Preface

These refereed proceedings contain all papers that have been accepted after anonymous review and their subsequent revisions by author(s) for presentation at the 13th Annual World Congress of the Academy for Global Business Advancement (AGBA), on November 26 - 28, 2016 and the 2016 AGBA—Indonesia Chapter's Inaugural Conference on August 3 - 4, 2016 that are being hosted by the Faculty of Economics and Business, Universitas Sebelas Maret, Indonesia.

These refereed proceedings have been edited by Dana-Nicoleta Lascu, (University of Richmond, USA), Eric Werker, (Simon Fraser University, Canada), Gary L. Frankwick, (University of Texas at El Paso, USA), Irwan Trinugroho, (Universitas Sebelas Maret, Indonesia), and Zafar U. Ahmed (Academy for Global Business Advancement, USA).

AGBA would like to express its appreciation and gratitude to Dr. Hunik Sri Runing Sawitri, Dean, Faculty of Economics and Business Universitas Sebelas Maret, Indonesia and Dr. Muhammad Agung Prabowo, Associate Dean, Faculty of Economics and Business, Universitas Sebelas Maret, Indonesia for their dynamic leadership, appreciable patronage and admirable support in organizing this fabulous global conference.

AGBA also wishes to extend its heartfelt thanks to Conference Organizing Committee at the Faculty of Economics and Business Universitas Sebelas Maret, Indonesia for organizing two great conferences.

We place on record our sincere thanks for your participation and support, and look forward to having you with us next year at AGBA's 14th Annual World Congress.

Sincerely,

Dana-Nicoleta Lascu

THE RELATIONSHIP BETWEEN INTEREST RATE AND STOCK PRICE: EMPIRICAL EVIDENCE FROM COLOMBO STOCK EXCHANGE

Dona Ganeesha Priyangika Kaluarachchi, Eastern University Sri Lanka, Sri Lanka
A.A.J. Fernando, University of Sri Jayewardenpura, Srilanka

Abstract

This study examines the relationship between stock price and the interest rate during the period from July 2012 to December 2015. Average daily stock prices calculated by Colombo Stock Exchange (CSE) and Sri Lanka Interbank Offer Rates (SLIBOR) are used as dependant variable and independent variable respectively. Accordingly, all Share Price Index (ASPI) and the Standard of CSE is used to analyze the overall impact of interest rate on stock prices whereas Standard and Poor Price Index (S & P) of CSE is used to measure the relation between stock prices of selected companies (Blue Chips) and interest rate. Regression is mainly used to examine the relation between stock prices and interest rates. As theory suggest, the study finds that both share prices reflected by ASPI and S&P negatively correlate with the interest rate. The findings urge policy makers and other interested parties to assess the impact of interest rate as a significant macroeconomic variable.
Keyword: *All Share Price Index (ASPI), Standard and Poor Price Index(S&P), Sri Lanka Inter Bank Offer Rate (SLIBOR), Stock Price, Interest Rate*

Introduction

Theory suggests that there is a negative relationship between the interest rate and the stock process in the financial markets. The policy makers and the other relevant investigators are attempting to understand the relationship of this dynamic interaction among the interest rate and the stock price. This study examines the dynamic relationship between interest rate and stock prices in order to identify the impact of interest rate changes on stock prices based Colombo Stock Exchange. Sri Lanka is an emerging market and therefore, it is worthwhile to examine whether impact of interest rate changes on stock prices is negative as the theory says or any other relation thus asking the main research question as what kind of relation can be seen between stock price as the main indicator of capital market in Sri Lanka and the macroeconomic variable of interest rate. Hence, the objective of the research study is to assess the nature of relation that exists between interest rate and stock prices on the ground that the outcome would be of value in terms of economic policy decisions are concerned.

Investors in financial markets are highly concerned about the interest rate as it is a major determinant of return on investment. Therefore, investors in the financial markets take interest rate into account when making investment dictions. Despite the fact that investors might have different objectives of investment, in general they try to maximize the returns while minimizing the risk of investment. Research has found that investments in fixed income securities and in equity securities are common vehicles for most of retail investor despite the fact that sophisticated financial instruments are available in the market. Therefore, it could be assumed that majority of investors either chose fixed income investment or equity investment. Interest rate can be regarded as a major variable that influences such investment decisions as well because investors can easily switch between equity investment and fixed income securities.

Literature Review

Finance theory explains interest rate as a measurement of time value of money which is one of the main determinants in stock prices. It plays a major role in any economy as a key macroeconomic variable defined as the cost of money. It is argued that any change in interest rate can cause difficulty for the investors and can affect the profitability of firms thereby fluctuating stock prices due to any change in this variable (Amarasinghe, 2015). Modern financial theory assumes that any firm generates a stream of future cash flows and the stock price of that firm is equal to the present value of all expected future cash flows discounted at the appropriate discount rate (Pablo Moya-Martíneza *et al*, 2015). Therefore, interest is embedded in the value of stocks as it is used to discount the cash flows. Cash flows are attractive for investors in determining the return as it is already realized and more realistic in terms of profitability. Pablo Moya-Martíneza *et al* (2015) explain the ways how interest rate influences stock prices. Accordingly, interest rates are said to influence stock prices through two primary channels. First, movements in interest rates have a direct impact on the discount rate used in equity valuation. Secondly, interest rate changes affect firms' expectations about future cash flows by altering the cost of financing, mainly in the highly geared companies. Therefore, it can be argued that interest rates a key determinant of stock prices and in turns on the returns on investment.

Methodology

Data required for the study was collected from CSE and published data by the central bank of Sri Lanka about interest rates. Values of daily ASPI and S&P of CSE were extracted for the period from July 2012 to December 2015 as dependant variables. Sri Lanka Inter Bank Offer Rate (SLIBOR) was taken as the independent variable with the main argument that interest rates can be hypothesized to influence stock prices.

Conceptual Framework

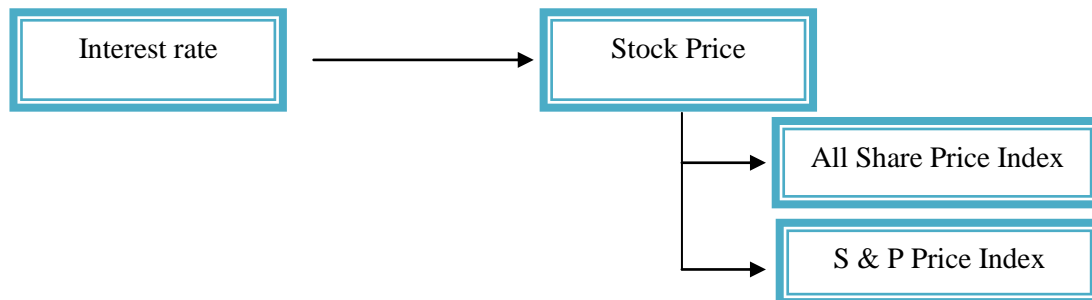
Study of the relation between interest rate and the stock prices can be explained as follow;


Figure 1 Conceptual Framework

For the purpose of investigating the relation between the interest rate and the stock price has are based on the variable of dependent and independent. There are two dependent variables explain such as ASPI and S&P. The changes in the stock prices have been evaluated through the ASPI and S&P price indexes.

1. **Development of Hypotheses**

In order to find the relationship between interest rate and stock prices the following hypothesis is formed.

> H0: $\beta i = 0$, the null hypothesis
> H1: $\beta i \neq 0$, alternative hypothesis
> βi = coefficients of interest rate

Accordingly, hypothesis is explained in the following way.

H0: There is no relationship between interest rate and the stock prices
H1: There is a relationship between interest rate and the stock price

Based on the results of the research most of the new investors can take their investing decisions. They can manage their positions and portfolios, if they can use news on interest rate changes as reliable information can be gathered from the research. And also it will benefit for the Investment analysts, fund managers and marginal investors can devise fundamentals based investment strategies.

2. Data Analysis and Discussion

The data used in this study was sampled on a daily basis over the period from July 2012 to December 2015. The relationship in between the interest rate and the stock process were analyzed using the correlation and the regression of the variables. Simple linear regression was used to analyze the relationship between the variables individually.

S & P and ASPI prices indexes have the higher volume numbers in stock markets. When the investor is deciding to invest in the stock market investors consider the stock prices and the interest rate in the market for better decision on the investment.

a. Numeric Summary

Following figure 2 explains the behavior of stock prices index (S & P and ASPI) in Colombo stock market in Sri Lanka.
Figure 2: Stock Price Indexes

Sri Lanka Inter Bank Offer Rate (SLIBOR) for the selected time period has been growing up. Figure 3 explains the behavior of SLIBOR
Figure 3: Sri Lanka Inter Bank Offer Rate (SLIBOR)

Based on the above two figures shows that SLIBOR has been grow up and the S & P and ASPI has been gone down. In the senior explain that the SLIBOR and S & P and ASPI have the negative relationship.

b. Correlation

Correlation explains the strength of the relationship in between the variables. Table 1 explains the correlation among the variables.

Table 1: Correlation among variables

Correlations		S & P	ASPI	SLIBOR
S & P	Pearson Correlation	1	.987**	**-.859****
	Sig. (2-tailed)		.000	.000
	N	816	816	816
ASPI	Pearson Correlation		1	**-.882****
	Sig. (2-tailed)			.000
	N		816	816
SLIBOR	Pearson Correlation			1
	Sig. (2-tailed)			
	N			816

Based on the results explain that there are negative relationship among the interest rate and the stock prices. Correlation among the S & P and SLIBOR in -0.859, explain that the variables have the strong negative relationship because of the correlation value is closer to the -1. And also ASPI and the SLIBOR also display the strong and negative relationship. The relationship in between S & P and ASPI are strong and positive is 0.987. The conceptual model and the variables of the model are significant due the sig. value of the model is .000 is less than the 0.05. The negative relationships explain that when the interest rate increases investors will invest their money in deposits, debentures and treasury bills. So the price of the stocks will be decrease. When the prices of the stocks increase the interest rate of the deposits

will decrease. Based on the analysis of the data the relationship between stock and the price and the interest rate is highly negative.

c. Regression

Simple linear regression has been used to explain the regression among the variables due to the two dependent variables in the conceptual model. S & P and ASPI are the dependent variables on the independent variable of SLIBOR. Table 2 gives the model summary of price index and LIBOR.

Table 2: S & P Price Index and SLIBOR

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.859[a]	.738	.737	203.64905

Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	5179.621	35.119		147.489	.000
	SLIBOR	-210.983	4.411	-.859	-47.833	.000

Predictors: (Constant), SLIBOR

Dependent Variable: S & P

The variables of independent are significant because of less value than the 0.05 significant level. The model is significant and be acceptable. According to the model explain the R^2 is 73.8%. Model explains the efficiency of the variable by 73.8%. As the R^2 is having the higher value, mode is more significant and efficient. The relationship between SLIBOR and S & P price index is negative and significant. Based on the results estimated model can be formed as follows and the data output of the model is given in table 3.

$Y^ = 5179.621 - 210.983_{(S \& P)}$

Table 3: ASPI and SLIBOR

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.882[a]	.778	.778	334.60825

Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	9393.161	57.702		162.787	.000
	SLIBOR	-386.891	7.247	-.882	-53.384	.000

a. Predictors: (Constant), SLIBOR

b. Dependent Variable: ASPI

Based on the results of the simple linear regression, model is significant and acceptable due to the sig. value is less than 0.005. R^2 is 77.8% and the efficiency of the model of the variables is highly efficient. The relationship among the variable are significant and highly negative. Efficiency of the model explains by the 77.8%. Estimated model for the regression as follows;

$Y\char`\^ = 9393.161 - 386.891_{(ASPI)}$

d. Hypothesis Testing

Research hypothesis testing was formulated as follows,

$H0: \beta i1 = \beta i2 = 0$

$H1: \beta i \neq 0$

$\beta i1 = S \& P \text{ Price Index}, \beta i2 = ASPI$

Based on the regression discussed in each dependent variables and the correlation of the variables can be summarized as follows in the table 4.

Table 4: Decision Table

H0	B	P value	Decision	Correlation	Conclusion
$\beta i\ 1 = 0$	$\beta 1 \neq 0$	0.000	Reject H0	-0.859	There is negative relationship between S & P and SLIBOR
$\beta i\ 2 = 0$	$\beta 2 \neq 0$	0.000	Reject H0	-0.882	There is negative relationship between ASPI and SLIBOR

CONCLUSION

Analyzed data conclude that there is a negative relationship in between interest rate and the stock price based on the data on daily basis over the period from July 2012 to December 2015. Model of the variables are significant and the acceptable. Results explain the high efficiency of the variables of both dependent variables. Regression and the correlation of the variable explain the higher negative relationship of the variables. Based on the evidence of results analyzed can be conclude that there is a strong negative relationship between stock price and interest rate.

Limitation of The Research

There might be some obstacles in collecting relevant needed data for this study and some of this are as follows.

➤ There is only few previous research has been done based on the Sri Lankan market
➤ Time factor is another serious constraint.

Abstract

This research aims to examine and to analyze the present of abnormal stock returns of food, beverage and pharmacy companies listed on Indonesia Stock Exchange (IDX) before and after decreasing and increasing oil price announcements. Besides, the research also examines the differences on the abnormal stock returns before and after the announcements. The method used in this research is by computing and processing abnormal return data using market model and t test to examine the differences before and after the announcements. The results is that all hypotheses are accepted. There are abnormal stock returns following the announcements of increasing and decreasing oil prices issued by government. Besides, there are also the differences on abnormal stock returns before and after the announcements. Investors should be careful to absorb the information spread in the market in order to avoid mistakes in making decisions.

Keywords: *Abnormal Returns, Oil Price, IDX*

Introduction

Oil fuel has a big influence on Indonesia economy. It bring some effects on every companies' activities. Yet, the use of it in each company is different. Manufacture companies use it to transform raw materials into ready-to-sell goods requiring more than non-manufacture companies. The oil fuel remains as one of costs for companies. So, if the price of oil becomes higher, the cost to produce goods is to do so.

This also happens in a capital market. An increase of oil prices has an effect on stock trading activities including stock volumes and stock prices. The market will respond every single change on oil prices either an increase or a decrease. It can quickly or slowly respond to the information about the oil prices. It will quickly respond to every event which is crucial to economic condition. Yet, it will slowly respond to an event which has no direct effect on the country's economy. Investors perform investment activities aiming to generate returns by considering the effects of macroeconomic variables such as inflations, the increase of oil prices, and exchange values on stock prices in a capital market in Ghana (Kuwornu, 2012)

According to Mackinlay (1997), economists are often asked to measure the impact of economic events on companies' value. It seems difficult, but a measure can be easily developed by using event study. By using financial data in the market, the event study can measure the impact of specific events on companies' value. The use of it comes from the fact that given rationality in the market, the impact of the events will immediately reflect on stock prices. The measurement of the impacts of economic events uses stock prices observed in relatively short period. Yet, the direct impacts on productivities may require the same months or years of an observation.

The event study has many implementations on all fields. In the research of accounting and finance, the event study has been applied for varieties from big economic events and specific

companies. Examples of economic events and specific companies are merger and acquisition (M&A), earning disclosure, issuing new bonds and stocks, and an announcement of economic variables such as trade deficit. An example of event study used in the fields of law and economics is to measure the impact of environmental changes related to the set-up on companies' value (William Schwert, 1981) and in the case of legal debts, the event study is used to assess the damage (Mark Mitchell and Jeffry Netter, 1994).

Ray Ball and Philip Brown (1968) and Eugene Fama (1969) introduced information contents of earning disclosures, and Fama researched the impact of stock splits after removing the simultaneous impacts of an increase in dividends. The focus on this event-study research is to study abnormal returns during the announcements of oil prices.

The event-study research about the increase in oil prices in Indonesia has been done by some researchers. Ramadhan F.S. (2013) studied the effects of an increase in oil prices in 2013 on stock investments by using the event-study method in 12 automotive and component companies listed on Indonesia Stock Exchange. The result showed that the examination of abnormal stock returns and trading volume activities leads to a conclusion that the average abnormal returns during the days of a price increase describes a significant difference, but in the trading volume activities, there is no significant different. However, Suparsa, I Made Joni and Ratnadi, Ni made Dwi (2013) researched the abnormal returns of LQ45 stocks in IDX in relation to the announcement of an increase in oil prices in 2013. The result showed that there is no difference on trading volume activities and abnormal returns related to the announcement. Also, a research undertaken by Ningsih, E.R and Cahyaningdyah, Dwi (2014) showed that there is no significant different on abnormal stock returns before and after the announcement of an increase in oil prices on 22 June 2013, and there is a significant difference on average trading volume activities before and after the announcement.

The result of a study done by Astuti (2006) was that there is no difference on abnormal returns related to the announcement of an increase in oil prices in 2005. The result of a study done by Riskin (2008) showed that the announcement of an increase in oil prices in 2008 gives no effect on abnormal returns. Yet, a research undertaken by Paultje (2001) stated that market reactions before and after the event of an increase in oil prices causes a significant different on abnormal returns, but there is no significant effect on trading volume activities. The results of studies about abnormal returns during an increase of oil prices mentioned above are still different. Therefore, the influence of the announcement of an increase and a decrease in oil prices on stock returns is important to be examined.

This research examines and analyzes the existence of abnormal stock returns during the event of an increase and a decrease in oil prices in food, beverage and pharmacy companies in IDX, the different effect of the changes in oil prices on stock returns of food, beverage and pharmacy companies in IDX both before and after the announcement of an increase and a decrease in oil prices, the difference in stock returns of food, beverage and pharmacy companies in IDX before and after the announcement of an increase and a decrease in oil prices.

In this research, it is expected that the research can deliver information to companies' management in order to identify the impact of the announcement on their stock returns, so that it can be consideration in decision-making process, can help investors put investments in the right companies and being able to thoroughly see the prospect of companies' growth in the future, and can be a reference to do another research.

THE CRITICAL REVIEW

a. The Event Study

According to Fama (1991) the event study is a part of the efficient market hypothesis theory. The event study is a study to examine semi-strong market efficiency. Besides, there are also weak market efficiency and strong market efficiency.

The events that become the research focus can be classified into several types, as follows:

- Conventional Event
- Cluster Event
- Contingent Event
- Relevant and Series Event

b. Stock Return

According to Jogiyanto (2000), return is an output that is gained from investment. The investors' goal in making investments is to maximize returns without ignoring risks from investments. Return is one of factors that motivate investors to invest as well as a yield for the courage to take risks of investment. Return earned by investors in the market is classified into two types which are current income and capital gain/loss. Capital gain (loss) is a difference on profit (loss) experienced by shareholders because the current price of stocks is relatively higher (lower) than the previous price of stocks. (Tandelilin, 2001:41).

Return can be in the form of real return that is already realized or expected return that is not yet realized but expected to realized in the future. Real return is really important because it is used as one of firm's performance measurements and as a basis to determine expected return and risk in the future. Expected return is return which is used to make investment decision. (Jogiyanto, 2000:107).

c. Abnormal Stock Return

Information of an event is publised as an anouncement (Jogiyanto, 2009). Information is all good news inside or outside the capital market that is received by investors and is a matter that can be used as a basis or a reference to decision making. In this research, information that is used for the event is the published information, particularly regarding to the announcement of a decrease and an increase in oil prices. If the announcement of an increase in oil prices delivers information, it is said that the event has information content. Conversely, if the announcement of an increase in oil prices delivers no information, it is said that the event has no information content. According to Jogiyanto (2009), the event study is mostly used to examine market reaction to an event or an announcement. The event study is also called residual analysis or abnormal performance index test or market reaction test.

A model used to capture stock movement in this research is the market model which explains that return of a stock is influenced by market return, where the effect of market is equal to all stocks. The research is based on 10-day observation of the market during the event, which is 5 days before the event (t-1 to t-5) and 5 days after the event (t+1 to t+5).

The Methodology of Abnormal Return Calculation
   a. Calculating Abnormal Return Using Model 1 "Mean Adjusted Model"
   Formula:
   R_i Daily = P_t - P_{t-1} / P_{t-1}
   E(Ri) = Ri(estimation period)/ t
   Abnormal Return (RTN) = Ri - E(ri)
   b. Calculating Abnormal Return Using Model 2 "Market Model"
   There are two steps to calculate abnormal return using Market Model:
   1)   Forming expectation model using realized data over estimated period.
        Calculating return with estimated period. Estimated period has been
        determined before event-observed period. The research uses estimated period
        90 days before observed period, which is from July to October 2015. Estimated
        period takes 90 days because that range of time can be used to estimate market
        return before the event.
   2)   Using expectation model to estimate expected return during observed period
        (period before and after the oil price increase, which is t-5 to t+5).

   Formula to calculate:

   rm=$IHSG_t$ – $IHSG_{t-1}$ / $IHSG_{t-1}$
   Alpha can be taken from calculating intercept value of market return (rm) to stock
   return (ri), while Beta can be taken by defining the slope of market return (rm) to
   stock return (ri).

   c. Calculating abnormal return using Model 3 (Market Adjusted Model)
   Market adjusted model follows the concept that the best predictor to estimate return
   of a stock is a market return index at the moment by using estimated period to form
   estimation model because an estimated stock return is identical to a market return
   index.

   Market adjusted model formula:

   RTN = Ri-rm
   Description:
   RTN : Abnormal Return
   Ri   : Return of stock i
   rm   : Return of Market

Previous Studies and Hypothesis Construction
   a. Abnormal Return during The Announcement of A decrease and An Increase
      in Oil Prices.
         Paultje (2001) undertook a research and said that there is market reaction to the
   announcement of a decrease and an increase in oil prices with a significant difference
   on abnormal return.
         A Kuwornu's research (2012) stated that the macroeconomic variable, oil
   prices, can effect on market stock return in Ghana Stock Exchange in 1992-2008. The
   increase in oil prices declined stock return in Ghana in 1992-2008.

Theoretically, an information content of an event will effect on stock prices in capital market and then influence stock return. Based on that explanation, a hypothesis can be constructed as follows:

H1: There is abnormal return during the announcement of a decrease and an increase in oil prices.

1. There Is A Difference in Abnormal Return before and after An Increase and A Decrease in Oil Prices

Paultje (2001) did an event-study research about an increase in oil prices and said that there is market reaction before and after the event of an increase in oil prices with a quite significant difference in abnormal return

A Kuwornu's research (2012) stated that the macroeconomic variable, oil prices, can effect on market stock return in Ghana Stock Exchange in 1992-2008. The increase in oil prices declined stock return in Ghana in 1992-2008. However, in Indonesia, Arisyahidin (2012) researched about the impact of an increase in oil prices on stock investment in IDX. This research found that there is a negatively significant different in stock return before and after the announcement of an increase in oil prices but nothing change in trading volume activities.

Theoretically, an information content of an event will effect on stock prices in capital market and then influence stock return. Based on that explanation, a hypothesis can be constructed as follows:

H2 : therre is a difference in abnormal return before and after the announcement of an increase and a decrease in oil prices.

2. There is a difference on abnormal return between food and beverage companies and pharmacy companies before and after the announcement of an increase and a decrease in oil prices.

An increase in oil prices will effect on manufacture firms from the activity of transforming raw material into ready-to-sell goods. Manufacture firms require oil fuel. An increase in oil prices will increase production cost. So, this research selects manufacture firms in food and beverage sector and pharmacy sector. These two sectors consist of firms that mostly effect on people's primary needs which are food, beverage and medicine. The increase in oil prices will effect on primary needs of Indonesian people.

A Kuwornu's research (2012) stated that the macroeconomic variable, oil prices, can effect on market stock return in Ghana Stock Exchange in 1992-2008. The increase in oil prices declined stock return in Ghana in 1992-2008. However, in Indonesia, Arisyahidin (2012) researched about the impact of an increase in oil prices on stock investment in IDX. This research found that there is a negatively significant different in stock return before and after the announcement of an increase in oil prices but nothing change in trading volume activities.

Based on that explanation above, a hypothesis can be constructed as follows:

H3 : There is a difference on abnormal return between food and beverage companies and pharmacy companies before and after the announcement of an increase and a decrease in oil prices.

Research Methodology

a. Types of Research

This research is a quantitative research. A quantitative research (Sekaran, 2006 : 65) is a research whose formulation is in certain units or in numbers with using secondary data.

b. Sample and Population

The population in this research is food and beverage and pharmacy firms in Indonesia Stock Exchange in 2015. The sample selection in this research uses purposive sampling method which is (Sekaran, 2006 :136) a sample selection method by applying certain purposes with some criteria or certain quota.

Consumer-good industry consists of:
a. Food and Beverage
b. Tobacco Industry
c. Pharmacy
d. Cosmetics and household goods
e. Other sectors that are not classified

The sample criteria is as follows:

a. Food and beverage firms and pharmacy firms that are registered in IDX from 2009 to 2015.
b. Food and beverage firms and pharmacy firms in IDX which publish financial statement over the period of 2009-2015
c. Food and beverage firms and pharmacy firms that are actively trading in IDX over the period of 2009-2015

c. Data Collection Method

Data used in this research is secondary data (Sekaran, 2006 : 65). This is because the data is obtained not from the first party. The source of secondary data used in this research is stock price data and Jakarta Composite Index (JCI) from yahoofinance.com.

Observation time in this research is as follows:

The Oil Price Increase

The event period   : 7 October 2015 (The Presidential Decree of Indonesia about oil price increase)
The window Period   : 2 October 2015 (5 days before the event date)
                      12 October 2015 (5 days after the event date)
The Estimation Period : 7 July 2015 (90 days)

The Decrease in Oil Prices

The event date   : 14 October 2015 (The Presidential Decree of Indonesia about oil price decrease)
The window period   : 9 October 2015 (5 days before the event date)
                      19 October 2015 (5 days after the event date)
The estimation period: 7 July 2015 (90 days)

d. Variable Measurement and Operational Definition

The operational definition of each variable used in this research is as follows:

a. The announcement of an oil price increase is one of information types which exists in society and also spreads over Indonesia Stock Exchange as an external fundamental factor.
b. Abnormal return is the actual return surplus to expected return. The measurement uses percentage or decimal number.

e. Data Analysis Technique

Analysis technique used in this research is:

a. Determining the time period of the event which is when the announcement of an oil price increase issues.
b. Calculating abnormal return during the event period (some time before and after the announcement of an oil price increase)
c. The estimation period (T-n-e until T-n) is period that is used to forecast expected return during the event period)
d. The event period (T-n until T+n) is period during the event (T0) that is used to examine any change in abnormal return.
e. Calculating abnormal return during the event period (some time before and after the announcement).

Formula according to Tandelilin (2010573):

RTNit = Rit – E(Rit)

Description:
RTNit = Abnormal return of i stock at t period
Rit = Actual return of i stock at t period
E(Rit) = Expected return

Calculating Abnormal Return Using Model 2 "Market Model".

There are two steps to calculate abnormal return using Market Model:

1) Forming expectation model using realized data over estimated period. Calculating return with estimated period. Estimated period has been determined before event-observed period. The research uses estimated period 90 days before observed period, which is from July to October 2015. Estimated period takes 90 days because that range of time can be used to estimate market return before the event.
2) Using expectation model to estimate expected return during observed period (period before and after the oil price increase, which is t-5 to t+5).

Formula to calculate:

$rm = IHSG_t – IHSG_{t-1} / IHSG_{t-1}$

Alpha can be taken from calculating intercept value of market return (rm) to stock return (ri), while Beta can be taken by defining the slope of market return (rm) to stock return (ri).

Calculating Average Abnormal Return

The abnormal return test is not applied for each stock, but it will be done by examining average abnormal return of all stock using cross section for each day in the period of the event.

The formula of average abnormal return is as follows:

$$RRTN_t = \frac{RTN}{k}$$

Description :
$RRTN_t$ = average abnormal return on the day of t
RTN = abnormal stock return
k   = the number of stocks which is influenced by the announcement of the event
The abnormal return test uses t-test which examine that zero hypothesis states average abnormal return is equal to zero. The examination is done by calculating abnormal return of all sample stocks in the same day of the observation period.

Cumulative Abnormal Return

Some researches about event study using abnormal return or cumulative abnormal return (CAR) are the sum of abnormal return before the event for each stock. The formula is as follows:

$$ARTN = \sum RTNi$$

Description :
ARTN   : Cumulative abnormal return
RTN : abnormal return

If there are k units of stocks, cumulative average abnormal return (CAAR) can be computed with a formula as follows:

$$ARRTN = \frac{\sum ARTNi}{k}$$

Notes   :
ARRTN   : Cumulative average abnormal return
ARTN   : Cumulative abnormal return
K   : the total of stocks

f.   Data Analysis Method

This research aims to identify linear relation between variables, so it uses statistic method to analize it. The analysis method is quantitative method by using statistics.

1. **Hypothesis Test**
   Hypothesis test aims to know that hypothesis used in this research is accepted or rejected.

   t-paired Test
   T test is used to know how significant independent variables partiallty effect on dependent variables. Hypothesis test using t-paired test is done by some steps as follows:
   a.   Defining hypothesis as follows:
      1) Ho: $\mu1=\mu2$, there is no difference in firm performance before and after the announcement of an oil price increase.
      2) Hi: $\mu1\neq\mu2$, there is a difference in firm performance before and after the announcement of an oil price increase.
   b.   Using level of significance(α) 5%
   c.   The test rules are as follows:
      1) If the value of significance $< 0,05$, Ho is rejected or Hi is accepted, which means there is a significant different.
      2) If the value of significance $>0,05$, Ho is accepted or Hi is rejected, which means there is no significant different

Data Analysis
Based on data processing and calculation in the research method chapter before, it gives some data analysis results that answer the research problems. The data analysis results refer to this research. The purpose of the research is to get empirical evidences related to the effect of an oil price increase and decrease on the stock return of food and beverage firms and pharmacy firms listed on Indonesia Stock Exchange.
   a.   Research Sample Selection
   Sample used in this research is 17 food and beverage and pharmacy fimrs listed in Indonesia Stock Exchange (IDX). The period of observation is 90-day estimation, 11-day observation of an oil price increase and 11-day observation of an oil price decrease.

Consumer-good industry consists of:
- Food and Beverage
- Tobacco Industry
- Pharmacy
- Cosmetics and household goods
- Other sectors that are not classified

b. Data Description

The research observation is started from 90 days before the observation period (the window period) for estimation. Then, the time of observation is 5 days before and after the announcement of an oil price increase and decrease.

Table 4.1 Sample Selection

The total population of food and beverage firms and pharmacy firms in IDX	24
Food and beverage firms and pharmacy firms that are listed in IDX in the period of 2009-2015 but no trading activities	5
The total number after criterion 1	19
Food and beverage firms and pharmacy firms which are not publishing financial statements during 2009-2015	2
The total number after criterion 2	17

a. Abnormal Return Calculation
   1. Oil Price Increase

Table 4.2 Average abnormal return market model during the oil price increase

Date	Day -	RTN	RRTN	Description
12-Okt-15	5	0,0345	0,0020	Level of significance 1%
11-Okt-15	4	0,0000	0,0000	Level of significance 1%
10-Okt-15	3	0,0000	0,0000	Level of significance 1%
09-Okt-15	2	0,1665	0,0098	Level of significance 1%
08-Okt-15	1	-0,0281	-0,0017	Level of significance 1%
07-Okt-15	0	0,2420	0,0142	Level of significance 1%
06-Okt-	-1	0,0873	0,0051	Level of

15				significance 1%
05-Okt-15	-2	0,2199	0,0129	Level of significance 1%
04-Okt-15	-3	0,0000	0,0000	Level of significance 1%
03-Okt-15	-4	0,0000	0,0000	Level of significance 1%
02-Okt-15	-5	-0,1582	-0,0093	Level of significance 1%

Based on table 4.2, it can be seen that the value of RRTN D+2 to D+5 after the announcement of the oil price increase shows the value less than 5 %. It means that from D+2 to D+5, the market significantly respond to the announcement of the oil price increase. The significance value of abnormal stock return can be seen from the value of RRTN and ARRTN of food beverage and pharmacy firm stocks (Jogiyanto, 2009). On the D+1 after the announcement of the oil price increase, the market gives a significantly negative response. This can be seen from the value of RRTN D+1 which is at -0,0017. -0,0017 is less than 0,005, so it is significantly negative. There is abnormal stock return of food, beverage and pharmacy firms in the D+1 after the announcement of the oil price increase. The abnormal stock return of those firms has a negative value. This is because the increase in oil prices effects on food, beverage and pharmacy firms, so the stock value of those firms decreases.

In the D-1 of the announcement of the oil price increase, the value of RRTN is at 0,0051, so it is significant because it is less than 0,05. This means that the abnormal stock return of food, beverage and pharmacy has a positive value. The market still respond positively before the announcement of the oil price increase. In addition, a positive market response also occurs in the D-2 until D4 of the announcement of the oil price increase. The significance value of RRTN D-2 until D-4 for each one is less than 5%. The market respond significantly positive to food, beverage and pharmacy firm stocks before the announcement of the oil price increase. Yet, in the D-5 of the announcement of the oil price increase, the value of RRTN is at -0,0093 which is less than 0,05, so it is significantly negative. This shows that in the D-5 of the announcement of the oil price increase, the market respond significantly negative. This indicates that the market has already known the information about the announcement of the oil price increase before the time it is published., so the market gives a negative response. The sock price of food, beverage and pharmacy firms has negative abnormal return. The oil price brings an effect on food, beverage and pharmacy firms, so their stocks has negative abnormal return.

In the day of the announcement of the oil price increase, the value of RRTN is at 0,0142 which is less than 0,05, so it is significantly positive. The market has not given any response yet regarding to the announcement of the oil price increase. The market slowly responds to the announcement of the oil price increase, so the abnormal stock return of food, beverage and pharmacy firms still has a positive value.

2. The Oil Price Decrease
Table 4.3 Average Abnormal Return Market Model during The Oil Price Decrease

Date	Day to	SIGMA RTN	RRTN	Description
19-Okt-15	5	0,0480	0,00282505	Level of significance 1%

18-Okt-15	4	0,0000	0	Level of significance 1%
17-Okt-15	3	0,0000	0	Level of significance 1%
16-Okt-15	2	0,4790	0,02817501	Level of significance 1%
15-Okt-15	1	0,0000	0	Level of significance 1%
14-Okt-15	0	0,0128	0,00075571	Level of significance 1%
13-Okt-15	-1	-0,0891	-0,0052389	Level of significance 1%
12-Okt-15	-2	0,0337	0,0019802	Level of significance 1%
11-Okt-15	-3	0,0000	0	Level of significance 1%
10-Okt-15	-4	0,0000	0	Level of significance 1%
09-Okt-15	-5	0,1620	0,00952696	Level of significance 1%

Based on table 4.3, it can be identified that the RRTN value of food, beverage and pharmacy firm stock in the D+1 until D+5 of the announcement of the oil price decrease are less than 0,05 and positive. This means that the abnormal stock return of food, beverage and pharmacy firms in the D+1 until D+5 of the announcement of the oil price decrease is significantly positive. The market positively respond to the announcement of the oil price decrease.

The RRTN value of food, beverage and pharmacy firm stocks in the D-5 until D-2 of the announcement of the oil price decrease is less than 0,05 and positive. It means that the abnormal stock return of food, beverage and pharmacy firms in the D-5 until D-2 of the announcement of the oil price decrease is significantly positive. The market positively respond to the announcement of the oil price decrease. The announcement of the oil price decrease brings good news for food, beverage and pharmacy firms, so the value of their stocks has positive abnormal return. However, in the D-1 of the announcement of the oil price decrease, the value of RRTN is at -0,00523 which is less than 0,05, so it is significantly negative. The market still feels uncertain about the announcement of the oil prices issued by government. The market thinks that the government will announce again the oil price increase, so the market gives negative response. It indicates that there is no information leak about the oil price decrease.

The value of RRTN at the time of the announcement of the oil price decrease (D0) is at 0,0007 which is less than 0,05, so it is significantly positive. It shows that in the day of the announcement of the oil price decrease, the market gives positive response. In the day of the announcement, there is positive abnormal return. The market respond well to the announcement of the oil price decrease. The announcement of the oil price decrease brings positive effect on food, beverage and pharmacy firms, so the abnormal stock return of those firms has a positive value.

    ii.   Variance Test

        1. Variance Test of the Oil Price Increase

Table 4.4 Variance Test of Abnormal Return During The Oil Price Increase

Day to	ARRTN_Bef	ARRTN_Af	RRTN_Bef	RRTN_Af
5	0,002	0,0051	0,0345	0,0873
4	0	0,0129	0	0,2199
3	0	0	0	0
2	0,0098	0	0,1665	0
1	-0,0017	-0,0093	-0,0281	-0,1582

Table 4.4 shows that there is a difference on abnormal stock return of food, beverage and pharmacy firms both before and after the announcement of the oil price increase. In the D-1 or D+1, the abnormal stock return of food, beverage and pharmacy firms is significantly negative. The market responds negatively to the announcement of the oil price increase. The market quickly responds to the event. Yet, in the D-2 until D-5 or D+2 until D+5, the abnormal stock return of those firms is positive. The market responds positively to the announcement of the oil price increase. It is because the firms have gained great trust from the public. The firms will potentially give positive return to investors.

2. ANOVA Test of The Oil Price Decrease

Tabel 4.5 Variance Test of Abnormal Return during The Oil Price Decrease

Day to	ARRTN_Tur_Bef	ARRTN_Tur_Af	RRTN_Tur_Bef	RRTN_Tur_Af
5	0,048	-0,0891	0,00283	-0,00524
4	0	0,0337	0	0,00198
3	0	0	0	0
2	0,479	0	0,02818	0
1	0	0,162	0	0,00953

Table 4.5 shows that there is a difference on abnormal stock return of food, beverage and pharmacy firms both before and after the announcement of the oil price decrease. In the D-1 or D+1, the abnormal stock return of food, beverage and pharmacy firms is significantly positive. The market responds positively to the announcement of the oil price decrease. The market quickly responds to the event. Also, in the D-2 until D-4 or D+2 until D+4, the abnormal stock return of those firms is positive. The market responds positively to the announcement of the oil price decrease. The announcement of the oil price decrease brings positive effect on food, beverage and pharmacy firms, so the abnormal stock return of those firms has a positive value.

Tabel 4.6 Paired Samples Test

		Paired Differences							
					95% Confidence Interval of the Difference				
		Mean	Std. Deviation	Std. Error Mean	Lower	Upper	t	df	Sig. (2-tailed)
Pair 1	RRTN_Bef - RRTN_AFT	,00028000	,00907508	,00405850	-,01098819	,01154819	,069	4	,948
Pair 2	ARRTN_Bef - ARRTN_AFT	,00478000	,15465920	,06916570	-,18725476	,19681476	,069	4	,948
Pair 3	ARRTN_Tur_Bef - ARRTN_Tur_Af	,08408000	,24508665	,10960608	-,22023527	,38839527	,767	4	,486
Pair 4	RRTN_Tur_Bef - RRTN_Tur_AF	,00494637	,01441536	,00644674	-,01295266	,02284540	,767	4	,486

Table 4.6 shows that pair 1 RRTN before and after the announcement of the oil price increase has t value at 0,069. The value of t table for df (5-1) 2 tailed is 2,776. 0,069 is less than 2,776, so the hypothesis is accepted. There is a difference in the abnormal stock return of food, beverage and pharmacy firms before and after the announcement.

Pair 2 RRTN before and after the announcement of the oil price increase has t value at 0,069. The value of t table for df (5-1) 2 tailed is 2,776. 0,069 is less than 2,776, so the hypothesis is

accepted. There is a difference in the abnormal stock return of food, beverage and pharmacy firms before and after the announcement.

Pair 3 RRTN before and after the announcement of the oil price decrease has t value at 0,767. The value of t table for df (5-1) 2 tailed is 2,776. 0,767 is less than 2,776, so the hypothesis is accepted. There is a difference in the abnormal stock return of food, beverage and pharmacy firms before and after the announcement.

Pair 4 RRTN before and after the announcement of the oil price decrease has t value at 0,767. The value of t table for df (5-1) 2 tailed is 2,776. 0,767 is less than 2,776, so the hypothesis is accepted. There is a difference in the abnormal stock return of food, beverage and pharmacy firms before and after the announcement.

Analysis and Discussion

There is abnormal stock return of food, beverage and pharmacy firms in IDX during the event of the oil price increase or decrease. Hypothesis 1 is accepted. This result supports the reserach of Paultje's (2001), Arisyahidin (2012), Kuwornu (2012), and Herisiswanto, Agus Tri and Fitria, Astri (2014).

There is a difference in the effect of the oil price increase and decrease on stock return of food, beverage, and pharmacy firms in IDX before and after the announcement of the oil price increase and decrease. Hypothesis 2 is accepted. This result supports the research done by Paultje (2001), Arisyahidin (2012), dan Kuwornu (2012).

There is a difference in the stock return of food, beverage and pharmacy firms in IDX before and after the announcement of the oil price increase and decrease. Hypothesis 3 is accepted. This result supports the research done by Kuwornu (2012), which stated that the oil price can effect on stock return.

Conclusion and Recommendation
Conclusion

1. There is significant results based on the value of RRTN and ARRTN of food, beverage and pharmacy firm stocks in IDX before and after the announcement of the oil price increase and decrease. There is abnormal stock return of food, beverage and pharmacy firms in IDX at the event of the oil price increase and decrease. Hypothesis 1 is accepted. This result supports the reserach of Paultje's (2001), Arisyahidin (2012), Kuwornu (2012), and Herisiswanto, Agus Tri and Fitria, Astri (2014).

2. T-test shows that the value of the calculated t < t table, so there is a difference in the abnormal stock return of food, beverage and pharmacy firms in IDX. There is a difference in the effect of the oil price increase and decrease on stock return of food, beverage, and pharmacy firms in IDX before and after the announcement of the oil price increase and decrease. Hypothesis 2 is accepted. This result supports the research done by Paultje (2001), Arisyahidin (2012), dan Kuwornu (2012).

3. T-test shows that the value of the calculated t < t table, so the abnormal return of two variables before and after the oil price increase is different. There is a difference in the stock return of food, beverage and pharmacy firms in IDX before and after the announcement of the oil price increase and decrease. Hypothesis 3 is accepted. This result supports the research done by Kuwornu (2012), which stated that the oil price can effect on stock return.

Recommendation

1. Investors should be careful to absorb the information shared in the market. It is to avoid any mistake in decision making process which will effect on the stock price in the market.
2. Investors should not feel panic about the information in the market, primarily one that relates to government policy. The firms in IDX are firms which have good reputation, so they can quickly deal with the government policy.

EMPIRICAL STUDY ON PROBLEMS FACED BY FARMERS UNDER CONTRACT FARMING IN PUNJAB

Harpreet Singh, Punjabi University, India
Amanpreet Singh, Punjabi University, India

Abstract

Contract farming is a process where the buyer and seller know each other, in other words seller sells its produce to the known buyer. Nowadays it is one of the most important strategic decision domains to match demand with supply. In this paper an attempt has been made to know the contract farming problems faced by farmers. A survey was conducted based on a structured questionnaire developed with the help of consultants and practitioners in this field. The data were digitized on SPSS sheet and factor analysis was done using Principal Component analysis of 497 farmer responses with stratified sampling. The results of the study reveal the problems faced by the as relating to the purchase, Inputs to crops, Agency, Facility, Credit and Processing. The findings of the study shall help the policy maker to understand the farmers' problems and developing strategies and policies for their betterment.

Keywords: *Contract Farming, Farming Problems, Punjab Farmers, Factor Analysis, PAFC.*

Introduction

Punjab "*The land of five rivers*" is well known for its rich culture, heritage and fertile land with all over the world. Punjab produces almost 14% of the total cereals produced in the country. Punjab has earned the title of "*Granary of India*" or "*food basket of India*" (NABARD, SFP, 2015-16).

In the present day situation, it has been seen that due to the rotated cropping pattern of wheat and paddy has pushed the Punjab farmers in the dark days. It has led social, environmental and economic growth related problems in the Punjab. It has been realized that under the present condition due to the rising cost of production, production growth has become very challengeable. Over exploitation of water and land has been observed and now either stagnant or declining growth in the production of important crops has been seen (Sidhu and Johal 2002). Fall in the income of farmers, rising costs, declining ground water table, environment pollution and soil degradation have led discontent among farmers, which is putting the pressure on state government to take some serious steps to find the suitable solution of this problem.

To look after this problem, the state government has constituted and expert committee under the chairmanship of *S.S. Johal* in 1986, which is popularly known as the *Johal committee*. This committee recommended that the 20 percent of the cropped area under wheat and paddy should be replaced with the area for the production of some fruits, vegetables and some other cash crops. After a sixteen year again in 2002, this committee recommended that 1 million hectares of area under wheat and paddy must be replaced by the production of those crops, consuming less water and which are suitable ecologically and are in high demand in the country. Working on the Johal committee recommendations, the Government of Punjab, visualized contract farming as a means to achieve the objectives of sustainable agriculture.

Contract farming is a system where technical know-how, raw material such as seeds, pesticides, etc. and suitable marketing channel is provided to the farmers. In 2002, the State

Government launched a multi-crops, multi-year scheme. PAFC was designated as a nodal agency for the smooth working of contract farming system in the state. Apart from PAFC, there are also many local and multinational companies which are in this business directly with the farmers in the state for e.g. Pepsi is procuring Basmati and chilly from the farmers of Punjab under contract farming.

No doubt contract farming is playing an important role in state agriculture reforms, but still a number of problems are there reported by the farmers. Even number of studies are also indicating towards the problems as It has been discussed in many studies that the farmers which are engaged in contract farming, firms provide them *poor extension services, overprice their services*, pass on the risk to the producers, offer low price for the produce, delay payment, and *do not explain the pricing methods has* been discussed by Gorsh (1994), Glover and Kusterer (1990). The major problem that contract growers are facing developing countries are different contract for different class of farmers , *manipulation of quality related inspection standards*, burdens of costs due to any calamity put on producers only, *late payments*, out-right cheating in accounts, monopoly behavior of the companies and indebted to the companies. Has also been discussed by Glover (1987), Singh(2000), Eaton and Shepherd,(2001)in their studies on contract growers.

This study has been conducted in the four districts namely *Amritsar, Jalandhar, Hoshiarpur and Sangrur* of Punjab state, has reported the various constraints faced by the contract farmers. Lack of technical know-how, manipulated terms of the contract, unwanted quality cuts on crop produce, delayed payment for the produce, lack of credit for crop produce, low price for the produced crop etc. has been observed as the major constraints under contract farming.

Review of Studies on Contract Farming

It is universally acknowledged fact that good research cannot be made without critically studying what already exists in relationship to it in the form of general literature and specific work done by researchers. So the review of related literature can be considered as a prerequisite to actual planning and execution of research work. Hence, for proper understanding of the research work sincere efforts have been made to review of the related literature. In the present paper due attempt has been made to summarize the results of the studies undertaken by the various researchers on the different aspects of Contract Farming.

Contract farming is the emerging concept among the farmers of Punjab. As has already been observed by the state Government that crop diversification is the need of the day for agriculture and environment sustainability and contract farming is the only way to get rid of the monoculture of wheat and paddy as has been recommended by Johal Committee, But still somewhere gap lies between the understanding of farmers and the contract companies which needs to be sorted out for the smooth working of this concept. In the present section attempt has been made to study the literature concerned with the problems faced by the farmers under contract farming in Punjab.

Variables	*Researchers*
1. V5 Degradation of fertility of soil	Singh(2002), Rangi and Sidhu(2000)
2. V4 Heavy use of Pesticides (Pest attack on crop)	Sukhpal Singh(2002), Rangi and Sidhu(2000), FAO(2006)
3. V3 Shortage of Labor at Peak season	NSSO, (2015),(FICCI, 2015)
4. V16 Lack of quality inputs	Dev(2005),Srivastva and Seetharaman(1989)
5. V19 Delay in arranging inputs	Srivastva and Seetharaman(1989)
6. V22 Delay in procurement of produce	S.S. Kalamkar (2012),Bijman,(2008),Parmod Kumar,(2007)
7. V2 Non-remunerative price for the crop under CF	Arun Kumar(2002),Shiva Kumar Gupta(2002)
8. V10 Lack of transparency in price determination	Gorsh,(1994), Glover and Kusterer,(1990), Arun Kumar(2002),
9. V20 Delayed payment for crop produce	Sukhpal Singh(2002), Arun Kumar(2002)
10. V1 Less bargaining power of farmers	Warning and Key(2002), Rangi and Sidhu(2000),Kirsten and Sartorius(2002),Birthal(2008), Singh(2005)
11. V15 Difficulty in meeting quality requirements	Banarjee et. al(2002), AsokGulati(2006), Dev and Rao(2005)
12. V14 Faulty grading by an agency	Arun Kumar(2002)

by Companies.

a.   Summary of Variables Regarding Problems Faced by The Farmers Under Contract Farming

Since the contract farming concept is still on the growth stage in Punjab. In the study of contract farming in tomato in Haryana, (Dileep et. al 2002) observed that the contract farming firms were biased towards large number of farmers while selecting the farmers for contract farming as the firms were giving preference to the big farmers as compared to the small and marginal farmers. He suggested that the contracting firms should be made legally obligatory on the part of contract farmers (Singh 2002) identified that series of problems associated with the contract vegetables production in Punjab. He observed violation of the terms of the agreements social differentiation and environmental sustainability and imbalance of power between farmers and firms. (Warning et. al.2002) in his study

explained that contract farming makes the farmers over dependent on contract crops, which leads to loss of bargaining power of the farmers. Singh sukhpal (2002)and Rangi et.al.(2002), revealed in their studies on contract farming that there was *no compensation* to the farmers on *crop quality failure due to natural calamity* in Punjab and Haryana. He also observed that *undue quality cut and pest attack on the crop*, delayed deliveries at the factory and *low price of the produce* by the firms has been seen. The small farmers' involvement in agricultural value chain is very limited (Barrett et. al 2011).High involvement of farmers in contract farming leads to less of autonomy, i.e. farmers fell exploited and dependent on the firms (Kirsten et. al 2002). The most negative effect on contract farming is, the terms of the contract are imposed forcefully on the small and marginal farmers (Poulton et. al 2008).

Decreasing the bargaining power of the small farmers can be considered as the most important problem of the farmers (Birthal 2008). V*ague terms and conditions of the contract* among farmers is the main cause of dispute among companies and farmers (Arun Pandit et. al 2009). Cost access to irrigated water*, lack of extension services* for commercial crops and exploitation of the farmers in the marketing of their produce, *costly and inadequate institutional credit*, *low quality input supply* are the main problems among small and marginal farmers in India (FAO 2006). The overexploitation of ground water, salination of soils, *decline in soil fertility* and pollution are the examples of environmental degradation due to contract farming has been discussed by Siddiqui (1998), Rickson and Burch (1996), USAID,(1994) in their studies on contract farming. S.S. Kalamkar (2012) analyzed in his paper broiler farming management and inputs provisions under contract and non-contract farming. He observed that most of the contracts are two or three years of duration and very few are of seven months duration. He also found that the average net income, per kg, is higher in non contract than that of contract farming. It is observed that none of the contract farmer possesses the copy of the contract.

Delay in supply of inputs, delay in payment, delay in produce lifting, low price of the produce and sometime even rejection of the produce on quality ground are the main problems faced by farmers under contract farming. Apart this high visiting charges, delay in providing checks and high deduction of tax at the source has also been reported by some farmers. Parmod Kumar (2007) and Nivedita Sharma et.al (2013) analyzed in his study on contract farming that the contract in most of the cases was written, but *without any legal obligations* both, on the part of firms as well as farmers. Only in the case of Chambal Agro-tech, all the farmers conformed that the company provided them a copy of the contract. Further, only in their case, the contract was formally done on a 'Stamp Paper' that is considered to be a legal document. The *medium of the written contract was mostly in English* that was *beyond the understanding of the local farmers*. Only in a few cases, the contract was written in the local language, i.e., Punjabi. It has also been found by Collins (1993) that at the time of surplus produce companies quits the agreements and do not compensate to the farmers for the losses due to

any natural calamities. Wilson, (1986) says that the terms of the contract are usually anti farmers, the market choices are limited and contracting tends to reinforce itself.

Glover and Ghee (1992),Burch (1996) discussed in their studies that the agribusiness firms also tend to practice *"Agribuness Normalization"* over time which mean they reduce the prices and other benefits offered to the farmers with which they commence operations, when the procurement base is created and there are enough farmers to procure from. The contracting firms tend to aggravate the environmental crisis as most of the contracts are short term(one or two crop cycles) and the firms tend to move on to a new grower and lands *after exhausting the natural potential of the local resources*, particularly land and water, or productivity declines due to some other reason shared by Morvaridi(1995), and Torres,(1997) in their research papers. Srivastava and Seetharaman (1989) discussed while providing an overview of agro-processing industries in their study suggested that backward linkage is the key element for success of fruit processing units. They observed that larger processing units often faced the problems of severe under utilization of capacity due to *inadequate and unsuitable supply of raw materials*. They concluded that the *uncertainty in supply* was the major reason for private processing units to forge backward linkage with the farmers for ensuring supplies. Porter and Phillips-Howard (1997) found that most of the negative effects of contract farming resulting from the fact that the relationship between individual farmers and the contractor is uneven, the latter often in a position to exercise power and non-competitive conduct in imposing the terms of the contract and same has been revealed in his study on contract farming by Poulton et al. (1998).

Dev (2005) observed the major problems of small and marginal farmers in India include *spurious input supply, inadequate and costly institutional credit*, lack of irrigation water and costly access to it, *lack of extension services* for commercial crops, exploited in the marketing of their produce, high health expenditures, and lack of alternative (non-farm) sources of income. Arunkumar (2002) opined that major problems faced by the contract farmers were *low contract price* and *irregular payments*. The other problems faced were unaware of potentiality of crops, *poor technical assistance*, manipulation of norms by firms and *higher rejection rate*. He also opined that major problems faced by contract firms were land constraints and fixing of contract price. The other problems were farmers' discontent and holding up of vehicles. The contract farmers try to put a lower grade into higher grade and it was difficult to check and make sure of the grade as quantity handled surely fall under desired category was more. Farmers held up vehicles in the villages demanding that they should be paid higher prices even though the agreement does not say so. (FICCI, 2015) in their report on labor shortage identified, that however in reality, the magnitude and pace of the shift away from agriculture have been substantial as has been evidenced here. It also has begun to make an impact as the *shortage in agricultural labor is currently not being compensated* by adequate measures to reduce the overall labor intensity of the sector. As a result, the primary sector in many Indian states is experiencing a severe labor shortage and escalation in farm wages which are adversely impacting the profitability of the farmer.

NSSO(2015) - National Sample Survey Office's periodic surveys revealed that India's agriculture labor market is in a state of continuous outflow.

The 34 million workers left the agriculture sector between 2004-05 and 2011-12. This is the first time in India's living memory that the sector is reporting a decline in labor participation (see 'India's labor crisis'). It is a worrying situation because agriculture still employs close to half of India's workforce and accounts for 64 per cent of rural employment. The dip in the agricultural labor force has been acute in India's key grain-producing states like Uttar Pradesh and Madhya Pradesh. To make matters worse, the *labor shortage* is impacting the country's five staple crops: rice, wheat, sugarcane, groundnut and cotton. Such is the impact of the shortage that laborers are now earning more than the farmers. It is a simple play out of the

change in Indian economy where people have better-paying livelihood alternatives in non-farm sectors such as construction and service sectors.

Research Methodology

To study the problems faced by the farmers under contract farming in Punjab, stratified sampling technique has been used to collect the data from the farmers. The data has been collected from the farmers of *Amritsar, Hoshiarpur, Jalandhar and Sangrur* district of Punjab as these are the main districts where farmers are engaged in contract farming to a large extent. The findings of the study are based on 497 farmers, selected from the above mentioned districts of Punjab. These farmers are having the experience of both contract farming and non-contract farming.

The farmers were selected from these districts, have been divided into four categories:

1. Small and semi-medium farmers with operational holding between 1 to 4 ha.
2. Medium farmers with operational holding between4 to 10 ha.
3. Large farmers with operational holding above 10 ha.

Source: Vijay Paul Sharma (2007)

To get the response of the farmers (Respondents), 2 Block/ Tehsil/ Taluks were selected from each district mentioned above and four villages from each taluk were selected to get the data from the farmers. Sarpanch of each village was contacted to get the information for the farmers which are engaged in contract farming. Hence 32 villages were covered to get the data from the respondents, and a total of 544 survey questionnaire had been sent out to which only 497 have been included in the main study. After due screening and error checking, it was found that remaining 47 questionnaire were not suitable as 20 questionnaires were not received back from the respondents, though phone calls were made, but they did not give any positive response and remaining questionnaire had blank answers (less than 25% of the questions).

After carrying out screening process 497 responses were considered valid for data analysis. This represents a success rate of 91.36%, which is considered to be good in view of time and cost.

Analysis

The factor analysis technique applied to the problems faced by the farmers under contract farming in Punjab, revealed specific factors, which clearly define the problems faced by the respondents (farmers). Six factors extracted from the 25 variables explained the 67.31% of variance and each factor was defined by at least three scale items. These specific extracted factors were unfair purchase practices, spurious quality of inputs, passive role of agency, lack of compensation, insufficient credit, and ineffective regulatory framework. All the problems related to the contract farming have been explained through these six factors, which were considered to be significant by the respondents.

Scale Development and Refinement
Table 2: Scale Reliability Analysis (Contract farming Problems among Farmers)

Variables	Extraction	Initial	Corrected Item-to-Total Correl.	Mean	Standard Deviation

V1 Less bargaining power of farmers	1.000	.566	-.510	19.960	.69269
V2 Non-remunerative price for the crop under CF	1.000	.667	.523	19.235	.66462
V3 Shortage of Labor at peak season	1.000	.695	.665	20.060	.75266
V4 Heavy use of Pesticides(Pest Attack)	1.000	.714	.511	19.235	.71996
V5 Degradation of fertility of soil	1.000	.763	.512	18.954	.74401
V6 Lack of technical know-how by the firms.	1.000	.710	.527	18.370	.85170
V7 No compensation of loss in case of natural calamities.	1.000	.788	.525	19.899	.73087
V8 *Preference to big farmers with High Investment in agriculture*	1.000	.734	.393	19.276	.74514
V9 Limited Access to credit for small farmers	1.000	.726	.508	20.744	.79596
V10 Lack of transparency in price determination	1.000	.620	.590	19.477	.72212
V11 No free extension services by the firm.	1.000	.709	.546	19.235	.78171
V12 Violation of the terms of the contract by Companies.	1.000	.654	.574	18.410	.85247
V13 Lack of credit to buy inputs for crop production	1.000	.629	.586	21.187	.77511
V14 Faulty grading by an agency	1.000	.745	.584	20.060	.73641
V15 Difficulty in meeting quality requirements	1.000	.761	.540	18.793	.68503
V16 Lack of quality inputs	1.000	.668	.681	19.577	.69866
V17 Provision of inputs at higher rate	1.000	.563	.503	18.652	.83276
V18 Poor service delivery by firms	1.000	.630	.550	18.833	.72015
V19 Delay in arranging inputs	1.000	.517	.585	19.235	.74202
V20 Delayed payment for crop produce	1.000	.640	.505	20.342	.65749
V21 No compensation if Market Price goes higher than the contract price of the crop produce	1.000	.540	.581	21.650	.83819
V22 Delay in procurement of produce	1.000	.678	.889	20.020	.69415
V23 Contract is written in English, which is difficult to understand	1.000	.756	.614	20.241	.78508
V24 Lack of Government control	1.000	.715	.641	21.489	.82181
V25 Cheating by an agency	1.000	.641	.548	20.905	.73359

A scale was developed to identify the factors revealed the problems faced by the farmers under contract farming. The literature for the same was reviewed as shown in literature survey and variable were selected to define the problems faced by the respondents. During the discussion with experts in the field of contract farming many items were deleted and added. The final 25 items were selected for survey and these items were rated on three points Likert scale by the respondents. Item wise reliability analysis was performed on selected variables to retain and delete scale items for developing a reliable scale. The scale so generated to achieve the objective was refined for reliability, validity and undimentionality. To know the extent to which items were correlated with a set of items under consideration, Cronbach alpha statistics and Inter item correlation were employed.

Factor Analysis
In order to reduce the data Exploratory Factor Analysis (EFA) was conducted to see if the face validity of items holds (Pallant, 2011). The item of the attitude scale was subject to principal component analysis (PCA) using SPSS. Prior to performing PCA the suitability of data for factor analysis was assessed. The correlation matrix revealed many coefficients of 0.3 and above as shown in Table 3. The Kaiser-Meyer-Olkin (KMO) measure was 0.835 exceeding the recommended value of 0.6 (Tabachnick and Fidell, 1996; and Kaiser,1974) and the Barlett's Test of Sphericity (Barlett, 1954) reached statistical significance, supporting the factorability of the correlation matrix. PCA revealed the presence of six components with Eigen value exceeding 1, explaining 67.311% of the variance. The variance explained by each factor is shown in Table 5. The value of communalities using principal component analysis ranged from .517 to 0.788 (Table2) Here it is pertinent to mention that communalities >0.5 is sufficient for explaining the constructs (Hair et. al 2009). All those values show factor analysis has extracted good quantity of variance in the items. Hence all the requirements of reliability, validity and undimensionality are met.

Pearson Correlation Analysis
Correlation was used to measure the degree of relationship between 25 main independent variables of contract farming, in order to measure whether the 25 variables were independent from each other. If a correlation coefficient r indicates 0 to 0.2, there is a weak correlation among variables. If 'r' is between 0.3 to 0.6 it is considered moderate. A correlation coefficient value of and 0.7 to 1 is strong (Dancey and Reidy, 2007).

V24	-.108	-.004	-.105	.099	.010	.326	.196	.264	.162	.184	.325	.272	.237	.279	.201	.136	.298	.272	.197	.123	.233	.106	.529	.601	1.000

Inter-item correlation: Mean=1.975, Minimum=1.837, Maximum=2.165, Range=.328, Max / Min=1.179, Variance=.009, N=25

According to the scale used if all the 25 items get a rating of 3 each, the score would be 75. The mean score of the respondents was 49.384 (TABLE 4). The correlation matrix was computed as shown in Table 4. The mean correlation was 1.975 and it varies from 1.837 to 2.165 with a range .328. There was a sufficient correlation to go ahead with the factor analysis.

Table 4: Factor Analysis of Problems Faced by farmers under CF (Varimax-Rotated Results and Scale Reliability)

	Unfair Purchase Practices	Spurious quality of Inputs	Passive role of Agency	Lack of Compensa-tion	Insufficient Credit	Ineffective Regulatory Framework

Cronbach's Alpha =.852, Kaiser-Meyer-Olkin Measure of Sampling Adequacy =.835, Bartlett's Test of Sphericity (Approx.Chi-Square=5.940, Df=300, Sig=0.000, Mean= 49.384

Extraction of Factors
Exploratory Factor Analysis (EFA) was employed to identify the underlying dimensions of contract farming. The respondents were asked to rate the twenty five variables at three points Likert scale, ranging from Never to Always. All the factors having loading more than 0.5 were considered good and in the present concern the loading ranged from .640 to .856.Items with factor loading less than 0.5 were removed. The six factors, so generated have Eigen values ranging from 1.423 to 6.249. The factor analysis results are validated as shown in Table 4.

Factor One: (Unfair Purchase Practices)-Five variables have been loaded in factor one and this factor alone explains 24.998% of the total variance. The variables which have been included in this factor are *(V2) Non-remunerative price for the crop under CF, (V10) Lack of transparency in price determination, (V1) Less bargaining power of farmers, (V22) Delayed payment for crop produce.* The farmers considered that the contract farming is not meeting expectations of them as the price offered to them is not up to the level they put the efforts to produce the crop. Lack of transparency in price determination is the problem under contract farming; companies do not disclose the method of price fixing of their produce. Farmers even can't force the companies to pay the market price or prevailing price for their produce because of the dominating attitude of the companies. Delayed payment for the produce is another demotivation factor to maintain long term relations with the companies. Companies should make ensure that there should be the timely procurement of the produced crop at a remunerative price, on a stipulated time, so that farmers can be motivated to remain in the contract with the companies in the long run. The factor loading ranges from.640 to .852 and the scale reliability alpha of this factor is .868. Non-remunerative price for the crop under CF has the highest loading under this factor. The inter-item correlation ranges from 0.427 to 0.685 and item to total correlation ranges from 0.581 to .685. It covers 6.249 of the Eigen values.

Factor Two: (Spurious Quality of Inputs)-Factor two explains 12.726% of the total variance and five variables, namely*, (V19) Delay in arranging inputs, (V4) Heavy use of pesticides (Pest attack on crops), (V16) Lack of quality inputs,(V3) Shortage of labor at peak season , (V5) Degradation of the fertility of soil* have been included in this factor. The result indicates that the major problem reported by the farmers is of delay in arranging inputs on time, which leads to the mismatching of seasons to cultivate the crop. Heavy use of pesticides and insecticides is another problems faced by the farmers which is responsible in the infertility of soil in THE long run. Lack of good quality seeds, pesticides, etc. is observed by the farmers under contract growing. One of the major problems reported by the respondents is a shortage of labor during peak season of crop cultivation which causes them heavy cost. In order to maintain the long relationship with the farmers companies should provide the farmers with sufficient quantity and quality of seeds and other inputs on stipulated time so that the delayed cultivation can be avoided. The factor loading ranges from 0.776 to .816. The inter-item

correlation ranges from 0.430 to 0.673 and item to total correlation ranges from 0.628 to 0.694. It covers 3.182 of the Eigen values.

Factor Three: (Passive Role of Agency)-third factor is labeled as "Passive Role of Agency". An agency is one sort of middlemen or representative of the company, which maintain the direct link with the farmers on behalf of the company. Four variables such as *(V15) Difficulty in meeting quality requirements, (V14) Faulty grading by an agency, (V25) Cheating by an agency, (V18) Poor service delivery by firms have been included*. It has been reported by the farmers that the quality parameters set by the agency are very difficult to meet. Despite the due care and instructions provided by the agency, it's still very difficult to meet the quality standards set by the agency. Most of the time it has been observed by the farmers that agency rejects the crop even if there is a very minor quality gap in the crop produce, when the same crop is available in the open market at less price. Hence farmers are cheated by the agency. Some farmers also reported that company representative do not come for inspection of the crop on the regular basis which leads to delay in taking action in quality improvement of the cultivated crop under contract. Factor three explains 9.010%of the total variance. The factor loading ranges from 0.837 to 0.776 and it covers 2.253 of the Eigenvalues. The inter-item correlation of this factor ranges from 0.516 to 0.757 and item to total correlation ranges from 0.728 to 0.755.

Factor Four: (Lack of Compensation)-the fourth factor has been labeled as "Lack of Compensation". The four variables, namely, *(V7) No compensation of loss in case of natural calamities, (V6) Lack of technical know-how by the firms, (V11) No free extension services by the firm, (V21) No compensation if Market Price goes higher than the contract price of the crop produce* have been included and this factor explains 7.922% of the total variance. Under this factor, it has been observed that the farmers also facing the problems related to the facilities offered by the company as it has been reported by the farmers that no compensation offered by the company if the crop gets spoiled due to any natural calamity such as flood, fire or heavy rain. Companies even do not provide technical know-how free of cost at village level. Farmers feel themselves deprived if the market price of the produced crop gets higher than the contract price and the company in such case offers no compensation. Companies should follow the fair price policy and due compensation should be granted to the farmers as they have no other source of income except agriculture. The factor loading ranges from 0.856 to 0.671 and this factor covers 1.980 of the Eigen values. The inter-item correlation ranges from 0.456 to 0.669 and item to the total correlation range is from .589 to .654.

Factor Five :(Insufficient Credit) - the fifth factor has been labeled as "Insufficient Credit". Four variables like, *(V8) Preference to big farmers with High Investment in agriculture, (V9) Limited Access to credit for small farmers, (V13) Lack of credit to buy inputs for crop production, (V17) Provision of inputs at higher rates.* Small and medium sized farmers have reported that they are also facing severe problem of limited access to credit as compared to big farmers. Big farmers are having their own sufficient funds to invest in agriculture equipment, so they are not bothered about credit offered by the companies. Many farmers reported that credit offered by the companies is not sufficient for farmers to buy inputs as well as equipment or some other things for farming and if that is offered, huge amount is charged at the time of repayment of that credit (loan). Apart from this, it has also been reported that huge formalities are performed to take the advances from the companies. So they reported that contract farming is the game of big farmers, that is beyond the approach of small and marginal farmers. This factor explains 6.963% of the total variance and factor loading ranges from 0.683 to 0.835 with a Eigen value 1.741. The inter-item correlation range of this factor is from 0.387 to 0.638 and item to total correlation ranges from 0.552 to 0.700.

*Factor Six: (Ineffective Regulatory Framework) - s*ixth and the last factor of *"Problems faced by farmers under Contract farming in Punjab"* has been labeled as *"Ineffective Regulatory Framework"*. Three variables, namely, *(V23) Contract is written in English, which is difficult to understand, (V24) Lack of Government control, (V12) Violation of the terms of the contract by the companies.* Under this factor, it has been reported by the farmers that the contract is written in English, which seems difficult for the farmers to understand and along this it has also been discussed by the farmers that companies do not obey the terms of the contract due to lack of Government intervention which motivates the companies to manipulate the terms of the contract in their favor and farmers feel deprived and cheated by the companies in the lack of proper implementation the contract Act. Government should clearly instruct the companies to strictly follow the terms and conditions of the contract so that any sort of dispute may not arise at later stage and maximum number of farmers can be motivated towards the campaign of crop diversification to improve the economic condition of the farmers. This factor explains 5.691% of the total variance and the factor loading of variables ranges from 0.743 to 0.817. This factor covers 1.423 of the Eigen values. The inter-item correlation of this factor ranges from 0.529 to 0.623 and item to total correlations range is from 0.623 to 0.643.

