explore credibility of Islamic bank we usedExploratory Factor Analysis (EFA) approach.

Analysis and Results
1. Respondent Profile
Table 1 reports the descriptive statistics of the respondents in this study. A total of 250questionnaires were distributed and 176 were returned (70.4 percent response rate). Thesample characteristic includes 95 male customers (54 percent) and 81 female customers (46percent). The dominantly respondents age is 31-40 years (38.1 percent) and works as businessman(39.2 percent) (Table III).

<center>Table III: Respondent Profile</center>

	Frequency	Percent	Cumulative Percent
Gender			
Male	94	54.3	54.3
Female	79	45.7	100.0
Age (year)			
18-23	12	6.9	6.9
24-29	44	25.4	32.4
30-35	65	37.6	69.9
36-41	41	23.7 9	3..6
42 and above	11	6.4	100.0
Occupation			
Government employee	38	22.0	22.0
Private employee	24	13.9	35.8
Businessman	67	38.7	74.6
Student	25	14.5	89.0

2. Assumption Tests of Factor Analysis

The Kaiser Meyer Olkin Measure of Sampling (KMO) test obtains the value of 0.923. This value ishigher than 0.6 (0.6 the lowest and 0.99 the highest). The Barlett Test of Spehricity obtained is2482.188 and the probability associated with the chi-squared statistic is lower than 0.05. TheMeasures of Sampling Adequacy (MSA) test has the Anti-Image Correlation values higher than0.5 (0.50 the lowest and 0.99 the highest). Subsequently these assumptions have met eligibilityfor factor analysis.

A. Communalities Analysis

To validate the scale of credibility we carried out communalities analysis of 22 indicators. Resultshowed that the values of extraction obtained are higher than 0.5 (0.50 the lowest and 0.99 thehighest) except indicator of reputation (X6). Furthermore indicator of reputation (X6) must beexcluded from the next analysis. Consequently total of indicators used the analysis is 21indicators (Table IV).

Table IV: Communalities Analysis

No	Indicators of Credibility	Extraction
	Reliability (X1)	0.755
	Concern (X2)	0.639
	Delight (X3)	0.634
	Recognition (X4)	0.567
	Justice (X5)	0.580
	Social Responsibility (X7)	0.532
	Consistency (X8)	0.571
	Sincerity (X9)	0.596
	Honesty (X10)	0.646
	Ethics (X11)	0.736
	Familiarity (X12)	0.648
	Prestigious (X13)	0.626
	Ability (X14)	0.563
	Expertise (X15)	0.623
	Experience (X16)	0.618
	Qualify (X17)	0.712
	Positive opinion (X18)	0.600
	Like (X19)	0.640
	Understand (X20)	0.640
	Mutual sharing (X21)	0.584

	Knowledge (X22)	0.674 Required > 0.5

B. Grouping the Credibility Factors

Eigenvalue Analysis showed that total factor of credibility is 3 factors. Total Eigenvalues obtainedare higher than 1 (Acceptance > 1) (Tabel V).

Tabel V: Eigenvalues

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative	Total	% of Variance	Cumulative	Total	% of Variance	Cumulative
1	10.830	51.570	51.570	10.830	51.570	51.570	5.564	26.494	26.494
2	1.346	6.409	57.979	1.346	6.409	57.979	4.652	22.154	48.648
3	1.045	4.975	62.954	1.045	4.975	62.954	3.004	14.307	62.954

Extraction Method: Principal Component Analysis.									

Rotation method or principal component analysis was performed to determine any indicatorsthat are part of the credibility factors (Factor 1, factor 2 and factor 3) (Table VI).

Table VI: Rotation Method.

No.	Rotated Components	Factors			Cronbach's Alpha
		1	2	3	
1	Reliability (X1)	.817			.922

2	Recognition (X4)	.691			
3	Justice (X5)	.562			
4	Social Responsibility (X7)	.570			
5	Sincerity (X9)	.585			
6	Ethics (X11)	.580			
7	Ability (X14)	.643			
8	Experience (X16)	.624			
9	Positive opinion (X18)	.542			
10	Like (X19)	.745			
11	Concern (X2)		.748		.886
12	Delight (X3)		.572		
13	Consistency (X8) .		577		
14	Honesty (X10)		.684		
15	Familiarity (X12)		.674		
16	Understand (X20)		.708		
17	Mutual sharing (X21)		.672		
18	Prestigious (X13)			.580	.822
19	Expertise (X15)			.605	
20	Qualify (X17)			.631	
21	Knowledge (X22)			.788	
			Required > .50		Required > .70

Rotation Method using Varimax with Kaiser Normalization showed that factor 1 has tenindicators namely; reliability, recognition, justice, social responsibility, sincerity, ethic, ability,experience, positive opinion and like. Value of Cronbach's Alpha for factor 1 is 0.922 (0.70 thelowest and 0.99 the highest). The factor is labelled the factor of reliability. Factor 2 has sevenindicators namely; familiarity, delight, consistency, honesty, concern, understand and mutualsharing. Value of Cronbach's Alpha for factor 2 is 0.866 (0.70 the lowest and 0.99 the highest).The factor is labelled the factor of concern. Finally factor 3 has four indicators namely;knowledge, expertise, qualify and prestigious. Value of Cronbach's Alpha for factor 3 is 0.866(0.70 the lowest and 0.99 the highest).The factor 3 is labelled the factor of knowledge.
Meanwhile component transformation also is conducted for validating three dimensions ofcredibility in Islamic Bank.

Table V: Component Transformation Matrix

Component	1	2	3
Reliability	.671	.592	.447
Concern	-.617	.780	-.106
Knowledge	-.411	-.205	.888

Factor reliability has correlation of 0.671 (0.50 the lowest and 0.99 the highest). Factor concernhas correlation of 0.780 (0.50 the lowest and 0.99 the highest). Finally Factor knowledge hascorrelation of 0.888 (0.50 the lowest and 0.99 the highest). These mean that credibility of IslamicBank in Indonesia has three factors namely reliability, concern and knowledge.

Discussion and Managerial Implications

The purpose of this research is to explore variable of credibility for full-fledged Islamic bank.This study expands the existing literature by exploring credibility in sector of Islamic bank.Previous researches have the different dimensions, namely expertise and trust (Belch & Belch,1994; Newell & Goldsmith, 2001; Erdem *et al.,* 2002; Sweeney & Swait, 2008). Haley (1996)developed four dimensions namely; expertise, attractive, trust and relevance. Goldsmith et al.(2000) added dimension of attractive and power so that it becomes four dimensions, namely:expertise, attractive, power and trustworthiness. In contrast to Kotler and Keller (2013) addeddimension likability to become three dimensions namely expertise, trustworthiness andlikability. While Riel (1995) and Keller & Keller (2013) have the same pastures that dimension ofcredibility consists of three dimensions: reliability, expertise and attractive.

In Islamic Banking Industry in Indonesia have three dimensions of credibility that should beconsidered namely reliability, concern and knowledge. Reliability is an important factor becauseit can increase the quality of service and satisfaction to customers. This factor supports theopinion of the Riel (1995) and Keller and Aaker (1998) say that reliability is an importantelement of the company's credibility. The factor of concern refers the key to establishing andmaintaining long-term relationships between companies and customers. In addition, concernmay increase the customer commitment and loyalty for the Islamic banks. The last factor isknowledge, can increase responsiveness to customers; improve work efficiency and ability toinnovate. However concern and knowledge are new factors in the theory of credibility that canbe applied in Islamic Banking.

Suggestions for the Future Studies

Credibility is a major driver in creating and maintaining customer satisfaction and loyalty.Satisfied and loyal consumers will have implications on the success of companies such as growthand profitability in the long term. Concern and knowledge is a new element that must beconsidered in the Islamic banks because it can have a significant impact on the progress of thecompany. Therefore, future research should focus on factor of concern and knowledge tomeasure credibility of company.

ACQUIRING CROSS-CULTURAL COMPETENCE: INSIGHTS FROM INTERNATIONAL FIRMS IN FOUR COUNTRIES

Desalegn Abraha, University of Skövde, Sweden
Syeda-Masooda Mukhtar, King AbdulAziz University, Saudi Arabia

Abstract

Firms increasingly have to compete globally in order to survive. An understanding of the host country's local culture arguably being one of the most important aspects of this survival. The greater the cultural difference, the higher the risk of miscommunication and of mismanagement. Given that cross-cultural management is acknowledged as an intrinsic part of firm establishment in foreign markets today, we set out to explore the linkages between the competence of international firms in managing cultural differences and the effectiveness of their business operations. How this 'cross-cultural competence' is acquired is of particular interest to this study. Swedish firms operating in Kenya, Lithuania, Poland and Russia are examined. The findings show that international firms tend not to formulate any preparatory measures to become 'culturally competent' prior to entering foreign markets. Learning takes place by doing. A Process Model of Acquiring Cross-Cultural Competence in Foreign Markets is constructed.

Keywords: *Internationalization; Kenya; Lithuania; Poland; Russia; Cross-Cultural Competence Process; National Culture; Cross-Cultural Management; Globalization*

Introduction

"Culture and communication are inseparable, therefore culture does not only determine as to who talks to whom, about what, and how communication is conducted, it also helps to know how people understand and interpret a message, how much weight they put in the message, and the conditions and circumstances under which the message can or cannot be sent, noted or interpreted. The fact is that the whole program of our communication behavior to a large extent depends on the culture that we have grown up in.Consequently, culture is the base of communication. As a result, when the culture varies, communication also varies." (Translated from Bjerke, 1998).

According to Bjerke (1998), in order to get the proper response from the receiver of your message, the key is to be an effective communicator and to know how much information you need to deliver. Culture, in other words, is a frame of reference within which people communicate with each other. It follows that the greater the difference among the various cultures, the higher the risk of miscommunication. In other words, effective communication is critical for firms if they are to compete successfully internationally. Firms must communicate in a manner that is understood within the local cultural context. Since, to do otherwise would be to get an inappropriate response i.e. the communication process would fail, as would the relationship. This implies that cultural differences would impact a firm's communication process significantly when operating in foreign markets. This is especially critical in today's business environment where firms, both large and small, often have to compete globally in order to survive (Czinkota and Ronkainen, 1998; Roadblock, 1993; Braker, 1995), where an understanding of the local culture is, arguably, one of the most important aspects of this survival (Czinkota and Ronkainen, 1998).

Some academics believe that it is, in fact, impossible to understand other cultures fully and completely (Trompenaars, 1993). As a result, one can, at best, hope for only partial success in foreign markets. According to Trompenaars (1993), the cultural gaps, which exist among countries, influence all aspects of business activities: business negotiations; consumer and organizational behavior and decision making; the measures taken to avoid uncertainties; employer and employee relationships; time and resources consumed in a firm's operations. It is these differences and the impact of these differences, which makes understanding and managing cultural differences properly a critical issue in international business operations. Hofstede (1984), while not totally rejecting Trompenaars' position, contends that it is possible to understand how other cultures' values differ from our own and postulates that, "culture is the collective programming of the mind which distinguishes the members of one Human group from another. Culture, in this sense, includes systems of values, and values are among the building blocks of culture." (Hofstede (1984, p. 12).

According to Hofstede (1984), therefore, culture is learned and not inherited i.e.it is mentally programmed. From the very beginning of his birth, a child is influenced by his family and thereafter continues the programming of mind with the help of the school, youth groups, work place, etc. A person's way of thinking, feelings and behavioral pattern are learned throughout his lifetime. To be able to understand other cultures, the learned one must be forgotten, which is very difficult. Our thesis concurs with Hofstede's perspective i.e. that culture is learned. If the culture within a certain society has to be learned, then it must also be possible for the international business practitioner to be able to learn and understand the culture of a specific market, and how it affects the behavior and the decision making process. However, unlike Hofsted's viewpoint, we do not believe that it is necessary to forget the learned one in order to be able to understand others. Moreover, we take the view that it is possible to learn foreign cultures through both experiential learning and factual learning where the latter can promote and make the former easier and more comprehensive. Comprehensive learning makes adaptations easier, relevant and more appropriate, while adaptation increases the chances of success. Even if all we learn in the process is

that a part of a culture cannot be understood. This discovery in itself is useful learning as it means that we have identified the various constituents of a specific culture and learned what is possible to learn, and what is not.

Research Proposition

As globalization gathers pace, so does the interest in the relationship between national culture and business practices (for example, Alder 2002; Dorfman et. al., 1988; Galliers, et al.,1998; Garfield and Watson, 1998; Gitman and McDaniel 2008; Hasan and Ditsa, 1999;Luthans, et al., 1993; Offermann and Hellmann, 1997; Thatcher, et al., 2003; Thomas and Ely, 1996;Trompenaars, 1997). This relationship becomes more complex when firms internationalize and find themselves confronted with an (often unfamiliar) national culture of their target (host) country. In other words, while managing internationalization poses a challenge in itself (Abraha and Mukhtar, 2014; Contractor et al., 2007; Ghoshal and Nohria, 1989; Roth, 1995; Sanders and Carpenter, 1998; Tihanyi and Thomas, 2005), adding the cultural dimension makes the process of firm establishment in a foreign market even more challenging.

Our thesis is that making advance 'cultural preparations' can increase a firm's chances of success in foreign markets. Such cultural preparedness promotes the creation of a good image in the host country, which in itself contributes to the firm's success, and speeds up the process of understanding and being accepted by the local host market, thereby accelerating the process of

firm establishment. Even if these preparations were not to have a direct impact on a firm's operational performance, at the very least, they can help firms to identify cultural gaps and to develop appropriate adaptations that narrow these gaps, and to handle the consequences of these gaps better. Cultural preparations represent an aspect of factual learning that can promote experiential learning as alluded to above. If a firm is culturally prepared, the chances of it making mistakes are minimized. Against this background, the specific issues addressed by this study are as follows.

1. To what extent are international business executives aware of the cultural differences and the impact of these cultural differences on their business operations prior to entering a foreign market?

2. Do international business executives make the necessary cultural preparations in order to identify cultural differences that might exist, and to mitigate the impact of these differences on business operations prior to launching their products in a foreign market?

3. If the international business executives do make cultural preparations prior to entering a foreign market, do they develop any mechanisms to manage the cultural differences that are identified, as well as their impact on business operations?

4. If the international business executives do not formulate a mechanism for managing the cultural differences that are identified prior to entering a foreign market, how do they learn; how do they bridge the cultural gap to mitigate the impact of these cultural differences on their business operations; and what results do they achieve?

Conceptual Framework

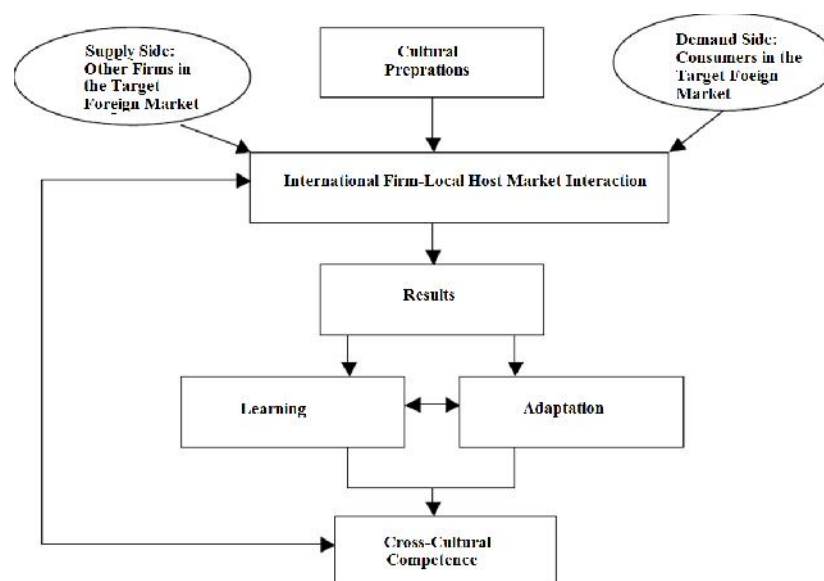
A Process Model of Acquiring Cross-Cultural Competence in Foreign Markets is constructed (Figure 1). This model is developed based on a culmination of the theoretical and conceptual frameworks adopted by Hofstede (1980, 1984); Czinkota and Ronkainen (1997); Samovar and Porter (1994); Collier and Thomas (1988;1989); Goldman (1992); Gudykunst and Ting-Toomey (1988); Schneider (1976); and Spitzberg and Cupach (1984). Due to space limitations, a detailed discussion of these theses is out of the scope of this paper. The Model serves as a conceptual framework to examine the linkages between the cultural competence of international firms and the effectiveness of their business operations.


Figure 1: A Process Model of Acquiring Cross-Cultural Competence in Foreign Markets

Cultural Preparations: Cultural boundaries are not the same as geographic boundaries. That is why we often find sub-cultures within one country spanning different norms and values. As a result, it may be difficult, even impossible, to completely understand the culture within one's own country let alone another culture (Trompenaars, 1993). However, despite these difficulties, international business executives must find a way to understand other cultures if they wish to avoid cultural blunders and mistakes (Lindblom, 1999). Today companies do make a more conscious effort of incorporating cultural competence into their business strategies (Braker and Walker, 1995). Understanding a culture involves learning about its origin, history, and structure and how it functions. Firms need to be aware of the fact that culture also changes over time and can impact the marketing of their products and services (Albaum et al., 1998).

Although cultural preparations can take many different forms depending on the market in question, 3M's operations in China and Thailand offer a good example of such measures (Czinkota and Ronkainen, 1998). 3M showed sensitivity by embracing the local culture. The company employed the locals to gain cultural knowledge, and it built relationships with the national leaders with a view to establishing contacts and trust before even considering doing business in China. This patient and long-term perspective paid off resulting in the Chinese government making 3M the first wholly owned foreign venture on Chinese soil. Cultural preparation also helped the company to 'Asianize' its products. The other important part of this cultural preparation involved helping employees to understand the company by sending them to the 3M Headquarters in the home country. Such visits had a dual effect: the Chinese employees gained knowledge of the company's culture on the one hand, while they contributed knowledge on the other by sharing their own insights which were incorporated in the company's planned operations in Asia.

In contrast, an example of 'cultural unpreparedness' is cited by Czinkota and Ronkainen (1998) relating to the head of a U.S. beverage firm who was involved in negotiations with a Japanese food company with a view to exporting beer to Japan. The American executive who was used to finalizing a deal in no more than two days back home, became increasingly frustrated when two days into the negotiations, the Japanese said nothing about the project under negotiation, while all their discussions centered around the history, traditions, and the ethos of their company despite the American negotiator's repeated attempts to focus on the project. The American ended up going back with no deal. This example shows that although the American business executive had assumed he was well prepared to do a deal in Japan, the fact was he had not done the necessary homework on the Japanese way of conducting business which often takes much longer than in the West. Another example of cultural unpreparedness is the case of a British Bank in Singapore (Usuiner, 1999). The Bank insisted on entering the Singaporean market using its blue and green corporate colors despite a warning from a consulting firm that in Singapore, green is associated with death. Eventually the bank had to change to another more culturally acceptable shade of green.

International Firm-Local Host Market Interaction: Hofstede (1984) identified four dimensions of culture: individualism versus collectivism; high versus low power distance; high versus low uncertainty avoidance; and masculinity versus femininity. So, if for example, the international marketer belongs to a society where the power distance is very high while the customer is from a country where the power distance is low, this will have a significant impact on their interaction. The outcome would be dissatisfaction, a lower business volume and an unstable relationship. Similarly, if the international firm is from a collectivist society such as Japan, while its

consumers are from the individualist society such as the U.S and Sweden, this cultural difference will not only influence but even distract their relationship if it is not properly identified and dealt with. High versus low uncertainty avoidance and masculinity versus femininity would have similar consequences. Based on Hoftsted's work, Mårtensson (1998) describes culture as: universalism versus particularism; ascribed status versus achieved status; specific versus diffused relationships in business networks, emotionally charged versus emotionally neutral dimensions. Czinkota and Ronkainen (1998) identify various elements of culture to include language, non-verbal language, religion, values and attitudes, manners and customs, material elements, aesthetics, education, and social institutions.

Thus in relation to the international firm-local host market interaction, which relates to both the supply side and the demand side, and where the demand side represents consumers in the target market, consequences of these cultural dimensions must be addressed. Otherwise, while the international firm might act in the belief that it understands the market, it may be faced with a quite unexpected behavior from consumers to the detriment of its business operations. Pepsi-Cola, for example, changed the color of its cooling and vending machines from dark blue to light blue in South East Asia not realizing that light blue has a negative connotations in that region. As a result, the company lost a significant market share to its competitor, Coca-Cola. The company, with the help of a local consultant, later discovered the cause and changed the color back to the original dark blue subsequently winning back its market share. Even the same English word or phrase might have different meanings in different English speaking countries. To say "at the end of the day" means at the end of the same day that people are conducting negotiations in some societies, whereas it means when the project or issue being discussed is over in others. If a business executive says, "the results bombed", it means the negotiations have failed in some societies, while the same phrase means the negotiations were a success in others.

Results: Results represent what an international firm is able to achieve following its interaction with the target market. It is worth noting that if a firm makes advance cultural preparations, it does not necessarily mean it would no longer make any mistakes, only that it will make less or minor mistakes. However, even mistakes that are seemingly minor, can be costly nevertheless in terms of market position and market share as was the case of Pepsi-Cola alluded to above.

Learning: The capacity of an international firm to learn is advanced with cultural preparations. Cultural preparations incorporate factual learning which both strengthens the capacity to interact and to learn from the preparation made, as well as from the actual interaction and the results achieved. This does not preclude firms from learning in the absence of cultural preparation. Simply that cultural preparation made in advance has a positive impact on the firms' interaction with the local market; the results achieved; the learning acquired; and the adaptations made. The firm, as a result, has a better chance of adapting its products and programs to the target market since it has now learned what functions well and why, and what further measures, if any, need to be taken to rectify the errors of cultural incompetence.

Adaptation: The adaptation or measures taken by an international firm in order to bridge the cultural gap depends very much on the results achieved. If these results are not satisfactory, it implies cultural incompetence and drastic changes are needed in the company's approach. In the case of Pepsi-Cola, it was evident that the company had to do something if the lost market share was to be won back, and changed the color of its vending and cooling machines back to the original dark blue. Similarly, the British Bank operating in Singapore had to change its Green

corporate color to a more 'culturally acceptable' green. These two examples highlight that learning through preparation, interaction and the results achieved, as well as the adaptation made increases the cultural competence of the international firm.

Cross-Cultural Competence: Although, a positive impact was noticeable following the adaptations made by Pepsi-Cola and the British Bank, success may not be guaranteed even after the necessary corrective measures have been taken. In which case, the international firm must develop the necessary cultural competence further, and more learning and adaptations must take place until the expected results are achieved. In other words, the measures taken in the form of adaptations following the learning, must necessarily have a positive impact on the results achieved i.e. such measures must reduce the cultural gap and thereby improve the international firm's market position and performance in the host country. Narrowing the cultural gap advances effective communication paving the ground for successful interaction and positive results. Once this has been achieved, only then could a firm be called culturally competent. *An international firm has realized 'cultural competence' when it has acquired the capability to understand and handle cross-cultural differences, and thereby mitigate the negative impact of these cultural differences on its business operations through minimizing the cultural gap.*

Empirical Data

Our target firms were from Sweden with international operations in culturally diverse countries. One of the key considerations was physical access to these firms for interviews. The sample comprised six Swedish firms with operations in Kenya, Lithuania, Poland and Russia. Semi-structured questionnaires were used for data collection. The interviewees were senior executives overseeing foreign operations and who were directly involved in the strategic decision making process in relation to firm establishment in the host country. The primary data collection process was corroborated with secondary sources where possible.

Findings

ABB in Kenya: ABB has been operating in Kenya since 1960. Old East African Trading Company (OEATC) was representing ASEA (through which ABB Kenya operated) from 1960-1978. When in 1975, the OEATC production manager, who was also responsible for developing customer contacts, together with some engineers formed another company, almost half of ABB Kenya customers shifted to his new company despite the superior quality of ABB products. The ABB market share declined by 20%. Following this setback, ASEA conducted an extensive research to find how it could improve its market position. The firm learned that a local presence with a fully owned company was critical to its survival and growth. ASEA decided to terminate the agency contract with OEATC in 1978. ASEA Ltd., a subsidiary of ASEA, was formed to undertake the production and the sales functions in the local market.

A senior executive highlighted another aspect of the cultural gap and its impact on ABB position and market share in Kenya. When ABB started operating through ASEA Ltd., several potential customers had sought appointments with the firm's managing director, but these customers were referred to his subordinates instead. There were long delays in decision making and most of the customers never returned despite repeated attempts by the firm to contact them.None of the deals that were negotiated with the lower management were ever finalized. Even though ABB Kenya was making reasonable offers, these were not being taken up. The managing director of ABB Kenya at the time, who had little knowledge and experience of the Kenyan market, could not understand the reason for the lack of customers' interest. When Gitonga was appointed as

representative of ASEA Ltd., he recommended that whenever the local customers approach the company, they should be given an opportunity to present and discuss their case with the top management and decisions should be made at the negotiation table even if it meant lengthy negotiations. Implementation of these recommendations yielded immediate positive results. The customers started to buy the electrical equipment from ASEA Ltd. and the company increased its market share drastically within a short period of time.

Tetra Pak in Kenya: Tetra Pak operates in Kenya through a wholly owned subsidiary Tetra Pak Converters Ltd. (TPC). According to the firm's production manager, the Kenyan government in 1950 initiated the idea of having Tetra Pak's packaging machines, filling lines, and packaging materials in Kenya. The purpose of inviting Tetra Pak was to improve the packaging and distribution of milk within the country. Tetra Pak started its operations in Kenya through a Swedish agent Anton Petterson & Henius in 1956. In 1969, Tetra Pak took over the leasing of machines from Anton Pettersson & Henius and established a new company, Tetra Pak Converters Ltd. (TPC). According to TPC managing director, the main product offered by Tetra Pak is packaging materials, and its main customer is the Kenyan Cooperative Creameries (KCC). Almost 40% of the milk produced by KCC is in the form of the long-life milk, known as MALA. It is notable that MALA was developed by Tera Pak following the learning from its market research that people traditionally preferred fermented milk in Kenya. Since MALA represented a traditional product, it was easier to introduce in the local market and showed significant growth despite a very short sales promotion campaign. Conversely, based on its experience of selling porridge in South Africa in especially designed packaging, the firm assumed incorrectly that the same packaging would also work in Kenya. The poor performance of this product led to the learning that Kenyans like to eat porridge in traditional cups or glasses. TPC had to abandon the packaged product and started to sell porridge in traditional cups and glasses in accordance with the local market taste. The product has taken off since. Similarly, packaged yogurt also did not succeed. At the KCC's request, TPC developed the high-cream milk which enabled the firm to expand its liquid milk market in Kenya.

DPC SKAFTE in Lithuania: DPC Skafte is a Swedish firm collaborating in Lithuania with a local firm. According to the DPC managing director, there exists a wide cultural gap between the two partners. The Lithuanian partner lacked the experience of managing a company commercially. This lack of expertise stems from the fact there was no market economy under the Russian administration. Furthermore, an acute shortage of money meant that special financial arrangements had to be drafted such as five year payment period with low interest rates. DPC found the morale of the Lithuanian employees was difficult to judge. The firm found Lithuanian administrative procedures not only different, but also very bureaucratic: everything must be registered; each product must be documented; each document must be translated; and payment must be paid for each individual product. Moreover, Lithuania does not have a properly developed legal system. Instead, personal contacts especially with the government officials are critical to doing business in Lithuania. DPC Skafte found that it had no choice but to adapt to the Lithuanian legal system. Further, the firm had to develop a strong social network in order to secure the necessary finance as DPC learned that in order to keep operations smooth, it was easier if a local representative handles such matters.

ACCEL Share Company in Lithuania: ACCEL Share Company produces and sells climatic system components and electronic equipment for the European Automotive Industry. The firm

company has product development and production facilities in Lithuania operated through a joint venture with a local company, AB TERRA. ACCEL Share Company. The Swedish partner owns 51 %, and the Lithuanian partner 49% of the company. According to the Swedish Managing Director, negotiations with the Lithuanian customs authorities are difficult and time consuming that can delay deliveries for up to 3-4 days. ACCEL finds it has no choice but to wait for the clearance. Over time, ACCEL has learned to handle such problems by making longer planning horizons and allowing greater time for negotiations with the concerned authorities. ACCEL has learned that the local work force operates at a slower pace and that their attitudes are still fashioned by the old Soviet
System making business operations more costly.

Bulten Tools Share Company in Poland: Bulten Tools Share Company is a public company listed on the Stockholm stock exchange. It has three major areas of operation: the automotive industry, general industry, (which produces screws and stainless material), and the electronics/ telecommunications industry (which produces screws for mobile phones). Bulten Tools established a joint venture in Poland with local partners with Bulten retaining 93% of the ownership. The negotiation process to form the joint venture was lengthy and resources consuming. More than ten meetings in Poland and Sweden were conducted following the initial expression of interest.The main focus of these negotiations was to formulate the contract, fix the price, and to assess the value of the company. Once the deal was finally signed, it took another five months for government approval. The bureaucracy involved the Ministry of Interior through to the Ministry of Agriculture because the company had bought some industrial land, and a number of parties had to sign it. In addition, the deal had to pass through the Ministry of Defense, because the company was going to use screws, which, according to the Polish officials, could potentially also be used in the weapons industry. One of the biggest obstacles faced by the Bulten was communication since only five out of the 525 Polish employees spoke English. Bulten decided to tackle this problem with the use of translators in the short-term, and through employee training and hiring a English speaking management team in the medium to long-term. It would be another fifteen months before Bulten management felt that it was able to communicate with some of the Polish employees effectively. For example, through an American Head Hunting Company, a financial director was selected – A Pole who spoke English and knew the Polish bookkeeping and tax laws, as well as the Western controlling principles. It is worth pointing out that competition for such personnel is intense as foreign firms entering Poland continues to rise.
Transition to a market economy is still a big challenge for the Polish people. The concept of marketing did not exist in the Polish language until 1990. Another cultural problem is that employees do not respond well to the delegation of responsibility. The general view is that the boss should take, and be responsible for, every decision so if something goes wrong, it would be his fault. Bulten learned that the Polish mindset shaped by the planned command economy for almost fifty years, meant that the locals had adjusted to the idea of someone doing something for them, someone else planning for them, while they simply followed orders to achieve specified targets. The underlying premise begin that if you don't take any initiative or do anything on your own then you will never make any mistake and hence could never be penalized. Such attitudes affect team building and business operations. In addition, the bureaucratic environment is complex and lengthy. It takes a long time for import/export clearance as each document has to be negotiated. This is partly because the Polish Customs officers work on a commission which is directly related to the level of the duty they are able to impose. As much as one third of their

total salary is made up of commission in this manner. Not surprisingly, they try their best to raise the amount of duty paid by the importers. As a result, the company is affected by the delays in production and delivery, as a direct consequence, more people have to be employed resulting in higher costs. Bulten management feels that these factors have negated the initial objective of selecting Poland as a low production cost country. However, low wage costs mean Bulten still has some cost advantages overall.

XYZ Share Company in Russia: XYZ Share Companyestablished a joint venture in Russia in collaboration with another Swedish firm. XYZ owned 85 % of the shares, and the other Swedish firm owned the rest. The Russians did not own any shares in the company. The cultural issues highlighted included the importance of personal contacts at the exclusion of all other factors. Compared to Sweden, where relationships are developed along business lines and offering a quality product at a competitive price is an important consideration, everything takes longer as you first have to cultivate personal friendships. XYZ learned that the Russians were used to responding to a very strong, clear and strict regime dictated from a very dominant leader who could tell them exactly what to do. The workers were used to operating in an environment where initiative and creativity were not encouraged. XYZ and its Swedish partner had to look for an authoritarian manager. However, this selection impacted the relationships between such a 'dominant' manager and the Swedish 'democratic' counterparts. Further, the Russian manager still needed clear instructions and guidelines from the Swedish management before proceeding with anything. XYZ also learned that Russian employees including top management happily take up additional jobs elsewhere if they came across an opportunity to earn extra money. The employees did not always give priority to their own company. XYZ has attempted to bridge this cultural gap through formal and informal training methods with some degree of success especially among the younger employees.

Discussion

The findings are discussed in relation to the constructed Process Model of Acquiring Cross-Cultural Competence in Foreign Markets (Figure 1) as follows.

Cultural Preparations: The above case studies show that, in general, the need and the application of cultural preparations are not well conceived or understood by the Swedish international executives. This cultural myopia has resulted in financial losses. Those who took the trouble found cultural preparations to be worthwhile. For example, DPC Skafte before forming the alliance with the Lithuanian partner identified that developing personal contacts at the individual level with the authorities is more important than having a quality product or service. This knowledge helped to assign and manage company's scarce resources. This cultural aspect was critical to DPC's eventual success. Tetra Pak developed successful products after identifying that people in Kenya prefer fermented milk, and developed high-cream milk in collaboration the local Kenyan customer, KCC. Conversely, when Tetra Pak attempted to market packaged porridge and yogurt without any regard for the local culture and tradition, their efforts were met with failure.

International Firm-Local Host Market Interaction: These cultural gaps for ABB Kenya related to power distance and the speed of decision making. The former meant that for the Kenyan customers, presenting their issue to the top management was more important than the quality of the goods. While, the latter meant that the Kenyan customers sought immediate answers and

decisions. The two aspects were very important within the Kenyan context, but only unfolded after interaction with the local customers and only after losing a number of customers. In the case of Tetra Pak, the successful products were only those that were developed as a result of interaction with the local market. It took time for Tetra Pak to learn that personal contacts play a critical role in interacting with customers in these markets. Until such knowledge was developed, the cultural gap hindered the company-customer interaction, strained relationships and impacted the effectiveness of the business operations negatively. Personal relationships as a prerequisite to doing business were also confronted by ACCEL Lithuania, DPC Skafte Lithuania, Bulten Poland and the XYZ Russia, while slow bureaucracy and the slow pace of work were another aspect of the cultural gap. The degree of uncertainty avoidance in the case of DPC Skafte is low while the opposite is the case with its Lithuanian counterpart. Inability to communicate in a common language was particularly detrimental to Bulten Poland operations. The Swedish firms learned that their Eastern European partners tended to be passive and expected to wait for someone else to make the decision for them which impacted the employees' capacity to work and necessitated hierarchical organizational structures.

Results: In cases where there were advance cultural preparations, the firms achieved positive results. These preparations can either be at the beginning of a firm's operations in a foreign market, or after the firm has already started its operations but before launching a product. For Tetra Pak and DPC Skafte, the positive impact of the cultural preparations included the realization and the subsequent identification of a suitable local representative who could handle the cultural differences which enabled these firms to increase their respective market share. In the case of ACCEL Lithuania and XYZ Russia, cultural unpreparedness meant that the firms suffered enormous delays in planning and delivery as well as higher production costs. Unpreparedness for firms operating in Eastern Europe and Russia, in particular, resulted in poor financial performance due to differences in working practices which slowed down the operations, while the uncertainty resulted in the waste of management time and resources.

Learning: Learning includes both factual learning through cultural preparation and experiential learning, as well as through interaction and observing the results achieved. For example, ABB Kenya learned that there is power distance and an expectation on part of the Kenyan customer to get an answer immediately when negotiating. Another learning was that negotiating with top management was critical to finalizing a deal in Kenya, as was the cultivation of personal relationships with customers. Tetra Pak Kenya learned that products and packaging were culturally bounded and that cultural norms do not necessarily conform across different African countries. DPC Skafte learned that the Lithuanians are not commercially minded and developing personal contacts with the Lithuanian authorities plays a decisive role in business deals, and that the culture has a high level of uncertainty avoidance. ACCEL Lithuania and Bulten Poland learned that negotiations are lengthy and resources consuming, and that employees have different work ethics, working culture and punctuality norms. Bulten Poland learned that language barriers impacted its operations considerably and realized that the firm was misguided in thinking that interpreters would suffice. Instead, Bulten Poland had to hire English speaking Polish managers, but it took 15 months before the firm felt that it had resolved the communication problem. XYZ Russia learned that employees work best with autocratic leaders and are used to carrying out specific instructions which meant teamwork and team building was difficult to enforce.

Adaptation: As a result of their interaction with the local market and as a direct consequence of their learning, the Swedish firms made several adaptations: shifting the focus on developing personal relationships; refraining from referring customers to lower level management; finalizing decisions at the time of negotiations; developing new products and packaging designs were developed; dropping products and packaging which clashed with the local culture; redefining organizational structures employing autocratic managers; accepting longer planning and negotiating timelines. The executives from all sample firms were unanimous in stating that if these cultural adaptations were not made by them, their firms would not have survived in their respective foreign markets.

Cross-Cultural Competence: The factual learning acquired from advance cultural preparation, as well as through market interaction combined with the results and adaptation can help firms to understand which aspects of culture in the foreign market influence its operations and what measures should be taken to minimize the identified cultural gaps to achieve better results. The acquired cultural competence has a positive impact on the firm's operations, learning capability and in reducing the cultural gap. Only as a result of this process (Figure 1), international firms can more easily understand and handle cultural differences and their consequences.

Conclusions

The findings emphasize the importance of cross-cultural management in international business operations. Yet, international firms tend not make any cultural preparation before launching their products and services in foreign market. Any cultural awareness that may exist within the firm,tends to be of a very basic nature. Much of the learning takes place by doing through direct interaction after entering a target market. The findings establish linkages between the level of the international firm's cross-cultural competence and the effectiveness of its business operations. Evidence shows that acquiring cross-cultural competence is a process. A Process Model of Acquiring Cross-Cultural Competence in Foreign Markets is constructed based on these linkages.The evidence shows that learning and adaptation critically contribute to, and raise the level of cross-cultural competence enabling international firms to formulate timely measures to manage cultural differences. Such measures yield superior results; help to avoid cultural blunders; increase competitiveness; and support positive image building within the target host market. It follows that conscious cultural preparations i.e. factual learning and learning by doing, are critical to making the necessary cultural adaptations, which, in turn, raise the cross-cultural competence of an international firm entering a foreign market and thereby minimize the cultural gap, as well as the negative impact of cultural differences on business operations.

INTERNATIONALIZATION OF SMALL AND MEDIUM ENTERPRISES: A PERSPECTIVE FROM SMES IN THE U.K

Syeda-Masooda Mukhtar, King AbdulAziz University, Saudi Arabia

Abstract

Operating in a global environment poses additional challenges as businesses face greater and more informed competition; more culturally diverse and discriminating customers; more disparate markets; and shorter response times than ever before. The challenges faced by Small and Medium Enterprises (SMEs) are greater in magnitude simply because such businesses are 'small'.The aim of this paper is to explore internationalization from the SME perspective. The findings based on a survey of over 1500 SMEs in the UK, show that small firms are still intimidated by the prospect of internationalization and by and large, their owners perceive themselves to be ill equipped to accommodate the transition from being a local/national business to becoming an international operator.

Keywords:_SMEs; UK; Barriers; Internationalization; Drivers; Globalization; Exports; Services; Manufacturing_

Introduction

Assisted by technological advancements, the unrelenting drive towards business globalisation continues to gather momentum.The business environment is fast changing where old assumptions and frameworks no longer apply.Competition is becoming more widespread, and an organization's ability to cope with uncertainty is more critical than ever before. Farmer and Richman (1965), for example, identify such uncertainties to include the nature of the economic system (i.e. whether predominantly under private or public sector), the level of competition, whether exchange is based on sound money, the degree of governmental control over economic activity, factor endowment, and size of the market. Notably, the nature of competition itself is fast changing. The sheer scale of an organization is no longer a guarantee of a secure market position, neither is past performance a reliable guide to future prospects."Competitive forces are all-embracing on the global battle field. Twenty-four hour a day competitors are probing for areas of weakness, market outposts that are asleep or otherwise unready" (Coulson-Thomas, 1992, p11-12). Regional groupings of states representing one particular market can fragment overnight as in the case of the former Soviet Union, and the more recent British exit from the EU, or are forged to protect national trading interests, such as the BRIC economies. Apart from making market operations complex, such formation of trading groups blurs the division between what is national and what is international i.e. is the EU internal market national or international to an organization? All these factors greatly influence the economic environment within which a firm operates and thereby dictate its decision-making process.