Table 5: Summary Table

Factors	No of Items	AVE*	Items
Unfair Purchase Practices	5	0.60	V2,V10,V1,V20, V22.
Spurious Quality of Inputs	5	0.61	V19, V4, V16, V3, V5.
Passive role of Agency	4	0.64	V14,V15,V18,V25,
Lack of Compensation	4	0.62	V7, V6, V21, V11.
Insufficient credit	4	0.60	V13, V8, V9, V17.
Ineffective Regulatory Framework	3	0.62	V12, V23, V24.

*Average variance explained.

Table 6 shows that average variance explained(AVE) by each construct is >0.50 which is suitable to validate the factors.

Validation of Result of Factor Analysis

Taking table 6 into account an attempt has been made to validate the factor analysis results by calculating "correlation between the summated scales" and "Correlation between representatives of factors and the summated scales"

Table 6: Validation of Factor Analysis Results for Contract Farming:
Table 6 (a) Correlation between the summated scales (Discriminant validity) constructs are distinct.

Factors	Unfair Purhase Practices	Spurious Quality of Inputs	Passive role of Agency	Lack of Compensa tion	Insufficien t credit	Ineffective Regulatory Framewor k
Unfair Purchase Practices	1					
Spurious Quality of Inputs	.36	1				
Passive role Of Agency	.39	.24	1			
Lack of Compensation	.37	.29	.35	1		
Insufficient Credit	.31	.30	.37	.25	1	
Ineffective Regulatory Framework	.42	.16	.43	.44	.34	1

Table 6(a) shows that the correlation among factors is <.50 which shows that factors are distinct from each other.

Table 6 (b): Correlation among factors and leading loading variables of Problems faced by farmers under contract farming

Factors Variables	Unfair Purchase Practices	Spurious Quality of Inputs	Passive role of Agency	Lack of Compensat ion	Insufficient credit	Ineffective Regulatory Framewor k
V2 Non-remunerative price for the crop under CF	.908**	.084	.566**	.583**	.563**	.237**
V19 Delay in arranging inputs	.295**	.732**	.264**	.353**	.263**	.078
V14 Faulty grading by	.501**	.031	.903**	.492**	.424**	.255**

an agency					
V7 No compensati on of loss in case of natural calamities.	.506**	.116**	.507**	.902**	.485**	.282**
V13 Lack of credit to buy inputs for crop production	.564**	.033	.548**	.587**	.889**	.160**
V12 Violation of terms of the contract by <u>Companies</u>	.352**	.076	.392**	.370**	.277**	.847**

** 0.01 Level of significance

Convergent Validity
The correlation among the summated factor scales and their leading loading variables is shown in Table 6(b). The result shows that factor unfair purchase practices' has the highest correlation with its most loading variables(v2), i.e. 0.908 at 0.01 level of significance. However, the comparative loading of this factor is very low with the other variables of the other factors, Hence it validates factor analysis results as loading values are greater than 0.50 (Hair et. al. 2009).

Limitations and Further Research Directions for Study
\As we think this is the first ever research conduct only on the farmers of Punjab, so it sets the groundwork for the further research. "*Multistage Stratified Sampling Technique*" has been used to collect the data from villages of only four districts of Punjab. The area of study can be extended to cover the other districts of Punjab. Second the sample size of collected data was very small was even unable to cover even all tehsils of these four districts. Only those farmers have been covered which are engaged in both contract and non-contract farming of Wheat, Paddy, Basmati, Potatoes and Cotton crops. So apart from it there are other number of crops which are being cultivated under contract farming and those crops can also be covered to study the Pros and cons of contract farming at micro level. Hence this study can prove worthwhile to the farmers and state Government to make new policies for crop diversification while taking into consideration the interest of the farmers.

Conclusion
In the light of the above analysis and discussion it has been seen that contract farming has a great impact on the farmers' life and their employment opportunities, but as it has been observed from the study that farmers are facing the number of problems under contract farming in Punjab, and that is the sole cause of declining rate of participants in contract farming in Punjab. With the intervention of State Government some malpractices can be

restricted to make the contract farming business a sustainable source of income for farmers. It is crystal clear that the monoculture of paddy and wheat has degraded the fertility of soil and pushed the farmers in their dark days of their economic instability. The only way to rescue the farmers of this vicious circle of poverty is crop diversification, which is possible only through the promotion and support of contract farming. So State Government should actively participate and make strict laws to promote contract farming venture in the state for the welfare of the stakeholders involved in contract farming. Monoculture of traditional crops can be de-motivated while providing suitable alternate of these crops.

STRUCTURAL RELATIONSHIP MODEL OF FACTORS AFFECTING STORE'S CUSTOMER LOYALTY FOR RETAIL CONVENIENCE STORE BUSINESS IN BANGKOK, THAILAND

Ratana Klankaew, King Mongkut's Institute of Technology at Ladkrabang, Thailand
Vinai Panjakajornsak, King Mongkut's Institute of Technology at Ladkrabang, Thailand

Abstract

The objectives of this research were (1) to develop and verify the structural relationship model of factors affecting customer loyalty for retail convenience store businesses in Bangkok and (2) to study the influence of perceived service quality, perceived price, perceived product quality and customer satisfaction on customer loyalty for retail convenience store businesses in Bangkok. The sample group comprised 400 customers at convenience stores in Bangkok, all of whom were selected on the basis of convenience sampling. A rating scale questionnaire with a reliability score between 0.911 and 0.967 was used as the research tool. The data were analyzed using percentage, average, standard deviation, Pearson's correlation coefficient, confirmatory factor analysis, and causal structural model analysis. The results revealed that the causal structural model under the hypothesis had a high relevance with empirical data (χ^2 = 192.456, χ^2/df = 1.492, df = 129, GFI = 0.956, CFI = 0.991, NFI = 0.972, IFI = 0.991, AGFI = 0.929, and RMSEA = 0.035). Causal variables were able to explain the fluctuation in loyalty for Bangkok convenience stores at the rate of 72.9%. This loyalty was directly influenced by customer satisfaction and perceived service quality. Meanwhile, perceived product quality and perceived price had an indirect influence on loyalty through customer satisfaction.

Keywords: *perceived service quality, perceived price, perceived product quality, customer satisfaction, store's customer loyalty, Thailand's convenience store industry*

Introduction

Thailand is the second-largest economy in the ASEAN region, followed by Indonesia (Euromonitor, 2015). Bangkok, which is Thailand's capital and a commercial hub of Asia, is witnessing changes in lifestyle, with people having busier work schedules and smaller sized families. These factors have contributed to the popularity of retail businesses such as supermarkets and convenience stores (HKTDC, 2015). Retail business in Thailand grew rapidly as a result. By early 1990s, many Thai and foreign retailers entered into the industry as the market intensified. Local and international retail brands aggressively expanded their outlets in Bangkok and other parts of Thailand. That growth was set to continue in 2013, with the increased need to shop and the expanding suburban developments driving that growth. Convenience stores became the most competitive area of retail market, with a number of large firms opening many stores (Economic Review Year-Q1, 2013/). A form of retail, a convenience store is a small shop with extended hours of operation that offers a limited variety of grocery and beverages (Fernie et al., 2011). In 2014, convenience stores in Thailand had the most aggressive expansion and also contributed to highest sales turnover (Euromonitor, 2015). Their growth rate for the year was 7% - the highest among all forms of retail business. The growth rate for convenience stores was followed by the growth rate for specialty stores at 4.5%. Customer loyalty is a very important element obtained over time through the delivery of superior customer service, with the aim of reaping long-term profits. Convenience stores are highly competitive because competitors are aware of one another's position (Codrington, 2002). Customer loyalty occurs when shoppers frequent a selected convenience store. In fact, loyal customers repeat and increase their purchases, which in turn increases the sales revenue of business organizations (Li and Green, 2011).

Therefore, customer satisfaction and loyalty are the feedback of a successful retail marketing strategy in a competitive market where customers look for value in how they spend their money. Convenience stores and traditional outlets have successfully coexisted in Thailand without any discrimination from the customers (Abu and Roslin, 2008). Household income indicated which customers are attracted to which type of outlet (Zain and Rejab, 1989). In Thailand, traditional retail stores attract the low and mid-level income consumers. Modern retail formats attract the upper and middle-income shoppers. However, consumer lifestyles and preference are changing rapidly, as along with the education level of the population (Abu and Roslin, 2008). Tesco of the United Kingdom, Big C/Carrefour of France, Family Mart of Japan, and 7-Eleven of the United States all have a presence in Thailand. Nevertheless, the daily routines of city dwellers, particularly those in Bangkok, have changed drastically.

According to the Siam Commercial Bank Research Center (2012), life became more fast-paced and thus, more convenience was needed. People buy less, but they buy more frequently. This behavior compelled entrepreneurs to open more convenience stores in Bangkok, to serve its residents. The intensity was such that saturation was nearly reached. This is consistent with an article by the Economy and Business Research Center (2014), which states that Bangkok families dwindled in size and typically lived in apartment or condominium buildings and that they rely more on convenience stores. Intense competition ensued. Each convenience store had to be competent to correspond to the needs of the consumers, particularly where customer service was concerned. This is a major factor contributing to the competitiveness and the survival of convenience stores. Given the above circumstances, the researchers wanted to study the influence of service quality on customer satisfaction, which in turn instilled loyalty, an important factor in succeeding in the increasingly competitive field of grocery retailing (Anderson et al., 1994).

Literature Review

Previous research on factors affecting customer loyalty, such as the work of Richard and Dorah (2014), Chang and Tu (2005), and Rahim et al. (2012), led to the synthesis of factors affecting customer loyalty as follows: 1) perceived service quality (PSQ); 2) perceived price (PP); 3) perceived product quality (PPQ); and 4) customer satisfaction (CS). This led to the development of the model and the hypotheses of this research. The details of which are explained below.

Perceived service quality

Service quality is considered to be the most significant element for the evaluation of an organization's efficiency, including the product market and the service market (Reddy et al., 2011). Service quality is a comparison of expected service against perception from actual service received (Li and Krit, 2012). This corresponds with the concept of Cronin and Taylor (1992), who stated that the basic concept of service quality concerned the comparison of a service user's experience against the expectation at the time of service. Additionally, service quality could be measured by the level of satisfaction or dissatisfaction. Meanwhile, Rust and Anthony (1993) defined service quality as the extension of service, comprising service process and capable organization. The literature contains varying definitions for service quality. One common consensus is that service quality is achieved when one provides a service that is consistent with the needs of the customer or one matching their expectation (Asubonteng et al., 1996; Dotchin and Oakland, 1994; Lewis and Mitchell, 1990).

Based on the above concept, Muhammad and Ahasanul (2014) have conducted a study on factors affecting customer satisfaction and customer loyalty for retail stores in Malaysia. Involving 350 customers, the study found that service quality had statistical significance as it correlated with customer satisfaction, which had a direct influence on customer loyalty. Similarly, research by Rahim et al. (2010) indicated that bank customers in Tehran, Iran,

developed satisfaction and loyalty to the banks due to service quality. The above definitions and theoretical concepts on service quality suggested the need to define and deliver quality service to fulfill the needs and meet the expectations of the customers; further it suggested the need to provide guidelines for the determination of organizational strategies with the customers' needs as a key concern. There are five components of perceived service quality, as per the view of academics and diverse research findings. The first component is accurate information. The reliability of retail stores can be evaluated from their provision of correct, mistake-free service information (Huang, 2009). Correct information and clear pricing of products are equal to accurate correction of product information (Vàzquez et al., 2001). The second component is problem solving. Several organizations use customer satisfaction as a supporting criterion for performance evaluation (Kotler and Keller, 2011).

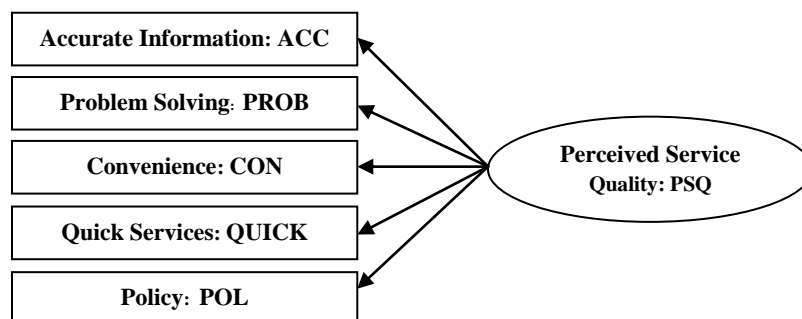
This encompasses the ability to refund or replace products. Employees need to be genuinely concerned about and attentive to complaints, with quick and straightforward resolution of problems (Swanson and Kelley, 2001) and (Vàzquez et al., 2001). The third component is Convenience. Convenience is defined as speed and ease for the customers with consideration for accessible location, proper parking space, operating hours and Internet-based communication. Easy access channels correlate with the choice of convenience stores by the customers (Bellenger et al., 1977). The fourth component is quick services. Transactions must be completed quickly and without complications. Payment methods, quick service, employee training, good service system design and time-saving at the counter all affect a customer's choice to use a particular convenience store (Lambert, 1979). The fifth component is policy. The policy must emphasize the development of service quality in five dimensions: physical aspects, reliability, personal interaction, problem solving and policy on merchandise quality (Dabholkar et al., 1996). Based on the information above, the research hypothesis was determined: perceived service quality directly affects customer satisfaction (H_1). The model is shown in Figure 1 below.


Figure 1: Measurement model of perceived service quality

Perceived Price

Perceived price also plays an important role in determining post-purchase satisfaction (Jiang and Rosenbloom, 2005). Hence, the more favorable the perceived price, the higher the resulting satisfaction. According to Alvarez and Casielles (2005), if the consumer perceives a gain (as a result of his/her positive price perception), he or she will be more satisfied and become a repeat customer. In addition, it has been suggested that, after the establishment of purchase behavior and even after the establishment of new price information, price perception is found to be a process that is dynamically regenerated (Mendoza and Paul, 2012). A comprehensive price strategy can help retailers achieve distinctive business success. Furthermore, Frazier-Coleman (2008) posited that creating and implementing pricing rules and strategy help retailers increase sales volume and the resulting profit. Hinz et al. (2011) found that the threshold price can increase revenue by as much as 20 percent through the increase of customer satisfaction and loyalty. Meanwhile, Muhammad and Ahasanul (2014) studied factors affecting loyalty through customer satisfaction. They designed and used an empirical survey with 350 customers at convenience stores in Malaysia and discovered that product price had a direct influence on customer satisfaction.

Additionally, a study by Sumaedi et al. (2011) determined that perceived price had a direct effect on satisfaction when the effects of perceived product quality and perceived price on customer satisfaction of students at Indonesian universities were examined. The above definitions and theories on perceived price highlight the need to determine an appropriate price for products and services to fulfill the needs and meet the expectations of the customers who might be willing to pay for those products and services and to provide the guidelines for developing organizational strategies with customer needs as a key concern. As per the view of academics and diverse research findings, there are three components of perceived price. The first component is the value of money. The price perceived by consumers shapes their decisions Oosthuizen, (2015). Price value is a perception of quality in connection with the price paid for products or services as a result of price competition, discount and sales promotion. (Varki and Colgate, 2001). The second component of perceived price is price fairness. Customers assess whether the price set by the seller is appropriate or fair and whether it is ultimately acceptable (Xia et al., 2004). Fair price is determined, in one way, through comparison with the benchmark price of the society (Bolton et al., 2003). The third component of perceived price is price sensitivity. The willingness of customers to pay for products and services is based on their perception of cost against the lowest and highest prices (Anttila, 1990). Price sensitivity is determined by the unit of products or services sold at differing prices (Levy and Weitz, 2012). Based on the information above, the research hypothesis was determined: perceived price directly affects customer satisfaction (H_2). The model is shown in Figure 2 below.
Figure 2: Measurement model of Perceived price

Perceived Product Quality

Perceived product quality is central to the theory that strong brands or good quality products added points to how consumers evaluated their purchase (Low and Lamb, 2000). As retail

stores typically thrive on pushing or selling products produced by others, the retailers need to be determined to stock quality products in their stores. How a shopper perceives the quality of a product typically influences that shopper's value appraisal, which eventually influences their level of satisfaction and loyalty. Munger and Grewal (2001), Minguela-Rata (2011) and Minguela-Rata et al. (2006) noted that product quality was a key component through which retailers or business firms could differentiate themselves from their competitors and gain competitive business advantages. Muzondo and Mutandwa (2011) said that products had a significant influence on a consumer's choice of main store for grocery shopping.

Yavas and Babakus (2008) identified, in a study performed on national retailers, that merchandise quality was the second-most important antecedent in the formation of store loyalty. In a study to identify perceived quality constructs of consumers, durable goods and perceived merchandise quality played a crucial role in purchases (Cronin et al., 2000). However, the importance of the merchandise quality influencing satisfaction and store loyalty is largely ignored. Schiffman and Kanuk (2004) stated that customers often judged the quality of a product on the basis of a variety of informational cues (intrinsic, extrinsic or both) pertaining to the product. The above definitions and theories on perceived quality highlight the need to determine appropriate quality for products and services to fulfill the needs and meet the expectations of the customers who might be willing to decide on those products and services and to provide the guidelines for developing organizational strategies with the needs of the customers as a key concern. As per the view of academics and diverse research findings, there are four components of perceived product quality. The first component of perceived product quality is product assortment. Diversity must be a consideration when arranging the products, considering the breadth and the depth of the store as well as the color, size and price of products within each category (Gilbert, 2003). Good product arrangement should entice customers to walk around the store to encourage them to buy more than they had planned to buy. (Levy and Weitz, 2007). The second component of perceived product quality is product quality. Product quality encompasses eight dimensions: performance, features, conformance, reliability, durability, serviceability, aesthetics and customer-perceived quality (Garvin, 1988).

The degree to which a product meets a certain standard designation is its quality of conformance, which is an internal focus, as opposed to the external focus of the user-based approach. Quality is reflected in the outcome of both the engineering and the manufacturing processes (Crosby, 1980). The third component of perceived product quality is stock keeping. Stock keeping mainly involves the number of inventory units and the availability of favorite brands (Amine and Cadenat, 2003). This static substitution model simplifies the resulting inventory and variety analysis, but it is a considerably unsatisfying assumption for categories in which consumers substitute readily when products are out of stock, such as cigarettes, soft drinks and grocery items (Mahajan and van Ryzin, 2001). The fourth component of perceived product quality is the selection of product. This component covers all items offered to market and attract attention, acquisition or consumption, including physical objects, services, personalities, organizations and desires (Drummond and Ensor, 2005). Based on the information above, the research hypothesis was determined: perceived product quality directly affects customer satisfaction (H$_3$). The model is shown in Figure 3 below.

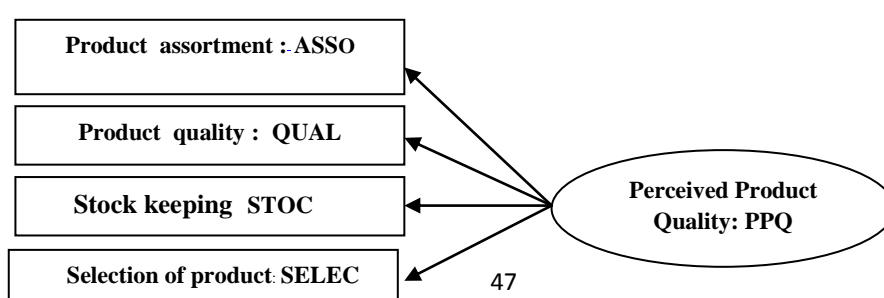
47


Figure 3: Measurement model of Perceived Product Quality

Customer Satisfaction

A widely observed element in business and commercial enterprises, customer satisfaction can be used as a measurement for products and services. Companies and stores need to be concerned about customer satisfaction and the growing range of diverse products and services to remain competitive, (Jayaraman et al., 2010). Customer satisfaction is explained as the feeling a customer has towards the value of the product or service (Sumit et al., 2013). It is achieved when the needs of the consumers are fulfilled and elevated to a level higher than the expectations of the customers (Oliver, 1997). Ching and Meng (2008) studied the perception of value when purchasing products from television programs. They found that customer satisfaction had a direct influence on loyalty. That corresponds with Richard and Dorah (2014), who studied the satisfaction of customers at 151 African retail stores, and found that satisfaction had a positive influence on customer loyalty. Meanwhile, Rahim et al. (2012) found that the positive relationship between satisfaction and loyalty was crucial to the customers. Satisfaction alone could not drive an organization to succeed or achieve the goals for them.

The above definitions and theories on customer satisfaction highlight the need to create one for the products and the services and to provide the guidelines for the development of organizational strategies with the needs of customers as a key concern. As per the view of academics and diverse research findings, there are four components of customer satisfaction. The first component is sale promotion. Promotion covers various forms of communication, including advertising, sales by staff and direct marketing media (Kerin et al., 2009). Enticement for repeat or multiple purchases with discounts, free handouts and introductory magazines may also be considered as sales promotion Reutenberg (2008). The second component of customer satisfaction is trust. Trust is earned from the genuineness with which a firm creates customer satisfaction. It is crucial to the building of a good relationship for the provider to meet the customer's expectation of product/service delivery according to the terms under the agreement (Liang and Wang, 2008). The third component of customer service is service staff. Customers can appreciate how staff perform their duties and marketing roles, as well as how they offer facilitation and added value (Valarie et al., 1985). Staff are expected to be knowledgeable about new products and their prices, as well as to be able to offer diverse options within the store while managing any complaints from the customer (Darian et al., 2001). The fourth component of customer satisfaction is process. An operational process of an organization should have a positive contribution to the retention of customers. Customers who are satisfied are likely to be loyal and express that loyalty by recommending the store to others and by vouching for the store (Sirohi et al., 1998) and (Yuen and Chan, 2010).

Based on the information above, the research hypothesis was determined: customer satisfaction directly affects store loyalty (H_4). The model is shown in Figure 4 below.
Figure 4: Measurement model of Customer Satisfaction

Store Loyalty

Studies have been conducted on customer loyalty since 1950, beginning from customer satisfaction with products and services (Rahim et al., 2012). Customer satisfaction is a main focus for efficient marketing campaigns. It is the sum of customer perception, customer evaluation and the customer's psychological experience with a product or a service. Customer satisfaction is an indication that they gain more benefits than the amount paid (Liu and Yen, 2010). Loyalty is the deepened commitment to purchase the same products or services with which they are satisfied again in the future, as may be influenced by marketing circumstances (Oliver, 1999). Loyalty can be determined from the level of relationship and repeated purchases (Pritchard and Howard, 1997). Dick and Basu (1994) stated that loyalty is the direct correlation between an individual's relative attitude and repeated patronage for a product or a service. Further, loyalty can be used to define and evaluate the attitudes and the behaviours of the customers purchasing a service or product. This can be measured from the continuity of the relationship a customer has had with a provider. Loyalty has a positive correlation with profitability and brings long-term growth to the company (Richard and Dorah, 2014). The above definitions and theories on customer loyalty highlight the need to create one, as well as the need to develop strategies for the creation of products and services that correspond with the needs of the customers, which in turn creates satisfaction and loyalty.

According to researchers who have studied product and service purchase behaviours with an aim to develop marketing strategies for successful and sustainably growing business Anton (1996), Singh (2006), Gupta and Cooper (2013), Bloemer and Odekerden (2002) Lin et al. (2005) Ranaweera and Prabhu (2003), Levy and Weitz (2009), Berman and Evans (2005), Chang and Tu (2005) and Omar (1999), there are four components of customer loyalty. The first component of customer loyalty is repeat purchase. A repeat purchase is when a person is satisfied with a previous purchase of product or service and decides to purchase the same item again from the store or the company. This satisfaction enhances the level of recommendation for products or services. The second component of customer loyalty is word of mouth. This type of communication is a testimonial for an organization, a product or a service. A positive word of mouth signifies loyalty and contributes to the confidence with which a business is run. Word of mouth has a direct correlation with service quality. The willingness of a customer to pass on this recommendation also has an influence on their decision to purchase. The third component of customer loyalty is customer retention. Business enterprises need to deploy advanced marketing tactics, out of economic concerns, to retain customers and to solicit sympathy. A true customer retention has the potential to create profit at a later time and lead to the type of loyalty that contributes to the success of an organization. The fourth component of customer loyalty is store image. Customers can be impressed by the image of a store and how it presents new products to attract them to come inside. For retail businesses, store image is generally defined by location, product, pricing, position level, customer service, target marketing, physical facilities and purchase experience as well as sales promotion tools such as advertising, sales by staff and community services. Therefore, the measurement model of store loyalty can be summarized as in Figure 5 below:
Figure 5: Measurement model of Store Loyalty

Based on the concepts, theories and research above, the researchers have defined the conceptual framework for this research as illustrated in Figure 6 below:
Figure 6: Conceptual framework

Research Methodologies

Population and sample group: The populations studied were customers or users at convenience stores in Bangkok. As the analysis of latent variables in the analysis of structural relationship model requires the use of data from a large sample group, Schumacker and Lomax (2010) proposed to use a sample group 10 to 20 times per one observable variable. There were 20 observable variables in this research. Therefore, a sample group was 400 customers or users at convenience stores in Bangkok. In this study, convenience sampling was used to obtain the sample group.

Research tool: The tool used in this research was a questionnaire with content that was divided into five parts as follows:

- Part 1: Inquiry of perceived service quality, covering five aspects: accurate information, problem solving, convenience, quick service and policy
- Part 2: Inquiry of perceived price, covering three aspects: value of money, price fairness and price sensitivity
- Part 3: Inquiry of perceived product quality, covering four aspects: product assortment, product quality, stock keeping and selection of product
- Part 4: Inquiry of customer satisfaction, covering four aspects: sales promotion, trust, service staff and process
- Part 5: Inquiry of store loyalty, covering four aspects: repeat purchase, word of mouth, customer retention and store image

The research tool quality was tested as follows:

1) Validity: The research tool was tested for validity, with respect to the Item-objective Congruence Index. It appeared that the IOC was above .50 for all questions (.60-1.00). This indicated the high validity of the research tool 90 (Prasitrattasin, 2003).

2) Cronbach's alpha: The research tool was tested for confidence in measurements through determination of a confidence coefficient or Cronbach's alpha. It was found that confidence was high for all measurements, with a Cronbach's alpha value above 0.70 for all items (Prasitrattasin, 2007). Perceived product quality has the highest Cronbach's alpha (0.967), followed by store loyalty (0.953), customer satisfaction (0.947), perceived service quality (0.941) and perceived price (0.911), respectively.

For the collection of data, after the questionnaire was verified and improved until reliable quality was obtained, the researcher and assistants entered the target area to use this questionnaire with the sample group, which was selected on the basis of convenience. A total of 400 individuals were asked to conduct a self-evaluation until data collection was fully completed.

Data analysis: Data analysis was conducted as follows:

1. Preliminary data were analysed through the use of means, standard deviation, skewness and kurtosis. The correlation coefficient between observable variables within the model was analyzed.

2. Structural equation model (SEM) was analyzed and verified for goodness of fit measures using the following statistical values: Chi-square statistics (χ^2), $\chi^2/$ df ratio, goodness of fit index (GFI), adjusted goodness of fit index (AGFI), standardized root mean square residual (SRMR), root mean squared error approximation (RMSEA) and comparative fit index (CFI). The criteria used to determine coherence of the overall model with empirical data were $\chi^2/$ df. ≤ 2.00, GFI ≥ 0.90, AGFI ≥ 0.90, CFI ≥ 0.90, NFI ≥ 0.90, IFI ≥ 0.90 and RMSEA ≤ 0.05 (Meyers et al., 2012).

Results and Discussion
Analysis of inter-variable correlation: Inter-variable correlation was analysed using Pearson's correlation coefficient as detailed in Table 1.

Table 1 verified the correlation between all pairs of observable variables studied in the structural equation model using Pearson's correlation coefficient. It was determined that all observable variables were correlated with statistical significance at the level of 0.05. Upon verification of the correlation level, all pairs of observable variables had a correlation not exceeding 0.80. Therefore, observable variables were not overly correlated and did not result in the issues of multicollinearity or overlapping. Appropriateness of correlation was verified once again on the basis of the Kaiser-Meyer-Olkin test equalling 0.957, which was higher than 0.50 and indicated that observable variables of the structural equation model were suitably correlated. Further, with Bartlett's Test of Sphericity equalling 6,801.368, df equalling 190 and P-value equalling 0.000, the statistical significance was 0.95, indicating that the matrix of correlation between all observable variables was sufficient for analysis of the model for measurement of the latent variables above

Table 2: Correlation coefficient between latent variables

	latent variables	PSQ	PP	PPQ	CS
PSQ	Perceived service quality				
PP	Perceived price	0.751*			
PPQ	Perceived product quality	0.792*	0.745*		
CS	Customer satisfaction	0.789*	0.721*	0.777*	
SL	Store loyalty	0.705*	0.633*	0.674*	0.741*

The analysis of correlation coefficient between latent variables as shown Table 2 highlighted that all latent variables had a positive correlation with one another with a statistical significance at the level of 0.05. The pair of variables with highest correlation was perceived product quality (PPQ) and perceived service quality (PSQ) (r = 0.792). The next three highest correlations were between customer satisfaction (CS) and perceived service quality (PSQ) (r = 0.789); between customer satisfaction (CS) and perceived product quality (PPQ) (r= .777); and between perceived service quality (PSQ) and perceived price (PP) (r = 0.751).

The analysis of the model for the measurement of perceived service quality, perceived product quality, perceived price, customer satisfaction and customer loyalty for convenience stores in Bangkok. The confirmatory study of structural components (perceived service quality, perceived product quality, perceived price, customer satisfaction and customer loyalty for convenience stores in Bangkok) produced the results shown in Table 3.

Table 3: Outcome of analysis of model for the measurement

Measurement model	Observable variables	Beta (β)	R^2
Perceived service quality **(PSQ)**	1. Accurate information (ACC)	0.90	0.77
	2. Problem solving (PROB)	0.72	0.81
	3. Convenience (CON)	0.88	0.87
	4. Quick service (QUICK)	0.90	0.88
	5. Policy (POL)	0.81	0.64
Perceived price (PP)	1. Value of money (VAL)	0.99	0.75
	2. Price fairness (FAIR)	0.80	0.89
	3. Price sensitivity (SEN)	0.62	0.80
χ^2 = 247.474, df = 138, χ^2/df = 1.793, GFI = 0.943, CFI = 0.979, NFI = 0.955, IFI = 0.980, AGFI = 0.913, RMSEA = 0.045			
Perceived product quality (PPQ)	1. Product assortment (ASSO)	0.88	0.90
	2. Product quality (QUAL)	0.94	0.91
	3. Stock keeping (STOC)	0.91	0.91
	4. Selection of product (SELEC)	0.91	0.90
χ^2 = 177.499, df = 102, Chi-Square/df = 1.740, GFI = 0.951, CFI = 0.989, NFI = 0.974, IFI = 0.989, AGFI = 0.928, RMSEA = 0.043			
Customer satisfaction (CS)	1. Sales promotion (SALE)	0.59	0.81
	2. Trust (TRUST)	0.76	0.92
	3. Service staff (STAF)	0.99	0.89

4. Process (PROC)		0.88	0.90

$\chi^2 = 103.674$, df = 57, χ^2 /df = 1.819, GFI = 0.966, CFI = 0.992, NFI = 0.982, IFI = 0.992, AGFI = 0.929, RMSEA = 0.045

Store loyalty (SL)	1. Repeat purchase (REP)	.77	.59
	2. Word of mouth (WORD)	.86	.74
	3. Customer retention (CUST)	.97	.95
	4. Store image (IMG)	.94	.89

$\chi^2 = 108.639$, df = 65, χ^2 /df = 1.671, GFI = 0.968, CFI = 0.992, NFI = 0.980, IFI = 0.992, AGFI = 0.933, RMSEA = 0.041

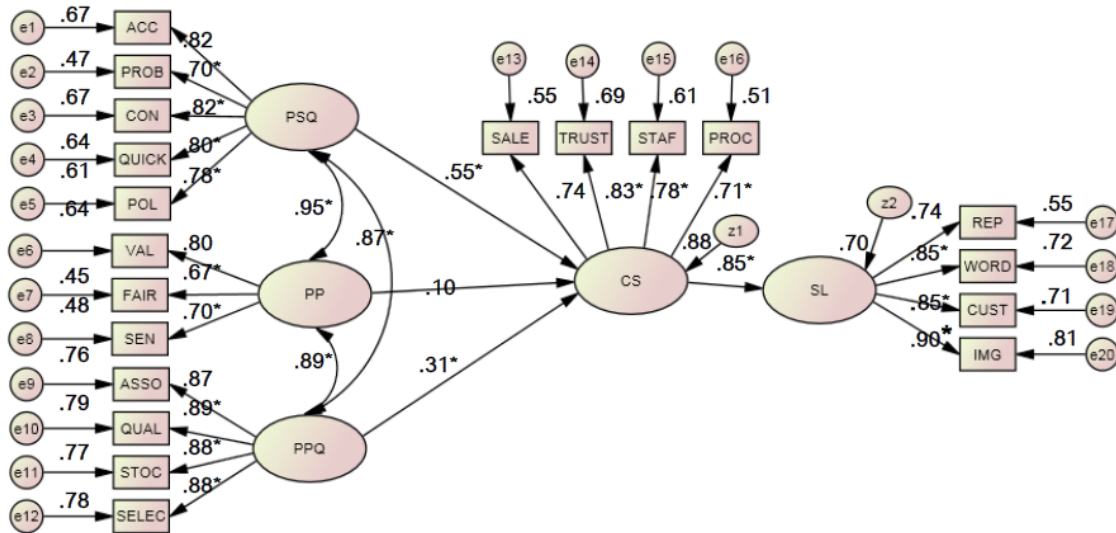
The analysis results from Table 3 indicated that the model of measurement for the latent variables of perceived service quality, perceived product quality, perceived price, customer satisfaction and customer loyalty for convenience stores in Bangkok correlated with the empirical data, according to the criteria χ^2/ df. ≤ 2.00, GFI ≥ .90, AGFI ≥ .90, CFI ≥ .90, NFI ≥ .90, IFI ≥ .90 and RMSEA ≤ .05. It was consistent with the conceptual framework of the research. The factor loading of each variable was as follows:

- Latent variables of perceived service quality (PSQ): accurate information (ACC = 0.90), problem solving (PROB = 0.72), convenience (CON = 0.88), quick service (QUICK = 0.90) and policy (POL = 0.81)
- Latent variables of perceived price (PP): value of money (VAL = 0.99), price fairness (FAIR = 0.80) and price sensitivity (SEN = 0.62)
- Latent variables of perceived product quality (PPQ): product assortment (ASSO = 0.88), product quality (QUAL = 0.94), stock keeping (STOC = 0.91) and selection of product (SELEC = 0.91)
- Latent variables of customer satisfaction (CS): sales promotion (SALE = 0.59), trust (TRUST = 0.76), service staff (STAF = 0.99) and process (PROC = 0.88)
- Latent variables of store loyalty (SL): repeat purchase (REP = 0.77), word of mouth (WORD = 0.86), customer retention (CUST = 0.97) and store image (IMG = 0.94)

Analysis of structural relationship model of customer loyalty for convenience stores in Bangkok: The analysis of structural relationship model of customer loyalty for convenience stores in Bangkok, as per Table 4 and Figure 7, revealed that Chi-square was 192.456 at the degree of freedom (df) of 129. The goodness of fit index (GFI) was 0.956, the adjusted goodness of fit index (AGFI) was 0.929, the comparative fit index (CFI) was 0.991, and the root mean squared error approximation (RMSEA) was 0.035. This indicated that the structural relationship model of customer loyalty for convenience stores in Bangkok correlated with empirical data, meaning that the developed model could effectively explain the causal relationship and the consequences of the various factors under the conceptual framework. It summarized the outcome of the research as follows:

Analysis of direct influence (DE), indirect influence (IE) and total influence (TE) of the factors studied in connection with customer loyalty for convenience stores in Bangkok (as shown in Figure 7 and Table 4 below) indicated that the store loyalty (SL) was positively influenced by the variable of customer satisfaction (CS) at the level of 0.85. Meanwhile, the variables of perceived service quality (PSQ), perceived product quality (PPQ) and perceived price (PP) only had positive influence on store loyalty (SL).

Perceived service quality (PSQ) was the variable with the highest indirect influence of 0.50, followed by perceived product quality (PPQ) and perceived price (PP) with indirect influences of 0.27 and 0.09, respectively. Perceived service quality, perceived product quality,

perceived price and customer satisfaction could explain customer loyalty for convenience stores in Bangkok at the percentage of 72.9 ($R^2 = 0.729$).


*P<.05, χ² = 192.456, df = 129, χ² /df = 1.492, GFI = 0.956, AGFI = 0.929, CFI = 0.991, NFI = 0.972, IFI = 0.991, RMSEA = 0.035

Figure 7: Structural relationship model of customer loyalty for convenience store in Bangkok.

Discussion and Conclusion

This study tested the structural equation model detailing the correlation of variables with influence on loyalty through customer satisfaction. These variables were perceived service quality, perceived price and perceived product quality. It was found that the key factor with statistical significance influencing satisfaction, which led to loyalty, was perceived product quality. Perceived service quality was another factor of statistical significance and influence on customer satisfaction. From the study, it was discovered that convenience stores in Bangkok should realize that their customers must be able to perceive the quality of their service and that they must procure products and develop a quality service pattern which corresponds with the needs of customers. It corresponded with the studies of Ullah (2012) and Jari and Jouni (2010), which similarly stated that quality management of service leads to customer satisfaction and repeat patronage.

Additionally, Chaniotakis and Lymperopoulos (2009) stated that customer satisfaction is derived from quality service and results in recommendations to other customers, which is a highly positive scenario for an organization. It corresponded with the study of Asma et al. (2015) on perceived product quality and purchase intention with consumer satisfaction that found that product quality had both direct and indirect influences on satisfaction. That study proposed for marketing managers to concern themselves with the continual enhancement of product quality, in part, as an organizational strategy to compete with others in the market.

Limitation

First, this research used convenience sampling in Bangkok, where 70% of the convenience stores are 7-Elevens, with TESCO Lotus Expresses and Family Marts following in number. Therefore, the sample group of this research comprised mainly 7-Eleven customers. The outcome of the research may be biased because of limited time and research capital. Second,

this study is a static type of research, but store loyalty, customer satisfaction, perceived service quality, perceived price and perceived product quality are all dynamic processes. As time goes on, the customers' needs will change, thus their standards of store loyalty will change, and these values will also change. Therefore, this research needs to be both developing and changing because the best research is conducted under dynamic situations.

Suggestions for Future Research

1. This study only chooses perceived service quality, perceived price, and perceived product quality and customer satisfaction as the factors to research. There are other factors that could influence the relationships of the four variables, such as customer value, customer awareness, customer consumption, technology and facility, word of mouth, the number of parking places, sense of safety and others. Thus, in the future, it would be worth considering whether to add those factors to the current model to make the model more perfect.

2. A future study should identify a good service strategy guideline that contributes to loyalty. It may use a qualitative research direction in conjunction with a quantitative one to arrive at clearer research findings.

3. This study did not scrutinize the influence of business image. A future research study may compare the influence of business image with the influence of service quality to see which of those has more influence on customer satisfaction and loyalty. Alternatively, it may study the joint influence of business image and service quality on customer satisfaction and loyalty.

4. A future study should balance the sampling group with other convenience stores because the customer's point of view for different convenience stores may affect the research quality outcome.

A CONFIGURATION OF MARKETING PRACTICE FIT WITH MANAGERIAL ASSUMPTIONS AND BUSINESS STRATEGY

Allam Abu Farha, Qatar University, Qatar

Abstract

This paper investigates how management perception and business strategy fits with the choice of the marketing practice. The study employs configuration approach from a data that were collected using three case studies in Palestine, and analyzed using informed coding method. The results showed that the three imperatives are inter-related, and internally coherent, resulting in viable configuration profiles. The research is unique and exploratory, and would help managers to carefully examine the internal logic of their marketing-related profiling, it can be used as an assessment tool of their marketing practices in relation to their frame of reference and business strategy, performance should be enhanced if the three variables are coherent.

Introduction

One of the fundamental issues of strategic marketing is to explain the differences in marketing behavior of competing businesses in the marketplace 1. Specifically, why do competing companies approach the same market differently?

The plurality of marketing practices is self-evident, and several studies has documented different marketing practices employed by firms (e.g. Brodie et al., 2008, Coviello et al., 2002). In addition, mainstream marketing thinking did adopt the traditional contingency view to explain this plurality (Donaldson, 2001). While the contingency approach offers insights into some of the reasons for this diversity, several studies have contradicted this hypothesis and suggested that firms do relate to the same market in different ways (Brodie et al 2008). This gap between theory and empirical studies suggests that further research is needed to understand diversity of marketing practices (Day and Montgomery, 1999, Pels, 2010, Varadarajan, 2010). Accordingly, this exploratory research addresses the issue of marketing practice diversity in the "same macro environment".

The first point of departure is found in strategic management literature since the presence of diversity and the search of archetypal order is well researched in this field. Earlier literature of strategic management argues that the strategic choices of firms are a reflection of the values and cognitive bases of powerful actors within the organization (e.g. Anderson and Paine, 1975, Elsbach, 2014, Hambrick and Mason, 1984, Kaplan, 2011). Researchers have reported that different strategic outcomes are a result of the diverse assumptions that managers make about their environment (e.g. Hambrick and Mason, 1984, Gallen, 2006, Schwenk, 2007). Surprisingly, marketing literature has ignored the effect of management assumptions on the choice of marketing practice (Pels, 2010).

Yet previous studies have provided evidence that the selection of functional strategies (e.g., marketing practice) flow from and are consistent with business strategy (Olson et al., 2005). Several studies found that strategic marketing responses differ with different strategic types (Mcdaniel and Kolari, 1987; McKee et al. 1989). Therefore, it is expected that business strategy would affect the marketing practice selection.

Drawing on the configuration approach which examines the multidimensional constellation of the strategic and organizational characteristics of a business (Meyer et al., 1993), this

exploratory paper integrates the organization's managerial assumptions, its business strategy, and marketing practices into a coherent framework that would help discover viable configuration profiles. Awareness of such profiles is important, not only for better understanding of marketing strategy formulation, but also to suggest a rationale for understanding it diversity (Miller, 1987) which is the main goal of this study.

This research examines the psychological and practical aspects of a unique cultural setting. The Palestinian market with its political, economic, and traditional orientation presents a unique setting for this exploratory research, which may complement or improve the predominant management and business models from the "developed" world. From a theoretical point of view, this paper may provide a better understanding of the reasons for diversity of marketing practice in a real business environment, through linking it to diversity of management assumptions and plurality of strategic business choice. In addition, it attempts to provide an integrative view of interfirm relationships as a means of value creation. From a managerial perspective, the findings should help firms to examine carefully the internal logic of their marketing-related profiling. Performance should be enhanced if the three elements are coherent.

The remaining parts of this paper are organized into three sections. First, the literature on management assumptions, business strategy, and marketing practice is reviewed, and an appropriate classification to represent each variable in the theoretical framework is selected. Next, the paper presents the findings of three case studies. Lastly, the paper concludes by discussing the findings, managerial implications, and future avenues for research.

Literature Review
a. Managerial Assumptions

The importance of managerial assumptions in the formulation of organizational strategies, and their role in explaining diversity of strategic behavior has been identified by management researchers (e.g. Child, 1997, Daft and Weick, 1984, Hambrick and Mason, 1984). This research stream suggested that organizational outcomes are a reflection of the values and cognitive bases of powerful actors within the organization (e.g. Gallen, 2006, Schwenk, 2007, Shrivastava and Mitroff, 1983). Several authors argued that the cognitive base affects the manager's field of vision, selectivity, and subsequent interpretation process thus "directly entering in the strategic choice" (Hambrick and Mason, 1984).

In the managerial discipline, different terms were used to refer to managerial assumptions: Frame of reference (Shrivastava and Mitroff 1983) Organizational culture (Good enough, 1971), Sense-making and sense-giving (Gioia and Chittipeddi, 1991). Taken Shrivastava and Mitroff (1983) Frame of reference (hereafter FoR) typology – clarity, clearness and the fact that an operation of its construct has been executed, and tested, this paper adopts it as a determinant of managerial assumption.

Shrivastava and Mitroff (1983, p. 163) described FoR as "the fundamental assumptions on which organizational inquiry into problems is based. They include methodological, epistemic, ontological, and ideological assumptions which enable organizational members to make consensual meaning out of social events". The authors identified four types of organizational FoR based on the following six constructs: cognitive elements: are the fundamental units of information – ideas, notions, concepts, and assumptions- which are taken for granted, and support a person inquiry system or concept of the world. cognitive operators: are the methods by which the vast amount of data obtained, ordered and rearranged to have a grasp and make a meaning of it. Reality tests: "They anchor organizational inquiry and resulting actions in specific rules and regulations, personal values, social ideologies, customs, or scientific knowledge, and thereby give them "truth" or reality" status"(Shrivastava & Mitroff, 1983, P.

165). Domain of inquiry: refers to the scope and boundaries of the inquiry process firms consider and address. Degree of articulation: it is not an element of FoR, but instead it pertains to the "degree to which the assumptions embodied in the other four elements have been articulated and codified". Metaphors: are the symbolical construction of the firm's world in meaningful ways.

Based on these constructs, they identified four organizational types: Political FoR, Entrepreneurial FoR, Bureaucratic FoR and Professional FoR. Table (1) clarifies these types with their main characteristics.

b. Business level strategy

A firm's strategy reflects its short and long-term responses to the challenges and opportunities presented by the business environment (Porter, 1996). Strategies can be formulated at three different levels: corporate, business and functional . This paper focuses on business level strategies because it is at this level that firms determine the general direction for each unit to follow in a given market (Slater et al., 2011). And business level strategies thereby directly influence the type of functional strategies such as what type of marketing practice is adopted (Mcdaniel and Kolari, 1987).

Table 1 Shrivastava & Mitroff's FoR typology

Elements of FoR	Entrepreneurial FoR	Bureaucratic FoR	Professional FoR	Political FoR
Cognitive Elements	Subjective information Personal commitment	Objective information Organizational commitment	Inter-subjective information organizational commitment	Subjective and objective interest group or coalition commitment
Cognitive Operators	Judgment/ Intuitive analysis Limited short term problem formulation and solution	Computational analysis Interpersonal inquiry	Planning and computational analysis long range problem formulation and solution	Bargaining and negotiation inter-personal problem solving
Reality Tests	Self-experience Facts are what work or get tasks accomplished	Organizational rules procedures procedural rigor	Empirical, experimental proofs methodological rigor	Popular wisdom social and organizational norms
Domain of inquiry	Problem specific changing continuously	Department fixed and well-drawn boundaries	Organizational fixed boundaries	Organizational and regional changes with stakeholder interests
Degree of articulation	Low through gestures	High through explicit	Medium explicit in the	Low through rhetoric

	and actions, non-verbal	statement of assumptions, rules	knowledge base utilized for decision making	and metaphorical communication
Metaphors	Economic/ militaristic	Economic/ Social	Scientific	Political

To examine the business strategy, we adopt Porter (1980) typology, due to its wide acceptance to explain diversity and competition. Additionally, it values clarity, simplicity and existence of clear operationalizing of its constructs makes it a perfect choice (Miller, 1988).

Porter (1980) proposed three strategies to overcome environmental threats and maximize organizations outcomes, which are differentiation, cost leadership and focus. Differentiation strategy helps a firm to distinguish itself from other competitors using products, services, technology, brands, and customer service. On the other hand, overall leadership centers on cost efficiency, by devoting much effort to cost control, permitting a firm to produce with the lowest cost, and making them appealing to buyers and competitors . The strategy of focus concentrates on being specialized within a specific range of products or serving a specific market segment, using one of the two previous strategies . Porter claimed that companies which try to seek both strategies at the same time may end up "stuck in the middle" with no competitive advantage.

c. Marketing practice

The current literature holds two perspectives on the types of marketing practice. The first approach takes a more dichotomous stand, and differentiates between transactional and relational marketing (Berry, 1983) , thereby seeing them as existing at opposite ends of a continuum (Grönroos, 1994), goods-centric marketing at one end and service at the other end (Vargo and Lusch, 2004). However The proponents of the second approach conceptualize marketing practice along a continuum and they adopt a more pluralistic view that looks at a range of marketing practices, including transaction marketing, database marketing, interactive marketing, and network marketing (The CMP group, e.g. Coviello et al., 1997), transactional exchanges, value-adding exchanges, and collaborative exchanges (Day, 2000), and also transactional, narrow, and broad relationship marketing (Sheth and Parvatiyar, 2000).

While the dichotomous approach is vital to differentiate and mark the relationship marketing terrain, it does not represent a variety or hybrid of practices that may appear in between (Pels, 2010). Therefore, we adopt a pluralistic view to treat marketing practices as complementary, rather than alternatives (Arndt, 1979). In doing so, this study adopts the Contemporary Marketing Practice group (CMP) work to demonstrate the diversity of marketing practice. CMP's work was chosen for multiple reasons. Firstly, it emphasizes on both theoretical development (suggesting a typology) and empirical evidence (eliciting taxonomy). Secondly, it is the most developed, and contains an extensive amount of empirical work (e.g. Coviello et al., 2002).

Coviello et al. (1997) developed a classification scheme that contained two themes (relational exchange and management activities) which corresponded to nine dimensions, relating on how firms interact with its markets. Based on these indicators, they identified four types of marketing practices: (1) Transaction marketing (TM): this type of marketing practice is a reflection of the marketing management school, where the focus is on "attracting and satisfying potential buyers by managing the elements in the marketing mix" (p. 509). (2) Database marketing (DM): the goal is to retain customers using technology-based tools. The seller is still the active part, and communication is "to" customers. (3) Interaction marketing (IM): this practice seeks to develop interpersonal relationships with the customers to create cooperative interaction for mutual benefit. It implies face-to-face interaction with the

communication being "with" the customer, rather than "to" the customer, and the goal is to retain current customers by creating a cooperative mutual benefit. (4) Network marketing (NM): this practice carries the elements of IM, but looks to formulate relationships between firms at different levels to permit coordination of activities between multiple parties to build up the organization's position within a network of several firm-level relationships.

Conceptual Framework

The previous discussion established that managerial assumptions play a vital role in marketing decision-making and that they are influenced by the FoR of the dominant coalition. Organization FoR underlie problem formulation, the collection and interpretation of data, the identification of alternatives, and the choice of final solution (Schwenk, 2007, Shrivastava and Schneider, 1984). In addition, business strategy covers the general direction that each unit decides to follow, and functional marketing activities are intended to support such choices by gathering, dissemination and responsiveness to information on customers and competitors (Slater et al., 2011). Therefore, it's expected that an interplay coherence between the three variables would occur.

The proposed framework presented in Figure 1 integrates the paper's three variables: the organization's FoR, business strategy, and marketing practices. Its function is to help identify viable configurational profiles. The resulted profiles should represent the different ways organizations relate to the market. Out of the interplay between the three variables 64 possible arrangements would appear. For example, one arrangement would be Political FoR, Differentiation strategy with Transactional marketing practice. However some of these profiles can be well aligned and some can be poorly aligned configurations (Ketchen et al., 1997). Therefore, only a reduced number of combinations are actually effective.

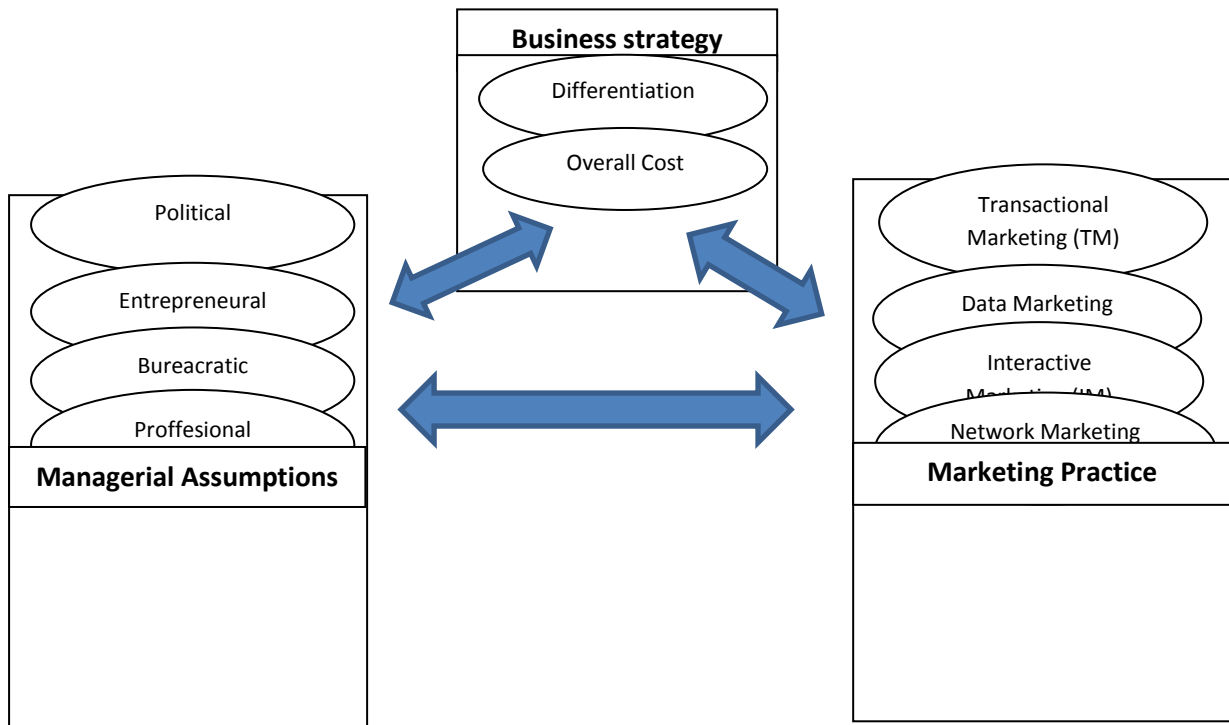
This paper and its suggested framework is exploratory in nature and it will not try to predict these profiles, rather it will inspect on how it is formed in a real business environment. As for almost any typology, the benefit of discovering such profiles is that it should fall into coherent patterns, where the presence of certain elements can lead to reliable predictions of the remaining components (Miller, 1987).


Figure 1 Conceptual Framework

Methodology

This paper employs a case study methodology based on the advice of Yin (2008) who argues that the question of "how" implied the use of a case study, since it gives room for detailed observations that can unveil various nuances and subtleties of behavior, which other empirical methods might miss. In addition, researchers have recommended the use of a case study when the focus of the study is on contemporary phenomena within real life contexts (e.g. Morse, 1993). The following sections discuss the research design, which guide our investigation process of collecting, analyzing and interpreting observations.

1. **Research Context**

The selected cases operate in Palestine. Palestine is considered as a part of the liberal countries within the Arabic region, which can reflect these countries' general criteria, their strong influence of religion and cultural factors, and most firs are family-owned, medium to small sized companies (Sabri, 2008).

2. **Case number**

Organizations are the units of analysis, since the three imperatives of this study occur at an organizational level. We investigated three cases following Perry (1998) suggestion that "the appropriate number of cases should fall between two and fifteen" (p. 791), and (Yin, 2008) who suggests considering multiple cases, that is to follow a "replication logic" not "sampling logic".

3. Case selection

Companies were not chosen arbitrarily. Instead, each had to fulfill three conditions: (1) They operate in different industries, a condition needed to reflect the coherence of the profile that is linked to marketing practices, rather than the size of the market share or which industry they operate in. (2) All companies operate in the "same macro environment", which means that they are all influenced by the same socio-economic conditions. (3) Companies are leaders in their fields and they operate with different strategies, a condition needed to reflect plurality of practices.

4. *Data Collection*

The data was collected using multiple collection techniques, including (in-depth interviews and documentary material) to allow for triangulation. Data was collected in the describe sequence as follows: first, two separate in-depth interviews with one of the top executives of the focal firms were conducted. The first meeting was to capture the three imperatives and their existence, and the second meeting was for further questions and to ensure the verbatim contained no mistakes. Secondly, several documents and secondary sources (such as company documentation, corporate websites, specialized press) were collected for further analysis.

5. *Measures*

The case studies were performed through semi-structured interviews, a detailed questionnaire was developed based on; Shrivastava and Mitroff (1983)'s operationalization of the ' FoR; Miller's (1988) questionnaire on Porter's generic strategies and the CMP's standard questionnaire (Coviello et al., 1997) to reflect on the marketing practices.

6. *Data Analysis*

Based on Morse (1993) suggestion of a 'conceptual template' to compare and contrast results, this paper employed an informed coding analysis method. This method checks the informed codes and constructs by linking the interview statements, data from the documents and answers from the discussion of questionnaires with the constructs, underlying dimensions and indicators. Pels (2010) described this style as "coding is analysis". We conducted two levels of data analysis; Initially, interviews and documents were analyzed to reveal the verification and discovery of a relationship between the constructs; second, cross-case analysis was performed to suggest some theoretical explanations of similarities and differences, and to identify patterns of marketing profiles.

7. Quality of case study research

Numerous researchers argue that the criteria to establish the quality of case studies included; conformability, credibility and transferability (Creswell, 2008, Yin, 2008, Perry, 1998). Conformability implies the certainty that what is being observed is supported by the data by using multiple sources (Yin, 2008). This study employed multiple sources of evidence (interviews, documents and internal reports). Credibility is the extent to which data and analysis are believable and trustworthy (Creswell, 2008). In this study, the verbatim of the interview was re-written and sent back to be read and discussed in separate meetings. Transferability: establishes the domain to which a study's findings can be generalized (Yin, 2008, Perry, 1998). The latter can be achieved through a robust theoretical support and replication of multiple case studies, which is the approach used in the presented study.

Results
Sinokort (Food Company)
Sinokort is a leading food company in Palestine. It has been operating since 1982, and has served 35 markets with over 60 products in the food industry, and has employed more than 430 people.

The data collected shows that Sinokort is compatible with Shrivastava and Mitroff's (1983, 1984) Political FoR. Managers in this company have an autocratic decision making style in which they operate with a low formal style and they trust internal sources of information, more than outside sources. As their marketing manager explained " … *we prepare our plans in accordance with the owner's vision and beliefs for future expansion*". They rely on their subordinates and peers whom are the main source of information. This is clear from the marketing manager words on the CEO *"...he depends on his believes, the employees and the distributors words as a main source of information, more than on reports or studies"*. Their reality tests are based on their personal experiences and education, and they have a broad domain of inquiry, with personal goals and coalition interest as the main drivers for their commitment.

Sinokort's business strategy reflects the overall cost leadership as a dominant strategy. Sinokort products sell at lower prices, as compared to its rivals in the market, and the company focuses on gaining profitability from building volume and reducing manufacturing costs ". the marketing manager explains " … *we try to provide lower prices than our competitors by trying to keep out cost down by having fewer product lines and fewer customer types than outright differentiators"*.

Sinokort's marketing practices are a reflection of TM. The conclusion is presented based on the firm's goal of attracting and satisfying potential buyers, the customer's passive in the relationship, and marketing activities were carried by functional marketing managers only. Their marketing practice can be shown by the comment of their marketing manager *"for us in the marketing department our emphasis is on sales because we believe in Gates philosophy that out of $10 he would spend 9 on sales"*.

NIC (Insurance Company)
NIC is the largest insurance company in Palestine. It has been operating since 1992. It serve the local market with 8 branches, benefitting from the experience of over 186 employees.

The data provided shows that NIC approximates Shrivastava and Mitroff (1983, 1984) Professional FoR. Managers in NIC depend on their professional knowledge and have a long-term vision with a clear preference for models. They use objective factors to make their decisions from both internal and external sources. Furthermore, they emphasize self-experience and scientific rigor as their reality tests. To give an example, we quote the company business development manager " *we work in a highly risk field, so just depending on our feeling or intuitive may lead us to disaster consequences therefore our strategic decision is always based on quantitative data that is coming from reliable formal sources.*"

NIC's business strategy is a reflection of Porter's (1980) differentiation strategy. It seeks to provide services that distinguish them as unique from a customer's perspective. The business development manager claims that *" our service is better compared to any competitor in the market ...we strive to provide innovative products and to create a strong brand image.*

The marketing practice of NIC is consistent with RM, since they have a strong attitude with interaction and network marketing styles. NIC's relationship with its customers takes two forms: formal and informal, and active and adaptive. Customers and distributors are active in the relationship, meaning communication is "with" the customer, not "to" the customer. The

business manager mentioned that "*through our offers or services we always try to build a relation with our customer to make them feel we are their partners more than a seller buyer relation*". Marketing is practiced by all members of the company, The company business manager commented that in NIC "*everyone is a marketer*".

Al-Quds (Pharmaceutical Company)

Al-Quds was established in 1969, and it now employs about 350 personnel specializing in different fields to serve the local and regional markets. Their product range spans the entire spectrum of ethical pharmaceuticals and over the counter products/nutritional supplements.

The data shows that Al-Quds combines criteria from different types of Shrivastava and Mitroff (1983, 1984) FoR typology. For space reasons we will show final results on the indicators without quotations. Al-Quds managers look at both short term and long term goals. They use priority models, while allowing space for intuitive and creative development. They use both formal and informal sources of information. They utilize both organizational norms and methodological rigors as reality tests. As for commitment, managers are committed to their own goals, with their domain of inquiry focused on the company.

Al-Quds uses a mixed business strategy. From one side, it aims to achieve differentiation by providing highly branded products, supplying high quality products, adopting the latest technologies and investing heavily in R&D. On the other hand, it tries to cut on its cost to attract and gain an advantage against its rivals for the price sensitive segment. The financial mangers explains this fact in the following words "*when setting the prices of our products we do take several elements into account beside the production cost, mainly the competition and frequent use of the drug.*"

Al-Quds marketing practices features aspects for all four categories from the typology of marketing practices, with no explicit preference for any. It combines traditional promotional tools when approaching end consumers, where emphasis is put on advertising and promotion. On the other hand, it employs relationship marketing when approaching doctors and pharmacists.

Discussion

A summary of the case findings in presented in table 2 (full analysis on these companies is provided in Appendix 1). This table shows that the investigated companies responded to different configuration profiles, indicating that there is an archetypal order between these three imperatives. In other words, firms differed in their FoR, which indicates that dominant coalitions are directing managerial thinking and decision making choices in each firm. In relation to generic business strategy, each company conceived the environment in a different way, therefore, their strategic responses were different. As for the marketing practices, companies clearly employed different marketing practices in approaching their markets, which provides evidence of diverse characterizations of marketing practices.

Table 2 Case studies results

Company/ type	FoR	Strategy	Marketing Practice
Sinkorot	Political	Overall Cost leadership	Transactional
NIC	Professional	Differentiation	Interactive & Network
Al-Quds	Mixed	Mixed	Plural

The data from the case studies helped to identify three viable types of marketing practices with its corresponding imperatives. While the proposed framework suggests that different relationships or profiles may exist, only few combinations are viable and able to survive according to the "fit" concept . Any miss match between the three different forces leads these profiles to be not feasible. In addition, these profiles were found in companies serving same "macro environment", which indicate that configurations can coexist in the same environment.

A synthesis of the findings from the three case studies can help us to make the following assumptions. First, the data shows that the three companies had different understandings of the environment (different frames of reference) as well as different strategic orientation (different business strategies and marketing practices). These differences support the categories elicited from the literature and suggested in the conceptual framework.

Secondly, the profiles found are inter-related, which supports the holistic approach adopted in the conceptual framework. The configuration approach argues that "organizational configuration denotes any multidimensional constellation of conceptually distinct characteristics that commonly occur together" [where] "the parts of a social entity take their meaning from the whole and cannot be understood in isolation" (Meyer et al 1993, pp. 1175-1178).

Thirdly, the data from the three cases shows that managers' assumptions and the choices of a given marketing practice were associated in ways that were internally coherent. This coherent suggests that a viable configuration profile will be produced. Thus, the set of viable configuration profiles represents the alternative marketing practices that can occur in the same market. In other words, this finding indicate that the choice of a marketing practice didn't seem to be associated to a contingent rationale, but rather to difference with these imperatives.

In short, the findings from the case studies support the rationale provided by proposed framework for understanding the reasons for diversity of marketing practices across firms operating in the same market. This means that, from the configuration perspective, diverse marketing practices are viable when they integrate a coherent configuration profile.

Conclusion

To date, studies have illustrated the existence of a diversity of marketing practices but there is no conceptual framework providing a rationale to help understand this plurality. This gap supports Day and Montgomery (1999) and Varadarajan (2010) calls for more research on a better understanding of how firm's relate to their markets. This paper has sought to understand how management perception and business strategy can relate to marketing practice choice. It employed a configuration approach to check how these variables relate to each other in a systematic, detailed and holistic image of reality.

The results found can provide us with three major conclusions: Each firm that has a different FoR was coupled with a different business strategy, as well as with a different marketing practices. Moreover, these forces were internally coherent, resulting in viable configuration profiles, which explains the success of these companies in interacting with the demand of their diverse pool of customers and their success.

The findings can help in answering the paper main question concerning plurality of marketing practice by indicating that the configuration marketing profiles found represent the different, coherent ways of relating to a market, in which each profile implies a diverse marketing practice. In addition, The results show that it's not the contingency factors that influence the marketing choice, otherwise how would we expect multiple successful marketing practices to

exist within the same environment, but rather it's due to an internal factors mainly the managerial assumptions.

The results are consistent with previous work in marketing, which shows there are different forms of marketing practices (e.g. Coviello et al., 2002) , and that managerial cognition strong influence marketing direction (Gallen, 2006, Pels, 2010) . It also confirms the strategic marketing theory prediction of the fit between business strategy and marketing strategy (Slater & Olson, 2001). The data found in the three case studies provide strong support for the paper's conceptual framework and suggest that when the combination of the imperatives is internally coherent, it will result into viable profiles which can be hypothesized and tested in future studies. The results affirm the strategic marketing theory prediction of the fit between business strategy and marketing strategy (Mcdaniel and Kolari, 1987). It also confirms previous results on the key role management styles play in marketing decisions (e.g. Hambrick and Mason, 1984, Gallen, 2006, Schwenk, 2007).

Contribution
This study has taken an in-depth approach to investigating the effect of managerial assumptions and business strategy on the choice of marketing practice In particular the question raised in this paper has related to how far can diversity in frame of reference explain diversity of marketing practice mainly in same macro environment markets.
The rich data gathered raise some questions about the adequacy of existing marketing models to explain marketing practice diversity. In addition, it makes several contributions to enriching the marketing literature. First, this paper provided a novel view on the reasons for marketing practice diversity by linking it to inter-play it has with the management assumptions and business strategy. Which fills the gap on the reasons of plurality of marketing practices that existed in same environment. Secondly, it presented a new imperatives that has been linked to decision making but neglected in marketing literature, the frame of reference imperative. The in-depth research done in this paper shows that frame of reference is the underlying explanation as to why different assumptions exist, and the important role it plays in their decision making. Finally, this paper can help in resolving the transactional-relational marketing debate by showing that different modes of marketing practices can coexist thus converting contradictions into alternatives by adopting a double continuum.
From a managerial standpoint, the results identified different profiles that should help firms to examine carefully the internal logic of their marketing-related profiling, and to manage their marketing practice accordingly. In other words, this study can be used by managers as an assessment tool to understand that marketing practices are inter-related to the other imperatives and that the coherency between the three imperatives is what allows it to be viable for their marketing practices in relation to their FoR and Business strategy, in order to gain viable effective practice. Finally, the results presented here may help managers to read and understand their competitors better.

Limitations and Future Research
In research design, there should be some tradeoffs. There are several limitations encountered in this study. This study sought to integrate knowledge from three fields: marketing, organizational theory and strategic management, which can be considered over ambitious, and may create some challenges. Second, the study was conducted in an emerging market context, using a case study framework, which may limit the generalization of its findings. Finally, this paper limited itself to identifying the different ideal profiles of FoR, business strategy and

marketing practice. However, explanation behind the occurrence of these profiles was not investigated due to limitations of space and time.

With these findings, we believe that the synthesis is incomplete at this point; What other viable profiles are there? How do these profiles occur? Do viable profiles vary in different environments? Finally, what is the effect of each configuration on performance? These are questions can be empirically examined in future research.

ETHNICITY, CONSUMER ANIMOSITY AND PREFERENCES: THE CASE OF STUDENTS IN PENANG

Teo Poh-Chuin, Tunku Abdul Rahman College University, Malaysia
Osman Mohamad, Multimedia University, Malaysia

Abstract

The importance of the concept of consumer animosity in the field of international research is increasingly. This study aims to test the significant differences between ethnic groups on their consumer animosity and their preferences towards different product categories-brands' countries of origin associations. Therefore, measurements that measure consumer animosity towards European countries, Singapore and USA that fit in Malaysia context were developed. The samples of this study were students in Penang and the sampling method was convenience sampling. Usable responses were 255 responses. SPSS version 17 was used data analysis purpose. The results of this study revealed that consumers with different ethnic groups displayed difference level of consumer animosity and preferences towards different product categories-brands' countries of origin, significantly. These findings brought some insights to market practitioners, where marketers of domestic and foreign brands are encouraged to take ethnicity, consumer animosity and product category in their consideration when designing marketing programs. Research contributions, limitations and suggestions for future studies were discussed.

Keywords: *Consumer animosity, Ethnicity, Brand' country of origin, Students in Penang, Preferences towards different product categories-brands' countries of origin associations*

Introduction
Nowadays, Malaysian consumers are increasingly exposed to and choosing from a wider range of products, brands, quality and process (Mokhlis, 2009). However, in this age of globalization, tensions stem from territory disputes, economic arguments, diplomatic disagreements or religious conflicts are presented throughout the world (Riefler & Diamantopoulos, 2007). Thus, Leong et al. (2008) pointed out that it is necessary for marketers to have a better understanding of foreign consumer reactions towards their brands in this expanding globalization era. Moreover, Bhaskaran and Sukumaran (2007) pointed out that researchers study on the influence of nationality while ignoring the sub-cultures within countries. Therefore, this study seeks to test the significant differences between ethnic groups on their consumer animosity and preferences towards different product categories-brands' countries of origin among students in Penang.

Malaysia in Context
The economy of Malaysia record one of Asia's best, while Malaysia's per capita GNP reached US$3,640 in 2001 (Naguib & Smucker, 2009). Malaysia is a multiracial country with the total population of Malaysia of 28.31 million in 2009 (Department of Statistics Malaysia, 2010). There are three major ethnic groups in Malaysia, with the largest group of Malay and other indigenous people (65.1%), followed by Chinese (26%) and Indian (7.7%) (Selvarajah & Meyer, 2008).

Muslim is one who practices Islam (Fam et al., 2004), while Malay was defined as the people who speak in Malay, lead the Malay way of life and is of the Islamic faith, and endogamy

seems to be the rule (Asmah, 1983; Run, 2007). The trade winds brought the Indian and Chinese traders to Malaysia, along with their cultural and religious, social and political influences (Selvarajah & Meyer, 2008). Besides, British colonization in mid-1800s attracted migrants from Southern China and South India (Bhaskaran & Sukumaran, 2007). The Chinese in Malaysia, descendents of the sojourners, came to Malaysia from China in the late nineteenth century (Selverajah & Meyer, 2008). They are mainly immigrants from the southern part of coastal provinces of China (Lee & Tan, 2000; Run, 2007), such as Fujian, and Hainan. Majority of them are multilingual where they can speak in Malay, English, Mandarin and their respective dialect (Lam & Yeoh, 2004). Initially they were serving as labor force in tin mining and railway construction; however they have developed in Malaysia's businessman (Soontiens, 2007). According to Selvarajah and Meyer (2008), the large-scale mobilization of Indians to Malaysia commenced in 1870 when British controlling Malaya, which happen during the colonization of European in Asia. They were mainly Tamil or Hindu origin, and worked in the plantation and building of country's transport systems.

The Malays are recognized as *Bumipytras,* son of soil, and have a privileged position in Malaysian society, where their position is protected by the Constitution (Selverajah & Meyer, 2008). The Malaysian government is sensitive to the need of the Muslim majority, while promoting religious freedom and it strive to offer products and services that conforming to Islamic principles (Salleh et al., 1998). Many countries have introduced policies that assist the mainstream indigenous communities, including Malaysia (Bhaskaran & Sukumaran, 2007). During the adoption of laissez-faire economic model in Malaya, the Chinese became intermediaries to foreign companies and several large Chinese enterprises grew and diversified business in construction, plantation, trading, finance and other sectors. They highlighted the economic power of the Chinese minority has fostered nationality based affirmative economic policies to assist the Malays, where the new economic policy (NEP) was introduced and the government provide a wide range of generous incentives to the Malays as well as help to increase their role and position in the country economy.

Different ethnic groups hold different values of life. In the cross-cultural comparison study that undertaken by Rashid and Ibrahim (2008); the Malays were characterized as a group that valued self-respect or face, politeness, sensitivity to feelings and relationship. Besides, the Chinese uphold the value of hard work or diligent, pragmatic, wealth or prosperity, face, harmony and risk taking. Lastly, the Indians also value face, as well as fear of God, sense of belonging, 'karma', champion of causes and filial piety. They believed that Chinese and Indian Malaysian still upholding similar fundamental values with Chinese in China as well as Indian in India, respectively. However, it is also believed that their cultural beliefs and practices also shaped by the interaction with other ethnic groups as well as the presence of British.

The multi-ethnicity background of Malaysia brought many challenges as well as market opportunity to marketers of both local and foreign brands. Within one nation, consumers in different ethnic act response differently to different marketing strategy and product cue. *Halal*, which means permissible", is one of the most important concepts in Islam that covers slaughtering, storage, display, preparation, hygiene and sanitation aspects (Shafie & Othman 2006). *Halal* logo plays a crucial role for Malay Muslim consumers in Malaysia. The introduction of halal logo has generated more awareness among Malay Muslims about the importance to make consumption that follow Islamic guidelines and principles, where it provides an avenue for manufacturers to indicate their target consumers that their products are *halal* and shariah-compliant, and meet the Islamic standard (Shafie & Othman, 2006). For example, all fast-food businesses in Malaysia are gazette under Malaysia law to serve only *halal* food and non-alcoholic beverages (Salleh et al., 1998). In the study of Shafie and Othman (2006) that investigated the impact of halal phenomenon to the consumers in

Malaysia, 89% respondent indicated that *halal* logo played role in their purchase decision. However, the effect of *halal* logo might do not have any impact on Chinese and Indian Malaysian's purchase decision.

Other than that, Chinese have different preferences as compared with consumers from another ethnicity, as in a similar fashion, Chinese are more readily accept goods colour or packaged in red or gold colors that signify good luck and prosperity (Salleh et al., 1998). Furthermore, they tend to show favorable behavioral intentions for the Bahasa Malaysia advertisements, as compared with Chinese language (Run, 2007). Nonetheless, the dominant ethnic group of Malaysia, Malay, reacted similarly to Chinese when viewing a Chinese advertisement, but they tend to react negatively to Chinese language advertisement. The study of Ong and Tan (2010) revealed that Malays were less likely to travel by Air Asia as compared to Chinese.

Penang in Context

The focus of this study was Penang students, as Penang achieved the highest economic growth, which is 9.9% and recorded the second highest GDP per capita, at RM30, 490 in year 2009 (Department of Statistics Malaysia, 2009). Moreover, Penang continues to be an attractive foreign direct investment destination, and this prove by the evidence that Pulau Pinang recorded its highest investment growth in the manufacturing and service related sectors in 26 years (Penang State Government Official Portal, 2007). Indeed, Penang students were selected as the sample of this study as Verlegh and Steenkamp (1999) identified that there were no statistically different effects between the studies using student samples as compared to those studies using consumer samples. Moreover, they represent the young consumers group that have been a growing population (Ramly et al., 2008).

Literature Review

a. Consumer Animosity

Consumers might avoid products from the offending nation because of exporting nation has engaged in military, political, or economic acts, which consumers difficult to forgive, where Klein et al. (1998) regarded this as consumer animosity, which relate tensions between nations to consumers' buying behavior (Riefler & Diamantopoulos, 2007). Klein et al. (1998) refers consumer animosity as the remnants of antipathy related to previous or ongoing military, political or economic events that will influence consumers' purchase behavior in international marketplace. For example, Ahmed and d'Atous (2008) found that Taiwanese's displayed some animosity towards China. In their research conducted in China, Klein et al. (1998) found that Chinese consumers demonstrated animosity towards Japanese products because of cruelties committed by the Japanese during their occupation of China. This animosity influenced their actual purchase decision, but did not influence their judgment of Japanese products as Japanese products were still evaluated better than local products.

Consumer animosity a construct different with consumer ethnocentrism, a construct that introduced by Shimp & Sharma (1987) that refers to the belief held by consumers about the appropriateness and morality of purchasing foreign-made products. In their proposed animosity model, Klein et al. (1998) proposed consumer animosity influenced willingness to purchase directly; whereas consumer ethnocentrism has direct and indirect (through product judgments) impacts on willingness to purchase foreign products. They found consumer animosity and consumer ethnocentrism were different constructs, but the effect of animosity on consumer preferences existed even when consumer ethnocentrism held constant.

Consumer ethnocentrism is a construct about consumers' general beliefs about buying foreign products, whereas consumer animosity is a country-specific construct (Klein et al., 1998).

High ethnocentric consumers perceived imported goods as inferior but perceived own products favorable. They tended to purchase domestic products instead of foreign goods, as they believed they purchase of imported goods will bring negative outcome to their country. Nonetheless, high animosity consumers might be able to accept imported products from foreign countries generally, but reject products from certain countries. They recognize the quality of products from dislike nations, but tended to reject their products (Riefler & Diamantopoulos, 2007).

There are four types of consumer animosity, namely national stable animosity, national situational animosity, personal stable animosity and personal situational animosity. National stable animosity arises from general historical background; national situational animosity temporarily arises caused by specific circumstance; personal stable animosity refers to the general negative feeling due to personal experience; and lastly, personal situational animosity refers to temporary negative sentiments caused by specific circumstance (Ang et al., 2004). For example, 'Japan is taking advantage of Malaysia' (national stable animosity); 'Japan s taking advantage of Malaysia during Asian economic crisis' (national situational animosity); 'I feel upset towards the Japanese' (personal stable animosity); and, 'I feel angry towards Japan for occupying Malaysia during World War II' (personal situational animosity).

Inter-Nation Conflicts

There are some conflicting issues between Malaysia and these countries, and the Malaysian governments and Non-Government Organizations (NGOs) have initiated some policies and campaigns that ban products from the abovementioned nations that influenced the purchase decision of Malaysian, such as Buy British Last Policy, Boycott Danish Products Campaign, Boycott Dutch Products Campaign and Boycott US Product Campaign. (Please refer Appendix for further information). This study seeks to examine consumer animosities of Penang students towards European countries, Singapore and USA, and significant differences between different ethnic groups.

Methodology

This is a cross-sectional study. Data collection method was self-administered survey, where a structured questionnaire was distributed to students in Penang. The sampling method was convenience sampling. A total of 300 questionnaires were distributed, and the usable responses of this study were 255 responses.

A questionnaire was designed to collect data needed. The questionnaire consisted 3 parts. The first part was designed to collect socio-demographic related information. Questions consisted age, gender, ethnicity, marital status, education and household income. Second, the questionnaire was designed to capture respondents' consumer animosity related information. A total of 15 items, based on economic, political, religion, military and social issues, were developed to measure subjects' national situational animosity level towards Europe countries, Singapore and USA, which were 5 items, 3 items and 7 items, accordingly. A five point Likert-scale ranging from 1=strongly disagree to 5=strongly agree was used to measure consumer animosity level.

The measure was developed after a discussion with a Professor of Marketing and nine PhD students from internationalization research cluster. Some corrections were made after a second and third discussion with a Professor in Finance and Economic and an expert in Political science. A five-point Likert scale was used to measure consumer animosity. A pilot study was conducted before the launch of data collection activity to check the content reliability of the measure. A total of 55 questionnaires were distributed to 55 Universiti Sains Malaysia students age ranged from 16 to 30 years old. A total of 52 questionnaires were usable responses. Reliability estimates (Cronbach's alpha) for consumer animosity was.87.

This value indicated good, where Sekaran (2003) suggested reliability coefficient above .80 considered good.

Lastly, the questionnaire was designed to capture respondents' preferences towards different product categories-brands' countries of origin associations. The measure consisted 5 products categories, namely fashion apparels and textiles, electrical goods and appliances, chocolate/confectionery's products, dairy goods and healthcare products, while the brands' countries of origin included Malaysia, Singapore, Holland and Malaysia. A five point Likert-scale ranging from 1=least preferred to 5=most preferred was used to capture respondents' preference towards different product categories-brands' countries of origin associations. Moreover, Statistical Package for the Social Sciences (SPSS) version 17 was used to analyze the data of this study.

There were five stages of data analysis process. First, frequency analysis was undertaken to measure respondents' socio-demographic background. Second, reliability analysis was conducted to measure the Cronbach's alphas of the measure of national situational animosity. Third, descriptive analysis was undertaken to measure the mean values and standard deviations of the overall measure of national situational animosity as well as its single items. Fourth, the analysis of compare means, namely one-way ANOVA was used to test the significant differences of consumer animosity between three ethnicity groups, namely Malay, Chinese and Indian. Lastly, one-way ANOVA was undertaken to test the significant differences between ethnic groups on their preferences towards different product categories-brands' countries of origin associations.

Results and Findings

Table 1 presented respondents' profile, which contained their age, gender, ethnicity, marital status, education and household income. Most of the respondents aged 21-25 (69.8%), female (60.4%), Chinese (38.2%), single (96%), tertiary degree's holders (60.8%) and household income RM1001 but less than RM3000 (41.3%).

Table 1 *Sample Characteristics*

Socio-demographic	Categories	Frequency (n=255)	Percentage (%)
Age	16-20	49	21.8
	21-25	157	69.8
	26-30	19	8.4
Gender	Male	89	39.6
	Female	136	60.4
Ethnicity	Malay	65	28.9
	Chinese	86	38.2
	Indian	74	32.9
Marital status	Single	216	96.0
	Married	9	4.0
Education	Secondary	48	21.4
	Tertiary	137	60.8

	Postgraduate	40	17.8
Household income	RM 1000 and below	92	40.9
	RM 1001 but less than RM 3000	93	41.3
	RM 3000 and above	40	17.8

Next, the Cronbach's alphas, mean values and standard deviations of the overall measure of consumer animosity and based on nation as well as its every single item were presented in Table 2. The Cronbach for overall measure of consumer animosity (15 items) was .92, which indicated good content reliability. Moreover, the Cronbach's alphas for consumer animosity towards Europe countries (5 items), Singapore (3 items) and USA (7 items) were .81, .76 and .87, accordingly. These coefficient reliabilities were accepted.

Table 2 *Mean and standard deviation of consumer animosity*

No.	Item	Mean value	Standard deviation
1	I feel angry that some European countries discriminates immigrants in their countries.	3.59	1.01
2	I feel upset that the European NGOs are blaming Malaysia for destroying the environment by planting oil palm trees.	3.52	1.01
3	I feel angry towards some European countries for their negative perception about Islam.	3.52	1.06
4	I resent the European Community for banning the import of our marine-based products.	3.38	1.22
5	I am very upset that the European Community has introduced measures to discriminate our palm oil products.	3.32	.89
	Europe countries	3.47	.80
	Cronbach's alpha	5 items	.81
1	I resent the World Court's decision in granting the legal right over the Pulau Batu Putih (Pedra Branca) to the Singapore.	3.52	1.05
2	I resent the way Singapore government has occasionally trespassed into Malaysian territory.	3.33	1.03
3	I am unhappy towards the way Singapore government treats Malaysia over the water issue.	3.24	.99
	Singapore	3.37	.78
	Cronbach's alpha	3 items	.76
1	I am unhappy with the US want to control Malaysian economy with their unfair terms through Malaysian-United States Free Trade Agreement (MUSFTA).	3.54	1.12
2	I resent towards the US for accusing Malaysia as a transit of human trafficking.	3.52	1.16
3	I feel angry towards the US for supporting the Zionist regime in Israel.	3.49	1.08
4	I am unhappy with the Americans as they are responsible for a lot of the world economic problems.	3.47	1.10
5	I resent the US for imposing unreasonable restriction on the issuance of VISA for visitors from the Muslim countries.	3.42	1.20
6	I feel angry whenever the US gets involved with other	3.41	1.09

	countries' internal affairs.		
7	I feel upset that the Americans are exporting American culture to other countries through television, movie, music, etc.	3.02	1.16
	USA	3.41	.85
	Cronbach's alpha	7 items	.87
	Overall	3.44	.76
	Cronbach's alpha	15 items	.92

Note: 5-point scale ranged from 1=strongly disagree to 5=strongly agree

The mean value for the overall measure of national situational animosity was 3.44 and the standard deviation was .76, while the mean values and standard deviations for their animosity towards Europe countries, consumer animosity towards Singapore and consumer animosity towards USA were 3.47 (.80), 3.37 (.78) and 3.41 (.85), respectively. These results imply that respondents displayed relatively high consumer animosity, indeed their posed highest animosity towards Europe countries, followed by USA and Singapore.

The mean value for the measure of consumer animosity towards Europe countries ranged from 3.32 to 3.59, where item "I feel angry that some European countries discriminates immigrants in their countries" recorded the highest mean value, while item "I am very upset that the European Community has introduced measures to discriminate our palm oil products" recorded the lowest mean value. Moreover, the mean value for the measure of consumer animosity towards Singapore ranged from 3.42 to 3.53. Item "I resent the World Court's decision in granting the legal right over the Pulau Batu Putih (Pedra Branca) to the Singapore scored the highest mean value, nonetheless item "I am unhappy towards the way Singapore government treats Malaysia over the water issue" noted the lowest mean score. In terms of consumer animosity towards USA, respondents scored the highest mean value for item "I am unhappy with the US want to control Malaysian economy with their unfair terms through Malaysian-United States Free Trade Agreement (MUSFTA)", nevertheless item "I feel upset that the Americans are exporting American culture to other countries through television, movie, music, etc." scored the lowest mean value.

Subsequently, the results of one-way ANOVA that test the significant different differences between ethnic groups (Malay, Chinese and Indian) and their consumer animosity level were presented in Table 3. Significant differences were found between groups on overall consumer animosity as well as their animosities towards European countries, Singapore and USA. In terms of overall consumer animosity, the mean values for Malay was 3.86, followed by Indian (3.37) and Chinese (3.18), where the mean value was 17.42. The mean score for Malay, Chinese and Indian for their animosity towards Europe countries were 3.80, 3.23 and 3.47, respectively, while the F-value was 10.35. Next, the mean values of consumer animosity towards Singapore for Malay, Chinese and Indian were 3.72, 3.10 and 3.36, accordingly. F-value was 11.26. Subsequently, the mean values for Malay, Chinese and Indian on their animosity towards USA were 3.91, 3.14 and 3.30, accordingly, where the F-value was 18.74.

In addition, Duncan's range test was undertaken to capture the significant differences between three ethnic groups. The results of Duncan's range test revealed that Malays are significant different from Chinese and Indian, where Malay demonstrated significant high overall animosity and animosities towards Europe countries, Singapore and USA, as compared to Chinese and Indian. In general, Table 3 showed that Malay presented the highest consumer animosity, followed by Indian, while Chinese displayed the lowest level of consumer animosity.

Table 3 *One- way ANOVA: Ethnicity and consumer animosity*

Consumer animosity	Ethnicity			*F*-value	Duncan's range test
	Malay (G1) (n=65)	Chinese (G2) (n=86)	Indian (G3) (n=74)		
Overall consumer animosity	3.86	3.18	3.37	17.42*	G1 vs. G2 & G3
Consumer animosity towards Europe countries	3.80	3.23	3.47	10.35*	G1 vs. G2 & G3
Consumer animosity towards Singapore	3.72	3.10	3.36	11.26*	G1 vs. G2 & G3
Consumer animosity towards USA	3.91	3.14	3.30	18.74*	G1 vs. G2 & G3

Lastly, one-way ANOVA was undertaken to test the significant differences between ethnic groups and their preferences towards different product categories-brands' countries of origin associations. The results of analysis were presented in Table 4. In terms of fashion apparels and textiles, Indian (3.73) showed significant high preferences towards brands from USA, followed by Chinese while Malay displayed the lowest preferences. The F-value was 6.26. However, Malay demonstrated significant high preferences towards Malaysian brands, followed by Indian and Chinese, where the F-value was 7.08. The results of Duncan's range test revealed that Malay significance different from Chinese and Indian on their preferences towards fashion apparels and textiles from USA and Singapore; nonetheless Chinese significance different from Malay and Indian on their preferences towards Malaysian brands.

Chinese (3.83) showed the highest preferences towards electrical goods and appliances from USA, followed by Malay (3.65), while Indian (3.23) showed the least preferences. The F-value was 5.56 and significant. Besides, Indian (3.64) showed the highest preferences towards Malaysian brands, followed by Malay (3.22) and Chinese (2.98), where F-value was 7.06. The results of Duncan's range test revealed that Indian was significance different from Malay and Chinese on their preferences towards the brands of electrical goods and appliances from USA and Malaysia; nonetheless, Malay was significance different from Chinese and Indian towards brands from Holland and Singapore.

In terms of chocolate/confectionery's product, significant differences between ethnic groups were found on their preferences towards brands from USA, Holland and Singapore, where the F-values were 18.10, 12.58 and 13.72, accordingly. The results of Duncan's range test showed that Malay was significance different from Chinese and Indian on. However, no significant result was found on their preferences towards chocolate/confectionery's product from Malaysia. Significant differences were found on preferences towards the brands of dairy products from USA, Holland and Singapore, where the F-values were 5.88, 2.64, 3.43 and 8.47. The results of Duncan's range test exhibited that Malay significance different from Chinese and Indian on USA and Singaporean brands; while Indian significance different from Malay and Chinese on their preferences towards Malaysian brands.

Table 4 *One- way ANOVA: Ethnicity and preferences towards different product categories-brands' countries of origin associations*

Preferences towards different product categories-brands' countries of origin associations	Ethnicity			*F*-value	Duncan's range test
	Malay (G1) (n=65)	Chinese (G2) (n=86)	Indian (G3) (n=74)		
Fashion (apparel & textiles)					
USA	3.17	3.72	3.73	6.26*	G1 vs. G2 & G3
Malaysia	3.60	2.91	3.26	7.08*	G1 & G3 vs. G2
Holland	2.78	3.15	3.09	2.60	-
Singapore	2.62	3.33	3.30	10.59*	G1 vs. G2 & G3
Electrical goods and appliances					
USA	3.65	3.83	3.23	5.56*	G1 & G2 vs. G3
Malaysia	3.22	2.98	3.64	7.06*	G1 & G2 vs. G3
Holland	2.89	3.22	2.91	2.39	-
Singapore	2.77	3.35	3.11	5.66*	G1 vs. G2 & G3
Chocolate /confectionery's product					
USA	2.97	3.88	4.07	18.10*	G1 vs. G2 & G3
Malaysia	3.29	2.87	3.23	2.41	-
Holland	2.89	3.80	3.61	12.58*	G1 vs. G2 & G3
Singapore	2.49	3.23	3.45	13.72*	G1 vs. G2 & G3
Dairy products					-
USA	2.97	3.57	3.55	5.88*	G1 vs. G2 & G3
Malaysia	3.80	3.59	3.41	2.64	-
Holland	3.89	3.35	3.14	3.43*	G1 vs. G2 & G3
Singapore	2.57	3.22	3.20	8.47*	G1 vs. G2 & G3
Healthcare product					
USA	3.80	4.01	3.85	.87	-
Malaysia	3.55	2.93	3.69	10.24*	G1 & G3 vs. G2
Holland	2.89	3.52	3.47	8.14*	G1 vs. G2 & G3
Singapore	2.78	3.50	3.68	14.70*	G1 vs. G2 & G3

Note: 5-point scale ranged from 1=least preferred to 5=most preferred

In terms of healthcare products, significant results were found on respondents preferences towards Malaysian, Holland and Singaporean brands, where the F-values were 10.24, 8.14 and 14.70, accordingly. Nonetheless, no significant result was found on USA brands. Moreover, the results of Duncan's range test indicated that Malay was significance different from Chinese and Indian on their preferences towards Holland and Singaporean brands; nevertheless Chinese was significance different from Malay and Indian on their preferences towards Malaysian brands.

Overall, Malay displayed the least preferences towards foreign brands but prefer domestic brands the most. For example, Malay prefer local brands while least prefer foreign brands in the cases of fashion apparels and textiles, chocolate/confectionery's products, dairy goods and healthcare products, with the exception of brands of dairy goods from Holland where they prefer the most as compared with Chinese and Indian. On the other hand, Chinese presented the least preferences towards home grown brands, in the cases of fashion apparels and textiles, electrical goods and appliance, chocolate/confectionery's products and healthcare products. Additionally, Indian demonstrated the least preferences towards domestic brands of dairy products, while they tended to display least preferences towards the brands of fashion apparels and textiles, electrical goods and appliances, chocolate/confectionery's product and healthcare products from Holland.

Discussions and Implications

This study aimed to test significant differences between ethnic groups on consumer animosity and their preferences towards different product categories-brands' countries of origin associations. This section will discuss consumer animosity of students in Penang, followed by the significance difference between ethnic groups on their consumer animosity and preferences.

In overall, students in Penang displayed relatively high consumer animosity; particularly they demonstrated the highest animosity towards European countries, followed by USA and Singapore. These results imply that students in Penang are sensitive to the international issue, especially conflict between nations. Marketers of the brands from these countries must take these results into account in the design and formulation of international marketing strategies, especially when they targeting or aim to target these groups of consumers. High animosity consumers tend to reject products/brands from dislike nations.

Additionally, in terms of consumer animosity based on ethnicity, Malay students tended to demonstrate the highest animosities, namely overall consumer animosity, consumer animosity towards Europe countries, consumer animosity towards Singapore and consumer animosity towards USA. Nonetheless, Chinese students exhibited the least level of consumer animosity. Indeed, Malay students were significance different from Chinese and Indian samples.

Marketers of brands from these countries are encouraged to mask their brands' countries of origin information when targeting Malay students, as their origin information will bring negative outcome on consumers' purchase decision. However, they are encouraged to associate their brands with favorable country image or focus on product attribute-related information when marketing their brands to this segment. On the other hand, when targeting Chinese students, marketers of brands from these nations are encouraged to incorporate their brands' countries of origin information in their marketing communication, as this segment displayed moderate animosity level towards Europe countries, Singapore and USA, particularly lower level of animosities towards Singapore and USA. Indeed, the brand origin information might bring favorable outcome on the purchase decision of this segment. Additionally, marketers are also encouraged to incorporate the brand origin information when targeting Indian students, as they hold relatively low animosity as compared with the Malay segment.

Marketers are encouraged to consider product category and brand's country of origin cues when targeting different ethnic groups. Students are significance different on their preferences towards different product categories-brands' countries of origin associations. Malay students were significance different to Chinese and Indian samples in most of the cases. Indeed, Malay students tended to display the highest preferences towards Malaysian brands, while Chinese students showed the least preferences towards home grown brand in all product categories, with the exception of dairy products when Indian prefer the least. Therefore, marketers of

domestic brands that target Malay students are encouraged to incorporate brand origin information when marketing their brands/products, as this will bring positive impact on consumer purchase decision. Nonetheless, marketers that targeting Chinese and Indian students are encouraged to focus on product attribute-related information and dissociate their brands with its origin, as their brand origin information will bring negative outcome on the purchase decision of these segments.

Furthermore, in terms of foreign brands, students in Penang tended to display highest preferences towards brands from USA, with the exception of dairy products for Malay students. Moreover, the preferences towards brands from Holland and Singapore for three ethnic groups were based on product categories. For example, Malay samples showed higher preference towards Holland brands rather than Singaporean brands in the cases of fashion apparels and textiles as well as electrical goods and appliances, nevertheless Chinese and Indian samples prefer brands from Holland rather than Singaporean brands. These results brought some insights to marketer of brands from these nations, where they are encouraged to design different marketing strategies that based on product categories when targeting different segment, but not standardized their international marketing strategies.

It s believed that consumer animosity of all three ethnic groups are related with their preferences towards different product categories-brands' countries of origin associations. For example, Malay students displayed the highest animosities level, while Chinese students showed the least consumer animosity. Therefore, Malay students demonstrated the highest level of preferences towards home grown brands in most of the cases; nevertheless, Chinese students displayed the least preferences towards domestic brands. Consequently, marketers should take all these three information, namely ethnicity, consumer animosity and product category, into their considerations when formulating and designing marketing strategies and programs. It is believed that the missing of either one consideration will results unwanted outcome on consumer attitude, behavior as well as purchase decision.

Contributions, Limitations and Recommendations

This study contributes to the body of knowledge by incorporate ethnicity and product categories in the study of consumer animosity. Previous studies studied examined the concept of consumer animosity generally based on nationality (e.g. Klein et al., 1998; Klein & Ettenson, 1999; Leong et al., 2007; Wansink et al. 2009; Funk et al., 2010; Smith & Li, 2010), but did not further explore consumer animosity based on ethnic group within a nation. Indeed, the results of this study revealed that consumers within a nation displayed significantly different level of consumer animosity. Additionally, they displayed different level of consumer animosity towards different dislike nations.

This study is not without limitations. This study focused only on ethnicity and consumers' preferences, but not their actual purchase decision. It is believed that different ethnic groups might significance different on their actual purchase behavior. Therefore, future researchers are encouraged to extend this study by examining ethnicity and consumers' actually purchase decision. In addition, they are also encouraged to explore the relation between ethnicity, consumer animosity and actual purchase decision.

Moreover, this study revealed that different ethnic groups presented significance different level of consume animosity towards different countries. However, this is not sufficient in providing a comprehensive picture how ethnicity works on consumer animosity. Hence, future researches are called to examine the mediating role play of two concepts, namely world mindedness and national identification. It is believed that consumers in different ethnic group with different level of world mindedness and national identification will demonstrate different level of consumer animosity. Indeed, these affect their attitude and behaviors towards the dislike nations.

Appendix

Buy British Last Policy initiated by the Malaysian government in 1981, when the UK press, *Financial Times*, reported the US government and companies used alleged tactics to win a Malaysian contract. Besides, Boycott Danish Products Campaign launched by NGOs in 2006

when Danish newspaper, *Jyllands-Posten*, abuse Islam by publishing twelve cartoons ridiculing Prophet Muhammad (The Brussels Journal, 2006). In 2008, Boycott Dutch Products Campaign was initiated, as a Dutch legislator posted a film that portrayed Islam as a violent religion (Kuwait Times, 2008). As a result, Malay Muslims were called to boycott Dutch-made products (The Star, 2008). In addition, Boycott US Product Campaign was initiated in 2009, as US support Israel that mounted the offensive in Gaze (BBC News, 2009). A boycott list includes over 150 products ranging from food and beverage to household and skincare items were introduced (Asia Pacific News, 2009). Indeed, there are also some boycotts from European Union to Malaysia. The European Union has initiated a ban on palm oil products from Malaysian in 2007 that resulted by some sensitive ecosystems issue, where they claimed Malaysian oil palm plantations cause to global warming by cutting down forest (The Star, 2007). Additionally, they initiated a ban on Malaysia seafood in the following year, where they found some Malaysian companies lack in health standards and practices set by the European Union (The Star, 2009). Moreover, the conflicting issues between Malaysia and Singapore related to the political right of Pulau Putih (Pedra Branca), water issue as well as territory issue.

LEARNING ORGANIZATION AND KNOWLEDGE MANAGEMENT FOR KNOWLEDGE ENTREPRENEUR: EMPIRICAL EVIDENCES FROM HIGHER LEARNING INSTITUTIONS

Kalsom Salleh, Kolej Universiti Poly-Tech Mara, Malaysia
Norhayati Wahib, Kolej Universiti Poly-Tech Mara, Malaysia

Abstract
Public and private higher learning Institutions should invest in intangibles such as human capital and research and development capacity through the integrative concept of Learning Organization and Knowledge Management in order to create and increase their knowledge creation and innovation from their academic and research excellence. Hence, the research objective of this paper is to empirically investigate the conceptual relationship between learning organization and knowledge management process of tacit knowledge which can contribute to the concept of knowledge entrepreneur of the higher learning institutions. A survey questionnaire was employed as the main instrument to collect data for statistical analysis from the academicians in the selected public and private higher learning institution in Malaysia. The empirical comparative findings of this study provide an initial step forward in identifying the significant conceptual relationship between the relevant dimensions of a learning organization and the effective knowledge management process of tacit knowledge which can enhance knowledge performance and innovation for the intellectual entrepreneurship of both public and private higher learning organization in Malaysia. This research paper adapts the studies of Watkins and Marsick (1993:1996), Hernandez (2000) and Salleh (2014) to identify the ways in which the seven dimensions of the LO and the transfer of tacit knowledge through knowledge management process (KMP)that could improve the knowledge performance and innovation of the selected public and private higher learning institution in Malaysia from the concept of learning organization to knowledge entrepreneur.
Keywords*: Learning Organization, Knowledge Management, Tacit Knowledge, Knowledge Entrepreneur, Higher Learning Institutions*
Paper Type: **Research Paper**

 Introduction
    The need for organizations to survive in a changing environment has led to the development of the concept of the learning organization (LO) and knowledge management (KM). When knowledge becomes core competency of the organization, a successful organization is one that pays greater attention to the development and preservation of internal skills and capabilities through the process of learning and sharing knowledge among individuals (Misha &Bhaskar, 2010; Salleh, Chong,Syed Ahmad & Syed-Ikhsan, 2012; Salleh, Syed Ahmad, Syed-Ikhsan& Lin, 2011).
    To strive for academic and research excellence, it is imperative for a public or private university in Malaysia to become a LO (Hussein et al., 2016). The university needs to undergo the transformation process of LO by adopting the knowledge management process (KMP) of transferring tacit knowledge for its future value driven of academic excellence (Salleh, 2014 &Hernandez, 2000).
    Hence, the objective of this research paper is to empirically investigate the conceptual relationship between the seven dimensions of the LO and the transfer of tacit knowledge through KMP for the future value driven of academic excellence of the selected public university and private university. This research objective adapts the studies of Watkins and Marsick (1993; 1996) and Hernandez (2000; 2003) to identify the ways in which the seven

dimensions of the LO and the transfer process of tacit knowledge which are deemed important in influencing and improving the knowledge performance and innovation.

The motivation of this study and its expected contribution is to develop an integrated conceptual model of LO and KM for intellectual entrepreneurship in the context of a selected public and private university in Malaysia which can be used as replication studies for other public and private universities in Malaysia and in other countries.

Literature Review and Research Model

LO is defined by Watkins (1996) (p.32) as one in which learning and work are integrated in an ongoing and systematic fashion to support continuous improvement at the individual, group and organizational levels. In other words, learning takes place in the individuals, teams and organization and even the communities with which the organization interacts. LO is also said to be about increasing an organization's problem solving capability and about changing behavior in ways leading to improved performance at the individual, team and organizational level (Buckler, 1998).

According to Watkins &Marsick (1993;1996) and (Selden & Watkins, 2001), the characteristics or the seven complementary action imperatives of LO are to:
1) create continuous learning opportunities,
2) promote inquiry and dialogue,
3) encourage collaboration and team learning,
4) establish systems to capture and share learning,
5) empower people toward a collective vision,
6) connect the organization to its environment and
7) provide strategic leadership for learning

KM is defined as the process of capturing the collective expertise and intelligence in a LO and using them to foster innovation through continued organizational learning (Davenport, DeLong & Beers, 1998; Meso& Smith,2000; Nonaka & Takeuchi, 1995; Quinn, Anderson & Finkelstein,1996, Salleh, 2013a &Salleh,Chong, Syed Ahmad & Syed-Ikhsan, 2013b). The ultimate goal of KM is to convert tacit knowledge (personal ideas and experiences) from individual knowledge to explicit organizational knowledge (documents, products and procedures) and utilized shared knowledge across organization effectively (Bennet & Bennet, 2003; Davenport, et al. 1998; Gupta, Iyer& Aronson, 2000, Nonaka & Takeuchi, 1995; Quinn, et al. 1996). Tacit knowledge transfer is the process by which tacit knowledge is moved and shared throughout organization through individuals and groups across various functions by personal, mechanical and electronic means (Hernandez, 2000;2003). Hernandez (2000 ; 2003) had carried out an empirical study to identify the ways the LO dimensions impact the transfer process of tacit knowledge which can improve the knowledge and financial performance within the private manufacturing companies in Colombia. The findings showed the positive structural relationship between the seven LO dimensions and the transfer of tacit knowledge process for a positive influence on knowledge performance.

According to Rowley (2000), a number of characteristics of knowledge need to be recognized and accommodated in learning processes and knowledge management. The concept of Knowledge Entrepreneur is proposed by Rowley (2000) which recognizes the multi-faceted nature of knowledge and defines cultures, values and systems that encourage appropriate organizational learning. Knowledge entrepreneurship cannot be achieved without an understanding of the knowledge which an organization and its learners need to achieve its vision. The key competence for the knowledge entrepreneur is the ability to learn how manage systems evolution to support individual and organizational learning for the articulation of tacit knowledge.

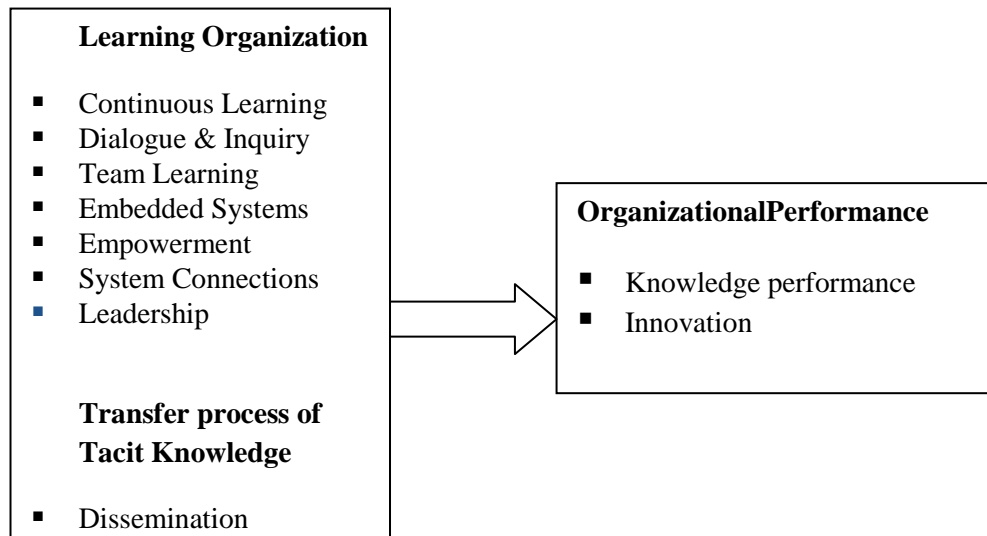
The following research model (see Figure 1) is proposed for the hypothesis development to test the conceptual relationship between LO and KM in terms of the impact between the seven dimensions of LO and the KM process of tacit knowledge transfer on the organizational performance in terms of knowledge entrepreneur for this comparative study of a selected public and private university in Malaysia.


Figure 1: Research Model

Research Methodology

In this study, a survey questionnaire was used as the main instrument to collect data from all academicians employed by the selected public university and private university in Malaysia. The selected case evidence for a public university is a Malaysia's largest institution of higher learning in terms of size and population. It has experienced phenomenal growth since its inception in 1956 and has expanded nationwide with numerous branch campuses, city campuses and affiliated colleges. This university attempts to become the new centre of academic and research excellence and expected to become a world class university by 2020. On the other hand, the selected case evidence for a private university is a Malaysia's leading university in engineering technology established on 20 August 2002. Its vision is to become the leading entrepreneurial technical university in the country by 2020 through excellence in research, education, training, entrepreneurship, consultancy and community services.

Questionnaires were posted to a total of 900 academicians from 26 faculties of a public university which are grouped for the three clusters of programs i.e. 1) science and technology, 2) business and management and 3) social sciences and humanities. Only 99 questionnaires (10%) were received and usable for data analysis purposes. For the selected private university, 500 questionnaires were distributed to academicians fromits13 branch institutes which offer various foundation, diploma, undergraduate and postgraduate programs. Similarly, 144 questionnaires only (29%) were received and usable for further data analysis.

The multiple question items in the questionnaire were adapted from the studies of Watkins and Marsick (1993;1996) and Hernandez (2000 ; 2003) to identify the ways in which the seven dimensions of the LO and the KMP of tacit knowledge can improve the organizational performance of a public university and private university. Besides demographic data, a seven-point scale from 1 to 7 was used for all questions concerning respondents' perceptions on the seven dimensions in the LO environment (42 items), the level of tacit knowledge (12 items) being disseminated and documented for information accessibility and usability and the organizational performance in terms of the knowledge performance and innovation (7 items). The Likert-point scale used ranges from 1 is for almost never, 2 is for seldom, 3 is for occasionally, 4 is for not sure, 5 is for frequently, 6 is for usually and 7 is for almost always. Statistical Package for Social Sciences (SPSS) version 23 was used to analyze data collected for statistical analysis and results.

Data Analysis and Results

The Cronbach's Alpha is computed to verify the reliability of the data collected and the study variables of this empirical research. According to Sekaran (2000), the closer the Cronbach's Alpha to 1, the higher the internal consistency reliability. The Cronbach′s Alpha coefficient for each research variable of this study is presented in Table 1.

Table 1: Coefficient of Cronbach′s Alpha

Variables	Number of Items	Cronbach's Alpha Coefficients	Cronbach's Alpha Coefficients
		Public University (N = 99)	Private University (N= 144)
Learning Organization Dimensions	**42**	0.974	0.983
1. Create continuous learning	5	0.767	0.838
2. Promote inquiry and dialogue	7	0.899	0.909
3. Team learning	6	0.907	0.911
4. Embedded Systems	6	0.886	0.922
5. Empowerment	6	0.900	0.938
6. System connection	6	0.922	0.923
7. Leadership	6	0.943	0.949
KM Process of Tacit Knowledge	**12**	0.943	0.942
Organizational Performance	**7**	0.927	0.920

The demographic questions for this study consist of the gender of the respondents, the levels of academic qualification and the type of faculties/institutes in the university. As for the gender of the respondents, 56% of the respondents are females and 44% are males in the public university and 49% of the respondents in the private university are male and 51% are female.

Table 2 reveals the academic qualification of the respondents. The majority (53.53%) of the respondents in a public university holds a Masters degree and 34.34% have a Doctoral degree. Likewise, the majority (44%) of respondents in a private university holds a Masters degree and 30% have a Doctoral degree. Most of the respondents (88% in a public university and 74% in a private university) are highly educated and thus, their responses are useful and relevant to this study.

Table 2: Academic Qualification of Respondents

Universities	Public University		Private University	
Current Position	Number	Percentage (%)	Number	Percentage (%)
Doctorate Degree (PhD)	34	34.34	43	30
Masters Degree	53	53.53	64	44
Professional Degree	5	5.05	19	13
Degree	3	3.03	15	11
Diploma	-	-	2	1.30
Not Stated	4	4.04	1	0.70
Total	**99**	**100**	**144**	**100**

The main objective of this paper is to investigate the effect of seven dimensions of the LO and the KMP of tacit knowledge which are deemed important in improving the knowledge performance and innovation in this selected public university and private university in Malaysia. Thus, the following statistical analysis such as factor analysis and standard multiple regression analysis (Tabachnick and Fidell, 2001) are used to extract the valid factors and to investigate the relationships between LO components and KMP of tacit knowledge (independent variables) and the organizational performance of the public university and private university in terms of knowledge performance and innovation (dependent variable).

Factor Analysis was used to confirm that only six (6) out of seven (7) LO components are in conformity to the literature review and are valid for this study of a selected public university. This is due to fact that factor analysis for this study has combined or grouped the two (2) components of LO i.e. empowerment and system connections as one (1) appropriate LO component. Table 3A shows the summary of factor analysis results, factors and Cronbach's alpha scores to justify that the study variables in this study of a public university were reliable for hypotheses testing via the standard multiple regression analysis.

Table 3A: Summary of Factor Analysis Results, Factors and Cronbach's Alpha Scores for a Public University

Factors	Items	Factor Loadings	Eigenvalue (%)	Cronbach's alpha
LO Components	**KMO = 0.899, Sig. = 0.000, Eigenvalue= 71.6%**			
Leadership	8	0.612 – 0.792	51.95	0.951
Team Learning	7	0.593 – 0.764	5.233	0.915
Empowerment and System Connection	8	0.521 – 0.737	4.462	0.934
Promote Inquiry and Dialogue	6	0.509 – 0.707	3.727	0.881
Embedded System	4	0.512 – 0.668	3.123	0.862
Create Continous Learning	3	0.661 – 0.730	3.105	0.744
KM Process	**KMO = 0.917 Sig. = 0.000, Eigenvalue= 72.7%**			
Tranfer of Tacit Knowledge	12	0.870 – 0.710	72. 7	0.944
Organizational Performance	**KMO = 0.934 Sig. = 0.000, Eigenvalue= 74.76%**			
Knowledge Performance and Innovation	7	0.933 – 0.778	74.76	0.942

Table 3B shows the summary of factor analysis results, factors and Cronbach's alpha scores to justify the study variables used in the study of a private university which were reliable for hypotheses testing via the standard multiple regression analysis. Factor Analysis was used to confirm that only five (5) out of seven (7) LO components are in conformity to the literature review and are valid for this study of a selected private university. The factor analysis for this study has combined or grouped the three (3) components of LO i.e. leadership, empowerment and system connections as one (1) appropriate LO component, the three (3) components of LO i.e. Promoting Dialogue and Inquiry, Team Learning and Creating Continuous Learning as another two (2) appropriate variables i.e. Promote Dialogue and Team Learning and Continuous Learning & Inquiry/Feedback. In addition, the factor analysis has also created the new study variable with a new title known as Recognition and Rewards based on the literature evidence.

Table 3B: Summary of Factor Analysis Results, Factors and Cronbach's Alpha Scores for a Private University

Factors	Items	Factor Loadings	Eigenvalue (%)	Cronbach's alpha
LO Components	**KMO = 0.950, Sig. = 0.000, Eigenvalue= 73.5%**			
Leadership& Empowerment & System Connections	21	0.459 – 0.767	60.025	0.976
Promote Dialogue and Team Learning	9	0.480 – 0.777	4.852	0.945

Continuous Learning & Inquiry/Feedback	5	0.562 – 0.700	3.272	0.894
Embedded System	4	0.635 – 0.715	2.808	0.924
Recognition & Rewards	3	0.644 – 0.747	2.589	0.809
KM Process of Tacit Knowledge	**KMO = 0.925 Sig. = 0.000, Eigenvalue= 73.80%**			
Knowledge Disemination	9	0.564 - 0.863	61.688	0.944
Knowledge documentation	3	0.859 - 0.889	12.116	0.905
Organizational Performance	**KMO = 0.888 Sig. = 0.000, Eigenvalue= 67.915%**			
Knowledge Performance and Innovation	7	0.763 – 0.879	67.915	0.920

Standard Multiple Regression Analysis was used for finding the relationship model betweem LO components and   KMP of tacit knowledge being identified as independent variables   and the organizational performance as dependent variable.   This statistcial technique also helps to identify the significant predictors between LO components and the KMP of tacit knowledge that could contribute to the knowledge performance improvement of the selected public university. Table 4A shows the summary of regression results for the research model on the conceptual relationship between LO Components and KMP of tacit knowledge (independent variables) on the organizational performance (dependent variable) in the selected Public University.

Table 4A: Summary of Regression Results of Relationship Model for a Public University

An Integrtated Model of LO Components, KMP of Tacit Knowledge and Organizational Performance	
Standard Multiple Regression Result	**R^2 = 0.714** F = 32.170 Sig. = 0.000***
LO Components	**B = Beta Coefficients P = P-Value**
Leadership	B = 0.239 **p = 0.036****
Team Learning	B = 0.228 **p = 0.024****
Empowerment and System Connection	B = - 0.032 p = 0.789
Promote Inquiry and Dialogue	B = - 0.110 p = 0.230
Embedded System	B = 0.062 p = 0.547
Create Continous Study	B = 0.181

	p = 0.021**
KMP of Tacit Knowledge	B = 0.398
	p = 0.000***
Dependent Variable	Organizational Performance
Note: Supported Hypotheses in boldface type:*p<0.01, **p<0.05, * p< 0.1**	

The regression model in Table 4A had presented the integrated model of LO, KMP of tacit knowledge and organizational performance in the selected public university in Malaysia. This regression model shows the value of R-Square is 0.714 or 71.4%. This indicates that the regression model for LO components and KMP of tacit knowledge explains 71.4% of the variances in the organizational performance in terms of knowledge performance and innovation indicators. When both the LO components and KMP of tacit knowledge are regarded as antecedents of organizational performance, KMP of tacit knowledge is found as the highly significant predictor with p-value = 0.000. The creation of continous study, team learning and leadership with p-values of less than 5% are among those of moderately significant LO components that have positive and significant relationship to the organizational performance of the selected public university.

The result of this study shows that three LO components i.e. continuous study, team learning and leadership characteristics are important LO dimensions for the integration concept of the seven LO dimensions with the transfer process of tacit knowledge to improve knowledge performance and innovation in the selected public university in Malaysia. This survey research discovered that the integration of LO and KM process of tacit knowledge can improve 1) individual's learning new skills,2) increase the number of research products and patents, 3) increase level of innovation and improve processes, 4) increase percentage of skilled workers/expertise and 5) increase percentage of total spending devoted to technology and information processing. The academicians (questionnaires' respondents) had placed greater importance on both human and innovation capital for the significant effect of LO and KMP of tacit knowledge in improving the intellectual entrepreneurship of their university.

The following are the top ranked information of KM process of tacit knowledge dissemination and documentation which can contribute to the concept of knowledge entrepreneur of the selected public university:

1. Existence of documentation describing administrative procedures,
2. New ideas or methods are disseminated and spread to other colleagues in helping to articulate the problem,
3. Insights from colleagues across departments were obtained when dealing with complex problems,
4. When encountering operational problems, attempts were made to look at other departments' experience for critical information and knowledge,
5. Faculty/Unit/Institute share with other members what works and what does not work when developing new ideas,
6. Parts of the work processes are embodied in software that have been modified/customized,
7. Cross-functional teams are used to transfer important learning across groups, divisions and departments,
8. Technology in faculty/unit/institute creates a database that is accessible to the entire organization
9. Recognition given to the value of the ideas and methods which have been made available to employees and organization.

The spirit of continuous study, team learning and good leadership style are among the moderately significant LO components that are regarded as paramount importance to the integration concept of LO and the KMP of tacit knowledge for the intellectual entrepreneurship of the selected public university in Malaysia. The following components for creating the environment of continuous study, team learning and leadership approach are considered to be critically important by the respondents for the integration concept of LO and KM in the selected public university in Malaysia.

1. Employees help each other to learn through continuous study and learning environment
2. Team learning can revise their thinking as a result of group discussions or information collected
3. Team learning can focus on both the group's task and on how well the group is working
4. Leaders empower employees to help carry out the organization's vision
5. Leaders generally support requests for learning opportunities and training
6. Leaders share up to date information with employees about competitors, industry trends and organizational directions
7. Leaders ensure that the organization's action are consistent with its values
8. Leaders continually look for opportunities to learn

The regression model in Table 4B had presented the integrated model of LO, KMP of tacit knowledge and organizational performance in the selected private university in Malaysia. This regression model shows the value of R-Square is 0.663 or 66.3% which indicates that66.3% of the variances in the organizational performance in terms of knowledge performance and innovation had been explained by the regression model for LO components and KMP of tacit knowledge.   When both the LO components and KMP of tacit knowledge are regarded as antecedents of organizational performance, KMP of tacit knowledge disemination is found as the highly significant predictor with p-value = 0.001. The co-existence of leadership, empowerment and system connections with p-values of less than 10% are found to be the more moderately significant LO component that has a positive and significant relationship to the organizational performance of the selected private university.

Table 4B: Summary of Regression Results of Relationship Model for a Private University

An Integrtated Model of LO Components, KMP of Tacit Knowledge and Organizational Performance	
Standard Multiple Regression Result	$R^2 = 0.663$ F = 38.221 Sig. = 0.000***
LO Components	**B = Beta Coefficients** **P = P-Value**
Leadership& Empowerment & System Connections	B = 0.239 **p = 0.096***
Promote Dialogue and Team Learning	B = 0.022 p = 0.833
Continuous Learning and Inquiry/Feedback	B = 0.062 p = 0.552

Embedded System	B = 0.140 p = 0.129
Recognition and Rewards	B = 0.017 p = 0.816
KMP of Tacit Knowledge	**B = Beta Coefficients** **P = P-Value**
Knowledge Disemination	B = 0.423 **p = 0.001***
Knowledge Documentation	B = - 0.051 p = 0.450
Dependent Variable	Organizational Performance
Note: Supported Hypotheses in boldface type:*p<0.01, **p<0.05, * p< 0.1**	

The following are the top ranked information of tacit knowledge dissemination through KMP which can contribute to the concept of knowledge entrepreneur of the selected private university:

1. When encountering operational problems, attempts were made to look at other departments' experience for critical information and knowledge
2. New ideas or methods are disseminated and spread to other colleagues in helping to articulate the problem
3. Organisation shares with other members what works and what does not work when developing new ideas
4. Cross-functional teams are used to transfer important learning across groups, divisions and departments
5. Insights from colleagues across departments were obtained when dealing with complex problems
6. Recognition given to the value of the ideas and methods which have been made available to employees and organization

The co-existence of leadership, empowerment and system connections are among the moderately significant LO components that are regarded as paramount importance to the integration concept of LO and the KMP of tacit knowledge dissemination for the intellectual entrepreneurship of the selected private university in Malaysia. The following components for creating the environment of co-existence of leadership, empowerment and system connections approach is considered to be critically important by the respondents of the selected private university in Malaysia for the integration concept of LO and KM and for the way forward concept of knowledge entrepreneur:

1. Leaders continually look for opportunities to learn
2. Leaders mentor and coach those they lead
3. Leaders ensure that the organization's action are consistent with its values
4. Organization invites employees to contribute to the organization's vision
5. Organization works together with the outside community to meet mutual needs
6. Organization encourages employees to think from a global perspective
7. Organization helps employees balance work and family
8. Organization builds alignment of visions across different levels and work groups
9. Leaders generally support requests for learning opportunities and training
10. Organization gives employees choices in their work assignment

11. Leaders share up-to-date information with employees about competitors, industry trends, and organizational directions
12. Organization supports employees who take calculated risks

5. CONCLUSION

This survey research has found that the integration of LO and KMP of tacit knowledge as antecedents to organizational performance of a public and private university can improve the percentage of skilled workers /expertise, improve individual's learning new skills, greater levels of innovation and improved processes and increase in research products and patents.

KMP of tacit knowledge dissemination and documentation in a selected public university is found to be highly significance in this integrated model. Knowledge sharing when developing new ideas, dissemination of new ideas/methods for solving complex problem, cross-functional teams, database technology and recognition given to the value of new ideas are found to have significant values for thenew integrated concept of learning organization and knowledge management towards knowledge entrepreneur of the selected public university.The spirit of continuous study, team learning and leadership are among the moderately significant LO components in this integrated conceptual model for the knowledge performance and innovation of this selected public university in Malaysia.

KMP of tacit knowledge disemination in a selected private university is found to be the highly significant predictor with p-value = 0.001 for the integrated concept of LO and KM for the intellectual entrepreneurship environment from the knowledge performance and innovation management perspective. The co-existence of leadership, empowerment and system connections is found to be the more moderately significant LO component that has a positive and significant relationship to the organizational performance of the selected private university.

The empirical findingsfrom this comparative study of LO and KM for knowledge entrepreneur of the selected private and private university in Malaysia appears to be consistent with the integration study of LO dimensions and KM process of tacit knowledge carried out by Hernandez   (2000; 2003)on the organizational performance of the manufacturing companies. Hernandez (2000; 2003)had discovered that the structural relationship between the seven LO dimensions and the transfer process of tacit knowledge consecutively showed a positive influence on knowledge performance of the manufacturing organizations in Colombia.

THE INFLUENCE OF CASH FLOW, INVENTORY TURNOVER, AND CAPITAL EXPENDITURE ON CASH HOLDING IN MANUFACTURING COMPANY LISTED ON INDONESIAN STOCK EXCHANGE FOR THE YEAR OF 2010-2014

Muslim A. Djalil, Syiah Kuala University, Indonesia
Jalaluddin, Syiah Kuala University, Indonesia
Cut Dhia Fadhilah, Syiah Kuala University, Indonesia

Abstract

The research examines the effect of cash flow, inventory turnover, and capital expenditure on cash holding in the manufacturing companies listed on Indonesia Stock Exchange for the year of 2010-2014.

This research employs secondary data of which the sources data are deriving from the financial statements published by the capital market reference centre at the Indonesian Stock Exchange Agency. The research type used in this research is hypothesis testing, by using purposive sampling method. There are 275 samples of the data that selected to be become the object to be researched. This research uses multiple linear regression analysis to test the hypothesis.

The result of this research shows that cash flow, inventory turnover, and capital expenditure have a simultaneous significant influence on cash holding. Meanwhile, tested partially, it indicated that both cash flow and inventory turnover has a significant positive influence on cash holding but in contrast capital expenditure has a significant negative influence on cash holding.

Keywords: *Cash Flow, Inventory Turnover, Capital Expenditure, and Cash Holding.*

Introduction

Each company was established with the aim of going concern, achieving optimal profit, gain owner revenue, and the prosperity returns to the shareholder. In order to achieve the aim, each company has obstacles or problems that can be expected and unexpected.

According to Syamsudin (2007), there are two main problems that commonly occur in any business entities. Firsty, fund allocation which can be seen in the statement of financial position on the side of its assets. Second, the fulfilment of the funds that can be observed in the statement of financial position on the liability and the equity side. The financial manager will always try to achieve a balance between assets and liabilities + equity in the statement of financial position. Managing funds seems the best way that can affect the balance of the company. In manufacturing companies we need the fund to operate the company, such as purchase of raw materials, payment of wages, and other payments (Soemarso, 2005). To effectively fulfil the fund we need to manage the cash. Cash principally is a liquid asset that can be used for payment (Suhayati, 2009). While cash is considered as the most current working capital. cash items that company, potential investors, investors, and analysts concerned is called cash holding.

Cash holding can be used for dividends distributed to shareholders, to repurchase shares, to repay debt, to finance the investment opportunities that are profitable, as a backup if there is a danger of unexpected, and save it for the benefit of the company in the future (Gill and Shah, 2012). The financial manager needs to maintain optimal cash holding in order to be going concern. If cash holding is too large is not productive and if cash holding is too small it is considered not good as well, because liquidity will be reduced. Cash holding is measured by

comparing the ratio between the amount of cash and cash equivalents of the company divided by total assets of the company (Teruel et al., 2009).

Every year cash holding in manufacturing company changes which is increase and decrease. The holding cash phenomenon occurs in companies listed on the Stock Exchange in 2010-2014 can be seen in Table 1.1 below. Based on preliminary observations of a total population of 125 manufacturing companies that suitable for the study criteria, it randomly selected 10 companies as the unit of observation of the research as shown below:

Table 1.1
Sample of Cash Holding in Manufacturing Company

No.	Companies	Cash Holding				
		2010	2011	2012	2013	2014
1.	GGRM	2.0830	1.2080	2.1340	0.2980	2.5320
2.	HMSP	0.6450	0.4080	1.0840	1.1480	2.4890
3.	DVLA	2.1310	2.3020	0.6360	0.5650	0.0210

6.	PYFA	0.5450	0.1570	4.9670	1.2090	0.7640
7.	TPSC	0.5420	0.1820	4.0880	0.8730	4.6250
8.	MBTO	3.7570	1.5580	0.2550	1.9110	0.6450
9.	TCID	1.2360	0.5640	1.2120	0.3100	1.1620
10.	KDSI	0.6910	0.1640	0.5510	0.4240	0.0760
	Total	14.603	8.313	16.868	7.613	15.381
	Mean	1.4603	0.8313	1.6868	0.7613	1.5381

Source: Data Processed (2015)

Based on observations as shown in Table 1.1, it indicated that the level of cash holding has fluctuated annually. The average of cash holding in 2010-2011 decreased from 1.4603 to 0.8313, but the average of cash holding for 2012 has increased to 1.6868. In 2013, the average of cash holding decreased again to 0.7613and even lower than in 2011. Not stable cash holding is caused by unstable cash flow, inventory turnover, and capital expenditure.

According to Bates et al. (2009) there are three motives of holding cash. First, transaction motive of which related to the operation of such companies providing cash for the payment of salaries and wages, debt payments, bill payments to creditors, and purchases of merchandise. High operational needs in the companies frequently lead to the funds or the cash need to be higher.

The daily activities of manufacturing companies closely related with inventory of which will be processed to finance the daily operations (Husnan, 1998; Atniati, 2010). High inventory turnover may generate low cash holding because the inventory can be converted into cash, otherwise low inventory turnover can generate higher cash holding because there is a risk in inventories value (Dittmar, 2003; Ogundipe et al., 2012).

Secondly, precaution motive, where the company maintain liquidity to face unexpected contingencies. Things may unexpectedly be experienced by the company is a business risk. Business risk is the risk that is affected by the activities of the business or operations of the company such as changes in prices of raw materials, machinery breakdown, fire, and accidents. This motif is related to the capital expenditure.

Capital expenditures are costs incurred by the company in order to acquire fixed assets (Hery, 2014). According to Bates et al. (2009), because of the need to hold cash, capital expenditure is expected to reduce cash holdings. Capital expenditure increases or creating new assets for the company since these assets can be guaranteed if needed. Capital expenditure also increased its capacity and weaken the need to hold cash. In addition, this

motif is also related to the trade-off theory which states that the company will be in debt to reduce the amount of cash holding.

The trade-off theory confirmed the positive relationship between capital expenditure with cash holding because of the capital expenditure can be guarantee as collateral for the debt, and therefore the cash holding in the company does not need to be too big. However, the results of Kim et al. (2011) and Jinkar (2013) stated that the capital expenditure and cash holdings are negatively related.

Third, the speculative motive that take advantage when the opportunity was there. For example, a company uses its cash to invest in securities (stocks or bonds) in the hope after buying these securities price will go up (Husnan, 1999; Atniati, 2010). This motif is supported by the pecking order theory which states that the financing comes from retained earnings, debt, and equity, also opportunity managerial theory stated that managers may prefer not to pay dividends to shareholders and use it for personal gain.

Theory and the motive justify the positive influence between cash flow with cash holding, where companies prefer internal financing compared with external funding, as was said earlier on speculation the motive, the company will use its cash and not by borrowing from creditors (Kim et al., 1998; Almeida, 2004; Kalcheva and Lins, 2007; Ogundipe et al., 2012).

Based on the pecking order theory, cash flow positively correlated with cash holdings, as well as results of research Ozkan and Ozkan (2004), Kim et al. (2011), Gill and Shah (2012), and Jinkar (2013). However, in contrast to the results of research Almeida et al. (2004) and Daher (2010) which states that cash flow and cash holdings are negatively related.

Referring to the problems above, the research examines the effect of cash flow, inventory turnover, and capital expenditure on cash holding in the manufacturing companies listed on Indonesia Stock Exchange for the year of 2010-2014.

Literature review and hypotheses

Cash Flow Effect on Cash Holding

According Opler et al., (1999) companies that have an increase cash flow tends to withhold their earning. The cash collecting can later be used to fund investment or utilized in the event of financial distress. According to Ozkan and Ozkan (2004) companies that have high cash flow will hold large amounts of cash as a result of their tendency to prioritize internal funding than external funding.

Companies prefer internal financing compared with external round of funding based on the motives of speculation, the company will use the cash that they have and not by borrowing from creditors(Kim et al., 1998; Almeida, 2004; Kalcheva and Lins, 2007; Ogundipe et al., 2012).

Based on the pecking order theory theory which states that the financing comes from retained earnings, debt, and equity, cash flow positive associated with holding cash, as well as results of research Ozkan and Ozkan (2004), Kim et al. (2011), Gill and Shah (2012), and Jinkar (2013). However, in contrast to the results of research Almeida et al. (2004) and Daher (2010) which stated that cash flow and cash holdings are negatively related.

Inventory Turnover Effect on Cash Holding

Based on transaction motive,highoperational needs will cause the funds or the cash needed become higher. The daily activities of companies closely related to the sale of inventory. According to Ogundipe (2012), high inventory turnover can generate low cash holding because the inventory can be converted into cash, otherwise low inventory turnover can generate highcash holding because there will be a risk in inventories value.

Capital Expenditure Effect on Cash Holding

Capital expenditure can increase debt capacity so as to reduce the level of cash. This is caused by companies that have more capital expenditure which can create more assets that can be used as collateral for the company in debt, so capital expenditure is a deduction for cash holding companies (Bates et al., 2009).

The trade-off theory confirmed the positive relationship between capital expenditure with cash holding because of the capital expenditure will be able to serve as collateral for the debt if required, and therefore the cash holding in the company does not need to be too big. However, the results of Kim et al. (2011) and Jinkar (2013) stated that the capital expenditure and cash holdings are negatively related.

Hypothesis

H1: Cash flow, inventory turnover, and capital expenditure have positive effect on cash holding.

H2: Cash flow has a positive effect on cash holding.

H3: Inventory turnover has a positive effect on cash holding.

H4: Capital expenditures has a negative effect on cash holding.

Results and discussion

Normality Test

Normality test is used to see whether the regression model, dependent variable and independent variables, normally distributed or not. A good regression model is a model with normal or near-normal distribution. Normality test in this test uses Kolmogorov-Smirnov test to determine whether the value of the residuals in the regression equation distribute normally or not. The criteria that should be fulfilled in this test if the significance value (p-value) is greater than alpha value 0.05 or 5%, and the variables are distributed normally(Ghozali, 2009).

Classic assumption test was first conducted by normality test of which can be seen on the Table 3.1 below:

Table 3.1
One-Sample Kolmogorov-Smirnov Test

		Unstandardized Residual
N		275
Normal Parameters[a,b]	Mean	.0000000
	Std. Deviation	.99963227
Most Extreme Differences	Absolute	.062
	Positive	.062
	Negative	-.061
Kolmogorov-Smirnov Z		1.035
Asymp. Sig. (2-tailed)		.234

a. Test distribution is Normal.

b. Calculated from data.

Source: Output of SPSS23 (2016)

The outcome of research above concluded that the significance value (p-value) is greater than alpha value 0.05 or 5%, and the variables are distributed normally. Hence, this data can be used in the model

MulticollinearityTest

Multicollinearity test aims to test whether the regression model found a correlation among the independent variables. A good regression model does not have any correlation between the independent variables (Ghozali, 2009). Multicollinearity can be seen from the Tolerance Value and Variance Inflation Factor (VIF). If tolerance < 0.10, or equal to the value of VIF> 10 then, there is multicollinearity that cannot be tolerated and those variables should be excluded from the regression model for obtained the unbiased results. The outcome of the test may bee seen on the table 3.2 below:

Table 3.2
Multicolonierity Test
Coefficients[a]

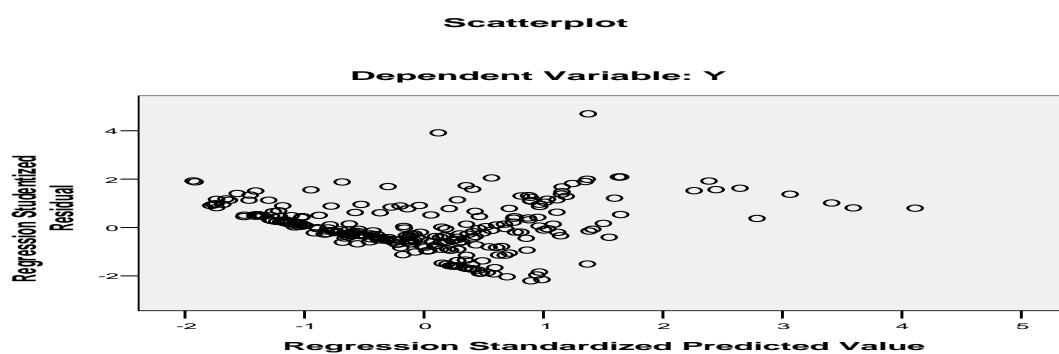
Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	-1.706	.192		-8.88	.000		
	CF	1.363	.269	.203	5.075	.000	.964	1.037
	IT	.532	.028	.758	19.06	.000	.974	1.027
	CAPEX	-1.536	.649	-.093	-2.366	.019	.988	1.012

a. Dependent Variable: CH
Source: Output of SPSS 23 (2016)

Based on the result above, the tolerance value of all variables is greater than 0.10 and also the VIF values is less than 10. Therefore, there is no multicollinearity between each independent variable in this regression model.

Heteroscedasticity Test

Heteroscedasticity test aims to test whether the regression model occurred inequality residual variance of an observation to another or not (Ghozali, 2006). This research uses scatterplot to test whether there is heteroscedasticity or not. "If there is a pattern like dots that not form the specific of a regular pattern (wavy, widened, and narrowed) then it indicates that there is heteroscedasticity. On contrary, if there is no clear pattern, as well as the existing points spread above and below the number 0 on the Y axis, then the heteroscedasticity is not occurred. The outcome of heteroscedasticity test can bee seen on the diagram 3.1:

Diagram 3.1
Test of Heteroscedasticity


From the diagram above, it shows that the spread of residual data is irregular. In addition, the dots are spread above and below 0 on the Y axis and does not form the clear pattern. Therefore, the heteroscedasticiy is not occurred in this regression test.

Autocorrelation Test

"Autocorrelation test is defined as the correlation between the members of a series of observations, sorted by time (as in the data row of the time) or space, as in a cross-sectional" (Gujarati, 2003). To test of autocorrelation in this research employs the Durbin-Watson Test. The result of autocorrelation test can be seen in table 3.4 below:

Table 3.4
Autocorelation Teste
Model Summary[a]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.763[a]	.583	.578	1.00515006	1.964

 a. Predictors: (Constant), CF, IT, CAPEX
 b. Dependent Variable: CH
Source: Output of SPSS 23 (2016)

The outcome of the table 3.4 above shows that the Durbin-Watson (DW) value is 1.964. The DW value will be compared with the Durbin-Watson table value that has the significance value 5% with the total sample (n) 275 and 3 variables (k). According to the Durbin-Watson table, the upper limit score (du) score is 1.7536, while (4–du) value is 2,2464. The provision equation of there is not any correlation between the residual is equation is du < DW < 4-du.

du < DW < 4-du = 1.7536 <1.964<2,2464

Therefore, with the DW value 1.964, there are no any autocorrelation pattern between the residuals in this research.