In such a turbulent environment, organizations find themselves in an exposed and vulnerable position. Their decision-making processes often require fast response times and immediate actions in order to stay ahead of their competitors.The speed of response can develop or destroy a major commercial opportunity. John F. Welch, Chairman and CEO of General Electric, states that speed is the driver sought by all of today's organizations and agility is critical to competitive success (in Hitt et al., 1995). In an attempt to deal with market uncertainties, organizations are

driven towards internationalization to spread their risk by having a diverse portfolio of activities, not depending on one particular market, and the SMEs are no exception.

However, it is surprising to note that while SME internationalization have been a topic of academic scrutiny for two decades now ,'globalization' as a subject, is still studied primarily from a large firm perspective This is partly because SMEs are perceived as regional players, a vehicle for <u>regional</u> economic and employment regeneration (Birch, 1979; 1981). Internationalization' and 'globalisation' are, therefore, terminologies which are not readily associated with the small business sector. It is further suggested that any internationally-based activities on part of small firms can, at best, be described as *ad hoc* (Bilkey and Tesar, 1977; Bannock, 1987) which are usually"unplanned, reactive and opportunistic" (Bradley and Mitchell, 1986).

Irrespective of how SMEs embark on the path to internationalization, there is a growing evidence that internationalization is inevitable if they are to survive and grow in the global economy (APEC 2015). Yet, despite being "a major source of growth and job creation, SMEs appear to be under-represented in the international economy relative to their contribution in the national local economies" (OECD, 2008, p.15). This begs the question: why SMEs remain reluctant to engage with the international markets despite operating in the information age, and despite being supported by a myriad of government initiatives worldwide (Figure 1)? We set out to explore this question.The findings pertain to SMEs in the UK.

Figure 1: Focus of Government Support Programs Assisting SME Internationalization

SMES and Internationalization

There are several definitions of internationalization (Table 1). At its most basic, the term internationalization simply refers to a firm's involvement in international markets. Notably, the two major rival theories that have dominated the discipline are the Uppsala model (Johanson and Wiedersheim-Paul 1975; Johanson and Vahlne, 1977) stipulating gradual engagement in international markets through experiential learning, and the transactions cost theory (Coase 1937; Williamson, 1975) according to which circumstances compel firms to absorb and internalize international transactions under its own organizational hierarchy. Other popular theories include the Network theory (Johanson and Mattsson, 1988), International Entrepreneurship theory

(McDougall and Oviatt, 2000) and the related International New ventures (INVs). Detailed analyses of these perspectives are well documented in the literature (e.g. Gelbuda et al., 2015). Just as the theoretical perspectives vary, so do the firms' motives to internationalize. Drivers for SME internationalization are cited as growth, profit, knowledge acquisition, network ties and reducing dependency on the local markets (Barnes et al., 2006; Camara and Simoes, 2008; Garvey and Brennan, 2006; So Won Jeong, 2015: Kocker and Buhl, 2007; Reynolds, 2007; Rundh 2007; Stoian, 2006).

Table 1:Definition of Internationalization

Author	Year	Definition
Welch and Luostarinen	1993	Internationalization is the outward movement of a firm's international operations
Calof and Beamish	1995	Internationalization is the process of increasing involvement in international operations
Johanson and Mattson	1993	Internationalization is the process of adapting firms' operations (strategy, structure, resources etc.) to international environments
Johanson and Vahlne	1990	Internationalization as a cumulative process in which relationships are continually established, developed, maintained and dissolved in order to achieve the firm's objectives
Lehtinen and Penttinen	1999	Internationalization as developing networks of business relationships in other countries through extension, penetration and integration
Lehtinen and Penttinen	1999	Internationalization concerns the relationships between the firm and its international environment, derives its origin from the development and utilization process of the personnel's cognitive and attitudinal readiness and is concretely manifested in the development and utilization process of different international activities, primarily inward, outward and cooperative operations
Ahokangas	1998	Internationalization is the process of mobilizing, accumulating and developing resource stocks for international activities

(Source:http://www. conceptme. pt/conceptme/images/9/97/

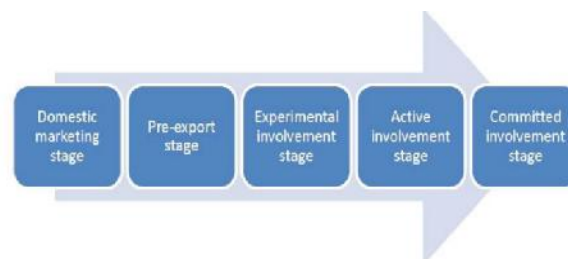
Despite the gains accrued from SME internationalization (Achtenhagen, 2011; Kalinic and Forza, 2012; Lee et al., 2012; USITC, 2010), research findings show that SMEs tend to be export averse (e.g. Czinkota and Johnston, 1981) despite possessing such natural advantages as an ability to innovate and respond swiftly to their external environment compared with larger firms (Levy and Powel, 1998).This export aversion is attributed, in the main, to a lack of knowledge of potential markets, inability to formulate market entry strategies, and lack of financial resources (Czinkota and Usric,1983; Edmunds and Khoury, 1986; Leonidou, 2004; Rabino, 1980; Seely and Iglarsh, 1981). Evidence also suggests that when offered, the take-up of export assistance is often poor on part of small firms (Bell et al 1992) making the task of SME internationalization

even more daunting (Seringhaus, 1986, 1987; Thomas and Araujo, 1985).Relatedly, Table 2 lists the barriers to internationalization.

Table 2: Barriers to Internationalization (Ranked by the SMEs)

1	Shortage of working capital to finance exports
2	Identifying foreign business opportunities
3	Limited information to locate/analyse markets
4	Inability to contact potential overseas customers
5	Obtaining reliable foreign representation
6	Lack of managerial time to deal with internationalisation
7	Inadequate quantity of and/or untrained personnel for internationalisation
8	Difficulty in matching competitors' prices
9	Lack of home government assistance/incentives
10	Excessive transportation costs

Source: OECD 2009

Internationalization may take various forms. Within the context of this study, we define internationalization as exporting activity, the most common form of international involvement for SMEs (UNCTAD, 2016). Relatedly, 72% of all government assistance programs worldwide tend to be export-centric (OECD, 2008). The six stages of Innovation Related Model (Figure 2) by Andersen (1993), is based on the export/total sales ratio, and postulates that every stage is an innovation for the firm (Gankema et al., 2000). The underlying premise being that exporting as a strategy for growth is the direct result of having an innovator within the firm (Vissak, 2003). It is worth pointing out that the number of stages may vary according to a particular innovation-related model (Bilkey and Tesar 1977; Cavusgil, 1980, 1982;Czinkota, 1982; Reid, 1981).


Source: Andersen 1993
Figure 2:Innovation Related Model

It follows that the export competence of small firms is not only critical to the owners and managers of SMEs, but is of paramount importance to both policy makers and policy deliverers. It is argued, however, that existing models offer partial insights into export development at best (Leonidou and Katsikeas, 1997). "No… model adequately explains the success of some companies to internationalize" (Etemad and Wright, 1999, p.9).Against this background, we set out to empirically analyse factors associated with, and influencing SMEs exports with a view to gaining insights into the process internationalization, as well as the owner-managers' perceptions and capabilities pertaining to internationalization.

Empirical Data

The data were gathered through a national survey based on a questionnaire which included responses on a Likert scale. The sample constituted randomly selected SMEs from the database of a national business organization. The internal reliability was acceptable based on the Cronbach's Alpha 0.88. 44.6% of the 1534 businesses in the sample were limited companies; proprietorship (28.5%) and partnerships (26.6%). In terms of size, 35.3% of businesses in the sample reported a turnover size of £150K-£499K, while 40.8% had a turnover greater than £500K (Table 3).The turnover is skewed towards larger businesses with £324,500 as the mean.

Table 3:Sample Distribution by Turnover Size (N=1534)

Turnover Size (£)	(%)
<44K	6.4
45K-89K	6.8
90K-149K	10.8
150K-499K	35.3
500K-999K	18.1
1M-4.9M	18.8
5M plus	3.9

In terms of employees, 62.3% of businesses in the sample had fewer than 10 people. The mean level of employment was 12 people (Table 4).

Table 4:Sample Distribution by Number of Employees (N=1534)

Number of Employees	(%)
1-4	32.4
5-9	29.9
10-19	20.3
2—49	12.2
50-99	3.8
100 plus	1.4

Table 5 shows the distribution of sample businesses by the industrial sector. The majority of businesses belonged to the manufacturing sector (23%) followed by services (27.0%) and the retail sector (20.1%).

Table 5:Sample Distribution by Industrial Sector (N=1534)

Industrial Sector	(%)
Agriculture	1.9
Construction	5.0
Manufacturing	23.0
Transport	4.0
Wholesale	7.3
Retail	20.1
Hotel/Catering	3.3
Printing/Publishing	2.7
Services (Financial/Business and other)	27.0
Professional	2.7

Other	2.9

45.3 % of businesses described themselves as 'expanding' businesses in terms of growth while 12.7% defined themselves as declining businesses; and 42% as static businesses (Table 6).

Table 6:Distribution of Businesses by the Stage of Growth (N=1534)

Stage of Growth	(%)
Expanding	45.3
Declining	12.7
Static	42.0

Findings

A detailed discussion of the hypotheses developed is omitted due to space limitations. Key findings are summarized as follows.

- Only a minority (32.5%, n=499) of businesses in the sample exported at all, while the majority of businesses (67.5%, n=1035) reported no international operations.

- Analysis by sector revealed that the professional sector showed the highest international activity at 43.7%.With the advent of new communication channels, it may very well be the case that professional businesses are now more able to engage in international activities than ever before. Other internationally oriented sectors include business/finance and other services (42.5%), transport (39.3%), and manufacturing (20.9%). Surprisingly, however, over 85% of retail firms had no exporting operations.

- It is not surprising to find a direct relationship between size of the firm and its propensity to undertake international operations. Exporting is far more significant in larger firms. Overall, over half of all businesses with a turnover size of £1M or more export, while less than 20% of firms with £150K report any international activity.

- Similar pattern emerges when international activity by employment size is analysed with over 60% of businesses with 50 or more employees engaged in exporting operations. The analysis reveals that firms with 'above average' exporting is only relevant to businesses with more than 10 employees.

- Expanding businesses have the greatest propensity to export (37.4%) while the proportion of static and declining exporting businesses is quite similar at around 28%.Comparison of SMEs experiencing actual growth and SMEs expecting growth in the future, show little divergence in international activity. In other words, the expanding businesses participate at an 'above average' level in the international process, which is also the case for businesses that expect future expansion.It is possible that businesses which have experienced expansion in the past are also likely to be the most optimistic about their future growth and thus most likely to report projected expansion in exports in the future and *vice versa.*

- Table 7 shows that by far the largest area of international operation for UK based SMEs is the European Union (79.2%) followed by North America (33.4%) and Asia (21.5%).Disaggregation of international regional activity reveals that the relative ranking of these three exporting destinations remains unchanged irrespective of the industrial sector, size, and growth rates of businesses in the sample. These results are congruent with the finding that 25% of EU SMEs export with only 13% active in markets outside the EU (European Commission, 2010).

- When the non-exporters were asked why they did not export, the majority (72%) attributed their reluctance to internal factors relating to firm-level capability and resource constraints

(Table 8). The most prominent include the lack of managerial ability; not knowing where to begin; poor knowledge of foreign markets; and the scarcity of time to engage in exports. The most notable external factors relating to the business operating environment include the lack of government support; training; access to finance; and economic uncertainty. These findings are congruent with earlier research alluded to above.

Table 7:Principal Exporting Destinations (N=499)

Exporting Area	Number of Businesses (%)
European Union	79.2
Eastern Europe	10.2
North America	33.4
South America	8.9
North and Central Africa	10.6
Middle East	14.0
Asia	21.5
China (inc. Taiwan)	17.7
Japan	7.8
Indonesia	0.7
Australia and New Zealand	1.0

Table 8:Factors Preventing Exports(N=1035)

Internal Factors(72%)	External Factors (28%)
Managerial ability to export	Government support
Do not know how to begin engaging in exports	Training opportunities
Knowledge of foreign markets	Access to additional finance
Availability of time to explore foreign markets	Economic uncertainty

- When the non-exporters were probed into how they knew if they lacked in managerial ability to export, or lacked in their knowledge of foreign markets, it was clear that their responses were based on their perceptions of themselves rather than on actual personal experience. In other words, it is possible that the SMEs reluctance to export is influenced by the owners' perceived barriers. No significant differences were observed across sectors in this regard. However, the size of business was correlated in that larger size SMEs put a greater emphasis on external factors compared with small businesses.

- Exporting did not feature high on the owner-managers' agenda in our study. In fact it ranked the lowest overall among their 20 most pressing business concerns. This finding substantiates the export-averse attitude of SMEs alluded to above.

Concluding Remarks

The evidence shows that despite the unrelenting drive towards globalization, small firms' owners remain apprehensive and reluctant to engage in international activity. The majority SMEs in our survey does not engage in exports, and do not plan to engage in exports.Any international activity that does take place tends to be restricted to countries which are within close geographical vicinity. SMEs in the services sector have the highest propensity to internationalize

their operations, as do the larger and expanding SMEs. Non-exporters have little idea about how to begin the process of internationalization.Despite acknowledging that internationalization offered opportunities for growth, taking part in international operations was still perceived as intimidating by SMEs in our survey.Their reluctance to take advantage of internationalization, in part, appears to be self-imposing. While this aspect is a subject for further investigation, it is clear that as a policy measure, there is a need to propagate awareness among the SME owners that they, compared to larger firms, possess a greater ability to exploit and penetrate niche markets swiftly in a global environment where there is a growing trend towards specialist and segmented, rather than standardized products, complemented by their managerial structures that are adaptable and less bureaucratic, and operations that are more flexible and require less lead and response times.

THE INFLUENCE OF NARCISSISM ON COUNTERPRODUCTIVE WORK BEHAVIOR: THE ROLE OF ORGANIZATIONAL JUSTICE AS MODERATOR

Zainnur M. Rusdi, Universitas Lampung, Indonesia
T. Hani Handoko, Universitas Gadjah Mada, Indonesia

Abstract

Narcissism is one of personality traits. Narcissist is likely to involved in aggressive behavior and other deviants when ego is threatened. Ego threat will lead to counterproductive work behavior that harm organization. Counterproductive work behavior is often linked to organizational justice, because someone will involved in counterproductive work behavior when perceived injustice in workplace. Perceived injustice will strengthen the influence of narcissism on counterproductive work behavior.

This study is aimed to examine the influence of narcissism on counterproductive work behavior and to analyze the role of organizational justice (distributive justice, procedural justice, and interactional justice) as moderator.The results indicates that narcissism did not influence counterproductive work behavior, in addition, distributive justice and procedural justice did not moderate the positive influence of narcissism on counterproductive work behavior. However, interactional justice moderated the positive influence of narcissism on counterproductive work behavior.

Keywords: *counterproductive work behavior, justice, moderated and narcissism.*

Introduction

The term of narcissism comes from Greek mythology, the story of a young man, Narcissus, who fell in love with his own reflection in the pool, which ultimately led to the death as a result of vanity (King, 2007). The term of narcissism was first introduced in 1898 in the psychology literature by Ellis and Nacke. It attracted the attention of Freud to the study of personality and narcissist's behavioral traits. Narcissism becomes an important construct in Freud's thinking of meta psychology throughout the year 1914 (Raskin & Terry, 1988). Currently, the term of narcissism described a pervasive pattern of overt grandiosity, self-focus, and self-importance behavior, displayed by an individual or groups of individual (American Psychiatric Association, 2000, cited in King, 2007).

Narcissism is a personality dimension, not just a psychological disorder. Emmons (1987) states that the extreme narcissism will lead to pathological disorder, whereas low level of narcissism is reflected as part of the personality. Based on Raskin & Terry (1988), more than a thousand books and articles have been written about narcissism, almost described it as clinical disorder. However, research has shown that narcissism can be measured as a personality (Emmons, 1987; Raskin & Terry, 1988).

Narcissism can lead to acts of aggression. Narcissism and self concept clarity is a significant predictor of anger, depression, and verbal aggression, related to negative feedback (Stucke & Sporer, 2002, cited in Judge et al., 2006). Exaggerated sense of love or inappropriate favourable view of self, tend to lead to acts of aggression, as a result of ego threat (Baumeister et al., 1996). Personality is linked with counterproductive work behavior. Skarlicki et al. (1999) linked the

negative affectivity and agreeableness with retaliation. Narcissism as personality has not been much studied in relation to counterproductive work behaviors (Penney & Spector, 2002).

Some research has linked of narcissism on counterproductive work behaviors (Penney & Spector, 2002; Judge et al., 2006). Counterproductive work behavior has various terms, such as workplace aggression (Neuman & Baron, 1998), workplace deviance (Robinson & Bennett, 1995), and retaliation (Skarlicki et al., 1999). But basically, that behavior disrupts the organizations and people related to organizations such as employees and customers (Penney & Spector, 2002).

Counterproductive workplace behavior often associated with organizational justice (Skarlicki & Folger, 1997; Skarlicki et al., 1999; Jones, 2009; Ambrose et al., 2002). Organizational justice related to perceptions of employees about the fairness or the treatment received in the workplace. There are three forms of justice (Jones & Martens, 2009) are distributive justice (perceived fairness by employee related to outcome), procedural justice (fairness of the procedures used to determine the outcome), and interactional justice (perceived of interpersonal treatment by the employee when the procedure is executed). Perceptions of injustice led to counterproductive work behavior. Ambrose et al. (2002) explained that organizational injustice is the main trigger of sabotage. Skarlicki & Folger (1997) states that employees will give the response of unfair treatment by negative emotions, and drives reaction in behaviors such as stealing or damaging (Greenberg, 1990).

Based on the theory of threatened egotism and aggression (Baumeister et al., 1996), aggressive behavior resulting from the ego threat, which leads to negative emotions. Narcissistic individuals are very sensitive to negative information and situations that challenge the positive image of themselves (Anderson, 1994, cited in Penney & Spector, 2002). The absence of justice would threaten the narcissist's ego, then become a driving force for narcissist to counterproductive work behavior.

Previous research examined the influence of narcissism on counterproductive work behavior, mediated by the ego threat, such as anger (Penney & Spector, 2002). Judge et al. (2006) examined the direct influence of narcissism on counterproductive work behavior by using self report and others. However, previous studies have not explained the factors that strengthen or weaken the direct influence of narcissism on counterproductive work behavior. The aims of the study are to analyze the influence of narcissism on counterproductive work behavior and to examine the role of organizational justice (distributive justice, procedural justice, and interactional justice) as moderator.

Literature Review and Hypotheses Development

 1. Narcissism

Narcissism reflects a set of attitudes, beliefs, and behavioral tendencies that may have an impact on each organization's criteria such as leadership, contextual performance, and task performance, in unique way (Judge et al., 2006). Emmons (1987) has developed measurement of narcissism, narcissistic personality inventory (NPI). Emmons (1984) examined the construct validity of the NPI and found four dimensions, which are labeled: (1) Exploitativeness/Entitlement (involve a heavy interpersonal manipulative content - expectations of favors, exploitation of others), (2) Leadership/Authority (emphasize enjoying being a leader and being seen as an authority), (3) Superiority/Arrogance (theme of superiority and grandiosity, and since one also has to be a bit arrogant), (4) Self-absorption/Self admiration (reflect traditional aspect of narcissism, such as liking to look at oneself in the mirror). Four dimensions showed high narcissism.

Narcissists have the extremes emotional in forming superiority, even if they are not sure their superiority is worthy (Bushman & Baumeister, 1998). Narcissists have a high self-esteem. Theory of threatened egotism and aggression (Baumeister et al., 1996) suggests that narcissist are likely to encounter information that challenges a positive image of oneself, the response of that will lead to aggression.

2. Counterproductive work behavior

Counterproductive work behavior has been conceptualized in a number of ways (Fox et al., 2001), including organizational aggression (Neuman & Baron, 1998), workplace deviance (Robinson & Bennett, 1995), retaliation (Skarlicki & Folger, 1997), and sabotage (Ambrose et al., 2002). Counterproductive work behaviors include acts such as theft, spreading rumors at work, or late for work. Almost every day, there are media reports of workplace deviance, whether it be corruption among police officers, violence in the post office, or illegal activity on Wall Street (Robinson & Bennett, 1995).

Fox & Spector (1999) found a positive relationship between situational constraints experienced by employees (frustration) and counterproductive work behavior, as a response to frustration (personal and organizational aggression), which was mediated by affective reactions to frustration. Frustration is affected reactions of people to work situations due to blocking an individual's goal attainment (Peters & O'Connor, 1980). The management of negative deviant behavior in the workplace is growing concern in organizations globally since such behaviors can be detrimental to their financial well-being (Appelbaum et al., 2007).

3. Organizational Justice

Organizational justice is a term used to describe the role of justice which is related to the workplace. Specifically, organizational justice associated to how employees determined whether they are treated fairly in their work. There are three forms of justice (Jones & Martens, 2009) are distributive justice (perceived fairness by employee related to outcome), procedural justice (fairness of the procedures used to determine the outcome), and interactional justice (perceived of interpersonal treatment by the employee when the procedure is executed).

4. Narcissism and Counterproductive Work Behavior

Theory of threatened egotism and aggression (Baumeister et al., 1996) argued about narcissistic individuals, because they are very sensitive to negative information, likely to encounter information or situation that challenge their positive self appraisal. In response to these challenges, or ego threat, the individual may experience negative emotions such as anger, frustration, or hostility, which turns into aggression.

Narcissism has dimension of authority, superiority, and high self esteem (Emmons, 1987). Narcissists believe that they are centre of everything (Konrath et al., 2006). Narcissists behave aggressively when they perceived an ego threat (Konrath et al., 2006), criticized or rejected by others (Campbell et al., 2004a). Ego threats which most often studied in research of aggression is a negative feedback or criticism (Bushman & Baumeister, 1998). Negative feedback such as failure in performance of task and criticisms related performance can threaten the ego of narcissist. Ego threat is a negative emotion or anger. It may be a manifestation of hostility, frustration, absenteeism, and reduced performance will lead to counterproductive work behavior. The hypothesis can be constructed in this research as follows:

H1:   Narcissism has positive influence toward counterproductive work behavior.

5. Distributive Justice as Moderator

Skarlicki & Folger (1997) examined the relationships of organizational justice with retaliatory (a form of deviant behavior), which is defined as the response behavior of employees, over the unfair treatment. Skarlicki & Folger (1997) also found that distributive justice, procedural justice, and interactional justice, interact to explain retaliatory. Based on equity theory of Adams, one would determine whether he was justly rewarded by comparing the input (effort) and the output they get, to the input and the output received by others. Organizational justice is also related with social exchange theory, which one would give in return for the benefits that received from the other party.

Narcissist will respond to the other parties related to perceived justice from supervisors or co-workers. If employees feel injustice, they will feel unhappy, upset, and angry, thus tend to be involved in aggressive behavior (O'Leary-Kelly et al., 1996). Narcissists have extremes emotional. Narcissist will be angry and feel ego threat, if did not perceived distributive justice, such as in terms of salary or a promotion. Ego threat led on acts of aggression that is counterproductive work behavior. Injustice is a common trigger of sabotage (Ambrose et al., 2002). Thus, distributive justice would strengthen the influence of narcissism on counterproductive work behavior. The hypothesis can be constructed in this research as follows:

H2a: Distributive justice moderated the positive influence of narcissism on counterproductive work behavior.

6. Procedural Justice as Moderator

Fair procedure is defined as a procedure that is not biased, based on accurate information, applied consistently, represent the entire section, can be corrected, and appropriate ethical standards (Leventhal, 1980, cited in Stecher & Rosse, 2005). Formal procedure is defined as the degree to which fair procedures were present and used in the organization (Moorman, 1991).

Fair procedures make individuals tend to be responsible for problems, than if the procedure is applied unfairly (Skarlicki & Folger, 1997). Procedural justice moderate the tendency of retaliatory, it will be maximum when distributive justice and interactional justice is low (Skarlicki & Folger, 1997). If the procedure be unjust (decision making), it will lead to retaliation (Cropanzano & Folger, 1989). Therefore, the hypothesis can be constructed in this research as follows:

H2b: Procedural justice moderated the positive influence of narcissism on counterproductive work behavior.

7. Interactional Justice as Moderator

Interactional justice is appeared when decision makers treat people with respect and sensitivity and explain the rationale for decisions thoroughly (Colquitt, 2001). Narcissism is characterized by feeling superior and more self praise and appreciation from others (Wallace & Baumeister, 2002). If the source of injustice was interactional, individuals tend to engage in

retaliation (Ambrose et al., 2002). Thus, interactional justice strengthen the influence of narcissism on counterproductive work behavior, the hypothesis can be constructed in this research as follows:

H2c: Interactional justice moderated the positive influence of narcissism on counterproductive work behavior.

Research Method
1. Sample and Data Collection
Data were collected through a survey of company managers in Bandar Lampung. Criteria used in sampling is at least have one year tenure at the company. Overall 220 questionnaires were distributed, and 173 questionnaires were returned, the response rate 78,64%. The 47 questionnaires were not returned, 9 questionnaires cannot be used. Accordingly, total questionnaires that can be further analyzed for this study were 164 questionnaires. In general, majority of respondents were 133 male (81,1%), with an average of age 41,56 years old, the majority of respondents were 152 married (92,7%), the educational background of the respondents were under graduated with more than ten years tenure.

2. Measures
A. Narcissism
Narcissism is excessive sense of love toward self-image. Measurement of narcissism using narcissistic personality inventory (NPI) which developed by Emmons (1987). Four dimensions of narcissism are labelled: (1) Leadership/ Authority ("I would prefer to be a leader"), (2) Exploitativeness / Entitlement ("I find it easy to manipulate people"), (3) Superiority / Arrogance ("I always know what I am doing"), (4) Self-absorption / Self-admiration ("I think I am special person"). Respondents were asked to fill out a list of statements about narcissism that consists of 37 item statements, using Likert scale (1 = strongly disagree to 5 = strongly agree). The reliability of 37 item scale was $\alpha = 0,913$.

B. Counterproductive Work Behavior
Counterproductive work behavior scale (fox & Spector, 1999) contains 27 items, but there is one item that is adjusted (taken any kind of drug to get high at work (including alcohol)) be "smoking when doing the task". This is done to reduce bias in eastern cultural context, which tends to give a neutral answer related to the sensitive item. Respondents were asked to fill out 27 statements of counterproductive work behavior (1 = strongly never to 5 = very often). The reliability of 27 item scale was $\alpha = 0,915$. One example of statements were "purposely did your work incorrectly".

C. Organizational Justice
Measurement of organizational justice was measure using Moorman (1991) item scale. Distributive justice was measured using five statements ("Fairly rewarded considering the responsibilities") with $\alpha = 0,834$. Procedural justice was measured using seven item statements ("Procedures designed to have all sides affected by the decision represented") with $\alpha = 0,866$. Interactional justice was measured using six item statements ("Your supervisor considered your view point") with $\alpha = 0,826$. The entire statements were 18 items (1 = strongly disagree to 5 = strongly agree).

D. Control Variable

Characteristic of the respondents was measured to ensure the influence of narcissism on counterproductive work behavior to be unbiased. Gender is included as a control variable, because previous studies have found a correlation between gender and aggression (Eagly & Steffen, 1986). Tschanz et al., (1998) also examined gender differences in the structure of narcissism, there is a difference between men and women related to the dimensions of narcissism, which showed that men are more narcissistic than women.

Results

Table 1 shows mean, standard deviation, and correlation between variables. Based on table 1, narcissism correlated with counterproductive work behavior ($r = 0, 162, p < 0,05$). Distributive justice ($r = -0,185, p < 0,05$), procedural justice ($r = -0,256, p < 0,01$), and interactional justice ($r = -0,408, p < 0,01$) are negatively correlated with counterproductive work behavior.

Table 1. Mean, Standard Deviation, and Correlation between Variables

Variables	M	SD	Narcissism	DJ	PJ	IJ	CWB
Narcissism	3,3354	0,41727					
DJ	3,7402	0,69324	0,107

** $P < 0,01$

Hypotheses testing used moderated regression analysis. There are four steps are performed: (1) entering control variable, (2) entering control variable and independent variable, (3) entering control variable, independent variable, and moderating variable, (4) entering control variable, independent variable, moderating variable, and interaction.
Prior to hypothesis 1 testing, gender are controlled in this study, so the results are not biased by confounding variable. The control variable (gender) had no significant effect ($\beta = -0,149$; t $= -1,924$; $p > 0,05$). Table 2 shows the results of hypotheses testing.

Table 2. Result of Hypotheses Testing

	2,363	2,660	

*P < 0,05
**P < 0,01

Hypothesis 1 states that narcissism has positive influence toward counterproductive work behavior, is not supported (β = 0,139; t = 1,773; p > 0,05). Furthermore, hypothesis 2a states that distributive justice moderated the positive influence of narcissism on counterproductive work behavior, is not supported (β = 0,396; t = 0,502; p > 0,05). Hypothesis 2b states that procedural justice moderated the positive influence of narcissism on counterproductive work behavior, is also not supported (β = 0,998; t = 1,308; p > 0,05). Hypothesis 2c states that interactional justice moderated the positive influence of narcissism on counterproductive work behavior, is supported (β = -2,363; t = -2,660; p < 0.01).

Discussion

Hypothesis 1 states that narcissism has positive influence toward counterproductive work behavior, is not supported. These results are contradicted to study by Judge et al., (2006) that examined the direct effect of narcissism on counterproductive work behavior using self-report and other-report. Not supported for hypothesis 1 because the influence of narcissism on counterproductive work behavior requires mediation of ego threats such as anger and frustration, which ultimately led to the act of aggression, as shown in study of Penney & Spector (2002). Not supported for hypothesis 1 that testing direct effect of narcissism on

counterproductive work behavior, supporting the theory of threatened egotism and aggression (Baumeister et al., 1996), which states that aggression is often caused by combination of self-esteem and ego threat.

The results are also influenced by eastern culture context where study was conducted, namely the concept of face (positive self-image), related to prestige (Kim & Nam, 1998). Chinese culture holds the concept of personal dignity, fear of losing face and status, to maintain harmonious social relationships (Cardon, 2006). Asian people are very concerned with positive self-image compared to the western (Kim & Nam, 1998). Thus, in the context of face, respondents tend to give a neutral answer on the item statements of narcissism (mean = 3,3354; SD = 0,41727).

Then, hypothesis 2a states that distributive justice moderated the positive influence of narcissism on counterproductive work behavior, is also not supported. Hypothesis was not supported because of the perception of distributive justice are not perceived at low levels (mean = 3,7402). Perceptions of fairness regarding the distribution of benefits also influenced by cultural context (Conner, 2003; Kim et al., 1990).

Individuals in individualistic cultures (e.g., USA) are very concerned with the allocation of rewards than individuals of collectivist cultures that tend to consider equality (Conner, 2003). East Asians did not respond to injustice as negative as North Americans, their perceptions of injustice are less likely to be detected (Li & Cropanzano, 2009). Individuals of collectivist cultures are very concerned with social harmony rather than self-interest (Li & Cropanzano, 2009). The study was in context of collectivist cultures, which tend not very concerned with the allocation of rewards and give attention to social harmony. Consequently, distributive justice means less important in the context of collectivist cultures.

Hypothesis 2b states that procedural justice moderated the positive influence of narcissism on counterproductive work behavior, is also not supported. Skarlicki & Folger (1997) suggests that the relationship between organizational justice and counterproductive work behavior will be stronger when interactional justice and procedural justice are low. Hypothesis 2b is not supported because perceived procedural justice are not at low level (mean = 3,8040), so it did not lead to counterproductive work behavior.

Cultural context where study was conducted also influence the individual's perception of procedural justice. Procedural justice associated with decision making procedures (Lind & Earley, 1992). Fair process as part of procedural justice had significant effect for individuals in individualistic cultures than individuals of collectivist cultures (Conner, 2003).

Hypothesis 2c states that interactional justice moderated the positive influence of narcissism on counterproductive work behavior, is supported. When source of injustice is interactional, individuals tend to engage retaliation than when source of injustice is distributive and procedural (Ambrose et al., 2002). Perceptions of justice also influenced by cultures. Fraternal relationship became an important element in the perception of justice in East Asia, which is concerned with social harmony (Li & Cropanzano, 2009).

Conclusion

Not supported the influence of narcissism on counterproductive work behavior, indicating a mediating role of ego threats such as anger in explaining the influence of narcissism on counterproductive work behavior. Based on the theory of threatened egotism and aggression (Baumeister et al., 1996), which states that aggression is often caused by a combination of self-esteem and ego threat.

Organizational justice consisting of procedural justice and distributive justice did not moderate the positive influence of narcissism on counterproductive work behavior. Hypothesis was not supported because of distributive and procedural justice are not on the low level. Perceptions of fairness also influenced by the cultural context where research is conducted, tend to be collectivism. Thus, not really concerned with the allocation of reward and prefer collective decision making.

Interactional justice moderated the positive influence of narcissism on counterproductive work behavior. Interactional justice associated with interpersonal treatment received by individual, so the impact is more sensitive to individual. Context of collectivism cultures is very concerned on social harmony, making interactional justice as the most important element in the perception of fairness.

Implication

Theoretically, this study confirmed the factors that strengthen or weaken the influence of narcissism on counterproductive work behavior, using organizational justice as moderator. Interactional justice strengthen the influence of narcissism on counterproductive work behavior. Meanwhile, the implication for managerial is to help corporate management to understand the factors that reinforce the occurrence of counterproductive work behavior. Given the importance of perceptions of justice in the workplace, especially interactional justice, the interpersonal treatment that maintain social harmony will reduce the occurrence of counterproductive work behavior, especially in the context of eastern cultures that tends to feminine and collectivism.

Limitation And Future Research

Sampling in this study using purposive sampling techniques (non random sampling), thus generalizing the results of research must be done carefully. Therefore, future research should use random sampling techniques, so that the generalization of the results will be higher.

The use of self-report data to assess narcissism and counterproductive work behavior, are less able to provide accurate reports and tend to bias related to social sensitivity of variables used in the study. Future research should also use other-report in measuring narcissism and counterproductive work behavior. Thus, the report will be provided more accurately.

Research conducted cross-sectional data with correlation design, consequently made it less able to explain the causality of the variables. Future research should use experimental designs to explain the causality of the variables.

THE EFFECTS OF TECHNICAL AND FUNDAMENTAL FACTORS ON THE INVESTMENT DECISION AND THE COMPANY VALUE IN THE AGRICULTURAL SECTOR

Mamay Komarudin

Abstract

This study aims to analyze the influences of technical variables, which consist of the stock price and the Total Volume Activity (TVA), as well as fundamental variables, which consist of the Price Book Value (PBV) and the Debt to Equity Ratio (DER) on the investment decisions and the company value measured by using the PER of some companies of agricultural sector listed in the Indonesian Stock Exchange. Path analysis is used as the data analysis method. The research results show that one of the technical factors that significantly influences the investment decision and the company value is the stock price. Meanwhile, one of the fundamental factors that influences the investment decision and the company value is the PBV. The hypothesis testing showing that the stock price factor and the PBV factor have positive effects on the value of agricultural sector company is proven or accepted. On the other hand, the other variables, according to *theorema trimming*, are proved to be not includable in the path calculation if the path is proved to be insignificant, in this case the DER and the trading volume variable.

Keywords: *Debt Equity Ratio (DER), stock price, company value, investment decisions, Total Volume Activity (TVA) and Price Book Value (PBV)*

Introduction

As a large agrarian country, Indonesia certainly has significant economic opportunities, especially in the agrarian sector. It is called an agrarian country because more than 40% of the Indonesian population either directly or indirectly, depend their lives on the agricultural sector. Therefore, the agricultural sector plays an important role in the national economy.

This sector also becomes a primary sector for many other sectors. It is simply because the products produced by the agricultural sector are also needed by the other sectors. Considering this condition, the agricultural sector certainly provides more opportunities for investors to make their investments through the capital market. Capital market is one of investment media that connects the investors, the party who have funds and hopes of gaining profit, with the companies, the party who are in need of capital for development.

Investors certainly expect maximum financial profit of their investment shares. That is why they, including those investing in the Indonesian Stock Exchange (BEI), will choose companies with great future prospects. To view the companies' prospects, the investors can do it by assessing their stock value. Recently, assessing and investing in the agricultural sector seems to be very promising.

Despite being profitable and interesting, stock investment is also classified as a high risk investment. Public company share is highly sensitive to changes, either good or bad, due to

changes in politics, economics, and monetary in foreign or domestic scope. Such changes can have a positive impact which means increasing the stock exchange, or a negative one which leads to the contrasting result. For that reason, in stock investment, an investor should conduct an analysis of factors that may affect a company, in order to minimize losses that could arise from the fluctuation in the growth and the development of the company in concern. In analyzing and selecting the stocks, there are two aspects or approaches that are often used, namely fundamental aspects and the technical aspects.

According to Rifman (2002), in a technical analysis, an investor tends to act pragmatically. To make an investment, an investor does not have to bother to review the various fundamental factors (such as the interest rate, the level of ownership, the financial ratio, the balance sheet, and etc.). In order to obtain the expected return, the indicator used is the movement pattern of the previous stock price and trading volumes. Technical analysis users believe that things like a sense of optimism, pessimism, and anxiety have been reflected in the stock price.

The fundamental aspects are identified to be able to affect the stock price that reflects a company's performance. A fundamental analysis is done by investors by using the company's financial data to calculate the stock value. Therefore, financial report is a very essential information. It is because a financial report describes the fundamental aspects of a company that is quantitative. An investment selection depends on several factors. One of the influential factors is the price of financial conditions that is described in financial ratios. By conducting a fundamental analysis, an investor can project and assess a company that can benefit the investor.

Fakhruddin (2008) explains that financial ratios, based on the purpose, are classified into five types, namely liquidity ratio, leverage ratio, activity ratio, profitability ratio, and stock ratio (common stock ratio). Liquidity ratio is a ratio that is intended to measure a company's liquidity, such as current ratio, cash ratio, quick ratio, and net working capital. The more a company is liquid, the more its stocks will be demanded, and that fact will obviously rise the price. Leverage ratio is a ratio that is intended to measure how far a company's assets are financed by debt, for example: debt to total assets, net worth to debt ratio, debt to equity ratio, time interest earned ratio, fixed charge coverage ratio, and debt service coverage. The more a company is able to pay its debts is, then the more its stocks will be demanded, and thus the share price will also rise.

Share ratio describes the parts of a company's profits, dividends and capital that are distributed to each share. Share ratio includes price earnings ratio, earning per share, dividend per share, dividend yield, payout ratio, price to book value, and book value per share. The greater the dividends are distributed, then the higher the share price will increase. The increase and the decrease of the company's ability indicated in the financial ratios may affect the demand and supply of the company's stock. As the result, it affects the stock price changes. An investor must have a strategy to invest his wealth in the stock market. The strategy is useful for arranging a portfolio. The portfolio arrangement is primarily aimed to reduce the level of risk faced by the investor.

In several studies conducted in the Indonesian capital market, most of the researches conducted studies relating to the fundamental and technical analysis only. A research by Fernandez-Rodriguez (1999) states that more than 90% of investors give a higher tendency to use technical analysis than fundamental analysis in buying and selling stocks. This can occur due to the investors' short-term-oriented tendency to buy or sell stocks.

An analysis of shares must be carefully conducted, especially regarding the level of return and risk. The analysis is expected to be the basis of decision making. The right decision will be able to provide an optimal result. Investors will be able to know stocks from many different sectors. If we look further, the stock performance of agribusiness in the stock market shows a rapid growth.

This is shown by the indexical movement graphic of the agricultural sector, which is higher on the stock exchange, compared to other sectors or to the IDX composite movement in the same period of time (Sugiartawan et al, 2013). Agribusiness companies are likely to produce greater returns than other companies or other issuers, so that investment eligibility in the agricultural sector, especially in the form of shares, will affect the generated investment returns.

The agricultural sector contributes 25.7% toward the company value in Indonesia's trade balance in 2008 until 2013 (http://agriwarta.fp.ub.ac.id). It is also noted that in 2013, the total export of agricultural products reached 23.89 million tons that was valued at US$ 22.2 billion (http://www.antaranews.com). The following table shows the share price development in agricultural sector in 2009-2013.

Table 1. The Average Stock Price of Agriculture (in IDR) (Years 2009-2013)

No.	Sector	Years				
		2009	2010	2011	2012	2013
1	Agriculture	1,913.647	2,344.557	2,456.066	2,248.026	2,139.96

Source: www.idx.co.id (processed)

Table 1 shows that the average stock price of agriculture sector fluctuated from 2009 to 2013. Table 1 also shows that agriculture sector decreased consistently for over the last five years. Although agricultural sector experienced a decline in stock price, agricultural sector is important for the Indonesian economy.

Based on this background, this study aims to analyze the influence of technical variables, which consists of shares and Total Volume Activity (TVA), and the fundamental variables which consist of Price Book Value (PBV) and Debt to Equity Ratio (DER), on the investment decisions and the company value in the agricultural sector, which is listed in the Indonesia Stock Exchange.

Theoretical Framework and Hypothesis

Fischer and Jordan (1991) defined that "an investment is a commitment of funds made in the expectation of some positive rate of return". It means that an investment is made based on a hope of obtaining a positive rate of return from the investment activities of the committed funds. Francis (1991) defined that "an investment is a commitment of money that is expected to generate of additional money". It means that an investment is the company's value on the money invested in the hope of obtaining additional money from the investments. Based on those statements, thus investment is allocating money or funds with the hope to obtain additional or certain advantages over those money or funds.

Based on the movement of the stock price index, the agricultural sector has a very fluctuating share price index movement. The movement fluctuation also influences the generated stock returns. The investor's decision is strongly influenced by the value of the received return value. Return has become the main indicator of a company's ability to create value for the investors in the form of dividend payments or capital gain.

To make a profit is the main reason for people to invest. In investment management, the investment profit rate refers to *return*. Thus, it is very reasonable if an investor demands a certain level of return on the funds he/she has invested. The expected return is a compensation for the opportunity cost and the risk of declining purchasing power due to the effects of inflation.

Investment process is a series of profitable activities in a purchase of tangible assets/securities. An investment process revolves around investment decisions relating to maximizing the wealth of an investor. An investment process should be based on the results of a technical and a fundamental analysis. According to Rode et al, (1995), the basic theory of technical analysis is a trading technique that uses some data in a specific time period that can be used for making an investment decision. So the object of technical analysis is to create a prediction, from a time-series data, by using an accurate prediction calculation method. Fundamental analysis is an analytical tool that is highly correlated with a company's financial condition. Darmadji (2006) showed that fundamental analysis is one way of conducting stock assessment by studying or observing the various indicators related to the macroeconomic conditions and the industrial condition of a company. Fundamental analysis is an analysis based on real data to evaluate or project the value of a stock.

A technical analysis can be based on the stock price and the trading volumes. The stock price formed on the market has already reflected all the available information. Factors, like the interest rate, the concentration of ownership, the company size, the profitability, the GMS (General Meeting of Shareholders), the growth, and so on, do not need to be analyzed quantitatively. The stock price is more like a function of demand and supply of the shares. The stock price that is formed individually or overall on market tends to follow the trend direction for a relatively long period of time. There are price patterns that will recur in the future. Indeed, the stock price movement patterns, that is based on the past price-movement observations, is contradicting the efficient market hypothesis, that says the stock performance in the past will not affect the stock performance in the future. The stock price is used by approximately 90% of the stockbrokers (Van Eyden, 1996 in Lawrence, 1997).

According to Ang (1997), the total volume activity of the stock price is determined by the demand and supply. This approach emphasizes the importance of the future investor's behavior based on the past, so that the analysts study the stock price changes by using the trade historical data. A technical analysis can also be done by using a stock assessment of the statistical data generated from the trading activity, such as the stock price, the trading volume, the demand and supply of a particular stock, or the overall market. One way that is frequently used by the analysts is charting (images and graphics). According to the graphics, how are the market trends, the securities, and the future commodities that will be selected in an investment are all clearly viewed. The analysts conduct a study using a chart with intention that they can find a price movement pattern, so that they can exploit it for profit. This technique ignores matters relating to the financial position of the company.

In addition to observing the stock price and the trading volume, performance measurement is also one of the important factors that are useful for the company's financial planning. Debt to Equity Ratio (DER) reflects the company's ability to meet all obligations. It is indicated by how much personally-owned capital is used to reduce the debt. DER shows balance between the debt burden and the personally-owned capital. DER also provides a guarantee on how much debt is guaranteed by the company's personally-owned capital. The selection of additional alternative capital usually comes from the debt, because in general the debt has several advantages (Brigham and Gapenski, 1997). Firstly, the interest will reduce the tax, so that the cost of debt is low; secondly, the creditors obtain limited return, so that the shareholders do not have to share the profits when the business conditions are improving; thirdly, the creditors do not possess the voting rights, so that the shareholders can control the company with the inclusion of small funds. More use of debt, which are reflected by the increasing debt ratio (the ratio of debt to total assets), at the same Earnings Before Interest and Tax (EBIT) will result in a greater earning per

share. If the earning per share increases, it will also have an impact on the increase of the stock price increase or the stock return. Theoretically, DER will have a positive influence on the stock return.

An investment decision can be influenced by the DER and PBV as the company's source of fund ability and the company's profitability in gaining profit. When investors want to invest their capital stock, especially in agriculture, they also have to consider Price per Book Value (PB or PBV). PB or PBV is a kind of ratio that is also often used by investors to assess a certain company, which is measured by PER. By using the ratio between the price and the net income (price earnings ratio - PER) to determine the market price and the earnings per share, the investor can calculate the share PER. Greater earnings lead to lower the share PER and vice versa. However, it should be understood that because stock investment is more associated with expectations, the net income used in the calculation is usually projected for the current year. Thus, it is also understood that if the issuers can gain a huge profit, then the shares will be pursued by the investors, because the projected profit for the current year is likely to rise. The PER magnitude will change following the price change in the market and the net profit projection. If the price rises and the profit projections remains the same, then practically the PER will also rise. On the contrary, if the projected earnings rises, and the market price does not move then the PER will go down. PER is often used as an indicator by the investors to make investment decisions in the stock. There is an assumption saying that lower PER means cheaper price of the stock concerned.

The hypotheses formulated in this study are the variables that have been defined as having influences on the value of agricultural enterprises. The hypothesis in this study are:

H_1: The stock price has a positive and significant impact on the investment decisions

H_2: The stock trading volume has a positive and significant impact on the investment decisions

H_3: PBV has a positive and significant impact on the investment decisions

H_4: The Debt to Equity Ratio has a positive and significant impact on the investment decisions

H_5: The share price has a significant and positive effect on the firm value

H_6: The stock trading volume has a significant and positive effect on the firm value

H_7: The PBV has a positive and significant effect on the firm value

H_8: The Debt to Equity Ratio has a positive and significant effect on the firm value

H_9: the investment decision has a positive and significant effect on the firm value

Research Methodology

The study was conducted by collecting the secondary data from 22 companies in the agricultural sector whose shares are listed on the Indonesia Stock Exchange, which consists of three sectors namely: plantations, fisheries, and other agricultural sectors as listed in table 2.

Table 2. The List of Agricultural Sector Issuers in the Indonesia Stock Exchange (BEI) 2014

No.	Stock Code	Name of Issuer
\multicolumn{3}{c}{Plantation Sub-Sector}		
1	AALI	Astra Agro Lestari Tbk
2	ANJT	Austindo Nusantara Jaya Tbk
3	BWPT	Eagle High Plantations Tbk
4	DSNG	Dharma Satya Nusantara Tbk
5	GOLL	Golden Plantation Tbk
6	GZCO	Gozco Plantations Tbk
7	JAWA	Jaya Agra Wattie Tbk
8	LSIP	PP London Sumatra Indonesia Tbk
9	MAGP	Multi Agro Gemilang Plantation Tbk
10	PALM	PT Provident Agro Tbk
11	SGRO	Sampoerna Agro Tbk
12	SIMP	Salim Ivomas Pratama Tbk
13	SMAR	Smart Tbk
14	SSMS	Sawit Sumbermas Sarana Tbk
15	TBLA	Tunas Baru Lampung Tbk
16	UNSP	Bakrie Sumatra Plantations Tbk
\multicolumn{3}{c}{Fisheries Sub-Sector}		
17	CPRO	Central Proteina Prima Tbk
18	DSFI	Dharma Samudera Fishing Industries Tbk
19	IIKP	Inti Agri Resources Tbk
\multicolumn{3}{c}{Other Sectors}		
20	BISI	BISI International Tbk
21	BTEK	Bumi Teknokultura Unggul Tbk
22	CKRA	Cakra Mineral Tbk

One of sampling techniques included in non-random sampling is the purposive sampling. In this research, sampling was done by using an approach through purposive sampling method, where data is taken based on certain considerations, and the requirements made as the criteria need to be fulfilled by the sample in order to obtain a representative sample (Sugiono, 2004).

The sampling was done by using purposive sampling method with the purpose to obtain a representative sample using the following criteria:

1. The agricultural companies in the plantation sector are listed in the Indonesia Stock Exchange and were active in doing transactions during 2010-2014 period.
2. The Companies completed their annual financial statements in the period of 2010-2014.

Based on the sampling criteria as mentioned above, the samples used in this study are 8 companies, as listed in table 2 below:

Table 2. Sampling Process Research

No.	Description	Company
1	Agricultural companies listed in the Stock Exchange in 2014	22
2	Agricultural companies not consecutively registered in 2010-2014	16
3	Agricultural companies in the plantation sector listed in the Stock Exchange in 2014	16
4	Agricultural companies in the plantation sector listed in succession in 2010-2014	8
5	Companies completing annual financial statements in the period 2010-2014	8
6	Companies consistently presenting financial statements of each observation period, namely 2010-2014	8
7	The company research samples	8

Source: The Indonesia Stock Exchange

Based on the process of sampling, there were 8 companies involved. The research was conducted during the period of 2010 to 2014

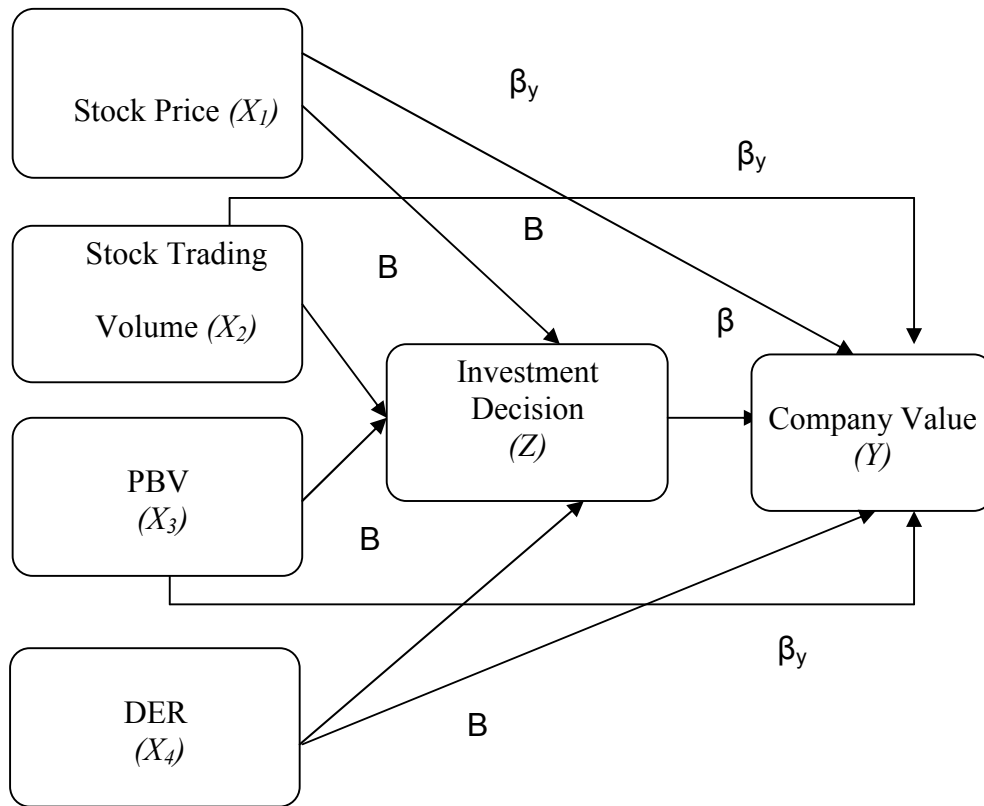
The Research Design


Figure 1. Research Conceptual Framework

Path Analysis

Path Analysis is an analysis to determine the contribution of the effects of each variable *X* and *Y* that use standardized variables. By using path analysis, the causal effect between the variable and the position of each variable in the pathway, either directly or indirectly, will be estimated. The model significant appears based on beta coefficient *(β)*, which is significant to the path.

Based on the results, these coefficients can be described as follows.

Z: βo = βzx1 + βzx2 + βzx3 + βzx4 +ε 1 ....(Equation 1)
Y: βo = βyx1 + βyx2 + βyx3 + βyx4 +βyz + ε 2 .... (Equation 2)
Note:
Y = company value
Z = investment decisions
X₁ = stock price
X₂ = stock trading volume
X₃ = PBV
X₄ = DER
β0 = intercept
ε 1.2 = residual variable / error

The result of the new structure are recalculated at each path coefficient. Based on the result, the direct and indirect effect, as well as the total effect, can be seen. The calculation step is to calculate the direct and indirect effects, as well as the influence of technical and fundamental factors toward the company value through intervening the investment decision variable *(Z)* and then calculating the remaining residual variable, that is variables other than the independent variables and intermediate variables that also affect the dependent variables, but are not included in the research model.

Discussion

1**. The Descriptive Statistics of the Research Variables**

Table 3 summarizes the results of the calculation of descriptive statistics on the variables used in this study.

Table 3. Descriptive Statistics Result

Variable	Minimum	Maximum	Mean	Std. Deviation
Stock Value *(X₁)* (IDR)	50.00	26,200.00	4,901.57	7,620.86
Stock Trading Volume *(X₂)* (million IDR)	3.00	25,229.00	6,182.17	7,181.46
PBV *(X₃)* (%)	0.14	5.72	2.14	1.31
DER *(X₄)* (%)	0.16	4.52	1.17	0.94
Investment Decision *(Z)* (million IDR)	-0.68	2.65	0.21	0.43
Company Value *(Y)*	-7.17	66.55	14.34	11.82

Source: Processed data, 2016

Table 4.8 shows that the average price of the companies' shares in 2010 until 2014 was IDR 4,901.57. The stock price value was in the range of IDR 50 to IDR 26,200. Meanwhile, the average price of the companies' shares in 2010 until 2014 was IDR 4,901.57, and the standard deviation was IDR 7,620.86. This indicated that the standard deviation value is away from the average value and the data dissemination is getting smaller. The standard deviation value indicates that the sample companies have stock prices that tend to be high, reflected through the companies' stock prices that is away from the average value and its variation is greater.

The average of the companies' trading volumes in 2010 until 2014 is IDR 6,182.17. The trading volume is in the range of IDR 3 million to IDR 25,229 million, whereas the standard deviation of the company's assets in 2010 until 2014 is IDR 7,181.46 million. It means that the sample companies tend to have low stock trading volumes, viewed through the sample companies' stock prices that moved close to the average value and its smaller variations.

The average PBV of those companies, from 2010 to 2014 is 2.14%. The PBV value is in the range of 0.14% to 5.72%. Whereas, the PBV standard deviation of the companies in 2010 to 2014 is 1.31. This indicates that the standard deviation value is away from the average value and the data distribution is getting greater. The DER average of the companies from 2010 to 2014 was 1.17%. The DER value is in the range of 0.16% to 4.52%. Whereas, the DER standard deviation of the companies from 2010 to 2014 was 0.94%. It means that the sample companies have a trading volume that is likely to be low, seen on the companies' stock prices that approach the average value and their variations get smaller.

The average investment of the sample companies from 2010 until 2014 is IDR 0.21 million. The investment value is in the range of negative IDR 0.68 million to IDR 2.65 million. Whereas, the

standard deviation of the investment decisions from 2010 until 2014 is IDR 0.43 million. The average value measured by the companies' PER from 2010 to 2014 is 14.32%. The PER value is in the range of negative 7.17% to 66.55%. Whereas, the PER standard deviation is 0.43%.

After conducting the descriptive analysis, the next step is to develop an empirical model by performing data processing stage, including data normality and hypotheses test. The hypotheses testing is conducted by formulating the null hypothesis *(Ho)* and the alternative hypothesis *(Ha)* first, to test the effect of stock price, trading volume, PBV and DER on the investment decisions and the value of the companies. The data analysis was performed by using data normality test and path analysis.

2. The Analysis Result of the Inferential Statistic Data

The data normality testing used in this study is the Kolmogorov-Smirnov test. This test is used to determine whether the operational variable data in the empirical model tested has a normal or abnormal distribution. The Kolmogorov-Smirnov testing condition is when the two comparisons or one have a significance level (two-tailed) that is greater than 0.05, which means the data has a normal distribution. If both comparators have a significance level (two-tailed) that is less than 0.05, then the data distribution is abnormal. The data normality test result is shown in Table 4 below.

Table 4. Normality Test Data with the Kolmogorov-Smirnov

Variable	K-S Z*	Significance	Description
Stock Price *(X₁)*	1.290	0.121	Normal Distribution
Stock Trading Volume *(X₂)*	1.461	0.128	Normal Distribution
PBV *(X₃)*	0.431	0.992	Normal Distribution
DER *(X₄)*	0.890	0.406	Normal Distribution
Investment Decision *(Z)*	1.162	0.121	Normal Distribution
Company Value *(Y)*	1.155	0.139	Normal Distribution

Source: Processed data
Note:* K-S Z: Kolmogorov-Smirnov test

Table 4 shows that the stock price variable *(X₁)*, the stock trading volume *(X₂)*, the PBV *(X₃)* and the DER *(X₄)* as well as the investment decision *(Z)* and the enterprise value *(Y)* have a normal distribution. The Kolmogorov-Smirnov test calculation shows normal distribution in all variables (significance value > 0.05).

The next step to conduct is the path analysis where it will describe each path in the model by using a path analysis. Each path tested shows that there are direct and indirect influences of the stock prices, the trading volume, the PBV and the DER factor, toward the investment decision, and the value of the agricultural sector companies. Before testing whether there is any direct or indirect influence, each path significance needs to be tested first.

Based on the result, we all know how much the influence (either direct or indirect) and the total effect of factors, such as: the stock price (X_1), the stock trading volume (X_2), the PBV (X_3), and the DER (X_4), as the independent variables on the company value (Y), as the dependent variable, through investment decisions (Z), as the intermediate variables. We also calculate the residual variable (e) that is an independent variable other than the free variable or the intermediary, which also influences the dependent variable but was not included in the research model. The results of the path analysis and the hypothesis testing are described in table 5 below.

Table 5. Path Coefficient and Hypotheses Testing Value

Hypothesis	Free Variable	Bound Variable	Beta (β)	t-calculation	ρ-value
1	Stock Price (X1)	Investment Decision (Z)	0.265	2.175	0.048
2	Stock Trading Volume (X2)	Investment Decision (Z)	0.028	0.169	0.867
3	PBV (X3)	Investment Decision (Z)	0.527	2.376	0.023
4	DER (X4)	Investment Decision (Z)	-0.015	-0.089	0.930
5	Stock Price (X1)	Company Value (Y)	0.280	2.272	0.012
6	Stock Trading Volume (X2)	Company Value (Y)	0.050	0.296	0.769
7	PBV (X3)	Company Value (Y)	0.566	2.606	0.013
8	DER (X4)	Company Value (Y)	-0.013	-0.079	0.937
9	Investment Decision (Z)	Company Value (Y)	0.265	2.686	0.010

Source: Processed data
Note: ** = Significant at $\alpha = 5\%$

Based on the result of the coefficient regression, the modeling can be described as follows.

$$Z = 0.265X1 + 0.028X2 + 0.527X3 - 0.015X4 \dots \dots (1)$$
$$Y = 0.280X1 + 0.050X2 + 0.566X3 - 0.013X3 + 0.265Z \dots (2)$$

After obtaining a multiple linear regression model, the next step is to test whether the model developed is BLUE (Best Linear Unbiased Estimator). BLUE assumptions that must be addressed include: no multi-collinearity, homoscedasticity, and no autocorrelation. The classical assumption testing performed on the two linear regression models are described as follows:

a. Normality Test Model

A data normality test is performed to determine whether the model obtained has a normal distribution or not. The path analysis result model must meet the assumptions of normality conducted on the samples by using the chart plots described in Figure 1 below.
Figure 1. The Result of Normalcy Model Assumptions

Figure 1 shows that the model in regression is able to meet the normality assumption in the model. This is shown through the data spread which is around the diagonal line and follows the direction of the diagonal line, so that the model meets the normality assumption model.

b. Multicollinearity Test
    One assumption underlying the linear regression model is the absence of a perfect linear relationship between some or all of the independent variables. That means the regression model does not violate the assumption of no multicollinearity. The presence or absence of multicollinearity can be seen in the Variance Inflation Factor (VIF). Santoso (2000:234) stated that an indication of multicollinearity will not occur among the independent variables if the VIF is less than 5. The result of the multicollinearity in this study can be seen in table 6.

Table 6. Multicollinearity Test Results

No.	Variable		VIF	Conclusion
1	Stock Price *(X1)*	Investment Decision *(Z)*	2.129	No Multicollinearity
2	Stock Trading Volume *(X2)*	Investment Decision *(Z)*	1.145	No Multicollinearity
3	PBV *(X3)*	Investment Decision *(Z)*	2.051	No Multicollinearity
4	DER *(X4)*	Investment Decision *(Z)*	1.191	No Multicollinearity
5	Stock Price *(X1)*	Company Value *(Y)*	1.238	No Multicollinearity
6	Stock Trading Volume *(X2)*	Company Value *(Y)*	2.076	No Multicollinearity
7	PBV *(X3)*	Company Value *(Y)*	1.191	No Multicollinearity

| 8 | DER *(X4)* | Company Value *(Y)* | 1.085 | No Multicollinearity |
| 9 | Investment Decision *(Z)* | Company Value *(Y)* | 1.238 | No Multicollinearity |

Source: Processed Data

According to table 6, there is no multicollinearity among the independent variables for VIF is less than 5. It means that there is not a perfect linear relationship between some or all of the independent variables.

c. Autocorrelation Test
The purpose of this test is to determine whether in a linear regression, there is a correlation between the linear regression error in the period *t* and the error in period *t-1* (previously). If it happens, then there is a problem of autocorrelation in the regression model. The regression model must not violate the assumption of no autocorrelation. The presence of autocorrelation in the regression model can be detected by observing the magnitude of Durbin Watson (DW). If the DW coefficient is between -2 to +2, then it means no autocorrelation (the investment decision = 1.802 and the company value = 1.902).

d. Heteroscedasticity Test
Heteroscedasticity Test is conducted through a scatter plot graphic test, and in the test result there is no clear pattern, and there is a point spreading wide above and below zero on the *Y* axis. It means that there is no heteroscedasticity among the variables of this study.
The basis for decision making among others are:
1. If there is a pattern like dots (points), which form a certain regular pattern (wavy, widened and then narrowed), then there is a heteroscedasticity.
2. If there is no clear pattern, as well as the points spread above and below zero on the Y axis, then there is no heteroscedasticity.
Figure 2. Scatter Plot

The graphic shows that the data distribution does not form a specific line, or in other words it distributes in random. This means that the independent variable does not form a heteroscedasticity.

Having performed the classical assumption test, a hypothesis test on each path is the next thing to carry out. Table 6 shows the stock price with beta coefficient *(β)* of 0.265 and *ρ-value* of 0.048. Since the *ρ-value* < α or 0.048 < 0.050, the *H1* is accepted. Thus, the hypothesis stating that the stock price has a positive influence on the investment decision is accepted. From the stock trading volume, it is known that the beta coefficient *(β)* is 0.028, with *ρ-value* of 0.867. Since the *ρ-value* > α or 0.867 > 0.050, then *H2* was unaccepted. Thus, the hypothesis stating that the stock trading volume factor positively influences the investment decision is unaccepted.

It is also known that the PBV *(X3)* has beta coefficient *(β)* of 0.527, with a *ρ-value* of 0.023. Since the *ρ-value* < α or 0.023 < 0.050, the *H4* is accepted. Thus, the third hypothesis which states that the PBV positively influences the investment decisions is accepted. While the DER *(X4)* has a beta coefficient *(β)* of -0.015, with a *ρ-value* of 0.930. Because the *ρ-value* > α or 0.930 > 0.050, the *H4* is unaccepted. Thus, the fourth hypothesis, which states that the DER positively influences the investment decision, is unaccepted.

The stock price has beta coefficient *(β)* of 0.280, with a *ρ-value* of 0.012. Because the ρ-*value* < α or 0.012 < 0.050, it means the *H5* is accepted. Thus, the hypothesis stating that the stock price has a positive effect on the company value is accepted. The trading volume has coefficient beta *(β)* of 0.050, with a *ρ-value* of 0.769. Because the *ρ-value* < α or 0.769> 0.050, then *H6* is unaccepted. Thus, the hypothesis stating that the stock trading volume factors has a positive effect on the company is unaccepted. The PBV *(X3)* has beta coefficient *(β)* of 0.566, with *ρ-value* of 0.013. Because the *ρ-value* < α or 0.013 < 0.050, the *H7* is accepted. Thus, the seventh hypothesis which states that the PBV has a positive effect on the company value accepted. Meanwhile, the DER *(X4)* has beta coefficient *(β)* of -0.013, with *ρ-value* of 0.937. Because, the *ρ-value* < α or 0.937 > 0.050, then *H8* is unaccepted. Thus, the hypothesis which states that the DER eight has a positive effect on the company value, is unaccepted. The investment decision *(Z)* has beta *coefficient (β) of* 0.265, with the *ρ-value* of 0.010. Because the *ρ-value* < α or 0.010 < 0.050, then the *H9* is accepted. Thus, the hypothesis which states the DER nine has a positive effect on firm value is unaccepted.

Based on Table 6, it is known that not all pathways are significant, so that some paths are eliminated. The paths that are significant to the investment decision and the company value are only the stock price and the PBV. Similarly, it is proven that the investment decision path affects the company value significantly. Figure 3 displays the hypotheses along with the path coefficients.
Figure 3. Path Analysis Model

According to figure 3 (the path analysis model), the direct or indirect influences of the stock price factor, and the influences of the PBV to the company value *(Y)* can be calculated. Table 7 displays the effect intensity based on the cross coefficient calculation of each variable.

Table 7. The Calculation of Direct, Indirect, and Total Influences

Explanation	Direct Influence	Indirect Influence	Total Influence
	(A)	*(B)*	*C = A + B*
Influence of *X*1 to *Z*			
X1 → Z	0.265	-	0.265
Residual *(ε1)*			0.928
Influence of *X3* to *Z*			
X3 → Z	0.527	-	0.527
Residual *(ε1)*			0.931
Influence of *Z* to *Y*			
Z → Y	0.265	-	0.265
Total Influence	0.265	-	0.265
Influence of *X1* to *Y*			
X1 → Y	0.280		0.280
X1 → Z → Y	-	0.265 x 0.265	0.070
Total Influence	0.280	0.070	0.350
Residual *(ε1)*			0.911
Influence of X2 to Y			
Influence of X3 to Y			
X3 → Y	0.566		0.566
X3 → Z → Y	-	0.527 x 0.265	0.139
Total Influence	0.566	0.139	0.705
Residual *(ε1)*			0.888

Source: Processed data

Based on the calculation of cross coefficients in Table 7, it appears that the total influence of the stock price *(X1)* factor toward the investment decision is 26.5%, which is a direct influence, and the total influence of the PBV *(X3)* toward the investment decision is 52.7%, which is also a direct influence. Meanwhile, the investment decision variable has a direct influence on the total company value *(Y)* of 26.5%, and the total influence of the Stock Price variable *(X1)* to the company value *(Y)* of 28%. Next, the total influence of the PBV variable *(X3)* to the firm value *(Y)* is 56.6%. Thus, the hypothesis stating that the stock price and the PBV factor have positive effects on the company value, especially for companies in agricultural sector, is proven or accepted. Meanwhile, the other variables, according to *theorema trimming,* are proven to be unable to be included in the path calculation if the path is proven to be insignificant, in this case the DER variable and trading volume variable.

The analysis result showed that any reduction on the stock price growth rate by one percent Rupiah will increase the growth rate of the investment decision and the company value. The positive relationship direction between the stock price variable and the investment decision variable shows that the higher the stock price will lead to higher investment decision. This relationship direction is in accordance with the expected relationship direction in the hypothesis. This study is not consistent with the findings of several previous studies because of differences in the research object, the time of the research, and the variable measurement used. This study is also consistent with Putra (2005), whose research concluded that the stock price, the trading volume, and the PER have influences on the investment decision.

The trading volume does not significantly influence the investment decision. This suggests that any increase in the stock trading will not necessarily raise the growth rate of the investment decisions. Thus, the stock trading volume variable does not affect the investment decision-making. The relationship direction of the result is consistent with the expected relationship direction in the hypothesis. Thus, the result of this study is also consistent with Nurrahman (2004) who researched about the effect of stock price, trading volume, and growth rate on the investment decision, concluded that the stock price, the trading volume, and the growth rate variable have significant influences on the investment decision. This research is not consistent with several previous studies because of differences in the research object, the research time, and the research variable measurement used.

The DER does not have a significant effect on the investment decision. This means that any increase in the growth rate of the DER by 1% will not increase the investment decision. Despite the fact that the DER variable is not significant, it has a positive sign to the investment decision. The implication is that in spite of the higher DER, the companies tend to improve the use of debt even further. In other words, even though the sample companies in this study have a high DER, their use of debt is also high. It is because of the high level of debt as the result of fluctuations in IDR exchange rate against USD, which sharply raise the corporate debt. Another explanation is that the companies increased the debt by not paying attention to their DER, as long as the creditors still put trust on the companies, and provide loans. The test result in this study is not consistent with a previous study conducted by Sofiati (2001). In her study concerning the effect of interplay between the debt and the equity on the investment decision of go-public companies in the Jakarta Stock Exchange (JSX), she concluded that the stock price

significantly influences the investment decision and the debt positively affects the equity. However, this positive coefficient is insignificant and it indicates that the company's growth does not relate to the company's investment decision-making. In addition, this research is also not in line with Ravid (2009), who states that the DER has a positive effect on the debt. That is because of differences in the research object, the research time, and the research variable measurement used.

The company value significantly influences the investment decision. This means that any 1 million rise in the growth rate of the company value will increase the investment decision. The positive relationship direction in the result is in line with the expected relationship in the hypothesis. This finding means that a larger company in agricultural sector in BEI will have an investment decision with a greater proportion of debt. The investment decision policy with a funding proportion from a larger debt can cause a higher financial risk. It means that companies in agricultural sector in the BEI is very vulnerable to monetary crisis affecting the financial distress. The result of this study is supportive and consistent with the Pecking Order Theory by Myers (1984). This theory is based on the asymmetric information and explains that when a company conducts financing by issuing new shares, it will cause the earnings per share to fall because the number of shares will increase and the company will not take advantages on the CR income from the debts. Therefore, the Pecking Order Theory describes that the funding sequence should come from the retained earnings as the first alternative, the debt as the second alternative, and the new share issuance of as the last alternative. The result of this study is also consistent with a previous study conducted by Putra (2005). In his study, he analyzes factors that influence the investment decision in manufacturing Industries. It is also consistent with Wahidahwati (2002) who stated that the company has a significant influence on the company investment decision ratio. However, this study is not consistent with Ariyanto (2002) who stated that the company value has a negative effect on the company investment decision.

Conclusion And Recommendation

The research result shows that the stock price is a technical factor that significantly influences the investment decision and the company value. Meanwhile, a fundamental factor that influences the investment decision and the company value is the PBV. The hypothesis stating that the stock price and the PBV have positive influences on the company value in the agricultural sector is proven or accepted. The other variables, corresponding to *theorema trimming,* are proven to be unable to be included in the path calculation if the path is proven to be insignificant, in this case the DER and trading volume variables.

Suggestions that can be proposed in this research are:

a. Companies need to be careful in creating an investment decision. Investment decisions should be based on the result of technical and fundamental analysis that can be taken into consideration for investors in deciding a profitable investment.

b. It is admitted that this research still needs to be improved and followed up by further researches. In order to achieve a better result than the previous studies, further researchers and academia are expected to pay attention on some following details:

    1. The research variables should be added with other study variables that may influence the investment decision (e.g. macro variables such as the exchange rate, the inflation, etc.).

2. The research time should be extended in order to obtain an accurate research results for a long term.
3. The research population needs to be extended by including industries from various backgrounds or adding more variables to gain a better result. Population that is extended by adding other industry sectors will produce a more generalizable result that can be applied to other research objects.

RELATION BETWEEN ECONOMIC GROWTH AND INCOME INEQUALITY AMONG THE REGION
(STUDY CASE ON LAMPUNG PROVINCE)

Toto Gunarto, University of Lampung, Indonesia
Marselina, University of Lampung, Indonesia

Abstract

The high economic growth rate was allegedly not accompanied by equal distribution of income. The high growth in a region believed to actually has a high income discrepancy. This study was conducted to prove this and to determined district/city anywhere that possess high growth but growing or not growing well and the inequality of income that occured using Gini ratio analysis and Klassen typology. The analysis begun with calculating the income inequality between district/city using Gini ratio. Gini ratio results are then linked with economic growth rates using Klassen Typology Quadrant. As a case study used in this study was the case of Lampung province which has particularly 16 districts/cities. The results indicated that there are 8 districts which were in the quadrant I with the districts/cities that its economic growth rate were relatively lower than the provincial average and have a low level of income inequality. There are five districts/cities that were in quadrant I with the districts that the economic growth rate is relatively lower than the provincial average with the level of low average income inequality. There are two cities that were in quadrant III, district/city whose economic growth is relatively higher than the average of Lampung province but with the high level of income inequality. Thus it is proven that high economic growth was not accompanied by equal distribution of income so low that because there was limited budget, then there must be one policy priorities which to prioritize region with high inequality through the policy of reducing income inequality first and then increase growth and improve the quality of growth for region which already had high growth.

Keywords: *gini ratio inequal income, economic growth, klasentypology*

Background

Income inequality is a major issue for national development. The ideal development policy is a policy of inclusive development policies that resulted in high quality, fair and equitable development. But until now the policy of regional development in Indonesia allegedly still not able to actualize the inclusive development. There are still high income inequality between areas where areas with high growth typically have high income inequality. Income inequality is bad for development due to inequal region which will halt the economic growth of other regions. While the low growth areas usually have low income inequality because nothing can be shared among communities. This matter is supported in the research by Esmara (1975) who found that low income gap occurs in areas where growth is too low.

To assess income inequality, Ardani (1996) utilized Williamson index and found that at the early stages of development there will be income gap between regions, but with the passage of time, the gap will be reduced. While other approaches used to calculate inequality between the regions used the Gini index or Gini Ratio.

Uneven economic growth, is suspected as the cause of this income inequality. Klassen typology is one approach that connects the two phenomenon which included in the four

quadrants. Klassen typology in this study is modified by dividing the quadrants based on two indicators: the average economic growth as the vertical axis and the average income per capita as the horizontal axis. The area is divided into 4 (four) classifications, namely (a) the fast forward and fast-growing area, which are areas that have high levels of economic growth and a higher income than the average growth of the province. (b) advanced but suppressed areas, which is the area that has higher per capita income but its economic growth is lower than the average growth of the province, (c) developing region which is an area that has a high economic growth but the level of per capita income is lower than the average income per capita in the province, (d) relatively underdeveloped area which is area that have lower growth and income rates than the provincial average.

Lampung Province as explained in advance has 15 districts/cities. There are several districts/cities including underdeveloped areas with high poverty and several other districts/cities which had made progress, but an exact number has not been obtained. The following are the number of poor between districts in Lampung which presented in the table below.

Table 1. The Amount of Poor and Poverty Line in Lampung Province
Year 2012

District/City Name	Poor Resident Amount (Person)	Poverty Line (Rp/Cap/Month)
Lampung Barat	67.900	269.670
Tanggamus	92.700	250.134
Lampung Selatan	177.700	256.153
Lampung Timur	189.500	257.284
Lampung Tengah	187.000	271.262
Lampung Utara	155.800	274.291
Way Kanan	72.500	241.330
Tulang Bawang	40.700	256.793
Pesawaran	77.100	251.723
Pringsewu	43.000	269.212
Mesuji	15.300	256.185
Tulangbawang Barat	18.100	253.773
Bandarlampung	121.600	359.948
Metro	19.000	225.231

Source: Lampung Dalam Angka 2013

Based on Central Bureau of Statistic data in 2013 as much as 32.26% of the population in Lampung are in the category of disadvantaged or region with high inequality. A large number of the poor is a result of inequality of development among regions.

The research question is whether the income gap between regions have relation with economic growth. On the territory of which this is the case and what policies are appropriate to the characteristics of each region. Districts/cities which included in the group of successful development are areas or regions with high economic growth but lower inequality or lack of proper development policies with the districts/cities with high economic growth and also high inequality.

The purpose of this study was to investigate the conditions of inequality between districts/cities in Lampung province using the Gini Ratio and how the relation between

income inequality with economic growth and which districts/cities that were on the criteria referred by Klassen typoligy. The end of this research is the proposal of regional development policy recommendations for each districts/cities in accordance with the conditions of inequality and economic growth. Policy priorities should be done because of the current budget constraints of regional development the local government must choose whether to do growth policies first or equalization.

Literature Review
1.   Income Distribution and Income Inequality
National income distribution theory basically questioned the percentage of overall labor income and compared it to the percentage of total revenue. Income distribution patterns can influence the demand for various kinds of goods. A certain number of public income will inflict different pattern of public demand if the certain income distribution pattern were changed. Economists distinguish two principal measure of income distribution used (Tadaro and Smith, 2006) which are size distribution of income and functional or factor share distribution of income per share of production factors. Size distribution of income can directly calculate the amount of income received by each individual or household. According to this measure, how much earning an individual recevied, regardless of its source. In addition, the location of the source of income (rural or urban) and the business sector into the main employment was also ignored. While functional or factor share of income distribution focuses on a part of the total national income received by each of the factors of production such as land, labor and capital.

2.   Gini Coefficient (Gini Ratio)
Gini Coefficient (Gini Ratio)is one measure that is most frequently used to measure the overall level of income inequality. The general formula of Gini coefficient were shown in the following equation, whereas the calculation as follows:

$$GR = 1 - \sum_{i=1}^{n} [fPi(Fci + Fci - 1)]$$

Where:
GR : Gini Coefficient (Gini Ratio)
fPi   : Resident Frequency in expense class-i
fCi   : Cumulative frequency from total expense in expense class-i
fCi-1: Cumulative frequency from total expense in expense class-i
        (i-1)

Gini Coefficient =

Sector A divided by
Source: Todaro and Smith (2006)
Figure 1. Lorenz Curve

A distribution of income were said to be more equitable if the value of the Gini coefficient were close to zero (0), while an increasingly inequal distribution of income then the coefficient Gini value will be closer to one. Criteria based on the Gini coefficient of income inequality (Susanti, 2007) are as follows:

- Lower than 0,4 then its inequality is low
- Between 0,4-0,5 then its inequality is high

3. Economic Growth

Economic growth is the increase in the growth of the value of goods and services in a country during one year of observation. One approach to obtain the economic growth rate is to use a figure of Gross Regional Domestic Product (area) constant value at t year reduced by Gross Domestic Product figures of the previous year or the GDP t-1 divided by the Gross Domestic Product or GRDP previous year t- 1 or by the formula as follow:

$$G_t = \left(\frac{G_t - G_{t-1}}{G_{t-1}}\right) * 100\%$$

4. Klassen Typology

Klassen Typology basically divide areas based on two main indicators, namely regional economic growth and per capita income of the area. Through this analysis, there are four characteristics of the pattern and structure of economic growth modes: local fast-forward and fast-growing (high growth and high income), developed regions but depressed (high income but low growth), the fast growing area (high growth but income), and relatively underdeveloped area (low growth and low income) (Kuncoro and Aswandi, 2002: 27-45) and (Radianto, 2003: 479-499).