Hypothesis Testing

Multiple Regressions Linear Analysis

This research is to test the hypothesis that using multiple linear regression analysis to determine whether there is influence of cash flow, inventory turnover, and capital expenditure on cash holding either simultaneously or partially. Multiple linear regression analysis is used to obtain the regression coefficients that will determine whether the hypothesis made will be accepted or rejected using a significance level of 0.05 (5%). The results of hypotheses can be seen in Table 3.5 below:

Table 3.5
Multiple Linear Regression Analysis
Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-1.706	.192		-8.88	.000
	CF	1.363	.269	.203	5.075	.000
	IT	.532	.028	.758	19.06	.000
	CAPEX	-1.536	.649	-.093	-2.366	.019

Source: Output of SPSS 23 (2016)

Based on the outcome of regression analysis from the table 3.5 above, it can be formulated the equation as follows:

$$Y = -1.706 + 1.363X1 + 0.532X2 - 1.536X3 + e$$

The results of the regression equation above can be further explained as follows:
1) The Constant Value (a) is -1706. It means that if cash flow, inventory turnover, and capital expenditure assumed to be constant, then the amount of cash holding companies listed in Indonesia Stock Exchange 2010-2014 period decreased by 170.6%.
2) The regression coefficient of cash flow amounting 1,363 indicated that every increase of 100% in cash flow will raise cash holding of companies listed in Indonesia Stock Exchange 2010-2014 period by 136.3%.
3) The regression coefficient of inventory turnover is 0532. It reveals that any increase in inventory turnover by 100%, it will raise cash holding companies listed in Indonesia Stock Exchange 2010-2014 period amounted to 53.2%.
4) The regression coefficient of capital expenditure is -1.536. This figure reveals that every increase of capital expenditureby 100% , it will lower cash holding companies listed in Indonesia Stock Exchange 2010-2014 period by 153%.
3.2.2 F- Statistical Test Result
F-statistical test is basically used to examine the simultaneous effect of all independent variables on the dependent variable. The results of F-Test can be seen in the Table 3.6 below:

Table 3.6
F-Statistical Test
ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	328.287	3	127.429	126.127	,000[a]
	Residual	273.799	271	1.010		
	Total	656.086	274			

a. Dependent Variable: CH
b. Predictors: (Constant), CF, IT, CAPEX
Source: Output SPSS 23 (2016)

As it can be seen on the table 3.6 above, since the significant value of which is 0,000 lower than the significance level of 0.05 (5%), the first hypothesis (H1) stated that independent variables have a simultaneous effect on cash holding.is therefore can be accepted

T- Test Result
T statistical test basically shows how far the influence of the independent explanatory variables individually or in explaining the variation of the dependent variable (Ghozali, 2009). T-statistic test is particularly used to examine how far the effect of one independent variable on the dependent variable. The results of T-test as shown on the table 3.5 indicated that:
1) The variable of cash flow (X1) has a significance value of 0.000 of which it is less than 0.05 (5%). Hence, it shows that the cash flow has a significant effect on cash holding. Thus, the second hypothesis (H2) which states that the cash flow effect on cash holding is accepted.

2) Inventory turnover variable (X2) have a significance value of 0.000 less than 0.05 (5%). This suggests that the inventory turnover affect the capital structure. Thus, the third hypothesis (H3) stating that inventory turnover affect the cash holding is accepted.

3) Variable capital expenditure (X3) has a 0,019 significance value less than 0.05 (5%). This suggests that capital expenditure affect the cash holding. Thus, the fourth hypothesis (H4) stating that the capital expenditure effect on holding cash is accepted.

Coefficient Determination Testing

This test is done to identify at what extend the independent variables can explain the dependent variable. The coefficient of determination can be seen from the R Square value from the Table 3.7 as follow:

Table 3.7
Coefficient Determination Result
Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.763[a]	.583	.578	1.00515006

a. Predictors: (Constant), CF, IT, CAPEX

b. Dependent Variable: CH

: *Output of* SPSS 23.0 (2016)

The table above shows that the R Square value is 0.58. It means that 58% from the change in dependent variable can be explained by the cash flow (X1), inventory turnover (X2), and capital expenditure (X3). Meanwhile, the others 42% can be influenced by other variables that are not used in this research.

Discussion

Cash Flow Effect on Cash Holding

Based on the statistical test results, partially cash flow has an effect on cash holding in the companies listed in the Indonesia Stock Exchange. It can be seen from the significant value of cash flow by 0000 (0%) or below 0.05 significance level. This positive relationship by 5.075 shown by the cash flow to capital structure indicated that the higher the cash flow in a company, the greater the cash holding. The outcome of the research is consistent with the study of Gill and Shah (2012), whose research regarding Canadian companies listed on the Toronto Stock Exchange 2008-2010 period of which revealed that cash flow has a positive and significant effect on cash holding. The research also confirm the research outcome of Ozkan and Ozkan (2004) which proved that cash flow also has a positive and significant effect on cash holding.

Inventory Turnover Effect on Cash Holding

The outcome of statistical test indicated that partially inventory turnover affect the cash holding in the companies listed in the Indonesia Stock Exchange. It can be seen from the significant value or profitability by 0,000 of which is below 0.05 (5%). The coeffecience of 19.068 indicated a positive relationship between inventory turnover and cash holding. It means that if the inventory turnover increase by 100%, cash holding also will increase by 19%. The high degree of Inventory turnover enhance company's ability to acquire future stocks without having to have liability with the thirt party.The result of this study is consistent with the results of research of Ogundipe et al. (2012), whose research conducted r on listed companies inNigerian Stock Exchange in the period from 1995 to 2009 which showed that inventory and a significant positive effect on cash holding.

Capital Expenditure Effect on Cash Holding
The outcome of statistical test indicated that expenditure affect the cash holding in the companies listed in the Indonesia Stock Exchange. It reveals by the significant value of liquidity by 0,019 or below the rate of 0.05 (5%). The negative relationship of -2.366 indicated by capital expenditure on holding cash means that the higher the capital expenditure in a company, the less cash holding will be. Company that financed by a high capital expenditure normally has most of the cash invested or used in the long term investment, thereby decreasing the company's cash holding. The result of this study is in line with the research results done by Kim et al. (2011), whose research conducted on the company's restaurants in the United States in 1997 to 2008. Their research show that capital expenditure has a significant negative effect on cash holding. This result also confirm the early research conducted by Jinkar (2013) on companies listed on the Stock Exchange in 2007 to 2011 whose findings reveals that capital expenditure has a significant negative effect on cash holding.

Conclusion
1) Cash flow, inventory turnover, and capital expenditure have a simultaneous effect on the cash holding
2) Cash flow has a positive effect on cash holding in the companies
3) Inventory turnover has a positive effect on cash holding
4) Capital expenditure has a negative effect on cash holding

Recomendations for future researched
1) It is expected that in future studies to add some other variables that may have influenced the cash holding such as financial leverage and good corporate governance.
2) The study was only performed on the companies listed in the Indonesia Stock Exchange. For further research, it is therefore expected to expand the object of study to other industries beyond merely manufacturing sectors.

THE EFFECT OF NET INTEREST MARGIN, OWNERSHIP CONCENTRATION, BANK-SPECIFIC AND MACRO FACTORS ON LISTED BANKS IN INDONESIA STOCK EXCHANGE

Pristin Prima Sari, Sebelas Maret University, Indonesia
Ardian Prima Putra, Veteran Bangun Nusantara University, Indonesia
Harmadi, Sebelas Maret University, Sebelas Maret University, Indonesia

Abstract

Net Interest Margin (NIM) reflects the level of bank's efficiency (clayes and Vennet, 2007), risk (Hellman, Murdock and Stiglitz, 2000), competition (Kunt, 2003) and profitability (Chen and Liao, 2011; and Angbazo, 1997) , NIM can be influenced by bank-specific and macro factors (Ikhide and Yinusa, 2012; Tarusa et al, 2012 and Kunt, 2003). The purpose of this study is to examine the influence of Ownership Concentration, bank-specific and macro factors on NIM on listed banks in Indonesia Stock Exchange (IDX). Based on the multiple regression analysis, the results show that Ownership Concentration, Non Performing Loan (NPL), Size, Age, Exchange Rate and Inflation simultaneously have a significant effects on NIM. Furthermore, t-test shows that Ownership Concentration, Age, and Exchange Rate partially have a significant effects on NIM. This research can be used by investors as well as the bank's management in controlling the level of bank's NIM.
Keywords : *Net Interest Margin, Ownership Concentration, Macro and Specific Factors, IDX*

Introduction

The Indonesian government through the Financial Services Authority (OJK) announced that the Net Interest Margin (NIM) of banking in Indonesia is the highest in Asia. Indonesia generated NIM at around 5%, while the countries of ASEAN and ASIA generated NIM at around 4%. The high NIM relatively indicates the high level of profitability of a bank. The high NIM also indicates that a bank is increasingly efficient in managing funding costs (cost of Fund) and the cost of borrowing. On the other hand, the government intends that the public can gain access to credit at low interest so as to encourage economic activities. Therefore, the government plans to lower the interest rate of Bank Indonesia (BI rate), so NIM of banking in Indonesia can go down.

If the government lowers the BI rate in order to lower banks' NIM, the profitability of banks will also decrease. Net Interest margin is the difference between interest income and interest expense (both showing a percentage of average earnings assets). So, it is important for banks to manage and control NIM that is, in turn, profitable for banks. In controlling NIM, banks are also required to conform to the government regulations in the form of BI rate policy.

Moreover, the impact of a decrease in NIM can also be felt by banks' investors. If the banks' NIM tends to fall, the profit those investors receive will also decrease, such as in terms of the distribution of dividends. In addition, the low level of NIM may have an impact on the stock price of the banks. The stock price tends to fall if the banks' NIM declines.

Banking in Indonesia is impacted by the government's efforts to reduce the level of NIM of banking in Indonesia. Bank Mandiri is impacted by government regulations to lower NIM in Indonesia at around 3-4%. Bank Mandiri recorded NIM at around 5% in early 2016 and is the lowest NIM compared to other state-owned banks. The average state-owned banks' NIM in Indonesia is around 7-8%. The average NIM of banks in Indonesia is recorded at 5.39% and is the highest NIM in ASIA. Bank Indonesia cut down its interest rate (BI Rate) from 7% to 6.5% driving NIM to be low.

Ndiame Diop (The Jakarta Post, February 2016) said that the NIM in Indonesia currently stands at 5% above the other countries that are at a level of less than 4%. Furthermore, he said that overhead cost in Indonesia is higher than those of countries. This may be due to particular geographical challenges in Indonesia and, perhaps, the low level of financial inclusion.

Net interest margin is the profit of a bank earned from asset management and intermediary function in the form of interest on loans and deposits. NIM is a measure of a bank's efficiency level (Drakos, 2003; Beck and Hesse, 2009; Lopez Espinosa et al, 2011) and profitability (Chen and Liao, 2011).

NIM is a summary to measure net interest return, an important component of a bank's profit (Angbazo, 1997). To identify the accounting, the bank's net interest margin (before tax) is equal to profit plus banks' operating costs, plus losses on loan, minus non-interest income (Demirguc-Kunt and Huizinga, 2000).

Micco (2007) said that the state-owned banks have a relatively higher interest rate margin. However Dracos (2003) stated that the state-owned banks in the countries of Central and Eastern Europe (CEECs) and the Former Soviet Union countries (FSU) tend to have a lower margin.

Research in bank-specific factors and macroeconomic factors toward NIM are Ikhide and Yinusa (2012), Tarusa et al (2012) and Kunt (2003). The results showed that bank-specific factors significantly influence the bank's NIM. Exchange rate and inflation significantly effect on NIM (Ikhide and Yinusa, 2012, and Ariefianto and Supomo, 2011).

Research about NIM in Indonesia Sidabalok and Viverita (2011), Manurung (2012) and Trinugroho (2014) said that NIM in Indonesia tends to be high. In addition, NIM in Indonesia is influenced by market power of banks, credit risk, liquidity level of banks, bank size, bank efficiency (cost to income), bank-specific factors, and the extent of the interest rate spread.

Table 1.1
NIM of Indonesia and other neighboring countries in 2014

Negara	NIM
Indonesia	5,49
Malaysia	1,77
India	2,85
Kamboja	1,11
Thailand	2,86
Pilipina	2,21
Vietnam	1,43
Papua Nugini	6,96
Australia	1,96
China	2,18
Jepang	0,9
Korea	0,72
US	3,47

Source : World Bank

Table 1.1 shows NIM of Indonesia and some other neighboring countries in 2014. NIM of Indonesia was higher than of US, Australia, China, India, and ASEAN. However, NIM of Indonesia in 2014 at 5.49 was lower than Papua New Guinea which reached at 6.96. The economic condition and system and the different level of competition among these countries are presumably causing the difference level of NIM between those of countries.

Table 1.2
NIM of Indonesia in 2006-2014

Tahun	NIM

2006-01-01	6,1706400
2007-01-01	6,502743000
2008-01-01	5,633601000
2009-01-01	6,6001700
2010-01-01	6,776053000
2011-01-01	6,349160
2012-01-01	5,9009960
2013-01-01	5,18055100
2014-01-01	5,48711200

Source : https://fred.stlouisfed.org/help-faq

Table 1.2 shows that NIM in Indonesia was around 5-6% in 2006-2014. The NIM had fluctuated annually. Indonesia remained as the highest NIM of some neighboring countries such as ASEAN, India, China and even the highest in Asia. NIM in Indonesia is influenced by several factors, both bank-specific factors and macro factors.

Based on results of previous research in NIM, factors that influence NIM show different results. The differences indicate that there is still a gap in theory and empirical testing. In addition, the research related to NIM accounts only a little number compared to the differences in economic conditions, economic system and level of banking industry competition among countries in the world. Variables effecting on NIM have not been thoroughly tested. Similarly, in Indonesia, research in NIM is not so many. For the reasons, the author is interested in examining the effect of ownership concentration, the macro and bank-specific factors toward NIM in Indonesia Stock Exchange (IDX).

This study is to examine and to analyze the effect of ownership concentration, NPL, size, firm age, exchange rate, inflation on net interest margin for listed banks on Indonesia Stock Exchange. This research is expected to benefit banks' management in controlling their NIM. In addition, investors can use the research as a reference in placing investment funds and for their investment decisions. Also, for banks' customers, this study brings a good influence related to banking service transactions.

2. Theoretical Review and Hypothesis Construction
2.1 Theoretical Review
2.1.1 Net Interest Margin (NIM)

Kunt et al (2003) said that net interest margin (NIM) in the traditional lending and borrowing operations of banks reflects the pure operational efficiency of banks and the competitive environment of banking markets. Inefficiency and market conditions tend to increase overhead costs instead of a great interest margin. The differences between the bank's interest margins may represent the choice of whether selecting high overhead costs or great margins rather than reflecting the differences in efficiency and competition. Furthermore, the bank's interest margin reflects asset allocations and risk level of the bank.

The high level of NIM can be interpreted in two viewpoints (clayes and Vennet, 2007). First, the high level of NIM reflects the low level of efficiency of banks and banking market condition which is not competitive. Second, the high level of interest margin reflects the inadequacy of banking regulation and high information asymmetry. In addition, it also indicates a high risk premium meaning that when the level of competition increases, it will encourage speculative behavior of the banking system that could lead the financial stability (Hellman, Murdock and Stiglitz, 2000).

2.1.2 Ownership Concentration (OC)

Kunt et al (2003) said that the impact of bank regulation and the use of concentration are to capture signal and to understand the role of government institutions in the regulation and market structure, one needing to test the operation of individual banks in different regulatory and institutional environment.

2.1.3 Non Performing Loan (NPL)

This study uses NPL to measure the quality of bank loans (Fungacova and Poghosyan, 2011). Banks facing greater credit risk have higher premium risk in their borrowing (Maudos and De Guevara, 2004) thereby increasing interest margins. On the other hand, Fungacova and Poghosyan (2011) said that depositors may require a higher interest rate on their deposits because they feel that banks are riskier, therefore, making interest margin lower.

2.1.4 Bank Size

Bank Size is the size of the bank in terms of total assets of the bank. Beck and Hesse (2009) said that the smaller banks could face higher costs and, therefore, set a higher margin. Bank Size can be measured by Ln (total assets).

2.1.5 Age Firm

Age shows how long the bank has operated. Age also reflects the experience of banks in managing their operation. The longer the life of the bank, the more experience the operation of the bank.

2.1.6 Exchange Rate

Exchange Rate is the value of rupiah against US dollar. Value Exchange rate indicates the macroeconomic condition in a country. Exchange rate influences the activity of trading and banking transactions in the country. Exchange rate of BI transactions is presented in the form of selling and buying rate toward rupiah currency, used as a reference to BI transactions with third parties such as governments (Bank Indonesia, 2007).

2.1.7 Inflation

Inflation is the rising prices simultaneously and continuously thereby increasing prices of other items (Bank Indonesia, 2007). Inflation can also be interpreted as the spreading effect of price increases. An indicator frequently used to measure the rate of inflation is the Consumer Price Index (CPI). Changes in CPI from time to time represent the price movement of a set of goods and services consumed by society.

2.2 Hypothesis Construction

2.2.1 Ownership Concentration and NIM

Niskanen (2010) found that managerial ownership tends to increase agency cost thereby lowering the availability of loans and increasing interest rate and loan terms. Furthermore, Muller and Inderst (2001) and Fillatotchev and Mickiwitz (2001) said that diversified ownership tends to have low agency cost and to use financial resources efficiently. The number of owners makes loans so available that it increases the availability of loans and lowers interest rate and loan terms.

Kunt et al (2003) found that the level of concentration of bank ownership has a significantly positive effect on the level of net interest margin. Claeys and Vennet (2008) found that the high level of industry concentration of a bank causes the high level of the interest margin. Ho and Saunders (1981) said that avoiding higher managerial risk will increase the interest

margin. State-owned banks tend to have NIM greater than private banks in banking sector in Indonesia (Trinugroho, 2014).
H1 : Ownership Concentration has a significantly positive effect on NIM

2.2.2 Non Performing Loan (NPL) Dan NIM
Beck and Hesse (2009) found that the level of risk that constitutes in bank loans effects on margin level. Media et al (2013) said that NPL has a significantly negative effect on the banks' NIM in Indonesia. Fungácová and Poghosyan (2011), Ariyanto (2011) and Trinugroho, et al (2014) said that NPL has a significantly negative effect on net interest margin.
H2 : Non Performing Loan (NPL) has a significantly negative effect on NIM.

2.2.3 Firm Size Dan NIM
Large banks have low margin than small banks. Large banks are more efficient than small banks. So, it has low NIM. Maudos and Solis (2009) found that greater market power measured by the Lerner Index drives NIM to be higher in Mexico bank. Fungacova and Poghosyan (2011) said that large banks relatively have higher margins. That is because the banks can achieve economies of scale that allow them to reduce their margins. Large banks tend to grow in the low-margin loan market (Lopez Espinosa et al, 2011). Manurung (2012) found that the Size has a negative influence on NIM, and market power has a positive influence on NIM.
Beck and Hesse (2009) and Fungácová and Poghosyan (2011) found that a bank with larger scale (bank size) has a significantly negative impact on NIM. Further research NIM in Indonesia, Manurung (2012) and Trinugroho (2014) found that Bank Size has a significantly negative impact on NIM.
H3 : Firm Size has a significantly negative effect on NIM

2.2.4 Firm Age Dan NIM
Aydogan (1996) stated that a bank with more experience has a lower interest margin. State-owned banks with longer experience in banking industry have a lower interest margin than private banks.
H4: Firm Age has a significantly negative effect on NIM

2.2.5 Exchange Rate Dan NIM
Ikhide and Yinusa (2012) found that Exchange Rate Depreciation effects significantly negative on net interest margins for banks in Botswana. Ariefianto and Supomo (2011) said that the Exchange rate has a significant effect on NIM.
H5 : Exchange Rate has a significantly negative effect on net interest margin.

2.2.6 Inflasi Dan NIM
Honohan (2003), Gelos (2009) and Husni (2008) found that inflation has a significantly positive effect on net interest margin (NIM). Furthermore, the same result was also found by Demirgüç-Kunt, Laeven, and Levine (2003). Kunt (2003) found that inflation has a significantly positive effect on NIM and regulations which are so stricter that hampering banks to enter through industry concentration. Similarly, a research conducted by Tarusa et al (2012) found that a higher inflation rate will increase the bank's net interest margin. Ariefianto and Supomo (2011) said that inflation has a significantly positive effect on NIM in Indonesia after crisis.
Based on those results, the research hypothesis is as follows:

H7: Inflasi has a significantly positive effect on NIM

3. RESEARCH METHODOLOGY

3.1 Research Design

This study uses quantitative methods. Quantitative method is a method of research that can be calculated by the number of specific units or presented with numbers using secondary data (Sekaran, 2006: 65). This research is a causality relationship research that is the influence of independent variables on dependent variables.

3.2 Population, Sample, and Research Sampling Technique

The population in this study is a conventional bank both state-owned and private listed in the Indonesia Stock Exchange (BEI) from 2010 to 2015. Meanwhile, the sampling technique uses purposive sampling method, sample selection method with specific purposes, criteria or certain quota (Sekaran, 2006: 136). The data is obtained from Bank Indonesia website, IDX, and banks' website.

3.3 Operational Definition and Variable Measurement
3.3.1 Net Interest Margin (NIM)

Net Interest Margin (NIM) is the difference between interest income and interest expense divided by interest earning assets.

$$NIM = \frac{\text{interest income} - \text{interest expense}}{\text{Average earning assets}}$$

3.3.2 Ownership Concentration (OC)

Ownership Concentration (OC) is a dummy variable. OC is 1 if the percentage of concentrated ownership is more than 50%, while the OC is 0 if the percentage of concentrated ownership amounted to less than 50%.

3.3.3 Non Performing Loan (NPL)

Non-Performing Loan (NPL) is a proxy from the measure of loan quality and bank soundness. According to Bank Indonesia Circular Letter No. 6/23 / DPNP / 2004, the formula of gross non-performing loan as follows:

$$NPL\ gross = \frac{\sum (\text{substandard loans} + \text{doubtful loans} + \text{default loans})}{\text{Total loans}}$$

Bank Indonesia states that the maximum limit is 5% for non-performing loans of banks. If a bank exceeds that figure, it will effect on the soundness level of the bank.

3.3.4 Bank Size

Bank Size is a measure of how large assets are owned by banks. The greater the total assets are owned by the bank, the larger the bank is categorized. Bank Size is measured by Total Assets LN.

Bank Size = LN (Total Asset)

3.3.5 Age

Age is the amount of time since the bank was established until the present day. Age is to measure how long the bank has operated. Age also reflects a bank's level of experience.

3.3.6 Exchange Rate

Exchange Rate is the value of rupiah against US dollar. Value Exchange Rate uses selling rate. Data is obtained from the exchange rate published by Bank Indonesia.

3.3.7 Inflation

Inflation is the rate of inflation in a country. Inflation is measured by the percentage of inflation rate in Indonesia. The inflation data is obtained from Bank Indonesia.

3.4 Teknik Analisis Data

Regression Analysis

Data analysis technique used in this study is multiple regression analysis because the independent variables in this study are more than one. Multiple regression analysis technique is a testing technique used to determine the effect of independent variables on dependent variables. Multiple linear regression equation is

$$Y_{NIM} = \alpha + \beta_1 \, OC + \beta_2 \, NPL + \beta_3 \, Size + \beta_4 \, Age + \beta_5 \, Exchange \, Rate + \beta 6 \, Inflation + e$$

Information:

Y NIM	= Dependent Variable (Net Interest Margin)
α	= Alpha
β	= Coefficient of Independent Variables
OC	= Ownership Concentration
NPL	= Non Performing Loan
Size	= Bank size
Age	= Bank age
Exchange Rate	= rupiah against US Dollar
Inflation	= Inflation in Indonesia
e	= Error

Hypothesis Test

A hypothesis test aims to determine the hypothesis used in the study is accepted or rejected. A hypothesis test consists of three tests which are f-test, coefficient of determination (R2) test, and t-test. Here are three kinds of the hypothesis tests:

Analysis of Variance (ANOVA)/ F-Test

An F-test is used to determine the significance level of the influence of independent variables on dependent variables simultaneously. The level of statistical significance used in this study is 0.05. If the value of F calculation is greater than the value of F table, then all independent variables have a significant effect on dependent variables simultaneously. If the significance value of an independent variable toward a dependent variable is less than 0.05, then the independent variable significantly influences the dependent variable.

Coefficient of Determination (R^2) or R Square

A coefficient of determination test indicates that how much the independent variables can influence or explain the dependent variable used in the study.

T-Test
A T-test is used to determine the significance level of the influence of an independent variable on a dependent variable partially.

Table 4.1
Descriptive Statistics of Banks in IDX 2010-2015

	N	Minimum	Maximum	Mean		Std. Deviation	Skewness		Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic	Std. Error	Statistic	Std. Error
Nim	132	,01890	,14000	,0597871	,00198305	,02278355	1,550	,211	2,246	,419
Oc	132	0	1	,70	,040	,458	-,907	,211	-1,196	,419
Npl	132	,00210	,08900	,0245409	,00124777	,01433580	1,529	,211	3,642	,419
Size	132	12,14450	29,93000	18,2650545	,23139619	2,65853978	2,138	,211	8,289	,419
Age	132	12	120	56,00	2,583	29,679	,771	,211	-,281	,419
Exchange	132	9036,00000	12378,00000	10324,0303030	122,23890819	1404,41813188	,555	,211	-1,587	,419
Inflation	132	,03350	,08380	,0585667	,00184753	,02122645	,085	,211	-1,815	,419
Valid N (listwise)	132									

Based on Table 4.1, Descriptive statistics shows that the number of observations is 132 observational studies. The number of samples is 22 listed banks in Indonesia Stock Exchange (IDX) 2010-2015. The research sample passes the classical assumption tests that are heteroscedasticity, normality, autocorrelation and multicollinearity. Net interest margin (NIM) of banks in Indonesia has the minimum value of 0.0189, the maximum value of 0.14, and the average value of 0.059. Ownership Concentration (OC) is a dummy variable. OC of banks in Indonesia has the minimum value of 0 indicating that ownership of the bank is spread (less than 50%), while the maximum value of 1 indicating that ownership of the bank is concentrated (over 50%). Non-Performing Loan (NPLs) of banks in Indonesia has the minimum value of 0.0021, the maximum value of 0.089, and the average value of 0,024. Bank size in Indonesia has the minimum value of 12.1445, the maximum value of 29.93, and the average value of 18.265. Bank age in Indonesia has the minimum value of 12 years, the maximum value of 120 years and the average value of 56 years. Exchange rate in Indonesia has the minimum value of Rp9036, the maximum value of Rp12378, and the average value of Rp10324.0303. Inflation has the minimum value of 0.0335, the maximum value of 0.0838, and the average value of 0.0585667.

Table 4.2
Coefficient of Determination Test (Adj R Square)

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	,310[a]	,096	,053	,02217271	1,623

a. Predictors: (Constant), Inflasi, age, npl, exchange, size, oc
b. Dependent Variable: nim

Based on table 4.2, the value of Adjusted R Square is 0.053. This implies that the independent variables which are NPL, OC, Size, Age, Exchange Rate and Inflation can influence NIM at 5.3%, while 94.7% NIM is influenced by other variables outside this study.

Table 4.3
F-Test of Banks in IDX 2010-2015

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	,007	6	,001	2,220	,045[b]
	Residual	,061	125	,000		
	Total	,068	131			

a. Dependent Variable: nim
b. Predictors: (Constant), Inflasi, age, npl, exchange, size, oc

Based on table 4.3, the significant level of F-test is 0.045. The significant level is 0.045 < 0.05 meaning that the independent variables which are NPLs, OC, Size, Age, Exchange Rate and Inflation simultaneously have a significant effect on the dependent variable NIM. F value of 2.22 implies that the NPL, OC, Size, Age, Exchange Rate and Inflation can increase NIM at 2.22.

Table 4.4
T-Test of Banks in IDX 2010-2015

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	,090	,020		4,460	,000		
	oc	-,009	,004	-,186	-2,098	,038	,917	1,091
	npl	,051	,139	,032	,369	,713	,943	1,061
	size	,000	,001	,044	,499	,619	,932	1,073
	age	,000	,000	,180	2,063	,041	,946	1,058
	exchange	-3,549E-6	,000	-,219	-2,541	,012	,975	1,025
	Inflasi	-,046	,092	-,043	-,504	,615	,990	1,010

a. Dependent Variable: nim

Based on table 4.4, t-test shows that OC has a significantly negative effect on NIM. The significance value of OC is 0.038. The significance level is 0.038 < 0.05 meaning that OC has

a significant effect on NIM. The t-value of OC is -2.098 meaning that OC has a significantly negative effect on NIM. Every single unit of OC will reduce NIM by 2,098. Ownership concentration can make the bank more efficient, so that it can lower the interest margin of the bank. Ownership concentration require low margin. These results do not support the research hypothesis which states that OC has a significantly positive effect on NIM (Muller and Inderst, 2001; Fillatotchev and Mickiwitz, 2001; Kunt et al, 2003; Ho and Saunders, 1981).

NPL shows the significance level of 0.713, and t-value of 0.369. The significance level is 0.713 > 0.05 meaning that the NPL has no effect on NIM. The level of NPLs of banks in Indonesia does not influence the level of NIM. It shows that NPL of banks in IDX tends to be low. Although the banks have NPL, they can still earn interest margin. Banks is more efficient in managing their income. This result does not support the research hypothesis which states that NPL has a significantly negative effect on NIM. The result of this study is inconsistent with the results of Fungácová and Poghosyan (2011), Ariyanto (2011) Trinugroho, et al (2014), and Beck and Hesse (2009). The second hypothesis is rejected.

Size shows the significance level of 0.619 and t-value of 0.499. The significance level is 0.619 > 0.05 meaning that Size does not influence NIM. The level of bank size does not effect on NIM of banks in IDX. Capitalization of large and small banks does not effect on NIM of banks in IDX. This is because the level of efficiency and management between banks is different. The result of this study is inconsistent with the results of Beck and Hesse (2009), Fungácová and Poghosyan (2011), Manurutng (2012), and Trinugroho (2014). The research hypothesis is rejected.

Age shows the significance level of 0.041 and t value of 2.063. The significance level of 0.041 < 0.05 implies that Age has a significantly positive effect on NIM. Every single unit of Age can increase NIM of banks by 2,063 in IDX. The longer the bank has operated, the greater the level of NIM increases. Banks with more experience can gain larger NIM. Banks which operate longer gain more customers, so they can have larger NIM. This result is inconsistent with the result of the research conducted by Aydogan (1996).

Exchange Rate shows the significance level of 0.012 and t value of -2.541. The significance level of 0.012 < 0.05 implies that exchange rate has a significantly negative effect on NIM. Exchange rate can decrease the level of NIM of banks in IDX. The macroeconomic conditions also influence the level of NIM. This is because banking activities on the Stock Exchange cannot be separated from transactions of foreign currency, especially US dollars. This result is consistent with the research conducted by Ikhide and Yinusa (2012). The research hypothesis in this study is accepted.

Inflation shows the significance value of 0.615 and t value of -0.504. This implies that inflation does not effect on NIM of banks in IDX. The inflation rate of banks does not effect on the level of bank NIM. The movement of the inflation rate in Indonesia does not effect on the banks in generating NIM. The macroeconomic conditions do not effect on the level of bank NIM. With any level of inflation rate in Indonesia, the banks can still generate NIM. The level of bank NIM in IDX is relatively stable from year to year. This result is not inconsistent with the research conducted by Honohan (2003), Gelos (2009), Husni (2008), and Kunt (2003). The research hypothesis in this study is rejected.

Conclusion and Recommendation

Conclusion

Net Interest Margin (NIM) can be interpreted as the efficiency and profitability level of banks. Claeys and Vennet (2007) said that the high NIM can be interpreted as a low efficiency level of banks and banking market condition. They also said that the High NIM reflects high information asymmetry and strict bank regulation. NIM can be influenced by the bank's

internal and external factors which include the bank's non-performing loan (NPL), Ownership Concentration (OC), Size, Age, Exchange Rate and Inflation. Internal factors come from the bank itself consisting of the bank's NPL, OC, Size, and Age while external factors are macroeconomic factors including the bank's Exchange Rate and Inflation. Based on the multiple linear regression analysis, the results show that the variables such as Non-Performing Loan (NPL), Ownership Concentration (OC), Size, Age, Exchange Rate and Inflation simultaneously have a significant effect on NIM. Furthermore, t-test shows that the variables such as OC, Age and Exchange Rate partially give a significant effect on NIM.

Recommendation

Further research is expected to add other variables that may effect on NIM in Indonesia. Total sample can be expanded into banks in Indonesia, so bank NIM in Indonesia can be thoroughly examined.

THE SHIFTING OF HOUSEHOLD WELFARE IN URBAN AND RURAL AREA VIEWS FROM THE CHANGES OF INCOME ELASTICITY OVER THE TIME ON A COMMODITY CONTRIBUTOR TO INFLATION IN THE PROVINCE OF ACEH-INDONESIA

Chenny Seftarita, Syiah Kuala University, Indonesia

Abstract

This paper tried to identify the shifting of public welfare in rural and urban areas in Aceh Province by observing a shifting point on income elasticity of demand over time. The data used in this study is a cross sectional data over the period 2009 to 2013. Data for the analyses are gathered from Susenas routine survey (National Social Economic Survey) in the province of Aceh which is routinely conducted in every March. Data are divided into two groups: rural and urban data. The emperical model used in this study is an Almost Ideal Demand System model (AIDS). Then, process of estimation will be generated using SUR approach (Seemingly Unrelated Regression). Whereas, for the calculating of elasticity AIDS model's it also applied significance tests. Data will be estimated per year and differentiated between rural and urban areas. The result shows that shifting in welfare due to inflation over the period of 2009 to 2013. Moreover, inflation greatly affect the income elasticity change, where rising inflation is causing the share of income for the greater food needs, while the share of income for non-food needs are decrease. In this case the government needs to maintain price stability for basic needs, and constantly develop policies to increase the income of societies.

Key Words: *Income Elasticity, An Almost Ideal Demand System model, Inflation.*

Background

Economic welfare can be measured from the levels of income. If the income is higher, then the economic welfare also higher. The problem is rising incomes will not increase welfare if inflation also increased. The increase in inflation very closely related to the level of welfare. According to Nogueira et.al. (2012), inflation will reduce economic welfare of households, especially those people with low income. The increasing of price will lead the household to loss of their income. It can be seen from the growing percentage of household expenditure for food. In line with this, Bosch and Koch (2009) argued that in general, inflation lowers the purchasing power of the societis because households will spend more money to buy necessary commodities. Moreover, Skoufias et.al. (2011) argues that inflation will reduce the real income of low-income societies. On the other hand, manufacturers do not have the time to increase their production in response to price changes. In the long term rise in prices will reduce the welfare of middle-class households.

Aceh Province becomes a local contributor of the high inflation. In the period 2008-2009, the rate of inflation in Aceh were above the national inflation rate, it is 11.92 percent in 2008 and decreased to of 3.72 percent in 2009 (The Aceh Province Regional Economic Analysis on the fourth quarter, 2009). In the period 2010 to 2013 the rate of inflation in Aceh is under the national inflation rate and continued to decline. Aceh inflation rate increased again in 2013, it is 7.52 per cent. The high inflation in national and regional level in that period are more affected by the increase in world food prices which resulted in higher prices for imported food, such as; rice, onion, soy, fruits and other foods. Furthermore, the seasonal factors and problems of distribution of goods also contributed to the rise in prices of

agricultural commodities. Admininstered price policies also play a role in contributing to inflation during the year. Lowest inflation was recorded in 2012, where the inflation in Aceh is at a level of 0.22 percent. Some commodity deflation and significantly lower the rate of inflation in that period.

Table 1. The Inflation Based on Household Expenditure Commodities in Aceh Province over the period 2010-2013 (in Pecent)

Household Expenditure Commodities	Inflation (December 2010)	Inflation (December 2011)	Inflation (December 2012)	Inflation (November 2013)
General	5,86	3,43	0,22	7,52
1) Food Material	12,37	3,14	-3,94	16,23
2) Manufactured goods, Beverages and	3,63	3,03	2,85	3,66
Tobacco	2,76	2,90	1,36	2,68
3) Housing	6,56	8,19	3,07	-0,61
4) Clothing and	1,05	8,25	1,59	2,10
Footwear	4,02	2,92	2,99	4,29
5) Health				
6) Education and Sport	0,35	0,69	1,25	10,81

Source: BPS, 2009-2013 (Crunched).

The cause of inflation in the Province of Aceh was relatively similar to other regions, which is the average dominant due to increases in the price of food material, such as; rice, fresh fish, onion, chili, chicken, and beef. If it is seen from the development of annual inflation in Table 1, the contribution of food inflation has declined after reaching a fairly high level in 2010, it is around 12.37 percent. The food category is even deflation in some specific commodities in 2012. In 2013, food has increased again and it is quite high until reaching 16.23 percent.

In Table 1, stated that the manufactured food, beverages and tobacco contributed a significant inflation, especially rice, side dishes and cigarettes. Then, other commodities which dominantly contributed to inflation, there are; gold jewelry, fuel, and tuition fees in colleges / universities. The government policy to increase the price of fuel and household fuels are also very significant in contributing to inflation over the period. Table 2 illustrates the key contributor to inflation of food and non-food group.

**Table 2. Dominant Commodities Caused the Inflation
in 2009 to 2013 in Aceh Province**

No	Food Commodities	Non-Food Commodities
1	Rice	Electricity Rate
2	Fresh Fish	Gas and oil
3	Cigarettes	Tuition fees for schools and universities
4	Chicken	Outpatient Service/Clinic
5	Beef	Fuel
6	Dishes	Transportaion Service (Airplane Ticket)
7	Egg	Rentals for housing
8	Chili	Gold and Jewelry
9	Onion	Furnitures

Source: BPS, 2009-2013 (Crunched).

In term of food commodity, rice is always dominant assisted for the highest inflation rate. Often agricultural commodities contribute for more inflation rate caused by the dispropostion between demand and supply. Agricultural commodities classified as a food group that are volatile, which is highly dependent on seasonal factors. Additionally the Aceh Province is still dependent on imports of goods from Medan (North Sumatra), it also affect fluctuations in agricultural commodity prices in Aceh. Meanwhile, non-food commodities are the dominant cause of inflation is still driven by increased electricity and energy, increases of education expense, transport, housing and health.

The increasing of population and rising up the income per capita in Aceh Province effect on growing of demand for commodities contributor to inflation. This cases can be indentified from the intensity of household spending on average per capita for food and non-food. Figure 1 shows the average expenditure of rural and urban households. When compared with Figure 2, it clearly stated the expenditures for food is greater than non-food spending, especially for rural communities. In urban areas, they spend more on foods and drinks, following the consumption of rice, fish and tobacco. It is slightly different from the consumption in rural areas, where spending is for the main food commodities of rice, then food and beverages, tobacco and betel, as well as fish and vegetables.

Figure 1.1

Monthly Average Expenditure Per Kapita (Rp) of Food Group in Aceh Province
Over the Year 2008 to 2012

Figure 2 shows the average expenditure per capita of non-food group. For non-food commodities in urban areas, it is spending closely to the expenditures for food, where the dominance of the expenditure is for housing and household items as well as goods and services. In the other hand, those expenses are smaller in rural areas, regarding to the consumption patterns of the rural population is still on basic need such as rice and fish. This condition reflects the actual welfare differences between urban and rural communities in Aceh.

Monthly Average Expenditure Per Kapita (Rp) of Non-Food Group in Aceh Province
Over the Year 2008 to 2012

The fluctuations of basic goods price could lead to inflation or deflation. This situation could affect the coefficient of elasticity of each good. Elasticity is associated with the level of social welfare. There are a lot of the literature and empirical studies that look well-being by looking at the magnitude of price elasticity and income elasticity. In almost ideal demand model, known as AIDS model (Almost Ideal Demand System), total spending for all commodities studied were deflated by the index Stone became a proxy for household income. The income elasticity or also known as the expenditure elasticity is a tool for measuring changes in welfare as a result of rising incomes. The characteristic of elastic indicates that the commodity purchased is a luxury commodity. The higher the income, the demand for luxury commodities will increase in larger quantities. While inelastic condition characterized by a relatively small revenue allocated to commodities. Some particular commodities are inferior even reduced their consumption if their incomes increase. This is evident from the negative income elasticity.

The AIDS model's introduced the first time by Deaton and Muellbauer (1980), which examined the request of the households in the United Kingdom Year 1954-1974 post-World War II. Results of elasticity that are analyzed in this paper are elasticity on the model of first differences with homogeneity restriction. Income elasticity of demand reflects the changes in the state due to changes in income. The rising of revenue caused increasing high demand on commodities of clothing, beverages and cigarettes. It looks from the income elasticity which is elastic. Whereas, transport and communication, as well as other services are normal goods which elasticity coefficient closed to one. Food commodities and housing are classify as

inferior goods with the elasticity close to zero, even negative (housing). This condition shows that after world war, the demand shifting has been occurred there is the changes of the demand on basic need commodities to luxury commodities. It needs to be underscore that the welfare is inceasing in Britain after the world war II.

Pons (2011), observed the level of prosperity in India are classified as emerging country using a model approach of AIDS. Pons indicated that changes in the price elasticity and income elasticity of urban and rural households over the period 1993 to 2004. In the period of the households in India, rising real incomes have led to changes in demand from 1993 to 2004. The expenditure on non-food commodities are increased, where households are more selective in food consumption.

The shifting of welfare over the time in developing countries in the period before and after the financial crisis of 1997/1998 one of them examined by Skoufias (2003). The research reported on how the effects of inflation as a result of the crisis on changes in income elasticity of demand for basic commodities (calorie foods, such as rice, maize, yam and cassava) in 1996 and 1999 in Indonesia. Rising inflation led to the income elasticity of demand for calories increases seen from a comparison before the crisis in 1996 and after the crisis of 1999. The elasticity of the highest income was Nusa Tenggara, but the elasticity coefficient is inelastic and it does not shift after the crisis (fixed). While, the increasing of inflation most influential in the region of Sumatra, where a shift in the income elasticity is quite large, following the other regions. The lowest changes occurred in households in East Java, where the coefficient of the income elasticity is the lowest compared to other regions. From these findings it appears that rising inflation is causing the income elasticity of demand for commodities increased calorie. Increases in the prices of basic foods cause household spending too much on food, this case reflects a decline in the welfare of the people in Indonesia due to the financial crisis of 1997/1998 ago.

Based on the previous research has been done on the income elasticity in various countries and regions. However, there are no studies on the comparison of the income elasticity of intertemporal particularly in the Province of Aceh. This research is important in order to analyze the effect of changes in the intertemporal elasticity coefficient between urban and rural areas, thus determine its effect on the level of welfare in the Province of Aceh. Some of the advantages of this study, among others, are; Firstly, this research has not been done in the Province of Aceh, especially in-depth study on urban areas and rural areas by using a model of AIDS (Almost Ideal Demand System). Secondly, there are no studies on the elasticity of intertemporal shifting to describe the shift in the level of welfare, especially in the Province of Aceh. Based on this background, writer is interested to further examine the study entitled: "The shifting of household welfare in urban and rural area views from the changes of income elasticity over the time on a commodity contributor to inflation in the Province of Aceh-Indonesia".

Research Problem

The research question is; Whether there was a shifting of household welfare in urban and rural area views from the changes of income elasticity over the time on a commodity contributor to inflation in the Province of Aceh?

Literature Review

1. Consumer Price Index (CPI) and Commodities Contributor to Inflationi

To calculate the amount of inflation is usually calculation used is the percentage change in the Consumer Price Index (CPI) or known as the Indek Harga Konsumen (IHK).

According to Akram et.al. (2010), Consumer Price Index (CPI) is an important tool in the approach to price changes as well as changes in the cost of purchasing approach that represents a set of goods and services. There are two ways of calculating inflation, with CPI calculation and calculation of core and non-core inflation (Seftarita, et.al., 2013). The first way is using the percentage change in CPI, in which the CPI value obtained from the calculation of the seven types of household expenditure, which consists of: 1. Food category, 2. Manufactured foods, beverages, and tobacco, 3. Housing, 4. Clothing and footwear, 5. Health, 6. Education and sports, 7. Transport and communications.

In general, there are many types of commodities that are included in seven of household expenditure above (approximately four hundred kinds of goods and services). These commodities are commodities contributor to inflation, where there are some of them become the dominant commodity accounts for the highest inflation (often the biggest cause of inflation). As an example of this commodity are rice, fresh fish, beef, cigarette filters, the fees of education, health, and others.

2. Welfare Economics Theory

According to Hanninger (1998), the indicators of welfare and poverty can be grouped in three dimensions. There are economic, social, and environmental access. In the economic dimension, welfare measures and poverty can be seen from consumption spending, income, and wealth (input variables). Consumer spending has been the foundation of the welfare theory, where household spending is an approximation of the standard of living. Further developments said that household consumption has become one of the indicators of poverty. In the social dimension, the welfare approach include; the availability of food and nutrition, energy, water and sanitation, health and family planning, and education.

In line with the above explaination, the pattern of household consumption expenditure is one of the variables that can be used to measure the level of welfare (economic) population, while shifting the composition of spending may indicate changes in the level of welfare of the population (IDHS 2012).

According to Ravallion (1992), the analysis of a welfare look more deeply about the welfare aspects of the economy, it is the level of living standards and incomes. There are important things according to the welfare approaches, the assessment of a person's welfare must be consistent with the order of preference expressed by the person. This approach analyzes deeply the level of satisfaction (utility) person. It is quite difficult to remember a person's choice to another very heterogeneous and depends on various conditions, such as individual characteristics, needs and consumption patterns, the size of households, and prices. The person with a high income do not necessarily have a high level of welfare if it has a high utility standards, and vice versa on someone with limited incomes may not necessarily uneasy (Maipita, 2013).

3. Income Elasticity of Demand and Welfare

Income elasticity of demand indicates the magnitude of changes in demand for a commodity as a result of the change in household income. The nature of the income elasticity of significance includes:
1. The nature of inelastic income elasticity means that the revenue increase does not significantly affect the increase in household welfare. Demand for commodities that have these properties classified as essential goods, inferior even if it is negative. Examples of these commodities, among others; rice, household fuel, side dishes, and others.
2. The elastic nature of the income elasticity means that the increase in income is very influential on the growing prosperity of the household. Demand for commodities that have

these properties are classified as luxury goods will increase demand with increasing income. Examples of these commodities, among others; jewelery, goods / services other and others.

3. The nature of the unitary income elasticity (unity) means that when the revenue increase proportionally increase household welfare. Demand for commodities that have these properties classified as normal goods. Examples of these commodities, among others are; health and education.

4. Previous Research

Ernest Engel (1821-1896) who was a Russian economist discovered the relationship between income and consumption of various types of expenditure, namely food, clothing, shelter, lighting and fuel, education services, legal and health, as well as the fun and recreation. This discovery shows that, wealthy families provide a smaller proportion of their purchasing power for food compared to the proportion of the purchasing power of poor households incurred. This discovery was later known as the law of Engel and an overview of the income elasticity (Nicholson, 2002).

Deaton and Muellbauer (1980) look at the welfare of the magnitude of price and income elasticities. This research was conducted in British years 1954-1974 and is the first paper that uses a model of AIDS. The results showed that the price is not too big impact on people's welfare. This is evident from the nature of inelastic price elasticity and even on some commodities looks perfectly inelastic. Observing from the income elasticity, it has improved welfare in British evident from the increasing demand for commodities outside of their primary needs.

Brockwell (2013) is seeing at welfare in developed countries, those are Sweden, Denmark, and the United Kingdom (UK) in 1970-2009. Judging from the price elasticity of basic commodities, rising inflation does not significantly affect household welfare, seen from the average price elasticity tends to be inelastic. The characterted of price elasticity can be seen in demand for commodities beyond basic needs. Therefore, the nature of the income elasticity, increased income led to the proportion of expenditure on basic goods even had a small proportion. In countries that have achieved a high level of welfare, the allocation of income tends to be dominated by the demand for non-food, luxury goods and services.

Tahs et.al. (2012) indicates the changes in the welfare of rural households in Iran over the period 1971-2008. It considered from the price elasticity, price increases continue to occur in Iran over the study period had an impact on the welfare of the decline of rural households in Iran. The increase in revenue over the period of the study was to improve the welfare of households in Iran. The level of welfare is evident from the elasticity of the average income elastic commodities beyond the basic necessities, such as food, drink, and clothing.

Pons (2011), saw the level of prosperity in India are classified as emerging country. In general, rising prices affect the declining levels of household welfare, especially in rural households. Rising real incomes have led to changes in welfare, in which spending on non-food commodities (non-food) increases. Increased household income causes more selective in food consumption. This evolution affects the reaction of demand to changes in price elasticity and income elasticity and further change in the welfare of the country.

Kahar (2010) analysed the welfare of urban and rural areas in Banten Province in 2007-2008. Increased commodity prices surveyed have lowered the welfare of rural and urban households. The greatest impact was seen from the declining demand for education and health services in the province of Banten. When viewed from the income elasticity, in general it can be concluded that in Banten province, household spending is still preferable to the needs of staple foods such as rice, this implies that prosperity is still relatively low in the province.

The shifting of intertemporal welfare by using a model of AIDS in the period before and after the financial crisis of 1997/1998 one of them examined by Skoufias (2003). The

subject of this study only discusses changes to the income elasticity in some regional areas in Indonesia. From these findings it appears that rising inflation is causing the income elasticity of demand for commodities increased calorie. The largest increase occurred in the province of a relatively low income. This reflects the decline in welfare in Indonesia as a result of the monetary crisis in 1997/1998.

Research Method

1. Field of the Research

This research analyzes the shifting of household welfare in urban and rural area views from the changes of income elasticity over the time on a commodity contributor to inflation in the Aceh Province over the period 2009 to 2013.

2. Source and Type of Data

The data used in this research are secondary data from 2009 to 2013 with time horizone is cross sectional. The data extracted from the sample on the activities of the household survey conducted by Susenas (National Social Economic Survey) in the Province of Aceh, one of the main activities are the publication of the data on Indonesian consumption per province. The data used in this study are the overall sample data which is used on Susenas household surveys in Aceh Province on March each year from 2009 to 2013. Data consisted of two groups of data. There are urban households and rural households, as shown in Table 3.1.

There are the commodities observed included commodities contributor to inflation over the period of the study, those are: rice, fish, cigarette, the cost of education (Tuition for School / or college / academy), household fuels (LPG), and healthcare services (Outpatient Service or / clinic). The researched commodities are commodities that are dominant and contribute to causing of inflation in the province of Aceh over the period from 2009 to 2013.

3. Emperical Model

The model applied in calculating the income elasticity is a model Almost Ideal Demand System (AIDS). This model was introduced by Deaton and Meullbauer (1980) where domestic demand can be measured from the proportion of the budget allocated for a particular item. AIDS gives a demand function models are as follows:

$$w_I = \alpha_i + \sum_j \gamma_{ij} \log P_j + \beta_i \log(^x/_p) \text{ for all i,j=1,2...7} \quad ....(1)$$

With P is an price index that determined by:
$$Log\ P = \alpha_0 + \sum_i \alpha_i log P_i + ^1/_2 \sum_i \sum_j \gamma_{ij} + log P_i P_j ....(2)$$

By using the Stone price index, equation (1) becomes linear and easy to estimate. AIDS Model will be regressed using a model Iterative Seemingly Unrelated Regression (SUR). The following models of AIDS were used in this study:

$$w_i = \partial_i + \sum_j \gamma_{ij} log P_j + \beta_i \log (x/p *) + \mu_i ....(3)$$

Where:

w_i : share consumption commodity i to the total of expenditure j commodity

i = j   : 1,2... (7 commodity contributor to inflation)

$log P_j$: commodity price j (where j=1,2...7)

log (x/ p*): log of the total expenditure which deflated to Stone Index

μ_i : error term

∂_i : constanta

γ_{ij}, β_i : regression coeffisient

The third equation (3) estimated using the SUR model, then it found the β_i coefficient on the variable log(x/p*) to calculating income elasticity. The following calculation formula based on the estimated income elasticity model of AIDS (Aliasuddin, 2003):

Formula to calculate an Income Elasticity $\quad \eta_i = 1 + \dfrac{\beta i}{w_i}$ ....(4)

To test the significance of elasticities will be used variance and standard error of each of elasticities, that is:

Var $(\eta_i) = \dfrac{Var\ (\beta i)}{W^2}$ ....(5)

Result of income elasticity estimation

Table 3 shows the income elasticity over the period 2009 to 2013. In general, the income elasticity is statistically significant. It means there is strong influence between income and increasing demand. In 2009, Aceh's economy experienced relatively slow growth and relatively low. Contribution of the oil and gas sector decreased, even with oil and gas fuel the economy is negative (-5.51 percent). Conditions that will encourage economic activity are the rehabilitation and reconstruction that occurred after the tsunami in 2006. The process of rehabilitation and reconstruction would be enough to absorb employment and impact on increasing purchasing power in urban areas. Thus, in 2009 the income elasticity on various commodities greater in urban than in rural areas. This condition reflects the level of prosperity which is quite good in urban areas.

In the year of 2010, the first quarter of 2013 economic growth in Aceh devoided oil and gas continues to grow in line with the declining of inflation. The coefficient of the income elasticity are very much influenced by the rate of inflation and price elasticity of each commodity, especially in basic commodity such as rice, cigarettes, fish and electricity. However, in rural area, they are more prosperous in fulfill the basic necessities such as rice, tuna, and electricity, but it is declining the welfare of fulfillment the needs of non-food commodities such as LPG, education and health.

***:Significance on the accuracy 95 percent (on t calculated 1.96)

Table 4 indicates the shiftind of the income elasticity of commodity rice. Consumption of rice per household is usually not too much changed, that depending on the number of household members and family eating patterns. Usually if a higher household income, the household will often eat outside the home so that the use of rice is not too much, compared to the poor families are heavily dependent on rice. However, the quantity amount can be expected considering the human body is also very limited in eating food. It is causing increased rice expenditure is due to price changes. The higher the price of rice, the expenditure on rice has also increased.

Table 4.
Shifting of Income Elasticity
on Rice Commodity

Rice Commodity	2009	2010	2011	2012	2013
Rural	0.634	0.739***	0.524	0.508	0.672***
Urban	0.890***	1.012	0.833***	0.821***	0.897***

Source: Regression Result of AIDS Model (Crunched), ***:significance on accuracy 95%
Figure 3. Shifting of Income Elasticity
on Rice Commodity over the period 2009 to 2013

In general, the elasticity of income in urban areas is greater than the value of elasticity in rural areas. There are several reasons why these differences occur, first; most of the rural areas can satisfy its own needs without having to buy rice, given that most households in rural areas work in agriculture, other than that they were not the rice farmers can buy at a cheaper price. This is in contrast to the urban areas that are pure consumers and should always issue income to buy rice at higher prices compared to the prices in the village. Second; rising prices or inflation in the food group will cause a portion of disposable income for rice growing. The greater the elasticity of the staple food is actually not a positive thing, even an indication of declining welfare.

In 2009 through 2010, inflation in food led to the increasing a coefficient of the income elasticity of rice both in rural and urban areas. This condition indicates a decrease in the welfare of both rural and urban areas. Urban area are measured less welfare from the point of view elasticity coefficient, which is 1,012 in 2010. This means an increase in income of 10 percent will increase the demand for rice by 10:12 per cent, but the value of this elasticity is

not statistically significant. Inflation declining in 2011 and 2012 caused the value of the income elasticity of rice commodities decreased both in rural and urban areas. This situation shows that the welfare of households in the province improved because of declining inflation. In 2013, the value of elasticity in urban and rural areas is increasing, this is due to rising inflation is quite high for the year. Widespread crop failure due to weather causes the agricultural sector contribution to Aceh's economic decline, even scarcity cause inflation in food commodity (agricultural). These conditions decrease the welfare of households in rural and urban area.

Table 5.
Shifting of Income Elasticity
on Fish Commodity

Fish Commodity	2009	2010	2011	2012	2013
Rural	0.789	1.067	0.599***	0.526***	0.393
Urban	1.018	1.109***	0.993***	0.988***	0.949***

Source: Regression Result of AIDS Model (Crunched), ***: significance on accuracy 95%
Figure 4. Shifting of Income Elasticity
on Fish Commodity over the period 2009 to 2013

Table 5 illustrates the shifting in the income elasticity of fish commodity. It is almost the same as rice, the value of the income elasticity of fish in the larger urban areas than in rural areas. In 2010 the value of the income elasticity of commodity swordfish increase, which becomes 1,109 in urban areas. The elasticity stretcher relatively elastic and showed that tuna is a luxury commodity. In 2011 through 2012, an income elasticity of commodity fish has declined in both rural and urban, this condition shows that swordfish is not a luxury commodity, but shifted into staples. In 2013 the value of this elasticity back slightly decreased both in urban and rural areas, but the elasticity is not significant in rural areas. In general, income elastisity coefficient for fish commodity is larger in urban areas than in rural areas. This situation shows that the demand for tuna is greater in urban than in rural areas.

Table 6.
Shifting of Income Elasticity
on Cigarette Commodity

Cigarette Commodity	2009	2010	2011	2012	2013
Rural	0.102	1.057	-0.258	-0.107	0.039
Urban	0.885	1.207***	0.762***	0.003	0.156

Source: Regression Result from the AIDS Model (Crunched), ***:significance on accuracy 95%
Figure 5. Shifting of Income Elasticity
on Cigarette Commodity over the period 2009 to 2013

Table 6 point the shifting of income elasticity on cigarette commodity. In general, the elasticity of cigarette commodities are greater in urban than in rural areas. But the coefficient of elasticity in rural areas is not statistically significant and therefore can not be concluded whether these coefficient represent actual conditions. In 2010 the coefficient of the income elasticity on thre cigarettes in urban areas increased becomes elastic that is equal to 1.207. This means that commodities are non luxuries demand increased if revenue increases. In 2011, the value of the income elasticity of cigarette commodities in urban is decreased to inelastic reflecting the declining allocation of household expenditure on tobacco consumption.

Table 7. Shifting of Income Elasticity
on Electricity Commodity

Electricity Commodity	2009	2010	2011	2012	2013
Rural	0.565***	0.456	0.562***	0.429***	0.364
Urban	0.601	0.313	0.259	0.116	0.245

Source: Regression Result of AIDS Model (Crunched), ***:significance on accuracy 95%
Figure 6. Shifting of Income Elasticity
on Electricity Commodity over the period 2009 to 2013

Table 7 indicates the shifting of income elasticity on electricity commodity. In general, the elasticity of electricity commodities are relatively inelastic and positive, which means that electricity is classified as normal goods and basic needs. From the results of the income elasticity of electricity commodity, seen in urban elasticity value is not statistically significant, so it can not be deduced how a shift in electricity demand seen from the income elasticity. In rural areas, there is significant value in 2009, 2011 and 2012. In general decline in the value of the income elasticity of electricity commodities in rural areas over the period. These conditions reflect a decrease in the welfare of rural households. Electricity is a basic requirement household allocation of household income must be provided for these commodities, despite an increase in the price of this commodity. Rising inflation will reduce the amount of electricity consumption, but demand for these commodities continue to increase with increasing population.

Table 8.
Shifting of Income Elasticity
on Gasoil Commodity

Gasoil	2009	2010	2011	2012	2013
Rural	-11.86***	-7.123***	0.709	1.015***	0.025
Urban	-1.424***	-1.038	0.985***	1.068***	0.730***

Source: Regression Result of AIDS Model (Crunched), ***: significance on accuracy 95%
Figure 7. Shifting of Income Elasticity

on Gasoil Commodity over the period 2009 to 2013

Table 8 addresses the shifting the income elasticity of commodity LPG (liquified petroleum gas). LPG is the fuel of households had some substitutes such as kerosene and firewood, substitute goods is increasingly rare, so the dependence on LPG increased. In 2009 through 2010 the value of the income elasticity of commodity LPG is negative and relatively elastic. The highest value found in rural areas. This means that an increase in income will reduce the demand for LPG. This elasticity results look very unrealistic, but there are several reasons that quite unacceptable. Rising inflation, including rising prices of LPG in 2009 and 2010 led to rural and urban households prefer other alternative fuels that are still available for the period. The relatively low income and high poverty rate causing the household budget allocation is limited to the needs of the food, and very little for other needs. Housekeeping is winning big with lots of replacement goods that are cheaper LPG. In 2011 and 2012, the welfare of households is getting better it can be seen from the increased value of the income elasticity of commodity LPG. Even in 2012 the coefficinet of the income elasticity for LPG are relatively elastic, which means that LPG is a luxury commodity. In 2013 the value of the income elasticity of commodity LPG decreased reflecting the declining welfare. The decline was highest in rural areas close to the value that is perfectly inelastic, but in rural areas the value is not statistically significant.

Table 9.
Shifting of Income Elasticity
on Education Commodity

Education Commodity	2009	2010	2011	2012	2013
Rural	0.643	0.441	0.642***	0.429***	0.724***
Urban	0.811	0.723***	0.347	0.655***	0.632***

Source: Regression Result of AIDS Model (Crunched), ***: significance on accuracy 95%
Figure 8. Shifting of Income Elasticity
on Education Commodity over the period 2009 to 2013

Table 9 shows the shifting of the income elasticity for education commodity at the college. In general, education is a normal good commodity (not a luxury) both in urban and in rural areas, this condition shows that education is not the main thing for households in Aceh. This condition can be seen from the comparison between the elasticity of food commodities such as rice and tuna with education commodities, where the value of the elasticity of the larger food commodities. Ideally, in some cases in developed countries, the income elasticity for education, health, and other non-food commodities has elastic properties, while food commodities has a value smaller elasticity and inelastic. The period between 2009 and 2011, the value of the elasticity of education has declined in both rural and urban areas. It reflects the level of welfare and concern for the importance of education in higher education is getting decreased. In 2012, the income elasticity of education commodities increased slightly in urban areas and stagnant in 2013. Slightly different where in rural areas, the elasticity of commodities increased education in 2013 which amounted to 0724 per cent. This situation shows that, the welfare of rural households was slightly better than in urban areas.

Table 10.
Shifting of Income Elasticity
on Education Commodity

Health Commodity	2009	2010	2011	2012	2013
Rural	-4.325***	-1.735***	-0.390	0.547	-0.464
Urbam	-5.151***	0.482	1.346***	0.683***	0.006

*Source: Regression Result of AIDS Model (Crunched), ***: significance on accuracy 95%*

Table 10 states the shifting in the income elasticity of health commodities (Outpatient Service). In 2009 demand for health services in Aceh is inferior both in rural and urban areas, visible from a negative income elasticity. In 2010, in rural area physician services has a negative income elasticity is caused by the presence JKRA program. Inferior usually defined as a commodity that has a low quality which demand decreases when income increases. But in this case the conditions are slightly different, where physician services are relatively expensive is no longer an option because no other alternative is the enactment of government programs such as the Health Insurance Rakyat Aceh (JKRA) are given for free to the people of Aceh. Besides rising inflation caused real household income decreased, so that although nominal incomes rise this will not increase household demand because prices also have risen.
Figure 9. Shifting of Income Elasticity

on Health Commodity over the period 2009 to 2013

The increasing income per capita in urban areas cause the coefficient of the income elasticity of physician services increased positive, even in 2011 the commodity physician services is a luxury item seen on the income elasticity is relatively elastic in the amount of 1,346. This means that the increase in revenue of 10 percent would increase the demand for physician services amounted to 13:46 percent. In 2012, the income elasticity of commodity physician services dropped to inelastic. This situation shows the declining welfare of urban households. In 2013 decline in real income due to inflation menyebaban people value the income elasticity of declining commodity physician services and even close to perfectly inelastic. Income elasticity of 2013 amounted to 0006 and classified as approaching the perfectly inelastic, but this value is not statistically significant (t <t table). Rising inflation causes commodity physician services become expensive goods that are not included in the calculation of household expenditure, and household re-use alternative to other health JKRA program. This situation shows the declining welfare of urban household.

Conclusion And Suggestion

A shift in welfare due to inflation over the period 2009 to 2013, where rising commodity prices cause inflation contributor to the decline in household wealth both urban and rural areas in the province of Aceh. Inflation greatly affected the income elasticity change, where rising inflation is causing the share of income for the greater food needs. Both in rural and urban areas, the increase in commodity prices caused inflation contributor allocation of income to buy food commodities increases, reverse allocation of income to buy non-food commodities is getting smaller, even on health commodities is negative. This situation shows that rising prices cause households in the province of Aceh increasingly prosperous.

The higher the inflation, the spending will be increased (this is closely related to the decline in real incomes due to inflation). In this case is necessary to control inflation by the monetary authority, Bank Indonesia. The caused of the inflation in food commodities are likely due to the demand side. One solution is to attempt self-sufficiency, especially commodities which have potentially owned by Aceh, for example, rice and fisheries. Then, advised on local authorities to continue to encourage development in the agricultural sector, especially since these sector provide a major contribution to the growth of non-oil economy in Aceh over the period 2009 to 2013. Finanlly, the government should focus on promoting food self-sufficiency program, such as rice and other agricultural commodities.

For non-food commodities, the local government should regulate commodity distribution smoothly every vital needs of society, including LPG. Education and health commodity are increasingly becoming less noticed by households. It is related to the low income households and low awareness of the importance of education, and health. Regarding this condition, we need the efforts of the government to create policies to boost household income.

MARKETING CAPABILITY FOR THE SMES: A MEASUREMENT SCALE

Popy Rufaidah, Universitas Padjadjaran, Indonesia

Abstract

This study developed a measurement scale for marketing capability of the SMEs. The study used marketing capability theory as the theoretical foundation for the bases of creating the scale item. A total of 315 survey responses collected from the business owners of the SMEs in Indonesia and were used to examine the factor structure of the scale using Exploratory Factor Analysis and Confirmatory Factor Analysis. Three factors emerge to measure marketing capability of the SMES: marketing intelligence, marketing execution and marketing strategy. Results from this study suggest that the concept of marketing capability for the SMEsprovides an attractiveavenueforbetterunderstandingofhowbusiness owners of the SMEs perceivestheir marketing capability. This research is one of the first to investigate simultaneously the measurement of marketing capability of the SMEs.

Keywords: *marketing capabililty, SMEs, measurement, scale*

Introduction

There are several challenges in developing the small and medium size enterprises (SMEs). These challenges have not been resolved to date, and continues to be fought. Global business has been entered the era of free trade for decades, making it mandatory for all stakeholders to provide strong support for the SMEs. One thing that must be continuosly done is to enhance ability to penetrate various market. The ability of marketing the products or namely as marketing capability is very interesting and attractive topic for the last three decades.

Marketing capability studies have been carried by many scholars in various field of study as well as at different type of organizations.Dutta et al (1999) testing the successfulness in high-technology markets as depended on the marketing capability. DeSarbo et al (2005) identified the sources of heterogeneity for empirically deriving strategic types in organization. They stated that capabilities in marketing, management, and IT are related to increased performance (e.g., profitability). Their study adopoted Miles & Snow's (1978) model on strategic type. It found out that successful prospecting strategic type should strengthen technology and IT capabilities, and successful defending strategic type should strengthen market linking and marketing capabilities. They also referred to Conant et al's study (1990) about strategic types, distinctive marketing competencies and organizational performance as a multiple-measures-based study.

Foss (2006) studied the knowledge elements in the Multinational Corporation. He referred marketing capability in a subsidiary in a certain country, or a patent held by the corporate center as part of knowledge element.

Hwang & Tong-Liang (2006)'s study investigated whether a company's managerial efficiency primarily depend on its marketing capability or investment capability in Non-Life Insurance Companies. Wang et al (2006) used the term of marketing competency instead of marketing capability in examining technological capability that influences business performance. Firms that work with stable (mature) technologies must rely on other kinds of capability (e.g. marketing capability) to a greater extent.

Kim (2006) studied the effect of supply chain integration on the alignment between corporate competitive capability and supply chain operational capability. His study found out that innovative marketing capabililty interrelated with the logistical supply chain capabilities, differentiation, and customer service capabilities for performance improvement.

Singer (2006) used the term of digital marketing capability in his study that assuming all players have access to virtually the same information and information technologies and can therefore equally target a demographic with precision. He argued that there is no compelling competitive advantage in any digital-marketing capability, regardless of how deeply it can reach to personalize a message.

Wang & Kess (2006) examined the partnering motives and partner selection among exporters. They agreed to what Shipley et al. (1989) point out that most exporters emphasize marketing capability and commitment while undervaluing the risk criteria; and established selection criteria in recruiting overseas distributor, which consists of sales and market factors, product and service factors, and risk factors.

Adam & Featherstone (2007) examined a comparison of web use in marketing by local government in the United States and Australia, found that based on the population size and economic performance, Californian counties exhibit a greater degree of sophistication in terms of their marketing capability than counties in Alabama.

Curtis et al (2007) investigated the role of marketing in bringing private sector skills to public health partnerships. Their study explore the contribution that the marketing capability of the private sector can make to health partnerships.

Fisher et.al (2006 in Endres 2008) stated that a number of things are required by different types of organizations to be competitive including marketing capability, physical resources, financial resources, and human resources.Sharma& Srinivasan (2008) argued that marketing capability of the firm is required at international level. Capron & Mitchell (2009) believe that marketing capabilities as important factor in the business that consists of the capability in mastering the customer knowledge, branding, and pricing.