Table 2.Klassen Typology Matrix

	Y1>y	Y1
r1>r	Fast forward and fast growing area	Fast growing area
r1	Developed but suppressed area	Relatively underdeveloped area

Methodology

This research is descriptive quantitative and qualitative research. Quantitative study was done using various size ratios to determine the category of regions and qualitative analysis used to describe precisely the properties of an individual, state, symptom, or a particular group, or to determine the frequency or the spread of a phenomenon or the frequency of particular relation within a certain symptom and other symptoms in the community. Data used in this study is a cross-section data. The data used for calculating the Gini coefficient, the economic growth using raw data that comes from the data of Susenas 2015. These data published by Central Bureau of Statistic which was performed by the data sorting, categorizing and coding. To determine the category of regions based on their economic condition used GRDP data, the total population, the number of kindergartens etc. issued by Central Bureau of Statistic from various periods.

Research stage begins with the calculation of income inequality between the regions first. Then connect between income inequalities with economic growth. To connect inequality and economic growth are used Klassen Typology.

Result and Discussion

Gini Coefficient (Gini Ratio)is one measure that is most frequently used to measure the level of income inequality. Initialized by determining resident frequency in expense class-i, cumulative frequency from total expense on class expense-i, and calculating cumulative frequency from total expense on class expense (i-1). Based on the Gini Ratio calculation results are as follows.

Table 3: District/City Name of Lampung Province and Gini Ratio Coefficient

Region Code	District/City	GR
1	Lampung Barat	0,3409
2	Tanggamus	0,3182
3	Lampung Selatan	0,3427
4	Lampung Timur	0,3687
5	Lampung Tengah	0,3608
6	Lampung Utara	0,3165
7	Way Kanan	0,3473
8	Tulang Bawang	0,3550
9	Pesawaran	0,3199
10	Pringsewu	0,3425
11	Mesuji	0,3093
12	Tulang Bawang Barat	0,3404
13	Pesisir Barat	0,2948
14	Bandar Lampung	0,3934
15	Metro	0,4002

1. Relation between Inequal Incomes with Economic Growth

The next step is to link the value of the Gini coefficient ratio with an economic growth rate of each district / city with the following results.

Table 4: Relation of Gini Ratio (GR) with Economic Growth
in Lampung Province

Region Code	District/City	GR	Economic Growth
1	Lampung Barat	0,34	5,29
2	Tanggamus	0,32	5,03
3	Lampung Selatan	0,34	5,37
4	Lampung Timur	0,37	4,26
5	Lampung Tengah	0,36	5,33
6	Lampung Utara	0,32	5,43
7	Way Kanan	0,35	5,27
8	Tulang Bawang	0,36	4,54
9	Pesawaran	0,32	5,11
10	Pringsewu	0,34	5,22
11	Mesuji	0,31	5,23
12	Tulang Bawang Barat	0,34	5,38
13	Pesisir Barat	0,29	4,93
14	Bandar Lampung	0,39	6,32
15	Metro	0,40	6,21
16	Prov. Lampung	0,38	5,13

2. **Klassen Typology Analysis**

Typology Klassen is one method for connecting between income inequalities with economic growth. The best district is when economic growth was high but equitable distribution of income is evenly distributed. Instead of districts/cities that bad if low economic growth and high income inequality. In detail the division of the quadrants as follows.

Quadrant I   Areas that have more Higher Economic Growth and Lower Gini Ratio than the Province

Quadrant II   Areas that have more Lower Economic Growth and Lower Gini Ratio than the Province

Quadrant III   Areas that have more Higher Economic Growth and Higher Gini Ratio than the Province

Quadrant IV   Areas that have more Lower Economic Growth and Higher Gini Ratio than the Province

3. Klassen Typology Result
Based on Klassen Typol   **Economic Growth**   ed on several districts/cities in Lampung province, located on the 4 Klassen quadrant, with the following results.

Table 5. District/City of Lampung Province Located on 4 Klassen Quadrant

	Lampung Tengah
	Way Kanan
	Lampung Selatan
Quadrant I	Pringsewu
	Lampung Barat
	Tulang Bawang Barat
	Lampung Utara
	Mesuji
	Lampung Timur
	TulangBawang
Quadrant II	Tanggamus
	Pesawaran
	Pesisir Barat
Quadrant III	Metro
	Bandar Lampung
Quadrant IV	-

From the 15 districts/cities in Lampung province there are 8 districts which arein the Quadrant I which is the region that has economic growth ratehigher than the average throughout the province of Lampung with lower inequality. The districts meant is Lampung Tengah, Way Kanan, Lampung Selatan, Pringsewu, Lampung Barat, Tulang Bawang Barat, Lampung Utara and Mesuji district. From the eight districts, there are 7 districts that are relatively new into the New Autonomous Region (DOB). With DOB existence is still wide open forms of development policyareas that can be implemented as a standalone. The euphoria policy creation of independent development opportunities policy challenges inclusive local development.

There are five counties that are at Quadrant II, namely Lampung Timur, Tulang Bawang, Pesisir Barat, Tanggamus and Pesawaran. The hallmark of these five district is based on Klassen Typology is a district that have low economic growth and low inequality. Lower economic growth compared with the average growth in Lampung province due to production productivity which had been managed conventionally have not been able to move significantly. Increasingly narrow land conditions, are no longer fertile and less touched by high technology, the age of the plants that are old and replaced, HR with unproductive workers, the number of incoming investments that do not increased significantly since limited infrastructure and high rates of criminality is suspected to be the causes of the low rate of economic growth at these 5 districts.

Klassen Typology quadrant based on results obtained or there are two town located in Quadrant III which are the region that has an average economic growth higher than the average economic growth of Lampung Province but with the average level of income inequality higher than the average of Lampung province. These 2 city located in Quadrant III which are the city of Metro and Bandar Lampung. Seeing these characteristics on the Quadrant III of region development policy in 2 cities should receive more attention from the provincial government. Primarily is a regional development policy to reduce the income gap. This 2 area is the area of town. Bandar Lampung city is the administrative center and the capital of Lampung province. A city have its own affinity for the people around to improve the standard of living. Migration to cities will be very high. Then the policy should be a policy priority to create jobs as much, access to technical and capital assistance. The poverty rate in the city is more severely affected due to poor households when not getting the food can not be working on its own (subsistence) as in the countryside. Poverty is perceived themselves. For that we need additional social safety nets programs. It concluded that the high economic growth have not been able to overcome the existing income inequality. Seeing these results turned out to urban areas for development policies that focus to spur high economic growth was not accompanied by equal distribution of income so that the high growth in fact have a high gap. The economic growth rate was only enjoyed by a small proportion of people, it is seen from a high index of inequality is still going on in the districts with relatively high growth. While there are five districts that have low economic growth and its inequality which also low because there is nothing to share more, but income inequality can be solved by the residents with subsistence farming.

Conclusion and Recommendation
Economic development policy which focuses on effort to achieve high economic growth is not yet able to make an effort and equitable development policies carried together, is unable to be conducted, so that local governments have to choose whether to carry out a policy of

growth in advance or first equalization policy. So that the development of policy recommendations given are for district with average high economic growth but higher-income inequality, the policy needs to be given is the policy of reducing income inequality in advance, because high inequality will increase the insecurity and instability in the economy. For districts that the economic growth rate is still low, should its development policy with more emphasis on improving the economic growth first to overcome the lag far to be run in conjunction with other districts that are more advanced. After high economic growth were achieved then the subsequent development is policy on income distribution policy.

DEVELOPING THE SUCCESSFUL MARKETING STRATEGIES FOR CLICK CAFÉ

Efia Sofia, Institut Teknologi Bandung, Indonesia
Agung Wicaksono, Institut Teknologi Bandung, Indonesia

ABSTRACT

The purpose of this research is to provide a better understanding and analysis as to what happened with the current practice of Click Café since it has opened over a year ago. The research attempt to find the solution of the business issue that Click Cafe is currently facing which is increasing their sales revenue. In order to make this study more structured and to organize the ideas, the writer uses the conceptual framework as the analytical tool to support the process Data collecting conduct by the qualitative analysis method using one-on-one in-depth interview along with quantitative analysis method using customer satisfaction survey. It can be concluded that there is the shifting of Click Cafe's marketing strategy from STP (Segmenting Targeting, and Positioning which include price, place, promotion and distribution) method to the new marketing wave (communitization, conversation, and communal activation).

INTRODUCTION
Background

Currently, coffee is the most favorite hot drink in the world. The survey has stated over 2.250 Billion cups coffee have been consumed every day in the world. This is such a big number compare to other hot drinks. The majority of coffee consumption is from people of developed nations, while the main suppliers of coffee are from the developing countries. Many people have known coffee since a long time ago, and coffee was not only famous for the drink during winter time to make our body warm, but also as the medicine. It happened in the Arabian culture during the classical period.

The history about coffee itself has started since a long time ago in the year of 850 AD where an Ethiopian man named Kaldi just noticed that his goats were 'so hyperactive' after eating "red cherries". The moment after this experience, Kaldi was doing the experiment with the 'fruit' also and began to feel energized.

In the year of 1100 M, the coffee trees were cultivated on the Arabian Peninsula. This coffee was roasted and boiled by the Arabians, and was called "Qahwa". The name was taken from Arabic word, which means "the Wine of Islam." Once after this happened, the first coffee shop was open in Constantinople in 1475, and followed by the other two in 1554. After it was opened, then it shut down in 1511 as per the instruction of Khair Bey – the Governor of Mecca due to his paranoid for taking over his power. This was happened only for a weeklong "reign of terror", then the sultan had announced that coffee was such a blessed therefore it shouldn't have been shut down in the first place.

In the year of 1600, coffee has entered the European continent. It went there initially through Port of Venice where the first Italian Coffee House was opened in Italyin

1683. By 1607, this drink was introduced to the New World (now, it is called the United States) by Captain John Smith who was also the founder of Virginia at Jamestown. In 1652, the first coffee house was opened in England, but sadly the coffee house was forbidden for women to enter. They only let the men to enter and have coffee in this coffee shop. No clear justification why it happened. Mostly, it was because the level of women in the society was lower than men, as per their opinion at that time.

Above is the slight overview regarding the history of coffee in the world. Now, how did coffee actually enter Indonesia? It was started in 1658, the Dutch transported and

cultivated coffee plants commercially, and in 1683, the Ottoman Army was being defeated and left many bags of coffee, which were taken by Franz Georg Kolshitzky – the Hero for Vienna's victory. He received the coffee as his reward and established Central Europe's first Coffee House. This was led to the opening of the first Parisian Café Le Procope in 1686.

As stated previously, the Dutch transported coffee from Java to Dutch Guyana in South America. This was initially introduced how to cultivate coffee in America. Also in 1616, the Netherlands East India Company (VOC) introduced coffee to Batavia, and then it became a valuable and very profitable trade commodity. In 1696, they planted the first seedlings that were brought from Batavia in Java. That was how coffee being introduced at the first time in Indonesia. Currently, Indonesia itself is one of top 4 producers for coffee, and we are the number 3.

Now, it is important to review how the development of Coffee Industry in Indonesia. Indonesia is very famous for Arabica Coffees such as Sumatra Mandailing and its specialty coffees e.g. Kopi Luwak. This country has the microclimate, which is very ideal to grow and produce coffee, and usually it will make the coffee's taste richness, full body, and mild acidity coffee (Source: International Coffee Organization(ICO)Website).

Below are Indonesia Coffee Varieties along with its single origin production:

ARABICA:
- Arabica Aceh Gayo (Bener Meriah, Takengon, Central Aceh)
- Arabica Sumatera Mandheling (North Sumatera)
- Arabica Sumatera Lintong (North Sumatera)
- Arabica Java (Central Java and East Java)
- Arabica Preanger (West Java)
- Arabica Bali Kintamani
- Arabica Flores (Bajawa, Ngada)
- Arabica Toraja
- Arabica papua (Wamena, Nabire)

ROBUSTA:
- Robusta Sumatera (Lampung, Bengkulu, Jambi, Palembang)
- Robusta Java (West Java, Central Java, and East Java)
- Robusta Flores

LIBERICA (Tanjung Jabung, Jambi - South Sumatera and Central Kalimantan)
EXCELSA (Meranti Island – Riau Province)
(Source:https://en.wikipedia.org/wiki/Coffee_production_in_Indonesia)

Also, Indonesia is the third biggest coffee producing country in the world, and also one of the leading countries for coffee export volume worldwide in December 2015 as per below:

Table1.1.LeadingCoffeeExportCountriesandVolumesworldwideinDec2015
(Source: International Coffee Organization (Statista2016))

Table1.2. Top 5 Coffee Bean Producers and Exporting Countries in 2014
Top 5 Coffee Bean Producers in Crop Year 2014 (in each Bags of 60 kilogram):

1. Brazil	45,342,000
2. Vietnam	27,500,000
3. Colombia	12,500,000
4. Indonesia	9,350,000
5. Ethiopia	6,625,000

Top 5 Coffee Bean Exporting Countries in 2014 (in each Bags of 60 kilogram):

1. Brazil	36,420,000
2. Vietnam	25,298,000
3. Colombia	10,954,000
4. Indonesia	5,977,000
5. India	5,131,000

(Source: International Coffee Organization (ICO)

Indonesia is always the top Ten of Coffee Producing Countries, and below is regarding the coffee consumption trends per Kg / Capital / Year locally:

Table1.3. Domestic Coffee Consumption Indonesia

Domestic Coffee Consumption Indonesia:

	2008/2009	2009/2010	2010/2011	2011/2012	2012/2013	2013/2014'
National Consumption (bags of 60 kilogram)	1,890,000	1,940,000	1,700,000	2,380,000	2,470,000	2,500,000

' indicates forecast

Source: United States Department of Agriculture (USDA)

(Source: United States Department of Agriculture (USDA) Website)

Based on the data above, Indonesia's coffee consumption is expanding rapidly. It is supported by the development of the coffee processing industries (coffee products), and also the growth of home and middle coffee industries. Not only that, there is a new life style for people especially in the big cities for hanging out in the café or coffee shop to have the work meeting or even just meeting their friends – only to chat. One important thing is the increasing numbers of coffee shops has happened not only in the big cities but also in the suburb areas, including in Bintaro Jaya – Tangerang Selatan, Banten.

Bintaro Jaya City has been established and developed since 1979 by PT. Jaya Real Property Tbk, one of subsidiaries of PT. Pembangunan Jaya – one of the oldest and largest Developer and Real Estate Company in Indonesia. Most of its shares are owned by DKI Jakarta City Governmental Office.

Bintaro Jaya City was initially introduced with "Park City" concept, then in the last 10 years, it has been changed and introduced itself as "The Professional City" since there are more than 20 office big buildings has been built in the areas. This is one of the reason Bintaro has become one of "Central Business District" in southern part of Jakarta (Source: http://www.jayaproperty.com/en/history-milestone).

Currently, there are so many shopping malls, private hospitals and many other attraction places can be found in Bintaro Area, including various coffee shops from the small one, middle size until the premium ones.

Saudagar Kopi and Kopi Manyar are two of them. They are brand new coffee shops; just less than three years, and can not be categorized as the premium coffee shops. Actually, what kind of coffee shops are they?

1. **Saudagar Kopi**

It is located in Bintaro Sector 9, and in the housing complex area. They have less than 10 employees, and the size of this seating capacity is approximately 60 visitors. Their coffee shop's theme is *"Very Homey Coffee Shop"*.

Figure1.1.Saudagar Kopi Coffee Shopping Bintaro Sektor9.

2. Kopi Manyar

It is located in Bintaro Sector 1, and in the housing complex area, too. Kopi Manyar also has less than 10 employees. The space of this coffee shop is almost the same as Saudagar Kopi which is +/- 60 visitors. The owner of this coffee shop is the architect couple and their friends.

Figure1.2.Kopi Manyar Coffee Shopin Bintaro Sektor1

These two coffee shops are being the benchmark for our case study of this final project, ***Click Café***; a very brand new and small coffee shop in Bintaro area. This is based on the assumption and consideration that they are fairly comparable in term of seating capacity size, the location since they are not located in them alls or shopping centers area, and the number of employees which is less than 10.

Company Profile

Click Café has been opened over a year ago, which was around end of April2015. The mission is to offer broad variety of Coffee Drinks, a selection of Indonesian and Western Main Menu, pastry products and local snacks or appetizers at a competitive pricetomeetthedemandoftheuniversitystudentsandemployeesaroundthearea, and also some middle income local market area residents with ***photography themed coffee shop experiences.*** Click Café is really designed not only for *'hanging out'* place for friends and families over a cup of coffee, but also the meeting point of photography communities. In fact, it has been broaden to the meeting point of various communities, too including Old VW Classic Cars Community and Class Moms Communities.

When the owner planned to open Click Café, actually it was not on their priority list previously. Late 2014, the manager of the company where the owner used to work (Weatherford–a Service Company for Oil and Gas Industry) was sent back to his own country, in the United States. He called and told the owner about the situation of their office in Indonesia, especially in the oil and gas industry. He suggested the owner to have some other plan beside working in oil and gas industry, and also he would help her to ask the region office to give her some severance payment although she resigned voluntarily since she has worked there more than 9 years. Fortunately, the region office accepted this proposal and she was given the severance payment. She was thinking about opening a small business where she has some passion in it. Since she is a coffee drinker and love to enjoy the free time

reading a book in a quiet and comfy coffee shop, suddenly, there was a 'crazy' dream in her mind along with some whispering voice *"to open the Coffee Shop"*.

She discussed this plan with her husband, and got the positive response. Her husband and their second child love photography, and also love to hang out with their photography 'buddies' after working especially in the coffee shops around Bintaro area. After over five months preparation, in April 2015– they have opened their small coffee shop in one of *Small Office Home Office (SOHO)* Complex in Ruko Sentra Menteng Bintaro Sector 7.

Figure1.3.Grand Opening Click Café Bintaro–end of April 2015.

They have named this small business "Click Café", to represent the "Photography Themed" Coffee Shop. They feel their shop's name is a very promising name and bring the photography themed as Coffee Shop Image. They have created the Logo of their Coffee Shop as below – with coffee, lens, the picture of Camera and letter of *"Click Café"* in it.

Figure1.4.Click Café Logo

The couple are the owner of this coffee shop, and have their close friend managing this small business daily. He has been assigned as the Operations Manager, and is supported by one staff leader, five coffee shop staffs and one experienced chef.

Figure1.5.Click Café Staffs and Indonesian TV Series Stars

As the owner of the place, they are lucky that Click Cafe does not need to rent the place. This small coffee shop has two floors, which can accommodate 25 people on the 1st floor and 35 people on the 2nd floor. Their main customers are College Students in the area of Bintaro and nearby (Indonesian State College of Accountancy, Pamulang University, Pembangunan Jaya University & Mercu Buana University), and the office workers in this SOHO complex.

Click Café has provided 24-hours Wi-Fi in the shop, and they have been the host for more than 7 photography events since the opening. The last event that they conducted was *"Photography Book Review and Discussion: On Street Photography and the Poetic Image by Alex Webb and Rebecca Norris Webb)".*

Figure1.6.Photography Book Review and Discussion at Click Cafe

A few Bintaro Local Magazines have covered this unique Coffee Shop, one month after it opened. There were some journalists who wrote some review about this coffee shop. One ofthem was from Kicau Bintaro Magazine– a Local Bintaro Residents Monthly Magazine in June 2015. Unfortunately, it is in Bahasa not English *(Appendix. A)*.

As mentioned above, this cafe would like to be defined and differentiated as being the "Photography Themed" Coffee Shop, so the owner has decorated their outside and inside Click Café interior with full of Photography items such as various pictures on the wall, the Black and White color of the couches, the color of the wall itself, and the drawing of photographic items on the wall.

Figure1.7.Click Café from outside

There are 10 seating outside for the smoking area, and parking lot from this SOHO Complex. While inside this coffee shop consists of two floors. The first floor is suitable for approximately 25 guests, and second floor for +/- 35 guests.

It has many artistic pictures on its wall which is called "Click Café – Wall of Fame". Every month they change the pictures on the wall and replace them with the new ones. The contributors of this "Click Café – Wall of Fame" can be anybody from the Coffee Shop's owners until the customers.

Figure1.8.Click Café–First Floor interior

Figure1.9."Click Café–Wall of Fame"

To show the "Photography Themed – Coffee Shop", The decoration on first and second floor are full of Photography items which some of them are painted directly to the walls. This 2nd floor is suitable for more than +/-35 guests. Usually, this 2nd floor is reserved for any gathering such as *Arisan Ibu-ibu,* Seminars from Photography topic, Book Review Club and others, and also Birthday Party Events.

Figure1.10.Click Café from 2nd Floor

Figure1.11.One of customer reservation events in Click Café–*Arisan Ibu-ibu*

Click Café has also offered various food both Indonesian and Western Styles. The menu and the opening hours are available in this flyers.

Figure1.12.ClickCaféFlyers

It is important to see how the condition of Click Café's financial during the first year of its operation. Below is their Sales Revenue and Net Profit / Loss Monthly.

Table1.4.Click Café–1st Year Sales Revenue & Net Profit/Loss Monthly

1stYear (May '15-April'16)	May '15	Jun '15	Jul '15	Aug '15	Sep '15	Oct '15	Nov '15	Dec '15	Jan '15	Feb '15	Mar '15	Apr '14
Sales Revenue (Rpin M)	16.57	15.23	17.57	18.58	15	25.7	19.5	25.32	21.8	24.2	27.71	27.3
Net Profit/ Loss (Rpin M)	-7.4	-5.8	-3.7	-2.3	3.57	4.2	-3.27	2.75	7.1	5.3	4.3	7.05
Problem Identification

Based on the above financial data, the writer has recognized that Click Café has Revenue Problems which will definitely impact to their net profit. According to the article from Small Business Chronicle, "*the average small coffee shops' total net profit should equal to 7 – 25% of their annual sales. Some successful ones can be higher than 25%*". (Source: http://smallbusiness.chron.com/average-profits-small-cafe-30768.html). Meanwhile Click Café only has net profit for 4.64% of their annual sales during the first year. It is still under the average of other coffee shops' annual net profit.

This is the main issue they are currently facing. It is caused by their number of sales, so it is extremely important for Click Café in order to survive in this business to increase their sales revenue. This is not an easy project, and will lead to a very important question: How to do this? How to Increase Click Café's sales Revenue to reach double digit growth rate for future year and 10% until 18% base profit margin respectively?

Study Objectives, Scope and Limitations
In aligning to the above question, the objectives of this study would be:
1. To find out the customers' opinion regarding Click Café's products and services.
2. To evaluate the current situation of Click Café based on the customer's opinions.
3. Finally, the logic further objective would be to come up with the marketing strategies which enable Click Café to solve the issue they are facing.

The above are the objectives of this study which mainly focus to Click Café Bintaro to research and to develop their best successful marketing strategies for next two until three years.

Business Issue Exploration
Conceptual Framework
The goal of this research is to find the solution of the business issue that Click Cafe is currently facing which is increasing their sales revenue. In order to make this study more structured and to organize the ideas, the writer uses the conceptual framework as the analytical tool to support the process. The conceptual framework was originally introduced by Isiah Berlin in 1953 through his essay "*The Hedgehog and the Fox: An Essay on Tolstoy's View of History*".

On this case, we have started this process by reviewing and analyzing their internal factor analysis using STP (Segmentation, Targeting and Positioning) and Marketing Mix methods and external factor analysis method using PESTEL and Competitor's analysis – Porter's 5 Forces Model. These methods are to evaluate how the condition of Click Café's business situation currently to define their SWOT (Strengths, Weaknesses, Opportunities and Threats) to identify which one are the positive and negative factors from Click Café (Source:https://en.wikipedia.org/wiki/SWOT_analysis). This is the first part of the framework, and has used the various data available from Click Café, the literature for marketing methods that has been implemented on this study, and also the result of the market research that the writer has conducted.

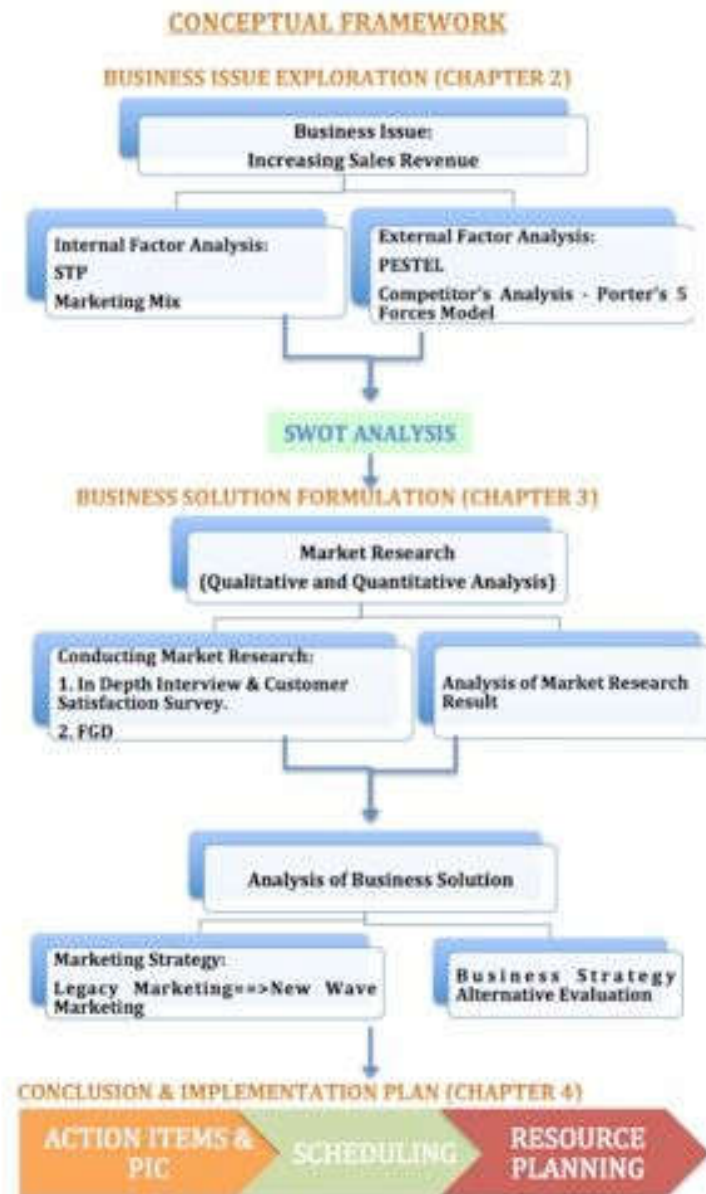
Revision


Figure 2.1. Conceptual Framework

The second part on this framework is Business Solution Formulation. This stage basically has described about the market research process both qualitative and quantitative, and the analysis of the results. Then combined with the result of the evaluation of current business situation in the first part, so we can start the analysis of the business solution of the issue.

In this study, we have conducted three market research which are One on one In-Depth Interview combined with online Customer Satisfaction Survey then complete it with Focus Group Discussion. Once we have the result of the marketing research, we can utilize and analyze them to come up with the analysis of business solution. To have more accurate and scientific result, it is very important to combine with some marketing literature. This marketing literature is basically as the theoretical marketing background which can support

the accuracy of the marketing data that we use or the result of the process that we have conducted. For this case, we use the literature for legacy marketing and new wave marketing. The purpose is to analyze the marketing issue and to come up with the business solution and the business strategy – alternative evaluation for Click Café.

The last part on this framework is the conclusion which will summarize and conclude the business solution explained in the second part and the action items, the PIC, the scheduling and the resource planning of their implementation plan.

Analysis of Business Situation

In order to develop the successful marketing strategies for Click Cafe, it is very important to review and analyze the current business situation or their business practice. The current business situation are affected by their internal and external factors. The internal factors mean the variety factors which influence the business within the business itself, and we are still able to control and manage these. The situation analysis methods such as STP (Segmentation, Targeting & Positioning) Marketing Model and 4Ps - Marketing Mix Model are considered under the internal factor analysis to assess the business situation (Source: Dr. West. Market Analysis and Strategy; Fisher College of Business, OSU; 2014).

On the other hand, the external factors are described as the variety factors which impact or heavily influence the business from outside of the company/the business. It is hard to control this. As a lot of people said that we do not have pretty much control over it. PESTEL Analysis and Competitor's Analysis – Porter's Five Forces Model are on this external factors analysis category (Source: Dr. West., Market Analysis and Strategy; Fisher College of Business, OSU; 2014).

Internal Factor Analysis - STP

STP (Segmentation, Targeting & Positioning) *marketing model which is originally was introduced by Phillip Kotler on his book "Marketing Management" (December 1987).* This STP approach will help to build the understanding how through segmentation, Targeting and Positioning, it can define the existing markets and plan how our future market is going to be.

Figure 2.2. Conceptual Framework Analyzing Current Practice through STP Approach

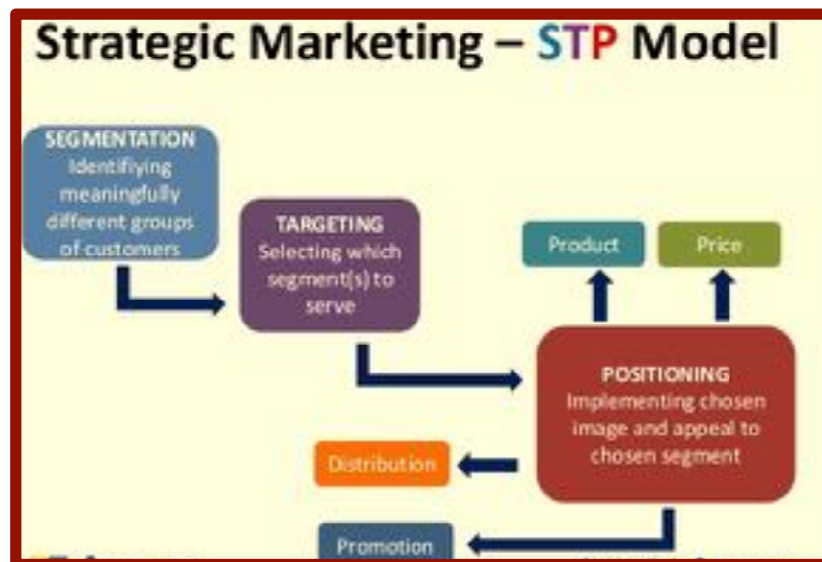
(Source: Hanlon, Ann Marie on the Segmentation, Targeting and Positioning Model, 2013)

This model is very popular and mostly used by market practitioners globally, since it can provide the details in order to be able to construct the current market segments, target market and product positioning. This is for review and analysis purposes for Click Café's future improvement, which is one of many reasons why this model is used to be able to develop the successful marketing strategies for Click Café Bintaro.

By using this model, there are three stages in developing the successful marketing strategies. Below are the details related to this marketing model:

1. Thru Market Segmentation; this stage is to identify the meaningful groups or customers based on the variables in segmenting the market; such as geography, demography, industry sector, age of customers, frequency of purchase etc. Once they are identified, then the stage is to develop the profiles of these resulting segments. This information is provided by market research and analysis of customer data. For this case, one-on-one IDI and Online Customer Survey are used.

2. Thru Market Targeting; this stage is to evaluate and analyze which segments are potential, commercially attractive and can give optimal contribution to the business. In other words, this stage is to choose which segment should be served in order to obtain more contribution to the business.

3. Thru Product Positioning; this stage is to identify and describe how one business is different form others based on its product, price, place and promotion. This is known by the term Marketing Mix (4Ps – Product, Price, Place, Promotion), and *was originally introduced by Phillip Kotler on his book "Marketing Management" (December 1987).*


(Source: Kotler, Phillip–Marketing Management: Universidad de Ibague-2015)

a. Market Segmentation

In defining the current market based on the segmentation, it is important to use the survey that has been done since the data should be accurate and up-to-date. The segmentation for this current consumer markets based on the survey, will be described based on five main variables below:

1. Geographic – it is based on the area.
2. Demographic–it is based on the population characteristics, such as age, occupation, marital status etc.
3. Psychographic – it is based on our consumer's lifestyle, interests and opinions.
4. Benefits sought–it is based on the specific benefits that our customers are seeking from us.
5. Behavioral – it is based on the customers' relationship with us.

Below is the Market Segmentation Data for Click Café:

1. Geographic: Bintaro Area (Tangerang – Banten).
2. Demographic:
   a. Age: 10 – 60 years old.
   b. Occupation: College Students, Mothers, Workers, and others.
3. Psychographic: Full Time Mothers, Photography Communities, Old VW Classic Cars Fan Clubs, and others.
4. Benefits Sought: Click Café's customers see this coffee shop as the comfortable place to wait for their kids taking the lessons from some Math / English Lesson Places in the neighborhood, and also to wait for Bersih Sehat's Family Massage place or The Dentists Clinic next door.
5. Behavioral: University students around the area (Indonesian State College of Accountancy, Pamulang University, Pembangunan Jaya University & Mercu Buana University) has created this café as their 'Student Lounge' or *"Base Camp"* for studying and meeting their friends.

Coffee shop itself actually is about building communities, and thru networking; it can start to establish the consumer's markets for Click Café. The owners belong to the communities where they can connect these communities to their own business.

There are various ways in connecting this coffee shop business and the communities which the owners are belong to. One of the examples is by conducting Moms Beauty Class in Click Café where the Beauty Consultant and the Beauty Class Participants area group of Moms under Parent-School Group (PSG) of Binus International School Serpong in which the owner is the member of this school community.

Moms Beauty Class – Click Café Bintaro

Figure2.4.Moms'Beauty Class at Click Café Bintaro

b. Market Targeting

Click Café Current Target Market are:

- College Students around Bintaro area.
- Mothers whose children go to the courses in the places around the neighborhood.
- Photography Communities.
- VW Classic Cars Communities.
- Workers whose offices inside this SOHO Complex area.

Click Café has targeted those communities thru the owners' relationships and hobbies. Below are the pictures from some photography events which were conducted in Click Café Bintaro where the owner is the member of these groups.
Figure2.5.Photography Events held in Click Café Bintaro

c. Product Positioning

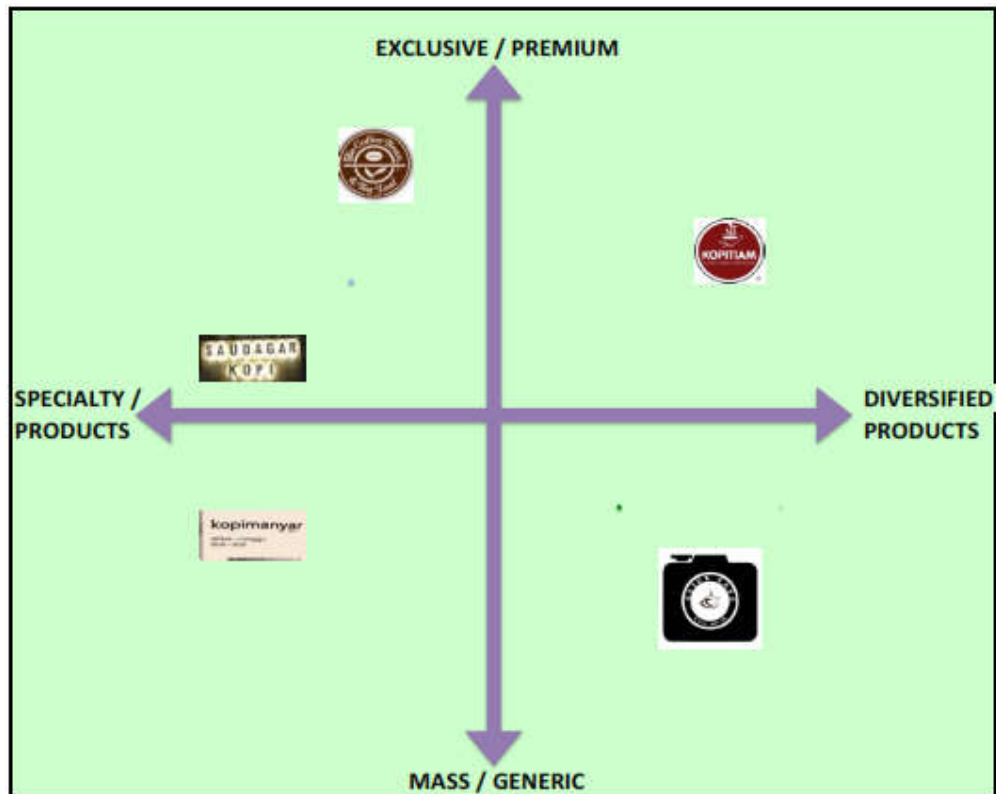
Product Positioning was first introduced by Peter Drucker on his book *"The Practice of Management" in 2007*. It was discussed as the Perceptual Mapping which shows where the business' positions are located in terms of pricing, product itself, promotion and place. In regards to this Positioning, Click Cafe position will not change in regards to the "Pricing" and "Location". This positioning will be based on the "Products" itself. The current product positioning shows that Click Café offers many diversified and mass products. It is definitely not under premium category which its coffee shop has some aesthetic design, high-end technology, elegant lighting, skilled and extensive knowledge of Barista, premium selection of exclusive sweet delicacies, or specialty, rare, premium brand, highest grade coffee, and of course with premium price. Click Café has given more choices to its customers to choose any products in the Café. Below are the mapping of Click Café and other Coffee Shops in Bintaro as for our comparison.


Figure 2.6. Click Café and other Coffee Shops in Bintaro - current product positioning (Source: The Perceptual Mapping – First introduced and explained by Peter Drucker on his book *The Practice of Management 2007).*

The above is Click Café and other coffee shops in Bintaro area - current product positioning. Click Café is categorized under Mass / Generic and Diversified Products.

The Coffee Bean is under Premium and Specialty Products category, while Kopitiam is under Premium and more diversified Products category. In the comparison with Click Café, how about Kopi Manyar and Saudagar Kopi Product Positioning? Based on the above picture.

Saudagar Kopi is under Specialty Products and a little bit more exclusive than Click Café, while Kopi Manyar is under Specialty Products and less Mass / Generic Products category.

Being under more diversified products positioning, Click Café offers many assorted menus from Indonesian Food until Western, and from Coffee products until non Coffee products such as Teh Tarik, Banana Split, Milk Shakes and others including Hot and Cold types. Click Cafe is considered not as Premium Coffee Shop (Exclusive) category due to their Target Market. Click Cafe is considered as Mass / General or Regular coffee shop.

Figure2.7.The Coffee and Non Coffee Products of Click Cafe

Internal Factor Analysis – Marketing Mix – 4Ps

The other internal factor analysis is The Four P' soft he Marketing Mix which is one of the tools to understand the current market environment. Marketing Mix-4Ps which consist of Products, Price, Promotion and Place as per Phillip Kotler is *"the variables that can be manageable to be adjusted to influence the target market"* Below is the **Marketing Mix – 4Ps** for Click Café:

- **Price:** Click Café has very affordable prices even cheaper than other coffee shops in the area.
- **Product:** It has very diverse products from Indonesian to Western menu.
- **Promotion:** 10% Discount for group reservation. Local magazines advertising and free coverage.
- **Place:** Avery comfy coffee shop, but not a great access to get to the Café. Also, it is not in the high traffic area.

These STP and Marketing Mix – 4Ps Methods are very important especially in the marketing strategy planning phase, but it still can be used for the evaluation phase to find out whether Click Café has really *"promoted the right products at the right price and the right place"(Greenspan, Roberta "Starbucks' Coffee Marketing Mix Analysis", 2015)*

External Factor Analysis – PESTEL

As explained above, the external factor analysis are the factors that can influence the business from outside of the company which we do not have any control over. This PESTEL analysis method consist of Politic, Economic, Social, Technology and Legal. This analysis can describe the external environment and the macro environment that will affect the business, as well. The result of this analysis will become the part of the SWOT analysis (Kotler, P, Principles of Marketing, 2005).

Below is the PESTEL Analysis (Porter; 1985) for Click Café:

➤ Political Influences: Local Autonomy Regulation or controls, Bad Politics in Indonesia which really can threaten the economy of Indonesia (source: http://www.amcham.or.id/fe/4261-indonesia-where-bad-politics-threatens-a-good-economy). For Click Café ,to open the business, they should apply the permit and report the local taxes from the city office in South Tangerang due to the regulations are under Banten Province not Jakarta. Nowadays, Jakarta is more structured and transparent in term of local autonomy regulation compare to Banten.

➤ Economic Influences: Bad economic performance in Indonesia which is shown by large pool of unemployment, inflation. This condition has really impacted Click Café, as well due to more people are trying to tight their budget due to this economic condition by reducing the spending for going out to the coffee shop or having dinner in the restaurant. This can be a threat for Click Café, too.

➤ Social Influences: Changing trends in a healthy lifestyle. More people are trying to reduce their caffeine consumption due to health concerns. This will affect people not to come to the coffee shop to enjoy the coffee. This can be a threat for Click Café.

➤ Technology factors: Changes in mobile technology can be the opportunity for Click Café to use this to promote the coffee's shops products.

➤ Environmental Factors: More people are really concerns regarding to Green projects and Saving Energy Project for the future. This will reduce the cost for electricity of Click Café if this saving energy project has really been implemented in Click Café by the staffs.

➤ Legal Factors: Minimum wage for employees in South Tangerang will impact Click Café's revenue, as well. It will impact the fix cost of the monthly income statement.

External Factor Analysis – Competitor Analysis – Porter's 5 Forces Analysis

The other external factor analysis that we use is the Competitor Analysis–Porter's 5Forces Analysis (Porter, 1985). This analysis method will explain the micro economic external environment factors which really impact to the business. This Porter's5Forces diagram will be the basis for competitive strategy originated by Michael Porter which describe the rules of the competition in any industry, and will show the attractiveness of the industry.

Below are Click Café Porter's Five Forces Model:

- Threat of new entrants – High.
  - ➤ It is easy to open the coffee shop in Indonesia.
  - ➤ For small coffee shop, it only requires small amount of capital.
  - ➤ This is the threat for Click Café since there are so many new players in the industry, and still plenty for the existing players, as well.
- Buyers Power – High.
  - ➤ Variety of products.
  - ➤ Variety of choices for services or places.
- Supplier's Power – Medium.
  - ➤ A few big suppliers with so many choices of materials.
  - ➤ The coffee shops still can choose the suppliers or even can choose the super market and the Modern Local Market in Bintaro to provide the raw materials for the coffee shop.

- Threat of Substitutes – High.
  - ➢ Customers can choose not only the other coffee shops, but also the fast food restaurants since they provide many coffee products, as well.
  - ➢ The customers can choose other comfy places to hangout not only coffee shops.
- Industry Rivalry - High
  - ➢ There are many local coffee shops and International coffee chain such as Starbucks, Coffee bean etc.

The above report is very important in assessing the strength of the coffee shop, and the position in the industry. Also we can see how Click Café's position compares to the other competitors. Once we evaluate the result of this report, we can make the improvement of this coffee shop to become more profitable.

SWOT Analysis

Based on the above Internal and External Factor Analysis, we can summarize those analysis and mapped them into SWOT Diagram. This SWOT Diagram will explain the current business situation internally and externally. Using this SWOT (Strengths, Weaknesses, Opportunities and Threats) Method *which was introduced the first time by Albert Humphrey in the 1960's.*The reasons behind this due to through SWOT, it is easier to understand the current business environment, evaluate the favorable and unfavorable factors to improve the business situation in the future.

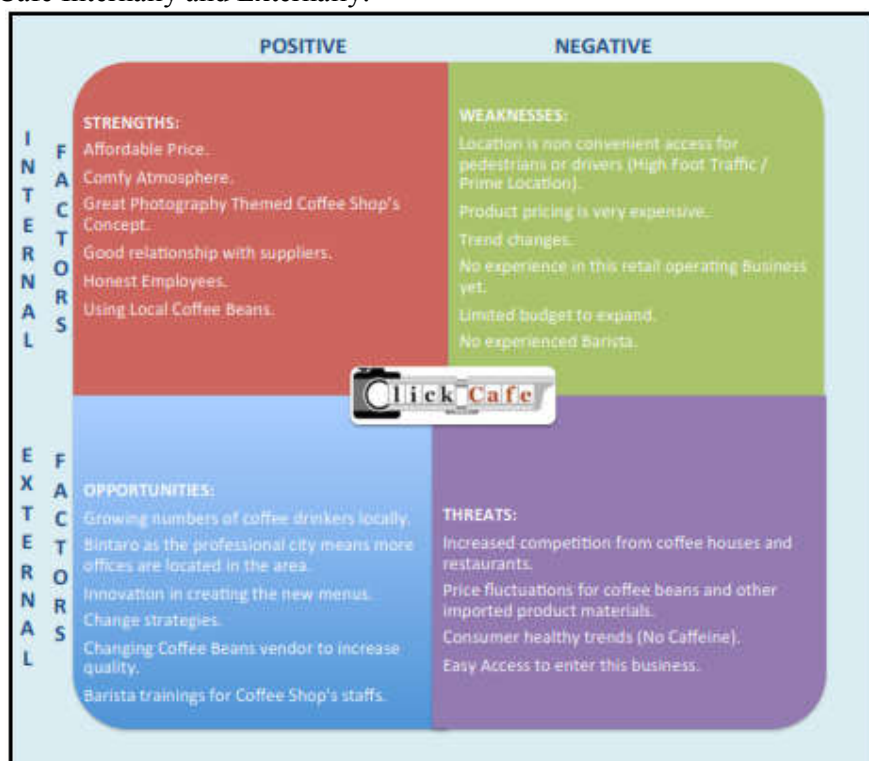
Below is the Diagram that shows the SWOT analysis of current business situation for Click Café Internally and Externally:


Figure2.8.ClickCaféSWOTDiagram
(Source: Humphrey, Albert– SWOT Analysis for Management Consulting, December2005)

Creating SWOT diagram for this Coffee Shop has described how the business situation for Click Café is; its current status and position.   The internal business situation for Click   Café   will   be   observed   by   its   strengths   and   weaknesses   while   the

external business situation will be based on the opportunities that Click Café has and the threats that they are facing.

Based on the survey that has been conducted in regards to the current business situation, Click Café's strengths can be considered that they are directly impacted by internal factors such as:

- Its affordable price. Click Café has targeted college students as their main customers. Most of the prices are cheaper than other coffee shops.
- Click Café has a great ambience. Their customers love the comfy atmosphere of this Café.
- They have set their interior with the concept of Photography Themed Coffee Shop. Most people love this place and choose this as the place for their events such as seminars, one of Trans TV Series shooting place, and also for *selfie and wefie* with friends.
- Click Café is very fortunate to have honest employees working for their café. This is one of their strengths, too.
- They have great relationship with most of their vendors/suppliers. This is a great thing in doing business.
- This coffee shop has used Aceh Gayo Arabica Coffee beans. This local coffee beans is one of the strengths.

The other business situation that has been affected by internal factors is the weaknesses. There are some internal factors that have been considered as weaknesses which are:

- Their location is not in the representative area or in "High Foot Traffic/Prime Location" area where it is easy to be accessed by many people, and always crowded. As it is already public knowledge that any coffee shop's sustainability really depends on customer traffic. This customer traffic is affected by many factors such as how easy it is to access the coffee shop, and the type of location itself whether it is prime location or not. On this case, prime location means 'crowded' business area, and unfortunately Click Café is not on this location.
- Some of our materials are very expensive due to they are imported by other countries such as "Matcha" Japanese Green Tea Powder which is imported by Japan, and Mozzarella Cheese which is imported by New Zealand.
- The trends in this coffee shop industry are easily to be changed.
- The owners still do not have any heavy experiences in operating the coffee shop. They are still on learning curve.
- Their expansion budget is very limited.
- They still do not have any experienced Barista yet. This is really one of their weaknesses, as well.

The other two important keys of the situation analysis are impacted by external actors. They are Opportunities and Threats, and below are the details.

The Opportunities for Click Café are:

- The number of local coffee drinkers are more likely increasing every year.
- Bintaro has changed its trend setting to the professional city where more offices are located in this area.
- Innovation for new Menu for us will be one of the opportunities to increase the number of sales.
- Change strategies in our marketing.
- Increasing quality of the coffee by changing to new vendor who is more likely to have higher quality of the local coffee beans.
- The competencies for their employees especially in Barista skills will be the other opportunity, as well.

The Threats for Click Café are:
- There are likely more increasing competition from coffee houses and restaurants.
- Price fluctuation (inflation) for coffee beans and other imported materials.
- Nowadays, people are more likely shifting to new healthy lifestyles, and one of them is "No Caffeine" healthy life style.
- More new players in this industry due to it is very easy to enter the market.

By assessing this SWOT structured planning method, it explains how and where Click Café currently stands. Then, this data can be used for future planning and to develop the marketing strategies for this Cafe which can help them to achieve their growth and success.

This SWOT analysis has described the complete details business current situation and assessment of its Strengths, Weaknesses, Opportunities and Threats. Through its strengths; it will be able to show the advantages of Click Café itself compares to other coffee shops, and thru its opportunities; it will identify the opportunities in order to develop the successful roadmap via strategic planning. These are considered as favorable factors.

But how about Weaknesses and Threats? Why are they also important? They are important due to based on the weaknesses, it is easy to analyze and understand this coffee shop in order to find the effective solutions for future strategic planning. Also, threats will help them in identifying how they are impacted to the business, and help themintryingtofindthestrategieshowtodealwiththeminthefuture.Although they are very important in this analysis, but they are considered as unfavorable factors from both internal and external of the business.

Thru SWOT, any business owner can analyze which items should be reduced and which actions should be completed in order to improve the performance. In other words, the business owner or practitioners should eliminate the negative internal factors or decrease the negative external factors, and improve the positive internal and external factors. These are the standard guidelines in SWOT analysis.

Business solutions

In chapter 2, the review and analysis of Click Café's current practice using Segmentation, Targeting and Positioning marketing model, and the discussion about the current business situation and problems have been completed. The discussion in analyzing this business situation using SWOT structured planning method is also being conducted in order to gain the clear pictures and understanding of what happened with Click Café's current business situation both internally and externally. Then, in this chapter, the discussion will start regarding the solutions of the problems stated in the previous chapter. Market research is primarily required in order to solve these problems.

The marketing research will be reviewed in this chapter, and should be based on the questioning research designs using both qualitative and quantitative marketing research. After gathering the data from the research or survey which is called data collection process, some analysis and discussion will be performed to develop the theories which should be implemented as the new successful marketing strategies for this coffee shop. This would be the final product of the research.

Conducting Market Research

As stated above, in performing this market survey, the process will start with gathering the data by conducting the Qualitative Analysis method using One on one In-depth Interview along with Quantitative Analysis method using Customer Satisfaction Survey. This research design was introduced *by Creswell, J. W .on his book "Research design: Qualitative, quantitative, and mixed method approached."* Then, analyzing and using this combined data to be discussed further into Informal Focus Group Discussions.

This One on one In-depth Interview and Customer Satisfaction Survey to any random respondents (both loyal customers and others who rarely came to the coffee shop) have been conducted. This customer satisfaction survey were conducted online to our various respondents. The number of respondents from One on one In-depth Interview was about 70 customers, and from customer satisfaction survey was more than 50 respondents.

The other qualitative analysis that has been completed was Informal Focus Group Discussion. This FGD would be better than the other two market research due to the result will reveal in-depth information and analysis, clear discussion results and covers various opinions towards any topic. In this case, there are three FGD shave been conducted to three different groups, and they are:

1. FGD with our existing customers
2. FGD with our Café's staffs.
3. FGD with 'random' people who haven't visited Click Café but already know what and where Click Café is.

The reasons why these three different market research have been completed, it is due to obtaining a better understanding as to what happened with the current business situation is. Once they truly understand their business situations and the problems they are facing, then it is easy for them to analyze and try to find some solutions based on the results of this research. These solutions would be their new marketing strategies which are expected to enable them in delivering the success of this coffee shop. This is the final conclusion and the main purpose of this research. In preparing the process of market research, it should start with the explanation of each method first in details.

One-on-one In Depth Interview (IDI)
(The Questionnaire Model for Qualitative Market Research)

One on one In-depth Interview is a qualitative research tool, and one on one 'interview' between the respondent and the moderator which should be more structured and require more active and knowledgeable moderator. For this study, there was one-on-one IDI has been done to +/- 70 customers who have been to Click Café less than 5 times and more than 5 times. The interviews were held in Bahasa Indonesia, but it has been translated in English for this Final Report purposes. This One on one IDI were a little bit different from the general one due to they were taking only short time and had a lot of respondents. One interview took about +/- 15 – 20 minutes, and the total of the respondents were 70 customers, while others usually took about 40–60 minutes and between 12 and 15 respondents *(One on one Interview: McIntyre)*.

The one-on-one IDI process has been done in the Café, and the writer was the one who directly interviewed their customers. The respondents of this IDI have got one free drink each for their contributions. Although sometimes it was a little bit biased since the respondents may not really more open in answering the questions, but they were definitely more detailed and structured. They are generally open ended questions which require the participants' opinions and personal views. This One on one In- depth Interview are more private, and should be able to observe the participants, as well. They can gather the data by observing their participants and their answers. Once the data collection process is done, then it is time to analyze and interpret the data.

The result of this data analysis and interpretation would be used to generate the main questions / topic to be discussed in the Focus Group Discussion. This process should be more comprehensive to develop the successful marketing strategies which fit their business.

Figure3.1.The Cycle from One on One In-Depth Interview (IDI) and Customer Satisfaction Survey to Focus Group Discussion (FGD)
*(Source: Creswell, J.W. "Research design: Qualitative, quantitative, and mixedmethodapproached."2003–Sage)*

Below are the profiles of the respondents and the summary of one on one IDI. The profiles are as follow:

Figure3.2.AgeofRespondentsProfile
Respondents under 18 years old are 11 people, between 18–29years old are 31 people, between 30 – 49 years old are 19 people and above 50 years old are 9 people.

GENDER
Figure 3.3. Gender of the Respondents
These respondents are 41 Male and 29 Female.

OCCUPATION

Figure 3.4. The Occupation of the Respondents

The occupation of the respondents are students for 8 people, college students are 24 people, employees around the neighborhood are 17 people and 21 people are full time mothers.

DEMOGRAPHICS
Figure 3.5. The Demographics of the Respondents

While 57 people are living in Bintaro Area, and the remaining are from outside of Bintaro.

FREQUENCY OF VISIT
Figure 3.6.The Respondents' Frequency of Visit

The respondents who have visited Click Café more than 5 times are 21 people and less than 5 times are 49 people.

There are about 70 respondents completed this one-on-one IDI from mid-April until early June 2016. It has 13 open ended questions with some proposed choice answers given to the respondents. When the question is asked, and the respondents were confused how to answer these, there were some *self help tips* given to answer the questions, but the respondents still answer the questions based on their own opinions. Below are the summary of these one-on-one IDI answers:

The most important items when visiting any coffee shop are actually Friends with whom we spend in the coffee shop. It is 44%.
Figure 3.7. The Most important items when visiting Coffee Shop

The reasons why people visit Click Café are mostly due to Click Café has been the meeting place for Photography Community which is 49%.
Figure 3.8. The Reasons why People Visit Click Café

The items that most people like about Click Café are the photography events and seminars conducted in this coffee shop. It is about 56%.
Figure 3.9. What do the Respondents like from Click Café

The next question is about what the respondents don't like from Click Café, and apparently most people do not like the access how to get to this coffee shop especially during night time since it is dark and very uncomfortable.
Figure 3.10. What you don't like most about Click Café

Then, when the respondents were asked about Click Café's price, most people answered that they are affordable. It is about 89% respondents.
Figure 3.11. The Price of Click Café's Products

The respondents have also answered that Click Café's food and drink quality should be increased. 30% respondents have commented this.
Figure 3.12. The Quality of Click Café's Products

While the comment about the service of Click Café's is more 'relieving', and the photography events are definitely expected and required by the customers.
Figure 3.13. The Service of Click Café's Products

The respondents have suggested Click Café to have the staffs to take more trainings so they can be dependable and knowledgeable.
Figure 3.14. The Quality of Click Café's Staffs

The respondents feel it is hard to find Click Café since the location is at the back of this SOHO Complex and has only one access. Also the parking fee is not cheap either.
Figure 3.15. The Access How to get to Click Café

Most people love Click Cafés due to it is comfy to study and to work, and also the coffee shop's theme is very unique which is photography.

Figure 3.16. Click Café's Ambience

The customers would love to visit Click Café again and recommend this coffee shop due to they have some connection with the owners, and some customers from the photography community also would like to visit this coffee shop only if it holds some photography events or seminars.

Figure 3.17. Customer's willingness to go back and recommend Click Café

The last question from this one-on-one IDI was the suggestions from the respondents regarding the future improvement for Click Café, and the highest response is related to requesting Click Café to hold more photography events such as seminars, book reviews and others. The other suggestions are improving the competencies of the Barista and coffee drinks quality. The qualities of products are very important not only to increase the sales volume which leads to the increase of their profit margin, but also to increase the customers' awareness and loyalty towards Click Café.

As stated above the result of One-on-one IDI *(The complete of One-one-one IDI Result will be attached on Appendix. B)* combined with the result of Customer Satisfaction Survey would be used to generate the main questions or topic to be discussed in the Focus Group Discussion.
This Customer Satisfaction Survey result will support and complement the IDI data, andgeneratemoreaccuratequestionsortopictobediscussedintheFGDs.Also, using this quantitative analysis will help the research to be more up-to-date and objective.Thisaspectisreallyimportanttobeabletogeneratethemoreaccurate result to find the most effective solutions. Below is the detail of the quantitative analysis using online customer satisfaction survey.

Customer Satisfaction Survey

This research was originally introduced by *NK Malhotra on his book "Marketing Research: An Applied approach" in 2007*. The second marketing research that has been conducted is using quantitative analysis approach which is online Customer Satisfaction Survey. It is an effective survey in assessing how satisfied the customers of Click Café are. Happy customers are definitely valuable to Click Café since they can increase the number of sales and create loyal customers by visiting this coffee shop repeatedly.

From the result of this survey, it can help this coffee shop to identify the satisfaction of the customers, and to track the number of happy and unhappy customers. On this case, the Customer Satisfaction Survey has been designed using Survey Monkey

(The complete Customer Satisfaction Survey will be attached on Appendix. C). (Source: NK. Malhotra, Marketing Research: An Applied Approach, 2007)

Figure 3.18. The result of Customer Satisfaction Survey to describe what "CLICK CAFÉ"

From the above result, there are many reasons and the percentage to describe how customer look at this coffee shop. This will support the question from one-on-one IDI which is *"Why do you visit Click Café?"* to be discussed further into the FGDs.
Figure 3.19. The result of Survey regarding customer's satisfaction

Based on the above survey result, there are more than 70% happy customers for Click Café, and a few unhappy customers. Due to this is only quantitative survey, it is unable to track and follow up the reason why they are unhappy. But this survey will support the question from

IDI which is *"How is Click Café's Services and Quality of Products?"* to be one of the sub-topic in the FGDs.
Figure 3.20. The result of Survey regarding Click Café's Atmosphere

Almost 70% are happy with Click Café's place and ambience. There are a few that do not like Click Café's place, but it is unable to follow up to find out what the reason is. The result of this survey again has supported the questions to be followed up in the FGDs about *"How is Click Café's Place?"*

In conclusion, the one-on-one IDI and the Customer Satisfaction Survey result will complement each other to produce more structured, accurate and objective questions or topics to be discussed further in the FGD, so it will create the more effective proposed solution.

(Source: Creswell, J.W. "Research design: Qualitative, quantitative, and mixed method approached." 2003–Sage)

Informal Focus Group Discussion (3 Different Groups)
Another question has come up as to why should we conduct this FGD after we have completed both one-on-one IDI and Customer Satisfaction Survey? One of the reasons is due to FGD is more effective in soliciting feedback from the respondents to understand what they think about Click Café, how and why they think like that to Click Cafe.

Now, it is the time to get the feedback from the respondents regarding the questions or topic to be discussed in Focus Group Discussion. The choices of topic or questions were from One-on-one IDI and Customer Satisfaction Survey questions which have got the highest rate answers comparing to others. Also, it has been added some new questions in order to strongly support the data analysis.

The list questions are as follow:
1. a. Why do you visit Click Café ?
   b. Why do you visit any Coffee Shop?
2. How is Click Café's Services & the Quality of Products?
3. How is Click Café's Place?
4. Would you still buy from Click Cafe even though they increase the price for 25%?
5. What are the Priorities for Click Cafe to Improve their Quality and Services?

6.   What do you think should be their Strategies to increase the Sales and Profit?
7.   Do you have any other comments / suggestions?

These three sessions of FGD were divided based on the 'internal stakeholders' of this Café, their loyal customers who have frequently been in Click Café more than 5 times, and the last group which was chosen from random people who have not been to Click Café previously.

The first FGD were conducted on June 3rd, 2016 at 19:30–21:00 hrs. The members of FGD were the owners and Café's staffs (Pak Hendy, Pak Brawijaya, Pak Ady, Mas Tommy and Mas Fahmi)

Figure3.21.First FGD with the owner sand the café's staffs

(June3rd, 2016)

The second FGD were conducted in the café, as well with Click Café's loyal customers (Class Moms Group from Mentari International School Bintaro – Ibu Milka, Ibu Vera, Ibu Ratih, Ibu Hani, Ibu June and Ibu Angela). It was on June 11th during Breakfasting Ramadhan Dinner started from 19:00 – 20:45 hrs.

Figure 3.22. Second FGD with Click Café's loyal Customers (June 11th, 2016)

The last FGD that has been conducted was with random people, and it should be the first time for them to visit this coffee shop. This was conducted on June 17th, 2016 at 16:00 until 17:30 hrs. They were two new students from Indonesian State College of Accountancy (Mas Ardia and Mas Fikri) and three Tax Office Employees from BSD Office (Pak Eko, Pak Bimo and Pak Lucky).

Figure 3.23.Third FGD with Click Café's new guests–Random people (June17th, 2016)

The details of the summary result from these 3 FGDs are as follow:

No.	Questions	FGD #1	FGD #2	FGD #3
1	The reasons why they visit Click Café?	N/A	Great friends - Meeting other Moms	They will visit the café to study.
			Their Base Camp for Class Moms Meeting	Free WIFI
			Waiting place to wait for their kids from school since they live in Jakarta area – far away from the school.	Comfy Place
			WIFI Reasons	
			Comfy Place	
2	How are the service and quality of Click Café's Products?	N/A	The service is great due to they can talk to the owner if they have any complaints.	No Comment Yet
			Increase the quality of the products and services by increasing the skills of the staffs.	
			Experienced Barista is Urgently required.	
			Delicious and healthy food since it does not contain MSG, freshly homemade and halal.	

3	What do you think about the accessibility to go to Click Cafe?	No Problem since this place is owned so do not	No Problem. They already know the area, and they feel comfortable to stay there	Very Homey
		Far from home for the staffs but it is still manageable. OK.	Very Homey	Comfy as the Study place for the students
			Comfy	Too far to work there from BSD
			Feel Click Café is like their 2nd home	Will manage to visit there if there are some photography events or book review clubs etc.

No.	Questions	FGD #1	FGD #2	FGD #3
4	What do you think if Click Café increase the price until 25% of their current prices?	Must increase the price due to inflations	No problem as long as the quality is still good.	No problem.
		The price of Product materials are more expensive	Click Café Is still cheaper than others.	Click Café is still cheaper than others.
5	The priorities to improve the quality and services of Click Café?	Barista Skills	Supported the collaboration with ROSSO MICRO ROASTERY to be the consultant of Click Café.	Supported the collaboration with ROSSO MICRO ROASTERY to be the consultant of Click Café.

		Replacing the coffee machine from automatic to the manual ones in order to increase the quality of coffee drinks products.	This would attract Random People to come to the coffee shop.	This would attract Random People to come to the coffee shop.
		Planning to Re-layout for Cooking place on the 2nd Floor.	Getting the other Communities to join and to be Click Café's loyal customers.	
		Coffee's Barison the first floor.		
6	New Strategies to boost the sales?	RE-CONCEPT:	Agree	Agree
		STP TO COMMUNITIZATION		

		PROMO-TION TO CONVERSATION (Strengthening connection in the communities with Social Media and more active in promoting Click Café with events for example. Group WA, Facebook Fanpage)		
		PLACE TO COMMUNAL ACTIVATION (More active and frequent in holding some communities events in Click Café Bintaro)		
7	Do you think Click Café will be successful in the future?		Very optimist that Click Café will be successful (more loyal customers, more profit and one of best coffee shop in Bintaro and BSD Area.	Very optimist that Click Café will be successful (more loyal customers, more profit and one of best coffee shop in Bintaro and BSD Area.
			It is important for Click Café to be engaged with many communities.	

Figure 3.24.The Result of 3FGD

Marketing Strategy: STP to New Wave Marketing
Based on the above market research, there are important items that should be the main focus of Click Café's improvement which will lead to the achievement of their objectives. Click Café should focus on:

- The quality of products.
- The Service of Click Café's staffs.
- Strongly fostering and engaging the communities.
- StrengtheningtheirUniqueSellingPropositionas"PhotographyThemed"CoffeeShop.
- Attracting more random people by creating new Layout in Click Café area.

In regards to the quality of the products and the service of Click Café's staff, Click Café should increase the quality of Click Café's products, and improve the service of their staffs by collaborating with ROSSO MICRO ROASTERY to be the vendor and also the consultant for Click Café.

Figure 3.25. ROSSO MICRO ROASTERY–Pasar Modern BSD

Rosso is the coffee shop in BSD area which owns its roaster service inside their shop, and their owner is one of The Best Skilled Baristas and Coffee Experts in Indonesia. That is the reason why the owner of Click Café has requested to have the working collaboration with Rosso. The contract with Rosso will be for Consultation, Training, Quality Control Service, The Purchase of La Marzocco Coffee Machine and Mazzer Grinder including the Complete Barista Tools.

Rosso will be their supplier for the fresh local roasted coffee with special grade and higher quality to increase the coffee drinks quality. To improve the service and barista skills, Click Café has requested Rosso to provide the training for the staffs. Also, Click Café will replace their automated Seico coffee machine with the manual one. This is the in order to improve the quality of Click Café's products, too.

Figure 3.26. La Marzocco Linea Classic EE2 Manual Espresso Machine and Grinder Mazzer

Click Café have used Social Media more frequently to strongly fostering and engaging with the communities they belong too. Click Café treats their customers as the subject of the communities, too by "*communitizing through listening, talking, energizing, and helping.*"(Kertajaya, Hermawan, 2008, *New Wave Marketing*, Gramedia Pustaka Utama). This coffee shop has started to use the social media to understand their customers. They do not need to spend their budget for making flyers or paying to advertise their coffee shops in the magazines or local newspapers.

The changes above are a part of Re-Concept process where there have been some shifted in the Strategic Marketing concept from Segmentation, Targeting and Product Positioning which involves Price, Product, Distribution and promotion to New Wave Marketing Concept. What does it really mean? It means that there is some shifting from Segmentation to Communitization in order to achieve the objectives since according to. Welcome to The New Wave Marketing Era in which there is the shifting from STP (Segmentation, Targeting and Positioning) to Communitization. (Kruseman, Eduard Nov 23, 2010 http://www.slideshare.net/YESFoundation/trends-in-marketing-and-business-development)

Accessed on August5th, 2016.

Although it has just opened only a year ago. There are so many customers who would love to visit Click Café, due to their comfy and *'selfie + wefie'* place, and some community events that are held frequently in Click Café. There is a   strong bond between Click Café owners and Customers which are mostly due to Communitization as well.

What is actually the Communitization in regards to this Coffee Shop? In regards to Click Café, their communitization means their "*markets will be based on groups of people with the same passion or interest from all walks of life from anywhere around the world as communities.*" (Kertajaya, Hermawan, 2008, *New Wave Marketing*, Gramedia Pustaka Utama). It means coffee shop basically is about communities and building communities around us, and the owners of Click Café have used their community connection and networking to create *"Click Café Loyal Customers",* for example with their involvement in their old classic VW Cars, School Moms or Parents School Groups organization and Photography Communities which have been the target of their market segment.

This is more powerful than segmentation itself due to Communitization on this case means connecting the communities where the owners' belong to and have gained the trusts and love of communities so it is easier to market this business. This is *"low budget and high impact".*

There are also some suggestion from the respondents that will strengthen the opinions in regards to Click Café and Communization which is more requests from the photography communities to Click Café to hold more events frequently and announce them online and offline. There are Facebook fan page, Instagram, Twitter, Whatsapp Broadcast Message, and

even creating the Whatsapp Group among the communities members as tools to promote these events. This is a part of fostering and engaging with the communities. They are listening, caring and talking to their customers. This is what New Wave Marketing called as Conversation. Promotion has been shifted to Conversation in this New Wave Marketing era. Below are the implementation:

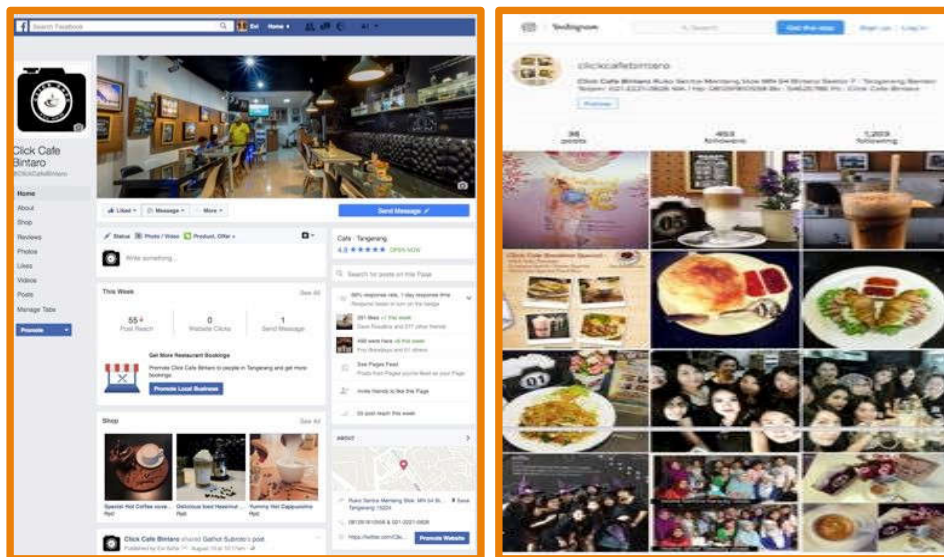

Figure 3.27. Click Café Facebook Fan Page and Instagram

The above Facebook Fan Page and Instagram are their conversation tools to 'chat' with their customers so it will be both ways instead of one way. This is the social media connection and building communities offline and online.

In order to succeed, Click Café must change the paradigm of segmenting the customers into communitization, promotion activities into conversation, and more active in creating the community events in Click Café frequently which is called communal activation. Click Café has started to implement this approach as per the announcement that has been posted to Click Café Facebook Fan Page and also Bintaro Photography Community members' Facebook last week.

Figure 3.28. ClickCafé –Communal Activation
(Monthly Photography Book Club Review Event)

Due to some changes that will be done in Click Café, there will be some movement in Click Café's product positioning, as below:

Figure3.29.Click Café and other Coffee Shops–New Product Positioning for Click Café
(Source: The Perceptual Mapping–First introduced and explained by Peter Drucker on his book *The Practice of Management 2007).*

Click Cafe will emphasize more on creating the "Premium" coffee with "Great Barista Skills", a brand new high quality coffee machine, special higher grade local coffee beans and more Photography and other community Events frequently and on schedules. Now, the product positioning of Click Café will be similar to Saudagar Kopi Coffee Shop.

Business Strategy Alternative Evaluation
Re-Layout
The other improvement would be Click Café's plans to Re-layout for more exclusive Coffee Bar and special cooking place. The coffee bar will be on the first floor to attract random people to visit Click Café, and getting other new communities to join to be Click Café's loyal customers, too. Also, the cooking place on second floor to give some special space on first floor to strongly connect the image of "exclusive Coffee Bar" and a great "Photography Themed" Coffee Shop.

Figure3.30.PlantoRe-LayoutClickCafé's1st Floor

http://www.lamarzoccousa.com/)

Figure3.31.PlantoRe-LayoutClickCafé's 2ⁿᵈ Floor Kitchen
(Source: http://retaildesignblog.net/tag/serbia/)

Re-Costing

Since there are some investment in the Barista's skills, new coffee machine, change the local coffee beans to the higher grade and special high quality, it is required for Click Café to do the price strategy to optimize the value of the product and achieve the other objective which is increasing the profit. Also, there are some comparison has been done to compare Click Café's prices with other coffee shops around Bintaro. The results are this coffee shop's prices are much cheaper than others.

minumkopi

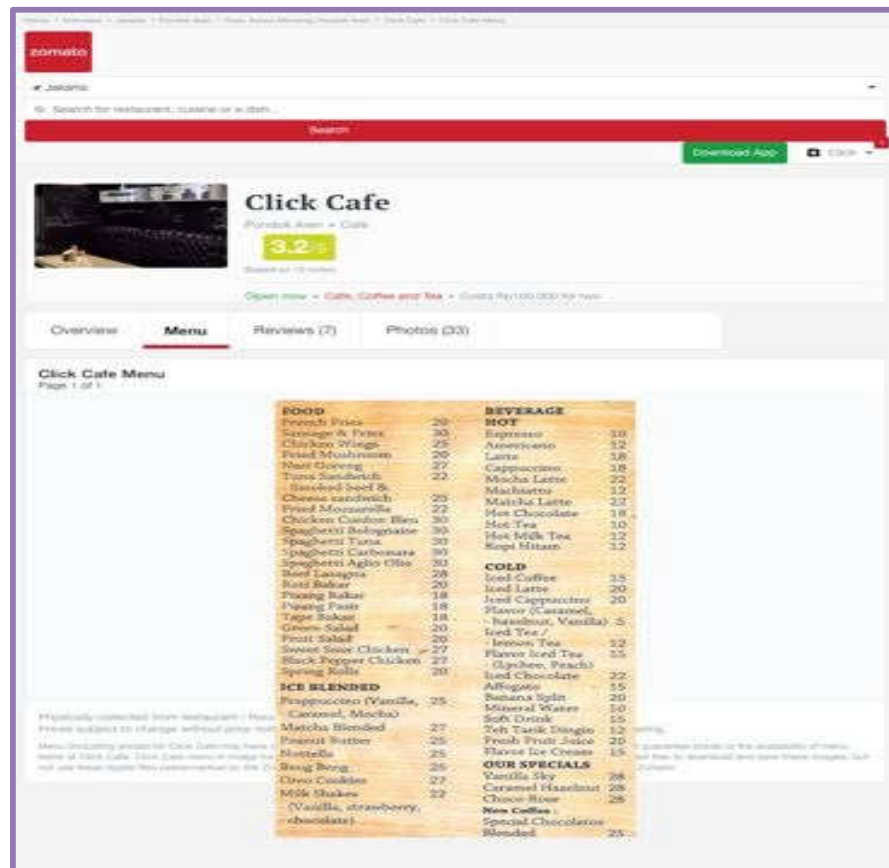
Figure 3.32. Prices of Kopi Manyar Coffee Shop (Source: Kicau Bintaro Magazine 2016)


Figure 3.33. Prices of Click Café in Zomato (online flyer of Click Café)

There will definitely be some price changes to optimize the profit as long as Click Café keeps maintaining, increasing their quality of the products, and also improving their services as per the result of survey. The customers will not be affected by the increase of prices in Click Café even until 25% increase of the current prices.

Conclusion and Implementation Plan

Conclusion

This final project is completed to provide a better understanding and analysis as to what happened with the current practice of Click Café since it has opened over a year ago. This analysis has covered the Internal (STP and Marketing Mix) and External (PESTEL and Competitor's Analysis – Porter's 5 Forces) Factor Analysis and their SWOT method in order to enable us to view the issues that Click Café is facing comprehensively so it can develop the marketing strategies which can help Click Café to achieve below objectives:

1. To find out the customers' opinion regarding Click Café's products and services.

2. To evaluate the current situation of Click Café based on the customer's opinions.

3. Finally, the logic further objective would be to come up with the marketing strategies which enable Click Café to solve the issue they are facing.

After conducting the marketing research quantitatively and qualitatively, there are some aspects that Click Café should focus on in order to sustain its business growth:
- The quality of products.
- The Service of Click Café's staffs.
- Strongly fostering and engaging the communities.

• Strengthening their Unique Selling Proposition as "Photography Themed" and "Community" Coffee Shop.

• Attracting more random people by creating new Layout in Click Café area. It can be concluded that there is the shifting of Click Café's marketing strategy from STP (Segmentation, Targeting and Positioning which include Price, Place, Promotion, and Distribution) Method to New Wave Marketing (Communitization, Conversation and Communal Activation) to response to the above concerns. Also, there are some alternative business strategy that we recommend which are "Re-Layout" and "Re-Costing". These are the strategies that will make Click Café a successful business in Restaurant and Coffee Shop Industry.

Implementation Plan

There are main action items as the implementation plan for Click Café to be successful in this coffee shop industry as follow:

• Strengthening the Unique Point of Sales as "Photography Themed" Coffee Shop and "Community" Café thru:

- Communitization
- Conversation
- Communal Activation

  o **Post more information about Click Café in Social Media including Group WA from new menu and new events.**

  o **Weekly events for Photography Seminars / Book reviews / Classes.**

  o **Monthly Women Talk Session or Classes.**

  o **The Total Budget for these events are Rp. 2,500,000 for 5 months Period.**

• Upgrading the Coffee Bar to be more Exclusive / Premium than before: Click Café has signed the contract with Rosso Micro Roastery to provide the upgrading coffee bar area. They are from the Consultation for daily operations of Click Café for 6 Months period after the new opening after renovation and training for Click Café Staffs to be Barista, Quality Control Service during the daily operations, and Coffee Machine purchasing process.

Below are the total budget:

1. Consultation for daily operations of Click Café
& Training for Click Café's staff to be a Barista   Rp. 20,000,000.
2.   Quality Control Service during daily Operations   Rp.   5,000.000.
3. La Marzocco Coffee Machine Linea Classic EE
including the Grinder, Consultation, Training& daily
Operations Quality Control.   Rp. 115,500,000.

Total Budget   **Rp. 140,500,000.**

- **Re-Layout**

> o **1ˢᵗ Floor Renovation to create Exclusive Coffee Bar.**
>
> o **Enlarging more space in front of main door for smoking area with the Fan.**
>
> o **2ⁿᵈ Floor Kitchen Area and Prayer Room Area Renovation.**

Until this time, Click Café is still searching the contractor to complete the above projects. The budget for these renovations for first and second floors are for the amount of Rp. 350,000,000.

- **Re-Costing**

The resources that will be required for this phase is only the data from the total cost of all expenses, the calculation of the profit expectation, and also the service charges estimation to get the products. There are few items that Click Cafe should consider when setting up the price for the products:

1.   Knowing all the cost of the products in order to find out the profit that we expected.

2.   As per the survey, the customers of Click Café do not mind when this coffee shop increase their prices until 25%.

3.   Click Café should check regularly the competitors' price. In order to succeed, Click Café should provide more value to their products much more than the competitors' values.

4.   Odd number pricing makes it more interesting to Click Café's target customers. They see Rp. 39,500. is more appealing than Rp. 40,000.

(Source: http://quickbooks.intuit.com/r/pricing-strategy/things-consider-pricing-your-product/)

The Timeline planning for the above action items are as follow:

Figure 4.1. The Project Timeline

In implementing these marketing strategies, it will benefit Click Café in achieving their success.

AN APPLICATION OF PROBLEM BASED LEARNING ON ACCOUNTING SYSTEM SEMINAR COURSE

Nanis Hairunisya, Universitas Panca Marga Probolinggo, Indonesia
Sunaryanto, Universitas Negeri Malang, Indonesia

Abstract

This research aims to describe how the application of problem based learning can improve student skills in solving problem on accounting system in small and medium size enterprises, and encourage student social skill. Participants of this research are eighty accounting department students who take accounting system seminar course. This study is designed as classroom action research, and implement Curt Lewin model of classroom action research. Result of this research demonstrates the implementation of PBL improve student skill in solving problem facing small and medium size enterprises as well as improve student skill in preparing and presenting their report.