Based on the aforementioned extant literature, very few studies of marketing capability amongst SMEs. So that, this study encourages to investigate marketing capabilities among SMEs. In this background, the study aims to test an empirical model of marketing capability dimension that could form the basis for a better understanding of the determinants of the construct.

The subsequent section summarizes the existing literature on marketing capability. Drawing from the literature, the study, firstly, conduct a qualitative study that generates attributes of marketing capability amongst SMEs. The proceeding section, as the second stage, describes the quantitative part, in exploring the purification and the validation of marketing capaility scale and its psychometric properties. The article then validates the scale to generate an empirically founded definition of marketing capability for the SMEs (MC-SME). The final section discusses the limitations of the study, offers directions for future research and discusses managerial implications.

Literature review

This paper provides a background on marketing capability by reviewing relevant literature and attempts to propose an operational definition of marketing capability.The term of 'marketing capabilities' oftenly has been used within various business types. But there is still no consistent definition for the term itself. Prior research stated that marketing capability is an "integrated process" designed using corporate knowledge, skills and resources to take advantage of market opportunities (Vorhies, 1998:4; Guenzi & Troilo, 2006: 975; Azizi *et al.*, 2009: 312). While Azizi *et al.* (2009: 311) alone state that marketing capability is a company's various marketing-related abilities and capacities.

Krasnikov & Jayachandran (2008: 1) see marketing capability as organization's ability to determine the need and demand of customers and effectively link it to what organization offers to customer better than competitors so as to take advantage of market opportunities. Marketing capabilities include market orientation in it, but apart from that, it cover another important aspect of marketing, i.e. business relationship marketing (Nguyen & Nguyen, 2011: 715).

On the other hand, Santos-Vijande*et al.* (2012: 26) defined marketing capabilities as complex processes that involve combining market knowledge and organizational resources to generate added value. Marketing capabilities aim to fulfill the market-related needs of the business, allowing firms to provide superior added value and to adapt better to changing market conditions (Vorhies, 1998: 16). Santos-Vijande*et al.* (2012: 26) cited Vorhies (1998), Weerawardena (2003), and Tsai & Shih (2004), then stated that marketing capabilities are evident when individuals use accumulated knowledge of clients, markets, and the environment; their experience; and the company's resources to resolve commercial problems, to generate higher value for the organization's clients, and to be competitive.

Nath *et al.* (2010: 319) defined marketing capability as the integrative process in which a firm uses its tangible and intangible resources to understand complex specific needs, archieve product differentiation relative to competition, and achieve superior brand equity. In the challenging and dynamic global marketplace, marketers must attain the agility and clarity to be able address these changes and this can only be achieved via building unique marketing capabilities (Day, 2011).

Kamasak (2014: 234) identify marketing capabilities as major determinants of firm performance because they address the so-called VRIN (Valuable, Rare Imitable, Non-substituable) criteria for strategic assets. Three distinct sets of marketing capabilities can be identified (Morgan *et al.*, 2009; Vorhies *et al.,* 2009; Kamasak, 2014) as: specialized marketing capabilities, architectural marketing capabilities, and market information processing capabilities.

In the context of SMEs, Pratono & Mahmood (2015: 10) in their paper concluded that SMEs should pay more attention on marketing capability as marketing capability has significant impact on organization performance (Para-Requena*et al*., 2012: 49). This supported further by Coviello *et al*. (2006: 49-50), Lam & Harker (2013) and O'Cass & Sok (2013), they stated that marketing capabilities are key to success for small firms. Within the scope of SMEs, Snell *et al.* (2015: 530) conceptualizemarketing capabilities as a portofolio of practices (transaction, database, interaction, network, and e-marketing) available to small firms.

Based on above mentioned literature review, lack of scientific instruments to measure marketing capability for the SMEs, this study aimed to propose a measurement approach of marketing capability for the SMEs (MC-SME). Thus, the important question of this study is how MC-SME is measured as a proposed measurement approach.

Measurement

The indicators used for marketing capability in the recent studies differ among the researches. Such studies who confirmed a positive link between marketing capabilities and organizational performance jointly measured using financial indicators (profits, returns, etc.) and market-related (sales, market share, etc.) indicators (i.e. Tsai & Shih, 2004 andKyrych & Kuzhda, 2015). While the other study, e.g. Snell *et al.* (2015) had adapting marketing capability's measurement from Coviello *et al*. (2006) consisted of six components (purpose of exchange, managerial intent, type of contact, duration of exchange, nature of communication, and managerial investment).

Nguyen & Nguyen (2011: 715) explain that marketing capability helps the firm to effectively implement marketing plans in rapidly responding to the needs of customers, competitive actions and macro-environment. While Pratono & Mahmood (2015: 4) state that marketing capability refer to capability in managing marketing mix strategy (i.e. covering pricing, selling, communication, channel management and product development).Wherein marketing mix has generally well-known as essential in building marketing plan, marketing mix itself is considered as a capability that may enable firm to set and implement new strategies to meet firm performance as organizational goal through responding market-changing conditions (Morgan *et al*., 2009: 910-911).

However, Morgan *et al*. (2009: 910-911) considers not only marketing mix but also marketing strategy development and execution as two interrelated marketing capability areas. They stated futher that these capabilities may be rare, valuable, non-substituable, and inimitable sources of advantage that can lead to superior firm performance.

Jiang *et al*. (2015: 1190) used Vorhies and Morgan (2005) scale to measure marketing capability including dimensions of marketing research, pricing, channel management and market communication. While we agreed that according to Pratono & Mahmood (2015) pricing, channel management and market communication are indicators measured marketing mix.

So that, based on the aforementioned extant literature review, this study defines marketing capability as the ability of the firm to analyze the competitive environment of the market, formulate strategy of marketing and execute various strategical marketing decision in order to enhance the marketing performance ofthe firm.

Thus, the research question of the study is as follows: first, whether marketing capability of SMEs is determined by the dimensions of competitive market environment, marketing strategy and marketing execution. Second, whether the proposed model of marketing capability is a valid measure. Based on the preceding discussion, the following hypotheses is investigated in this study: firstly, that there is a relationship between the dimensions of marketing capability and their underlying latent constructs. Secondly, the model of marketing capability is a fit model. In other word, the hypotheses is as follows:$H_0 : \square = \square(\square)$, the structural equation model (SEM) is a fit model. $H_1 : \square \square \square(\square)$, the structural equation model (SEM) is not a fit model.

Methodology

Scale Development

The present study is part of larger study that investigated the relationship amongst entrepreneurial marketing, tourism competitive advantage and destination world of mouth marketing. In order to validate empirically the marketing capability scale, this study adopted scale development that was presented based on the suggestions of Churchill (1979). Churchill's scale development has been adopted by many scholars in marketing as one of the most comprehensive steps (Rufaidah 2006, in press). The first step involved was specifying the domain of the construct to portraying exactly what is included in the definition i.e. marketing capability definition. The construct of marketing capability has already been specifically defined in the literature review section to make clear what is included in that construct.

The second stage included was generating a sample of items. Generating an initial item pool through qualitative research by conducting individual in-depth interviews with 30 business owners of the SMEs. The author of the study was incharged as the consultant and training instructor for the The New 100.000 Entrepreneurs Formation Program of West Java Provincial Government in the periode of 2013-2018.

The program is implemented by the Department of Cooperative, Micro, Small and Medium Enterprises (DCM-SME) of West Java Province.The author incharged as a researcher in this study and have had direct access toward respondents of the study. The respondents were the business owners of the SMEs in West Java Province who recruited under the abovementioned program. They were invited to participate in the training held by the DCM-SME of West Java Province.The interviews were conducted after the training session for the SMEs is finished.

The third stage involved was developing questionnaire scaling and development. Furthermore, the stage of collecting the data was executed. Finally, the last stage of scale development wasassessing the validity and reliability.

Content validity or face validity was implemented by inviting comments, suggestions and feedback from experts (academicians, researchers and business practitioners) so as to effectively address all the aspects of marketing capability of the SMEs. After this process, the original 19 items developed to measure marketing capability for the SMEs was approved. Results of the pretest items revealed none instances of ambiguous wording (which were subsequently retained). The instrument also is confirmed for the completion based on the feedback from experts.

This study also has completed the purification step using exploratory factor analysis (EFA). Then, it applied the assessment of the scale using validity and reliability test. The results of the tests is presented after the descriptive statistics is discussed.

Data collection

Paper based questionnaires were distributed to the respondents and they were asked to give their answer on a five-point Likert scale (ranging from 1, indicating very strongly disagree to 5, indicating strongly disagree).

Exploratory and descriptive research were adopted for this study. The descriptive research used in this study to describe the characteristics of phenomena (Malhotra, 2010), such as, the frequency of the occurrence of the activities of the SMEs in evaluating their marketing capability as entrepreneurs.

The respondents of the study were the business owners of the SMEs. The sample of 315 respondents was provided by the Department of Cooperative, Micro, Small and Medium Enterprises (DCM-SME) of West Java Province from more than 10.000 databases of the SMEs in West Java Province.

According to Hair *et al.* (1998), the sample size needed to conduct CFA is five observations per scale item. Thus, the sample size for the validation stage of the study of 315 qualified responses exceeds the requirements to achieve a high level of statistical power.

The 315 respondents were invited by the DCM-SME to participate in the training session where the author in charged as an instructor of the training. The DCM-SME gave the author an opportunity to obtain direct contact with the respondents. The corresponding survey generated 100% response rate. The data collected were subsequently analyzed utilizing the software packages SPSS and LISREL.

Descriptive statistics

The background information of the surveyed respondents is shown in Table1.Themale respondentsoutnumberedthe femalerespondents(56,5% and 43,5%).Morethan73%ofthem are agedabove25yearsold. The category of the SMEs as respondents studied were classified based on on their product produced: as food/drinks producers (33,7%), fashion/garments makers (14,9%), services providers (13,7%) and others type of service businesses (37,8%). More than 46.7% of them are highly educated in their educational background i.e., college graduate and

postgraduate. More than 52.0% of them have been running the business for more than one year.

Table 1 Respondents Characteristics (N=315)

Demography		F	(%)
Gender	Male	178	56,5%
	Female	137	43,5%
Age (years)	<18	10	3,8%
	18-24	72	22,9%
	25-34	86	27,3%
	35-44	93	29,5%
	45-54	36	11,4%
	≥54	16	5,1%
Product Produced	1. Food/Drinks	106	33,7%
	2. Fashion	47	14,9%
	3. Services	43	13,7%
	4. Others	119	37,8%
Education	Elementary School Graduate	12	3,8%
	Junior High School Graduate	27	8,6%
	Senior High School Graduate	131	41,6%
	College Graduate	30	9,5%
	University Graduate	112	35,6%
	Other	3	1%
Length in the business	0-1 year	151	47,9%
	1-2 years	35	11,1%
	2-3 years	32	10,2%
	>4 years	97	30,8%
Education	High School Graduate	55	26.6
	Diploma Graduate	5	2.4
	College Graduate	56	27.1
	Posgraduate (Master)	86	41.5
	Posgraduate (Doctoral)	5	2.4

Results and discussions

Before performing statistical analysis, data preparation procedures were done, following the recommendations of Hair et al. (1998): assessment of missing values, outliers, and normal distribution. The results of the assessment shows that the database ready for the quantitative analysis.

The following section discussed the testing of the measurement model, which is performed through exploratory factor analysis (EFA) and confirmatory factor analysis.

(CFA). The EFA is used as part of the purification stage, whilst the CFA is used as part of the structural equations modeling (SEM).

EFA is particularly appropriate for scale development i.e, finding the factors of dimension of marketing capability or when there is little theoretical basis for specifying a priori the number and patterns of common factors (Hurley et al., 1997).The CFAis particularly used to test the power a specific set of indicators in measuring causal relationships between latent variables (Garson, 2002).

Result of the EFA

In the stage of applying the EFA, the data test the appropriateness of the 19 items for generating the dimensions of marketing capability of the SMEs, hence refining the scale.

The principal component analys is was used as the extraction method and the factors were rotated using the varimax rotation method with Kaiser normalization. Priorto that,reliability test was performed and only item swith an index greater than0.4 were considered for factor analysis.

Using Kasier's (1960) criterion to retain the components with eigenvalues greater than 1.0, theEFAprovides a 3-factor solution with 46,813% Total VarianceExplained (TVE). The factor loadings exceeded 0.50 and, since items did not cross load, these results demonstrate discriminant validity of three scales (F-1: Factor-1; F-2: Factor-2; F-3: Factor-3).

Table 2 Result of EFA

No.	Code Item	C	Component		
			F-1	F-2	F-3
1.	MC1	0,668	0,717		
2.	MC2	0,561	0,713		
3.	MC3	0,536	0,644		
4.	MC4	0,539	0,529		
5.	MC5	0,614	0,721		
6.	MC6	0,654	0,577		
7.	MC7	0,637		0,587	
8.	MC8	0,506		0,534	
9.	MC17	0,622		0,619	
10.	MC18	0,714		0,772	
11.	MC19	0,692		0,763	
12.	MC9	0,630			0,679
13.	MC10	0,587			0,711

14.	MC11	0,667			0,755
15.	MC12	0,620			0,724
16.	MC13	0,539			0,643
17.	MC14	0,595			0,564
18.	MC15	0,487			0,538
19.	MC16	0,503			0,607
Variance Explained		5,738%	7,301%	46,813%	

Note: C:Communalities, F-1: Factor-1 (Dimension-1); F-2: Factor-2 (Dimension-2); F-3: Factor-3 (Dimension-3).

The Bartlett Test of Sphericity shows a very small p-value (0.000), indicating that there is a statistical probability that the correlation matrix has a significant correlation among at least some of the variable (Hair *et al.,* 1998). Furthermore the Kaiser-Meyer-Olkin Measure of Sampling Adequacy is also very high, 0.937, indicating that the latent constructs can predict the variability in the responses on the observed variables. Kaiser-Meyer-Olkin (KMO) was calculated to determine sampling adequacy for factor analysis of the marketing capability' items in terms of homogeneity of variables. Both the test provides evidence that support factor analysis.

Table3displaystheresultsoftheKMO and Bartlett's Test.All items with factor loading greater that 0.4 were used for the final run of the factor analysis.Looking at the communalities score, the lowest score was the item of MC15 0,487; it illustrated that the loadings nearly closed to the threshold of 0.50. Therefore, researcher decided to retain the abovementioned item as the factor loading score was above 0.500.

Table 3 Results of KMO and Bartlett's Test

No.	Factors	KMO	Bartlett's Test of Spericity
1.	Factor-1	0,862	647,371 (p = 0,000)
2.	Factor-2	0,830	625,179 (p = 0,000)
3.	Factor-3	0,902	1201,138 (p = 0,000)
4.	Marketing Capability	0,937	3238,615 (p = 0,000)

Note: Significant at level 5%

The resulting three factors and corresponding items were presented to three marketing academics familiar with the research. Klaus & Maklan's (2012) steps was adopted for this study, in order to label the appropriate label for each dimension. The expert panel was given the conceptual description of the three dimensions and asked to rate the three dimensions

description as either "very applicable," "somewhat applicable," or "not applicable" relative to the dimension and its items. Dimension descriptions needed to be rated at least as "somewhat applicable" to be retained. This procedure resulted in the labeling of the following dimensions of marketing capability of SMEs, namely, marketing intelligence, marketing strategy and marketing execution.

Factor-1 is composed of 6 items that focuses on the level of existing marketing competencies as entrepreneurs in the following aspects i.e., MC1: Knowledge of consumer preference for similar products offered by their business; MC2: Knowledge of competitor products that have similar characteristics with their products offered; MC3: Knowledge of product trends preferred by growing consumer; MC4: Skills in predicting or forecasting profits accurately; MC5: Awareness of the major strengths of business that is currently occupied; MC6: Knowledge of competitors' product marketing planning process. This factor was labeled marketing intelligence.

Factor-2 was defined by 5 items that related with the level of existing marketing competencies as entrepreneurs in the following aspects i.e., MC7: Knowledge to allocate resources to marketing activities; MC8: The ability to integrate marketing activities with the rest of business activity; MC17: The ability to set the location of production facilities / business; MC18: The ability to mix used in the cost-effectiveness of doing business; MC19: Ability to evaluate the activity of marketing for future improvements. This factor was labeled marketing execution.

Factor-3 was strongly the reflection of the items that measures the level of existing marketing competencies as entrepreneurs in the following aspects i.e., MC9: Skills to segment market served; MC10: The ability to establish the uniqueness of the product / service business offered; MC11: The ability to develop products / services of the new business; MC12: The ability to improve the quality of service of their business; MC13: The ability to set prices according to the market being served; MC14: The ability to design messages for product promotion; MC15: The ability to establish a media campagin that match the capabilities of business; MC16: Knowledge of the current image of the product / business based on customers' impression. This factor was labeled marketing strategy.

Result of the CFA

CFA is employed to test whether the measures of a construct of marketing capability of the SMEs are consistent with researcher's understanding of the nature of that construct. CFA is often used in data analysis to examine the expected causal connections between variables (Hurley et al 1997). The CFA is executed using the Structural Equation Modeling (SEM). SEM is a statistical methodology that takes a confirmatory i.e., hypothesis testing approach to the analysis of a structural theory (marketing capability of the SMEs) bearing on some phenomenon.

The present study involved using SEM on the survey data to test the initially conceptualized model (Figure 1) for overall data-model fit.

In a test of validity, significance of the contribution of each variable to each manifest latent variables can be seen from the t-value of its loading factor / t-value (factor loading).The current model of SEM have had a critical t-value $\geq$ 1,96. This shows that all the indicators or manifest variables significant in reflecting their respective latent variables. However, based on the above figure, it can be seen that not all indicators have standardized loading factor (SLF) $\geq$ 0.7. MC2 has the lowest indicators (SLF is 0.57). So, in other word that the contribution of indicators MC2 is not strong enough in explaining Dimension-1, when it compared with other indicators that make up the dimension-1. However, the rest of the indicators are strong enought to explain the other two dimensions.
Figure 1. Measurement Model – Three Factors

A two-step analysis process was conducted using LISREL as recommended by Byrne (1998). Firstly, a CFA was performed to assure that each latent variable was measured appropriately. The second step was assessing the overall data-model fit of the model. A measurement model was specified and the model's overall fit was assessed to determine to which degree the model was consistent with data.

Reliability

Reliability is defined as the probability of obtaining similar results with independent observations. The study determined the reliability dimensions from the factor analysis by computing the internal consistency coefficient, Cronbach's alpha coefficient. A magnitude of 0.5 to 0.6 for the Cronbach alpha statistic was sufficient in the early stages of basic research (Nunnally 1967), but that an alpha of 0.8 is more desirable. The results of the Cronbach's alpha levels for 3 factors items (Factor-1, Factor-2 and Factor-3) showed acceptable alphas (D-1: .843, D-2: .844, D-3: .892). High scores on all three scale indicate respondents' positive attitude toward all three dimension of the scale.

The convergent validity of the research instrument can be assessed by three measures: item reliability, construct (composite) reliability and average variance extracted (Fornell&Larcker, 1981 in Chau 1997). In this process, the examination of the convergent validity adopted Chau's (1997) explanation.

Item reliability specifies the amount of variance in an item due to the underlying construct rather than to error and can be obtained by squaring the factor loading (Fornell and Larcker, 1981 in Chau 1997) i.e., item of MC14 that measures the level of existing marketing competencies as entrepreneurs in designing the messages for product promotion; is measures

individually. Either an item reliability of at least .50, a significant t value, or both, observed for each item in marketing capability measurement is considered to be evidence of convergent validity.

Table 4 Result of Validity and Reliability Tests

No.	Factor, TVE & CR	Code	Validity	α
1.	Marketing Intelligence (Factor1) AVE = 0,44 CR = 0,83	MC1	0,751	0,843
		MC2	0,726	
		MC3	0,753	
		MC4	0,731	
		MC5	0,771	
		MC6	0,758	
2.	Marketing Strategy (Factor3) AVE = 0,50 CR = 0,88	MC9	0,780	0,892
		MC10	0,744	
		MC11	0,785	
		MC12	0,778	
		MC13	0,737	
		MC14	0,783	
		MC15	0,729	
		MC16	0,707	
3.	Marketing Execution (Factor2) AVE = 0,48 CR = 0,82	MC7	0,737	0,844
		MC8	0,738	
		MC17	0,789	
		MC18	0,837	
		MC19	0,823	

Note: AVE=Average Variance Extract, CR=Construct (composite) Reliability;α=Cronbach's alpha

Table 4 presents the results of the convergent realibility measurement using AVE, CR, Validity and Cronbach's Alpha.

Construct Reliability (CR) or composite reliability was applied to get the result of reliabity of each item that is used in this research. CR benefits in this study to determine the consistency of construct validity (Said, Badru & Sahid 2011:1099).The formula of construct reliability is as follows: (square of summation of factor loadings)/(square of summation of factor loadings) + (summation of error variances) (Fornell and Larcker 1981 in Chau 1997). Nunnally (1978) suggested a minimum of .80 for evidence of convergent validity.

The average variance extracted (AVE) measures the amount of variance that is captured by the construct of marketing capability of the SMEs in relation to the amount of variance due to measurement error (Fornell and Larcker 1981 in Chau 1997). The formula of AVE is as follows: (summation of squared factor loadings)/(summation of squared factor loadings) + (summation of error variances) (Fornell and Larcker 1981 in Chau 1997). They suggested that it is desirable that the construct exhibit estimates of .50 or larger. However, it is very often variance extracted estimates will be below .50, even when reliabilities are acceptable (Jiang et al 2000). So that, the variance extracted estimates for each dimension of marketing capability of the SMEs are also considered acceptable as shown in Table 4 (Factor-1,2,3 fall between the range of .44 - .50).

Composite reliability is analogous to the Cronbach (1951) coefficient alpha for measuring the reliability of a multiple-item scale (Jiang et al 2000). Composite reliability exposes the internal consistency of the indicators measuring a given factor (Fornel&Larcker 1981).

The composite reliability values for each marketing capability of the SMEs dimension are relatively high (> .80). Furthermore, the traditional Cronbach's alpha values for each of the marketing capability dimensions as shown in Table 4 for comparison, all values exceed the recommended value of .70 (Nunnally, 1978).

After completing the convergent validity test, next stage, isconsidering the good fit of the data. The model will provide a good approximation to reality, if it provides a good fit to the data. In this study, the CFA was performed by carrying out path analysis using a structural equation modeling.This is step is operated to test the first hypotheses investigated in this study: that there is a relationship between the dimensions of marketing capability and their underlying latent constructs.

Given that the structural equation model specifies the causal relationships of the constructs (Factor-1, Factor-2 and Factor-3) to one another as posited by underlying theories (Chau 1997).

A wide range of goodness-of-fit indices is used to assess the model (Tabek 5), namely,Goodness-of-fit Index (GFI)**,** Adjusted Goodness-of-fit Index (AGFI)**,** Root Mean Square of Approximation (RMSEA)**,** Normed Fit Index (NFI)**,** and Comparative Fit Index (CFI)**.**

A value greater than .80 is desirable for AGFI, and values greater than .90 are desirable for CFI, RMR, and NNFI (Anderson &Gerbing, 1988).For both GFI and CFI, values > .95 constitute good fit and values> .90 acceptable fit; For the RMSEA, it has been suggested that values < .05 constitute good fit.

Table 5. Result of fit indices

Ratio χ^2/df	GFI	AGFI	RMSEA
1,775	0,93	0,90	0,048
	Good Fit	*Good Fit*	*Close Fit*
NFI	CFI	PNFI	PGFI
0,98	0,99	0,77	0,66
Good Fit	*Good Fit*		

Standardized RMR	P-value	Chi-Kuadrat (χ^2)
0,039	0,00	239,62
Acceptable Fit		

All the fit indices (Table 5) indicate that the marketing capability of the SMEs' scale is a three-factor construct and the evidence indicates that the full model is valid.

Validity
Validity refers to the capacity of a set of indicators to really measure the underlying concept. Several different forms of validity can serve as criteria for assessing the psychometric soundness of a scale i.e., marketing capability scale (Grapentine, 1995 in Robledo 2001): face validity, convergent validity, discriminant validity, and predictive or concurrent validity. Face

validity has been executed and discussed previously. In this section, the study presented the results of the other three of validity tests.

Convergent-validity analysis pertains to the extent to which scale items of marketing capability of the SMEs assumed to represent a construct (marketing capability of the SMEs) do in fact "converge" on the same construct (Robledo 2001). Convergent validity is the extent to which each measure correlates with other measures of the same construct and high interitem correlations within each construct indicate convergent validity (Chau 1997).

The convergent validity of the instrument for measuring marketing capability can be determined using Bentler Bonnet coefficient (Voon & Lee 20092 in Voon & Lee 2009). The Bentler-Bonnet coefficient represents the ratio of the chi-square value of the specified measurement model to that of a null model, which has no hypothesized item loading on a construct (Siu-Cheung and Lu, 2004). Scales with this coefficient value of 0.90 or above demonstrate good convergent validity. The results of the Bentler- Bonnet coefficient (delta) for the threefactors of marketing capability of the SMEs are greater than 0.9, si that the scales demonstrate strong convergent validity (Table 6).

Discriminant validity is the extent to which the measure of a construct i.e., marketing capability does not correlate well with measures of other constructs (Chau 1997). Discriminant validity can be achieved if an item correlates more highly with items intended to measure the same construct than with items used to measure a different construct (Chau 1997).

To test the discriminant validity, this study adopted the steps and the justification presented by Voon & Lee (2009). Their test used the justification from Ahire*etal.,*(1996) and Sureshchandar *et al.,* (2001). The discriminant validity of a measure is the degree to which the measure is diverge from the measures that are theoretically not similar (Sureshchandar *et al.,* 2001 in Voon & Lee 2009). If it can be shown that the different components on the constructs actually measure different things, this will be a sound basis to claim that the instrument posses discriminant validity. The chi-square difference test was used to establish the discriminant validity of the instrument.

Table 6Fit Indicies of Marketing Capability's Dimension

Dimension-1: Marketing Intelligence, Number of items: 6	*ROSR*	χ^2/df	RMSEA	GFI
	0,60 – 0,75	2.065	0,059	0,98
	AGFI	**CFI**	**TLI**	**BBC Coef. Δ**
	0,95	0,99	0,98	0,98
Dimension-2: Marketing Execution, Number of items: 5	*ROSR*	χ^2/df	RMSEA	GFI
	0,58 – 0,86	2,438	0,067	0,99
	AGFI	**CFI**	**TLI**	**BBC Coef. Δ**
	0,95	0,99	0,98	0,99
Dimension-3: Marketing Strategy Number of	*ROSR*	χ^2/df	RMSEA	GFI
	0,62 – 0,77	1,977	0,055	0,98
	AGFI	**CFI**	**TLI**	**BBC Coef.**

items:				Δ
8	0,95	0,99	0,99	0,99

Note: ROSR: Range of Std. Regression; BBC = Bentler-Bonett Coefficient

To further assess the degree of uni-dimensionality of the constructs and the convergent validity of the items representing the constructs, measurement models were specified for each construct. In this stage, the CFA was carried out for the individual constructs of marketing capability to check how closely the designated items represent the construct (Thompson 2004).

According to Ahire *et al.,* (1996in Voon & Lee 2009; Siu-Cheung and Lu, 2004), 'a goodness of fit index of 0.90 or higher for the model suggests that there is no evidence of lack of uni-dimensionality' (Ahire *et al.,* 1996, p.38 in Voon & Lee 2009).

Table 6 shows the results of the CFA on the individual constructs. CFI value of 0.99 and above testifies strong scale unidimensionality, Δ value of 0.90 and above testifies strong scale convergent validity (Sureshchander *et al.,* 2001 in Voon & Lee 2009).

To test the discriminant validity, this study adopted the steps and the justification presented by Voon & Lee (2009). Discriminant validity refers to the property of a construct to be measuring only one concept and not overlapping another. Discriminant validity is a type of construct validity that assesses the extent to which an item of one dimension (i.e., marketing intelligence) does not correlate with other dimensions (i.e, marketing execution) of construct (Emari et al 2016). Discriminant validity was evaluated by two tests, firstly, examination of the inter factor correlation (Kline 2011 in Emary et al 2016). Secondly, comparison of the squared correlation with AVE value of each of the three latent constructs (Fornel and Larcker 1981 in Emary et al 2016). If the inter factor correlation is below 0.85 so discriminant validity can be established (Kline 2011 in Emari et al 2016). The chi-square difference test was used to establish the discriminant validity of the instrument.

In this test (Tabel 7), the CFA was performed on selected pairs of constructs, allowing for correlation between the two constructs andthenthetestwasrerunagainbyconstrainingthecorrelationbetweenthepairsbyfixingit to1(Ahire*etal.,*1996). Fornell and Larcker (1981 in Emari et al 2016) suggested that a squared correlation between three constructs (i.e., marketing intelligence, marketing strategy and marketing execution) should be lower than the AVE for each construct. Because the root AVE value not greater than the value of the correlation between the latent variables then the latent variable has not good enough value of a discriminant validity. Moreover, AVE is a common method of testing discriminant validity (Gerbing and Andersen 1988). The cutoff of AVE should be above the recommended value of .50 (Fornell and Larker 1981). Very often, variance extracted estimates will be below .50 when realiabilities are acceptable (Jiang et al 2015). Table 4 provides the score of the AVE for the dimensions. Thus, all dimensions were found to have adequate convergent validity based on their high factor loadings (>.50) (Gerbing and Andersen 1988). Furthermore, the AVE (Table 4) for each latent factor exceeded the respective squared correlation between factors, thus providing evidence of discriminant validity (Fornel and Larker 1981).

Table 7The Discriminant Validity

	MI	ME	MS
MI	**0,663**		
ME	0,86	**0,693**	
MS	0,84	0,90	**0,707**

Note: MI: Marketing intelligence; ME: Marketing Execution); MS: Marketing Strategy

Based on the seven model fit measurement indices (Table 5 and Table 6), almost all of them meet the requirements of fit model, thus the model is categorized good fit. Figure 1 shows the model as fit by the CFA. So that, based on model fit index, the null hypothesis is accepted ($H_0 : \square = \square(\square)$, the SEM model is a fit model) and the alternative hypothesis is rejected ($H_1 : \square \square \square(\square)$, the SEM model is not a fit model). So that, the scale of the marketing capability of SMEs (MC-SME) is an accepted instrument.

Discussion

Marketing capability is considered crucial for SMEs to survive in sustaining its position in the market. Marketing in SMEs is often largely base on the owner capability. Based in the results of the study, the dimension of marketing capability for the SMEs consists of three factors. First factor is labeled marketing intelligence. Marketing intelligence represent a continuous process of understanding, analyzing, and assessing an SME's internal and external environments associates with customers, competitors, and markets (Chern *et al.*, 2015: 399). These continous process usually blended with the acquired information and knowledge to support the SME's marketing related decision.

Similar to the indicators that shape first dimension of the marketing capability of the SMEs, namely marketing intelligence. This factor composes of 6 items that represents the level of existing marketing competencies of the entrepreneurs in grasping the knowledge of consumer preference for similar products offered by their business (MC1); knowledge of competitor products that have similar characteristics with their products offered (MC2); knowledge of product trends preferred by growing consumer (MC3); skills in predicting or forecasting profits accurately (MC4); awareness of the major strengths of business that is currently occupied (MC5); knowledge of competitors' product marketing planning process (MC6). These items are the representation of marketing intelligence of the SMEs in understanding, analyzing, and assessing an SME's internal and external environments of the business. Furthermore, Chern *et al.* (2015) state that marketing intelligence can help the firm in providing road map of current and future trends in customers' preferences and needs, new market and segmentation opportunities, and major shifts in marketing and distribution in order to improve the firm's marketing planning, implementation, and control.

Second factor is labeled marketing execution. Marketing execution or implementation (Sashittal and Jassawalla 2001) emerges as an organizational's adaptive response to day-to-day market events. This factor was defined by 5 items that portraying the level of existing marketing competencies as entrepreneurs in mastering the knowledge to allocate resources to marketing activities (MC7); the ability to integrate marketing activities with the rest of business activity (MC8); the ability to set the location of production facilities / business (MC17); the ability to mix used in the cost-effectiveness of doing business (MC18); ability to evaluate the activity of marketing for future improvements (MC19). These items are the representation of marketing execution of the SMEs. Marketing executionusually play the role as mediator that mediates the relationship between marketing strategy development and firm performance (Morgan 2010).

Final factor is labeled marketing strategy. This factor was strongly the reflection of the items that measures the level of existing marketing competencies as entrepreneurs in conquering skills to segment market served (MC9); the ability to establish the uniqueness of the product / service business offered (MC10); the ability to develop products / services of the new business (MC11); the ability to improve the quality of service of their business (MC12); the ability to set prices according to the market being served (MC13); the ability to design messages for product promotion (MC14); the ability to establish a media campagin that match the capabilities of business (MC15); knowledge of the current image of the product / business based on customers' impression (MC16). This factor was labeled marketing strategy. These

items are the representation of marketing strategy formation of the SMEs. Ferell and Hartline (2011: 19) state that to develop a marketing strategy, an organization must select the right combination of target market and marketing mix in order to create distinct competitive advantages over ts rivals.

Conclusion

The current study provides evidence of robustness of MC-SME scale in terms of construct validity. This is based on the fact that EFA results yielded three dimensionality of MC-SME. Based on the results, MC-SMEs can be usable in the SMEs' context, particularly measuring marketing capability of the business owners. Most importantly, this study is one of the studies that extensively test the scale of the MC-SME. The three dimension found in current study were supported by the data collected. As the main objective of this study was fulfilled in developing a measure for measuring marketing capability of the SMEs; this new measure will be used for the final survey to test the relationship between entrepreneurial marketing and marketing capability of the SMEs in marketing their products in larger target market i.e., in some tourism destination.

THE EXPLORING OF CAUSALITY RELATIONSHIP BETWEEN ISLAMIC WORK ETHICS, ORGANIZATIONAL JUSTICE, AND ACCOUNTANT'S WORK STRESS: CASE OF INDONESIA

Amilin Amilin, Universitas Negeri Syarif Hidayatullah, Indonesia
Ahmad Rifai, Universitas Negeri Syarif Hidayatullah, Indonesia

Abstract

The objective of this study is to explore the causality relationship between Islamic work ethics and organizational justice, and its impact on work stress. The respondents are the accountants who work in the Islamic financial institutions in Indonesia. The method of data collection is questionnaires. The method of sample selection is purposive sampling. The method to test the hypothesis is Structural Equation Modelling (SEM) with AMOS Software.The results of the study as follows, first, Islamic work ethics positivelyinfluence toprocedural justice andinteractional justice but not todistributive justice. Second, distributive justice negatively influences to work stress but not to procedural justice and interactive justice. Third, Islamic works ethics negatively influence to work stress. This study is important for the employees, especially for accountant professionas guidance in working to support organizationperformance with the values of Islam as the basis of work.

Keywords: *Islamic work ethics, distributive justice, procedural justice, interactional justice, job stress*

Introduction

The study of Islamic work ethic associated with organizational justice and job stress is an interesting issue to researched.This issue has not yet examined on the accounting profession in the previous research. This study is a combination of Rokhman and Hassan (2012) and Lambert *et al.* (2007) studies. Rokhman and Hassan (2012) investigated the relationship between Islamic work ethic with organizational justice, while Lambert *et al.* (2007) examined the impact of distributive justice and procedural fairness to work stress, worksatisfaction, and organizational commitment. Islamic work ethic variable and organizational justice variable on the study of Rokhman and Hasan (2012) and distributive justicevariable, procedural justice variableand job stress variablein the study of Lambert (2007) re-examined in this study.

Yousef (2001) stated that one of the factors influence to the individual'sattitudes on workplace environment is Islamic work ethic. An action can be considered ethical or unethical is based on fairness in the decision-making process as well as the acquisition of the results. In the organizational context, the meaning of organizational justice usually related to the resource allocation problem. Implementation of justice in the organization to be significantconcern for employers and employees (Folger and Cropanzano, 1998). Currently, employees looking for organizations which offering a justice and the working environment in which everyone felt welcome, respected and appreciated (Suliman&Al-Khatiri, 2013).

Elovainio *et al.* (2002) found evidence that organizational justice is one of the stress factors as the cause of physical and psychological reactions. The organizations that have not objective in implement a justice would impact to stress and sleep disturbances on employees. Adeoye (2000) suggested that the stress usually associated with interpersonal relationships in the workplace, such as conflicts with supervisors, conflicts with co-workers, conflict with subordinates and disputes with management policies.Levy and Dubinsky (1983) argue that the

level of stress increase when employees find obstacles in implementing ethics into their work. Meanwhile, Jaramillo *et al*. (2013) found that the work ethic is a significantly positive impact in reducing stress levels.Other evidence from Sert *et al.* (2014) showed that the development of work ethics and organizational justice could reduce an employee stress levels.

Accountants have a strategic role in assessing and calculating resources, liabilities, and equity of the company, then put them in a financial report. Many parties concerned with the financial statements, so sometimes accountants faced in a depressed condition. By applying of Islamic work ethic within the organization fairly, is expected could reduce the stress level of accountants. The issue of Islamic work ethic about the implementation of organizational justice and job stress isan important issue and interesting to analyze because to obtain the empirical facts about first, the impact of Islamic work ethic on organizational justice. *Second*, the impact of organizationaljustice implementation to the work stressof accountants, and *the third*, the impact of Islamic work ethic on work stress experienced by the accountants. The results of this study are expected to contribute for the parties, especially for accountant profession as guidance in working to support organization performance with the values of Islam as the basis of work.

Literature review and hypotheses

Equity Theory

Equity theory as a basis theory of this study. According to this theory, an employee is treated fairly or unfairly within the working environment by comparing the outcomes ratio(Adams, 1965). The main components of this theory consist of inputs, outcomes, comparison person (Wexley & Yuki, 1977).

Islamic Work Ethics

The initial concept of Islamic work ethics derived from the Qur'an and the Hadith. Ali and Al-Owaihan (2008) defined Islamic ethics works thisas an orientation to shape the engagement and participation for adherents in the workplace. While Yousef (2001) stated that the Islamic work ethics emphasizes the aspects of cooperation in the work and solve the problems in work through communication to avoid errors in the completion of the work. Furthemore, Rowold (2008) stated that Islamic value applied on the behavior ethics and career orientation in the workplace as a guide of value in human life.

Organizational Justice

In general, the organizational justice conceptconsistsof three dimensions: distributive justice, procedural justice, and interactive justice (Cropanzano *et al.*, 2001). Distributive justice is justice in thecontextof the amount and awards received from individuals (Robbins and Judge, 2008). Procedural fairness is a concept of justice that focuses on the methods used to determine the amount of remuneration (Noe *et al.*, 2010). Interactional justice is a concept of justice that refers to individual perceptions about how to treat people with dignity, attention, and respect (Robbins and Judge, 2008).

Job Stress

Definition of job stress according to Mangkunagara (2005) is a pressure of feeling experienced by employees in a working environment. Ajob stress definition according to Greenberg and Baron (2003) is a pattern of an emotionalsituation and physiological reactions that arise as a response from within and outside the organization.

Hypothesis Development

Islamic Work Ethics and Organizational Justice

The results of Trevino and Weaver (2001) study indicates that if organizations treat their employees fairly, the unethical actions shouldbe decreased significantly. Employees who feel unfairly treated will seek opportunities to improve their welfare in their way, despite taking an unethical manner. Rokhman and Hassan (2012) obtain empirical evidence that Islamic work ethics positively contribute to the three dimensions of organizational justice (distributive, procedural and interactional). Based on these findings it can be formulated hypotheses as follows:

H_{1a}:   Islamic work ethics positively influence to distributive justice
H_{1b} :   Islamic work ethics positively influence to procedural justice
H_{1c} :   Islamic work ethics positively influence to interactional justice

Organizational Justice and Work Stress

Khan,*et al.* (2015) study showed that procedural justice is negatively related to low employee work ethics. The study of Sert,*et al.* (2014) found that there is a significantly negative correlation between distributive and procedural justice against work stress. The study of Lambert,*et al.* (2007) found that procedural justice and distributive justice negatively influence to work stress. Work stress of employees increased when their work was not accepted fairly. A hard workingemployeereceived the same compensation with lazy employees. Study of Judge and Colquitt (2004) on the employees whose working at 23 universities in the United States shows that procedural fairness has a strong relationship with a workstress. Based on the results of that studygenerally can be concluded that organizational justice (distributive, procedural, interactional) negatively related to job stress. More unfair treatment on personnel organization, the more stress experienced by employees. In this regard, it can be formulated hypotheses as follows:

H_{2a}:   Distributive justice negatively influences to work stress
H_{2b} :   Procedural justice negatively influences to work stress
H_{2c} :   Interactional justice negatively influences to work stress

Islamic Work Ethics and Work Stress

Study of Sert *et al.* (2014) in Turkey that examined the influence of Islamic work ethics on work stress showed evidence that there is a significantly negative relationship between Islamic work ethic with work stress. The results of a studyconducted by Jaramillo *et al.* (2006) on 138 salespeople showed that Islamic work ethic influence to employee stress. When the level of stress was low, employees more feel happy with their jobs, so they were more committed to the organization and motivated to develop a mutually satisfactory relationship with the customer. Deconinck (2010)supportthis research which found evidence that the norms of Islamic work ethic can reduce work stress. Some other studies conducted by Myburgh and Poggenpoel (2002) showed evidence that when employees are working in a work environment that values work ethic is low and does not apply the principles of justice, the employee will be vulnerable to job stress. Base on some of previous studies, it can be formulated the hypothesis as follows:

H_3:   Islamic work ethics negatively influence to work stress

The Framework of Research Model

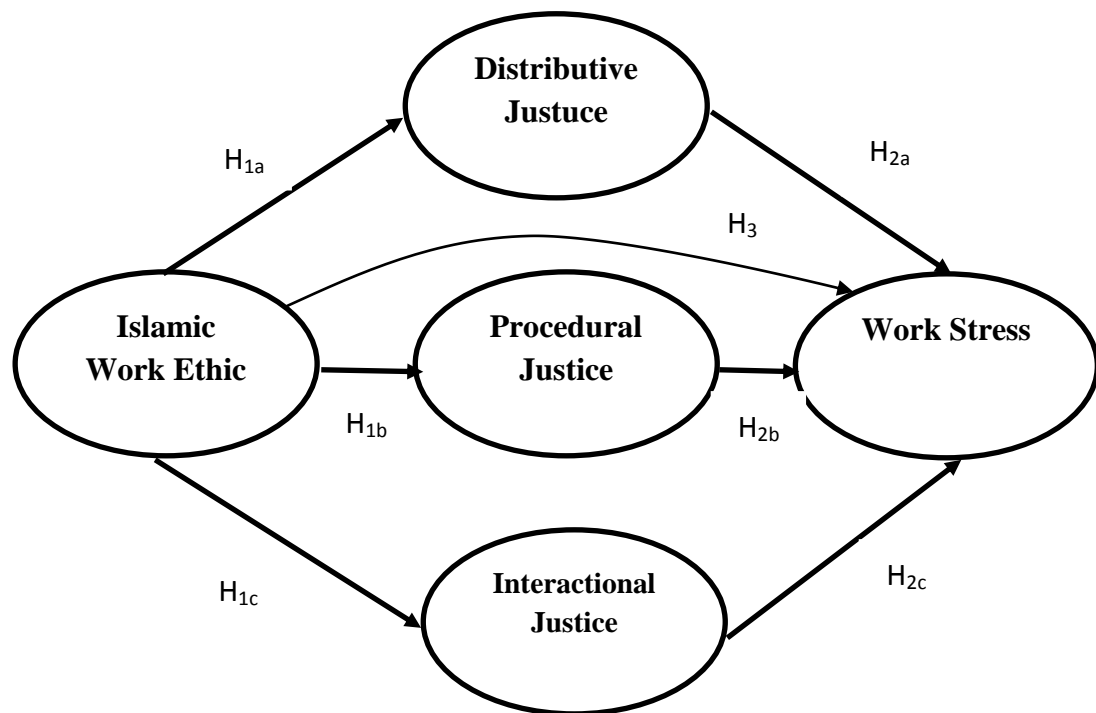
The framework of research model describes the relationship between the independent variable, the moderating variable and the dependent variable. Figure 1 below describes the research model.


Figure 1. The FrameworkResearch Model

Research method

Population, Data for Research, and Sample Selection Methods

The population who particapated in this research are the management accountants. The research samples who selected as respondents in this study are accountants who work in the Islamic financial institutions. The questionnaire used to collect the data is from the answer of respondents. The period of the data collection was from April to June 2015. The purposive sampling method used to select the research sample. Sample criteria Participated who could have this research are management accountants who have work experience at least one year in an Islamic financial institution in Indonesia.

Measurement of Variable

The measurement of variables are as follow: An Islamic Work Ethic variable measured with seventeenstatement items developed by Ali (1992). An Organizational Justice variable was drawn up by Niehoff and Moorman (1993) as 19 questions from three dimensions: distributive justice (5 items), procedural justice (5 items), interactive justice (9 items). The Job Stress Variable was measured with 7 statement items developed by House and Rizzo (1972), adopted by Caplan *et al.* (1975) and has been used by Rout and Rout (1993), Wallace et al. (2010) and Lu and Kuo (2016). All statement elements in the questionnaire of these variables were measured using ordinal scale (Likert) from one to five. The range of scores: (1) strongly disagrees, (2) disagree, (3) neutral, (4) agree, and (5) strongly agree.

The Technique of Data Analysis

Data were tested using descriptive statistical test and data quality test. The testing consisted of descriptive statistics: the number of data (sum), the maximum data, the minimum data, the average of data (mean) and the standard deviation of data. Meanwhile, the testing of data quality consists of the validity and the reliability of data. The validity test to calculate the correlation between the scores of each of the questions with the total score. If the correlation between the scores of each of the questions with a total score has a significance level below 0.05, the questions are declared valid, and vice versa (Ghozali, 2013). Data reliability test used Cronbach's Alpha. A statement was reliable if the value of alpha is greater than 0.6 (Ghozali, 2013). The method of hypothesis testing employed Sequential Equation Model with AMOS as software.

Results and discussion

Level of Questionnaires Return and Respondents Profile
The number of questionnaires distributed was 239 copies while the number of questionnaires returned was 208 copies (87.03%). The data that can be processedincluded 202 copies (84.52%). In Table 1 is presented the respondent's profile by type of industry. From these data, the majority of respondents worked in the insurance industry as much as 105 people (52%), other industries 43 (21.3%), and the banking sector as many as 26 people (12.9%).

Table 1. Respondents Profile by Type of Industry

	Industry	Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Banking	26	12,9	12,9	12,9
	Insurance	105	52,0	52,0	64,9
	Cooperation	28	13,9	13,9	78,7
	Others	43	21,3	21,3	100,0
	Total	202	100,0	100,0	

Source: Primary data processed

The Results of Descriptive Statistical Test
Table 2 presented the results of descriptive statistical test variables used in this study.

Table2. The Result of Descriptive Statistical Test

	N	Minimum	Maximum	Mean	Std. Deviation
Islamic Work Ethics	202	17	51	29,11	6,462
Distributive Justice	202	5	21	12,56	3,276
Procedural Justice	202	5	21	11,50	2,943
Interactional Justice	202	9	33	19,68	4,152
Work Stress	202	16	35	26,66	3,952
Valid N (listwise)	202				

Source: Primary data processed

Table2 informed that the average value of the Islamic Work EthicsVariable is 29,11; Distributive Justice Variable is 12,56; Procedural Justice Variable is 11,50; Interactional Justice Variable is 19,68; andWork StressVariable is26,66.

The Results of Data Quality Test

The following tables present the results of validity and reliability data for all variables. In Table 3, presents the results of testing the validity of data for Islamic Work Ethics variable. The results of testing the validity of this variable presented in Table 3 below.

Table 3. The Results of Validity Test for Islamic Work Ethics Variable

Source: Primary data processed

Table 4 above shows that all statements of Distributive Justice variable (5 indicators), Procedural Justice variable (5 indicators), Interactional Justice variable (9 indicators) declared valid because all of items have a significant correlation value at 0.01 level (2-tailed). Furthermore, in Table 5 below are presented the results of the data validity test for Work Stress variable.

Table 5. The Results of Validity Test for Work Stress Variable

The Statements	Pearson Correlation	Sig (2-Tailed)	Description
WS1	0,826**	0,000	Valid
WS2	0,811**	0,000	Valid
WS3	0,731**	0,000	Valid
WS4	0,699**	0,000	Valid
WS5	0,705**	0,000	Valid
WS6	0,278**	0,000	Valid
WS7	0,738**	0,000	Valid

Source: Primary data processed
Table 5 above shows that seven indicator items on the statements of Work Stress variable declared valid because all of indicators have a significant correlation value at 0.01 level (2-tailed). Furthermore, in Table 6 below are presented the results of the data reliability test.

Table 6. The Results of Data Reliability Test

Variables	Cronbach's Alpha	Description
Islamic Work Ethics (IWE)	0,856	*Reliable*
Distributive Justice (DJ)	0,843	*Reliable*
Procedural Justice (PJ)	0,833	*Reliable*
Interactional Justice (IJ)	0,859	*Reliable*
Work Stress (WS)	0,854	*Reliable*

Source: Primary data processed

Table 6 can be conclude that all the variables were reliablebecauseof the value of Cronbach Alpha greater than 0.6 (Ghozali, 2013). The next step is the hypothesis testing.Table 7 below show the results of feasibility testfor full construct model represification.

Table 7. The Result of Feasibility Tests for Full Construct Model

Goodness of fit index	Cut off value	Result	Criteria
Chi-Square	≤ 204,690	957,900	Less Good
Probability	≥ 0.05	0,000	
DF	>0	673	*Over Identified*

GFI	≥ 0.90	0,842	*Marginal Fit*
AGFI	≥ 0.90	0,778	Less Good
CFI	≥ 0.90	0,941	*Good fit*
TLI	≥ 0.90	0,921	*Good fit*
CMIN/DF	≤ 2.00	1,423	*Good fit*
RMSEA	≤ 0.08	0,046	*Good fit*

Source: Primary data processed

From Table 7 above can be concluded that the overall fitness model assessed with chi-square test amounted to 957.900 with a degree of freedom 673. The probability of this model is 0,000. When compared to the cut-off value, this model has a poor outcome. To measure the goodness of fit more can be seen that the value AGFI showed poor results as well, but for the CFI, TLI, CMIN / DF, and RMSEA indicate good fit and value that shows the value of GFI marginal fit. If there are one or more parameters that have been fit then declared fit models (Solimun, 2005). So for the measurement of this model is considered fit.

The Results of Hypothesis Tests
Tests conducted on the hypothesis by using t-Value with a significance level of 0.05. T-Value in AMOS 18.00 a critical value ratio (C.R.) on Regression Weights: (Group number 1 - Default model) of the fit model or full model. If the value ofcritical ratio (C.R.) positive or negative ≥ 1.967 or the probability value (P) ≤ 0.05 then the research hypothesis is accepted. In Table 8 presents a summary overview of the results of hypothesis testing.
Hypothesis testing using t-Value with a significance level of 0.05. t-Value in the output of AMOS program is a critical value ratio (C.R.) on Regression Weights: (Group number 1 - Default model) of the fit model or full model. If the value of critical ratio (C.R.) positive or negative ≥ 1.967 or the probability value (P) ≤ 0.05 then the research hypothesis is accepted. In Table 8 presents a summary overview of the results of hypothesis testing.

Table 8. The Results of Hypothesis Tests

Hypotheses	Exogenous variables	Endogenous variables	Critical Ratio	Probability	Conclusion

Discussion

From the data in Table 8 it can be seen that the Islamic work ethics not significantly influence to distributive justice, so this finding not supported the hypothesis H1a. This findingwas not consistent with the study of Schminke *et al*. (1997) and Rokhman and Hassan (2012) which states that the application of the Islamic work ethics well done will be a positive influence on distributive justice. The further findings showed that Islamic work ethics significantly influence to procedural justice and Interactive justice, so the hypothesis H1b and H1c hypothesis was supported. Theseresultswere consistent with Rokhman and Hasan (2012) which showed that the Islamic work ethics influence to the application of procedural justice and interactional justice in the organizations. This finding was relevant to the fact that every employee had hoped to get justice in his work. The Islamic work ethic encourages the implementation of justice,so that established a good relationship each employee and between leaders and subordinates. Each employee will give the best contribution to the company because the rate of work is worship. These findings are also relevant to the opinion of Robbins and Judge (2008) which states that procedural justice is fairness perceived by each employee on rewards distribution.

Next findings showed that the implementation of distributive justice could reduce the level ofaccountant stress (H2a supported). This finding was consistent with the study of Sert *et al.* (2014) and Lambert et al. (2007) which indicated that the implementation of distributive justice could reduce the level of employee stress. In this case, the accounting profession has workloads with high levels of stress.They are responsible for preparing the companies financial statements as a material to make business decisions. If accountants are treated fairly by the firm, they will feel comfortable in work. When accountants feel comfortable in working, their stress level wouldreduce. The treatmentof distributive justice to an accountant, for example, with give a reward totheir duties and responsibilities.

The empirical evidence showed that procedural justice and interactional justice were not successful in reducing an accountantstress levels. The results of this study are not consistent with the findings of Sert *et al.* (2014) and Judge and Colquitt (2004) which stated that procedural justice and interactional justice negatively influence to work stress. However, these results still support the research of Lambert *et al.* (2007) which stated that procedural justice did not affect to the work stress.This finding implies that even if the accountant had an opportunity to argue and a right to review the decision (as implementation of procedural justice) and they get an attention and be treated with dignity and respect (as the implementation of interactional fairness), but not necessarily be able to lower the stress level of an accountant.

The difference of this finding may be due to differences in the population of the study. The respondents in a studyof Sert *et al.* (2014) dominated by employees who work in non-financial services sector companies. While all respondents in Judge and Colquitt (2004) study of working in the field of education.While all respondents of Judge and Colquitt (2004) study were working in the area of education.The situation of Islamic work environment automatically the aspect of procedural justice and interactional fairness, so that accountants work stress more easily managed through the implementation of distributive justice.The practicalsituation of respondents on Islamic finance companiesare generaly more Islamic than other. Working conditions Islami automatically pay attention to aspects of procedural justice and interactional justice, so that accountants work stress more easily managed through the implementation of distributive justice.

The latest findings of this study showed that the Islamic work ethicscould reduce accountant work stress. This finding was consistent with the study of Sert *et al.* (2014) and Jaramillo *et al.* (2006) which stated that the implementation of a good work ethic at the company could reduce employee stress levels. Thus, the Islamic work ethic encourages accountantsenthusiastically work without stress and avoid corruption.If the accountant works

well, expected to be a positive influence on other employees.This positive effect is projected to improve overall company performance.

Conclusion

This study examined the influence of the Islamic work ethics on the three dimensions of the organizationaljustice (distributive justice, procedural justice, and interactional justice)and its impact on worksstress of accountant. The results of the study show that, first, the Islamic work ethics did not positivelyinfluence to distributive justice, whereas Islamic work ethics positively influence to procedural justice and interactional justice.Second, distributive justice also negatively influence to the work stress, whereas procedural justice and interactional justice has no effect on works stress. Last, Islamic work ethics negatively influence to work stress. This study is important for the employees, especially for accountant profession as guidance in working to support organization performance with the values of Islam as the basis of work.The limitation of this study, first,the sample proportion of industry category was disproportionate. Second, this study have not connected yet with aspects of culture especially in the context of technology alliance in modern era. The recommendations for further research, first,the study have a balanced proportion of all types of industries, to have a stronger generalization for each industry. Second, next study should consider the cultural aspect in modern technology alliances such as the study by Lew *et al.* (2016).

GOVERNMENT INTERNAL AUDIT EFFECTIVENESS: EVIDENCES FROM INDONESIA

Sutaryo, Universitas Sebelas Maret, Indonesia
Arifudin Tri Anto, Badan Pengawasan Keuangan dan Pembangunan Republik Indonesia, Indonesia
Harun Al Rasyid, Universitas Indonesia, Indonesia
Bayu Giri Prakosa, Kementerian Perindustrian Republik Indonesia, Indonesia

Abstract

This research identifies the determinants of government internal audit effectiveness in Indonesia. Independent variables used are professional expertise of internal auditors, quality of audit work, organization's independence, career and advancement, and the support from the leadership of the internal audit entity, with geographical location, sex, degree in formal education, and auditors' functional position as control variables. This research deploys a structured questionnaire involving 385 functional auditors working for the Badan Pengawasan Keuangan dan Pembangunan (BPKP, literally: "Finance and Development Supervisory Agency"). Results show that professional expertise of internal auditors, quality of audit work, organization's independence, career and advancement, and the support from the leadership of the internal audit entity positively affect government internal audit effectiveness in Indonesia. Nevertheless, all of the variables deployed are still possible to be further developed according to advance analysis testing results. Internal audit entity requires internal auditors who possess professional expertise, independence from any party, and who can demonstrate high quality audit work results. Internal audit entity should also enact proper career policy for auditors and give full support to the execution of the auditing. Research findings are discussed in terms of how they can contribute to the effectiveness of the internal audit and provide added value to the auditees.

Keywords: *internal audit effectiveness, professional expertise of internal auditors, organization's independence, the support of the leadership of the internal audit entity*

Introduction

Government internal audit is a part of government internal body that oversees the practice of governance. It is an essential part in government structural organization (Coram, et al., 2008). If a well-configured internal audit function is implemented, internal auditing can play a crucial role in the governance and accountability of institutions engaged in public sector by improving their evaluations on key organizations control, governance, and risk management processes (Asare, 2009). This is also supported by D'Silva & Ridley (2007) by stating that internal auditing creates occupation for auditors in risk management, controlling, and governance processes, both on strategic and operational level.

According to Sarens & De Beelde (2006a), internal audit has four dimensions, i.e., evaluating, diagnosing, informing, and recommending. Furthermore, an internal auditor is also required to report his personal jugdment on existing defects in the observed process and internal control. Later on, the auditor should formulate recommendation(s) that could improve the auditee's performance. This is why, according to Sarens & De Beelde (2006a), many senior managements in many firms in Belgium assert that internal auditing should be widely

177

implemented so as to support the management in monitoring, risk management, and intenal control improvement, as well as in organizational culture oversight.

Internal auditing is also closely related with fraud detection. According to Halbouni (2015), internal auditing plays a role in preventing, detecting, and reporting fraud indication in an organization as an endeavor to build public trust. Salsabila & Prayudiawan (2011) also supports this argument by stating that internal auditing is an attempt to prevent natinoal assets misuse and manipulation. Internal auditors, working for an organization, function as a superintendent, both for operational and administrative affairs. Being a superintendent inside an organization also means that internal auditors generally have a power to oversee all activities performed within the organization, including those in planning, execution, and reporting phases. Frauds committed during planning and execution phase are difficult to be detected by external auditing (auditing based on financial report) as those making the report might be a master in concealing oddity, but are easy to be detected by internal auditing because of the superintendence performed. Organizations with good internal audit function can better detect and indicate fraudulent practice of asset misuse compared to those without (Coram, et al., 2008).

In Indonesia, internal auditing has its own standards, i.e., Standar Audit Inter Pemerintah Indonesia (literally: "Indonesian Government Internal Audit Standards"), that is included in the decree no. KEP-005/AAIPI/DPN/2014 on the enactment of Kode Etik Auditor Intern Pemerintah Indonesia (literally: "Indonesian Government Internal Auditors' Ethical Codes), Standar Audit Inter Pemerintah Indonesia (literally: "Indonesian Government Internal Audit Standards"), and Pedoman Telaah Sejawat Auditor Intern Pemerintah Indonesia (literally: Indonesian Government Internal Auditor's Peer Review Guidelines) by Dewan Pengurus Nasional (DPN, literally: "National Board") and Asosiasi Auditor Intern Pemerintah Indonesia (AAIPI, literally: "Indonesian Government Internal Auditor Association"). It is decreed in the standards that all internal auditing shall be performed only by Aparat Pengawasan Intern Pemerintah (APIP, literally: "Government Internal Supervisory Apparatus"). APIP is a government agency established to perform internal supervision inside the central government and/or local government. APIP consists of Badan Pengawasan Keuangan dan Pembangunan (BPKP, literally: "Finance and Development Supervisory Agency"), Inspectorate General/Inspectorate/Internal Supervisory Unit to Ministries, Main Inspectorate/ Inspectorate of Non-Ministry Governmental Bodies, Inspectorate/Internal Supervisory Unit of Secretarial of both State Institution and of Supreme State Institution, Inspectorate of Municipal Government, and Internal Supervisory Unit to other governmental legal entities according to the law.

Peraturan Pemerintah No. 60 tahun 2008 (translate to "Governmental Act no. 60 in year 2008") on Government Internal Control System article 2 verse 1 clarifies that in order to create an effective, efficient, tranparant, and accountable state financial management, the head of a state agency shall take control of the governance, that is the Sistem Pengendalian Internal Pemerintah (SPIP, literally: "Government Internal Control System"). The verse is followed with an assertion that one of many approaches to be done is to establish an effective government internal supervisory apparatus. Thus can be concluded that effective goverment internal supervisory apparatus' role is important in order to create an efficient, effective, transparant, and accountable state financial management.

As such, data of how Indonesia is fighting corruption from the past five years i.e., 2012-2016 derived from the Komisi Pemberantasan Korupsi (KPK, literally: "Corruption Eradication Commission") available on its website (kpk.go.id) are worthy of observing (KPK, 2016). The data show that based on the number of corruption case handled, ministries/government institutions are placed on top ranks with 119 cases, followed by municipal goverments with 57 cases, and provincial governments with 46 cases (KPK, 2016).

The fact has many wondering because these three groups of governmental bodies has its own APIP working from within as decreed in the Governmental Act no. 60 in year 2008. If observed further in the AAIPI's internal audit standards, it is inscribed that APIP is to perform anti corruption activities e.g., to give early notice of fraud indication. This indicates a problem of effectiveness within APIP in functioning as a government supervisory apparatus. Therefore, this is worthy of further investigation.

As such, this reserach is aimed to identify the determining factors of the effectiveness of government internal audit in Indonesia. Previous researchers have also studied the determining factors of the effectiveness of government internal audit i.e., auditors' professional expertise—e.g., auditor qualification, development, and training (Al-Twaijry, et al., 2003; Mihret & Yismaw, 2007; Arena & Azzone, 2009)— , independence—studied by Al-Twaijry, et al., (2003), Mihret, et al., (2010), Cohen & Sayag (2010), and D'Onza, et al., (2015)—, career and advancement—which is found having no direct effect to the effectiveness and studied by Goodwin & Yeo (2001) and Cohen & Sayag (2010)—, management support (Mihret & Yismaw, 2007; Cohen & Sayag, 2010), organizational climate—i.e., organizational status, policies, and procedures, studied by Mihret & Yismaw (2007)—, and relationship between internal auditee and internal auditor—studied by Arena & Azzone (2009).

This research works within Indonesian context, a nation struggling to improve its state financial management accountability. This means that the effectiveness of internal superintendence is an important issue for Indonesia to ensure state financial management transparance and accountability. Also, this research uses BPKP's APIP as its subject because although BPKP is a central government's agency, it has a branch office in each of Indonesia's all 33 provinces. This is to represent the actual condition both in central and local scope thus assuring that the result is as representative as possible. Furthermore, BPKP also employs adequate number of certified internal auditors i.e, 3786 auditors (data per Q2 2015 from its website, bpkp.go.id), a 58,89% from its total 6429 employees. This will help validate the result for the subjects are relevant (BPKP, 2016).

As such, this reserach contributes to government internal supervisory policy making in terms of its determining factors so that the state internal supervisory function can be effective and the state financial management accountability could be manifested as mandated by the law. Also, this reserach contributes to to government accounting references, particularly in terms of internal audit effectiveness and its affecting factors.

Literature Study
Internal Audit Effectiveness

According to Institute of Internal Auditors (IIA) in 1999, the definition of internal auditing is as follows,
"Internal auditing is an independent, objective assurance and consulting activity designed to add value and improve an organisation's operations. It helps an organisation accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of risk management, control, and governance processes."

The above definition demonstrates that internal audit is aimed to add value to organizations and to help improve its organizational processes. The three roles mentioned above are the basis for internal audit function in public sector (Asare, 2009). The above definition also corresponds with AAIPI's Internal Audit Standards (2014b) which clarifies that internal auditing is an independent and objective activity in form of assurance activities and consulting activities, designed to add value and improve auditee's operations. This activity will help an organization in achieving its goals through systematic and ordered

approaches to evaluate and improve the effectiveness of risk management process, control, governance (public sector).

Government agencies and senior managements in public sector require effective and efficient internal audit services (Asare, 2009). Recommendations and evaluations from internal audit are required by the government for making decisions. Hence, internal auditing has to be effective in order to formulate valid and reliable recommendations, as well as to add values to the auditee (Mihret, et al., 2010).

AAIPI's Internal Audit Standards (2014b) clarify that an effective internal auditing is manifested in (1) proper encouragement towards obedience, prudence, efficiency, and effectiveness in executing duties and functions of government institution (assurance activities); (2) early noticing and risk management effectiveness improvement in executing duties and functions of government institution (anti-corruption activities); (3) giving advices that can maintain and improve the management quality in performing duties and functions of government institution (consulting activities).

According to Mihret & Yismaw (2007), internal audit effectiveness should be seen as an interaction between four different factors i.e., internal audit quality—reflected by auditors' capability in generating audit findings and recommendations that are useful to auditees; management support—e.g., resources and commitment towards implementing internal auditor's recommendations; organizational climate—e.g., organization profile, budget, policies, and SOPs; auditee's behavior—e.g., attitude and auditee's cooperation.

Internal Auditors' Professional Expertise

To achive the previously determined goals, an organization should employ reliable personnel that is the personnel who are professional and are expert in their fields. Professional expertise will act as assurance for the organization that the task given to the personnel will be properly done. This is also the case for an internal audit entity. The tasks of an internal auditor are ought to be done with technical competence e.g., formal education, experience, and continuous trainings (Awaluddin, 2013).

According to AAIPI's Internal Audit Standards, APIP's effective role can be manifested if supported with auditors' professionalism and competence, i.e., education, knowledge, expertise, experience, and other competence required to perform duties and responsibilities. As time goes by, auditors shall maintain and keep their expertise updated in order to optimally perform duties and responsibilities through Pendidikan dan Pendidikan dan Pelatihan Profesional Berkelanjutan (translate to "Continuous Professional Education and Training). This will guarantee that the auditors' competence will correspond to APIP's requirement and also, to the most state-of-the-art supervisory practice.

Awaluddin (2013) asserts that professional expertise is a technical competence, which is a competence required for auditors working in either auditing, accounting, government administration, or communication sciences. Technical competence possessed by internal auditors especially needs to be continuously improved so that the auditors can provide efficient, effective, and high-quality service to interested parties (Mihret & Yismaw, 2007; Mihret, et al., 2010).

Furthermore, internal auditors shall posess knowledge beyond accounting and auditing. This is one of many components of internal auditors' professional expertise. The knowledge could be in form of advanced understanding of the audited organizations' goals, system, risk, and culture (Asare, 2009). The knowledge of auditing posessed by auditors will determine how they will sort errors and detect risks during audit process so that it will result in good output which could be used as basis for the stakeholders to make decisions (Salsabila & Prayudiawan, 2011).

Quality of Internal Audit Work

One of many factors that can be observed during intrenal auditing is its quality of work. The quality of audit work can be seen from the quality of the audit result which can be evaluated from how many good responses made towards the work (Salsabila & Prayudiawan, 2011). The quality could also be observed from the obedience committed to the valid audit standards as an assurance of the audit work reliability. Work reliability can be translated into how far the work will deviate if done in different times, except in some very rare cases. Low rates of deviation is achieved by working strictly according to the standards so that the standards' interpretation made and procedures done will also be according to the standards. D'Onza, et al., (2015) and Cohen & Sayag (2010) argue that when internal auditing is executed according to valid professional audit standards, the auditing will add values to the auditee.

AAIPI's Internal Audit Standards have clarified that an effective role of internal audit can be manifested if supported with high quality internal audit results (2014b). Hence, the leader of the internal audit shall design and develop a development and quality assurance program which covers all aspects of internal audit activities, from the planning and executing phase, up until the completion and reporting phase. This program could be in form of internal evaluation based on the audit standards and auditors's code of ethics.

The quality assurance program shall also run during assignment, i.e., the proper execution of auditors' supervision by direct supervisor in every phase of internal audit assignment. This is done to ensure goal achievement, quality assurance, and auditors' competence improvement in every assignment.

Also, the AAIPI's Internal Audit Standards have declared that the internal audit leader shall design a strategic audit planning (for 5 years) and detail it into annual internal auditing plan with priority put onto the activities possessing highest risk and highest correspondence to internal auditing goals (2014b).

Internal Audit Organization's Independence

Independence in auditing is translated into a circumstance in which the auditors are in an independent state, liberated from any parties' interest, and bow to no intervention from any party whatsoever in performing their duties. Auditors have to be independent enough from the auditee and have to assure that they can perform their duties with no intervention nor obstacles (Cohen & Sayag, 2010). This is not easy, as Mihret, et al., (2010) put it, internal auditors will face difficulties to remain independent for they are basically employed by the organization as employees. This is also put by Salsabila & Prayudiawan (2011) who argue that internal auditors will face problems when reporting findings not beneficial to management or to the auditee with their position as an employee to the audited organization.

According to Christopher, et al., (2009), three kinds of independence threat exist between internal auditors and the management; (1) if the auditors' career is dependent to the auditee; (2) if budget approval is held by the auditee; (3) if management (auditee) is involved in internal auditing development planning. With regards to internal auditors' career in current career advancement system, that internal auditing can be a step to take a position may act as a threat in terms of internal audit independence (Goodwin & Yeo, 2001). This is also expressed by Stewart & Subramaniam (2009) by stating that the positioning system of putting internal auditors into managerial position may result in auditors' reluctance in executing the auditing properly for they know that they may occupy the position they audit in the future.

Independence threat can also be caused by confusion of internal auditors' role between assurance activities and consulting activities (Cooper, et al., 2006), even though experiment by Stewart & Subramaniam (2009) concluded that internal auditing does not become biased during consulting activities. Nevertheless, indepence threat may occur when internal auditors

are involved in the audited organization's risk management process (Stewart & Subramaniam, 2009). This contradicts the findings of Arena & Azzone (2009), that by doing monitoring in internal control system and risk management, intenal auditing can help managers in accomplishing their goals through advices on the control effectiveness.

Regardless of all, internal auditors' independence shall be continuously defended in every assignment as an assurance that the auditors will face no obstacles, neither fear nor intervention which can influence their judgement. Internal auditors are not justified when taking sides for no matter how flawless their technical expertise might seem, they would not be able to defend the liberty of their judgements without their independence (Singgih & Bawono, 2010). Independence will guarantee that the auditors will be objective so that the audit results would be valid and can be accounted for. In common perceptions, internal auditors cannot effectively perform internal auditing without independence and objectivity because these two are fundamental attributes for interal auditors to maintain their credibility (D'Onza, et al., 2015). AAIPI's Internal Audit Standards regulate internal audit independence by clarifying that internal audit leader's coordination with the head of ministry/institution/ local government is to be manifested into a signing of audit charter between internal auditors' party and government/local government party (2014b). This is to serve as a manifestation of commitment that goverment/ local government will not intervene internal audit work so that responsibility of its execution can be accounted for.

Internal Auditors' Career and Advancement

Career and advancement mean available career opportunity for internal auditors in the internal audit entity. Currently, in many nations, many auditors are making internal auditing an attempt to take managerial positions (Goodwin & Yeo, 2001). By joining the internal audit entity, an internal auditor has two career opportunities, (1) to continue stepping the internal auditing career ladder or (2) to get promoted into managerial positions. Cohen & Sayag (2010) argue that open career opportunities can drive internal auditors to work harder in demonstrating excellent work performance so that they could get higher chances of getting promoted.

Goodwin & Yeo (2001) further argue that there are two kinds of employees included in the internal audit entity. The first are those who are newly hired and not long after, get promoted into managerial positions. The second are the old employees who will get promoted but first positioned into internal audit entity for learning.

Entity Leader Support

According to Cohen & Sayag (2010), management support is the support towards internal audit activity programs or such support in assuring that the internal auditing has enough resources required to perform all of its activities. This is in accordance with the argument from Mihret, et al., (2010) on support, i.e., adequate human and material resource allocation and other forms of coordination with auditees so that a good collaboration with internal aditors could be established during internal audit work.

Management support towards internal auditing is the management viewpoint onto internal audit entity (Sarens & De Beelde, 2006a). When audit entity has an excellent work performance—i.e., unbiased, competent, and credible—, the resulted recommendation will also have a good quality, able to solve problems, and create improvement. This will grow trust in the management team so that they will support internal audit entity. Therefore, legitimacy of internal audit activity and mission has to be well understood and supported by the senior management of government bodies in order to improve effectiveness in creating good governance, control, and risk management system (Asare, 2009).

Entity leader support implies a support from the internal audit entity's top management in any form which could be used in assuring the smoothness of internal audit task and responsibility execution. AAIPI's Internal Audit Standards have decreed that the internal audit entity leader shall communicate and ask for approval of annual internal audit activity to the head of ministry/institution/local government (2014b). This is the early step of supporting the internal audit entity. The presence of well designed activity planning combined with support in terms of human resource, funding, or facilities will smooth the internal auditing process. Other kinds of support from government/ local governement may take a form of audit charter.

Hypotheses

Auditors' Professional Expertise and Government Internal Audit Effectiveness

Professional expertise e.g., professional competence and thoroughness, according to AAIPI's Internal Audit Standards, are required to be possessed by internal auditors in order to perform their duties and responsibilities (2014b). Audit competence can be in form of formal education, knowledge, experience, skills in terms of auditing and others. Meanwhile, professional thoroughness can be in form of watchfulness, professional scepticism, and due professional care. These two will collectively form a professional competence or expertise which will enable auditors to effectively perform their duties and responsibilities.

With professional expertise, especially in terms of internal auditing, auditors will be able to perform their duties professionally so that the audit will end up in optimum result. The result will latter be followed up by the auditees and thus, it will give an improving impact to the audited organization or institution. If the expected result can be generated, then the audit internal can be considered as effective. As such, the better the auditors' professional expertise is, the more effective the internal audit would be.

Professional expertise in terms of auditors' qualification, development, and trainings contributes to internal audit effectiveness improvement (Al-Twaijry, et al., 2003). This is supported by Zain, et al., (2006) and Mihret & Yismaw (2007) who argue that besides those three mentioned, internal audit staffs' expertise and minimum rotation also positively contribute to the effectiveness. According to Arena & Azzone (2009), auditors' competence will improve internal audit team because the team will get recognition form the audited organization. Based on these analyses, a hypothesis can be drawn as follows,

H$_1$: *Auditors' professional expertise positively affects government internal audit effectiveness*

Quality of Internal Audit Work and Government Internal Audit Effectiveness

The quality of internal audit work can be observed from audit planning, audit scope, audit authority, and supervision of the audit follow-up implementation based on audit recommendation. This is clarified in the AAIPI's Internal Audit Standards which decree that internal audit entity leader shall manage internal audit activity e.g., designing annual internal audit plan, manage resources, making policies as well as procedures, and ensuring that the internal audit activites add values to the auditees.

Auditors shall pay attention into the quality of internal audit work and other works under their responsibilities. This is crucial because every work done will generate a recommendation which will be followed by the auditees to improve their organization. Maintaining quality also means maintaining the credibility and trust earned from the auditee. This will contribute into effective internal audit as assurance activities, consulting activities, and anti-corruption activities

Cohen & Sayag (2010) also argue that the quality of internal audit work has a correlation or a relationship with internal audit effectiveness. One of many factors affecting internal audit effectiveness is its quality shown by its capability to provide useful findings and recommendation to the auditees (Mihret & Yismaw, 2007). Based on these analyses, a hypothesis can be drawn as follows,

H₂ **:** *Quality of internal audit work positively affects government internal audit effectiveness*

Audit Entity Organization's Independece and Government Internal Audit Effectiveness

Independence implies liberty, unboundness, and no side-taking. For auditors, independence means taking no side (Singgih & Bawono, 2010), performing duties without influenced by any party's interest whatsoever, and being liberated from strong economic ties between auditor and auditee which may influence auditors' judgement on issues detected from the auditees (Zhang, et al., 2007). This is consistent with AAIPI's Internal Audit Standards which govern that internal auditors and internal audit activities shall be independent and that the execution of internal auditing shall be objective (2014b). As such, independence is not only to be hold by auditors per se, but also by the internal audit entity in performing its responsibilities. It is further clarified in the standards that internal auditors' position is to be set as such that they shall be liberated form any intervention, fully supported by ministries/institutions/local governments, and that the internal audit entity shall be active and fully responsible for the independence held by the entity it supervises (2014b).

Auditors who can manage to defend their independence will have their credibility unquestioned. In normal circumstances, the stakeholders will fully trust the recommendation resulted and will follow it. This implies that the internal audit can give positive impact towards auditees' improvement and thus can be perceived as effective.

Independence affects internal audit effectiveness (Cohen & Sayag, 2010; Mihret, et al., 2010). Furthermore, D'Onza, et al., (2015) also found that internal auditors' independence gives a positive impact into internal audit capability in adding values to the audited organization. Based on these analyses, a hypothesis can be drawn as follows,

H₃ **:** *Audit entity organization's independence positivily affects government internal audit effectiveness*

Auditors' Carrer and Advancement and Government Internal Audit Effectiveness

Career and advancement are organization's policy to make internal audit entity an attempt in educating or training employees who will later be promoted for managerial positions. The case in the government in which staffs are transfered from internal audit entity to certain positions in ministries/institutions/local government serves as an example of how the policy of career and advancement is implemented in public sector.

This policy has two impacts. First, internal auditors will have a personal motivation to perform their duties excellently so that their work will yield an optimum result. Second, the knowledge and experience earned by internal auditors during their auditing work will contributes to improvements in the government so the government body in which the auditors will be positioned will function more accordingly to the valid regulations and standards.

This policy of career and advancement has been widely practiced inside many firms in Singapore (Goodwin & Yeo, 2001). Being first positioned as internal auditors, newly hired employees will learn what exactly an organization is, its business process, flaws which may occurs within it, and how to fix them. In other words, the employees will learn and understand how an organization is managed and controlled (Cohen & Sayag, 2010). Based on these analyses, a hypothesis can be drawn as follows,

H₄   **:**   *Auditors' career and advancement positively affects government internal audit effectiveness*

Internal Audit Entity Leader Support and Government Internal Audit Effectiveness

One of many factors determiming the success of an internal auditing is the support from entity leader. The support can be in form of funding (Cohen & Sayag, 2010), or adequate human resource allocation (Mihret, et al., 2010).

AAIPI's Internal Audit Standards clarified that internal audit entity leader support can be in several forms, e.g., internal audit entity leader shall manage required resources—funding, human resources, or equipments—, internal audit entity leader shall make policies and procedures to ensure that all internal audit activities are performed effectively, internal audit entity leader shall design a program to develop and assure internal audit quality—e.g., internal evaluation on auditors' performance based on audit standards and auditors' code of ethics (2014b).

Internal auditing cannot be properly performed without support form entity leader, both in form of adequate funding and in form of proper facilities. Furthermore, support can also be in form of physical and mental security for internal auditors so that the auditors will face no burden outside their scope of assignment. With such support, auditors will perform their duties excellently so that good recommendation will be generated and the recommendation will add values to the auditees.

Top management support significantly affects to internal audit effectiveness (Cohen & Sayag, 2010). This is supported by Mihret, et al., (2010) by arguing that adding management support in form of human resource allocation and adequate material will affect internal audit effectiveness. Based on these analyses, a hypothesis can be drawn as follows,

H₅   **:**   *Entity leader support positively affects government internal audit effectiveness*

Research Methodology

Research Population and Sample

The population in this research is all functional officials working for BPKP (3,786 personnel) in 34 BPKP offices (a head office and 33 branch offices) in Indonesia. The sample size is determined according to Sekaran & Bougie (2013) i.e., if the population reaches 4,000, the ideal sample size would be 351. Samples were chosen based on simple random sampling method. 385 samples were succesfully collected, thus meets the ideal sample size.

Data and Data Sources

This researh uses primary data directly collected from the source using questionnaire distributed thorugh post mail. 700 questionnaires were sent in case some are damaged or unreturned. 405 questionnaries were collected but 20 of which were damaged of not fullly filled thus cannot be processed. Hence, 385 questionnaires were processed, a 55% of all questionnaires distributed.

Operational Definition and Variable Measurement

In this research, the operational definition of the variables is based on previous research by Cohen & Sayag (2010) as tabulated in the following table. 1

Table 1
Variables and Operational Variables

NO.	VARIABLE	DEFINITION	DIMENSION	VARIABLE
1.	EFKTV*	Government internal audit effectiveness	Audit Quality (20 questions) Auditee's evaluation (11 questions) Additional contribution of internal audit (5 questions)	Dependent
2.	AHLI*	Internal auditors' professional expertise	Auditors' formal education and trainings (2 questions)	Independent
3.	KLTS*	Quality of Internal Audit Work	Internal audit planning and scope (4 questions) Auditors' and auditees' response on audit result (2 questions)	Independent
4.	INDP*	Internal audit organization's independence	Work relationship within internal audit entity (3 questions) Work relationship with the auditees (6 questions)	Independent
5.	KRIR*	Internal auditors' career and advancement	Trainings, promotions, and employee career development (3 questions)	Independent
6.	DKGN*	Internal audit entity leader support	Facility and funding support (4 questions)	Independent
7.	GEO	Auditor's geographical location	1 = Java, 0 = Outside Java	Control
8.	GDR	Auditor's sex	1 = Male, 0 = Female	Control
9.	PDK	Auditor's current degree in formal education	1 = Bachelor, 0 = Non-Bachelor	Control
10.	JFA	Auditor's functional position	1 = Expert auditor, 0 = Skilled auditor	Control

*__Source:__ *Cohen & Sayag (2010) with adjustements according to regulations and real condition in Indonesia*

As can be seen from Table 1, the dependent variable used in this research is internal audit effectiveness and the independent variables used are professional expertise, quality of audit work, organization's independence, career and advancement, and support from internal audit

entity leader. One variable from the research of Cohen & Sayag (2010) went unused i.e., internal audit sector. This is because in their research, internal audit sector is classified into two—public sector and private sector—whereas this research only investigates public sector. Dependent and independent variables were measured using 4-points likert scale (1 = strongly disagree, 2 = disagree, 3 = agree, 4 = strongly agree).

In this research, 4 control variables are added i.e., geographical location, sex, current degree in formal education, and functional position. These variables are categorial and denoted with either 1 or 0 to measure each category.

Data Analysis Method

This reserach uses multiple linear regression model to analyze data and to see the relationship how independent variables affect the dependent variable. Also, additional tests were performed to observe the interaction between independent variables and the dependent variable.

The multiple linear regression equation in this reserach is expressed as follows,

$$\text{EFKTV} = \alpha + \beta 1 \text{AHLI} + \beta 2 \text{KLTS} + \beta 3 \text{INDP} + \beta 4 \text{KRIR} + \beta 5 \text{DKGN} + \beta 6 \text{GEO} + \beta 7 \text{GDR} + \beta 8 \text{PDK} + \beta 9 \text{JFA}$$

Notation:

EFKTV	:	Internal audit effectiveness
σ	:	Constant
β1, β2… β3	:	Regression coefficients
AHLI	:	Professional expertise
KLTS	:	Quality of internal audit work
INDP	:	Organization's independence
KRIR	:	Career and advancement
DKGN	:	Internal audit leader support
GEO	:	Internal auditor's geographical location
GDR	:	Internal auditor's sex
PDK	:	Internal auditor's current degree in formal education
JFA	:	Internal auditor's functional position

Data Analysis Result

Respondents Details

Male respondents make up the majority of respondents in this research i.e., 266 respondents or 69.09%. When seen from the office level, most respondents are from BPKP's head office counting up to 46 respondents or 12.21% from the total respondents. However, when seen from geographical category, the majority of respondents are from outside Java i.e., 263 respondents or 68.31%.

Based on degree in formal education, the majority of respondents hold a bachelor degree i.e., 249 respondents or 64.67% and the rest sum up to 136 respondents or 35.33%. Based on functional position, the majority of respondents are classified as expert i.e., 237 respondents or 61.56%.

Table 2
Respondents Details

No	Details	Category	Sum	Percentage
1.	Auditor's geographical location	Java	122	31,69%
		Outside Java	263	68,31%
2.	Auditor's sex	Male	266	69,09%
		Female	119	30,91%
3.	Auditor's current degree in formal education	Bachelor	249	64,67%
		Non-Bachelor	136	35,33%
4.	Auditor's functional position	Expert auditor	237	61,56%
		Skilled auditor	148	38,44%

Validity and Reliability Testing

Questionnaire validity testing was performed using Pearson Correlation for each questionnaire item from each variable. Results show that there is one unvalid questionnaire item which needs to be removed from the hypotheses testing.

The reliability testing results show that the value of Cronbach's alpha from all depentdent and independent variables are in a range of 0.616-0.945 which is greater than 0.60. This indicates consistency within respondents' responses and thus the responses is reliable for hypotheses testing (Ghozali, 2006).

Descriptive Statistics and Data Correlation

The mean of internal audit effectiveness variable is 3.0075 and its standard deviation is 0.2987, the lowest compared to other variables'. This is because the responses are mostly in between disagree and agree i.e., 259 respondents or 67.30%.

The mean of career and advancement variable is the lowest of all variables' at 2.7735 and its standard deviation is the highest of all variables' at 0.5025. This is because the responses are mostly in between disagree and agree i.e., 333 respondents or 86.5%. Meanwhile, the mean of professional expertise variable is the highest of all variables' at 3.2974 and its standard deviation is 0.4913. This is because the responses are mostly in between agree and strongly agree i.e, 354 respondents or 91.90%.

The descriptive statistics and data correlation are shown in the Table 3 as follows,

Table 3
Data Description and Correlation

AHLI = Professional Expertise, KLTS = Quality of Audit Work, INDP = Organization's Independence, KRIR = Career and Advancements, DKGN = Leader Suppport, GEO = Geographical Location, GDR = Sex, PDK = Educational Degree, JFA = Auditor's Functional Position;

Dependent Variable = Government Internal Audit Effectiveness (EFKTV)

[a] Significant at 0,01, [b] Significant at 0,05, [c] Significant at 0,1

Based on the table above, the quality of audit work variable has a mean and a standard deviation value of 2.9966 and 0.3681 respectively with the majority of response in between disagree and agree i.e, 270 respondents or 70.10%. The organization's independence variable has a mean and a standard deviation value of 2.8883 and 0.3321 respectively. Its standard deviation is the lowest of all variables'. This is because the responses are not really diversed with the majority of responses in between disagree and agree, i.e., 302 repondents or 78.40%.

Meanwhile, audit entity leader support variable has a mean and a relatively high standard deviation value of 2.8405 and 0.4626 with the majority of response in between disagree and agree i.e, 307 respondents or 82.30%. Correlation testing was performed using Pearson Correlation. As shown in Table 3, the relationship between independent and dependent variable is strong and directly proportional because the correlation value is nearing +1. The value of sig. is lower than 0.05. This indicates a significant relationship between independent variable and dependent variable in the research.

Data Classical Assumptions Testing

The classical assumptions testing performed in this research is normality testing and multicollinearity testing. The data normality testing was performed using One-Sample Kolmogorov-Smirnov and the multicollinearity testing was performed by observing the tolerance and VIF value. Testing results show that the data are free from all classical assumptions.

Hypotheses Testing

Results show that F significance for all regression are below 0.05 indicating that all fit regression equation can be used in the testing. The testing resuts also show that the mean value for adjusted r-square from regression 1-5 is 29.04 indicating that the independent variables of professional expertise, quality of audit work, organization's independence, career and advancement, and internal audit entity leader support can adequately explain the variable of government internal audit effectiveness. The resultes are tabulated in the following table,

[a] *Significant at 0,01*

Table 4 indicates that the variables of professional expertise, quality of audit work, organization's independence, career and advancement, and internal audit entity leader individually (regression 1-5) and collectively (regression 6) affects internal audit effectiveness positively and consistently. This is because the sig. value for every variable is below 1%, 5%, and 10%. Therefore, all hypotheses tested in this research are accepted.

Professional expertise can improve internal audit effectiveness. If the government internal auditors possess professional expertise that is consistent with their work scope, they can professionally function as government internal supervisors and can ensure that the auditing processs professionally executed. This finding supports the findings of Al-Twaijry, et al., (2003), Mihret & Yismaw (2007), and Arena & Azzone (2009).

The quality of audit work can be in form of good planning and good responses toward auditing in terms of follow-up execution supervision and continuous auditing. If the audit results have good quality and are followed up, the internal auditing will add values to the auditees. Therefore, the quality of audit work affects internal audit effectiveness. This finding is consistent with that of Mihret & Yismaw (2007).

Internal audit organization independence assures public credibility and trust towards audit results. Independent auditors execute audits based on real facts so that the audit results would be valid. Hence, organization's independence affects internal audit effectiveness. This finding supports that of Cohen & Sayag (2010), Mihret, et al., (2010), and D'Onza, et al., (2015).

The policy of career and advancement affects government internal audit in Indonesia. Auditors' background combined with experience, knowledge, and understanding of the organization and regulation will give a positive impact towards the institution, in other words, will add values to the auditees.

The execution of internal auditing requires support from entitly leader both in terms of funding or other facilities. Adequate support will enable the auditors to perform excellently so that the results will also have good quality. Therefore,—consistent with the finding of Cohen & Sayag (2010) and Mihret, et al., (2010)—support from entity leader affects internal audit effectiveness.

Hypotheses Testing (advanced analysis)
The testing results indicates existing effects from the interaction between two independent variables and a dependent variable individually and collectively. Within all regressions (7-26), the significance of F-test is 0.000 (lower than 5%), indicating that all regression equations used are fit. Furthermore, the adjusted r-square values for the regressions are greater than those of the main testing. This indicates that the adding of interacting variable

among variables in the regression model can enhance how variation explanations of the dependent variable. Thus, the equation with interacting variable more fit. The extended analysis testing results below indicates that the two-variable interactions in regression 8, 16, 20, and 26 are significant towards the dependent variable.

The tables above also show that there are two-variable interactions that are insignificant towards the dependent varibale. This indicates that the independent variables used in this testing are sensitive when treated with interactions, meaning that the variables are possible to be further developed in the measurement of dependent variables.

Discussions

Results show that all independent variables—i.e., professional expertise, quality of audit work, organization's independence, career and advancement, and internal audit entity leader—significantly affects government internal audit effectiveness in Indonesia. The first hypothesis (professional expertise) is accepted while proven to be significantly affecting the government internal audit in Indonesia. The expertise implies the competence individually possessed by the auditors. In the context of auditing, this is commonly evidenced by certain

formal education degree or certain training certifications. The broader the auditors' knowledge, the higher the auditors' formal education degree, and the more trainings the auditors attended, the better perspectives and knowledge on auditing the auditors would possess. Hence, the work done by the internal auditors would also have better quality. This finding is consistent with that of Al-Twaijry, et al., (2003), Mihret & Yismaw (2007), and Arena & Azzone (2009).

The quality of audit work refers to how well the auditors' responsed on the auditing performed as well as how obedient the auditors are to the established standards. The quality of internal audit work demands the internal auditing to have good planning, significant scope for auditees, and good response towards the auditing process both in terms of follow up supervision and in terms of continuous auditing. Also, the auditors are expected to act as consultants to the auditees. If done well, the internal auditing will be effective. Thus, the second hypothesis is accepted in this research. This finding supports that of Mihret & Yismaw (2007).

The results also show that the third hypothesis is accepted. This indicates that internal audit organization's independence is important and significant to internal audit effectiveness especially in terms of providing assurance services. Unindependent auditors will tend to conceal facts outside auditees' interest or will try to make them insignificant so that other parties will also conceive them as being so. This will make the audit results invalid and will make the auditing ineffective. This finding supports that of Cohen & Sayag (2010), Mihret *et al.* (2010) and D'Onza, et al., (2015) which shows that independence significantly affects internal audit effectiveness even though, with regards to internal audit function outside assurance services—e.g., consulting services—, independence is not really considered important

The fourth hypothesis (career and advancement) is also accepted while proven significantly affecting government internal audit effectiveness in Indonesia. Based on simple logics, public officials from internal audit entity will have a good understanding of the institution in which they are positioned i.e., what is good and bad, what is to be improved, and how to fix it. Therefore, an official's career started from an internal audit entity will have a positive impact towards the organizations. This indicates that the internal auditing has been effective.

In performing internal audit activities, support from entity leader is really needed, both in form of physical and non-physical support. Physical support can be in form of funding or facilities and non-physcial support can be in form of psychological security and convenience for the auditors in performing their duties. Absence of such support will auditors' performance and can even lead to fraud. This will make the result cannot be accounted for, will have a negative impact towards the auditees, and will make the internal auditing ineffective. Results how that the fifth hypothesis in this research is accepted for the support from entity leader significantly affects government internal audit in Indonesia. This finding supports that of Cohen & Sayag (2010) and Mihret, et al., (2010).

Results from testing the two-variable interaction between professional expertise variable and quality of audit variable indicates a significant influence to government internal audit effectiveness. Professional expertise in terms of technical competence is required for the auditors to perform the auditing process. This is also the case for quality of audit work which refers to audit planning and responses towards audit result. Auditors possessing excellent expertise and who are able to design a good audit planning will execute the auditing in a most optimum way.

A significant influence is also shown in the interaction between the quality of audit work and organization's independence. Independence will enable auditors to perform their duties according to existing facts, neutrally, and unbiasedly, so that the audit results will be free

from errors resulted by a particular party's interests. Independent auditors combined with good planning will assure the optimality of the auditing.

The interaction of quality of audit work and organization leader support also affects government internal audit effectiveness. Supports in form of funding or other resources can be very beneficial for auditors in performing their duties. An auditing performed with robust planning combined with full support from entity leader will be very effective and its results will become added values to the auditees.

The testing of two-variable interaction shows that the quality of internal audit work is one of many factors affecting internal audit effectiveness. The quality of audit work can be in form of audit planning and response towards audit results. This proves that the auditing performed is affected by how its planning is prepared and by what is to be done afterwards. Good responses towards the audit will guarantee the its recommendation will be executed so that it will become an improvement for the auditees.

Conclusion, Implication, and Limitation

This research is aimed to identify factors affecting government internal audit effectiveness in Indonesia. Results from hypotheses testing show that professional expertise, quality of audit work, organization's independence, career and advancement, and support form audit entity leader positively affect government internal audit effectiveness in Indonesia. Professional expertise, quality of audit work, organization's independence, career and advancement, and support from the leader are important factors in achieving internal audit effectiveness. This makes it important for the internal audit entity to improve audit professional quality through formal education, continuous trainings, proper planning and audit follow-ups, independence from audited institution assuring, policy making on auditors' career for audited institution, and adequate funding and facility support.

This research also has a limitation i.e., the researchers cannot fully control the questionnaire filling, both in terms of respondents' understanding on every questionnaire item and responses verification. This is because respondents are officials still active in BPKP in every provinces in Indonesia. This creates a geographical barrier and furthermore, there is also a barrier on assignment time and other duties that the officials have to perform. Also, the independent variables used in this reserach can still be further explored both in terms of construct and in terms of questionnaire item because the testing results are still relatively sensitive when treated with interactions among independent variables.

FACTORS OF ORGANIZATIONAL DEVELOPMENT TO IMPLEMENT SECTORAL INTEGRATED REPORTING SYSTEMS (STUDY IN REGIONAL GOVERNMENT SOUTH KALIMANTAN)

Syaiful Hifni, UniversitasLambungMangkurat, Indonesia
Akhmad Sayudi, UniversitasLambungMangkurat, Indonesia
Chairul Sa'roni, UniversitasLambungMangkurat, Indonesia

Abstract

This study was conducted in accordance Research of Master Plan (RMP) of Lambung Mangkurat University Year 2011-2014, namely through leading sector of development information technology   related to the sectoral of reporting wetland environment. For local governments, this study related to strategic issues related to the role of the Government in the AEC 2015, MDGs 2015, SDGs, where the presence of changes in the environment, including the globalization of the environment require organizational attitude to deal with it, so that, the role as "agents of development" can be maintained. Its objective is to identify the factors in the development of the organization of Regional Government through the strategic aspects, administrative, social, and techniques in the implementation of accrual based financial reporting system since in 2015. The study was conducted on 386 (three hundred and eighty six) population of Government Work Units (GWUs) or SKPD, with 100 (one hundred) GWUs (SKPD) sample. Uses ofmethods the chi-square tests for testing the differences   and test for relationship of variables with C Contingency. Using the nominal measurement scale on aspects: (X1) Accrual reporting: All information for users, (X2) Computer Based Information Systems (CBISs): for sustainability and integrated reporting; (X3) Individual Ethical Intelligence: social intelligence; (X4) Organizational Intelligence: Organizational infrastructure; (X5) characteristic of Change: Personal Change, (X6)   Institutional Isomorphism , (Y1) Implementation of integrated sectoral Reporting, with: (Y1.1.): The guiding principle, and (Y1.2) Content Element. The results show the X observation is = 24.512 and X in table = 41.34, showed no difference from the application of theory in the implementation of sectoral integrated reporting system. Implications of the role of theory can be met on a degree of freedom (5-1) (4-1) at the 0.05 alpha X value table = 21.03. Implications of the role of theory met through role aspects X1, X2, and X3, with the value of the relationship C Contingency 0.275. These aspects can distinguish of each Government Work Units as   Leading sector of the Provincial / District / City in South Kalimantan, which is associated with their activity in reporting the object of integrated reporting sectoral, namely aspects of the: "capitals", with information : financial, manufactured, intellectual, human, social and relationship, and natural capital.

Key words: *Organizational Development, Reporting on an accrual basis, CBISs, Ethical Intelligence,   and   Characteristics   of   Change,   sectoral   integrated   reporting.*

Introduction

Implementation Government Accounting Standard (Government Regulation Number 71 Year 2010) since 2015, marking the adoption of the accrual system into financial reporting of the Indonesian government. This system provides development for for every regional government and central government to consolidate financial reporting as unity in financial reporting of Indonesian government. The implementation of the accounting system was needed in line with the effort to develop the organization   to fulfill the System National of Accounts (SNA), as well as in the fulfillment of Government Financial Statistics (GFS). This GFS system puts the conception of   the integration for : (i) the Accounting System of Central Government   (ASCG), (ii)   the Accounting System of Regional Government (ASRG), (iii) Budgeting system, and (iv) accrual base for reporting system   with reference Government Accounting Standard (Government Regulation No. 71 Year of 2010). Implementation of accounting systems and performance of information system is a system requirement in fulfilling a role model to the GFS and SNA systems. This is consistent with an effort to meet the needs the development for integrated accounting systems and the performance of information system between regional and central government.

The accounting system of governmentalorganization with the implementation of accrual reporting base was the representation of public sector organizations that are in financial accounting environment (Tearney et al., 1997).   Parera and Baydoun (2007), describes The Accounting Ecology of Indonesia. The concept of ecology of accounting includes 5 (five) separateaspects but has parts that interact in the environment, namely: social, organizational, professional, individual, and accounting. Social environment refers to the structure of the elements of the economic system, political system, and the legal system, the element of cultural and non-cultural (geographic and demographic) in a society. The organizational or institutional environment refers to the size of the organization, technology, complexity and culture, human and capital resources. Professional environment refers to the various aspects of the profession, such as education, training, registration, discipline and ethics. Environment individually refers to the overall individual determination in respect of which reported of organization, professional and non-professional members of the other community. Environmental of accounting refers to the disclosure and measurement requirements and practices, the type and frequency of reporting accounting, and accounting infrastructure. All aspects of accounting environment underlying the establishment of the organization's policy in meeting the organization's financial accounting reporting practices, laying the basic mechanisms of audit control functions, as well as the identification of the needs of information users.

Based on activity of accounting and information system for financial reporting which has done by governmentalorganization is as the basis for meeting the information needs related to stakeholders who will use the information. The information which be produced of government consists of : position of economic resources, liabilities, and equity of Government at the end of the period, the information of economy, information adherence to rules, information about financial performance, information on planning and budgeting and narrative information about the financial and environment of   organization (GAS, Government Regulation No. 71/2010). Meanwhile, to anticipate and responses global issues such as: AEC, MDGs, and SDGs be needed stages for "sustainability reporting" and towards initiative "integrated reporting" as idea of Global Reporting Initiative (GRI). Fulfillment of Global Reporting Initiative carried out with the support of financial information completeness that communicated which refers to the Government Accounting Standards (GAS) with accrual base of governmental organization.

Relationships of implementing of financial accounting and information system with accrual base was put forward in the context, in which accounting system and information system was designed to produce financial information for performance assessment. Based on "evolution on corporate reporting", showed milestone of reporting system. Began in 1960 with   Financial Statements, to year of 1980 with Financial statements, Management Commentary, Governance and Renumeration, environmental reporting, to year of 2000 with element of reporting, namely: Financial statements, Management Commentary, Governance and Renumeration, and sustainability reporting, and toward year of 2020 with initiative for sustainability reporting and integrated reporting or integrated reporting to be projected, namely financial information, governance and renumeration, sustainability information, and management commentary (IIRC, 2011, in IR, 2014, P: 5)

From financial reporting to sustainability reporting and toward integrated reporting. Until now, we can see, that "sustainability reporting is becoming a mainstream business practice. Sustainability reporting is the critical first step in implementing strategy that can help an organization understand the impact on its stakeholders, and ways in which it might mitigate a negative impact on the economy, society and the environment (GRI, 2013, p: 4). Meanwhile, Integrated reporting is a concept that has been created to better articulate the broader range of measures that contribute to long-term value and the role of organizations in society. Central to this thing is the proposition that its value is increasingly shaped by factors additional to financial performance, such as reliance on the environment, social reputation, human capital skills and others. This value creation concept is the backbone of integrated reporting and, and this is the direction for the future of corporate reporting. In addition to financial capital, integrated reporting also examines five additional capitals that should guide an organization's decision-making and long-term success — its value creation in the broadest sense".
(IR/IIRC, 2014, p:1).

Efforts to reach the reporting of financial information and the economic aspects as well as aspects of the ESG, is a government organization's efforts to meet accountability and to be the global insightful organizations referring to global issues to fulfill sustainability reporting and towards integrated reporting as Global Reporting Initiative (GRI). Regional Government can take role as global insightful organizations through sustainable reporting toward integrated reporting. Based on support and because of readiness in implementation of financial reporting with accrual base. Reporting on GWUs and regional government (Provincial/District/City) has conformity with content element of the sustainability report, and the report to fulfill or conform with the integrated reporting criteria. All of types of information and the type of report that has been prepared Local Government has a complete type of information or report as classified in sustainability reporting (economic, environmental, social and governance) and also has similarity and completeness with allof information contents of integrated reporting, which consists of information about: financial, Manufacturing, Property Right, Human, Socio and relationship, and natural (Integrated Reporting, IIRC,2014).

The role of theoretical framework is required to fulfill of equality in relationshipbetween "agent" and "principal", whether the agent has acted appropriate and appropriate, because the agent has managerial opportunism. This concept describes the tendency of the attitude of behavior in specific actions to meet their own interests. This concept is a tool or a trigger that explains how and why the organization will ultimately have a tendency to move from diversity (diversity) to the level of equalization or similarity (similarity). This theory as a complement of the economic theory that has the common meaning (in general), and the special significance (particular) which was expressed as a resource dependency theory (Carpenter and Feroz, 2001: 565). Appropriate description of this

theory, the integration of institutional theory and the theory of resourcesdependency is to develop a theoretical framework that helps to explain, to control, and to predict an selection process in initiative implementation of GRI of Government with integrated reporting. Because this reporting system can achieve the accountability of economic resource allocation for organization and the impact for social welfare for citizens. Indeed, the whole point of a universal welfare policy is not to discriminate between citizens, not to separate "the needy" and "the poor" from other citizens and to treat them differently. Social policy should seek instead a moral obligation to furnish all citizens social welfare. Government performs the function and role in development by setting the budget framework through the state budget and the state budget, and regulatory frameworks in facilitating the role of private and community in development participation.

Focus on the main task to enhance social welfare and the to fulfill development objectives of global era, has raised the need in the development of organization of Indonesian government. This is done to fulfill the functions and role of development in accordance of Development Plan for long term, Medium Term Development Plan, Strategic Plan, the Regional Government Work Plan. This is related to the strategic aspects of the social dimension, administrative and technical organization. There are priorities and efforts to achieve the goal of social welfare linked to the global context namely AEC, MDGs and SDGs. In the infrastructure development of the organization, this thing referring to a way to be fulfilled that are met through the organization reporting system capacity.

Relevant mechanism of implementation of accounting system and information system of government refers to the state finance law and based on regulation (Government Regulation No. 71 of 2004); and other "ex ante" regulation, namely (Government regulation No 56 Year of 2005 About Regional Financial Information System, Government Regulation Number 8 Year of 2006 About Financial Reporting and Performance of Governmental Institution). For organizational development based on strategic approach with socio aspect, administrative aspect and technical aspect, can refers the theoretical aspects which can support to explain, to control and predict initiative for implementation of sectoral integrated reporting in Indonesia.

This study has conducted in assessment of the initiative for the implementation of sectoral of integrated reporting in government. Based on effort and role of the individual and organizational aspect of environment. Perspective of effort in initiative for integrated reporting is as contingency (Otley, 1980), because the result of this process be determined with many different aspects in every decision-making's environment be taken. There was perspective which describing that no information system that is universally applicable to all circumstances and at all locations of its application. This theory explains there are other situational factors that interact in influencing certain situations. Brownell (1982), and Govindarajan (1986), describe classification aspects of contingency and individual and organizational attributes as a variable that is contingency. The variables are expressed as contingency factors that influence the planning and control systems within the organization for government in Indonesia referring to organizational development to anticipate impact of globalization. Brownell (1982) suggested a variable contingency classification: culture, organizational (stability, environment, technology, uncertainty of tasks, organizational structure), interpersonal (leadership style, task characteristics, group characteristics, the situation, the pressure assignments, group size, and the fit between the individual with the task), personal (locus of control, authoritarian). Govindarajan (1986) argued contextual variables organizations and individuals that include the locus of control, leadership style, motivation, attitude, commitment, group characteristics, pressure duty (attributes of individual psychology), and the organizational structure, organizational culture, production technology,

market factors, environmental organization, compensation systems, strategies, difficulties in the task of contextual of organization.

Writing of this article based on the assessment which has done referring to theoretical aspects. (1) Accrual reporting: All information for users, (2) Computer Based Information Systems (CBISs): for sustainability and integrated reporting; (3) Individual Ethical Intelligence: social intelligence; (4) Organizational Intelligence: Organizational infrastructure; (5) characteristic of Change: Personal Change, (6) Institutional isomorphism, (7) Implementation of integrated sectoral Reporting, with: (7.1.): The guiding principle, and (7.2) Content Element.

Perspective of reporting with Accrual basis is to produces all of information for users. According to Law No. 17 of 2013 that the form and content of the report accountability of APBN / APBD prepared and presented in accordance with Accounting Standards in government (Article 32) The provisions concerning the recognition and measurement of the accrual basis of revenue and expenditure as Referred to in Article 1 point 13, 14, 15 and 16 of this law is implemented at the latest within 5 (five) years. During the recognition and measurement of revenue and expenditure accrual base has not been done, can be used cash basis for recognition and measurement (Article 36 paragraph 1). Preparation of the Government Accounting Standards (Government Regulation No. 24 year of 2005), then through Government Regulation No. 71 of 2010 concerning the Government Accounting Standards with accrual basis. Implementation of the accrual basis can be fully implemented since year of 2015.

Implementation Government Accounting Standard (Government Regulation No. 71 year of 2010), is a part of financial accounting environment and also as part of accounting ecologi of Indonesia. Based on this standard the government of Indonesia has the guidelines for implementation of the accounting system and performance of information system to produce 7 (seven) elements of financial statements in meeting public accountability, namely: the Balance Sheet, Budget Realization Report, Cash Flow Statement, Statement of Changes More Budget Balance, Statement of Operations, Statement of Changes in Equity, and Notes to Financial Statements (GAS, 2010; Regulation of Ministry of Internal Affair Number 64 Year of 2013). An integration of accounting systems specify achievements the performance of financial reporting. Integration with the fulfillment of the implementation of financial accounting system is to achieve the performance of financial information systems of organization that is characterized by the fulfillment of a characteristic of information that can fulfill the usefulness of information in decision-making (Jones et al, 1985; Kam 1986; Scott, 2006). Performance of information systems provides the benefits of information which is reached through financial reporting with accrual basis. Performance of information systems is measured by indicators of the benefits of information such as for accountability, stewardship, managerial and external supervision (Zimmerman, 1997; Halim, 2004; Curristine, 2005; Carnegie & West, 2005).

Computer Based Information Systems: for sustainability and integrated reporting. Base on " A Model Showing How the CBISs subsystems Are Used in Problem Solving". Computer Base Information Systems (CBISs) as model of MISs consist of : (i) Accounting Information Systems; (ii) Management Information Systems; (iii) Decision Support Systems; (iv) Office Automation Systems; and (v) Expert Systems. (Raymond, 1995: 20). CBIS models with regard to efforts to fulfill the quality characteristics of information management. This is an essential perspective attached to the type of management information, both qualitative information form and the form of quantitative information. Definition of quantitative information is: "Information of data consisting of numeric or numeric data is transformed into graphs. Qualitative information: consisting of descriptive information of data (Scott, 1986: 58). Information generated qualitative terms any SIM design, in addition to the

design of information systems transaction processing. Information generated form of quantitative information systems transaction processing, which includes quantitative information in the size of the financial and quantitative information in the non-financial measure.

The discovery of ethical intelligence widened the possibilities of individuals to manage their own future. Ethical intelligence defines how people generate added value, influence the environment, manage time, build strategies and focus on reality (UPC, 2014). Wayne and Mark (2010, P: 7-8) who refers to (Albrecht, 2006 and Goleman, 2006) has identified ethical intelligence individuals and ethical intelligence organizations. At individual levels, be stated attributes of social intelligence, i.e. the interpersonal skills, knowledge and abilities needed to interpret and understand different social situations and be oneself in social interactions, and to understand social roles and norms and act in accord with them in the establishment and maintenance of effective interpersonal relationships. At the level of the organization, the key attributes include an ethically infused organizational infrastructure- i.e. systems, process and practices that ensure ethical considerations form an inherent and fundamental element in the organization's decision making criteria at all levels and across all functions.

Based on "Anatomy of Personal change" Personal change is both an internal and external experience. It stems from a change in mindset and branches out from there. In truth, it is constantly moving toward some things, and away from others. But in order for noticeable transformation to occur, we must pass through a series of tipping points in succession. This does not mean that a personal change can't take place quickly, because it can. What it does mean is that all meaningful change, regardless of the time required, will follow a certain sequence. The 7 (seven) stages of personal change : (i) Awareness, (2) Discovery (3) Ownership (4) Exposure (5) Intention (6) Action (7) Integration" (http://advancedlifeskills.com/blog/anatomy-of-personal-change/). Characterictic of Change with role of Personal Change will enhance the benefit for personal (her/him) self and for organization. As part of institutional change, process of change consist of incremental and abrupt, and will give result of change with continuity and discontinuity impact (Lucie, 2013). Meanwhile, 5 characteristics of a change agent has described, namely: (1) Clear vision (2) Patient yet persistent (3) Asks tough questions (4) Knowledgeable and leads by example, and (5) Strong relationships built on trust (George, 2013)/http://georgecouros.ca/blog/archieves/3615.)

Institutional Isomorphism. Implementation of the decisions related to public policy, the explanations can be taken through the agency theory (Jensen and Meckling, 1976), and institutional theory (DiMaggio and Powell, 1983). Perspective of agency theory put forward in accordance with the description that: "... conclusion drawn from formal economic models (i.e. agency theory) that ignored the behavioral factor should be interpreted cautiously" (Kren, 1997: 4). DiMaggio and Powell (1983), put forward the concept of isomorphic mechanism which described as competitive isomorphism and institutional isomorphism. The concept of competitive isomorphism with regard to the description of the organization's efficiency and economic survival of the organization, while the institutional isomorphism with regard to the strength of their social environment that gives rise to a certain pressure for organizations to be able to develop certain practices that can be accepted in the organizational environment. Initiative for implementation of the decisions for integrated reporting as a way to reach insightful government need decision in a public policy referring to agency theory (Jensen and Meckling, 1976), and institutional theory (DiMaggio and Powell, 1983). The concept of the institutional isomorphism with regard to the strength of their social environment that gives rise to a certain pressure for organizations to be able to develop certain practices that can be accepted in the organizational environment.

Implementation of integrated sectoral Reporting, consist of: (i)   The guiding principle, and   (ii) Content Element. Guiding Principles: (i) Strategic focus and future orientation insight into the organization's strategy; (ii) Connectivity of information showing a holistic picture of the combination, interrelatedness and dependencies between the factors that affect the organization's ability to create value over time; (iii) Stakeholder relationships insight into the nature and quality of the organization's relationships with its key stakeholders; (iv) Materiality disclosing information about matters that substantively affect the organization's ability to create value over the short, medium and long term; (v) Conciseness sufficient context to understand the organization's strategy, governance and prospects without being burdened by less relevant information; (vi) Reliability and completeness including all material matters, both positive and negative, in a balanced way and without material error (vii) Consistency and comparability ensuring consistency over time and enabling comparisons with other organizations to the extent material to the organization's own ability to create value. (Integrated Reporting, IIRC,2014). Content elements (IIRC), consists of: (i) Organizational- overview and external environment what does the organization do and what are the circumstances under which it operates? (ii) Governance- How does an organisation's governance structure support its ability to create value in the short, medium and long term? (iii) Business model – What is the organization's business model? (iv) Risks and opportunities – What are the specific risk and opportunities that affect the organization's ability to create value over the short, medium and long term, and how is the organisation dealing with them? (v) Strategy and resource allocation – Where does the organization want to go and how does it intend to get there? (vi) Performance – To what extent has the organization achieved its strategic objectives for the period and what are its outcomes in terms of effects on the capitals? (vii) Outlook – What challenges and uncertainties is the organization likely to encounter in pursuing its strategy, and what are the potential implications for its business model and future performance ?, and (viii) Basis of preparation and presentation - How does the organization determine what matters to include in the integrated report and how are such matters quantified or evaluated ? (Integrated Reporting, IIRC,2014).

The Association of Chartered Certified Accountants, International Integrated Reporting Council, and the International Association for Accounting Education and Research have awarded three research projects to stimulate fresh insight on issues at the heart of integrated reporting… The first of the three projects is : *Meeting users' information needs: The use and usefulness of Integrated Reporting, (Faye, 2015).* A global body is to be created to help public sector organizations develop integrated reporting – reporting that incorporates both financial and other relevant information, including Environmental, Social, and Governance (ESG). The new initiative, which will include inputs from investors, is to be christened the Public Sector Pioneer Programme, and will be formed jointly the International Integrated Reporting Council (IIRC) and the UK-based Chartered Institute of Public Finance and Accountancy (CIPFA). These are: the main aim to implement integrated reporting across the various different types of bodies in the public sector to demonstrate how it can be applied. It mean that public sector bodies can use a way with share their experiences of initiative of integrated reporting with the private sector. Be describes, that although public sector organizations already publish a wide range of data on their social and environmental impacts, few present a 'complete and coherent picture' of how this links into their economic performance. The decision to launch the programme follows a CIPFA scoping study of the issues involved in applying integrated reporting in the public sector. It concluded that integrated reporting principles 'can readily be applied in the public sector, although there are some sector-specific issues to be considered in

more detail to facilitate this. (**http://www.unpri.org/whatsnew/public-sector-to-get-integrated-reporting-body/**)

Previous other Research result showed that:

- Evidence of previous research (Mooghali and Azizi, 2008), among others shows that: strategic outlook is related to knowledge management (hypothesis is rejected), share fate is related to knowledge management (which confirms this hypothesis), and Appetite for change is related to knowledge management (refutes this hypothesis) Performance pressure is related to knowledge management (confirms this hypothesis).

- There was potential avenues for research – analysis of integrated reports, such as: Analysis of integrated reports will contribute to the development of good practice. There is a need for analysis of: Quality of reporting on content elements especially: external environment; opportunities and risks; strategy and resource allocation; business model; future outlook (Carol, 2013).

- The results above gives meaning that readiness in financial reporting with accrual base has supported by management support, communication effectiveness and the role of internal supervision, but not fully supported by the role of regulation. Level of readiness of local government in financial reporting with accrual base provides organizations development opportunities as the global insightful organizations to fulfill the national issues for national integrated reporting uses System national of Account (SNA) and referring to global issues referring to fulfill sustainability reporting to achieve integrated reporting as Global Reporting Initiative (GRI) (Syaiful, 2016:1)

- Determination for initiative of implementation for integrated reporting as decision making process will related to content of decision and environment where decision will taken. This policy referring to decisions which will involves many parties. Jones stated policy definition (1984: 26): "as a standing decision characterized by behavioral consistency on the part of both Reviews those who make it and Reviews those who abide by it". Every establishment of policies will be related to the context of the "who" earned "what" and "how" to get it. There are various aspects determines for the policy implementation.

Methods

Research Design
This research is a quantitative research with non-parametric statistical tests.

Research methods

Subject and Object Research
Subjects of research areGovernment Work units (GWUs) in Banjarmasin City, Banjarbaru City, Banjar District, Tanah Laut District, Tabalong District, and South Kalimantan Province. Characteristics of the subjects be selected for eachGWU which have accounting entity and reporting entity. Sampling technique using multi stages sampling with 2 (two) stages to determine : (1) taking sample for local government from 14 (fourteen) entities Regional Government, and (2) taking sample of local Government Regional Work Unitsof selected regional government in line with the forms of work unit as: Board, Agency, Office, and Secretariat. The amount of population target of research are 386 (three hundred eighty six) of work units. The amount of selected sample are 100 (one hundred), which for

each Government work unit is represented with 1 (one) respondent. List amount of work unit as population and as sample be stated in table 1 below:

Table 1.
Proportion of Classification Sample Research

No	Classification of GWUs	Population	Ratios (%)	Sample
1	Board/Agency/Body	98	25	33
2	Service /Affair	208	54	54
3	Office/Sub District	48	12	4
4	Secretariat/Part of Secretariat	32	9	9
	Total	386	100	100

(Sources: Primary data):   Where: GWUs: Government Work Units

The object of study are; Accrual reporting: All information for users, Computer Based Information Systems (CBISs): for Sustainability and Integrated Reporting; Individual Ethical Intelligence: social intelligence; Organizational Intelligence: Organizational infrastructure; Characteristic of Change: Personal Change, and Institutional isomorphism. Implementation of integrated sectoral Reporting, consist of: (i)   The guiding principle, and (ii) Content Element.

Data analysis

Data were analyzed through analysis of informational and statistic analysis using non-parametric Chi-square and C Contingency. Phase of data analysis is done by collecting a score for each variable with each indicator. Indicators that fulfilled rated 1 and for indicators that are not met be valued 0. The maximum number of each indicator of each variable is 5 and the lowest value is 0. Use of Contingency table, where this table contains the distribution of observed frequencies (Fo) generated from tabulation of scores from each indicator of one variable. Based on data from Fo can be calculated distribution that expected as frequency (Fe) generated by using the formula:

Σ ij = ni x nj / N, where:

Σ ij = frequency distribution of expected in the row and column i to j

ni = number of frequencies on the line to i

nj = number of frequencies in the column to j

N = the total number of frequencies

i = 1, 2, 3, ...

j - 1, 2, 3, ...

Xo^2 calculations generated from the data with the formula :

$$Xo^2 = \sum_{I=1}^{r} \sum_{j=1}^{k} (Oij - \Sigma ij)^2 / \Sigma ij , \text{ where:}$$

r = Coulumn

k = row

Oij = observed frequency distribution row i and column j

Σij = expected frequency distribution row i and column j

Xo^2 value compared to the value X2 table, namely to test Ho1 on different test, where if $Xo^2 >$ X^2 table then H01 can be rejected, and, if $Xo^2 < X^2$ table then H01 can not be rejected. X^2 table is determined according to the table Chi-Square, namely the (row - 1) x (column -1).The coefficient of Contingency (Contingency C) obtained by the formula:$C = \sqrt{Xo^2 / N + Xo^2}$ where: C = coefficient value is limited ie associations between 0 <1, where:0 = no correlation and 1 = a perfect relationship

Xo^2 = Chi squared observations

N = number of responses in observation

Interpretation of the value of C based Guilford's Empirical Rule.

Table 2
Guilford's Empirical Rule

Nilai	Interpretasi
0,0 - < 0,2	Slight correlation : almost negligible relationship
> 0,2 - < 0,4	Small correlation ; low relationship
>0,4 - < 0,7	Moderate correlation : substantial relationship
>0,7 - < 0,9	High correlation: dependable relationship
>0,9 – 1	Very high correlation: very dependable relationship

RESULT AND DISCUSSION

Description Data

Below will be stated the descriptive statistics for "score keeping" based on uses questionnaire. Based on table 3 until table 18, which be varied of score for each variables from a score of 1 until score 5, showed relatively large score 5 which show the high effectiveness for role of theoretical aspects.

Table 3
Number Frequency of responses (Fo): Accrual Reporting: all information for users

Frequency of Scores	1	2	3	4	5	Total
Responses of GWUs	0	2	2	13	83	100

Scores 5 has achieved with a relatively large up to 83,00 percent. It showing a High effectiveness and a positive response in the ranks of GWUs to accept aspects accrual for reporting: all information for users.

Table 4
Responses for Accrual Reporting : All Information for Users

No	Indicators to be considered	Fulfilled	Not Fulfilled
1	Information of position of economic resources, liabilities, and equity of Government at the end of the period,	98	2
2	Information of economy	86	14

3	Information of adherence to rules	95	5
4	Information of financial performance	99	1
5	information on planning and budgeting and narative information about the financial and environment of organization	100	0

Except for information of economy being lack about 14%, all of information for users which be produced through accounting system and information system has effectiviness with fulfilment almost 100. This thing in line with Vicky (1997: p: 56) who refers Libby (1981), which described that information presentation appears to be a key element in financial decision making; yet, for many years, the method of displaying the information ”...received surprisingly little attention from financial accountans, managerial accountants, information system designers, and auditors.

Table 5.
Number Frequency of responses (Fo): Computer Based Information Systems : for Sustainability and integrated reporting.

Frequency of Scores	1	2	3	4	5	Total
Responses of GWUs	1	1	6	7	85	

Score 5 has achieved with a relatively large up to 85 percent. It showing a high effectiveness and a positive response in the ranks GWUs to accept CBISs as part of implementation the accounting system and the information system referring to Management Information Systems.

Table 6
Responses for Computer Based Information Systems: for Sustainability and integrated reporting.

No	*Indicators to be considered*	Fulfilled	Not Fulfilled
1	Applications Financial Accounting System as per the terms Accounting Standards	100	0
2	Application Information Reporting Systems for Organizational Decision Management	95	5
3	Decision Support Systems (DSSs) of organizations use management model	88	12
4	Decision support system of organization using the application program	99	1
5	Fulfillment for Office Automation with intranet and internet	92	8

Based on assessment for indicators, except for DSSs with management model with 12 % as being lack from high effectiveness, all of indicators has a high effectiveness in clarity role for initiative GRI with integrated reporting in government. Role   MISs with CBISs will enhance government in empowerment of accounting system, information system with general and special purpose of information. Role of CBISs to support the aim in integrated reporting in line with a way Establishing a decision stage and information required based on

information technology.

Government establish CBISs. This is priority to make sure that all of development policy meet the requirement for reporting system development of organization. This assessment result in line with (Joe and John, 2016: p: 11) which describes:"…However, we believe that there is still a significant 'knowing-doing-gap'; the knowledge of what should and can be done is well established, but the evidence is that it is unfortunately not followed in practice often enough…Managing IS/IT successfully Is perhaps even more difficult in today's environment of uncertainty, complexity and faster business change…".

Table 7
Number Frequency of responses (Fo): Individual Ethical Intelligence: Social Intelligence

Frequency of scorers	1	2	3	4	5	Total
Responses of GWUs	0	1	1	9	89	

Score 5 has achieved with a relatively large up to 89%. It showing an effectiveness and a positive response in the ranks GWUs to accept and recognize role of aspects of social intelligence as individual ethical intelligence.

Table 8
Responses for Individual Ethical Intelligence: Social Intelligence

No	*Indicators to be considered*	Fulfilled	Not Fulfilled
1	Integrated reporting as the economic situation (capital) requires a social role of GWUs / Sector	99	1
2	Norms and actions related to integrated reporting requires interpersonal skills	93	7
3	Clarity of roles on the relationship between the parties (Government / State, private, socio) in integrated reporting	99	1
4	Common goals in the fulfillment of integrated reporting strategically	100	0
5	Fill each principles integrated reporting require the ability of strategy for implementation	96	4

The high achievement of individual role in supporting of cross-function in reporting system. These are good response of GWUs to justify that the organization has capability to combine content of information in capital context which consists information for : economic, socio, and environment of organization. In Fact, the government until now, has well done with their reporting system, where they have reported of financial, economic, and environment aspect in many of forms reporting as officially. Government has produced the information which can be used to fulfill the accountability, managerial, stewardship, and for supervison internally and externally.

Based on identification of several key attributes (Wayne & Mark, 2010), stated individual level for social intelligence consists of interpersonal skills, knowledge and ability to support the organization in initiative for implementation of integrated reporting. Meanwhile, Albrecht (2006) stated that assets that what employers are really seeking is something more nuanced and multi –dimensional : " social intelligence". In Albrecht's

version of social intelligence, these innate abilities can be measured using five dimensions of assessment, in   yet another acrony-SPACE: Situational Awareness; Presence; Authenticity; Clarity;   and   Emphaty"   (Powerpress:http://gsbm-med-pepperdine.edu/gbr/audio/summer2010/Book Corner/).

Table 9
Number Frequency of responses (Fo): Organizational Intelligence: Organizational infrastructure

Frequency of Scorers	1	2	3	4	5	Total
Responses of GWUs	0	0	3	7	90	100

Scores 5 has achieved with a relatively large up to 90 percent. It showing a effectiveness and a positive response in the ranks GWUs to accept aspects of Organizational Intelligence: Organizational infrastructure.

Table 10
Responses for Organizational Intelligence: Organizational infrastructure

No	Indicators to be considered	Fulfilled	Not Fulfilled
1	The ethical aspects as the criteria which inherent in any decision-making of organization	98	2
2	The decision of organization considers the involvement of all levels and functions of the organization	98	2
3	Decision of organizations consider the involvement of all functions of the organization	97	3
4	Ethical aspects become fundamental criteria in the main focus of the organization's services	95	5
5	The process's approach in meeting the organization's output	99	1

Fulfillment for an ethical infused infrastructure (Wayne & Mark, 2010) as part of organizational development. Management creates strategic Program / Administrative / Socio / Technical to support all functions of each level of management will enhance capability initiative for integrated reporting of government. The agreement can be included two important components, namely: the priority integration sectors, and to all sector which needed to be reported through financial reporting to sustainability and integrated reporting.

Table 11
Number Frequency of responses (Fo): Characteristic of Change: Personal Change

Frequency of Scorers	1	2	3	4	5	Total
Responses of GWUs	0	2	4	3	91	100

Score 5 has achieved with a relatively large up to 91   percent. It shows a high effectiveness and a positive response in the ranks GWUs to accept aspects of personal change as a way to support organization toward initiative of integrated reporting.

Table 12
Responses for Characteristic of Change: Personal Change

No	Indicators to be considered	Fulfilled	Not Fulfilled
1	The need for self-development in the face of initiative integrated reporting	94	6
2	Clarity of purpose and process for the initiative implementation of integrated reporting	92	8
3	The complexity of the work requires the development of working methods related initiatives integrated reporting	90	10
4	The quality of the integrated reporting activities require the availability of written reference available for the organization.	96	4
5	Accountability implementation always requires accountability reporting system	98	2

Response from personal of each GWUs shows that they have both an internal and external experience referring to activity in financial reporting and experience of other reporting of management, such as performance reporting, prognosis reporting, also   availability for reference as ex ante regulation. This thinggive meaning that a personal change can support for requirement of organization development in initiative of integrated reporting.

Table 13
Number Frequency of responses (Fo): Institutional isomorphism

Frequency of Scorers	1	2	3	4	5	Total
Responses of GWUs	1	1	7	7	84	100

Score 5 has achieved with a relatively large up to 84 percent. It shows a high effectiveness and   a positive response in the ranks GWUs to accept aspects Institutional isomorphism referring to   institutional change and globalization.

Table 14
Responses for Institutional isomorphism

No	Indicators to be considered	Fulfilled	Not Fulfilled
1	Needs on efficiency andeconomics'survival for organization related to initiative of integrated reporting.	96	4
2	Adaptation to the strength of the social environment for organizations to develop activities related to the initiative of integrated reporting	95	5
3	The organization's policy in professional training programs, based on professional education, and professional codes of conduct related to initiatives of integrated reporting	94	6
4	The organization's needs to imitate other organizations that have realized more legitimacy or success meet good governance.	92	8
5	Needs on organizational external reference for the needs of the practicing of the organization with the regulatory framework in an integrated reporting initiatives	95	5

Referring to institutions as are the foundation of social life. These attributes of Institutional isomorphism will accommodate : formal and informal rules, monitoring and enforcement mechanisms, and systems of meaning that define the context within which individuals, corporations, labor unions, nation –states, and other organizations operate and interact with each other (John, 2004). It mean that when government do regulatory impact assessment for initiative of implementation of integrated reporting, this policy will enhance role of government to become organization with insightful globalization referring to AEC, MDGs and SDGs which has declared linked with Indonesia.

Table 15
Number Frequency of responses (Fo): Implementation of sectoral integrated Reporting, with: The guiding principle

Frequency of Scorers	1	2	3	4	5	Total
Responses of GWUs	0	1	5	6	88	100

Score 5 has achieved with a relatively large up to 88 percent. It showing a high effectiveness and a positive response in the ranks GWUs to accept the initiative for implementation the guiding principles for integrated reporting.

Table 16
Responses for Implementation of sectoral integrated Reporting, with: The guiding principle

No	Indicators to be considered	Fulfilled	Not Fulfilled
1	Strategic: organizations with a strategic focus and future orientation	100	0
2	Strategic: to compare the information with other organizations to create own value for the organization	95	5
3	Social: the nature and quality of the organization's relationship with the organization's key stakeholders	94	6
4	Administrative: Connectivity information as an overall view of the combination, linkages and dependence factors to create value for the organization from time to time	92	8
5	Technique: The content of the information concise and packed in accordance with context of the strategis of organization, governance and prospects without being burdened by the lack of relevant information	93	7

Response to aspects of the guiding principles of integrated reporting related to the principle of how the financial reporting complied with at government organizations. This is explained through the implementation of Accounting Standard as rule that it contains a conceptual framework and Principles of public sector accounting.

Implementation of Government Accounting Standard with Accrual basis (Government Regulation No. 71 year of 2010) has an omnibus regulation through "Regulation of Ministry of Internal Affairs, No. 64 year of 2013", which covers technical references, namely: (1) Policy of Accounting of local government (2) System of regional Government Accounting , and (3) Chart of Accounts Standard . Accounting policies comprises:
- Preparation of financial reporting accounting policy, which consists of:
(1) Statement of Government Accounting Standard 01, Presentation of Financial Statements;

(2) Statement of Government Accounting Standard 02 on Realized Budget Report;
(3) Government Accounting Standard 03, Cash Flow Statements;
(4) Government Accounting Standard 04 Notes to financial statements;
(5) Government Accounting Standard 11 of the Consolidated Financial Statements;
(6) A statement of the Government Accounting Standards 12 Report on Operations;
(7) Interpretation of Accounting Standards Technical Bulletin Government and the
     Government Accounting Standards related to financial reporting;
- Preparation of accounting policies account, consisting of:
(1) PSAP 05 on Accounting for inventory; (2) PSAP 06, Accounting for Investments
(3) PSAP 07 on Accounting for Fixed Assets; (4) PSAP 08, Accounting for Construction in progress; (5) PSAP 09 on Accounting for Obligations; (6) PSAP 10 of the Correction of Errors, Changes in Accounting Policies, Changes in Accounting Estimates and discontinued operations and; (7) Technical Bulletin IPSAP and SAP-related accounts.

Table 17
Number Frequency of responses (Fo): Implementation of sectoral integrated Reporting with: Content Element

Frequency of Scorers	1	2	3	4	5	Total
Responses of GWUs	0	2	6	7	85	

Score 5 has achieved with a relatively large up to 85 percent. It shows a high effectiveness and   a positive response in the ranks GWUs to accept aspects of Content for implementation of sectoral integrated reporting.

Table 18
Responses for Implementation of Sectoral integrated Reporting with: Content Element

No	Indicators to be considered	Fulfilled	Not Fulfilled
1	Strategic: information about the risks and opportunities for the organization to create value in the short term, medium term and long term	98	2
2	Strategic: complete information related to the allocation of organizational resources and how to achieve it	94	6
3	Social: presentation of information governance structure of the organization that supports the ability to create value for the organization	89	11
4	Administrative: information challenges and uncertainties that may be encountered in achieving the strategy, as well as the potential for the business model / service of organizations and the level of organizational performance	97	3
5	Technique: Information that included in the integrated report and how these are measured and evaluated	96	4

Conformity of content element with all of information which has produced through reporting system of government. Government interest related to information system which produces information initiated a national level. First, to fulfill the national issues for national integrated reporting uses System national of Account (SNA) and, secondly, to be the global insightful organizations referring to global issues to fulfill sustainabilityreporting and towards integrated reporting as Global Reporting Initiative (GRI). Government   can take role as

global insightful organizations through sustainable reporting toward integrated reporting, be supported and because of readiness by: (i) Reporting on GWUs and regional government (Provincial/District/City) organizations which has compatibility with the completeness of the information content, content of the sustainability report, and the report to fulfill the contents integrated reporting criteria. Transparency is regarding the completeness of the information content filled in various forms organizational reports referring to Local Government; (ii) The type of information and the type of report that has been prepared Local Government has a complete type of information as classified in sustainability reporting (economic, environmental, social and governance performance and has similarity and completeness with all of information contents of integrated reporting, which consists of information about : financial, Manufacturing, Property Right, Human, Socio and relationship, and natural. Reports that compiled at GWUs Local Government.

Hypothesis Test

Frequency as result of measurement data with each five (5) indicators on the 8 (eight) study variables presented through the following table below:

							on	

(Sources; Primary Data, 2016)

Where:
$$Xo^2 = \sum_{I=1} \sum_{j=1} (Oij - \sum ij)^2 / \sum ij , \text{ where:}$$

r = Coulumn; k = row
Oij = observed frequency distribution row i and column j
$\sum$ij = expected frequency distribution row i and column j

X^2 table is determined according to the table Chi-Square, namely the (row - 1) x (column 1).
X table = degree of Freedom (5-1) (8-1) = 28 refering to 0.05 be found 41.34

For (in case all of aspects used in measurement), shows the result $Xo^2 < X^2$ table, namely 24.511 < 41.34. It mean that H01 can not be rejected. Result of hypothesis test is that there was no differences with role of theoretical aspects in implementation to sectoral of integrated reporting in government.

For role clarity of theoretical aspects (in case not for all of theoretical aspects used in measurement), where only 3 (three) theoretical aspects (X1, xx2, X3 with Y), so that = (5-1) (4-1) =12 refering to 0.05 be found 21.03. It mean that $Xo^2 > X^2$ table, then H01 can be rejected. Result of hypothesis test is that there was differences with role of theoretical aspects, namely Accrual reporting: All information for users, Computer Based Information Systems (CBISs); for sustainability and integrated reporting; and Individual Ethical Intelligence: social intelligence; in implementation to sectoral of integrated reporting in government.

Relationship of these theoretical aspects with implementation to sectoral of integrated reporting in government is counted by the coefficient of Contingency (Contingency C) obtained by the formula:
$C = \sqrt{Xo^2 / N + Xo^2}$, so that:
$C = \sqrt{24.511 / (800-300) + 24.511} = 0, 2162$, where: $Xo^2 =$ Chi squared observations is 24.511 and N = number of responses in observation is (800-300)* (from table 18 where 3 (three dependent variable not included in measurement)

Interpretation of the value of Contingency coefficient referring to Guilford's Empirical Rule, shows that C = coefficient value is limited i.e. associations between 0 < 1, where: 0 = no associations/relationship and 1 = a perfect associations/relationship. Based on the Guilford Empirical Rule indicates the degree of association between variables, which for coefficient C Contingence is amounted to 0.2162 can be stated as " Small correlation ; low relationship ".

CONCLUSION

Based on role of theoretical aspects, namely: Accrual reporting: All information for users, Computer Based Information Systems (CBISs): for Sustainability and Integrated Reporting; and Individual Ethical Intelligence: social intelligence with initiative of implementation of integrated reporting, the government need to strengthen with regulation

framework. Be needed regulation impact assessment to justified next organizational development strategically through socio, administrative and technically approach.

Accrual reporting: All information for users. In the public sector (Hanah, 2010:p:6), that reporting by national government is often driven by domestic political pressure, international agreements, so should consider to provide performance of information system that produced the information not only in financial term but also consider sustainability in all its social aspects, environmental and economic elements. Reporting is one of key aspects of sustainability in business. "Reporting demands measurement of the different elements that are critical to effective sustainable business operations. Strategy helps to build on sustainability reporting as a tool to understand the internal and external impact on the business, using the data to help address the challenges of 21 st –century business, and create a competitive edge in a world increasingly shaped by the effects of resources scarcity and climate change. Sustainability reporting is the critical first step in implementing a strategy that can help an organization understand the impact on its stakeholders, and ways in which it might mitigate a negative impact on the economy, society and the environment. Even, in new form of integrated reporting with new indicator referring to the capitals aspect as value to stakeholders, namely: financial, manufacture, human, intellectual, social and relationship, and natural capital.

Computer Based Information Systems (CBISs); for Sustainability and Integrated Reporting. All GWUs of Regional Governments have conducted financial reporting (the role of system performance information) through the implementation of an accounting system with the characteristics of technology, namely: (i) use the application program namely Regional Finance Management Information Systems (RFMISs) and Regional Management Information Systems (RMISs). (Ii) Availability of reference of national regulations and regulatory for the region, and (iii) Supported the regulation of governor / Regents / Mayors of RG in the accounting system implementation and performance of information systems

Individual Ethical Intelligence: social intelligence. Because of phenomenon that "The emerging emphasis on environmental factors recognizes that not only does the organization surrounding decisions impact individuals judgments, but individuals also tend to make decision as part of a team or group.(Vicky, 1997:p 76).