Keywords: Problem Based Learning, Action Research, Accounting System Seminar Course

Preliminary

Accounting system seminar is a compulsory subject for undergraduate student who study at accounting department in Universitas Panca Marga. The objective of the course is to provide student with knowledge in accounting system applied in a company, produce report related to the application and present it in the classroom. Focus of the report should be problem in accounting system facing small and medium enterprises (SME). By enrolling in this course student will have problem solving skill in accounting system and personal skill of communicating their ideas. In general, accounting system can be defined as the forms, scripts, procedures and tools which are used to process the data about the economic activity. The purpose is to produce a report used as feedback needed by management to control their business. The report is also useful for shareholders, creditors, and government agencies to assess the results of the operation. Prerequisite of the course is accounting system. Students who take accounting system seminar should have been passed accounting system course.

To achieve this objective course, the lecturer needs to implement learning models which help the students to have the skill. At the beginning of the course, the students were given tasks by the lecturer to observe and interview with small and medium enterprises on issues related to accounting system, and then report their finding to the class.

However, this teaching strategy does not work well. It is found from the preliminary study conducted in the first semester of academic year 2014-2015 that the students take a lot of time to identify and analysis and give alternative solution of the problem facing SME. This weakness make the students could not present their report timely. Less than fifty percent of the student did not produce their report properly. Student ability to prepare report related to the problem was less than expected. Accordingly, students often have difficulty in accomplishing the academic task. They still lack of skills in identifying problem facing a company in its accounting system, solving the problem, and communicate the cases in front of the class. As a result, some students have to take remedial in the next semester. These problems partly arise because the teaching model implemented by the lecturer does not encourage students to get the skills. Considering this weakness, we structure problem based learning to help student have skill according to the objective of the course. The implementation of this model to improve student skill is based on literature indicating problem based learning can help student to have thinking and problem-solving skills (Arends,

2012). Therefore the purpose of this research is to describe how the application of problem based learning can improve student skills in solving problem on accounting system in small and medium size enterprises, and encourage student social skill.

Problem Based Learning

Problem-based learning (PBL) is a learning model which encourages knowledge construction by starting each learning experience with a complex real-life problem that is typically presented to a small group of students in a tutorial setting (Smith & Harland, 2009). Students take responsibility for their own learning as they identify what they already know about the problem and then ascertain what they need to find out, what questions are relevant to their inquiry and what actions they need to take. Members of the student team tend to work independently as they research different aspects of the problem before bringing their findings back to the group and to the tutorial in order to co-construct new knowledge (Smith & Harland, 2009). Problem-based learning aims at promoting student-centered learning and enhancing the development of students' higher-order thinking and fostering students' social skills. The latter allows students to function as a member of a team and to learn cooperatively by sharing his or her newly acquired knowledge. In PBL, students work collaboratively to solve ill-structured problems, identify their learning needs, and locate relevant information to address their needs. Students first encounter a problem followed by a systematic inquiry and reflection process (Barrows &Tamblyn, 1980).

The problem comes first to stimulate and focus students' curiosity leading to an exploration and activation of pre-existing knowledge. Guided discovery with a tutor helps students to identify the edge of their knowledge, a zone between what they know and what they need to know. Discussion, self-directed learning, elaboration, timely feedback and reflection are processes characteristic of small-group PBL(Norman & Schmidt, 1992)..

Studies in cognitive psychology envision three roles for PBL: (1)the acquisition of factual knowledge in a context in which it will ultimately be used; (2) learning general principles and concepts in such a way as to facilitate transfer to new, similar problems; (3) the acquisition of prior examples that can be used for problem solutions on the basis of similarity or pattern recognition(Norman & Schmidt, 1992).

PBL initially was promoted as an approach to developing overall problem-solving skills (Barrows &Tamblyn,1980), however, subsequent research has shown that problem-solving skills and expertise are highly content and context dependent and do not generalize across subject domains (Norman & Schmidt, 1992).

Problem-based learning has been widely used in both medical and health education courses (Barrows &Tamblyn, 1980, Caplow et.al.1997) as well as in non-health disciplines such as management education (Sherwood, 2004), business communication (Pennel& Miles, 200) and accounting(Johstone& Biggs, 1998).

Arends (2012) summarize five phases of problem-based learning and required teacher behaviors for each phase as presented in Table 1.

Table 1: Sintax for Problem Based Learning

Phase	Teacher Behavior
1. Orient students to the problem	Teacher goes over the objectives of the lesson, describes important logistical requirements, and motivates students to engage in problem solving activity.
2. Organize students for study	Teacher helps students define and organize study task related to the problem.
3. Assist independent and group investigation	Teacher encourages students to gather appropriate information, conduct experiments, and search for explanations and solutions.
4. Develop and present artifacts and exhibit	Teacher helps planning and preparing appropriate artifacts such as reports, videos, and models, and helps them share their work with others.
5. Analyze and evaluate the problem solving process	Teacher helps students to reflect on their investigation and the process they use.

Source: Arends (2012:411)

Research Method

This research was designed as a classroom action research. Mills (2003) define action research is any a systematic inquiry conducted by teacher researchers, principals, school counselor, or other stockholders in the teaching /learning environment to gather information about how their particular schools operate, how they teach, and how well their students learn. The purpose of an action research is

Participants of this research are 80 students who take accounting system seminar course in the odd semester of 2015-2016 academic year. They are the seventh semester students of Accounting Department of Universitas Panca Marga located in Probolinggo city.

This research uses classroom action research method of Kurt Lewin model. This model consists of four components: 1) planning; 2) action; 3) observation and 4) reflection. In the planning phase, the researchers orient students to the problem and organize students for study. The researchers go over the objectives of the lesson, describe important logistical requirements, and motivate students to engage in problem solving activity. Researchers also help students define and organize study task related to the problem. The academics tasks that student would be accomplished are identify, analysis, and solve problem in accounting system facing small and medium size enterprises, prepare a report and present their finding in the classroom. To accomplish this task the students are divided into small group of five students. They will do the academic task collaboratively. In the action phase, the researchers assist independent and group investigation. The researchers also encourage students to gather appropriate information, conduct experiments, and search for explanations and solutions. The next stage is observation. This was conducted by monitoring how the students work. The students identify the application of accounting system in small and medium size enterprises

and then try to find problem that need to be overcome. They prepare a report to be presented in the classroom.

Result and Discussion

Improving students' ability to solve the problems

The application of problem based learning in accounting system seminar course has provided the students with ability to solve problems facing small and medium size enterprises. Before the application of problem based learning in accounting system seminar course, most students have some difficulty in identifying, analyzing and solving accounting system problem. Based on observation conducted before the application of this teaching model, students have no enough experience to identify problems. However, after the application of problem based learning most students skills in identifying, analyzing and solving problems have been improved. Most of the students can accomplish the task properly. This is possible because at the start of the problem based learning lesson, researchers communicate clearly the aims of the lesson, established a positive attitude toward the lesson, and describe what the students are expected to do. For example the researchers explain that the aims of the lesson is students would be able to produce a report based on problem facing small and medium size enterprises on accounting system, and discussing the problem and the solution in the classroom. The topic of the discussion is the process of preparing the financial statement, software usage in preparing the financial statements, the health practice in the company. The researchers also explain the model's processes and procedures in some detail. With the explanation the students have clear understanding about what to do.

In addition, improving the students skills in solving a problem is also encouraged by the researchers who develop collaboration skills among students and help them to investigate problems together, and assist the group to investigate the problems.

Improving students' skill in preparing and in presenting the report

The implementation of problem based learning in accounting system seminar course has improve students skill in preparing the report related to accounting system problem facing small and medium size enterprises. All groups engaged in this learning process accomplish the academic task of preparing a report of a case on accounting system. Before the implementation of problem based learning model, the students have some difficulties in preparing a report. The lack of skill in writing is a burden for students to prepare the report. The students have difficulty in organizing data as result of their observation and interview with the owner or management of SME. The researcher solve the problem by assisting the students in writing the report step by step.

Presenting problem and the solution encourage discussion in classroom. Discussion is thought to be a useful teaching technique for developing higher-order thinking skills that enable students to interpret, analyze, and manipulate information (Arends, 2012). The students explain their ideas and thoughts, rather than merely recount or recite memorized facts and details. When they were presenting their report, they explain the problem, how data were collected and analyzed to produce solution. Students support idea with evidence, where their opinions are subject to challenge by their peers as well as the lecturer researchers, and where the lecturer's ideas are equally open to criticism.

This activity encourages students to engage in a discussion. During discussion the students are not passive recipients of information that is transmitted from the other. Rather, the students are active participants. As they interact during the discussion, students construct an understanding about the topic by expanding each student information on the topic with information from other student. The discussion also fosters different perspectives on a topic; provide opportunities to present alternative ideas about a topic; provide opportunities for other

student to criticize, accept, or refute these alternative ideas; and encourage mutual modifications among the students' opinions to produce a group decision or consensus. Group interaction is the important component for each of these as it shapes and directs the exploration of a topic (Larson, 2000).

Conclusion and Suggestion

Based on result of the research, it can be concluded that the implementation of investigated group model is extremely help the students in understanding the problems of Accounting System implemented by SME. Lecture is a facilitator who assist students actively for solving their problem. The small groups used in PBL encourage the students to work collaboratively in expressing their opinion, holding out their argument about the problems during discussion in the class. This method also makes the students more active in discussion and solving the problem, and can create more conducive environment in the classroom.

This method can improve students' understanding on accounting system. However, there are considerations when applying PBL. PBL methods should be implemented only after basic technical accounting knowledge has been acquired, appropriate problem solving strategies should be explicitly taught, and innovative approaches for teaching problem solving skills should be encouraged. A teacher teaching in PBL classes should possess expert technical knowledge of the subject area.

EDUCATION AND ENVIRONMENTAL EFFECT OF COMPETITIVE ADVANTAGES AND PERFORMANCE OF WOMEN ENTREPRENEURS IN MALANG

Aniek Wahyuati, Sekolah Tinggi Ilmu Ekonomi Indonesia (STIESIA) Surabaya, Indonesia
Anindhyta Budiarti, Sekolah Tinggi Ilmu Ekonomi Indonesia (STIESIA) Surabaya, Indonesia

Abstract

In the culture of Indonesia, where the position of men in the public realm is more dominant than the women, began to crumble slowly. Changes in culture and social system gives greater space for women to participate economically in society. Research involving 120 respondents in the city of Malang women entrepreneurs is aimed to determine the effect of education and the environment against the competitive advantage and business performance. Data analysis was performed with path analysis, and generate some conclusions. Environmental contribution to competitive advantage is greater than education. Good business performance is driven by the high competitive advantage
.

Keywords: education, environment, competitive advantage, business performance, business women.

Introduction

Entrepreneurial and business world in this decade is no longer dominated by men. Based on research conducted by the National Foundation for Women Business Owners (NFWBO), the number of women business owners (women-owned business) in the world increased by 31.5% between 1997 and 2002. In many countries the average growth of women entrepreneurs is higher than average growth male entrepreneurs (Reynolds et al., 2002). Many well-known companies with the characteristics of entrepreneurs, their motivation, family background, educational background, work experience, as well as the problems of employers of men and women.

The patriarchal system that has long been grown in a culture of Indonesia, where the position of men in the public realm is more dominant than the women, began to crumble slowly. Changes in culture and social system gives greater space for women to participate economically in society. In this case Tinaprilla (2007) stated that the phenomenon of women's businesses is the impact of the program by the government to improve gender equality. Women were given the role of a more plural and enjoy a higher education. Thus, many women who appear and was instrumental in the life of the state, nation and society that one of them is as a woman entrepreneur.

Performance of a company depends on the fit between the collection of own resources and external environment. If there is good agreement between the resources with the outside environment, the company will gain superior performance, but if conformity is bad, then the performance will be worse (Hisrich, 2008). Women entrepreneurs can create a business that will provide the basis for the company's high performance for a long period through sustainable competitive advantage. Competitive advantage is a factor which a company may be superior than its competitors in a competitive environment.

The potential success of women entrepreneurs and their equal access of women to men, it is necessary and important for the government to formulate strategies and develop programs to empower women in the economic field, especially as an entrepreneur. Although structurally

and culturally women are not sufficiently fair treatment, and even personal characteristics, women also do not quite have the confidence to succeed, but the reality shows that the number of women who choose a career as an entrepreneur and proven successful in increasing numbers (Jati, 2008).

Theoretical foundation

Entrepreneurship is a dynamic process in creating additional wealth. Wealth generated by individuals who bear the main risk in terms of capital, time, and / or commitment to a career or provide value for some product or service. Products or services may be visible or may not be unique, but in many ways the value will be generated by a businessman with receiving and placing the skills and resources needed this.

Education

Education limits suggested by experts depending on the viewpoint used. In Act No. 20 of 2003 on National Education System stated that: Education is a conscious and deliberate effort to create an atmosphere of learning and the learning process so that learners are actively developing the potential for him to have the spiritual power of religion, self-control, personality, intelligence, morals noble, as well as the skills needed him, society, nation and state. Education takes place continuously or lifetime implemented in a variety of environments both an environmental family, school and society. According to Umar T (1995), classified in three groups, namely education informal education, formal and non-formal.

Environment

Environmental dynamism shows the level of turbulence products, technologies and demand for the products on the market (Miller, 1998). A company in the business environment, as well as in other organizations, is the pattern of all external conditions and influences that affect the life and development of the company. Relevant environmental affect on operations strategy decisions. Pearce and Robinson (1991) identified three types of business environment is an environment far as economic, social, political, technological and ecological, industrial environments such as barriers to entry, power suppliers, buyer power, substitutes, and competition, and the operating environment such as competitors, creditors , consumers, workers, and suppliers.

Porter (1980) suggests that the business environment can be divided into two categories: external and internal environment. The external environment is divided into two categories namely: general environmental and industrial environments, while internal environment are aspects that exist in the company. Environment far include political factors, economic, social and technological. Environmental industry include aspects contained in the concept of competitive strategy (competitive strategy) covering aspects of barriers to entry, aspects of the bargaining power of suppliers, bargaining power of buyers aspect, the aspect of the availability of substitutes and competition aspects in the industry. Internal environment includes aspects of finance, human resources, marketing, operational and management aspects. The business environment can affect all aspects of the business both at the level of organizations and individuals. Important components of the internal environment, namely:

1. Resource
2. Capabilities
3. Core Competencies

Competitive Advantage

A company is said to have a competitive advantage when the company has something that is not owned by a competitor, do something better than other companies, or be able to do something that is not able to be done by another company (Mudrajad Kuncoro, 2004). Competitive advantage as defined by Man, et al., (2002) is the knowledge (knowledge) adequate, expertise (skills), and the ability (ability) are adequate to meet the needs, such as the effective performance of a job. Baum et al., (2002) developed a number of variables that explain the competitive advantages of business, in example knowledge, cognitive ability, self management, administration, human resources, decision skills, leadership, opportunity recognition, and opportunity development.

Competitive advantage is the company's ability to formulate strategies for achieving profit opportunities through maximizing revenue from the investments made. There are two basic principles that need to be owned by a businessman to gain a competitive advantage that is the view of customer value and uniqueness of the product.

Performance

Hunger and Wheelen (2001) argue that the performance of the company is the end result of corporate activities. The measurements are used to assess the performance is dependent how the organizational unit will be assessed and how the objectives will be achieved. The target set at the stage of strategy formulation in a strategy management process (with respect to profitability, market share, and the measurement of costs) should be used to measure the performance of the company during the implementation of the strategy. The company's performance is measured by respondents' assessment and market share, the self assessment relative to competitors, Return On Assets (ROA), sales growth (growth in sales), and the success of new products (Astuti, in Perspective, 2003).

Research Methods

This type of research is explanatory research. According Sugiyono (2005) study by the level of explanation is research that intends to explain the position of the variables studied and the relationship between one variable to another variable. This research includes studies associative or relationship, with the research method used was survey method using a questionnaire instrument as a means of data collection. The time horizon of this study was cross sectional namely research or data collection at a certain time span. The population in the study distinguished between the target population and the population of access. Target population in this study were women entrepreneurs. While the population in this study is the access of women entrepreneurs in Malang, which has a small License with net worth or paid up capital in the deed of establishment / change with a value of up to US $ 200,000,000.00 (two hundred million rupiah). Total population known for certain access based on data obtained from the Department of Cooperatives and SMEs Malang. Tools of analysis in this study using the Path Analysis. According to Hair et. al. (2006) determination of the number of respondents who required that a proportional sample as many as 14-20 times the number of variables. Variables examined amounted to 4, then the number of samples used in this study were at least 80 respondents and the number of respondents who obtained is 120 entrepreneurs. The research variables were four, two exogenous and two endogenous. Exogenous variables are education (X1) and the environment (X2), whereas endogenous variables are the competitive advantages (Z) and performance (Y). Analysis of the data used in this study using path analysis (Path Analysis) with the help of calculation by SPSS.

Research

Characteristics Sample

Data were obtained from questionnaires distributed to respondents. The number of respondents involved in this study amounted to 120. Characteristics of respondents in this study consisted of districts of origin, commodity, age, marital status, years of becoming an entrepreneur, the activity before becoming entrepreneurs, the main source of family income, number of employees, as long as the investment fund, the reasons starting a business, the problems in the business. The characteristic feature of the respondents below is a representation of the population. While the diversity of characteristics of the respondents could be a source of differentiation plays fourth assessment of the variables studied.

Distribution of respondents in five districts, mostly from districts Lowokwaru ie 48 respondents (40%), while in four other districts have almost the same proportion is about 14-20 respondents or 11.7% - 16.7%. The large number of respondents from district Lowokwaru because in this region is an area with a number of college education at most, so the business potential in this region is the greatest.

Commodity option work done by women in Malang most in the segment of food or beverages (34.2%) and followed by convection or garment (15.8%). In addition to these two main commodity, the work done is craft commodities (10.0%), beauty (9.2%), trade (10.8%), contractor (5.0%) and other commodities (15%) as children's education, maternity hospitals and laundry services.

Composition of respondents by marital status, most were already married by the number of respondents 109 (90.8%). Whereas in 11 others unmarried status (5.8%) and widowed (3.4%). The distribution of respondents by age at most in the range of 41-50 years with a total of 47 people (39.2%) then the next group is aged up to 30 years (13.3%), 31-40 years (33.3%), and more than 50 years (14.2%). The high number of respondents aged 31-50 years could mean that among these economic problems have started to become a major problem in the family, so many women who decide to take to open a business that can support the family economy. The number of respondents based long been the most widely ranged businessman 6-10 years (35.8%). The new small part of doing business for less than one year (5.0%), while 26.7% of respondents had been running the business more than 10 years.

The education level of respondents who studied are diverse ranging from elementary school (SD) to graduate S-2. Educational composition of respondents uneven with dominance at the level of high school education and diploma, amounting to 78 people (65.0%). Before becoming an entrepreneur, most of these women are working purely as housewives (47.5%), while on the other is never an employee or employees (30.8%) and 21.7% was recently completed to be a student or students ,

Business carried on female entrepreneurs, most of the sources of investment are from the husband (42.5%), get a loan from banks (31.7%) or assisted by other family members (10.8%). Reasons behind among women become entrepreneurs for two that want to find a side income (38.3%) or economic factors (29.2). Also found an excuse to continue the family business (9.2%). The issue is currently running the business entrepreneurs is the difficulty in dividing time between attempted and responsibilities in the family (54.2%). Problems trouble finding capital loans and develop innovation in their business will still be a problem faced by women entrepreneurs.

b. Path Analysis

Estimation path coefficient which shows the influence of education and environment variables for competitive advantage is done by using multiple linear regression analysis. Path coefficient obtained from the standardized regression coefficients (beta). Table 4.12 describes the test results simultaneously and partially the effect of the independent variables on competitive advantage. In the F test values obtained calculated F= 53.421 (greater than F-calculated) and coefficient of determination of 47.7%. This explains that the test results simultaneously obtained the significant influence of the two independent variables on competitive advantage with a contribution of 47.7%.

Tabel 1 Result of Path Coefficient Test to Competitive Advantage

VARIABEL	Beta	t-calculated	p	EFFECT
education	0.367	4.902	0.000	Positive and significant
environment	0.443	5.923	0.000	Positive and significant
(R^2) = 47,7% F-calculated = 53,421 2,042			critical value : t_{table} = 1,986 F_{table} =	

Partial effect of education on competitive advantage with path coefficient of 0,367 positive effect on the competitive edge. T-test results for this path coefficients are significant. It is evident from the value t count = 4,902 bigger than t table = 1.986 (p <0.05). This result explains that the competitive advantage of diversity can be explained by education.

Partial effect of the environment on competitive advantage with path coefficient of 0.443 positive effect on the competitive edge. T-test results for this path coefficients are significant. It is evident from the value t count = 5.923 greater than t table = 1.986 (p <0.05). This result explains that the competitive advantage of diversity can be explained by the environment.

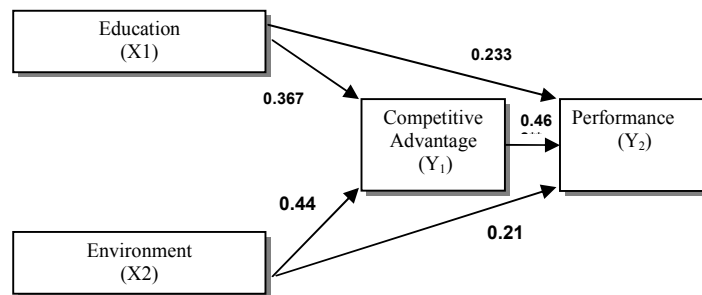
Estimation path coefficient which shows the influence of the variables of education, environmental and competitive advantages on the performance of the business is done by using multiple linear regression analysis. Path coefficient obtained from the standardized regression coefficients (beta). For more details, description of the regression analysis results obtained are presented in Table 2

Tabel 2 Result of Path Coefficient Test to Performace

VARIABLE	Beta	t-hitung	P	PENGARUH
Education	0.233	3.288	0.001	Positif dan signifikan
Environment	0.217	2.952	0.004	Positif dan signifikan
Competitive Advantage	0.469	5.884	0.000	Positif dan signifikan
(R^2) = 61,5% F-Calculated = 61,672	Critical Value t_{table} = 1,984 F_{table} = 3,938			

The table above describes the test results simultaneously and partially the effect of three independent variables on the performance of the business. In the F test values obtained F-cal = 61.672 (greater than F-table) and coefficient of determination of 61.5%. This explains that the test results simultaneously obtained the significant influence of three independent variables on the performance of the business with a contribution of 61.5%.

 Partial effect of education on the performance of the business with a path coefficient of 0.233 positive influence on business performance. T-test results for this path coefficients are significant. It is evident from the value t count = 3.288 greater than t table = 1.984 (p <0.05). This result explains that the diversity of business performance can be explained by education. Partial effect of the environment on the performance of the business with a path coefficient of 0.217 positive influence on business performance. T-test results for this path coefficients are significant. It is evident from the value t count = 2,952 bigger than t table = 1.984 (p <0.05). This result explains that the diversity of business performance can be explained by the environment. Partial effect of competitive advantage to the business performance path coefficient of 0.469 with a positive effect on business performance. T-test results for this path coefficients are significant. It is evident from the value t count = 5.884 greater than t table = 1.984 (p <0.05). This result explains that the diversity of business performance can be explained by the competitive advantage.

 The fifth track on the model of the whole track is a significant hypothesis. The dominant role of the competitive advantages derived from education, while the dominant influence on the performance of the business comes from the competitive advantage. In particular the two predominant pathways to be interesting because a determinant of high performance businesses. For more details on the analysis overall track can be presented in Figure 4.1.


Notes: * = Significant at α = 0.05

The accuracy of the model hypothesis of the research data measured from the relationship of two coefficients of determination (R2) in both equations. In the first equation obtained value of 0.477 R21 and R22 at 0.615 in the second equation.
Results of the model accuracy is:
R2 model = 1 - (1 - R21) (1 - R22)
      = 1 - (1-.477) (1-.615)
      = 1 to 0.201
      = 0.799 or 79.9%

Results of the model calculation accuracy of 79.9% explained that the contribution of the model to explain the causal relationship of the four variables studied was 79.9% and the rest is explained by other variables not involved in the model. Direct influence on the competitive advantage comes from education and the environment. Then there is also the direct influence of education, environmental and competitive advantages to business performance. So there is the indirect effect of education and environmental variables on the performance of credit business through competitive advantage

Discussion of Results

Influence Education Against Competitive Advantage

Research data supports that women entrepreneurs will have a competitive advantage if it has a background appropriate if formal and informal education sufficient. Of two coefficient lines connecting the two variables against a competitive advantage, the path coefficient of education is greater, namely 0.308. The results are consistent with research conducted by Lee (1997), the research results show that education has a strategic role in shaping attitudes and directs entrepreneurial intentions. Women who are educated, have strong incentives to be successful and have the advantage.

Research on the difference between those with low and high achievement requirements in relation to the level of success has been a lot going on. A person with a high level of achievement needs, tend to be more active and dynamic in doing any work entrusted to him. Education is able to develop one's potential, so as to realize the personality, intelligence and the skills required. According Zahara Idris (1992) suggested that education is a series of communication activities between an adult human with students face-to-face, using the media in order to provide assistance to the development of the students completely in order to develop their potential as much as possible in order to become mature and responsible human beings. Potential herein include potential physical, emotional, social, moral, knowledge and skills.

Opinions Ngalim Purmanto M. (1993) says that education is any deliberate effort given by adults to children in the physical and spiritual growth in order to be useful to themselves and society. The opinions above explains that education is a series of activities or efforts of adults towards their students consciously and deliberately to help develop good personal spiritual boost potential (knowledge and attitudes) and physical (skills) in order to become a responsible adult who useful to themselves and society. Education is a conscious and deliberate effort to create an atmosphere of learning and the learning process so that learners are actively developing the potential for him to have the spiritual power of religion, self-control, personality, intelligence, noble character, and skills needed him, society, nation and state.

Female entrepreneurs can increase competitive advantage through education. Formal education is certainly not easy to go through because it will take time and the cost is quite high. The role of non-formal education would be an appropriate alternative in supporting business performance. Education takes place continuously or lifetime implemented in a variety of environments both an environmental family, school and society. Informal education is a process that actually happened a lifetime because each individual acquire attitudes, values, skills, knowledge of everyday experience and environmental influences that come from family, friends association, and society. Informal education cannot be ignored because it is very important in the personal formation. The influence of family and friends could determine the attitudes and values that are used in the guidelines of his life.

The basics of education provided family like character, adhering to the norms of society. If a family has a business sector, the explanation of the knowledge of the management of the business will be known directly unnoticed. Entrepreneurial knowledge and skills absorbed from the environment or family without going through formal and non-formal education. While formal education is held in the school education / specific place, structured, has a degree / level, runs from primary school to university. Formal education a person can be reached through educational institutions elementary, junior high, high school, PT with level / specific learning period, systematically planned with a specific time period through the stages.

A company is said to have a competitive advantage when the company has something that is not owned by a competitor, do something better than other companies, or be able to do something that is not able to be done by another company (Mudrajad Kuncoro, 2004). Every company needs to improve its internal strengths in dealing with competition. Basically the necessary competitive advantage are the hallmarks that are constantly so that the company can survive and thrive in its environment. Competitive advantage is the company's ability to formulate strategies for achieving profit opportunities through maximizing revenue from the investments made. There are two basic principles that need to be owned by a businessman to gain a competitive advantage that is the view of customer value and uniqueness of the product. Competitive advantage will occur if there is a customer view that they obtain a certain value of economic transactions with the company. The uniqueness is characterized by the products cannot be easily imitated by competitors. The characteristics of uniqueness among other things: the ability of financial and economical, demonstrated by the ease of entrepreneurs to obtain financial resources relatively quickly with a relatively lower interest rate than the market rate. Moreover, it can be a company's ability to press the price of a product that is cheaper than the price of the same products from other entrepreneurs. The ability to create strategic product, the shape and form of the advantages of this unique type of product features compared to similar products from other companies. Among others, can be seen from the aspect of flavor, size, appearance and product safety as well as the atmosphere of the business environment .. The ability of technology and processes, the company should have different characteristics in

making and presenting products to customers compared to other companies. Organizational ability, characterized by an excess of the company in the management of organizational systems commensurate with the needs of customers.

Porter (1980) states that a company will have a competitive advantage when the company was in the favorable conditions of the five principal competitive factors, namely the entry of new entrants, threat of substitute products, bargaining power of buyers, bargaining power of suppliers, and rivalry among existing competitors. Competitive advantage will be achieved if companies know the product or service unique and valuable by the market response (Mintzberg and Quinn, 1996). Achieve competitive advantage means doing a comparative analysis of closely related to organizational processes and improved performance to achieve success.

Environmental influences Against Competitive Advantage

Data analysis to produce research results that support the environment will strengthen the competitive advantages of women entrepreneurs. Path coefficients of the environment to a competitive advantage is 0.423. The results are consistent with research that has been done by Bitange Ndemo (2007), in his research revealed that women entrepreneurs in making decisions influenced by the environment. The environment is a social system that provides guidelines that direct perception, attitude and behavior of members of the community group. An enterprise environment are all conditions that affect the development of enterprises .. An entrepreneur needs a strong environmental support in every phase of the business, because the environment provides information, advice, and guidance on matters such as organizational structure, revenue sources necessary financial and marketing.

A company is said to have a competitive advantage when the company has something that is not owned by a competitor, do something better than other companies, or be able to do something that is not able to be done by another company (Mudrajad Kuncoro, 2004). Competitive advantage must be owned by a business is knowledge (knowledge) adequate, expertise (skills), and the ability (ability) are adequate to meet the needs, such as the effective performance of a job (Man, et al., 2002). Every company needs to improve its internal strengths in dealing with competition. Basically the necessary competitive advantage are the hallmarks that are constantly so that the company can survive and thrive in its environment.

Competitive advantage is the company's ability to formulate strategies for achieving profit opportunities through maximizing revenue from the investments made. There are two basic principles that need to be owned by a businessman to gain a competitive advantage that is the view of customer value and uniqueness of the product. Competitive advantage will occur if there is a customer view that they obtain a certain value of economic transactions with the company. Competitive excellence is also characterized by the resulting product can not be easily imitated by competitors. The characteristics of the uniqueness of the competitive advantages include financial viability, creating strategic products, technological capabilities in process and organizational ability. Financial and economic capabilities, demonstrated by the ease of entrepreneurs to obtain financial resources relatively quickly with a relatively lower interest rate than the market rate. Moreover, it can be a company's ability to press the price of a product that is cheaper than the price of the same products from other entrepreneurs. The ability to create strategic product, the shape and form of the advantages of this unique type of product features compared to similar products from other companies. Among others, can be seen from the aspect of flavor, size, appearance and product safety as well as the atmosphere of the business environment. Technological capabilities and processes, the company should have different characteristics in making and presenting products to customers compared to other companies. Organizational ability,

characterized by an excess of the company in the management of organizational systems commensurate with the needs of customers.

Porter (1980) states that a company will have a competitive advantage when the company was in the favorable conditions of the five principal competitive factors, namely the entry of new entrants, threat of substitute products, bargaining power of buyers, bargaining power of suppliers, and rivalry among existing competitors. Competitive advantage will be achieved if companies know the product or service unique and valuable by the market response (Mintzberg and Quinn, 1996). Achieve competitive advantage means doing a comparative analysis of closely related to organizational processes and improved performance to achieve success.

Effect of Competitive Advantage Of Business Performance

Research data supports that business performance will be strengthened if women entrepreneurs can choose the appropriate competitive advantage to compete in the market. The results are consistent with research that has been done by Brienley (2005) that the competitive advantage in the low will hinder the performance, so it is necessary to establish some policies to encourage the growth of women entrepreneurs.

The success of the business's performance can be viewed from two aspects, namely: qualitative and quantitative. In the quantitative performance of a company can be seen from the achievements of the company compared to what was done in the past or compare with its competitors in a number of factors, such as net income, the return of capital, market share, sales growth, production costs and efficiency, employee turnover (turn over), and employee satisfaction index. Qualitative measure, in the form of questions to determine the goals, strategies and plans are integrated and comprehensive of a company has been consistent, precise and can run or not.

Hunger and Wheelen (2001) argue that the performance of the company is the end result of corporate activities. The measurements are used to assess the performance is dependent how the organizational unit will be assessed and how the objectives will be achieved. The target set at the stage of strategy formulation in a strategy management process (with respect to profitability, market share, and the measurement of costs) should be used to measure the performance of the company during the implementation of the strategy.

Education Influence on Performance of Business

Research data supports that business performance would arise if women entrepreneurs have sufficient levels of education. Path coefficient from education to business performance is 0.330. The results are consistent with research that has been done by Katherina Sarri (2005) in his research that analyzes the characteristics and motivations of women entrepreneurs in Greece, found that education levels affect a woman entrepreneur creativity, autonomy and self-reliance in developing business ideas, make plans and expand their business activities.

Women have a need for achievement as men, even more access to information have also begun to gain equality. In fact, the need for women's achievement even higher since they are aware catch up with men. Women are encouraged to constantly improve themselves and show themselves that they too can be successful as men.

Education is able to develop one's potential, so as to realize the personality, intelligence and the skills required. According Zahara Idris (1992) suggested that education is a series of communication activities between an adult human with students face-to-face, using the media in order to provide assistance to the development of the students completely in order to develop their potential as much as possible in order to become mature and responsible human beings. Potential herein include potential physical, emotional, social, moral, knowledge and skills.

Opinions Ngalim Purmanto M. (1993) says that education is any deliberate effort given by adults to children in the physical and spiritual growth in order to be useful to themselves and society. The opinions above explains that education is a series of activities or efforts of adults towards their students consciously and deliberately to help develop good personal spiritual boost potential (knowledge and attitudes) and physical (skills) in order to become a responsible adult who useful to themselves and society.

Environmental Influence on Performance of Business
Research data supports that high environmental support will even become a factor driving business performance. The results are consistent with studies that have been conducted by Friederike Welter (2004) in research on environmental influences on the productivity of women entrepreneurs in Germany, stated that many environmental constraints that limit the creativity of women entrepreneurs to develop their businesses.

Competitive advantage becomes the most important aspect in an attempt to win business competition. Competitive advantage can be created in a competitive environment, and competitive advantage influence the productivity and performance of women entrepreneurs (Friederike Welter, 2004). An enterprise environment are all conditions that affect the development of enterprises .. An entrepreneur needs a strong environmental support in every phase of the business, because the environment provides information, advice, and guidance on matters such as organizational structure, revenue sources necessary financial and marketing.

Environment is the basis of public officials. The role of the family describe a set of inter-personal behavior, nature, personal activities associated with certain positions and situations. The elements in a good family, cultural, economic and even family size greatly influenced the treatment and thinking entrepreneurs. Family environment to prepare potential for growth and the formation of the entrepreneur's personality. Family environment is quite important factor in influencing the development of the business.

In addition to the family, women entrepreneurs also need an environment that supports the organization. The work environment is a context that can be perceived characteristics, have the supporting factors and inhibitors for entrepreneurs. Work environment refers to things that are around and covers the work of entrepreneurs. Women entrepreneurs should be more sensitive in reading the business environment that is being executed. The internal environment encompasses human resources, financial, management, market (market). The organization's progress is determined by human resources, where the threat or external influences will affect the organization's progress and destruction. While the external environment, employers must be able to accurately recognize the macro environment. Macro environment, which comes from outside and are indirect. Microenvironment consists of: supplier (supplier / provider of a wide range of needs), customer (user / user), competitors (competitors) and substitute (replacement).

Business performance can be viewed from two aspects, namely: qualitative and quantitative. In the quantitative performance of a company can be seen from the achievements of the company compared to what was done in the past or compare with its competitors in a number of factors. Qualitative measure, in the form of questions to determine the goals, strategies and plans are integrated and comprehensive of a company has been consistent, precise and can run or not. The performance of the company is the end result of activities of the company (Hunger and Wheelen, 2001). The measurements are used to assess the performance is dependent how the organizational unit will be assessed and how the objectives will be achieved. The target set at the stage of strategy formulation in a strategy management process (with respect to profitability, market share, and the measurement of

costs) should be used to measure the performance of the company during the implementation of the strategy.

Conclusion

Based on the analysis and discussion and its relevance to the research objectives will be obtained several conclusions. Education significant effect on the competitive advantages of women entrepreneurs in Malang. Education significant effect on the performance of women entrepreneurs in Malang. Competitive advantage mediate the effect of education on the performance of women entrepreneurs in Malang. Environmentally significant effect on the competitive advantages of women entrepreneurs in Malang. Environment on the performance of women entrepreneurs in the competitive Malang. Advantage City mediate environmental influences on the performance of women entrepreneurs in Malang. Education and environment significantly influence competitive advantage and performance of women entrepreneurs in Malang.

Modeling results in the four variables studied resulted in some suggestions. For academics or other similar research, the results of modeling in this study is expected to become a factor in planning and developing a small business performance. In a normative perspective Economic Sciences (economics which holds that moral norms and should be an integral part of economic practices in the community) the contribution of this study is significant because it supports studies of fair economic practices in the form of small business empowerment, especially among women. The study provides an explanation of the factors that influence the success of the business for the community whether sourced internally or externally of self merchants in the form of regulations issued by the government. It required the efforts of continuous learning in order to improve the independence and progress of the business for the group of small businesses through the development of training modules that simple according to the needs of the target communities and adaptive training curriculum and models of innovative learning.

For financial institutions in the banking sector and micro scale related to the empowerment of the community can utilize the research results to be used as consideration in the improvement of the empowerment program that is now being implemented or in the future, especially the training curriculum that emphasizes practices needed namely entrepreneurship training oriented to public service as well as a variety of motivational training and negotiation techniques to expand the network of small businesses.

For the association of small business operators and investors in credit financing small results of this study can be used as a reflection of the phenomena that occur in the field as well for consideration undertake strategic steps to prepare a realistic business plan for the development of small businesses making the micro enterprises bankable , For small business partners on these results become the reference in mentoring activities by implementing methods principled advocacy and promoting participatory local knowledge and to consider aspects of leadership and entrepreneurship so as to foster social capital and the achievement of the target program.

HOW TO ACCELERATE THE PERFORMANCE OF A RESEARCH CENTER: A CASE STUDY

Darsono Darsono, Universitas Sebelas Maret, Indonesia
Muhammad Agung Prabowo, Universitas Sebelas Maret, Indonesia
Irwan Trinugroho[1], Universitas Sebelas Maret, Indonesia
Doddy Setiawan, Universitas Sebelas Maret, Indonesia
Stefanus A Kristiawan, Quality Research Assurance at Institute of Research and Community Services, Universitas Sebelas Maret, Indonesia

Abstract

Scientific publication in reputable journals as an outlet to disseminate research and proposition has been widely considered to be a main measure of individual and institutional reputation. This paper provides an insight on how to accelerate the performance, especially with regard to scientific publication, of a relatively small research group in university located in an emerging country. Our research center in banking and finance which was established in the end of 2013 has performed progressively. We have accelerated the number of scientific publication in reputable international journals. Our strategies are mainly on the collaboration with international scholars, introducing research group members to the international environment, research collaboration with industry and regulator and providing technical assistance and some guidelines especially for our junior researchers and extensive networking with scholars in the same fields from domestic and overseas universities.

Keywords: Research group, scientific publication, international journals, networking, technical assistance

Introduction

The fundamental concept of a research center in a research-based university is to serve a research mission, is set apart from the departmental organization and to solve complex interdisciplinary problems (Sabharwal and Hu, 2013; Bozeman and Boardman, 2003). More sophisticated, in some countries especially in Europe and the US, research centers are the main army to bolster the number of scientific publications. They are facilitated by substantial budget and facilities. They may also hire PhD students with scholarships.

In the recent years, the Indonesian government has paid much more attention to accelerate the quantity and quality of scientific publications, especially in the universities, as it could be considered to reflect the competitiveness of a country. However, the importance of research centers in universities has not been revitalized.

Indonesian universities contribution to international research environment especially with regards to scientific publication and innovation is far behind some neighboring countries for example Thailand, Malaysia and Singapore. To bolster the quality of research centers or research groups within a university which is ultimately expected to accelerate the publication in international reputable journals; it needs a strong commitment, budget policy, good governance and strong network. Revitalization and restructuring of research centers/ groups could be an appropriate strategy particularly in the social sciences and humanities.

In this present paper, we provide a case study of managing and accelerating the performance of a research group which is the research group of Governance, Banking and Finance (CGBF). This

---

[1] Corresponding author: irwan.trinugroho@gmail.com

research group is under the Faculty of Economics and Business, Universitas Sebelas Maret (UNS), Indonesia. UNS is a state (public) university which recently occupies 6th for top Indonesian universities (awarded by the 4International Colleges and Universities/4ICU). UNS has established its vision to become a center for knowledge, technology, and art which is leading at international level based on noble values of national culture. It is generally known that to be internationally recognized, scientific publications at the international level should be the main priority. UNS has provided a substantial budget to boost the quality of research and scientific publication in international reputable journals.

Although the research group of CGBF is relatively very young, it has performed very well especially in scientific publication compared to many others research center in the same field in Indonesia. Moreover, this group is the best research group in areas of the social sciences and humanities in UNS.

We expect that our success story could be a benchmark for other research groups or research centers in Indonesia particularly with regards to the policy of Indonesian government to accelerate the number of scientific publication in international reputable journals.

Research Group Strategies

Research group of Governance, Banking and Finance (CGBF) which is under the Faculty of Economics and Business of Universitas Sebelas Maret has a long-term goal to be an internationally reputable research center in the areas of governance, banking and finance. The original name was the Center for Corporate Governance (CCG) which was established in 2012. The research group received its first research project from the USAID through the SEADI (Support for Economic Analysis Development in Indonesia) project on a research entitled "Local governance, rent-seeking and regional economies" in the latter half of 2012.

In the end of 2013, following the policy of UNS to establish research groups within the schools (faculties), our research group then renovated and extended its scope to Governance, Banking and Finance. At that time, the group is strengthened by 10 internal members (only 4 members hold PhD degree). Most of them are junior faculty members with limited experiences in research and publication. The members have diversity in their research interests including banking, corporate finance, corporate governance, Islamic finance, accounting, strategic and human resources management.

Our main strategy, to be much more competitive especially in the international environment, is first, we continuously strengthen our governance and network particularly with regard to the research collaborations and joint papers with overseas reputable scholars. Research collaboration with reputable scholars can help the members of research group to access to expertise, learning tacit knowledge about a technique and methodology, enhancing productivity, pooling knowledge for tackling large and complex problems, obtaining prestige or visibility and access to data sources (Rijnsoever and Hessels, 2011; Bozeman and Corley, 2004).

Taking advantage of the network of some research group members, we have more than 30 partners even though some of them are not actively be optimized. More specifically, this research center is supported by 3 external experts (2 experts from US universities and 1 expert from the Indonesia Deposit Insurance Corporation) and 32 international partners and advisers mostly from reputable overseas universities. By doing such collaborations, we have published 6 joint papers in reputable international journals with scholars from University of Limoges France, Purdue University Calumet USA and Universiti Sains Malaysia. We have also some working joint

research projects with University of Twente, University of Limoges, Universiti Sains Malaysia and Purdue University Calumet which will lead to publication in reputable international journals. Moreover, we also attempt to collaborate with industries and regulators in policy research especially to access to data sources and to get funding. As explained by Kafouros et al. (2015), research collaboration with industry could facilitate funding as well as could lead to innovation. In addition, research collaboration with regulators could be optimized for scientific publication as well. We have done collaboration with some financial regulators in Indonesia including the Central Bank of Indonesia, the Indonesia Financial Services Authority and the Indonesia Deposit Insurance Corporation (see table 1 for the details).

The other strategy is to extensively provide technical assistance to our junior members and provide and facilitate them with opportunities to present their working papers in international conference. During two years (2013-2015), 31 papers have been presented by the group members in international conferences. By doing so, it is expected that the members, especially junior members, will be familiar and having more international exposure.

Moreover, we also include those junior faculty members in the joint paper projects which subsequently will bring some benefits for them (getting published in journals, having network with international scholars, familiar with scientific writing and publication…..). In addition to publication, we also continuously organize a working paper forum to facilitate members to present their first draft of papers to get inputs and comments from other colleagues before getting ready to be submitted or presented in international conferences. Trainings on methodology and econometric tools have also been conducted. In 2014, we invited Dr. Yun Zhu from Fordham University USA to deliver technical assistance on STATA for research in finance.

After two years of the establishment of this research group, almost all members have published papers in Scopus-indexed journals.

Outcomes
Performance of Research Group of Governance, Banking and Finance in 2013 - 2015 is impressive. 23 papers have been published and accepted to be published in Scopus-indexed Journals; some of them are getting published in higher rank journals. The policy of Indonesian government and UNS is to benchmark Scopus in order to justify the quality of international journals.

Moreover, in 2014 and 2015, this group has received a substantial amount of research funding both research grants from UNS and the Directorate of Higher Education in Indonesia (DIKTI) and research collaboration with regulators and industry. We collaborated with Bank Indonesia, Indonesia Financial Services Authority (OJK) and Indonesia Deposit Insurance Corporation (LPS) in some policy researches including Financial Inclusion and Literacy, Micro Credit and Bank Liquidity. CGBF is also the best (with highest group index/ performance evaluation indicator) and the most active research group at the Faculty of Economics and Business of UNS. Most of publications of this school in Scopus-indexed journals are contributed by this research group.

Moreover, this group has actively organized a number of international and reputable events. In 2013, we held a Conference on Risk, Banking and Financial Stability in collaboration with the Journal of Financial Stability. Furthermore, we organized the 2014 Annual Conference of Asian Finance Association in collaboration with the Asian Finance Association (Asian-FA). In January 2015, we hosted the First Conference and Declaration of Indonesian Finance Association (IFA) in collaboration with Indonesian Finance Association (IFA), two larger Indonesian universities

(Universitas Indonesia and Universitas Gadjah Mada) and the Indonesia Deposit Insurance Corporation.

Table 1 exhibits the summary of performance of Research Group of Governance, Banking and Finance for the period of 2012-2015.

Conclusion

We have provided a case on managing and accelerating the performance of a research group in the context of Indonesia. During almost three years of this research group, it has performed significantly especially in scientific publication to disseminate the research findings. 23 papers have been published and accepted to be published in Scopus-indexed journals. Almost all of research group members have contributed in writing those papers.

Moreover, this group has successfully granted many research grants from the university, the Directorate of Higher Education in Indonesia (DIKTI) and some international agencies such as the USAID. In addition, research collaboration with industry and regulators have also been done. However, to be more competitive in the international environment, this research group should accelerate the capabilities and skill of research group members. Extensive international partnership will also be bolstered.

DYNAMIC MARKETING CAPABILITY IN HOTEL

Evo Sampetua Hariandja, Business School Universitas Pelita Harapan, Indonesia
E-Mail: evo.hariandja@uph.edu

Abstract

The hotel industry has shown significant growth and gain greater attention in today's business environment. Hotel industry becomes important when the government decided to further push the service sector and to increase the tourism sector. In competition, the hotel industry should be able to offer innovative services to guests through utilize their service innovation capabilities and do the proper marketing strategy in accordance with its market segment in a dynamic market through utilizing dynamic marketing capabilities in providing excellent service. This study addresses to explore how the hotel industry in Bandung (3-star to 5-star) can survive and succeed in achieving their service excellence using the capabilities of the dynamic marketing and generates proposition: dynamic marketing capability will support service excellence. The proposition generated from the descriptive case study that involved five hotels (3-star to 5-star) then tested in an explanatory case study involved three hotels (3-star to 5-star). The key informants in all case study stated that dynamic marketing capability works to achieve service excellence. The results of the study indicate that the dynamic marketing capability in the eight hotels show some similarities in all activities of market sensing, learning, The difference lies in the marketing strategies, which are tailored to the target markets and occasions.

Keywords: dynamic marketing capability, service excellence, hotel industry

Introduction

Bandung is the biggest city and the capital of the West Java province. The city is located 140 km southeast of Jakarta, and is the third largest city in Indonesia after Jakarta and Surabaya. The city is geographically located in the centre of West Java province. Thus, Bandung has a strategic value to the surrounding areas. Bandung is a very interesting destination for culinary, shopping, spa, golf, and so on. Most traffic from Malaysia and Singapore reached 40% [1]. As a weekend destination for local tourists, Bandung is also an attractive place for foreign tourists who need a hotel to stay. It has an impact on the growth of the hotel industry. The tourists visited Bandung shown in Table 1.1 below. There is an increasing trend over the period 2010-2011, a decrease in 2012 then increased again in 2013.

Table 1. Number of tourists visiting Bandung 2010-2013

Year	Foreign Tourists	Domestic Tourists	Total	Number of Guests Stay	Occupancy Rate (%)
2010	685,347	14,854,317	15,539,664	9,615,807	62
2011	676,755	19,461,717	20,138,472	12,228,216	61
2012	530,565	15,241,752	15,772,317	10,541,115	67
2013	529,296	16,164,876	16,694,172	11,692,287	70

Source: Bandung Culture & Tourism Department, 2014

Currently, in order to survive, hotels in Bandung performed with a limited promotion in order to adapt to rapidly changing market, do not have a network or international co-operation in particular local hotels, and limited service innovation. In competition, the hotel industry should be able to offer innovative services to guests through utilize their service

innovation capabilities and do the proper marketing strategy in accordance with its market segment in a dynamic market through utilizing dynamic marketing capabilities in providing excellent service. To survive in the business competition and qualify the operational, the hotel occupancy rate should be at the least of 70%. The occupancy rate of hotel is the measurement of success in attracting visitors to a particular hotel which the number of rooms sold divided by number of rooms available.

From the above conditions, raises the questions of how they innovate in serving their customers and what can be learned from their marketing capabilities. The hotel industry in Bandung has to utilize their capabilities to create new value to customers through dynamic marketing and deliver value. This study addresses to: (1) explore how the hotel industry in Bandung (3-star to 5-star) can survive and succeed in achieving their service excellence using the capabilities of the dynamic marketing, (2) test the conceptual framework that emerged from the review of literature that illustrates how dynamic marketing capability works through the activities in the hotel industry in Bandung that will support in achieving service excellence and confirm in the other hotels.

The conceptual framework serves as a tool for hotels in Bandung to identify their dynamic marketing capability and determine the gaps between the current state and the desired state of dynamic marketing. Therefore, this framework helps the hotel industry in Bandung to be more adaptive to market changes and encourage them to be more innovative in achieving service excellence for their customers.

Dynamic Marketing Capability

Dynamic marketing capability (DMC) idea emerges from the strategic management theory and gives another translation on how companies in the environment that change quickly get their competitive advantage [2] [3]. The stress in the resource-based strategy literature is presently on the creation and exploitation of dynamic capabilities. While dynamic capability by and large are the capacity to create new resources in changing markets, dynamic marketing capabilities are the ability to create new marketing resources to identify, respond to and exploit change. For example, in using the technology for customer's database to facilitate the hotel to serve their market target or combining the artists and designers to design the hotel's amenities. Guaranteeing evolutionary fit between market needs in a dynamic competitive environment and market offers is the quintessence of effective strategic marketing. As indicated by the typology recommended by [4], [5] grouping dynamic capabilities into three principle sorts: absorptive, adaptive, and innovative capability. "Absorptive capabilities are the processes that enable firms to recognise the value of new information from the market and to assimilate it. These processes focus on knowledge acquisition and assimilation [5]. The absorptive capabilities comprise of two capabilities, for example, market sensing and learning. Market sensing is a firm's ability to take in their customers, collaborators, and rivals to sense, process, and use data and in addition to act persistently on trends and events in prospective and present markets [6]; [7]. Particular capabilities incorporate the ability to embrace (or viably commission) marketing research and competitor analysis, and the ability to guarantee dissemination of the ensuing information all through the organization as a premise for decision making. Market sensing infers being near the customer, encountering products and services in the same way that the customer encounters them. Firms working in B2B markets may have specific customers that they are particularly close to whom they will discuss new product development opportunities with.

Learning capability empowers firms to keep up long-term competitive advantages over opponents, to make due in dynamic and competitive environments, and to be responsive to acquiring and assimilating external knowledge [5]. Learning empowers to recognize new opportunities, take into account redundancy to incorporate information from the external

environment in quest for improved effectiveness [8]. As [5] said that "adaptive capabilities centre on the firm's ability to identify and capitalise on emerging market opportunities. Adaptation implies doing things differently in response to external stimuli". Market targeting and positioning capabilities incorporate the ability to identify alternative opportunities and afterward select appropriate market target, where the firm's resources and capabilities are adjusted for the best impact. Positioning is not only a marketing decision, notwithstanding. In adjusting resources and capabilities to changing markets, the competences of all parts of the business (including operations, finance and R&D) and marketing need to be considered. As market change, so might the positioning adopted need to change. As [9] stated that capabilities coordinate tasks and also present a functional dimension. In this respect, marketing represents an important area of functional knowledge in a firm's value chain [10]. As [8] stated that dynamic capabilities are different from operational capabilities. Marketing capabilities help firms acquire a living in harmony by satisfying current customers, exploiting existing products and distribution channels, and promoting existing brands. In [6], for example, keeps up that channel bonding is a marketing capability that fortifies the association with wholesalers. In [11] found that a particular sort of marketing capability that he calls customer competence permits firms to serve certain customers. Dynamic marketing capabilities, rather, help firms at present transforming from their stationary process. Actually, dynamic marketing capabilities are particularly centred about discharging and incorporating market knowledge that helps firms evolve. Under dynamic marketing capabilities, this study intend to incorporate what others have marked market sensing [6], learning [8] and market targeting and positioning [5].

Service Excellence

Organisations are increasingly providing service excellence as an integral part of their superior service to win the customers' hearts and stay competitive in the market [12]. Service excellence, which is viewed as being "easy to do business with" [13], delivers promises and is as an expression of very high satisfaction [14]. This suggests that the service organisation does not only need to satisfy the customers but has to delight them as well [15].

Service excellence in this study is based on service process and delivery, service-scape, customer participation, and customer responsiveness. Flexibility and customization in service process and delivery are highly appreciated by customers [16]. Well planned and designed service delivery may directly contribute to the whole service excellence. Service-scape is related to the style and appearance of the physical atmosphere and environment in a service organisation that has some impacts on customers' experience [17]. As [18] also confirmed the importance of architecture and design as key value drivers that influence the customers' perceptions of service excellence.

Customers' participation increasingly plays active and even leading roles in service production and delivery processes [19] in most of the service organisations. The nature of service characteristics that is highly simultaneous requires customers to be part of the service transaction or as a co-producer. The customer's engagement in service as a co-producer is important in the cost reduction and service quality improvement [20]. Thus, the degree of service success may depend very much on the customer's participation to make the service happens. In other words, in some services, the customer is acting as a partial employee of the organisation.

## Dynamic Marketing Capability And Service Excellence

Hotels are competing for the market share and develop new strategies to leave their competitors behind. In order to improve their image and increase their profit, hotels should put more effort into investigating the needs and expectations of their target groups. Only with

a deep understanding of their customer's desires can the hotels keep their customers loyalty [21]. The study conducted by [22] reveals that market sensing and learning play their roles as determining factors in service excellence. The evolutionary fit between market needs and market offers is the essence of effective service excellence. Sensing captures the effectiveness in order to generate, disseminate, and respond to customers' needs. Firms with higher absorptive capability demonstrate greater ability to learn, integrate external information, and transform it into their embedded knowledge [23].

Table 2.Research position compare to previous studies

Study	de Farias (2010)	Hou (2008)	This research
DMC→SE	Review and synthesis the literature using internal marketing (programme, product, price, communication and distribution) and service excellence (committed employee).	Conceptual model with hypothesis using market orientation and dynamic capability.	Conceptual model with propositions DMC→SE using market sensing, learning, and market targeting and positioning. Using case study 8 hotels 3-Star to 5-star in Bandung.

Considering the Table 2 above, this research proposes a conceptual framework that involving the dynamic marketing capability in achieving service excellence as shown in Figure 1 below. This study identified and explored the specific activities using the case study in the hotel industry context.
Figure-1.Conceptual framework for DMC and SE

Research Methods

To explore and test the propositions, this study gathered data from 5 hotels in descriptive study (stage 1). To test the propositions, this study re-gathered data from 3 current hotels in stage 1 in order to confirm the activities in both capabilities and service excellence and add the 3 new hotels as a comparison. These data were collected as part of a wider study of hotels. Case study methodology was used in this study [24], as it allows the questions what, why, and how to be answered. Cases were selected from hotels based on literal replication logic, that is, cases were chosen that were expected to lead to similar results [24]. The replication logic requirement of the multiple-case design provides suggestions to determining the number of cases. The initial decision regarding a satisfactory number of cases is between six to eight for a theoretical replication and three to four for a literal replication [25]. For a theoretical replication, that prescriptive number of cases is considered satisfactory when "rival theories are grossly different," however, the number needs to be increased when "rivals have subtle difference," [25]. The final decision about the number of cases is usually a judgmental decision made by the researcher and is positively influenced by the indifference between rival theories, the high degree of certainty the researcher wishes to attain and the differences between the cases [25].

In the preliminary literature review has resulted two constructs for conceptual framework: the dynamic marketing capability and service excellence. In order to explore the existence the constructs and indicators, the case study research was used through descriptive study (stage 1) and generate the propositions. To test the propositions, the case study research (stage 2) was used through within-case and cross-case. Finally, from the both stages, this study concluded the results.

Our main criteria for case selection based on:

(1)Hotel star classification from 3-star to 5-star with independent or chain network,

(2)Hotel star classification from 1-star to 2-star not include in this study. Based on the preliminary interview, the activities for dynamic marketing in both the hotels classification are rarely done and not have procedures and processes are well documented.

(3)The key individuals have had considerable experience in the hotel business with a variety of work that have ever dealt with,

(4)The hotel located in Bandung and surroundings areas. The study have sent a participation letter to 17 hotels but only 5 hotels that provide answers and are willing to be interviewed. This study does not involve consumer of hotels directly due to the time limitation. Comments and reviews from guests who have stayed from Trip Advisor and Agoda will be taken as a basis for data triangulation. From the hotels that have contacted, five hotels agreed to participate in the study stage 1 and six hotels in stage 2. All of the hotels in our final list were tested with an expert to confirm that they were fulfilled as 3 to 5 star hotel classification. This study Descriptions of the chosen hotels are provided in Tables 3.

In order to guide the execution of the case study research, a research protocol was created before data collection started. The research protocol uses the English but overall the answers from informants in Indonesian. The content of the protocol includes the following aspects:

-General questions about the hotel;

-Formation phase: about the current hotel industry environment, marketing and service innovation strategy;

-Operational phase: about the activities of dynamic marketing capability (DMC);

-Evaluation phase: about service excellence (SE) compare to direct competitors.

The primary data collection was interviews with managers involved in the hotels studied. The data were collected via semi-structured interviews using a research protocol (consist of competition, dynamic marketing and service excellence) during 2012 and 2013 for

stage 1 and during 2013 and 2014 for stage 2. Overall, 5 interviews were conducted typically lasting 1 to 1.5 hours each in stage 1 and six interviews in stage 2. Interviewees came from a variety of positions in the organizations, and their job titles included corporate operational manager, general manager, sales director and business development director. In the interviews, the propositions were not addressed directly in order to prevent leading questions.

The overall text on the interview for each hotel thoroughly readable using narrative analysis to get the main idea of each of the constructs contained in the case study protocol. The results of narrative analysis are used to see whether the activity of each capability found in each hotel and in what form. Within-case analysis is used to explore the characteristics, uniqueness, and insights from each hotel. Then detailed analyses are done using the case description and the collected data. Detailed analysis is used with the help of the variables that have been operationalized in the case study protocol. For the specific questions of each construct, the results of interviews of each informant will be given mark bold, underlined, or coloured to indicate that there are those activities in the hotel. The results of the narrative analysis of each indicator on both the capabilities and the interaction then matched with the indicators contained in the case study protocol, and then compared with the indicators contained in the service excellence, the results of the reviews from guests who have stayed, and evidence of internal documents such as photos, sales kits, hotel profile, and others.

Table-3.Description of case study

Hotel	Star	Position	Experience	Network
Scarlet Dago	3	Corporate Operational Manager	25 years	Local chain
The Ardjuna	4	General Manager	11 years	Independent
Golden Flower	4	Sales Director	13 years	Local chain
Grand Preanger	5	General Manager	17 years	Local chain
Aston Primera	4	General Manager	26 years	International chain
D'Best	3	General Manager	25 years	Independent
Gumilang Regency	4	General Manager	12 years	Independent
Papandayan	5	Business Development Director	25 years	Local chain

Operationalization of variable is the process of translating or defining a variable so that it can be measured. Dynamic marketing capability and service excellence are operationalized and discussed below. Dynamic marketing capability is operationalized through a market sensing, learning, and target market/positioning. Market sensing is measured as the capacity to learn the external environment with respect to demands, customers, and competitors appropriately, the purpose of which is to guide a firm's actions [6]. Learning is measured as the ability of the organization to implement the appropriate management practices, structures, and procedures that facilitate and encourage learning [8].

Market targeting or positioning is measured as the ability to identify alternative opportunities before selecting appropriate market targets that are aligned for the best effect [5].

Service excellence is operationalized through service delivery, service-scape, customer's participation, and service responsiveness. Service delivery is measured as the method and sequence in which the service operating systems work to create the service experience and outcome [16]. Service-scape is measured as the style and appearance of the physical elements encountered by customers at service delivery sites (items based on [17]. Customer participation is measured as the actions and resources supplied by customers during service production and/or delivery [19]. Service responsiveness is measured as the ability of a hotel to respond individual guest's requirements [26].

Results and Discussions

The findings of the five hotels in descriptive study are summarized in Table 4. The market sensing in all case studies uses the guest comments, internal data (sales reports and profitability analyses) to sense the trends and events in the market which are used as the basis for marketing decision making. The information exchange is done with the competitors, PHRI, Riung Priangan, Trip Advisor and Agoda. The General Manager monitors customers' wants and complaints by using different IT-systems. The Aston Primera Pasteur is using the REVINET tool to monitor the customer's complaint. The tools using for hotel assessment. By using the advanced technology, the Aston Primera Pasteur move a step forward compared to the other hotel in order to anticipate their target market. The market sensing allows the hotel to respond customers quickly, to deliver the best service by involving customers to participate, and to offer the best facilities according to customer expectations. Several hotels classified into Riung Priangan. This is a group classified hotel for 3-star up to 5-star. Through this group, the exchange of information such as occupancy rate, room availability, and current trend can be implemented. The market sensing enables the hotels to analyse data from the market to design and prepare the service delivery and process and service-scape (rooms, facilities, and amenities). The better service delivery and process will facilitate the customers to participate and it will make staffs eager to response the guest's requirements.

Mostly hotel in descriptive study encourage and support their staff to take the responsibility in various manners. The sharing idea carried-out in formal meeting such as morning briefing, monthly meeting, and general meeting. The learning process in the hotel allows the staffs will get and manage the relevant information that needed in achieving excellent service. The dedicated staffs will serve the guests better. The sharing idea forum as a formal meeting will give the staff flexibility to process and deliver services.

Market targeting or positioning of one hotel is different from another and has its own unique differentiation. Grand Preanger Hotel, for example, is focused on the heritage hotel for tourists especially for the European, Japanese and Indonesian. Aston Primera is more focused on big oil, gas, and mining companies. Golden Flower is more focused on convention hotel and tourists from Southeast Asian countries. The ability of each hotel to sort the appropriate segments and communicate its own positioning in customer's minds makes the service delivery of each hotel in accordance with the target market. By engaging customers and responding quickly to fulfilling customer expectations, each hotel achieves its own desired service excellence.

The explanatory study involved the six hotels as a sample. In this study the three hotels are current hotel in the descriptive study such as: The Ardjuna Boutique Hotel and Spa, Grand Preanger Hotel, and Scarlet Hotel Dago. The current hotel is being used as a comparison in order to confirm the propositions. The additional of three hotel are The Papandayan Hotel, D'Best Hotel, and Gumilang Regency Hotel. Three new hotels as additional in explanatory study are used in order to see whether the proposition put forward

in chapter 4 is supported or not. Respondents from all three hotels are general manager with various experiences over 12 to 25 years in the hotel industry. The data analysis of case study in stage 2 only carried-out for 3 hotels as additional case. The data analyses for the current case refer to previous data analyses which describe same condition in descriptive study.

The findings of the eight hotels in descriptive and explanatory study are summarized in Table 4. The market sensing in all case studies uses the guest comments, sales reports, and profitability analyses to sense the trends and events in the market which are used as the basis for marketing decision making. Papandayan using the guest experience manager (GEM) to bridge the related departments with marketing. Mostly the information exchanges are done with the competitors, PHRI, Riung Priangan, Trip Advisor, Agoda and Pegipegi.com. The General Manager monitors customers' wants and complaints by using different IT-systems. This market sensing allows the hotel to respond customers quickly, to deliver the best service by involving customers to participate, and to offer the best facilities according to customer expectations.

Market target or positioning of one hotel is different from another and has its own unique differentiation. Papandayan hotel, for example, is focused on the convention hotel for big MICE market while D'Best hotel focus on small MICE market. Gumilang Regency hotel is more focused on family and group. The ability of each hotel to sort the appropriate segments and communicate its own positioning in the minds of customers makes the service delivery of each hotel in accordance with the target market. This is according to stage 1 in descriptive study. By engaging customers and responding quickly to fulfill customer expectations, each hotel achieves its own desired service excellence.

Table 4.Case study observations

Observation Hotel	P: DMC→SE	Market Sensing	Learning	Target and Positioning
Scarlet Dago	√	√	√	√
The Ardjuna	√	√	√	√
Golden Flower	√	√	√	√
Grand Preanger	√	√	√	√
Aston Primera	√	√	√	√
D'Best	√	√	√	√
Gumilang Regency	√	√	√	√
Papandayan	√	√	√	√

Note: A √ indicates that one or more examples of that activity were found in a particular case study hotel. The absence of an v indicates that such examples were not observed in the hotel studied. P = propositions.

In aggregate, these points motivate the following testable proposition based on theoretical framework and interview results of descriptive study.

Proposition: Dynamic marketing capability that involving market sensing, learning and market target and positioning will support in achieving service excellence.

The explanatory study involves the six hotels as a sample. In this study the three hotels are current hotel in the descriptive study such as: The Ardjuna Boutique Hotel and Spa, Grand Preanger Hotel, and Scarlet Hotel Dago. The current hotel is being used as a comparison in order to confirm the propositions. The additional of three hotel are The Papandayan Hotel, D'Best Hotel, and Gumilang Regency Hotel. Three new hotels as additional in explanatory study are used in order to see whether the proposition put forward in chapter 4 is supported or not. Respondents from all three hotels are general manager with various experiences over 12 to 25 years in the hotel industry. The data analysis of case study in stage 2 only carried-out for 3 hotels as additional case. The data analyses for the current case refer to previous data analyses which describe same condition in descriptive study.

The market sensing in all case studies uses the guest comments, sales reports, and profitability analyses to sense the trends and events in the market which are used as the basis for marketing decision making. Papandayan hotel used the guest experience manager (GEM) to bridge the related departments with marketing. Mostly the information exchanges are done with the competitors, PHRI, Riung Priangan, Trip Advisor, Agoda and Pegipegi.com. The General Manager monitors customers' wants and complaints by using different IT-systems. This market sensing allows the hotel to respond customers quickly, to deliver the best service by involving customers to participate, and to offer the best facilities according to customer expectations.

Market target or positioning of one hotel is different from another and has its own unique differentiation. Papandayan hotel, for example, is focused on the convention hotel for big MICE market while D'Best hotel focus on small MICE market. Gumilang Regency hotel is more focused on family and group. The ability of each hotel to sort the appropriate segments and communicate its own positioning in the minds of customers makes the service delivery of each hotel in accordance with the target market. This is according to stage 1 in descriptive study. By engaging customers and responding quickly to fulfilling customer expectations, each hotel achieves its own desired service excellence.

The findings from this study will be presented within the context of research proposition. The responses extrapolated from the interview phase of research were analysed by initially extracting common themes from the data collected and then categorizing these in terms of the specific research propositions that they related to. With regard to the presentation of qualitative data, the term 'statement' was utilized where the direct responses of interviewees were cited. Construct was used to indicate an interpreted response.

The market sensing plays the role in order to achieve service excellence. Through the guest' comments, revenue report, yield analysis as the basis of marketing decision to sense trends in the market. Skills in market sensing enable the hotels to attract the customer participation into their service delivery and process. Those skills also may hotel's staff to response the customers quickly and design the amenities of hotel according to their target market. All the informant support the process in order to achieve service excellence in hotel through providing training, the conducive environment to generate, present and share the staff' ideas to all staff. Through learning make the hotel can response quickly to market dynamic and implement their program that suitable with their customer and environment

Each hotel has the specific and unique selling point in the market. By offering their uniqueness and communicate their brand according to the above statements. It support that selection of the appropriate segment will be facilitate the hotel to design and prepare the service delivery and process, to response quickly, to design the concept of service-scape in order to achieve service excellence. From the three factors above that involving market sensing, learning, and target market and positioning, all the statements from respondents

support that dynamic marketing capability will support in achieving the service excellence in the hotel.

The dynamic marketing capability work and exist in all hotels in descriptive study and explanatory study. The existence of the activity the capability in all hotels varies depending on the type and classification. Classified hotel 4-star and 5-star indicate that there is a clear standard operating procedure (SOP) in each service process. All hotels have the same mechanism in anticipation of changes in the market using various sources such as competitors, PHRI, Riung Priangan, and the media. Hotels with more budgets attract the customers through telemarketers and sales offices. Otherwise the hotel with a limited budget is only able to do so through the traditional promotion. The usage of Revinet technology in Aston Primera for managing and respond to the market quickly in order to anticipate and respond to customer's needs.

Conclusions

The conceptual model described in this study examines the existence of activities in all case studies. All of activities work for each hotel through specific ways according to hotel classification, the management system, their positioning, and target market.

The service excellence are highly depend on how the hotels able to sense trends and events, respond the market demands through the learning process, sorts out the right target markets, and communicate with the customers. The service excellence is achieved by defining the services, participants, and physical facilities clearly; continuously performs the audit services; and conduct market test for the new services.

This exploratory research does not seek to draw statistical inferences, therefore is subject to the following limitations arising from the case study methodology. The application of the dynamic marketing capability and service excellence in hotels is limited in Bandung area only. The coverage of case study and findings are based solely on the eight unique classified hotels (3, 4 and 5 star-hotels), which may not be generalizable to the other classified hotels (1 and 2 star-hotels), non-classified hotels, and in the other areas. All hotels were very welcome to share their insights, company profile and sales kit. This study just explored the activities that related to dynamic marketing capability and service excellence. The information about financial and accounting performance does not explored in this study.

This model contributes to the existing literature in several ways. The first key contribution of this work is its inclusion of the concept of dynamic capabilities; that hotels are able to compete not only due to their ability to exploit their existing competence and capabilities, but also thanks to their ability to renovate and develop their organizational capabilities. Therefore, this study argue that in order to maintain service excellence it is not enough for hotels to be in possession of valuable capabilities; hotels also require dynamic capabilities to develop and renovate their organizational competence and capabilities. The application of dynamic capability theory has been done in the various industries. This study applied the dynamic capability theory for marketing in the hotel industry context.

This study seeks to provide the empirical data for the hotel industry to reveal variables dynamic marketing capability such as: market sensing, learning, and market targeting and positioning. The previous study conducted by [22] that link internal marketing (programme, product, price, communication and distribution) with service excellence (committed employee), this study revealed the dynamic marketing capability support the service excellence.

The findings of this work also could improve current firms' management by enabling these hotels to achieve their objective of achieving service excellence. This study expected to contribute to the development of conceptual model in dynamic marketing capability to achieve service excellence for hotel industry in Bandung. For the practice, this study is aimed

at helping hotel industry to better plan and move towards effective and intense dynamic marketing and greater service innovation implementation. This study will hopefully provide insights on some of the factors of dynamic marketing capability which would assist hotel industry in Bandung to prepare and create the activities to achieve service excellence through the co-ordination and communication among department in the hotel and finally to satisfy the customer and make the customer loyal. This study could be the basis for policy makers to prepare the regulation in the hotel industry in Bandung.

The presented study need to be further research. The following recommendations are made for further research. Further research could apply this conceptual framework to analyse hotels for 1-star and 2-star hotels and non-classified hotel. Therefore, research on other industries (financial service, airlines, consulting, etc.) possessing interaction capabilities is needed. The confirmatory quantitative research is needed to test the model and the causal relationship through statistical inference by generating and testing the hypothesis. From the case studies, the strong brand names of the three hotels seemed to contribute to their service excellence. It is recommended that further research on the causal relationship between capability and service excellence to the hotel performance could be applied.

SERVICE QUALITY IMPROVEMENT FOR ACCOUNT OPENING PROCESS IN STATE-OWNED BANKS

Evo Sampetua Hariandja, Business School Universitas Pelita Harapan
evo.hariandja@uph.edu
Resti Regina, School of Business and Management, Institut Teknologi Bandung

Abstract

This study aims to gain the affectivity of existing account opening process in State-owned bank in Bandung area. The study conducted by distributing questionnaires to 365 customers of state-owned bank. In order to find the root causes of the problem in account opening process, some analysis were conducted. Servqual method is used to measure the service quality by using the service quality dimensions. After that, Important-Performance Analysis (IPA) matrix is used to find important factor that should be considered by bank in order to meet customer's expectation. Based on the analysis, it was found that the root causes lies in human capital, technological, technical, and procedural aspects. This study suggests an online account opening facility for prospective customer in order to improve service quality in state-owned bank.

Key words: service quality, servqual method, Important-Performance Analysis (IPA)

Introduction

In the current competitive business world, companies strive to improve the quality of products or services in order to maintain existing customers or to attract new customers. Banking industry is one of business industry that is growing rapidly. In order to compete, the use of technology is a must. State-owned banks have been utilizing advances in information technology to improve the quality of service. This facility is known as electronic banking (e-banking). By the rapid development of information technology, it is also increasing customer expectations of excellent service quality. Although there are various types of banking transactions that can be accessed through e-banking anytime and anywhere, unfortunately, it does not provide account opening for prospective customer yet. Prospective customers still keep coming to state-owned banks branch for account opening process. By the rapid development of information technology, it is also increasing customer expectations of excellent service quality. This causes companies vying to improve the service quality by developing a wide range of banking facilities including e-banking facilities. State-owned banks have developed various types of banking transactions that can be accessed through e-banking anytime and anywhere. State-owned banks expand its e-banking through Internet Banking, Phone Banking, SMS Banking and additional ATM outlets. State-owned banks also lead the improving of service quality to *branchless banking*, where the customer does not need to come to the branch for account opening. But unfortunately, State-owned banks account opening facility is only accessible to existing customers. For prospective customers, they still have to go to bank in order to open an account. Existing process of account opening state-owned banks takes about 30 to 40 minutes. Based on survey of Marketing Research Indonesia (MRI), this time delivery service is still showing unsatisfactory. This is because the time expectation for account opening process is about 15 minutes.

Therefore, necessary to develop an online account opening facility for prospective customers, so that the use of online service is really satisfying customer expectations. This study aims to gain the affectivity of existing account opening process in state-owned banks, especially in Bandung area and analyze the benefit of online account opening facility for prospective customers to improve the service quality in state-owned banks.

Literature Review

Service Quality

According to Kotler, et.al (2002:83), the service quality is any action or activity that can be offered by one party to another, which is essentially intangible and does not result in any ownership. In general, a high level of service will generate high satisfaction and repeat purchases more frequently. Therefore, perceived service quality is good and satisfying if the services received exceed the customer's expectations. Following are service quality dimensions as shown in Table 1.

E-service Quality

According to Zeithaml et.al (2000:11), e-service quality is comprehended both from pre and post web site service perspectives. It can be understood as the valuation of the efficiency and effectiveness of online shopping, purchasing, and delivery products or serves. Following are dimensions of e-service quality as shown in Table 2.

Table 1. Item of Service Quality

Service Quality Dimensions	Items Scale
Reliability	Providing service as promised Dependability in handling customer's service problems Performing services right first time Providing services at the promised time Maintaining error-free records
Responsiveness	Keeping customer informed as to when services will be performed Prompt service to customers Willingness to help customers Readiness to respond to customer's requests
Assurance	Employees who instill confidence in customers Making customers feel safe in their transactions Employees who are consistently courteous Employees who have the knowledge to answer customer's questions
Empathy	Giving customers individual attention Employees who deal with customers in a caring fashion Having the customer's best interest at heart Employees who understand the needs of their customers Convenience business hours
Tangibles	Modern equipment Visually appealing facilities Employees who have a neat, professional appearance Visually appealing materials associated with the service

Source: Parasuraman et.al in Kotler and Keller, 2012:414

Table 2. E-Service Quality Dimensions and Descriptions

E-Service Quality Dimensions	Descriptions
Reliability	It is included correctness of order fulfillment. Prompt delivery, and billing accuracy.
Attentiveness	It is included individualized attention, personal thank you notes from online retailers and availability of a message area for customer questions or comments.
Easy to use	It is related to easy to remember URL address, well organized, well structured, and easy to follow catalogues, site navigability, and concise and understandable contents, terms, and conditions.
Access	It is included the list of the company's street and email address, phone, and fax number, accessibility of service representatives, availability of chat room, bulletin board, and other communication channels.
Security	It is included security of personal information and minimal online purchase risks.
Credibility	It refers to the business history of online retailers, special rewards or discount, and referral banners on other web site.

Service Quality in Banking

Chun and Zheng state in their research that *"there are 18 dimensions of service quality in banking: access, aesthetics, attentiveness, availability, care, tidiness, comfort, commitment, communication, competence, courtesy, flexibility, friendliness, functionality, integrity, reliability, responsiveness, and security* (2006:23)" (Johnston, 1995). They continued that security and reliability were considered most important dimensions; responsiveness, communication, and competence were important for customers. Other dimensions such as comfort, cleanliness, and aesthetics were not worth much attention. Additionally, Nantel (2000) proposed six underlying key dimensions in retail banking. These dimensions were effectiveness and assurance, access, price, tangibles, service portfolio, and reliability (ibid). Research about service quality in banking was also conducted by Najjar and Bishu (2006). They found that reliability and responsiveness are two most critical dimensions of service quality and they are directly related with overall service quality. This research supported previous work by Zeithaml and Parasuraman.

Research Methodology

Data was collected from 365 state-owned bank customers who active internet banking facility by spread the questionnaire in Bandung area. Besides that, this study also used documents to get information about company and observation to collected facts and evidence. Finally, interview was also conducted to state-owned banks employees in order to confirm the collected. In analyzing, Servqual method is used to measure the quality of service then Importance-Performance Analysis (IPA) matrix is used to determine attributes that should be

improved to increase service quality in state-owned. Following is service quality dimensions that used in this research related e-banking facility:

Table 3. Service Quality Dimensions to Develop and Formulate

Service Quality Dimensions	Measurement Criteria	Sources
Reliability	It concerns the ability to keep service promise accurately and consistently. It includes correct service, service promise, and accurate record.	Jun and Cai, 2001; Santos, 2003; Raman, et.al, 2008; Lau, 2013.
Responsiveness	It means prompt service, quick problem solving, and convenience services.	Jun and Cai, 2001; Baksi and Parida, 2012; Lau, 2013.
Security	It means low risk associated with online transaction, personal information safety, and online transaction safety.	Yang et.al, 2004; Baksi and Parida, 2012.
Communication	Keeping customer informed and communicating in a language they can understand. It consists of various contact method and language choices.	Santos, 2003; Raman, et.al, 2008.
Access	It consists of availability of help; phone access, email access, and account access when abroad.	Jun and Cai, 2001; Raman, et.al, 2008; Baksi and Parida, 2012.