Based on absence of role of theoretical aspects, namely: Organizational Intelligence: Organizational infrastructure; Characteristic of Change: Personal Change, and Institutional isomorphism, where, because the organization needs to explains, to control, and to predict the initiative of implementation of integrated reporting, then the government need for internalize and socialization this theoretical aspects with regulation framework, also be needed regulation impact assessment to perform next organizational development with strategically through socio aspect, administrative approach and technical approach with these intended theoretical aspects.

For Implementation of integrated sectoral reporting, with the guiding principle, and fulfillment of   Content Element, the government need to create the content of policy and environment of policy, namely through:

Unite the guiding principles of integrated reporting into guide through   regulation ofreporting of government.

Incorporate content element integrated reporting as the suitability and completeness of the report type and content of the reporting system of organization, including financial

reporting, sustainability reporting, and content aspect of financial reporting and sustainability reporting into format of integrated reporting

Environmental policy implementation which requires time dimension towards 2020 and the support of members of the organization in the role and implementation.

Implementation for sectoral integrated Reporting for governmental organizations is needed to realize the role of government in duty to develop social welfare referring to global situation. Fulfillment of information completely will enhance the organization take advantage of management for future with reach level insightful organization globally.

Government needs stages, namely: Financial Reporting with accrual basis to sustainability reporting and toward initiative of implementation of integrated reporting, through:

Implementation of accrual reporting requirement on SKPD that supports presentation of 7 (seven) elements of financial reporting by local government (has been done since 2015)

Green Reporting readiness for presentation of related organizations (presentation of financial and non financial information and reporting environmental aspects) (includes in Notes to Financial Statements)

-Readiness of Sustainability Reporting for presentation of related organizations (unified reporting of financial aspects, social, and environmental aspects sectoral) (Includes in Notes to Financial Statements)

-Readiness for presentation of Integrated Reporting (merger reports related aspects of finance, governance, and sustainability reporting related to the value of the organization) (need formal policy making)

LEADER'S WILLINGNESS TO SACRIFICE IN THE STATE OF BUSINESS FAILURE: A PERSPECTIVE OF JAVANESE LOCAL WISDOM

Titik Setyaningsih, Universitas Sebelas Maret, Indonesia
Pram Suryanadi, Universitas Sebelas Maret, Indonesia
Joko Suyono, Universitas Sebelas Maret, Indonesia
Sinto Sunaryo, Universitas Sebelas Maret, Indonesia

Abstract

This research aimed to examine the leader willingness to self sacrifice when the business falling down into deep crisis. The purpose of this study was to explore the spirit of leader's willingness to self sacrifice and develop leader's willingness to sacrifice himself to keep the business running in the context of the Javanese local wisdom.

A qualitative research was conducted with a phenomenological approach to analyze the spirit of a leader willingness to sacrifice on business traditional batiks entrepreneur in Surakarta. The traditional batik industry was elected in the research object with the justification that batik product has become the most popular icon of Indonesian national heritage product which has a cultural uniqueness due to the national competitive advantage.

The result shows that the leader's willingness to self-sacrifice comes from the calling and their obligation to maintain local wisdom. The business failure is caused by internal financial factors such as: mismanagement and complicated tasks, insufficient working capital including a weak cash position. Other factors are external (non financial) such as: high competition, market trend, inability to maintain business network, and high volatility of currency.

Introduction

1. Background

Indonesia has charmed the world by presenting its hospitality, archipelago's natural beauty, culture, and batik that has been recognized by UNESCO as intangible cultural heritage. As a part of Indonesian culture, batik has high historical value. It is not only as a mode of fashion, but also as a form of visual non-verbal communication on philosophy and cultural values (Rarick & Sunaryo, 2013). However, the competition in batik industry is getting tighter in the economic globalization where cheap Chinese batik threatens Indonesian batik existence and ASEAN Economic Community (AEC) emerges. Batik industry in Indonesia has to make the best effort to improve its sustainable competitive quality in order to be able to compete with other countries' batik industry. One of the ways is by prioritizing the basic and most important resources (the human resources) and applying human resources management adding benefits and uniqueness to the organization (Barney, 2001). One of the unique traits to explore is local value based leadership.

Western management system sees bureaucracy vertically and horizontally. This notion believes in superordinate and subordinate (vertically), and positions at the same level to the right and to the left (horizontally). Leadership wisdom is in line with the belief i.e. how somebody influences other people in the framework of vertical and horizontal bureaucracy.

In Indonesia, however, there is a leadership concept with a different dimension namely a concept recognizing 3 positions (front, middle, back). This concept is proposed by Ki Hajar Dewantara, the father of education in Indonesia. He's also the founder of Taman Siswa School in 1922. The school embraced a famous Javanese motto of the founder saying: *ing ngarso sung tulodho, ing madya mangun karsa, tut wuri handayani* or front leaders lead by examples, those in the middle raise the spirit, and those in the back position drive and

motivate.

The leadership concept does not break down people by their levels but by their roles. Roles are different in nature. A leader plays her/his role in the front position sometimes. She/he can also play the role in the middle position. When required, she/he plays the role in the back position. A leader is a role model. People will look up to this role model. Therefore, a leader has such big moral obligation. Her/his attitude, behavior, way of thinking, and habit are all looked up by people around. A leader being in the middle of subordinates has to initiate, motivate, and empower the human resources. The true leader is required in the back row. From the back row, the leader drives her/his people to move forward. The leader in the back position has to be smart in managing and keeping up with the people in the front row in order to maintain the consistent movement and goal. This is called *goal congruency* where the individual goal in an organization is in line with organizational goal. The *goal congruency* is particularly important otherwise the organizational movement will be in a heavier state due to a different or contradictory movement. The true leader has to be able to take care of the people. It means that she/he is to serve, to teach). (www.pembelajar.com).

This research focuses on a transformational leadership concept where a leader motivates the people to implement and internalize the bigger values and common goals rather than transactional leadership (Bass, 1985; Burns 1978). The leadership research focuses charismatic leadership paying attention directly to the essence of leadership aspect called "leader's willingness to sacrifice" (Conger & Kanungo, 1998). Leader's willingness to sacrifice gives huge contribution to leadership effectiveness (Choi & Mai-Dalton, 1998).

Leadership mostly determines the success or failure of an organization. Saying expresses that it is the leader who is responsible for the failure of a certain work. Choi and Mai-Dalton (1998) state charismatic leadership shows that leader's willingness to sacrifice gives huge contribution to leadership effectiveness and organization. Leaders willing to sacrifice are considered to be more charismatic and able to mobolize the people to contribute and serve the organization (Yorgers et al 1999). A research by De Cremer (2002) and De Cremer & van Knippenberg (2002) propose a comparison between leaders with willingness to sacrifice and those without. It shows that leaders with willingness to sacrifice perform and achieve higher in their organization.

Leadership is the key factor to the sustainability of an organization, be it high scaled, middle scaled or low scaled public organization or business; state owned or private owned organization or business; and solely led or collectively led organization or business. Burns in Purwadi (2007) emphasizes on people's motivation to willingly participate to realize the organization's goal based on leader's personal goal. Organization has to develop manager's transformational leadership in order to improve the performance of organization (Waldman et al. 2001). Studies show that leader's willingness to sacrifice influences her/his sub-ordinates by enhancing mutual reciprocal norms (Choi & Mai Dalton, 1999), and by positioning a leader as an example (Shamir et al. 1993).

A business entity with credible going concern has no plan or thought of liquidating its business in the future. In the state of economic crisis, however, there are entrepreneurs doing work termination due to company's insolvency (Setyaningsih, 1999). In this case, an entrepreneur and leader of a company has to sacrifice to save the business and workers from insolvency and layoffs. The main cause of business failure is high intensity of competition or entrepreneur or manager who applies transactional leadership. An efficient business management will be wise in dealing with the competitors. Some businesses might fail due to poor human resources managing the business. Management inability happens when a manager or leader is unable to manage her/himself in the time of hard work that results in inability to dedicate or focus on various and big responsibility (Grant, 1975).

2. Problem Formulation

The problem formulation is stated as follows:

1. What is the meaning of leader's willingness to sacrifice in batik enterprises in Surakarta?
2. What is the background of leader's willingness to sacrifice in batik enterprises in Surakarta?
3. Do batik entrepreneurs in Surakarta still have willingness to sacrifice when the company is in the state of failure?

3. Research Objective

The research aims to develop a model of leader's willingness to sacrifice which is in line with local Javanese value and wisdom particularly when the company is in the state of failure. Besides, the research also aims to explore the meaning of leader's willingness to sacrifice. The phenomenological approach is applied to explore the attitude of leader's willingness to sacrifice of batik entrepreneurs in Surakarta. The research will yield proposition or descriptive theory and proposition or prescriptive theory on the leader's willingness to sacrifice.

State of the Art & Previous Results

1. Leader's Willingness to Sacrifice

The grouping of transactional and transformational leadership has been known widely. The transactional leadership in dealing and communicating with people in order to do the exchange is important. However, the transformational leadership drives people to higher moral values (Burns, 1978). A leader shows the increase of commitment perception to her/his sub-ordinates on company's vision by being willing to sacrifice. Leader's willingness to sacrifice is proven by leader's perspective on being a leader by serving others (Greenleaf & Spear, 2002). Leader's willingness to sacrifice is also manifested by leader's willingness to take personal risk in order to achieve the bigger goal of the organization. The willingness to sacrifice improves the perception of sub-ordinates towards their superordinate. A leader is perceived to be a charismatic and interesting figure, acting and leading people by examples (Conger & Kanungo, 1987).

A leader is also somebody who "dispels totally/partially and/or defers permanently personal interest, privilege or well-being, reward distribution, and right of power" (Choi & Mai Dalton, 1998). On the other hand, De Cremer & van Knippenberg (2004) observe the advantages granted to other parties if a leader is willing to sacrifice. They claim that leader's willingness to sacrifice means "spending personal expenses to achieve company's goal". Leaders are those who are willing to sacrifice for public good (Bass & Steidlmeier, 1999). Leader's willingness to sacrifice will create trust, earn public acceptance as an example, shape transformational leadership, (Bass, 1985). Conger et al. (2000) and strengthen the opinion that leader's willingness to sacrifice is positively related to sub-ordinates' sense of respect.

Further, leader's willingness to sacrifice will result in giving habit and being unselfish in an organization (Choi & Mai-Dalton, 1999).

2. The Development of Leader's Willingness to Sacrifice Concept

The development of leader's willingness to sacrifice concept is presented in table 2.1 below

Table 2.1
The Development of Leader's Willingness to Sacrifice Concept

No	Researcher	Dimension	Indicator
1	Conger & Kanungo (1987)	Raising a dimension of leader's willingness to sacrifice	Containing two questions
2	Choi & Mai Dalton (1999)	Researching a model of leader's willingness to sacrifice consisting of one dimension	Containing 13 questions
3	Singh & Khrishnan (2008)	Yielding two dimensions, however, one dimension consists of low reliable items to remove. Hence, only one dimension to be used	Developing 6 questions

Source: Various sources, prepared 2014

a. Conger & Kanungo (1987)

Conger & Kanungo (1987) propose a concept of leader's willingness to sacrifice consisting of one dimension and two questions. The two questions are: (1) Leaders take personal high risk for the sake of the organization, (2) In achieving the goal of organization, leaders make big sacrifice.

b. Choi & Mai Dalton (1999)

Choi & Mai-Dalton (1999) develop a concept of leader's willingness to sacrifice consisting of one dimension and 13 questions.

c. Singh & Khrishnan (2008)

Singh & Khrishnan (2008) develop a concept of leader's willingness to sacrifice by conducting *explanatory factor analysis* based on Choi & Mai Dalton's (1999). The test results in two dimensions. However, one dimension consists of low reliable items to remove. Hence, only one dimension to be used consisting of 6 questions. Some questions are presented as follows: (1) voluntarily defers or refrains from using the authority, power position, or privilege for personal benefit, (2) Frees her/himself from privileges granted by other business leaders, (3) bears and/or be responsible for failure, misfortune, incident, mistake, and so forth where she/he is not the only bearer.

The research on concept of leader's willingness to sacrifice has so far yielded inconsistent results. Therefore, this concept is considered as unsettled. This is likely to be caused by research context differences.

2.1. Research Topic Novelty

Research topic novelty is:

1. Inconsistent research results on leader's willingness to sacrifice are likely to be caused by research context differences especially local context. On the other hand, there is a limited number of researchers doing empirical research on such a notion in relation with local wisdom and value. Furthermore, the Western and Eastern perspective on leader's willingness to sacrifice is different. The Western leadership concept emphasizes on competition, while the Eastern one suggests cooperation. The Western leadership concept features reason and rationality, while the Eastern concept proposes wisdom. Thus, it is important to develop a model of leader's willingness to sacrifice to be adjusted to local context and to be in line with local wisdom and values.

2. This research is a qualitative research in nature employing a phenomenological approach. It is not only a study trying to describe some actions (shown by the subjects' action/attitude, utterance, and/or conversation among research subjects) thoroughly, holistically, and contextually, but also an effort uncovering the meaning of any actions that become a phenomenon, i.e. ***noumena*** being in line with local wisdom and value.

Research Method
1. Research Design
The research is a qualitative research in nature employing Schutz's phenomenological approach. The assumption of phenomenological approach is that in making interaction with others, a person has various ways in assigning meaning to her/his experience. The meaning of the experience shapes acting reality shown/manifested by each person (Waters, 1994; Dimyati, 2000; Collin, 1997). The phenomenological approach goes deeper into the world of meaning to be concerted innately in a self to be expressed in the form of phenomenon and tries to answer the questions on how structure and nature of experience influences a symptom of a person (Ritzer, 1992).

Phenomenological approach in a qualitative research claims that individual behavior must be related to some motives: "because" (*because motives*) and "in order to" or "purpose" (*in order to motives*) (Schutz, 1972).

a. Steps of Qualitative Research with Phenomenological Approach
According to Fatchan (2012), steps of qualitative research with phenomenological approach are:
i. General Observation
General observation is conducted by observing unique and specific businesses having local wisdom and value. The observation results show that batik business is in uncertain phase due to high competitive atmosphere. Questions to be posted are:
1) What is the meaning of leader's willingness to sacrifice in batik enterprise in Surakarta?
2) What is the background of leader's willingness to sacrifice in batik enterprise in Surakarta?
3) Do batik entrepreneurs in Surakarta still have willingness to sacrifice when the company is in the state of failure?

ii. Focus and Subject/Informant
Subject/informant in this research are entrepreneurs willing to sacrifice. The method is purposive sampling. Should there be too many subjects or the number is indefinite, then the researcher selects the subjects using the snow ball method.

iii. Participant Observation
Qualitative research employing phenomenological approach is a field research emphasizing on participant observation (Haberman & Miles, 1994). Observation plays an important role in observing batik entrepreneur's daily activities such as leading a meeting, doing the monitoring, and so forth. This step is expected to find out the *noumena* description or the "nature" behind the leader's willingness to sacrifice in Surakarta.

iv. Observation on Subjects' Conversation
Observation on the topics being discussed by the subjects is conducted when the subjects are in interaction such as in a meeting (formal or informal). This step is conducted to find out the *noumena* description or the "nature" behind the leader's willingness to sacrifice based on

the conversation's content among batik entrepreneurs in Surakarta.

v.   Description Analysis and Data Validation

Description analysis and data validity are *primary interpretation* or *first order understanding* i.e. understanding on information data gained from the research subjects presented in the form of narration/result original information. This is conducted simultaneously one by one during the research by reading the participant observation and observation on conversation done by the subjects. Data validation is conducted at the same time as description analysis. According to Fatchan (2012), there are standards or criteria to ensure qualitative data validity as follows: (a) Credibility, (b) Transferability, (c) Dependability, and (d) Conformability. Description analysis and data validation are expected to find out interpretation's description or the meaning of "something" on each leader's willingness to sacrifice.

vi.   In-depth Interview (in the form of dialog with the research subjects)

In-depth interview is a structured interview. This interview is guided by a number of questions based on data/information gained in participation observation and observation on conversation done by the subjects. This step is a sort of dialog to explore and confirm the deep meaning on each leader's willingness to sacrifice.

vii.   Substantial Analysis and Data Validation

Substantial analysis is an effort to unite and relate inter-theme, inter- substance, or inter-category that has already been confirmed to the subjects. Substantial analysis and data validation are expected to find out cause-effect relation of inter- theme, inter-substance, and inter- category in order to reach a new proposition or substantive theory on each leader's willingness to sacrifice.

viii.   Subject's Understanding/Perspective

This step is meant to find out thorough description of in-depth interview result and substantial analysis. The data will be in the form of statement of each subject. The statement is analyzed and directed to a new proposition or theory. It will result in statements of cause-effect relation of inter- substance or inter-theme hypothetically, interpretatively, and argumentatively. Then, it will be narrated in minor and major propositions in accordance with the focus of the research and in the light of Schutz's theory.

ix.   Understanding the Subject's Perspective

Understanding the subject's perspective is   secondary interpretation or second order understanding. It is the researcher's understanding on subjects' understanding/perspective. This is conducted by discussing the research results with experts or testing it using the relevant theory. The new proposition is competed and compared with the existing theory and/or the previous research results by the previous researchers. This step aims to criticize, debate, reconstruct, and even "claim" that the research result is "a new finding". In other words, this step is meant to explain the theoretical implication of the new results, i.e. how they are different from the theory and previous results, how some of them are similar or supporting the theory or previous results.

Finding and Discussion

Business failure is caused by various reasons of different side and nature (macro, micro, external, and internal factors). External factors are beyond company's control such as inflation rate, change of political situation, economy, society, and culture. Internal factors are, on the contrary, under company's control such as financial ratio,

company's strategy, and management and accounting system. Foster (1986) classifies a company into four types based on the insolvency categories as seen in Table 4.1

Table 4.1 Insolvency Category

	Without Financial Problem		With Financial Problem
Not insolvent		I	II
Insolvent		III	IV

Source: Foster (1986: 535)

It can be seen in the table that category I is a healthy company. It means it has no financial problem that it has sustainable and credible going concern. A company might fall into category II (having financial problem but it is not insolvent). There are non-financial factors making the company survive. Non-financial factors and other factors cause a company insolvent and fall into category III. Category IV shows that financial factors become the only factors for company's insolvency.

In this research, in-depth interviews are conducted to 3 (three) subjects where all are batik entrepreneurs in Surakarta. The meaning of leader's willingness to sacrifice is gained from the interview with A as follows:

Monetary crisis in 1998 was pretty hard. At that time, Laweyan's batik industry was all in zero stage. Then, an owner of a batik store went to Malaysia with other entrepreneurs. In Malaysia, the owner earned valuable experience. It The statement above shows how a leader is willing to lose the position and turn to be a worker to earn money and rebuild the business. The leader also teaches the new generation to understand and observe the meaning of sacrifice to nurture and conserve batik. The fact that the leader teaches young *was a dramatic change, however, for her/him as from an owner of a batik store into a worker. She/he also learned about screen printing. After two years working in Malaysia, she/he went back home with money and experience and started the batik business again. It has been growing so well. It survives because it is a family business. Laweyan itself is the center of batik. The region had existed long before Solo was born. "This batik business is my great grandfather's business. I survive and so does this business. I don't want to leave this. This is part of my life becoming my flesh and blood. Batik is family heritage and cultural signature. I observe the values passed by the elderly. I know and realize how tough they were in the past that my family went to another country to make a living due to business insolvency and earn some money to rebuild the business. Therefore, I don't want to leave it and I'm proud of being able to nurture it".*

Generation is in line with Yorges et al. (1999). They state that leader's willingness to sacrifice shows sincerity to lose something to maintain the strong belief and value. A's business insolvency was purely caused by financial problem. This is proven by the following statement: "...*To be precise, the business was in a low stage because of financial and capital problem. It's impossible to buy raw materials since the price was determined by dollar's currency. The dollar's currency during the monetary crisis was really high.*"

The statement of A shows her/his business had low current asset (inability to buy raw materials). Company's management failed to manage the working capital. Hence, goods and credit could not be converted into cash to pay the debt. Capital was dramatically and continuously reduced. A's statement is also in line with C's statement as follows*:*

"Our batik business is our grandmother's. Our business partners trusted our grandmother more. During batik's golden era, people in the structure or prominent figures of this country ordered batik from the store and it was directly delivered to Jakarta. Well, our grandmother passed away. We, the younger generation, nurture and conserve the heritage. We have to survive. We realize that the purchase volume is not as big as it was. There are many young competitors as well. We have to find a way to attract the buyers such as by making an abstract motif. Blue abstract motif relates to sea life. We also combine it with **parang** *that such combination makes our batik interesting and unique"*

Both A and B's statements emphasize that leader's willingness to sacrifice to nurture and conserve the heritage comes from the inner calling. This is in accordance with Yorges et al. (1999). They mention that willingness to sacrifice is defined as "giving an important thing to someone". B's business failure which is stated as "the volume of purchase is not as big as it was" is caused by financial factors, i.e. young competitors and failure to maintain the network built by the predecessor. Something different is stated by B:

"Our company has decreasing turnover because of changes in consumer's taste and interest. Once the customers were given an example of cloth and they would buy it directly. However, they now ask for design breakthrough with more modern and colorful design. We target young consumers. As a consequence, we cannot maintain batik motif with darker color as the elderly wore. We are all supported by our parents. Our father has good network. Even if there is a change in management where now I become the CEO but customers are still loyal to our store. This is how our business survives. Well, I have more passion in beauty salon. However, I try to merge the two as both are closely related. At first, I was insisting on beauty salon and cosmetic business. But when I was told about the history and value of batik and my father asked me to nurture and conserve Javanese culture, then I agreed. That was the start."

B is a young successor in batik industry (28 years old). She felt that she was forced to manage the business. She was more interested in beauty salon. However, she agreed with the offer. She then manages the business that her father established. She experiences how her customers change in batik color taste. Now they tend to get into more colorful and catchy batik motifs. This business survives because it is able to adjust to the market's tendency. B's willingness to sacrifice is caused by her parents' order and not purely by the inner calling. This is in accordance with Grant's theory (1975). B as a leader is given more work to manage the two companies that both are able to mutually subsidize. The business fails in conventional market that now it turns to online market as stated by B as follows:

"... I build the market by going through online store and market. Problem emerges when I am out town and my customers urge me to serve them. They don't want to deal with my employees. So far, it survives. It is subsidized by other businesses that I have."

B's business survives because of internet advancement that she builds an online store. The advancement of IT also helps business survive by reaching customers through *Whatsapp* (WA) and *Blackberry Messenger* (BBM) as done by C below:

"Business atmosphere supports batik promotion, especially in Solo. I do promotion on WA or BBM. I post batik motifs that customers are interested in. Well, the fashion trend is sometimes not as perfect as our idealism. However, they are the kings to serve, right?"

Another factor of business failure suggested by A is government regulation. A says something in contrary:

"... these days batik has been so popular as supported by Solo municipal government. It officiates Laweyan as the batik center in line with the UN declaring batik as Indonesian intangible heritage. We get what we want and all our effort pays off. However, there is

something wrong. The government never changes the regulation regarding the raw materials. All raw materials are imported. This is not right. It is very difficult for batik sellers and producers to access the raw materials because of the unchanged regulation. Why?"

A has difficulty in assessing the imported raw materials. A wants the government to revise the regulation and protect the batik producers regarding the bureaucracy. A also hopes for the protection from fluctuating dollar currency. C, however, expresses her/his fear of losing the business:

"I need more capital, to be honest. It is hard to have customers with down payment. Now it still survives, but I cannot guarantee what it will be like in the future. It is also difficult to ask my children to manage the business in the future. They tend to be professionals than batik sellers."

C's statement indicates inability to survive in the future. The current networks are not as strong as they were. Networking is only a means to survive as C suggests:

"I have no other skill than manufacturing batik. Being the firstborn in my family, I become the bread winner for my family."

In other words, she/he has no successor for she/he lets the children to choose their own professional career.

Conclusion and Suggestion
1. Conclusion
From the discussion it can be concluded that:
a) A and B's willingness to sacrifice comes from the inner calling to rebuild the business and conserve the heritage. This supports Yorges et.al. (1999). They claim that leader's willingness to sacrifice shows the sincerity to lose something to maintain the faith and personal value.
b) B's statement supports Grant's theory (1975) stating that business failure is caused by management inability. Management inability happens when a manager or leader is unable to manage her/himself in the time of hard work that results in inability to dedicate or focus on various and big responsibility.
c) Business failure is caused by financial problem such as insufficient working capital including a weak cash position.
d) Business failure is also caused by other external factors such as high competition, changes in market trend and taste, inability to build network, changes in currency, changes in technology, and changes in government policy and regulation.

2. Suggestion
Business insolvency can be avoided by doing and having the following:
a) There is rate protection when batik sellers buy the raw materials so that they are protected from rate changes.
b) There is credit facility provided by banks to ease and defer company's debt payment when company's working capital is in the weak position.
c) Company makes a tactical effort by not only changing the working atmosphere inside it to be a profitable business area but also taking into account other factors and phenomena outside it which are sometimes beyond its reach. Company shall protect the business by insuring all activities to easily recover in time of crisis. Government shall make another breakthrough in protection such as providing batik insurance.

THE IMPACT OF COMPETENCY CERTIFICATION AND LEADERSHIP STYLE ON EMPLOYEE PERFORMANCE IN MINING COMPANY EAST OF INDONESIA

Irwan Usman, Universitas Hasanuddin, Indonesia
Haris Maupa, Universitas Hasanuddin, Indonesia

Abstract

The study aims to determine and analyze the impact of recognition of the relationship between competence and leadership style with the performance of employees which is focused on operation department in Mining Company in east of Indonesia. Optimal performance of employees who will support the achievement of corporate objectives that the management should be carried out as well as possible. This study is causal, ie the type of research where researchers want to find the cause of one or more issues.
This research was conducted at PT Vale Indonesia Tbk, PT Freeport Indonesia and PT Newmont Indonesia as representative of mining companies which apply competency certification in the east of Indonesia. The population in this study is employees numbering 105 persons. Side technique used is purposive sampling. Statistical analysis of the data using the tools of statistical program SPSS (Statistical Program / Package for Social Science) version 23.0.
These results indicate that the recognition does not affect the relationship between competence and transformational leadership style on employee's performance. Employees are more motivated to work optimally to achieve good performance instead of supported by their superior as a motivator for the improvement of work performance, therefore it is recommended that the superior always gives recognition in the form of praise or other simple expression through body language to encourage his subordinates to work optimally, if the frequency is increased superiors and subordinates will have a better relationship.

Keywords: *competency certification, leadership style, performance*

INTRODUCTION

Background of study

The role of human resources is deemedessential to develop human resource management as one of the main keys to get the pre-eminent performance. The broadly meaning of performance in his book entitled 'Key Performance Indicators' elucidates that a performance is a record of the results obtained from job functions or activities for a certain period. He also mentions that a performance is regarded as a person's success in executing a job (Moeheriono-2012).

A performance can be influenced by competence as stated by Gilley et al (1999), "Competency are useful in employee recruiting and selection of a given job classification. They can also be used to determine the training and development activities in which employees must participate to acquire adequate levels of performance mastery." It signifies that a performance is affected by the competence of each individual which is determined by the training and development of human resources to achieve the desired level of performance. Previous researches have confirmed that competence significantly affects the employees' performance as a result of research by Fitran (2012) for employees at the level of managerial

positions in ABC Islamic Bank. The other study is conducted by Xu and Ye (2014). In their research they mention that there is positive and significant correlation between the competence of teachers (lecturers) and performance, the sample in the study is representative of eight Universities in Beijing.

Nowadays only company with competitive advantage can compete in the global market. A research conducted by Tjiptohadi&Agustine (2003) states that "in order to survive, companies are rapidly changing from a business based on labor (labor-based business) towards a knowledge based business (knowledge-based business), with science as the main characteristic". Thus, it is evident that human resources play a very important role in realizing the company's goal primarily associated with free trade competition.

According to Stajkovic (2014), recognition is the official statement, approval, and genuine appreciation (and not false praise). In his study he mentions that the recognition given by the employer in the form of a sincere compliment will trigger employees to re-enact positive behavior in the future. One reason to grant recognition to employees during a study shows that employees who get appreciated will get positive feedback about his/herself and the ability to contribute (Daniels, Darling et al., Nelson, Gostick and Elton in Tessema et al., 2013).

Based on a survey of 200,000 employees, it is concluded that if recognition is carried out correctly then it can increase profits and the level of service to customers and also strengthen the correlation between employees and job satisfaction. In addition, in a study about the granting of recognition only 50 percent of managers state that they only grant recognition to high-performing employees (Tessema et al., 2013).

Leadership is also one of the critical factors for a successful organization. The role of leader is necessary not only to play an active role in encouraging employees in channeling creative ideas, but also to act positively for the betterment of the company. According to Kurniawan (2011), leadership is one of the elements that have an impact strong enough for the running of the organization and its survival. Indeed the role of the leader is crucial for the achievement of organization's direction and goals.

Kurniawan (2012) reveals that a performance is an organization's ability to be able to achieve its goals by using resources effectively and efficiently. Effective transformational leadership is vastly essential to be known, understood, managed, and even created with the aims to improve performance, achieve goals and be able to create organization's competitive advantage.

This study is conducted in PT Vale Indonesia Tbk, PT Freeport Indonesia and PT Newmont Indonesia. Both companies are representatives of mining companies to employees and have implemented BNSP competence certification. This study aims to determine and analyze the effect of certification of competence and leadership style with employee performance as a moderating variable.

Theoretical Basis

Resource Based View (RBV)

Grand Theory of this study is the Resource Based View (RBV) (Wernerfelt, 1984). RBV is a theoretical concept that can be trusted because it was born out of research in economics which observes the factors that affect the company's competitive advantage (Hasbi and Surya, 2015). RBV perceives that employees' knowledge and company's intellectual capital will the key to the future performance of a company (Lanvin et al, 2013: 20).

RBV considers that company's resources are deemed as a major factor driving performance. In order to produce the performance, resources should be managed with the capability, the ability to process performance (Barney, 1991). Resources and capabilities are combined to produce the company's competency. HR competency is one of the resources that need to be

managed by the capability to produce the company's competency to compete and generate performance.

Performance

The word performance is derived from the words job performance and also called actual performance or achievement that has been achieved by an employee as stated by Moeheriono (2012: 69). According to Emmyah (2009: 32), etymologically, the word *kinerja* comes from the word performance. Performance comes from word to perform that has multiple entries, namely (1) to conduct, (2) to meet or to run, (3) to execute a responsibility, (4) to do something that is expected by someone. From these inputs, it can be interpreted that a performance is executing an activity that enhances the work in accordance with its responsibilities to achieve the expected results.

According to Mangkunagara (2001: 67), the performance term is derived from job performance or actual performance (job performance or actual achievements attained by someone). Performance (job performance) means: the result of the quality and quantity of work that can be achieved by an employee who performs his/her duties in accordance with the given responsibilities. In connection with the concept of performance, Simanjuntak (2005: 10) states that a performance is the level of achievement of results on the application of certain tasks. Individual performance or the employee's performance reflects how she/he fulfills the job requirements accordingly. Whitmore (1997: 104) defines that a performance is the implementation of the functions demanded by someone, a performance is an act, an accomplishment, a common cast skills. Employee's performance within a certain time period shall be evaluated or assessed for the assessment is a part of the staffing process, which starts from the process of recruitment, selection, orientation, placement, training and performance appraisal process as explained by Alwi (2001: 177).

From these definitions above, it can be concluded that a performance is the work of individuals and groups according to the powers and responsibilities provided to achieve organization's goals. Quantity and quality of performance can be measured and is influenced by several factors: environmental, organizational, external environment factors and employees' internal factors. Internal factors include skills, competence and experiences shown in the job performance.

Competence

Boyatzisconceptor of competence and implementation quoted Spencer and Spencer (1993: 9) suggests the fundamental characteristics of an individual are causally related to the tremendous effectiveness or performance. According to Palan (2007: 5), there are two terms that appear in work, two of them are competency and competence. These terms arise from two different schools of thought about the concept and suitability in work. Syaiful F. Prihadi (2004: 83) decribes the two terms are interchangeable. He refers to the terms contained in the Indonesian dictionary, namely 'an ability to do something or for a task'. Regarding this statement, he also explains that a single person has the competence to manage his/her work. More specifically that person is competent to plan a series of activities to achieve certain targets. In this case the competence generally refers to the ability to run a job.

According to Kessler (2011: 7), competence is the main characteristic shared by most successful people in an organization or profession that helps them to become successful. Similar to Kessler, Mathis & Jackson (2011: 219) defines competence as basic characteristics that can be attributed to improved performance of an individual or a team. Furthermore, in order that competence can function effectively within an organization, it shall be turned into relevant competence for each department or profession within the organization or company. Competence refers to the underlying characteristics that describe behavior patterns, personal

characteristics (typical), self-concept, values, knowledge or expertise of a person who is considered as a superior performer in the workplace. The concept of competence comes from David McCelland article entitled Testing for Competence Rather than Intelligence. He draws a conclusion that based on the study results of traditional academic proficiency test and content knowledge test, as well as scores and diplomas from school is as follows:

1) We cannot predict successinworks/life.
2) It is usual for low socio-economic communities.

The next question is, if it is not intelligence, what can predict success in work and life. This is why a research method is necessary to predict employees' performance and not influenced by economic, social or racial. The method is called criterion Sample, comparing between successful and less successful people. The goal is to identify the characteristics associated with success. Characteristics or competencies that appear consistently can lead to successful outcomes.

Berger Lance & Berger Dorothy (2007: 82) describes a competence is a characteristic (a combination of several characteristics) that can be measured reliably and it relatively lasts a long time (stable) owned by a person, a team, or an organization. Likewise Laksmono (2004: 1) defines that generally competence is the underlying characteristics of a person to possess high performance on the job. Those characteristics appear in the form of knowledge, skills and other ability or personality. Meanwhile, according to Ulrich (1997: 68) competence reflects the knowledge, skills and abilities among an employee and a group of employees.

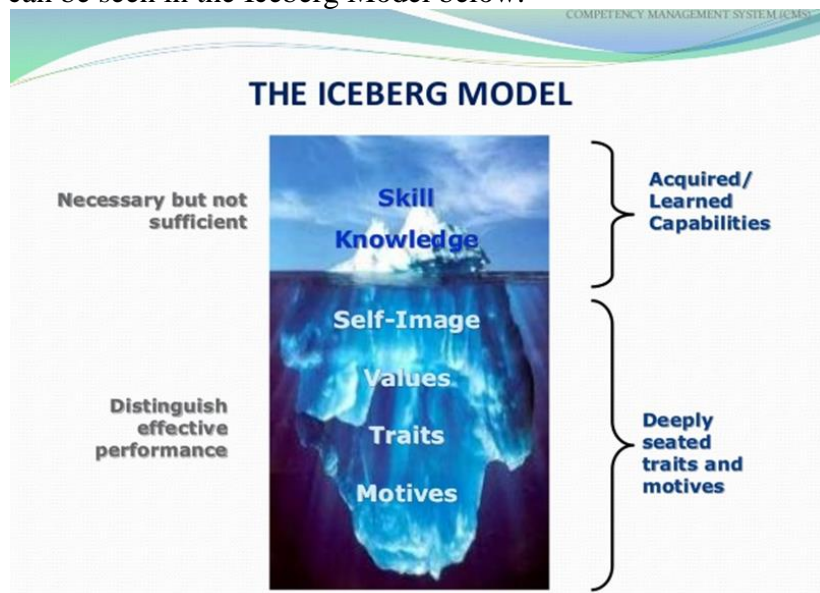
The common definition accepted by the public is the definition of competence as a basic characteristic of someone who has a causal correlation with the reference criteria of effectiveness and/or excellence in a job or a particular situation. Description of five types of characteristics can be seen in the Iceberg Model below.


Figure 1. The Iceberg Model
Source: Spencer & Spencer (1993)

Spencer and Spencer (1993: 34) classify dimensions and individual competence into three components, namely: (a). intellectual competence, (b). emotional competence, and (c). social competence. It seems Spencer and Spencer has perceived competence components from human dimension aspects and inter-personal relationships, but they do not produce spiritual competence components.

According to the National Professional Certification Board (2014), an assessment is a process of assessment to a person on the fulfillment of the requirements set forth in the certification scheme. Then, a competency test is performed. It is a procedure as a part of the assessment to measure the certification participants' competence using one or several means such as written, oral, practice and observation, as specified in the certification scheme. Yodhia (2007) suggests that this assessment phase is a critical stage where it must be done after an organization or company has competency directory along with the competency requirements per position. At this stage the level of employees' competence and a gap between the level of required competence and employees' current level can be identified.

Another competency test method is applying certification of competence issued by an independent and credible entity. In Indonesia there are institutions recognized nationally and internationally, such as, LSP (Profession Certification Institute) PERHAPI (Association of Indonesian Mining Expert), LSP IATKI (Association of Electrical Indonesia), Indonesia Tourism LSP and others.

Competence Recognition

Basically, a competence is a person's ability to do anything right. For it is ability, the competence is developed through the process of learning. Dreyfus and Dreyfus (1980: 19) introduce the theory of the stages of human competence development that categorizes into five groups: beginner, competent, proficient, expert, and master.

Meanwhile, recognition is an appreciation of an achievement or claim to recognize the existence or validity of something (Microsoft Encarta, 2009). Recognition can be expressed publicly using a symbol, both formal (awards, certificates) or non-formal (speech, respect). Recognition also can be done socially by the community and professionally by the organization.

Leadership and leadership styles

One of the fundamental qualities sought in organization's employees is the ability to lead others. Attitude and leadership attitude of a leader to influence his/her subordinates is exceptionally decisive in the achievement of organization's goals. When leaders feel motivated, enthusiastic, and active, they are more likely to give energy to their subordinates and convey a sense of effectiveness, competence, optimism and excitement as stated by Robbins & Judge (2008: 342).

Leadership style is selected and utilized behavior or method of a leader to influence thoughts, feelings, attitudes, and behavior of the members of the organization/subordinates (Siregar 2006: 8). Different styles are essential in different situations and each leader shall know when to make an appropriate approach. According to Stoner et al., in Kurniawan (2011: 28) leadership styles are patterns of behavior preferred by leaders in the process to direct and influence their employees. Kurniawan (2013: 29) elucidates that the better the employees' perception of leadership style adopted by their leader, it will trigger an impact on the employees' loyalty because of their high respect for the leader.

To examine the impact of motivation and recognition on employee's performance in Public and Private Sector Banks in Punjab and Haryana.	**Independent Variable** Motivation Recognition **Dependent Variable** Performance	Regression analysis	Performances of employees are significantly affected by the salary and other monetary benefits provided by the organization. Recognition is the most important non monetary reward which improves performance of the employees of banks

Conceptual frameworkandhypotheses

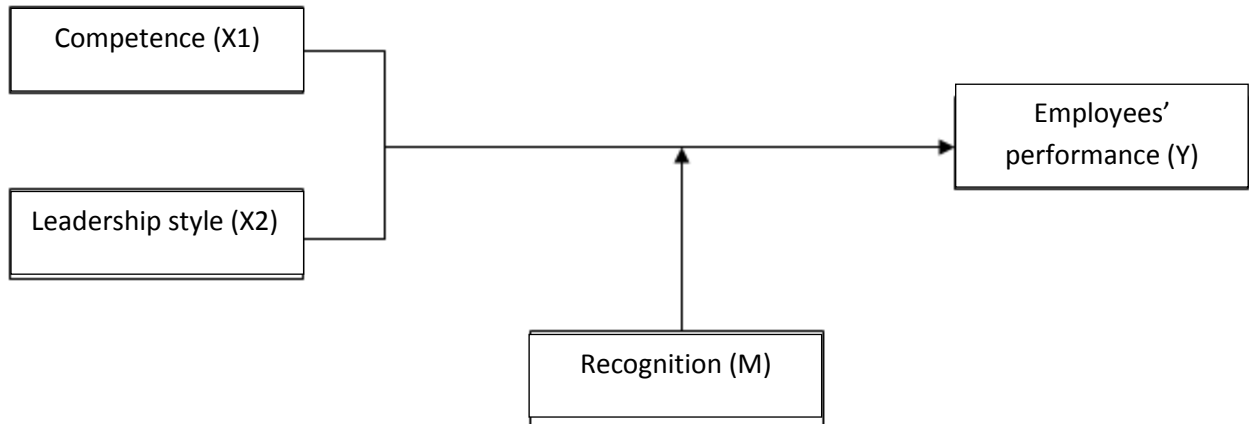
Conceptual framework
The conceptual framework of this study is as shown below:


Figure 4.Conceptual Framework

Hypotheses
Based on the research paradigm, the author compiles the following hypotheses:
H1:   H1: It is suspected that competence and transformational leadership style have significant influence on employees' performance
        Competence can influence employees' performance. The higher the employees' competency is and in accordance with the demands of the job role, those will enhance the employee's performance. Competent employees usually have certain character of attitudes and behavior or a willingness and ability to work which is relatively stable especially when they face a situation in the workplace that is formed from the synergy between character, self-concept, internal motivation, and contextual knowledge capacity so that they can quickly overcome the problems, execute works quietly and with confidence, perceive work as an obligation that must be done sincerely, and openly improve themselves through a learning process.This will encourage employees to finish their jobs efficiently and effectively as well as psychologically it will provide meaningful work experience and a sense of personal responsibility on the results. In the end, all these things will enhance both employee performance related to occupational factors and personal characteristics. It is supported by a theoretical statement of Spencer & Spencer (1993: 78) that intellectual, emotional, and social competences as parts of people's personality can predict or influence the effectiveness of individual performance. In addition an empirical statement expressed by Kusumastuti in Winanti (2007: 258) supports that individual competences have significant, positive effect on the performance with influence contribution amounting to 0.278.
        Transformational leadership style influences employees' performance as an indicator of leadership styles such as charisma, inspirational, individual attention, and intellectual stimulus elicits them to feel more comfortable and motivated without feeling pressured so that they can achieve the expected performance. From the frequency distribution of respondents this study proves that the average of employee agrees with transformational leadership style. It shows that employees feel comfortable with transformational leadership style that has been applied.
H2:   It is suspected there is moderating effect of the recognition on competence and transformational leadership style on employee performance.
Subhi (2014: 8) describes a performance is influenced by three variables, namely individual, psychology and organizational variables. Individual variables consist of willingness and

skills, family background, social and demographic levels. Psychological variables consist of perception, attitude, personality and motivation. Furthermore, organizational variables consist of resources, leadership, structures and appropriate reward systems.

A leader should be able to unite the various competencies and appropriate recognition systems. Proper implementation of leadership style and granting recognition will contribute to employees' satisfaction who will ultimately improve their performance. Research conducted by Allen and Helms in Tessema et al (2013: 3) confirms the importance of recognition done by managers and leaders, which is to encourage employee behavior to achieve strategic goals

Research method

Approachandtypes of research
This study is causal research, the type of research where researchers aims to determine the causes of one or more issues. In causal study, it is necessary to determine the causal relationship by employing correlational analysis or specific regression.

Research location
This research is conducted in PT Vale Indonesia Tbk, PT Freeport Indonesia and PT Newmont Indonesia as representatives of mining companies to employees who have been certified competence by BNSP (National Professional Certification Board).

Population and sample techniques
Population in this study consists of 105 employees who have been certified and they are from PT Vale Indonesia Tbk, PT Freeport Indonesia and PT Newmont Indonesia. Sampling technique used in this study is purposive sampling.

Data source
This study employs two data sources, namely primary data and secondary data. Primary data is data obtained directly from the list of questions provided in the form of questionnaires to employees who have been assessed by Professional Certification Institute (LSP) PT. Vale, LSP Perhapi (Association of Indonesian Mining Expert) at PT Freeport and Newmont.

Secondary data is taken from the documents related to PT. Vale, LSP Perhapi in PT Freeport and PT Newmont in accordance with this research.

Based on primary data collected through questionnaires, the obtained data by age of respondents can be seen in the following table:

Table 5.1
Distribution of Respondents by Age

Age (Year)	Total Respondents	Percentage (%)
< 25	1	0.95
25 - 30	14	13.33
31 - 40	69	65.71
> 40	21	20.00
Total	105	100

Source: Primary data, processed 2016

Data collection technique

Data collection instruments used in this study is a list of questions and statements in the form of questionnaires. This technique is conducted by delivering or distributing questionnaires to a sample of respondents who provides answers to the questions or statements. The scale used in this questionnaire is Likert scale.

Data analysis technique

In this study the existing data are analyzed quantitatively. Quantitative approach emphasizes quantitative analysis on the numerical (numbers) data processed using statistical methods. Multiple linear regression analysis is selected for the dependent variable is affected by more than one independent variable or explanatory variables. For analysis and hypothesis testing, data is processed statistically using a statistical program called SPSS (Statistical Program / Package for Social Science) version 23.0

Chapter v discussion

From table 1 above SPSS output results present the correlation matrix between variables. The correlation between competences and performance variables is equal to 0,816. The correlation between Leadership style and performance variables is 0.678, and the correlation between recognition and performance variables is 0.659.

Furthermore, table 2 compares F count to F table. To identify F table in hypothesis testing in regression model, the degree of freedom (df) or known as df2 while in F table symbolized as N2 are determined by using the following formula:

$$df1 = k - 1$$
$$df2 = n - k$$

Where n = number of observations in the period of data.
Where k = number of variables (independent and dependent).
This test is performed by using a confidence level of 5% or 0.05 hence we can test using the formula. In df1 = 3-1 = 2 and df2 = 105 - 3 = 102, then the value of F table is 3.09.
Based on SPSS output results in Table 2, F count is greater than F table (79.040> 4.74) with a significant level below 0.05 is 0.000. Based on the decision making of simultaneous test in the regression analysis, it can be concluded that competence, leadership style and recognition variables when tested together or simultaneously result in significant effect on employee performance improvement.

From Table 3 the competence regression coefficient is 0.593, has positive value hence competence has positive influence on employee performance. The positive effect can be interpreted that the increasing competence will also increase employee performance. Furthermore, to determine whether the effect is significant or not, the regression coefficient for competence variable is examined by comparing t count and t table. If t count > t table, competence has significant effect on employee performance.

To identify t table, the value of df is determined using N-2 (N = number of respondents) and the result = 1,984. Based on the results of the regression calculated using SPSS and Table t, it is found that t count is 7.471 and t Table = 1.983, which means t count > t Table, it can be interpreted that the competence has significant effect on employee performance.

From Table 3 the leadership style regression coefficient is 0.124 and positive hence this variable has positive effect on employee performance. The positive effects can be interpreted that the better leadership style will also increase the performance of employees. Furthermore, to determine whether the effect is significant or not, the regression coefficient

value of this leadership style is examined by comparing t count and t table. If t count > t table, the leadership style has a significant effect on employee performance.

To identify t table, the value of df is determined using N-2 (N = number of respondents) and the result = 1,984. Based on the results of the regression calculated using SPSS and Table t, it is found that t count is 1.984 and t Table = 1.983, which means t count > t Table, it can be interpreted that leadership style has significant effect on employee performance.

Table 3 also shows that recognition regression coefficient is 0.106 and has a positive value hence this variable has positive effect on employee performance. The positive effects can be interpreted that the better recognition will also increase the performance of employees. Furthermore, to determine whether the effect is significant or not, the regression coefficient value of recognition is examined by comparing t count and t table. If t count > t table, recognition variable has a significant effect on employee performance.

To identify t table, the value of df is determined using N-2 (N = number of respondents) and the result = 1,984. Based on the results of the regression calculated using SPSS and Table t, it is found that t count is 1.845 and t Table = 1.983, which means t count > t Table, it can be interpreted that recognition variable has significant effect on employee performance.

Closing

This study indicates that there is effect between competence and employee performance. The results of the calculations have obtained value prob. T count in the table of coefficients (SPSS output shown in column sig.) is 0.000 less than the error rate (alpha) 0.05 (predetermined). Thus, it can be concluded that the independent variables (from t count) have significant effect on the dependent variable. Value of prob. t count of the competence variable is 0.000 smaller than 0.05 hence the competence as independent variable significantly influences the dependent variable which is employees' performance at alpha 5%, or in other words, competence influences employee performances on a confidence level of 95%.

The regression coefficient of competence is positive which means when competence increases, the amount of the employee's performance will also increase and vice versa. This implies higher employee competency will result in the increasing performance. On the other hand if the employee is less competent, his/her performance will not be optimal that could eventually lead to lower productivity.

The results of this study indicate that competence has significant effect on employees' performance. This is because the required competence through Competence Standards that exist in the company. These results are consistent with research by Emmyah (2009), Arcynthia (2012), Fitran (2012), Xu and Ye (2014), Ierhasy et al (2014) and Kartika (2014), which conclude that the competence variables can significantly affect employees' performance.

Better leadership style can be a charismatic leader, motivational inspirational subordinates and has good individual consideration, provides intellectual stimulation for his/her subordinates, and becomes a good role model that will improve employees' performance.

Transformational leadership style will result in the employee's performance that is getting better. On the contrary poor leadership style will discourage employees' morale and it will affect their performance. These results are consistent with research conducted by Kurniawan (2011), Subhi (2014) and Lina (2014), who conclude transformational leadership style has a significant effect on employees' performance.

Partially recognition does not significantly influence employee performance because its effect is only 0.096 or 9.6%. However, granting recognition to the dimensions of the

relationship will cause emotional feelings and confidence for employees so that their morale increases. Moreover, recognition and appreciation will boost employees' morale to work better. The increase in morale will improve employees' performance. These results are consistent with research by Bradler et al (2014), and Muchay (2014), who states that recognition, has a positive effect on employees' performance. Further, it is concluded that recognition in the form of consistent compliment is closely related to the increase in employee retention, increased customer satisfaction resulting in increased profits. Recognition is a non-monetary reward that is deemed most essential to improve the employees' performance (Aryan, 2015).

Therefore recognition is not moderating variable but it is an independent variable just like competence and leadership style variables which significantly influence employees' performance. The results of this study have never been examined before and a preliminary study to see the effect. Most studies utilize non-monetary reward variable as another name of the recognition variable. As stated by Mulyadi in Dalmy (2010), the performance-based reward system is a control tool used by employees to motivate their personnel to achieve company's objectives by displaying appropriate behavior of the company's expectations.

Conclusion and suggestion

Based on the results and the discussion it can be concluded that recognition does not affect the correlation between competence and transformational leadership style on employee performance hence in this study recognition is not moderating variable. Based on respondents' statements about recognition, the results show that employees are encouraged to work optimally to achieve good performance, instead of leader's support as a motivator for the improvement of work performance. Therefore, it is recommended that a leader shall frequently grant rewards in the form of praise or other simple expression through body language to encourage his/her subordinates to work optimally, if the frequency is amplified, it can result it the better relationship between superiors and subordinates.

A MODEL OF MANAGING BUSINESS ORGANIZATION CHANGE PROCESS: A CASE STUDY OF INDONESIA LOCAL GOVERNMENT BUSINESS FIRM

Muhamad Rizal, Universitas Padjadjaran, Indonesia
Erna Maulina, Universitas Padjadjaran, Indonesia

Abstract
In 2020-2030, Indonesia face facts a great era of population, what we call it as a "*bonus demografi*". This situation, off course, have some consequences. One of the consequence is government need more budget to optimize this situation. In local level, the situation is hardly, because most of local government of Indonesia also face facts a hard budget constraint. One of the opportunity is to increase the local government revenue by increasing the performance of their BUMD (Badan Usaha Milik Daerah) or local government firm/enterprise. Meanwhile, most of BUMD have a bad performance, and today, all of the local government of Indonesia have to implement the new regulation about local business organization. On this new regulation, Government of Indonesia had been declare the change management policy on their local business organization. In other side, many theorist claims that business organization change process is not easy, and many of them tend to failed. The goal of this research is to try to develop a model of managing local government business organization change in Indonesia. The research used qualitative methods with a single case study approach.

Keywords: *change management, local business organization, business organization change process, model of managing local government business change.*

Introduction

Indonesia is one of the country which will enjoyed by the situation of – what we call it as "a window opportunity" – that is a large amount of population. In years of 2020 and 2030, Indonesia is predicted have a 268 million and 293 million people (Romdiaty, 2013). The large amount of population will challenging the government to optimize this situation.

To optimize the situation, one of the consequence is that government need more budget. In local government level, the situation is hardly, because most of local government of Indonesia are face facts a hard budget constraint. One of the opportunity is to increase local government revenue by increasing the performance of their BUMD (Badan Usaha Milik Daerah) or local government firm/enterprise.

The new regulation of Indonesian government – Indonesia Act No. 23/2014 of *Pemerintahan Daerah* (Local Governmental System) – declaring un-act of Indonesia Act No. 5/1962 of Perusahaan Daerah as Local Government Company, and dictating local government company to the new type to "*Perumda*" and "*Perseroda*". The differences of the three type are:
-      *Perusahaan Daerah* (*PD*) or Local Government Company is a company which all capital or a half of capital are funding by local government.
-      *Perusahaan Umum Daerah (Perumda)* or General Local Government Company is a company which all capital are funding by local government.
-      *Perusahaan Persero Daerah (Perseroda)* or Local Government Limited Company is company which all capital is divide by shares, and local government owned all capital or at least more than 51% of the share.

The implication of the new regulation is very huge and very complex. Why? Because of the change – in our prediction – is so widely and deeply. After 7 decade, the old-closely management system is change by the new-openness management system, or what we call it as good corporate governance system. The flow of change can be shown in figure as a below:

Figure 1
The Steps of Local Government Business Change Process

Considering the huge of change and the complexity of the problem, the change process is predicted has a big threat. To make the change process are successfully, we need a raw model to direct the change process, and the goal of this research is to develop the model. The outcome of this research is more understanding about local government business organization change in Indonesia.

Methods
The research used qualitative methods with constructivism paradigm. A single case study approach (Yin, 2009; Dul&Hak, 2008) is applying to PD. X in province of Y. Right now, PD. X is still in the progress of their change process. Data and information will be collected by depth-interview and documentation study.
To analyze the change process, we will use not only some theoretical perspectives, but also practical perspectives of business change process. From both perspectives, then, we will applying to generic process of change management by John Hayes (2010). Some experience of organization change in Indonesian State Owned Enterprises (SOEs) is also considered. By this approach, we can get some variables which can be used to collect data, to analyze, and to develop the models.

Theoretical Background
Generally, organizational change is the process by which organizations move from their present state to some desired future state to increase their effectiveness (Jones, 2010: 292). To get the future state, some effort need to be taken. Beckhard (2006: 3) comment that:

> *Organization development is an effort (1) planned, (2) organization-wide, and (3) managed from the top, to (4) increase organization effectiveness and health through (5) planned interventions in the organization's 'processes', using behavioural-science knowledge.*

On his comment, Beckhard want to be explain that (2006: 3-7): (1) "*planned*" by mean that organization development involves a systematic diagnosis of the organization, the development of strategic plan for improvement, and the mobilization of resources to carry out the effort; (2) "*organization-wide*" mean that organization development refers to a system which is relatively free to determine its own plans and future within very general constraints from the environment; (3) "*managed from the top*" mean that the top management must have both knowledge and commitment to the goals of the program and must actively support the methods used to achieve the goals; (4) "*increase organization effectiveness the organization and health*. The effectiveness mean that organization have a "self-renewing", and can "adapt and cope with the changes in its environment". Health organization mean that organization concerned with task accomplishment, internal integration, and involving mutual adaptation of the organization and its environment; (5) "*planned interventions*" mean that the intervention used draw on the knowledge and technology of behavioral sciences about such process as

individual motivation, power, communications, perception, cultural norms, problem-solving, goal-setting, interpersonal relationship, intergroup relationships, and conflict management.

In practical perspective, Beckhard argument about the urgency of "planned intervention" effort was proven. Some experience of project management practitioners argues:

> *It isn't easy to manage projects and programs that call for a high degree of behavioural change. Of all the different type of projects, they are ones most likely to encounter delay (especially if they are particularly large and complex). Yet in today's business environment, with business models in a state of flux just as products and service are, it is virtually impossible for organizations to implement their chosen strategies without undertaking the kinds of strategic initiatives that inevitably require substantial behavioural and cultural change. It is not surprising that a recent report from the Economist Intelligence Unit identifies 'the organization lacks change management skills' as the most frequently cited reason for the failure for strategic initiatives.* (Terry Cooke-Davis. 2014. Perspective: The Strategic Benefits of Change. PMI's Pulse of the Profession In-Depth Report: Enabling Organizational Change Through Strategic Initiatives. p.3).

> *A good practice at the launch of a strategic initiative is to develop a deliberate and structured change management plan to address both the hearts and minds of employees up and down the organizational hierarchy. The 'minds' component includes, among other things, addressing the contextual elements that reinforce the desired behaviours (e.g., metrics, incentive compensation, organizational structure and responsibilities, management forums). The 'hearts' component includes aligning leaders to speak with one voice, helping stakeholders to understand what the change means for them, and maintaining morale over time in the face of inevitable challenges in actual execution.* (Jeanne Kwong Bickford. 2014. PMI's Pulse of the Profession In-Depth Report: Enabling Organizational Change Through Strategic Initiatives. p.3).

> *Projects and programs by their very nature create change. To successfully implement organizational strategy, companies need project and program manager with the skills to drive and navigate change, while ensuring that those changes are strategically aligned to business goals. The success or failure of a change initiative is not just about initiating, planning, monitoring, executing and evaluating the project that will drive the change. It also involves preparing your organization for transformation, ensuring stakeholders buy-in, and engaging executive sponsors to champion and support the change before, during and after its implementation.* (Tricia S. Cabrey and Amy Haughey. 2014. PMI's Pulse of the Profession In-Depth Report: Enabling Organizational Change Through Strategic Initiatives. p.2)

From theoretical and practical perspectives, we can conclude that an essential condition for change program successfully are highly respond to people issues, and to respond it, its important to use a behavioral science.

Regarding the importance of people issues in managing organizational change effort, according to Hayes (2010: 140-142), there are six variables to be considered. The six variables are:

1. Stakeholder management. A conceptual framework for identifying which stakeholders are likely to be most important at various stage of a change project and for selecting appropriate ways of managing relationship with them;

2.   The role of leadership. The leader's role in terms of creating a vision, aligning relationships around the vision and inspiring others to achieve the vision;

3.   Communicating change. A communication that focus to the issues associated with change managers perceiving, interpreting and using information communicated to them by others;

4.   Motivating others to change. A general level of commitment in an organization can affect the level of support for change and identifies some of the most common sources of resistance to change;

5.   Managing personal transitions. People going through change experience with a variety of emotional and cognitive stages. The seven transition stages are shock, denial, depression, letting go (acceptance of reality), testing, consolidation, and internalization/reflection/ learning (Adam, J, et.al. in Hayes, 2010: 215-216). Then, managing personal transitions is how change managers can create a plan and implement organizational change in ways that will maximize benefit and minimize cost for the organization and those affected by the change;

6.   Modes of intervening. The modes to intervene in a way that helps others to help themselves. Usually this involves adopting a collaborative approach like supporting, theorizing, challenging, and information gathering, but also a prescriptive approach like advising.

Result and Discussion

1.   *Stakeholder Management*. The result shown that the management of PD. X didn't developed a conceptual framework for stakeholder management. They are only making studies about change initiatives with two organizations. First, with state government organization budgeting review, and second, with the university. The result of studies are some recommendation to take some program and project in terms of due diligence process, but not in terms of appropriate ways for managing stakeholders. The management of PD. X are also make a consultation to Kementerian Dalam Negeri and Kementerian Hukum dan HAM - which is are not as a key stakeholders organization.

2.   *The role of leadership*. The top management of PD. X had been create a vision – in context of change - in their Business Plan 2012-2016. But, their vision is not enough elaborating to program and project which have strong relation to change initiatives. In other words, the programs and projects of PD. X is not enough to top leader's of PD. X to aligning relationships around the vision and to inspire others to achieve the vision.

3.   *Communicating change*. The management of PD. X have been developed an effort to communicate to the stakeholders. But, this communication effort is only implemented in the first stage of change process, and the goal of communication is only to explain the objectives of change initiatives. According to Clampitt et.al. (2000: 41-57), this communicating can be categorize to "*tell and sell*" strategy which is not effective enough to make change happened. Clampitt states that "*underscore and explore*" strategy is the best strategy for change, because can give others (stakeholders) feel free to explore their opinion about the implication of change initiatives. Those strategy also can give the change leader's and manager's to listening attentively for potential misunderstandings and unrecognized obstacles.

4.   *Motivating others to change*. The management of PD. X was passively motivate their employee to support the change initiatives because - in their opinion - at

least two main reason: *Firstly*, their employee is not capable enough to implemented the change initiatives; *Secondly*, and the change initiatives will results in a settlement of employment. According to Kotter and Schlesinger (2008: 1-14), misunderstanding and lack of trust is one of the main reason why people resist of change.

5.   ***Managing personal transitions.*** Managing personal transition was correlated to communicating the change. As we know, the management of PD. X have an effort to communicate to the stakeholders. But, this communication effort is only explain the objectives of change initiatives. Meanwhile, people going through change experience with a variety of emotional and cognitive stages, and that is needed a time. Normatively, the management of PD. X do not implement in managing transitions.

6.   ***Modes of intervening.***
Basically, the management of PD. X is not create the modes of intervening. The management of PD. X tend to intervene the process of change by lean to political support. This action can not supporting others (stakeholders) to help themselves.

Conclusion

The management of PD. X is lacking attention to respond the people issues on the change process. This lacking attention has been result in delayed the whole process of change, and so it is tend to deadlock. The research also shown that the six variables have a strong relationship each other, and have focus on the role of leadership and his/her communication strategy. The others variables was start on managing stakeholders, follows other variables: motivation to change, modes of intervening, and managing personal transitions. Based on the relationship of six variables, we can develop a model of managing business organization change process, especially in the level of government in Indonesia (a model can be shown in figure 2 as a below).

The result of the research also can recommend a concept for local government business organization change as below:

> *The successful of managing a local government business organization change - especially (a) in the form from "Perusahaan Daerah" to "Perseroan Daerah/Terbatas", and (b) in terms of the local government are giving full authority to the top leader's as change leader - will have strongest relation to the role of leadership of the change leader's and their communication skill; and will have strong relation to stakeholder management, motivating others to change, modes of intervening, and managing personal transitions.*

TRANSFORMATIONAL LEADERSHIP MODEL IN IMPROVING UNIVERSITY PERFORMANCE
(STUDY IN UNIVERSITY OF LAMPUNG)

Habibullah Jimad, University of Lampung, Indonesia
Roslina, University of Lampung, Indonesia

Abstract

Leaders played an important role in determined the survival and development of a university. Leaders can defined policies to be taken and decisions that determined the success of a university. Therefore, research on the model of leadership, especially transformational leadership is very important to be conducted by the University of Lampung. The purpose of this study was to test the effect of transformational leadership on performance, test the effect of transformational leadership on organizational support, as well as test the mediation support for innovation in organizations on performance. The research was conducted by survey method. The research samples were 300 person, taken using nonprobability sampling techniques with convenience sampling analysis done using Structural Equation Model. Validity test results indicated that there are two items which invalid on variable support for the organization, as well as one item statement on performance variables. The test results by using SEM analysis is known that transformational leadership does not directly influence the performance of lecturer and staff, but indirectly affect by mediated with the support for innovation in organization variable. Transformational leadership effect on support for innovation in organization, as well as support for innovation in organization variable fully mediated the effect of transformational leadership on the performance of lecturer and staff at the University of Lampung.

Keyword: *transformational leadership, support for innovation in organization, performance*

Introduction

University is an institution that create the human resources that are reliable and able to answer the challenges of the world of work and to anticipate the changes that occur in society. In an effort to create skilled human resources (have academic capability, have good character, faith, and discipline) then the university should have a leader who is able to direct the achievement of these objectives.

Leaders play an important role that determines the survival and development of the university. Leaders can define policies to be taken and decisions that will determine the success of university. Leaders must be able to motivate lecturers and staff to contribute more for their strong commitment to university education without being forced.

The role of a leader who is able to transform ideas, desires, goals, Lampung University in order to be well understood and implemented by lecturers and staff at the University of Lampung is very important that teachers and lecturers willing to contribute maximum with initiatives arise from them without any coercion from the leader, high motivation of lecturers as well as their strong commitment to the organization, which is University of Lampung. Therefore, research on the model of leadership, especially transformational leadership is very important to be conducted by the University of Lampung.

Studies conducted in several countries, namely Israel, Nigeria, Singapore and Tanzania, showed that transformational leadership committed by leaders of schools and university will affect job satisfaction, behavior of organizational members and commitment to the organization (Koh, et al, 1995; Bogler 2001; Nguni et al, 2006; Othman et al, 2013).

The problem often faced by university relating to leadership, among others, different styles of leadership among the leaders will lead to difficulties in achieving the set goals, the lack of coordination between the leader of lecturers and staff can cause communication gaps that can lead to conflict, lack of motivation given by the leaders would make lecturers and staff feel that they did not get the attention and support of the leader, the lack of commitment from lecturers and staff to contribute the maximum to the organization, and the behavior of lecturers and staff were seen from the still productivity, resource utilization and lacking coordination among the leaders and lecturers as well as lecturers.

Literature Review
Transformational Leadership

Leaders plays an important role in executing a company operational activities and in understanding an organization. (Posner and Kouzes, 1993).Bass (1985) and Yukl (1999) on Pieterse et al (2010) defined transformational leadership as*"a style of leadership that transforms followers to rise above their self-interest by altering their morale, ideals, interests, and values, motivating them to perform better than initially expected."*

The transformational leader has been described as a person who articulates a vision of the future that can be shared with colleagues and subordinates, stimulates subordinates intellectuality, attention to individual differences between people, prefer to use private resources including time, knowledge and experience, and serves as a coach, teacher and mentor (Yammarino and Bass, 1990; Yukl, 1989 in Shivers-Blackwell (2004).

Transformational leadership contains four components: (Bass, 1985, 1998; Bass & Avolio, 1993 in Bass and Steidlmeier, 1999): (1) charisma or ideal influence (associated with behaviors). (2) Inspirational Motivation. (3) Intellectual stimulation . (4) Consideration of individual.

Posner and Kouzes (1988) in Posner and Kouzes (1993) designed a way to assess the capabilities needed by a leader, who is referred to as The Leadership Practices Inventory (LPI). LPI was developed based on the analysis of case studies on more than 1,100 managers based on their best experience as a leader. The behavior and activities of the managers are grouped into five categories: challenging the process, inspiring the shared vision, enabling others to act, modeling the way, and encouraging the heart.

Support for innovation in organization

Support for innovation in organization refers to employee perceptions of respect and concern for the organization (Eisenberger et al, 1986). Support felt in organizations can increase employee expectations that the organization will provide greater reward to the achievement of organizational goals (Eisenberger, et al, 1986). Research by Zhou and George (2001) in Joiner (2007) were carried out on organizational support for creativity, which refers to the degree to which an employee feel that the organization encourage, respect, appreciate and recognize the employees who demonstrate creativity.

Innovative organization defined as one the matter which fosters creative functions of its members (Siegel and Kaemmerer, 1978). Some dimensions of the creative organization: (1) leadership, leadership type that characterizes

An innovative organization that they support the initiation and development of new ideas in the whole system and ensure the diffusion of power throughout the system. (2) ownership, related to group members who develop ideas, processes and procedures at their work place. (3) Norms for Diversity, members of the system has positive attitude towards diversity and the system itself positively responds to creativity, and several different behaviors. (4) Continuous Development, and (5) Consistency.

Eisenberger et al (1986) measured the employee commitment to provide support to organizations with Perceived Organizational Support consists of 36 statements that measured by 7-point Likert scale to express their consent to the item in question. The study was conducted at a private high school teacher. The results showed that the effect of perceived organizational support will be greater on the teachers who have a strong ideology to change than the teachers who have a low ideology for change.

Performance
Performance is a multidimensional concept. Performance at the basic level can be regarded as aspects of the process, and aspects of performance results. Performance includes certain behavior. Based on these conceptualization only action that can be improved which can be regarded as the performance (Campbell et al., 1993 in Sonentag et al, 2008). In fact, this performance concept explicitly describe only goal-oriented behavior, which is behavior to encourage employees to improve organizational performance (Campbell et al., 1993 in Sonentag et al, 2008).

Research conducted by Li and Hung (2009) focuses on two types of performance which are task performance and organizational citizenship behaviors (OCB). Task performance defined as behavior that is recognized by the formal reward system and is part of the requirements described in the job descriptions, while citizenship behavior is the discretionary individual behavior, which indirectly or explicitly recognized by the formal reward system, and which, in the aggregate, promote the efficient and effective function from organization (Organ, Podsakoff, & MacKenzie, 2005 in Li and Hung, 2009). William and Anderson (1991) stated that there are two categories of Organizational Citizenship Behavior or OCB: (1) OCBO which is profitable behavior that the organization in general such as informing a person does not come to work, adhere to the informal rules designed to keep order. (2) OCBI which is a behavior that directly benefit certain individuals and indirectly contributes to the organization. William and Anderson measured OCB performance using 21 item statements related to OCBO and OCBI.

RESEARCH METHOD
The method utilized is exploratory research with survey to lecturers and staff in the University of Lampung with the aim to gather information related to the leadership that has been implemented at the University of Lampung. Roscoe (1975) in Sekaran (2006) states that a decent sample size in the study were between 30 to 500. Based on the matter, the number of samples in this study was 300 people. Samples were taken by using non probability convenience sampling technique. Data analysis was done using Structural Equation Modeling (SEM).