Results and Discussion

Analysis of Respondent Profile
Following is the data of respondent who participate in this research:

Table 4. Respondent Profile

Sex	Number	Percent
Male	192	52.6
Female	173	47.4
Total	**365**	**100**
Age	**Number**	**Percentage**
< 18	2	0.5
18-25	219	60.0
26-35	83	22.7
36-45	47	12.9
> 45	14	3.8
Total	**365**	**100**
Education	**Number**	**Percentage**
High school	61	16.7
Bachelor	278	76.2
Master	26	7.1
Doctor	0	0
Total	**365**	**100**
Occupation	**Number**	**Percentage**
Students	194	53.2
Housewives	3	0.8
Entrepreneurs	9	2.5
Military/police	0	0
PNS (Civil Officer)	10	2.7
Private employees	50	13.7
Employees of BUMN/BUMD	95	26.0
Professional	4	1.1
Total	**365**	**100**
Using Internet Banking Period	**Number**	**Percentage**
1-3	216	59.2
3-5	114	31.2
> 5	35	9.6
Total	**365**	**100**

Based on the data above**,** the comparison between male and female is almost equal. From 365 respondents, the number of male is 52.6% and female 47.4%. Based on age, that the most respondent are in the range 18-25 years old and the least was under 18 years old. If we compared to Internet users in Indonesia, the largest user also is in range 18-25 years old

(Sapriyanti, 2015). From education data, the most respondent education is bachelor degree (76.2%) and none of the respondent was educated doctorate. However, this data shows that the respondent can be considered to have enough knowledge in term of understanding the question on the questionnaire given. Based on occupation, the most respondent is students (53.2%) and least is housewives. This data describes that the state-owned banks as the bank that manages colleges and schools has the majority of the customers are students. The last, based on using internet period, most of respondent have been using internet banking for 1-3 years. It can be assumed that the respondent has been adept in using the internet banking and will be easy to understand the development of the features in this facility.

Servqual Calculation

Servqual calculation is conduct based on the result of questionnaire data. The questionnaire was developed to determine customer's perspective on service quality of existing account opening process in state-owned banks and their expectation for future improvement. For more detail comparison, then compiled the following table.

Table 5. Servqual Calculation on Account Opening Process in State-owned Banks

Dimensions	Code	Current	Expect	Average Current (C)	Average Expect (E)	Gap (C-E)	Ratio (C/E)
Reliability	R1	1273	1754	3.49	4.81	-1.32	0.73
	R2	1362	1672	3.73	4.58	-0.85	0.81
	R3	1277	1745	3.50	4.78	-1.28	0.73
	R4	1377	1696	3.77	4.65	-0.87	0.81
Responsiveness	W1	1305	1675	3.58	4.59	-1.01	0.78
	W2	1352	1682	3.70	4.61	-0.90	0.80
	W3	1222	1734	3.35	4.75	-1.40	0.70
	W4	1319	1676	3.61	4.59	-0.98	0.79
Security	S1	1401	1714	3.84	4.70	-0.86	0.82
	S2	1440	1737	3.95	4.76	-0.81	0.83
	S3	1437	1727	3.94	4.73	-0.79	0.83
	S4	1359	1707	3.72	4.68	-0.95	0.80
Communication	C1	1376	1692	3.77	4.64	-0.87	0.81
	C2	1370	1696	3.75	4.65	-0.89	0.81
	C3	1309	1685	3.59	4.62	-1.03	0.78

	A1	1348	1700	3.69	4.66	-0.96	0.79
	A2	1358	1694	3.72	4.64	-0.92	0.80
Access	A3	1271	1716	3.48	4.70	-1.22	0.74
	A4	1274	1721	3.49	4.72	-1.22	0.74
	A5	1322	1698	3.62	4.65	-1.03	0.78

Based on the data above, it can be seen that there is a gap and ratio between real or current condition and expectation in each statement. The value of gap sign negative which means each dimension needs to be improved to meet customer's expectations.

The next step is mapping all attribute into Importance-Performance Analysis (IPA) quadrants. IPA is a patterned descriptive statistical method. Following is the data mapping of servqual attributes:
Figure 1. Importance-Performance Matrix of Servqual Attributes on State-owned Banks

Based on the Figure 2 above, it can be explained that the first quadrant is the upper left quadrant, the second quadrant is the upper right quadrant, the third quadrant is the lower left quadrant, and the forth quadrant is the lower right quadrant. Refers to the theory of Martilla and James in IPA Matrix, the first quadrant contains attributes which have high expectation but perceive to have low satisfaction value by customers (Silva & Fernandes, 2010). Therefore the attributes in this quadrant become the main priorities to be improved.

Discussion
Based on the calculation of data, the root causes are the attributes in first quadrant which become the main priority to be improved. The attributes are:
R1   : Time delivery of account opening process
R3   : Account opening form design
W3   : Occurring of network interruption
A3   : Sufficiency of customer service officers in state-owned banks
A4   : Effectiveness of account opening queue to customer service

The causes of each attribute above can be classified in following aspects:
a. Human capital aspect
    -   Lack in number of customer service officer;
    -   Lack in number of human capital staff;
    -   Lack in number of technician;
    -   No regular training schedule for preparation of customer service candidates.
b. Technological issues aspect
    -   Separate application in account opening process;
    -   Different queuing system in each sub-branch;
    -   Server is not restarted regularly;
    -   Lack of advance technology, such as e-ID card reader, customer's finger print, and other security devices.
c. Technical aspect
    -   Account opening form is not simple and unfriendly;
    -   Supervisor's authorization mechanism;
    -   Unpredictable of time delivery service impact to the queuing time.
d. Procedural aspect
    -   Service standard of MRI;
    -   Account opening rules according domicile;
    -   SOP account opening form filling.

This study proposes an alternative solution which can solve problems in all aspects above. The alternative solution is a facility that can facilitate customers to open an account anytime and anywhere. This solution is an **online account opening facility**. This facility is suitable to support *branchless banking* system. So, with developed an online account opening facility, state-owned banks can improve service quality of account opening process. There are some benefits gained by developing an online account opening facilities. These benefits are not only obtained by the bank but also by the customers. Following are benefits of online account opening facility.

A. Benefits for Bank
Some benefits that obtained by bank are:
•   Online account opening facility can be a way to attract new customers even more than branch customers and also attract different customer types, in particular, younger generations and tech-savvy customers;
•   Bank that implement online account opening facility can capture funds more quickly through the workflow with automated processing;
•   This facility can reduce processing errors and costs associated with the manual handling of applications, then automatically decrease operational costs;

- Providing solutions to problems related the account opening process, especially the limited number of customer service officers and time delivery service.

B. Benefits for Customers

Some benefits that obtained by customers are:

- Customers who have made online data inputting can be served quickly than filling out the form manually;
- Short time delivery service provides can improve cross selling products by officers;
- The waiting time for customers who also want to go to customer service become shorter as an impact of short time delivery service;
- Enhance the customer experience as users of bank services especially for customers who demand self-service option.

In order to improve the service quality in opening account process, the state-owned banks have to consider as follows:

- The bank must collect a lot of information on appropriate technologies to be improved to encourage the success of this online account opening facility;
- Important to concern about security and fraud prevention. The customer ID-verification step relies heavily on innovations in multifactor identity verification. By automatic customer ID-verification, it will be possible approval processed without manual intervention, leaving only the exceptions for bank staff to handle manually;
- Attention to compliance with the rules or regulations governing the development of online banking facilities and account opening process;
- Bank must ensure that the support facilities are available equally in every branch. Or else for early stage, bank can anticipate by providing a list of some branches that have been supported to continue the process of this online account opening;
- Provide complete information about bank products that can be opened through online facility so that customer can be easier to choose the appropriate product;
- Online account opening form is designed in a simple and friendly so easily to be understood by customers, but still qualify from Know Your Customer (KYC) principle.

Conclusions

Based on data of this study, it can be conclude that the account opening process in State-owned banks especially in Bandung area are not fulfill the customer's expectation. All attributes of Servqual dimension that used in this study have negative gap value between current condition and expectation. Important-Performance Analysis (IPA) is used to determine the priority of improvement. After mapping the Important-Performance matrix, the priority to be improved is the quadrant I. In this quadrant, the performance or the current condition value is low while the expectation value is high. There are five attributes that was taken as priority in the quadrant I. The attributes are:

R1   : Time delivery of account opening process
R3   : Account opening form design
W3   : Occurring of network interruption
A3   : Sufficiency of customer service officers in each sub-branch of state-owned bank
A4   : Effectiveness of account opening queue to customer service

After conducted deep analysis of the root cause which led these attributes have low performance, then obtained some causes which can be classified in four aspects, namely human capital, technological, technical, and procedural.

State-owned banks have to review of SOPs regarding employee, ranging from regulation of the recruitment process, employee training schedule, and maintenance schedule for technician, and also review of SOPs regarding account opening procedures such as MRI standards, use of ID cards to be appropriate domicile, account opening form design, etc. Improve technological system by develop an online account opening facility for prospective customer that can be solve the problems of all aspect, human capital, technological, technical, and procedural; and integrate menu for internet banking activation. In this study, there are some limitations that exist as follows: this study is limited to determine the affectivity of existing account opening process and benefit of online account opening facility for prospective customers to improve the service quality in state-owned banks; customer who becomes the object study is the individual customers and the account opening process is for saving account; this study is not explain about types and features of saving products that offered by state-owned banks; and this study does not study other aspects of this account opening facility such as, financial advantages, investment analysis, design of online feature, and risk management.

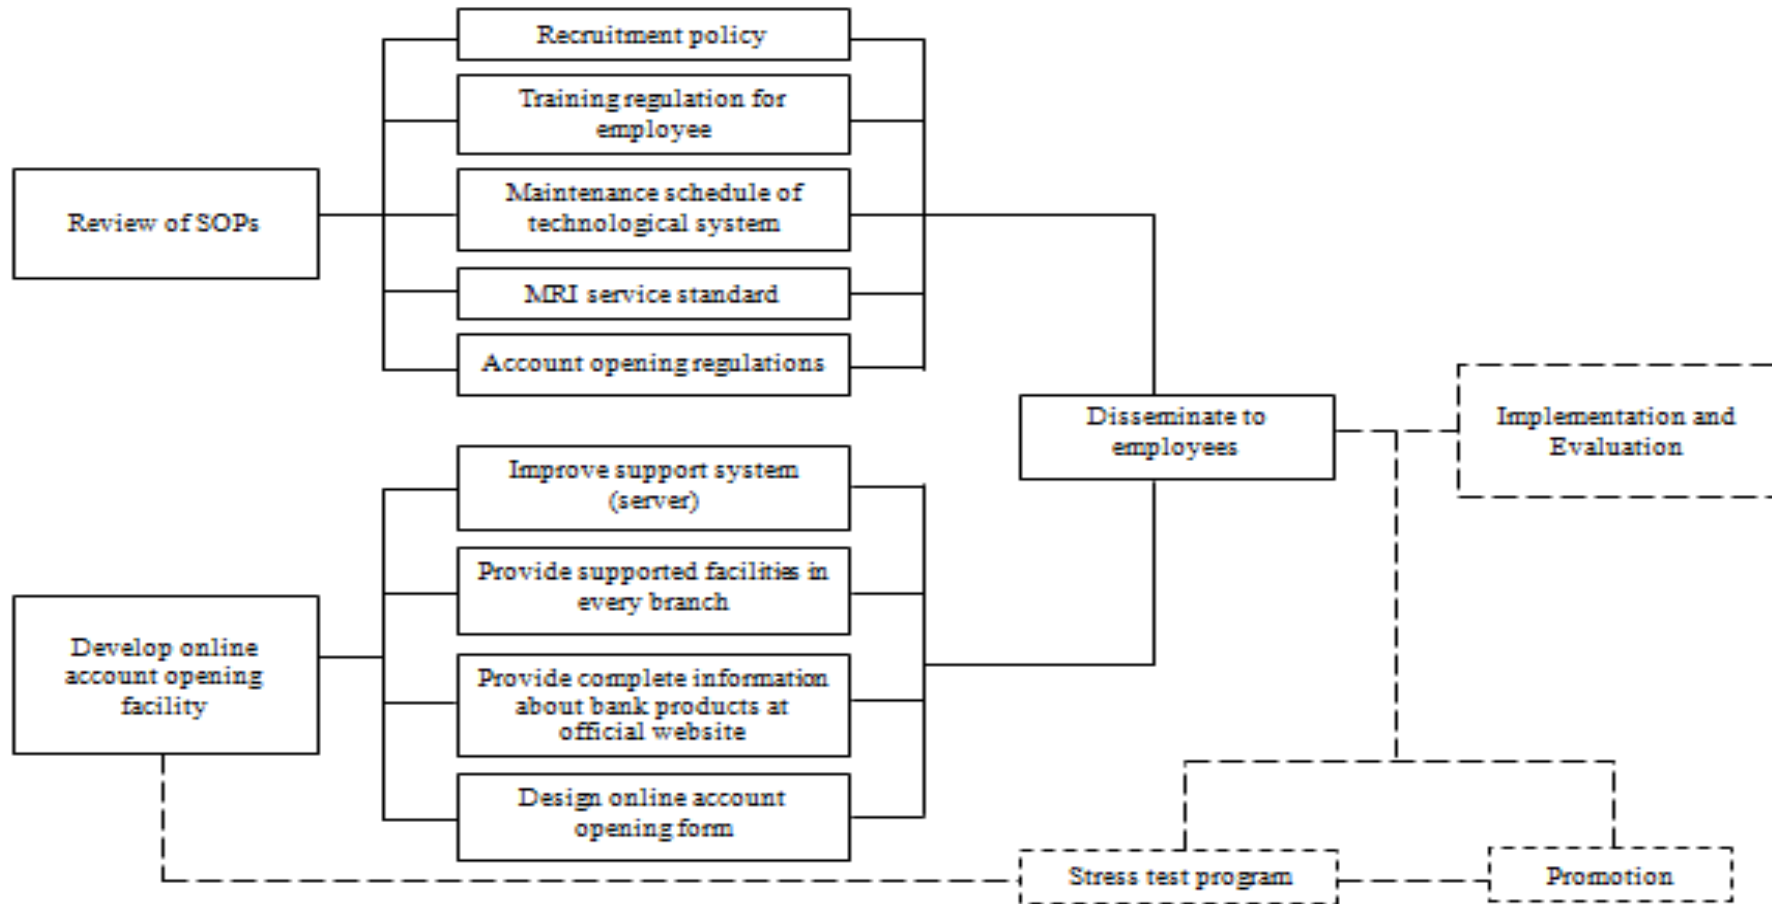
Further research should be done on an object and a wider scale by taking a particular region, such as each province and it should be able to examine the different variables associated online account opening facilities, such as risk management or investment costs analysis to develop online account opening facility. The recommendations above are expected to improve service quality in state-owned, especially in Bandung area. In order to apply these recommendations, following are suggested implementation scheme.


Figure 2. Proposed Activities as Solution

DETERMINANTS OF OCCUPATIONAL DIVERSIFICATION AS STRATEGY FOR DISGUISE UNEMPLOYMENT IN SWAMP LAND FARMER HOUSEHOLDS: LESSON LEARN FROM KANDIS AREA

Dessy Adriani, Sriwijaya University
Elisa Wildayana, Sriwijaya University
Yulius, Sriwijaya University
dessyadriani@fp.unsri.ac.id, dessyadriani@gmail.com

Abstract

Limited working time allocated to paddy farming households make farmers tend to have a lot of leisure time and accidentally became underemployed. Some studies show farming households have economic and social rationality to increase income through the occupational diversification. The research objective to analyze: (1) the allocation of work time and income received by households of swamp lowland paddy farmers to diversify their work structure, (2) determinants of occupational diversification of household of swamp lowland paddy farmers in Ogan Ilir. This research was conducted in the Miji village Kandis Subdistrict Ogan Ilir district. The research method is the survey. Sampling method is simple random sampling. The data obtained were processed tabulation, mathematical calculations, and is described descriptively. In swampy areas occur underemployment 270.47 HOK. Occupational Diversification led to an increase of working hours, 626.01%, a 56.08 % decrease in underemployment, as well as increased income 256.41%. The behavior of occupational diversification in paddy farming is significantly affected negatively by non-farm income and non-rice farm income, and positively by age variable. The behavior of occupational diversification except in paddy farming is significantly affected positively by non-farm income, farm income and non-paddy land. Occupational diversification causes a threat to the swampy area's role in food security.

Keywords: Occupation, Diversification, Determinants, Disguise Unemployment

Background

Improved food security is one of the objectives of national development. This is understandable because food shortages can cause extensive impact economically, socially and environmentally. One of the factors that guarantee food security is land. From the economic side, according to the Utama (2006) land is the main input of the various productions, not only on agricultural commodities but also for non-agricultural. According Dwipradnyana (2014), demand of land affected by two types of demand, namely direct demand and derived demand. On direct demand, land serves as consumer goods or for residential and directly provide utility. Through a derived demand, the increase in the population will increase demand for goods and services as a satisfying needs. To produce goods and services required land as a factor of production, which does not only provide direct but also derived from the consumption of goods and services. Because the supply of land is fixed, while the demand continues to grow, so there will be competition in the use of land for various activities (Dwipradnyana, 2014)

Wetland conversion constitutes a serious threat to food security because of the impact of land conversion is permanent. A wetland that has been converted to other has very little chance to turn back into a wetland. The substance of the problem of land conversion is not only came from the land conversion, but also from compliance with zoning, economic impact

and environmental benefits in the long term and other alternatives that can be taken, so that the benefits outweigh the impact (Pakpahan *et al*., 2007).

Food security requires agricultural land, especially paddy fields with sufficient quantity and quality in a sustainable way. As one of the key factors in the food production system, the availability of land gives a severe challenge to agricultural development to this day because of its limiting. These conditions have pushed swampland use as one of the potential land for paddy cultivation.

Swamp land agro-ecosystem is one of the potential natural resources. It has been used as farmland potentially. Swamp land area in 2012 reached 24 % (33.4 million ha) of the total land area in Indonesia, consists of 59.8 % (20 million ha) tidal lands and 40.2 % (13.4 million ha) swamp lands. Constraints in swamp lands include puddles, low pH, toxicity Fe, pyrite and salts.

One of the provinces in Indonesia, South Sumatra, has swamp land and tidal land. The tidal land consists of 71% (379 450 ha) of potential land and 29% (156 763 ha) functional land. Swamp land consists of 72% (129 062 ha) of potential land and 28% (45 992 ha) of functional land. Utilization of swamp land in South Sumatra, especially for paddy farming is growing from year to year as well as production. Production of swamp land in South Sumatra has a great contribution to the food needs in South Sumatra and improving the economy of the area.

Ogan Ilir is a regency in South Sumatra Province, which has the second largest swamp land, which amounted to 63 503 ha, after Ogan Komering Ilir Regency with amounting to 90 221 ha. Most of the population are rice swamp land farmers. However, the production of food crops (paddy), and horticulture still not up, especially rice farmers can only plant paddy once a year.

Farming by farmers in Ogan Ilir are still rudimentary and can be cultivated and planted only once a year in the dry season. While the rainy season, the land is followed because the land was inundated by high water and it is not possible to do paddy cultivation. So that the results achieved are still unfavorable and would affect income. With limited working time that can be allocated on paddy farming, they tend to have a lot of leisure time and accidentally became disguise unemployment. It further impact on low income households. To overcome this, farmers do occupational diversification from outside of paddy farming. According Adriani (2015), in such conditions, the domestic farmers will have economic and social rationality to increase household incomes through occupational diversification of. Economic rationality, which is caused by the low income of rice farming, has encouraged the growth of social rationality (through occupational diversification). Occupational diversification has a positive impact on the reduction in disguise unemployment of 49 percent and an increase in revenues of 187 percent. While the Occupational diversification impact of a decrease in disguise unemployment at 69 percent and increase income by 267 percent.

Nghiem (2010), shows three kinds of motives behind the occupational and income diversification, which is (a) Risk motivation, (b) Poverty motivation, poor households in developing countries faced with the constraints of the market, and resources, (c) Economic expansion motivation. This motivation explained diversification as part of the efforts undertaken households to expand its economic base. Furthermore, according Bekti *et al*., (2014), diversification of income is motivated by poverty, households want to meet basic needs and to overcome the difficulties. Thus, poverty is the driving motivation of farmer households in swamp areas to diversify.

Kandis Area is one of the areas of land dominated by swamp lands. Paddy farming implemented by farmers in this area is still on a small scale where many constraints faced by farmers, such as land use is still limited where the land use is only once a year, labor is

sometimes insufficient, lack of capital owned by farmers so that the means of production used are still very few, and the lack of understanding of farmers on cropping patterns should be applied. Farmers will choose a commodity that they have earned as a commodity, they enjoy without supported by economic calculations in the pursuit of farming. Therefore, with increased utilization time allocation of swampy lands working, expected revenue received by farmers can be increased so that the farmers' welfare is also increasing. In that regard, it is considered necessary to do research to assess the allocation of work time farmer in the Kandis village Ogan Ilir subdistrict.

Results of previous studies show farmer households do social and economic rationality to overcome the problem of low income from paddy farming. The social and economic rationality embodied in the occupational diversification. Until now there has been no study that analyzes the determinants of changes in the occupational diversification. Therefore, this study aimed to analyze: (1) the allocation of working time and income received by households, farmers in swamp land with occupational diversification (2) the determinant of the behavior of occupational diversification chores paddy farmers in swamp land, Ogan Ilir.

By knowing the behavioral determinants of occupational diversification chores paddy farmers in swamp land, then we can know whether the occupational diversification supports or threatens food security.

Theoretical Framework

The prevalence of occupational diversification has begun to be recognized in the early to mid-1990s, and by the end of the decade was firmly established (Reardon, 1997; Ellis, 2000; Barrett et al., 2001). It was found that the main figures of between 40 per cent and 60 per cent of rural household income deriving from non-farm activities and transfers were commonplace. Later consolidated evidence this understanding: in South Asia, the mean proportion has been Often around 60 per cent, while in Sub-Saharan Africa it converges on 50 per cent, and in Latin America average figures of around 40 per cent growing niche to be observed.

Occupational and income diversification are often associated with a reduction of risk, opportunity and uncertainty of income. Household level, diversification through business diversification and asset utilization, besides aiming for value-added capital also to reduce instability household income (Pakpahan, 1990; Stafen and M. Zeller, 2005). Diversification can be done in agriculture, non-agricultural, or both. The diversity of the environment as a push and pull factors of households to diversify income. The main factors or reasons of farm households to diversify revenue is increasingly limited land areas, causing farmers are not able to maximize agricultural production, so that the acceptance of the farming sector was not optimal and cannot face the basic needs. This has led to domestic farmers must undertake diverse activities that can generate an income in order to survive. Social, cultural, economic and also causes differences in diversification of farmers. Besides the limiting factor of income diversification, it is a factor of skill or expertise of a person (Gatoet and Handewi, 2002; Handewi et al., 2003; Susilawati et al., 2002).

Hypotesis

Expected that land area, income other than paddy farming, non farm income, age and number of family members have real impact on the occupational diversification for paddy swamp land farmers.

Research Method

This research was conducted in Kandis Area, Ogan Ilir Region. The location determination is done intentionally (purposive) on the basis that this area is swamp lowland paddy production centers in Ogan Ilir. The data collected from February to April 2016. The research method is a survey method. Sampling method is the simple random sampling method with 30 farmers of 397 KK This research uses two kinds of data sources are primary data and secondary data. The data obtained in the field processed by tabulation, mathematical calculation and systematic description. The first objective (1) to calculate the allocation of working time, will be calculated the amount of time each activity for one year and then be explained descriptively (Hernanto, 2002):

$$JK\ total = JO \times HK \times JK$$
$$HOK = \frac{JK\ total}{JKS}$$

Where:
HOK = Total Amount of Work day (Weekdays)
JO = Number of Persons (person)
HK = Work Day (the day)
JK = Hours of Work (hours)
JKS = Standard Hours of Work (hours)

As for counting the number of time allocation of labor swampy paddy farmers, using the formula:

$$W_K = W_P + W_{LPS}$$
$$W_{LPS} = W_{USP} + W_{NU}$$

Where:
WK = Number of household labor time allocation for various activities (HOK / yr)
WP = Working time allocation of paddy farming activities (HOK / yr)
WLPS = Allocation working time outside of paddy farming activities (HOK / yr)
WUSP = Allocation of working time farming other than paddy farming (HOK / yr)
Wnu = Allocation of work time for non-farming activities (HOK / yr)

Allocation of working time to farming is the principal (WUP) is determined by the formula

$$W_P = \sum_{i=1}^{8} W_i$$

Where:
WP = Allocation of paddy farming working time (HOK / yr)
Wi = Allocation of paddy farming working time (HOK / yr)

Disguise unemployment are those who are of working age, but his working time was below its potential. Disguise underemployment is calculated by estimating the potential of working hours available and compare it with the actual working hours. Potential farm household labor is the amount of potential labor available to family farmers. If the potential is higher than the work hours of actual work, then there is underemployment. According Hernanto (2002), the potential of the male labor force to work is 300 days (HOK / yr), 226 days for women workers (HOK /yr) and 140 days for children (HOK / yr).

To calculate the amount of income from farming uses the following formula:

$$PnUTp = Y \times Hy$$
$$PdUTp = Pn - BT$$
$$\sum Pd = PdUTp + PdUL + PdNUT$$

Where:

Pn	= Revenue received by farmers (Rp / year)
Pd	= Income (Rp / year)
Y	= Production (kg)
Hey	= Output prices (Rp / kg)
BT	= Cost (Rp / kg)
NUT	= Non Farming
UL	= Other farming
UTP	= Paddy farming

To answer the third project, which analyzes the determinants of work time allocation behavior in swamp land paddy farmers used a multiple regression equation as follows:

$$Ln\ CH\ U_{Pi} = Ln\ a + b_1\ Ln\ PdU_{Pi} + b_2\ Ln\ Pd_{LPSi} + b_3\ Ln\ Pd_{NUi} + b_4\ Ln\ U_i + b_5\ Ln\ P_i + b_6\ Ln\ JAK_i + b7\ Ln\ LH\ U_{Pi} + \mu_i$$

$$Ln\ CH\ _{LPSi} = Ln\ a + b_1\ Ln\ PdU_{Pi} + b_2\ Ln\ Pd_{LPSi} + b_3\ Ln\ Pd_{NUi} + b_4\ Ln\ U_i + b_5\ Ln\ P_i + b_6\ Ln\ JAK_i + b7\ Ln\ LH\ _{LPSi} + \mu_i$$

Where:

CH UP	= Occupational Diversification in paddy farming (HOK / yr)
CH LPS	= Occupational Diversification from outside the paddy farming, that is another s farming than paddy farming and non-farming (HOK / yr)
PdUP	= Income of Paddy farming (Rp / yr)
PdLPS	= Income from outside the paddy farming (Rp / yr)
PdNU	= non-farming income (Rp / yr)
U	= Age (yr)
P	= Education (yr)
JAK	= number of family members (people)
LHUP	= paddy farming land area (ha)
LHLPS	= non-paddy farming land area (ha)
μ	= standard error

Results and Discussion
a. Diversification Work and Income Structure

Table 1 presents a case of disguise unemployment of 628,25 HOK is found in swampy areas. Paddy farming can only absorb 7.17 percent of the available potential labor. This has an impact on lower income farmers in the region. As shown in Table 2 , the household income of paddy farmers is only Rp 9,919,083.73 (Rp / lg / Year) .

Table 1. Potential, Allocation Working Time for Paddy Farmings, and Disguise Unemployment on Swampy Land of Kandis Village, 2016.

No	Classification	Man		Woman		Children		Total (HOK)	Allocation (%)
		HOK	(%)	HOK	(%)	HOK	(%)		
1	Potential Hours of Work Allocation Working Time for Paddy Farmings	300.00	45.05	226.00	33.93	140.00	21.02	666.00	
2		29.54	13.04	14.72	8.99	3.49	57.78	47.75	7.17
	Disguise Unemployment	270.46	43.75	211.28	34.17	136.51	22.08	628.25	92.83

Occupational diversification done by farmers in order to cover the low farm income. Selection of the job is the work of non-paddy farming and non farming (labor, the private sector, civil servants, trade). Based on Table 2 shows that that the total household labor time allocation to farmers amounting to 226.58 HOK for men than for women in the amount of 163.72 HOK and for the allocation of working time of 6.04 HOK for children. In this case, the allocation of working time of man greater than women and children because the man is a head of household who is obliged to meet the needs of his family. Allocation of working time greatest, namely on non-farming activities amounted to 270.00 HOK, then amounted to 76.70 HOK for non-paddy farming and by 47.75 HOK for paddy farming.

Table 2. Occupational Diversification in Swamp Land of Kandis Village, 2016

No	Occupational Structure	Man		Woman		Children		Total (HOK)
		HOK	(%)	HOK	(%)	HOK	(%)	
1	Paddy farming	29.54	13.04	14.72	8.99	3.49	57.78	47. 75
2	Non paddy farming	50.78	22.41	23.37	14.27	2.55	42.22	76.7
3	Non farming	146.26	64.55	125.63	76.73	0	0	270.00
	Total	226.58	100.00	163.72	100.00	6.04	100.00	394.45

Time working allocation for non Farming activities are biggest. This is caused by the non- farming activities has uncertain time. It can work for more than 8 hours per day such as trade, drivers and laborers. One thing that draws attention to the occupational diversification has led to an increase in the actual hours worked by 626.01 percent and a decrease in disguise unemployment amounted to 56.08 %. Research results are consistent with research Adriani (2015).

The total income is a combination of all revenues received from all income received by farmers, either from paddy farming, nor from non-paddy farming and non-farming. The total income of farmers in detail can be seen in Table 3.

Table 3. Income Diversification of Farmer in Swamp Land Kandis Village, 2016

No	Income Structure	Amount (Rp/lg/th)	Percentage (%)
1	Paddy farming	9,919,083.73	21.91
2	Non paddy farming	18,808,785.06	41.55
3	Non farming	16,543,750.00	36.54
	Total	45,271,618.79	100.00

Based on Table 3 is known that the largest source of the total income of farmers derived from 41.55 percent non-paddy farming, non-farm that is equal to 36.54 percent, while paddy farming by 21.91 percent. The The biggest revenue sources are from outside of paddy farming activities amounted Rp.35, 352,535.06 per year. Thus, occupational diversification has increased household income of farmers amounted to 256.41 percent. This study is consistent with research Adriani (2015) that the occupational diversification can increase total income of farm households. Ersade (2003) also found that rural households growing niche to have a more diversified portfolio of income, compared to reviews their urban counterparts and the degree of diversification decrease with the level of urbanization. However, there are important differences in the level of diversification within the rural and urban areas depending on wealth.

b. Analysis of Occupational Diversification Determinants
1. Diversification Work on Paddy Farming

The results of multiple regression analysis showed that the coefficient of determination or R^2 are 0.546 for the allocation of work time paddy farmers. The results of a partial analysis explain the behavior of working time allocation is influenced by variables in Table 4.

Testing violation of classical assumptions results: (1) autocorrelation can be seen the value of Durbin Watson rice farming amounted to 2,044 which in this case is not autocorrelation, (2) multicollinearitycan be seen from the results output regression in the form of VIF (Variance Inflation Factor) where the regression equation multicollinearityobtained does not happen because the average VIF is less than 10, and (3) Heterocedasticity test used to determine the presence or absence of classic assumption deviation Heterocedasticity namely inequality variants of residuals for all observations in the regression model. The testing method used is Glesjer Test, in this case the regression results obtained are not going Heterocedasticity for all independent variables with absolute residuals greater than 0.05.

Based on the F test statistic, obtained an F value of 3.775 as compared to the F-table is significant at the 1 % level. From the F test results are known non-farm income, age, and number of family members giving real effect jointly to conduct the allocation of working time farmers. Based on t-test conducted on the regression equation, there are three variables were not significant on the behavior of the allocation of working time farmers on paddy.

Table 4. Parameter Values of Multiple Regression Equations of Working Time Allocation Farmer Households on Paddy Farming in Swamp Land: *Lesson Learn from Kandis Village*

Variable	Parameter	Standard Error	T-stat	Prob-t	Note
Intersep	-1,099	4,913	-0,224	0,825	-
Ln paddy farming land (LnLH)	0,123	0,222	0,552	0,587	-
Ln paddy farming income (LnPDUP)	0,174	0,278	0,627	0,537	-
Ln non-paddy farming income (LnPDLPS)	-0,004	0,011	-0,344	0,134	Significant
Ln non-farming income (LnPDNUT)	-0,017	0,011	-1,518	0,143	Significant
Ln age (LnU)	0,630	0,334	1,886	0,073	Significant
Ln education (LnP)	-0,158	0,156	-1,014	0,322	-
Ln number of family member (LnJAK)	0,363	0,142	2,553	0,018	Significant
$R^2 = 0,546$ F- stat = 3,775					

The analysis revealed a number of factors need to be attentive to make farmers still allocate her time for paddy farming. If we hope to materialize food security, then some of these factors need to be a concern. Land use, education and income of paddy farming is not an important factor that encourages farmers allocate their work time on paddy farming.

Factors that influence the allocation of work time on rice farming is outside of non-paddy farming and non-farm income. The estimation results show a negative relationship between them. This means that if an increase in non-paddy farming and non farming income, the working time allocation of paddy farming will decline. These results give a serious signal to the sustainability of food security in swamp land. Occupational diversification performed farmer households to overcome Disguise Unemployment, it led to a new problem that is a threat to food security. With an opportunity to diversify the work on the fields outside of paddy (non-rice farming and non farming), farmers tend to abandon paddy farming. It is dangerous if it is associated with aspects of food security. In the future, it is caused to decrease food production and food security is not achieved.

The parameter values for age at 0.630 and prob-t value of 0.073, which means significantly positive at α = 1%. This means that in case of a 1% increase in the age, the working time allocation of farmers will increase by 0.630%. Age becomes the deciding factor for farmers in paddy farming. A positive value indicates paddy farming would be dominated by the older workers; while a young age worker is more like working on outside of paddy farming. It also bodes no good for the development of food security. Opportunities to diversify the job from rice farming into non-rice, instead of decreasing interest of young people in paddy farming.

The estimation results also show that the number of family members a real positive effect on the behavior of the allocation of working time farmers amounted to 0,363. This

means that if there is an increase in the number of family members by 1%, then the behavior of the allocation of working time farmers will be increased by 0,363%. This is as expected, due to the increasing number of family members then increasing the allocation of working time farmers. In this case the number of family members more will influence the farmer's decision to allocate work time due to the number of family influence on the amount of labor.

The results of this study are consistent with Ersado (2003), Households with a more diversified income base are better-able to withstand the unfavorable impacts of the policy changes and weather shocks. The fact that are relatively better-off Households have a more diversified income base following the shocks implies that the poor are more vulnerable to economic changes Unaccompanied by a well-designed safety nets.

2. Diversification Work with Outside of Paddy Farming

The results of multiple regression analysis showed that the coefficient of determination or R^2 of 0.871 for the allocation of non-rice farmer working time. Here are the results of a partial analysis that explain the behavior change work time allocation is influenced by variables in Table 5.

Table 5. Parameter Values of Multiple Regression Equations of Working Time Allocation Farmer Households on Outside of Paddy Farming in Swamp Land: *Lesson Learn from Kandis Village*

Variable	Parameter	Standard Error	T-stat	Prob -t	Note
Intersep	-1,084	5,668	-0,191	0,850	-
Ln paddy farming income (LnPDUP)	0,219	0,296	0,739	0,468	-
Ln non-paddy farming income (LnPDNUT)	0,116	0,018	6,595	0,000	Significant
Ln non-paddy farming income (LnPDLPS)	0,024	0,017	1,357	0,189	Significant
Ln non paddy farming land (LnLH)	0,381	0,197	1,932	0,066	Significant
Ln age (LnU)	0,295	0,528	0,559	0,582	-
Ln education (LnP)	0,112	0,255	0,437	0,666	-
Ln number of family member (LnJAK)	-0,226	0,216	-.1,046	0,307	-
$R^2 = 0,871$ F-stat = 21,270					

The results of multiple regression did not occur autocorrelation and Multicollinearity, as obtained Durbin Watson out of 1,255 rice farming which in this case is not autocorrelation. Multicollinearity can be seen from the results of the regression output in the form of VIF (Variance Inflation Factor) where the regression equatio n obtained multicollinearity not happen because the average VIF outside the rice farm is less than 10. Heterocedasticity test gained nothing happens Heterocedasticity for all independent variables with absolute residuals greater than 0.05.

Based on the rules statistict F-test results, obtained an F value of 21.270 as compared to the F-table is significant at the 1 % level. From the results of the F-test can be analyzed that the variable land area outside of the paddy farming, income beyond non-paddy farming and non-farming income effect jointly to conduct the allocation of working time farmers on outside of rice farming. Based on t-test conducted on the regression equation, there are four variables were not significant on the behavior of the allocation of working time farmers.

Paddy farm income did not significantly affect the behavior of the allocation of working time farmers. Paddy farming income is smaller than the non-farm income. This is due to farming activities and labor costs compared to the non-farming activities were just a little cost and effort. So that the allocation is used tends to non-farming activities due to a larger income than paddy farming. So the paddy farm income did not significantly affect the behavior of the allocation of working time farmers. Age, number of family members, and education also had no significant effect on the behavior of the allocation of work time. Thus, age, number of family members and education are no longer a consideration when entering the labor market. In rural areas, the poverty issue is becoming a driving factor to enter the labor market. As stated by poor households are trying to diversify since the total amount of revenue generated from all resources is apparently greater than the revenue gained by utilizing all the resources focused only on a single income option. This motivation by Ellis (2000), called "necessity" or "push-distress diversification". These results are also in line with Rafhael and M. Qaim (2009), almost all the households to diversify, the contribution of income earned outside the main farm of more than 50%.

Factors non-paddy farming land has a real positive influence on the behavior of the allocation of working time farmer. This is as expected, due to increased non-paddy farming land, the farmers working time allocation behavior also increased. Paddy farm income factors beyond a positive significant effect on the behavior of the allocation of working time farmers. The estimation results also show that the non-paddy farming income and non-farming income positive significant effect on the allocation of work time non-paddy. This finding is interesting that income into consideration a person to increase their working hours. This is common in poor households. As stated by Ellis (2000) that the Poverty motivation, poor households in developing countries faced constraints and resource markets. As a consequence, they are not able to expand a single activity in order to obtain income to a level which allows basic needs are met.

These results are also consistent with studies Ellis (2004), empirical work shows that at the lowest levels of income per capita, immense Efforts are required in order to 'break through' into opportunities and returns to labor that enable the family to climb out of poverty; on the other hand, at somewhat higher levels just above the poverty line, it Becomes substantially less difficult, to Achieve a virtuous spiral that can lead to higher levels of income and a more secure livelihood. The key to reviews these thresholds traps and lies in the asset status of families, and especially in human capital (education and skills) and flexible assets that can be quite quickly intervening converted into cash or other assets (money itself, credit access, livestock). It might be thought that the attention paid by the better off Households to non-farm activities would result in the neglect and poor performance of Reviews their farming activities. Not so at all. Recent evidence from Sub-Saharan Africa shows how agricultural productivity per hectare rises steeply across the income ranges in parallel with the diminishing reliance on agriculture of the better off. Net farm output per hectare in a series of country samples was between three and six times higher for the top income quartile of households compared to the lowest income quartile.

Conclusions and Policy Implications
a. Conclusion

Lesson learn in the swampy areas from Kandis Village, there are cases of disguise unemployment of 618.25 HOK. Occupational diversification has led to an increase in the actual hours worked by 626.01% and a decrease of 56.08% disguise unemployment, and increasing household income of farmers amounted to 256.41%.

The behavior of occupational diversification in paddy farming is significantly affected negatively by non-farming income and non-paddy farming income. With a real positive influence of age, then the paddy farming is dominated by older workers, while younger workers will be more work outside of paddy farming. The behavior of occupational diversification in addition to paddy farming is significantly affected positively by non-farm income, farm income and non-paddy land.

b. Policy Implication

The results of the analysis give a serious signal about the role of swampy areas on the sustainability of food security. Occupational diversification performed farmer households to overcome underemployment, it led to a new problem that is a threat to food security. With an opportunity to diversify the work in the field of non-paddy farming and non-farming, the farmers tend to abandon paddy farming. In addition, opportunities to diversify jobs from paddy farming to non-paddy farming, instead of decreasing interest of young people in paddy farming. Paddy farmers will be dominated by the elderly.

To overcome this problem, it is necessary the intervention of the government to carry out socioeconomic empowerment and community-based institutions and also local agricultural resources. Development of non-paddy farming and non farming should remain geared to support the development of paddy farming.