The variables in this study consisted of transformational leadership (X), performance (Y) that is mediated by the support for innovation in organizations variable (Y), measured using five Likert scale which are: strongly agree (SS), agree (S), quite agree (CS), disagree (TS) and strongly disagree (STS).

Transformational leadership using the Leadership Practices Inventory (LPI) developed by Fields and Herold (1997), which consists of 24 item statements, but in this study leadership was measured using 20 items statements, which are follows the developments that have an impact on the organization, explains the future to be achieved. Performance using questionnaire developed by William and Anderson (1991), which consists of 21 item statements, but in this study only used 18 item statements, and support for innovation in organization variable using indicators developed by Siegel & Kaemmerer (1978).

RESULT AND DISCUSSION

The study was conducted using a survey by distributing questionnaires for lecturers and staff in the Faculty as well as in the Technical Services Unit and the bureau at the University of Lampung. The questionnaire contains 65 items about transformational leadership, the support for innovation in organization and performance. Questionnaires were distributed as many as 280 copies of questionnaires, the returning and possible to processed was 259 copies. Thus the response rate in this study was 92.5%.

Respondents in this study came from seven faculties and two UPT and one bureau at the University of Lampung. Most of the respondents are male (as many as 131 person or 50.58%) aged 36-40 years (51 person or 19.69), with the number of lecturers 109 person (42.08%) and staff 150 person (57.92%) and the working period of 2- 15 years (36.67%).

1.   Validity and Reliability Testing Results

Validity test results on transformational leadership variable showed that all item statements were valid with factor loading greater than 0.5. In the variable support to the organization, there are two invalid statement items, and one item of performance variables is not valid because it has factor loading less than 0.5.

The results of reliability testing on transformational leadership variable were consistent with the results of tests performed by Fields (1997) and Kouzes and Posner (1993), in which the reliability value (α) is between 0.82 to 0.92. In the variable support for innovation in organization, there are four unreliable item statements, and on performance variables, there are three unreliable item statements.

2.   Qualitative Analysis Result

Based on the responses of respondents about transformational leadership it is known that the leaders of the University of Lampung rated by lecturers and staff were excited about the future that will be achieved by the University of Lampung. Lampung University leaders are optimistic and enthusiastic in achieving the vision of the University of Lampung is Becoming Ten Best Universities in Indonesia. In order to achieve this, the leader of the University of Lampung seeks to motivate lecturers and staff to provide support to the University of Lampung in achieving that vision.

Lampung University leaders also rated by lecturers as eager to achieve better future, it is seen from the efforts to do re-accreditation of the institution as a first step to achieve the vision that has been set by the University of Lampung. However, respondents stated that the leadership of the University of Lampung were taking less time to celebrate the achievements that have been reached with lecturers and staff. It is important for them as it celebrates the achievements on the achieved accomplishment as a form of appreciation and rewards for the efforts and the attempts that have been made by lecturers and staff in living and improve the reputation of the University of Lampung. Respondents also expect the leaders of the University of Lampung to ensure that they are recognized for their contribution for the success of a project. Based on this, it can be stated the importance of the recognition given by the leader of the University of Lampung on contributions of lecturers and staff for success or performance that still need to be increased to motivates employees to contributes more and achieve more in achieving vision set by University of Lampung

Respondent responds about the support to the organization showed that most respondents (81.41%) stated that they are committed to achieving the objectives of the University of Lampung. This commitment is very important, because without the commitment of lecturers and academic staff at the University of Lampung, the desired objectives will not be achieved. The role of the Executive Board of Lampung which provide support to lecturers and staff also rated quite well by the respondents. The support given by the Executive Board in Lampung can increase motivation to work for lecturers in the University of Lampung environment.

However, respondents also stated that the methods used by the organization is still unsuitable with the goals to be achieved by the University of Lampung. The method applied by the University of Lampung perceived by some lecturers and staff are still not undergo much changes from years earlier, so that it can slow the target achievements set by the University of Lampung. The majority of respondents (43.41%) stated that at the University of Lampung, how to do the job is still not perceived as important as the work performed. This suggests that the process of carrying out the work have less attention, but leaders are more likely to focus more on the judging of the final results achieved. This can lead to delays in achieving the goals set, given the process undertaken will determine the final result set. If the process is done well, for example in providing good service to the stakeholders will have an impact in the form of an impression (image) is good for the University of Lampung because the services provided have been able to satisfy stakeholders and to improve the effectiveness of goal attainment.

In the performance variables, most of the respondents (86.87%) stated that they would tell their superior or co-workers if they can not go to work. Attendance is one of indicators in assessing the performance of lecturers and staff, and it is also related to compensation to be accepted which are remuneration and incentives of meal allowance calculated on the basis of their presence. Respondents also reported that they comply with the informal rules applied by the University of Lampung in order to maintain orderliness (81.08%). Furthermore, the commitment of lecturers and staff (77.22%) to maintain the property or goods of the organization is high. It is important remembering the sense of ownership for the property or the property of the organization will make lecturers and staff maintain and preserve the property. Respondents also stated that they did not take time off more than conditions set (55.04%). Increasing awareness of lecturers and staff for activities in accordance with the specified schedule can happen because of several faculties at the University of Lampung have implemented ISO 9001: 2008, such as the Faculty of Economics and Business, Faculty of Law, Faculty of Social and Political Sciences and other faculties processing towards the ISO so they have strict rules relating to hours of service to stakeholders.

3.   SEM Analysis Results
A.   Normality Testing

Data distribution will be said to be normal if the value of the critical ratio (C.R) resulting from skewness and kurtosis were greater than ± 1.96.

Based on the results of normality testing, point declaration in univariate normal distribution is Y11, Y10, Y9, Y8, X1.11, X1.13, X1.14, X1.17, X2.19, X2.13, X2.7, X2 .6, X2.4, while overall multivariate were greater than ± 1.96 which is 30.766. So that overall existing data are not normally distributed. However, this data will still be used as data is the real answer of the respondents.

1.   Outliers Testing

Outliers detection using D^2 Mahalanobis measurement, D^2 were divided by number of variables used on the research (D^2/df). For small sample if D^2/df value were greater than 2,5 meanwhile for big sample category, if it is greater than 4 thus it is assumed that outliers is exist(Hair, et al., 2010). Based on outliers measurement, there are no statements which indicates the existence of outliers, where each of D^2/df were no greater than 4.

2.   Goodness-of-Fit Model testing

Goodness of-Fit model shows how well a particular model reproduces the observed covariance matrix between the items which are in common covariance matrix indicators

observed and expected (Hair et al, 2010). Value Goodness of Fit (GFI) after the modification are as follows:

Table 1. Structural Model GOF Criteria Evaluation

Measurement Index Criteria	Reference Values	Result	Description
CMIN/DF	≤ 3	2,675	Good
GFI	$\geq 0,90$	0,653	Marginal
AGFI	$\geq 0,90$	0,616	Marginal
RMSEA	$0,03 - 0,08$	0,08	Good
TLI	$\geq 0,90$	0,710	Marginal
CFI	$\geq 0,90$	0,727	Marginal

The model used in this research is adequate, it can be seen from some of the values that have met the criteria of fit of the model.

3.   Mediation Test Result

Mediation test was conducted to see the intervention of a third variable. The mediation test results are as follows:

Table 2 Mediation Test Result

Variable	Beta estimates	S.E.	C.R.	P-value	Result
Before Mediation					
Performance<--- *Transformational Leadership*	**-0,349**	0,241	-1,446	0,148	**Not Significant**
After Mediation					
Performance<--- *Transformational Leadership*	**-1,047**	0,369	-2,838	,005	**Significant**
Organization Support <---*Transformational Leadership*	0,972	0,198	4,912	***	Significant
Performance<--- Support for innovation in organization	0,742	0,243	3,051	,002	Significant

Source: Appendix 9

Based on the mediation test results above, the direct effect of transformational leadership on performance was not significant (β = - 0.349, p value = 0.148), and when the transformational leadership is mediated by the support for innovation in organization, the influence of transformational leadership on the performance become significant (β = -1.047, p value = 0.005). Therefore, **full mediation is supported.**

Based on the research that has been done it can be stated that the performance of lecturers and staff will increase with the existence of transformational leadership and support for innovation in organization. The leader of the University of Lampung should be taking the time to celebrate the success that has been achieved together with lecturers and staff at the University of Lampung, appreciation or reward for the success of the work done by lecturers and staff at

the University of Lampung. Lampung University leaders should not only oriented to the achievement of the results of jobs but also pay attention to the process in doing the job. In doing their jobs, lecturers and staff should be given the freedom to work on a job in a manner that is different from the usual, thus encouraging them to be more innovative in doing the task assigned to them.

Conclusion

The results showed that transformational leadership is not directly improve the performance of lecturers and staff. This means that the performance of employees will not directly increase due to good leadership adopted by the leader of the University of Lampung, but there are other factors which is support to the organization. Support for innovation in organization mediates the influence of transformational leadership in improving the performance of lecturers and staff at the University of Lampung. Support for innovation in organization plays a role in improving performance where employees will feel appreciated for the efforts that has been made and given the freedom to to try a new method to solve a given task, so this will have an impact on their performance.

A CAUSAL ANALYSIS OF THE RELATIONSHIP BETWEEN COLLABORATIVE LEADERSHIP, CREATIVITY, INNOVATION, JOB SATISFACTION, AND ORGANIZATIONAL LEARNING

George Youssef Maalouf, Arts, Sciences and Technology University In Lebanon, Lebanon

Abstract
The overall purpose of the current research is to examine the relationship between collaborative leadership, creativity, open innovation, job satisfaction, and organizational learning. Gained knowledge can be applied in improving the effectiveness of organizations and mainly their leadership, ensuring positive work environment, higher productivity, and excellence in business operations and strategies. A theoretical study was generated about the topic, followed by a questionnaire with participants from diverse Small and Medium Enterprises. The questionnaire is divided into seven parts measuring: leadership, organizational innovation, organizational creativity, organizational learning, delegation and job satisfaction, performance in addition to the demographic characteristics. To test the hypothesis and answer the research problem, the researcher in the current study collected primary data from a very large sample and used structural equation modeling for analysis. Important results of this research are the set of recommendations for further studies and the implications for policy and decision making.

Keywords: *Transformational leadership, empowerment, followers' creativity, Organizational innovation, organizational learning*

Introduction
Collaborative leadership, job satisfaction, innovation, creativity, and organizational learning are important elements of today's business world. They are needed to achieve organizational success, competitive advantage, survival, and growth as challenges and threats are highly increasing.

In the current paper, we will study the relationship between these constituents to be able to derive results that will benefit the company, when its employees will be empowered to work together in order to achieve goals as one group sharing knowledge and skills, helping each other, presenting, and adopting new ideas and ways of doing business. This research will have significant impact on both theories and practices, and it can be adopted by leaders and organizations seeking for world-class practices and development in leadership which will promote leadership effectiveness and excellence.

First of all the study discusses an existing gap in the previous researches that link collaborative leadership, creativity, open innovation, job satisfaction, and organizational learning. Secondly, the increasing challenges due to globalization and reduction of barriers globally will require from all organizations and groups to make critical changes in their structure, and behaviors. These activities are mainly achieved through investing in improving the ways of thinking of senior management and CEO to focus on new ideas, and on continuous organizational learning while motivating the employees to search for the latest innovations, and this study contributes to the knowledge in this field. The current research problem is to find the relationship between collaborative leadership, job satisfaction, creativity, innovation, and organizational learning.

Our hypotheses are:
- Collaborative leadership is an effective tool to promote job satisfaction, creativity, innovation, and organizational learning.

- Collaborative leaders are effective leaders.

Literature Review
1.   Collaborative Leadership Style
Initiating a conversation about given topic in the entire organization will make people more aligned around the mission, establishing therefore an open and inspiring culture. It became a trend to have teams working globally due to social media, and the connectedness making collaboration easier to be performed. Leaders adopting "Command and Control" style will find it hard to change as it is not easy to move into the correct leadership style (Hansen, 2011, p. 3). According to (Silverthorne, 2011, p. 1), CEOs adopting usually command-and-control leadership style have minimal chances to succeed in a current world where the collaborative leadership style is required.

Collaborative leaders possess strong skills in the following areas: Connecting people together, appealing diverse capacities and talented individuals, showing collaboration, and all needed efforts to prevent the team from being stuck in debates (Hansen, 2011, p. 4).

Leaders are continually interested in forming diverse groups to be more productive. Most successful collaborations are performed by joining in teams experienced people as well as new employees at the beginning of their career. To keep high levels of performance in the business, collaborative leaders make sure to continually hire new blood (Hansen, 2011, p. 6).

In today's global world, managers know the need to lead differently but they struggle to know how. Leaders need a new playbook, and it is important to understand the collaborative leadership style, needed skills, and how to learn them in order to obtain higher levels of performance in the company. Successful leaders are proven to be pioneers in collaborative leadership. Nowadays we have the technological development, globalization, trends in social media, and virtual teams that require additional transition to adopt collaborative leadership style. People who won't be able to deal with connectivity and collaboration will be lost (INSEAD, 2011).

Leaders are key drivers in the collaboration inside a business. Collaborative Leadership style is based on engagement and openness between all the employees (INSEAD, 2011).

The presence of CEO in social media is not a superficial activity, as there are many methods to be used like "Check In" to improve collaboration by motivating employees to raise work related matters, and ideas through virtual or direct contact after this announcement of her/his presence in the company. This practice will ease communication. This is not a case of distraction but CEO will be leading by example though inspiring employees to focus more on external environment, connecting them inside the business (Hansen, 2011, p. 4).

Effective leadership will empower the team to achieve excellent results, and due to diversity in current teams, it will be wasteful trying to standardize everyone in this group because narrowness in differences between the members of a group will limit or even kill creativity and innovation. Talented people may be different, and we must be familiar, accept, and adopt such differences (Hansen, 2011, p. 5).

Leaders' behavior must influence the team in order to effectively collaborate in alignment with the company's values. This style doesn't focus solely on short-term performance of the company, but it is based on socialization of senior management as well as compensation of highly collaborative managers, instead of focusing on agendas (Hansen, 2011, p. 5).

Collaboration consists of keeping a firm hand to prevent any abuse through unifying commands for diverse teams, and to prevent meetings from becoming useless or any occurrence of never-ending conflicts. When it comes to assigning authority, the person in charge of the final decision should be known and in case of no agreement, she/he should interfere to make decisions (Hansen, 2011, p. 6).

Collaborative leaders promote an environment, in which ideas, people, and resources are well connected in the company as well outside it, and this is related to knowledge and capacity of knowing when to exercise influence, when to decide, and when to call all the team to discuss job-related issues (Hansen, 2011, p. 6).

Researches show that if a leader doesn't collect information and ideas from outside organizational borders, searching for new causes of encouragement; she / he will risk being beaten by competitors. To stay at the head of the game, leaders should consider talking and discussing with important components of the external environment including and not limited to: individuals, groupings, and diverse stakeholders (Karabell, 2011, p. 1).

To survive and excel in today's business world, organizations should rely on Collaborative leadership, making benefits more than ever from cleverness and ingenuity of the team. This will emerge the power of mutual intelligence that can save Billions of Dollars, and it will boost the development and introduction of new revolutionary product, service, or systems that may change the status quo. In the end, organizations will be able to survive when others are dropping out of business. Low collaboration in the workplace doesn't have negative financial impact, but workforce will miss motivation, creativity, joy, and increasing productivity, all of which are present in a collaborative environment (Goman, 2014, p. 1).

The following tips will help in adopting collaborative leadership style within an organization: sharing information between departments is essential to increase efficiency, productivity, and prevent any power scuffle. Collaboration is mainly a change in employees' behavior, and investments should focus on promoting successful collaboration to benefit the whole organization. Any organizational change can't be achieved without the commitment, collaboration, intelligence, and involvement of the employees from the beginning, and this is the correct way to transform any company. Common purpose and vision between management and employees will originate into business success (Goman, 2014, p. 2).

Diverse teams resolve problems effectively due to the ability of thinking differently, and therefore they are not limited by a given number of ideas as they have different viewpoints and options. Strong interpersonal relationships in the workplace help the team to be more productive, and it is achieved through different methods like assembling a team together to present a new project. This is the first step in strengthening relationships, and obtaining common understanding of tasks in hand. Trust and sharing knowledge between the leader and her / his employees are mandatory to obtain a strong open collaboration based on complete information and continuous communication. Body language is essential in collaborative leadership, eye contact, and focusing on speakers without distraction will demonstrate attention, engagement, and willingness to listen (Goman, 2014, p. 3).

According to (Wiese, 2012, p. 1), "From the marketplace to the battlefield, no one's going it alone", technological development, and electronic advancements in a globalized world are changing the way business is conducted while disruption is happening in many industries. Collaborative leadership benefit from technological development but many efforts of collaboration are facing failures.

Leaders must lead by example, which will encourage employees to collaborate, break silos of the organization, and obtain a competitive advantage (Wiese, 2012, p. 2). Successful collaborative leaders share the following qualities: trustworthy, avoid being passively aggressive, transparent, deal with resources as instruments and not assets, and they develop and maintain proper and formal documentation of decision rights, accountability, and rewards, in addition to the relationship between them (Wiese, 2012, p. 3).

A.   Job Satisfaction

For the last forty years, Job satisfaction was considered as one of the most important topics for researchers. The main driver behind launching these studies was the need to find solutions

for absence, turnover, low output, and the development of condition and wellbeing of the workforce (Taylor, 2016, p. 1). In modern management researches, job satisfaction remains also a very important topic to handle (Jonathan Westover, 2010, p. 372).

The literature of business contains various definitions for Job Satisfaction, and according to (Locke, 1976, p. 1297), it is an emotional situation that occurs when an individual value her / his job. The researcher in (Snyder, 1975, p. 318) defines job satisfaction as an assessment of the circumstances in a job, and results obtained from it. In the study (Charles L. Hulin, 2003, p. 255), the writer considers that job satisfaction is composed of multidimensional inner answers to the job by an individual, which is composed of cognitive, affective, as well as behavioral constituents.

Measuring job satisfaction is a rough task, and many variables may interfere in this measurement, covering the following factors: individual, culture, and environment (Gupta Kavita, 2012, p. 90). Not all employees are satisfied in the same way, as the degree of satisfaction will differ between them (Gupta Kavita, 2012, p. 91). According to (Sempane M. E., 2002, p. 30), there is a relationship between organizational culture and job satisfaction.

To motivate employees, many companies make decisions based on three elements: money, wages, and conditions of service. Money has the highest influence in motivating eployees, and encouraging them to be more productive. Inducements on salaries are adopted to increase employee satisfaction, and the successful achievements of tasks and duties to achieve employee's satisfaction of the tasks done. The conditions of service play important role in satisfying and engaging employees, as they search for better treatments, possibility of improvements, and advancements, rich communication, safety and security, and sharing of knowledge (Gupta Kavita, 2012, p. 92).

According to (Sinoway, 2012, p. 1), employment crisis and limited opportunities make the employees at all levels trapped, and unsatisfied. The sole solution to change this situation can be obtained through economic revival leading to a creation of jobs for people in need, and also improving the opportunities for those who currently work.

First of all, an employee can meanwhile initiate a road for their satisfaction under the current conditions, following these stages: development of individual vision for long-term professional and personal goals, questioning whether this is the right path, and if she / he will remain in the same position after a reassessment of current goals in the job, household, material capital, and society. Secondly, employee may reconsider what is "insecure", knowing that sometimes doing nothing may be risky. This occurs when no decision is made to face given risk, and employees will stay in the same situation despite that she / he will be heading directly off a cliff. Thirdly, employee may start their "individual board of directors" (IBOD), which is composed of individuals who can act proactively to advance her / his career, by continually providing needed feedback, support, and advises to have skills that meet opportunities available in the market, and to compensate professional weaknesses. Finally employee must focus on the main zones in which she / he is mostly skillful, and have more competencies and capabilities than competitors who seek the same opportunities (Sinoway, 2012, p. 2).

B.   Creativity

Creativity is usually defined as the development and the presentation of new ideas like Pablo Picasso when developing new ways of painting (Amabile, 1998, p. 2).

In business, new ideas should be clear, easy, appropriate, and able to be transferred into actions. Creativity may be involved in all departments without exception, as it can provide benefits for the whole organization. It is related to the way people think about these problems, or how they imagine it. This is the creative-thinking skill, and its components: expertise and motivation (Amabile, 1998, p. 2).

According to (Sternberg, 2005, p. 3), creativity can be defined as the combination of skills and characters to develop new ideas, and products of high quality with new characteristics that are required in the market, and can satisfy the customers' needs. Creative leaders will develop ideas influencing the followers that will adopt them and follow them. Creativity is a must for all the leaders who may share the creative ideas with employees through many stories according to the situation and the business, in addition to the position of the leader.

Developing a culture of creativity in the workplace will promote growth, increase market share of the organization, along with a higher leading position of the company in the market (David Burkus, 2015, p. 1).

Creative companies perform better than other rivals, as they will have higher revenues, and bigger market share, which is a main driver towards continually seeking innovations, and inspirations. Those are the sources of the highest levels of creativity obtained by empowering individuals to think and behave outside their comfort zone (Levirne, 2015, p. 1).

Sources of creativity are sometimes misunderstood, and therefore leaders may harm the moral of their team members in times when they need it the most. Leaders may consider some limitations in which their behaviors will determine the extent of influence they have on empowering or damaging the creativity of their team members, and entire organization. When negatively influencing the development of innovative products and services for example, a reflection of these negative issues will shape all the departments in the entire company, and will influence operational as well strategic activities and decisions, which can change the future of the business in a current global world (David Burkus, 2015, p. 1).

Researches on creativity started more than one century and a half ago, and it is still difficult to find the sources of different ideas standing behind it. Researches considered the creativity as a trait for individuals and groups, without considering other assumptions like the need of people to be different from others, and development of something that no one else has previously presented (Walton, 2016, p. 1).

Creativity can be initiated by moving people out of their comfort zone, increasing challenges, and promoting risks and original thoughts. While initiating creativity, we may distinguish between discomfort and fear to prevent fear from replacing discomfort in the organization which will be harmful for the whole business. This fear will make people seek self-protection instead of achieving organizational goals, reducing firm's capacity to innovate, creating an environment of trust, and cooperation among team members, and management (David Burkus, 2015, p. 2).

Fear will be prevented when discomfort is constrained accordingly, because fear will push employees to search for self-protection, losing concentration of their tasks and duties. Discomfort will also push individuals to move, act, innovate, and drive results, but fear is harmful and dangerous (Levirne, 2015, p. 1).

Creativity is unique for the organization, and it is challenging to find the balance between artificial results and the business outputs. Organization aims to stay profitable, which constraint the leaders in their daily as well as strategic decisions and activities, preventing any investment in finding creative solutions, and enabling the business to focus only on the elements that provide direct return, and increase directly the profits of the business. The manager responsible of the creativity may apply the following three steps: protect the team responsible of creativity, protect creativity process, and finally communicating directly to obtain new ideas and results. Managers of such creative organization usually intervene to resolve any problems, and to balance art with commerce. These interventions require efforts and skills to convince other individuals (Bangle, 2001, p. 8).

Creative ideas come from those who focus on boosting their knowledge of artistic quality, and they welcome all information related to excellence in design. Critics may be presented to respect the emotional relation between these individuals and their designs. The protection of

creative individuals is essential from all company's responsible and managers who are directly responsible of them, because these individuals are at the highest levels of sensitivity which can constraint the global efforts of development of new and different products, services, and processes. Individuals responsible of creativity will be also competing between themselves carving into new environment of higher levels of creativity (Bangle, 2001, p. 9).

Managers also work to protect the whole process of creativity, and they teach other employees about the importance of working in this creative department. Learning is performed through the involvement of top management in the creative process, seeking and obtaining highest levels of excellent results, and putting themselves in the customers' shoes to make any needed changes from this perspective (Bangle, 2001, p. 7).

Managing well the relationship between art and business will be accomplished through a rich communication process focusing on sharing the most important things in the company to be more efficient. Non-verbal communication and gestures may be utilized to share better the message in question, in a way that describe reality of the situation instead of speaking about it. This is an innovation in the communication process to be able to obtain needed understanding, and to resolve gaps (Bangle, 2001, p. 8).

D. Innovation

Innovation is a set of steps for elaborating, developing, and applying new ideas, decisions, new products and services, new methods of doing business and dealing with diverse stakeholders, etc. The study of innovation is concerned with ideas behind this newly created element of the business life, which is a primary reason behind the effectiveness of any organization or group of people (Xiaomeng Zhang, 2005, p. 2).

Innovation may be related to manager's response to change, with all needed steps after its occurrence, and it is related to the relationships leader – followers. This will boost creativity and innovation when trust is shared between them (Xiaomeng Zhang, 2005, p. 2).

Innovation can't always be considered as a solution for all problems in the organizations as sometimes, it may worsen them (William McKinley, 2014, p. 1).

"Innovate or Die" is a sentence that created continuous debates (Ignatius, 2014, p. 1) after that Peter Drucker mentioned it. Innovation requires an investment in R&D, which has sometimes big costs in terms of time and money, and can't be afforded by all companies. Despite that all of them acknowledge the importance of innovation, and of developing unique products and services or the "Next Big Thing". This is continually happening for example in the case of P&G, one of the most innovative global businesses (Ignatius, 2014, p. 1).

Companies seek inventions and consider them as a major source of experimentation and development. Failure in these experiments is of high cost: reducing the performance, and influencing negatively the business in all its functions. These failures may endlessly occur, without being noticed, because when a product, a process, or a firm fail, therefore they will go directly out of the scope of literature, and rarely books debate the causes of failure (William McKinley, 2014, p. 2).

Flexibility in Innovation may be used to prevent companies from having a rigid situation of innovation. In this case, the built-in flexibility will regulate the bad influences on companies. This flexibility is about two main characteristics: First of all the multiple configurations that this product and/or process can have whenever it is introduced, and how quickly it takes to move from one configuration to another (William McKinley, 2014, p. 1).

The cases of organizational declines may occur globally, and the majority of organizations are not able to turn things around. Many factors are the reasons behind this decline including and not limited to uncertainty, managers' mistakes, wrong decisions, and bad operations. Organizations have to ask themselves: "What Then?" and to know what opportunities are

available to survive setbacks, and what time is required for adaptation after implementing this innovation (William McKinley, 2014, p. 3).

E.   Organizational Learning

The technological development, and increase in competition are continually forcing companies to be transformed into learning organizations at all managerial levels. Companies will continually learn new methods to perform their tasks, and different functions, because the whole organization will seek learning, and not only CEO or the board of directors. The assessment of its current situation, strengths, weaknesses, advantages and disadvantages of its strategies and tactics, will help in determining what is needed to be done, and what decisions should be made in order to make the business better and to increase its competitive advantages (David A. Garvin, Is Yours a Learning Organization?, 2008, p. 3).

For a successful organizational learning, three primary factors are required, and they are: existence of an environment that promotes and supports learning within organizations, strength and quality of the content, and reinforcement through leaders' behaviors. Those are the three basis of a successful organizational learning, and it is critical to seek for long term learning experience, and to continually adopt the latest efforts and researches in this concern for better business results, and achievements (David A. Garvin, Is Yours a Learning Organization?, 2008, p. 1).

First, the environment is affected by the following four factors: Psychological Safety, respect and awareness of the differences, seeking new ideas, and time factor. Psychological safety is obtained when employees are able to express their ideas and concerns easily with complete trust, and when they are motivated to show all personal information accordingly. The respect and awareness of the differences is needed in a challenging world where the threats are in continuous development, and they are becoming more harmful whenever not considered correctly. New ideas are required during learning experience to benefit from it. This is not only limited to Trial-And-Error, but it goes to the point of finding new ways to do business, and to creatively work in elaborating new elements which can change the status-quo in the industries. A fair time is needed in learning organization for people to behave correctly under diverse situations, and to motivate investment of time in development the organizational processes and procedures (David A. Garvin, Is Yours a Learning Organization?, 2008, p. 3).

Secondly, strength and quality of the content is a factor of primary importance, as learning process is the development, grouping, implementation, and consumption of given information aiming to beat the competition, and to provide additional information in all the value chain. It will also monitor the flow of information, and their methods of use. Internal sharing of information in a learning organization in addition to the entire gained knowledge is of primary importance. This can be done with individuals, groups, as well as the whole organization through the following directions: inward, downward, or lateral. This step will confirm that information is well received by people who are in need for it. This will make the learning experience effective and efficient. An example of this approach is the AAR "U.S. Army after Action Review", which is adopted in the business world by many organizations. This approach consists of answering the following questions: What were our targets? What happened in reality? Why this result happened? How we will perform next time?

Answers and results will be published in documents which will be a very important learning experience for the company (David A. Garvin, Is Yours a Learning Organization?, 2008, p. 4).

Thirdly, leaders' behaviors have the biggest influence on learning organization, and how it deals with different situations where employees are required to seek learning, and innovative solutions for the problems after proving a will to find alternatives, and to be a part in the learning process. The leader will start to behave accordingly to motivate employees to pursue

steps to obtain a good learning experience. Employees will think about the situation using many criteria after a complete knowledge about the directions towards resolving the problem, and the possible results to obtain (David A. Garvin, Is Yours a Learning Organization?, 2008, p. 5).

2.   Procedures and Materials

The decision regarding what method to adopt is critical, and it follows the study's topic, purposes, problems, variables, and questions. The researcher was supposed to perform a clear overview of philosophies and paradigms of leadership in addition to different views in performing the research studies. Here we don't aim to contrast different elements of the research but to precisely determine where the current research study is positioned.   The chosen sample is representative of the population needed. The study aims to obtain results by using sampling statistics which add value to the work.

The analysis is structural equation model which is a strong multivariate analysis composed of many different methods. This model requires a familiarity with the concepts of variance, covariance, and correlation (Dell, 2015, p. 2).

According to (Christof Nachtigall, 2003, p. 2), SEM is the future of data analysis in academia, and it is hard and even impossible to understand it completely. And despite its importance, we cannot present a complete definition of SEM.

In (Kaplan, 2009), Structural equation model was defined as set of methodologies seeking to represent the information about resources in doing the analysis.

Structural Equation Model is sometimes called LISREL models, which is the abbreviation of Linear Structural Relations, and these structural relations are performed between variables using usually linear regression equations, presented by a graph in which related variables are linked using arrows (Christof Nachtigall, 2003, p. 3).

BEHAVIORAL CONTAGION, TRANSMISSION OF INFORMATION SIGNALLING AND ACTION BASED OF HERDING:
AN ANALYSIS ON THE EVENT OF FINANCIAL DISCLOSURE ANNOUNCEMENT

Elok Pakaryaningsih, Universitas Gadjah Mada, Indonesia
Marwan Asri, Universitas Gadjah Mada, Indonesia

Abstract

This study aims to examine the existence of contagion effect of bank herding on security market. Unlike the common use of contagion measurement, that is stock price, this study focus on the use of behavioral measurement of contagion and action based of herding. The underlying argument for the use of such measurements are the theory of social influence and behavioral contagion, which is stated that contagion is exercised whenever the need for reducing uncertainty is persisted and the positive reference individual is existed. Using such argument, this study argues that the contagion effect of bank herding on security market is purely behavioral. The transmission channel for the behavioral contagion is information signaling, which is carried by the depositors, as they are being perceived as the positive reference individual by the investors in security market. The action based of herding behavior in each market will also be explored to provide in depth understanding about the dissimilar (or similar) motives of herding amongst depositors and investors due to their decision making of investment maximization.

Keywords: *behavioral contagion effect, information signaling, herding*

Introduction

The classical economic theory, by the use of expected utility theory has assumed that individual decision making process is rationally completed. The rational decision making process is characterized by completeness and transitivity. Completeness assumes that one is able to comprehensively weighing and measuring all of available alternatives or choices, while transitivity assumes that one is capable of making priority amongst available choices. Transitivity and completeness are exercised since there is an existence of individual expected positive outcome (or expected utility) from the decision making process. In such case, expected utility is assumed can be calculated using rationally quantitative tools. Based on those assumptions, the chosen alternatives under classical theory will be consistent across times and situations.

However, rationality on decision making process has recently been questioned, especially by behavioralists, who believe that the process is actually irrational, that is, mainly based on one's behavior. In that case, emotion plays an important factor which significantly affect the decision. Beside emotion, is the existence of bounded rationality which also plays an important role on the irrational decision making. Bounded rationality argues that one's rationality is actually, contained by his or her irrationality, such irrationality are one's sentiment and perception. The argument of bounded rationality is especially based on the fact that the available information is imperfectly shared for only some of individuals, meaning that some will received only small portion of information. Such individuals, then will make a decision based on emotions, mainly theirperception and sentiment. The effect of such behavior, especially on financial market is the
existence of market anomalies, such as black Monday and dotcom bubble.

In the field of finance and investment management, the believe that trading activities always preceded by in depth fundamental and technical analysis (the rational process) has been argued by some empirical evidences. Some of those evidences notice the significant of behavioral factors behind investor decision on investment. Tversky and Kahneman (1974) on the theory of "anchoring and adjustment", found that the decision making process on investment was mainly determined by the presence of reference individual. Such individual is believed as an expert that poses a significant knowledge in an investment area. Reference individual then, becomes an anchor for investor on making the investment decision especially on determining asset value, disregarding the heavy reliance on rational tools. Furthermore, Tversky and Kahneman found that investor's value prediction only have a small deviation from its anchor's value. Based on the finding, it is confirmed that rational decision making process is not relevant. Moreover, Thaler (1988) found that imperfect market information has caused difficulty for investor to determine the true value of an asset. In this case, investor have a high tendency to predict the value either higher or lower than the true value of asset. Such condition is called "the winner's curse". DeBondt (1998) argues that value prediction usually determines based on historical data of asset price and the reputation of asset issuer (firms). While behavioral factor may cause market anomalies and price dis-equilibrium, Black (1986) predicts, that the role of behavior which is represented by the presence of noise trader or irrational investors, will create more dynamic financial market in the future.

On the perspective of psychological domain, the main reason for the occurrence of irrational behavior on investment is the cognitive bias. Such bias emerge since investors do not involve structural and logical thinking while making decision. Cognitive bias is mainly affected by behavioral variables. One example of cognitive bias is heuristic bias that is bias due to the tendency of investor on simplifying problems. In this situation, investor simply rely on available information (availability bias) or rule of thumb without further need to find more comprehensive information.

This study emphasize the analysis on behavioral contagion which is part of irrational behavior. Behavioral contagion argue that investor's decision making is determined by an observation of other's behavior. Wheeler (1966) defines behavioral contagion as a sudden change of investor behavior in order to imitate the behavior of initiator. In this situation initiator doesn't have either specific relationship or communication with the imitator. Further, the decision making process by the imitator is explained by the concept of approach-avoidance conflict. Using this approach, Wheeler (1966) argues that the necessary condition that must be met in the process is imitator's internal conflict on facing a critical circumstances: whether make some actions (approach) or avoiding actions (avoidance). Since the information is limited, imitator will observe behavior of others in order to make a decision.

Studies of contagion in finance and investment management, usually associate contagion with herding behavior. To be specific, contagion is the effect of herding behavior. Contagion will trigger financial market instability and financial crisis. In that case, the law of one price become the major explanation for contagion. This law argue that the same asset in the same market will have similar price. In that case, the spreading of contagion will take place exclusively in one and similar market (purely contagion) and asset's price will determine the level of severity, contagion had caused. Contrasting with the law of one price, studies on contagion using purely behavioral arguments and measurements are still rare. In this light, behavioral arguments and measurements need to be explore since the root of contagion is purely affected by one's behavior, not the price. Furthermore, herding which precedes contagion, is the behavior that emerge from the existence of heuristic bias. Scharfstein and Stein (1990) define herding as the behavior that follows the crowd. Such behavior emerge since the information possessed by other (or crowd) is perceived to be more accurate compare

to those of one's private information. Consider in the extreme trading situation that investors have to decide, whether to buy or sell an asset: 50 investor with the substantial private information that has already decide to sell an asset, will suddenly change their decision due to 1 investor in that group that has a different decision (buy an asset). Banerjee (1992) argues that herding behavior in the financial market follows a sequential mechanism. It means that one will engage in herding behavior after observing the first individual in the group exercising some action. In that case, crowd's behavior provide a powerful signal of the real market condition.

Several studies empirically find the contagion effect that emerge after herding behavior. Mostly, such contagion depart from bank herding (run) event, that is a massive sudden withdrawal by depositors due to the perceived of poor liquidity management. Aharony and Swary (1996) find that herding on the failure bank will be subsequently followed by another bank, which mainly have smaller size than the first (failure) bank. The study confirm the presence of pure contagion effect.

Furthermore, Cornett, McNutt and Tehranian (2009) find that the competitor of failure bank will

have better performance in the long run if the failure is caused by bank characteristic not fundamental factors. In that case there is no pure contagion effect. Conversely, fundamental factors will become the source of failure of both the failure bank and its competitors.

As mention earlier, most studies of contagion effect use stock price as a proxy to measure the degree of contagion. For example, Aharony and Swary (1983) find that bank run is usually followed by the sharp fall of stock price in the financial institution sector. Consistent with Aharony and Swary (1983), Swary (1986) find that the failure of Continental Illinois is also followed by the sharp decline of its stock price. Similarly, Goldsmith-Pinkam and Yorulmazer (2010) find that the fall of a specific bank in UK due to herding or run has significantly followed by the fall of its stock price. The use of stock price to measure contagion, cannot appropriately portray the pure contagion effect in banking sector. The significant fall of stock price due to bank run, is actually showed the pure contagion on the other side of market that is security market. However, this study is not aiming on finding the best measurement for contagion effect of bank run. The security market instability due to bank run is seen as the possibility that banking sector and security market may have interdependent relationship that provide a transmission for contagion. To be more specific, this study is aimed to examine the interdependent relationship between the two sectors by using the argument of behavioral contagion and measurement. In order to have an in-depth analysis of behavioral aspect of contagion, the action based of herding within each sector will also be analyzed.

Since the occurrence of interdependent relationship between the two sectors might be realistic, the question that must be raised is that, what kind of transmission channel that might create behavioral contagion between them? It is arguably, that theories that can be used to explain such behavioral transmission channel is still rarely explored. However, before answering the question, it is important to identify that the contagion effect is constantly depart from bank run to security market, not from the opposite direction. Knowing the process of contagion will help and enhance our understanding on how the behavior being shaped in each market, then how it become very contagious.

The argument of systemic risk begin with the existence of interbank short term loan, which caused high interdependence amongst banks in the financial market. The liquidity failure in bank A will affect another bank's liquidity, since such failure mean that bank A is unable to meet its loan commitment for both; the depositors and another bank (non-failure bank). For non-failure bank the event will cause illiquidity problem, since they will suffer from cash due to the default.

On the other hand, depositor's trust on bank A decreases and substantially withdraw their investment, which is followed by sudden withdrawal on non-failure bank due to the fear that the saving can't be reimbursed. This circumstance drive the total failure of bank especially on functioning the intermediary role. Since bank's intermediary role is also assuring trading liquidity of stocks, the failure will affect the price of stocks due to delays on trading activities. Stock price usually fall and cause the sudden behavioral shift of investor, namely flight to quality. This behavioral shift take place due to the changing perspective of investors on risk. Saving which is being perceived as the safest investment, become risky due to bank run event. Hence stock which is more risky than saving now become riskier. This changing perspective of risk then trigger a substantial selling decision on stock, drive the stock price to severely decrease. Based on this perspective of flight to quality, it can be seen that the contagion is actually based on the changing perception which is part of the cognitive bias. It is purely behavioral and irrational. In the light of implicitly behavioral factors of contagion, Pritsker (2001) confirms that contagion from banking sector to stock market is purely behavioral and irrational. However, Pritsker (2001) sees that the source of irrational behavior is trust, not the changing perspective of risk. Since bank also play as an asset intermediary for the real sectors, the failure may discontinue the operation of some industry in the real sector, then slowing down the economic growth. In such situation, investor trust on bank and firms (as part of real sector industries) will decrease as portrayed on the sudden selling action of real sector stocks.

Using the argument that contagion is depart from bank run and contain behavioral characteristics, this study argue, the transmission channel for the contagion might be occurred is information signaling. Information signaling is information send by depositors to investors via herding behavior that carry fundamental circumstance of bank. The underlying argument for the signaling information is the theory of "Social Influence" The theory argue that social influence may occur whenever one's emotion, belief, and behavior, are affected by the behavior of others.

Hirshleifer and Teoh (2008) argue, since the trading activities in security market are mainly based on behavior observation which subsequently reflected on cognition (reasoning) and emotion, it is important for social influence to be the main explanation for the contagion. Under social influence theory, one's emotion, belief and behavior are assumed transfer one's idea, business strategy, or forecasting regarding specific financial asset. Behavior imitation then, according to the behavioral contagion theory may occur since there is an approach-avoidance conflict especially on facing and reducing the risk of uncertainty.

Based on these argument, this study argue that contagion effect from banking sector to stock market is purely behavioral with information signaling play as the transmission channel. To have an in-depth understanding on the behavioral factor of contagion, the action based of herding as the main source of bank run and then market crash will also be explored. In addition this study argue that the event of financial disclosure announcement will add more insight on the occurrence of behavioral contagion. Gu (2011) states that financial disclosure become the main source of information for depositors to decide whether to withdraw or not. The importance of financial disclosure then add more knowledge on the degree of severity of bank run through herding behavior. The intense severity of bank run will expectantly bring the understanding on how the event will convey information leading to investor imitation behavior.

Literature Review
1.   Behavioral Contagion, and Bank Run
In the light of the law of one price, herding followed by bank run, has resulted on pure contagion effect to the entire system of banking sector. Aharony dan Swary (1996) find that small size bank appear to have higher possibility of run compare to those of bank with bigger

size. In addition, Aharony and Swary (1996), Chakravarty, Fonseca dan Kaplan (2012) find that pure contagion actually comes from depositor observation of non-failure bank, to the behavior of depositor of failure bank. Trautmann dan Brown et.al (2014) argue that the contagion effect occur since depositors know the interbank economic linkage.

Studies which examine that bank run may trigger behavior contagion into different market that is security market are still rare. In addition, since the contagion is assumed not behaviorally occur, the measurement of contagion generally use stock price. For example, Goldsmith-Pinkam and Yorulmazer (2010) finds that the contagion effect of herding and bank run in UK reveals in the decreasing stock price of affected bank. This study argue that the use of stock price in fact show the pure contagion on security market, not the financial institution market (bank). However, the significant fall of stock price following bank run, may indicate that bank and security market are actually integrated. Using the proposition of market integration, it is important to comprehend that such integration may occur since each market are systematically connected. Using the argument of systemic risk, it is clearly show that the contagion will always depart from bank run to stock market. The contagion itself demonstrate the possibility of integration.

By means of systemic risk argument, the occurrence of behavioral contagion between the two markets can be described in two perspective: traditional and market perspective. Traditional perspective sees bank as an intermediary for those the need and the have of capital. The main source of bank failure from traditional view is the liquidity shock due to asset mis-management. Generally, bank balance sheet is characterized by the presence of substantial proportion of longterm loans (for the need) which are financed by mostly short term liabilities (from the have) including interbank loan. The failure occur once longterm loans are default due to downturn of economic situation, resulting on bank failure to pay its short term liabilities (Hendricks et.al, 2006). Since interbank short-term loan are also allowed, the liquidity shock may generate shock to another bank. Such circumstances create the flight to quality phenomenon for both, banking sector and the stock market. Depositors and investors suddenly change their asset for an exchange of the saver one, characterized by sudden withdrawal of saving and massive stock selling.

The second perspective of systemic risk is market perspective. This perspective accommodate the recent shifting of bank role from traditional to market intermediary. One of such role is to ensure the liquidity trading of securities including stocks. The failure of bank due to liquidity shock or macro economic downturn cause the delays of trading resulting the stock price decreasing.

2.   The Transmission of Information Signalling

The argument of systemic risk implicitly stated that bank and stock market are integrated. Such integration require a channel of transmission, a channel that convey an information from one market to the other different market. Hirshleifer and Teoh (2008) argue that reasoning and emotion become relevant in the analysis of investment decision, since many empirical findings confirm such behavioral factor through market anomalies. In this case, contagion which can also be seen as decision making contagion, might occur in the behavioral manner. Furthermore, Hirshleifer and Teoh (2008) argue that the theory of social influence become important on explaining behavioral contagion, especially on how the behavior from one market is transmitted to another market.

Social influence theory stated that reasoning will resulted on the imitating behavior. The imitating process occur since one perceive that the behavior of others convey (signal) some information (Hirshleifer dan Teoh, 2003). The behavior of other is also believed carry some strategies or analysis of specific financial asset. This circumstance arise due to the information blockage that is a lack of factual information on the side of the imitator. From the

investor perspective, the case of bank run, the herding behavior that massively withdraw saving is believed bring some important information about affected bank. Since bank financial disclosure become the main source of information for depositors, investor then, believed that depositors have better analysis on bank fundamental situation. Depositor's herding then, become important and trusted signal for investor which subsequently followed by investor herding. Based on these explanation, it is clearly seen that imitating behavior that is contagion occur due to the presence of trusted and important information brought by one's behavior.

Furthermore, Ogunlade (1979) argue that the occurrence of imitating behavior that is behavioral contagion is spontaneous in order to lessen the fear of uncertainty. Ogunlade also stated that the necessary condition for the spontaneous occurrence is that the imitator and the initiator must be in the same critical situation. Further, initiator must also have a significant expertise for the imitator to be interested. In this case initiator become the positive reference individual for the imitator.

3.   Depositor Herding and Financial Disclosure

To have an in-depth understanding that contagion is occurred from behavior to behavior manner, this study explore the action based of herding for each market. Gu (2011) argue that depositor herding arise in the more dynamic and rational mode. Thus, the occurrence of depositor herding is more fundamental than panic action. This argument arise since there is a believe that depositor's trait namely patient and impatient play an important role on herding decision.

Depositor with high impatient tend to herd compare to those of with low impatient. In that case depositor with low impatient (patient) will not herd on the first period (timing) of herding. Furthermore it is confirmed that depositor with high patient usually investor that have considerable amount of saving (big account). Since depositors with big account are well informed, the behavior of big account depositors will usually followed by the small account-uninformed depositors. In this situation, eventhough critical situation force depositor to withdraw, the occurrence of such withdraw is small since the big account-well informed depositors remain unwithdraw.

Furthermore, Gu (2011) argue that fundamental herding doesn't always resulted on market stability or new equilibrium. On the extreme case, when big account depositors withdraw due to the motive for consumption not fundamental motive, it may cause sudden liquidity shock for healthy bank. The consumption motive will be followed by herding of small depositor resulted on bank cash drain eventhough bank is fundamentally healthy.

The correlation of herding and financial disclosure are given by Garriga dan Gu (2012). On their study it is found that the more detail the financial disclosure, the high possibility for bank to get affected by run. On the contrary incomplete financial disclosure resulted on the small possibility of being run (Parlatorre, 2015). The argument is that, on the low transparency of financial disclosure, both big and small depositors can not appropriately read the signal brought by the disclosure. Thus it may lead to inefficient and misleading herding.

4.   Investor Herding and Financial Disclosure

Contrary to those of depositor, investor herding behavior is more emotional due to their bounded rationality on coping noisy information (DeBondt, 1998). Barber et.al (2009b) find that the emotional level will be high for individual investor than those of institutional investors. This is due to the characteristic of individual investor who prefer taking risky investment than the safer one. Based on the emotional level, action based of investor herding is divided into two categories, intentional herding or panic herding and unintentional herding or fundamental herding.

Intentional herding is type of herding that is executed by abandoning private information. Such herding rely heavily on non-fundametal factors such as: reputation and size of the issuer (firm). On the other hand, unintentional herding is done by considering fundamental analysis and information such as: earning announcement, interest rate fluctuation and other changes of fundamental macro economic variables. In conjunction with financial disclosure Han et.al (2013) find that detailed financial disclosure will draw noise trader attention. Noise trader that usually has poor capability on analyzing the information (financial report) and short-term oriented will use the event of financial disclosure announcement as a means to acquire higher return.

5.   Propositions Development

Based on the argument this study develop two propositions, which are:

Proposition 1: There is a behavioral contagion effect from bank run to security market on the event of financial disclosure announcement.

Proposition 2: There is a difference action based of herding for each market

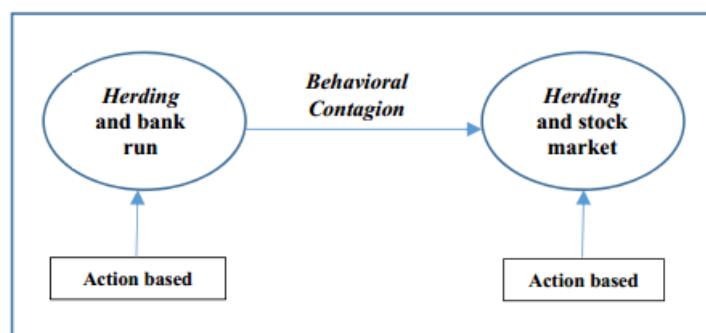
The model for the analysis is presented below:


Figure 1. The model of behavioral contagion

Based on the figure 1, it is shown that the behavioral contagion is flown from herding on bank run event to stock market herding which may leading to market crash. The behavioral contagion is based on the argument of social influence in which investor will imitate the behavior of depositor as a positive reference individual. As a reference individual depositor behavior became the channel of signaling which convey information regarding bank fundamental situation. For each market there is acertain type of action based herding. Especially on the side of bank run, the type of action based herding will determined the severity of run then subsequently imitated by investor in the stock market. The nature of action based herding of investor will consequently determine the degree of imitation.

SUKUK AND CONVENTIONAL BONDS PERFORMANCE IN INDONESIA (COMPARATIVE ANALYSIS OF RETURN AND RISK)

Evi Mutia, University of Syah Kuala, Indonesia
Evayani, University of Syah Kuala, Indonesia
Muhammad Shaleh, University of Syah Kuala, Indonesia

Abstract

Sukuk and bonds are two kinds of financial instruments that share in the Indonesian capital market. Sukuk is bonds that the implementation based on the principles of Islamic law. Sukuk is not like other interest-based securities, but in conventional bond yields received one of them in the form of interest. The conventional bonds are based on debt instrument while the Sukuk financing is based on the equity method. The aim of this research is the comparative analysis of return and risk between sukuk and conventional bond in Indonesia by using model calculations Yield to Maturity (YTM) and Value at Risk (VaR) framework for the period 2010-2014. This study used various methods on analyze the data. The result indicates that there is a significant performance difference between Bonds and sukuk based on Yield to Maturity. YTM of sukuk is greater than conventional bonds. When compared risk with conventional bonds the sukuk stands better in these sensitivity measures and sukuk have a lower level of risk than conventional bonds.

Keywords: *sukuk, bonds, return, risk, islamic finance*

Introduction

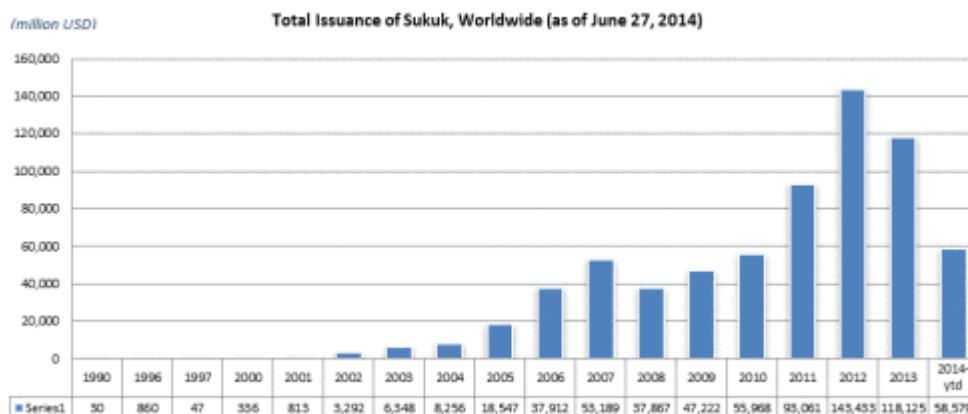
Sukuk and bonds are investment instruments of some other investment instruments that exist in the financial sector. Both of these have similar investment instruments as securities issued by the issuer of sukuk or bonds in this case the companies or institutions that need capital to investors. Since almost two decades , the issuance of sukuk as an alternative source of financing both the corporation and the state continues to experience rapid growth. Based on data from the Islamic Financial Information Service (IFIS), total sukuk issuance recorded worldwide has reached approximately USD 683.8 billion or equivalent to Rp 8277 trillion (1USD = Rp12.103) in 2014. Much improved when compared to the number of publications in 2004 , which reached approximately USD 8.2 billion.


Figure 1. Total Issuance of Sukuk, Worldwide (as of June, 2014)

Issuance of sovereign sukuk worldwide have been carried out by 15 countries . Indonesia as the country's Muslim majority world turned out to be the country 's sovereign sukuk second largest publisher in the world , with total issuance reached USD 19.16 billion. The development of sukuk in Indonesia can be seen from the number of companies issuing financial securities with a total value of sukuk bonds owned by the community or institution. The Sukuk high growth rate is an indicator that the sukuk investment is very promising for investors. The higher the total value of sukuk emissions in Indonesia from year to year, the higher investor interest in investing in sukuk.
Figure 2. Sovereign Sukuk Issuance Worldwide (million USD)

As for the total issuance of international sukuk denominated in US Dollar , Indonesia ranks third in the world with a total issuance reached USD 4.15 billion. Surpass Malaysia in the fourth position with a total issuance of $ 4 billion . As the largest international sukuk issuance of sovereign states is dominated by the UAE (USD 7.4 billion).

Issuers that issued sukuk must conduct its business in a business that is not included in the business carried on gharar group, maysir , or usury, but the business is run with the lawful business systems and good manufacturing and other service companies . This is done in order to avoid violating the provisions of Islamic law whereby the three types of businesses in the group gharar, maysir, or usury is not justified in Islam as preventive measures to avoid the uncertainties and risks that would arise from business practices that are not in Islamic law.

Other financial instruments that have characteristics such as sukuk is bonds. Referring *Sukuk* as "Islamic bonds" is due to some similarities between *Sukuk* and bonds, especially in terms of financial process. In fact, some studies say that *Sukuk* are innovated to mimic the financial features of bonds in addition to being compliant with Islamic finance principles, we cite for example the work of
Lahsasna and Lin (2012).

In fact, several similarities exist between Sukuk and bonds; however, these two financial instruments are different and are not duplicate tools of financing. Like conventional bonds, Sukuk has fixed term maturity, coupon and are tradable at normal yield price (Zakaria, Isa, & Abidin, 2012). Unlike bonds, Sukuk is issued in accordance with Sharia principles. Indeed , Sukuk differs from conventional bonds since bonds are defined as long-term debt instruments that are issued by corporations and government (Tahmoures, 2013) while Sukuk is defined by AAOIFI (2008) as certificates of equal value that represent proportion ownership of an existing asset or a pool of diversified assets.

The convergence between Islamic and conventional finance, particularly in the case of *Sukuk*, is gaining momentum as foreseen by several scholars (Mirakhor 2007). This said, there are certain differences between conventional bonds and *Sukuk*. A bond represents the issuer's pure debt, while *Sukuk* represent ownership stake in an underlying asset. Furthermore, since

the issuance of some types of ṣukūk securities, especially in large funding cases, may affect the balance sheet of the issuer the risk structure of the issuer is affected. In other words, by issuing ṣukūk particularly with a transfer of assets to a special purpose company owned by the fund providers as asset-backed ṣukūk such as is the case in ijārah, ownership of some parts of the assets of the issuing entity is transferred to the intermediating entity (i.e., Special Purpose Vehicle, or SPV) whose ownership is vested with the fund providers as ṣukūk-holders. This is not the case in conventional collateralized bonds and introduces greater risk, unlike in conventional bonds. Moreover, the profit stream of a ṣukūkissuing firm is not entirely dedicated to the equity holders because parts of the profit streams belong to SPV. Some portion of this profit of the SPV is distributed to the ṣukūk-holders as profit shares (or as rent for lease funding in ijārah) instead of interest payments, which is strictly prohibited in the structuring of ṣukūk funding (Safari, 2013).

The risk analysis and the level of profit are very important for an investor to invest in conditions of uncertainty (probabilistic). Sukuk with mudharabah and musyarakah returns to investors by the use of expected return due to its floating depends on the income used as the basis for the results (Purnamawati, 2013). This causes the floating nature of the risks that may occur as a result of the performance of the sukuk assets as collateral. According to Samson (2006: 218), the risks inherent in bonds with fixed coupon rate will occur if general interest rates rise or fall beyond specified limits. Risks that may occur as a result of a rise or fall in interest rates is the reference of return obtained by conventional bondholders. Therefore sukuk mudharabah and conventional bonds comparable risk because both have similar characteristics. So sukuk mudharabah be an alternative in comparing risk with conventional bonds.

Sukuk Mudharabah and conventional bonds are investment instruments in the capital markets basically, have similar characteristics. However, sukuk mudharabah require underlying assets for the sukuk issuer to avoid transactions prohibited by sharia . Underlying assets used as the basis for setting a number of bonds that may be issued to the public so that the total value of sukuk emissions equal to the value of the underlying assets.

According to Wahid (2010: 284), contracts Musharakah and mudharabah adopts a profit loss sharing, the risk of this form will be a shared responsibility between shahibul maal and mudharib, where shahibul maal will lose capital and profits, while mudharib will suffer losses and management advantages. Sukuk Mudharabah has risks due to volatile market conditions as a whole, causing losses to tangible assets in sukuk transaction. It can also be seen on conventional bonds that use a floating interest rate in determining return . Performance bonds are influenced by market conditions, where the increase in interest rates will cause bond values decline so it can be detrimental to the issuer.

The objective of this paper is to investigate risk and return structure of sukuk and conventional bonds in Indonesia by using model calculations Yield to Maturity (YTM) and Value at Risk (VaR) framework. The chosen VaR methodology for evaluating risk is widely applied in the area of finance. The VaR approach measures the downside risk of a portfolio position as the maximum loss that can materialize at a future prescribed date with a given probability due to adverse changes in relevant asset and liability prices. Application of this methodology to bonds requires a decomposition of the securities and an estimation of variances and covariance of returns on these securities. Variances and correlations of returns of each debt instrument are estimated from historical data.

Method

This research is a comparative research which is a research that uses T-test analysis tool, has a minimal intervention level, does not set the research condition, has sukuk mudharabah and conventional bond as its analysis units, and its time horizon is longitudinal (period of 2010-

2014). This study uses quantitative secondary data derived from the financial statements, the annual ratio (financial highlights), and cash flow statement and income statement. In this study, the data used quantitative secondary data obtained from the Stock Exchange, Kustodian Sentral Efek Indonesia (KSEI), Indonesia Bonds Pricing Agency (IBPA), financial services authority (FSA) and the Bond agency.

The sampling model in this study is nonprobability sampling that the chosen design is judgment sampling. Judgment sampling is based on certain considerations, including selecting a subject which is in the most favorable place or in the best position to provide necessary information (Sekaran, 2006: 137). The number of observations is 25 observations from the 11 companies, 9 of sukuk mudharabah, and 16 of conventional bond . Sugiyono (2009: 263) stated that, if the object of research it has a number of samples (n) which are different (homogeneous variance), then the number of samples can vary by using the pooled variance formula.

This study analyzes one calculation of yield and one VAR (Value at Risk). The yield calculation is Yield to Maturity ratio and the VAR uses the historical method (Back Simulation). The Value-at-Risk method is used to test whether the introduction of Sukuk to bond portfolios creates any diversification benefits. Formally, VaR measures the worst expected loss of a portfolio over a certain holding period at a given confidence level, under normal market conditions (Jorion 2006).

In other words, VaR is an expression of the portfolio's market risk, representing the maximum amount which may be lost, during a holding period, in all but (say) one percent of cases. For example, the VaR method can state with either one percent probability or a 99 percent confidence level that a certain amount of dollars will be lost in a given day, month, or year. Various methods, including simulation techniques, are applied to estimate the distribution of future portfolio values and to calculate the possible losses by using historical data. VaR is based on the variance of the return on the portfolio:

$$VarT = V.1,65.\sigma\tau$$

Where:
V = the market value of the asset at time T
$\sigma\tau$ = standard deviation of the portfolio
T = period of time during the standard deviation of returns counted

Yield-To-Maturity (YTM) is the internal rate of return earned by a bondholder who buys a bond certificate today, at market price, and holds it until the maturity, entitling the ondholder to all coupon payments as well as maturity payment. YTM is the discount rate that equates the total present value of a given bond's future cash flows to the spot market price. In other words, it is the internal rate of return or Yield to Maturity. This YTM is inversely related to the value of the bond. If YTM increases the bond's value declines. This fall in value is the VaR which is needed for hedging decisions. Yield-To-Maturity calculated as follows,

$$YTM\ approximation\quad = \quad \frac{c_i+\frac{P_p-P}{n}}{\frac{P_p+P}{2}}\ x\ 100\%$$

T-test is used to determine whether two unrelated objects have different average values. It is performed by comparing the difference between the average value with a standard error of the two research objects (Ghozali, 2009: 6).

Results and Discussion
Summary descriptive statistics for various *şukuk* securities and onventional bonds are presented in Table 1

Table 1. Descriptive statistics YTM of Sukuks and Bonds

	N	Minimum	Maximum	Mean	Std. Deviation
YTM_Sukuk	9	8,12	13,51	10,3706	1,53416
YTM_Bonds	16	7,92	12,50	10,2400	1,49197

The minimum value of the variable Yield to Maturity conventional bonds known the maximum value of 7.92 and 12.50. The average value of 10.24 with a standard deviation of 1.49197, can be interpreted variations contained in the Yield to Maturity of bonds. the value of 10.24 shows a high number because the standard deviation on the Yield to Maturity of bonds is lower than 10.2400 that is 1,49197. This indicates that the Yield to Maturity of conventional bonds on average by 10.24 %.

Table 2. Descriptive statistics risk of Sukuks and Bonds

	N	Average Market value (million USD)	Average VaR 1 day (million USD)	% Of total market value
VaR_Sukuk	9	256094	541,667	0,21151
VaR_Bonds	16	525876	1499,375	0,28512

The average market value of the index sukuk mudharabah amounting to 256.094 , while the average market value of a conventional bond index amounted to 525 876. While the average per 1 day VaR amounted to 541.667 sukuk mudharabah and conventional bonds amounted to 1499.375. The percentage of the total market value of conventional bonds amounted to 0.28512 larger than sukuk mudharabah amounting to 0.21151. The conventional bonds and sukuk mudharabah that have coupons and tenors are not the same, the VaR of sukuk mudharabah has a smaller value than VaR of the conventional bonds.

The value of VaR is highly dependent on the magnitude and duration tenor coupon for each bond and sukuk. Basically, there are several things that affect the amount of a bond VaR according to the VaR model in this study. One of the main factors is the tenor of bonds. Tenor that meant of here is the tenor of the day VaR measurements until the final maturity of the bonds.

Table 3. Sukuks and Bonds mean differences and t values of YTM

Independent Samples Test

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper

	Equal variances assumed	,037	,849	-,252	32	,803	-,13059	,51903	-1,18781	,92664

Y T M	Equal variances assumed	,037	,849	-,252	32	,803	-,13059	,51903	-1,18781	,92664
	Equal variances not assumed			-,252	31,975	,803	-,13059	,51903	-1,18785	,92667

Table 3 provides results of sample t-tests on pairs of YTM sukuk mudharabah and conventional bond. The F Value for YTM of sukuk and conventional bonds is 0,037 and probability for 0,849, greater than 0.05. it can be concluded that both variants of bonds and sukuk are same. It implies that is insignificant. it can be concluded that the YTM on conventional bonds and sukuk mudharabah are not significantly different.

Table 4. Sukuks and Bonds mean differences and t values of Risk

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Risk (VaR)	Equal variances assumed	,375	, 519	2,251	25	,020	1685,72 48	660,80770	302,638	3068,81
	Equal variances not assumed			2,655	16,851	,017	685,7248	634,89612	345,309	3026,14

Table 4   provides results of sample t-tests on pairs of risk sukuk mudharabah and conventional bond. The F Value of VaR of sukuk and conventional bonds is 0,375 and probability for 0,519, lower than 0.05. it can be concluded that both variants of bonds and sukuk are same. It implies that is significant. it can be concluded that the risk on conventional bonds and sukuk Mudharabh are significantly different.

Based on the results showed the market risk data is known that there are significant differences between sukuk mudharabah and conventional bonds because the level of significance of less than 0.05. The level of market risk is seen from VaR turned out for the time horizon (tenor) 1 day in quantitative portfolio of sukuk has a risk with VaR value lower than the VaR value of conventional bonds. Sukuk lower risk than conventional bonds. There are several reasons for this, the first in the sukuk is no moral restraint of the perpetrator so that the counterparty risk can be minimized. Second, although the sukuk inflation risks but did not have enough influence is high, so is the interest rate which is not a benchmark in sukuk. Third, sukuk do not allow the transaction containing gharar, usury and speculation. Product / transaction financed by sukuk is a real business / real and project / transaction is lawful. Bonds also did not allow for speculation, such as margin trading, forward and option. This is different from conventional bonds, which allow all forms of transactions or projects funded.

Conclusion

This research has compared the performance of sukuk and bonds portfolios using YTM and Value at Risk in in the Indonesian Sukuk and bonds market. Indeed, we use the indices of the series Sukuk INDEX reflecting the performance of sukuk and bonds market in Indonesia for the period from 2010 to 2014. We first addressed that the development of sukuk issuance in Indonesia is not in line with the development of sukuk trading. There are several factors that caused it, they are: the limited issuance of sukuk corporate in Indonesia, the investor has a lack of understanding about the corporate sukuk trading in the secondary market.

Secondly, There are not differences YTM of sukuk mudharabah and conventional bonds schemes. The results of correlation also indicate a significant and positive correlation between risk of sukuk and bonds portfolios.All these results imply that the sukuks are more apt investment for risk averters, whether they follow Islam or any other religion. Investors who choose bond market for investment will be normally risk averse else they will go to stock market which is more risky and with better YTM. In spite of its shortages and risks, sukuk market has a great potential for further growth. While significantly smaller than conventional bond market, sukuk market is developing rapidly and expanding to new areas of international capital market.

THE *"DIWANIYYAH"* AND KUWAITI'S DECISION TO INVEST IN KUWAITI STOCK EXCHANGE:
A PROPOSED RESEARCH FRAMEWORK

Nawaf Ebrahim, Multimedia University, Malaysia
Abdullah Ebrahim, Multimedia University, Malaysia
Fahad Al Samhan, Multimedia University, Malaysia
Osman Bin Mohamad, Multimedia University, Malaysia
Ridzwan bin Bakar, Multimedia University, Malaysia

Abstract
Investment refers to the sacrifice of current financial assets for future income. The stock market is one of the avenues that are available for investors to sacrifice their current finances for a future income. The decision of an investor to invest in a given stock market is driven by a number of factors such as the expected returns, the risk appetite as well as their individual needs. Their perception of the stock markets is influenced by microeconomic and macroeconomic variables. The paper is proposing a behavioral approach to understand Kuwaiti investors' decision to invest in Kuwait Stock Exchange.

Introduction
Reforms in Kuwait have seen increased participation of investors in its stock market. This has seen the KSE emerge as one of the best performing markets in the Gulf region. However, the country's economy is still highly dependent on oil revenues (Balcilar, Demirer and Hammoudeh 2013). The frequent fluctuation of oil prices in the international market usually has a direct impact on the economic performance of the country (Abdmoulah 2010). Such events coupled with other international and local events also impact the performance of Kuwait's stock exchange. Currently, the Kuwait Stock market is exposed to a number of negative events including political and religious conflict in the Gulf region as well as the falling oil prices. It is thus important for the attitudes of investors in the Kuwait stock market to be analyzed in the face of these events, which are likely to impact the future performance of the KSE.

To the authors' knowledge there is obvious lack of studies on factors explaining investors' behavior in the Kuwait's securities market. The current study seeks to fill this gap. The next section traces the establishment and development of Kuwaiti Stock Exchange. This followed by a discussion on an important cultural aspect of Kuwait society, diwaniyyah, and is followed a proposed research framework.

The Growth of Kuwait Stock Exchange
It is reported that share trading in Kuwait began as early as 1952 with the establishment of the Kuwait National Bank, which was the first shareholding company in the country (Kuwaitse 2015). During these periods, merchant markets, real estate brokerage offices as well as public cafes were the only means through which shares could be traded. The issuing of the Amiri decree in 1983 led to the establishment of the Kuwait Stock Exchange market (Heritage 2015). The Amiri decree saw the stock exchange being established as an independent financial institution. The exchange was placed under the management of the executive administration and exchange committee.

The establishment of the KSE during this period marked the beginning of the securities market in this region. The stock market as by 2007 had a total of 49 companies with a grand total of $10.11 billion registered (Ibpa USA 2007, p. 236). The securities market in Kuwait is

in the developing stages given the country's status as an emerging country (Indexmundi 2015). The securities market has over 200 shares listed on the Kuwait's Stock Exchange (KSE) (Indexmundi 2015). The 2000 decree allows foreign investors to own shares in companies that are currently established in Kuwait and those that may be formed in the future (Indexmundi 2015). As a result of this legislative framework, it is widely expected that more foreign investment into the stock market will be realized in the near future (Kuwaitse 2015). The growth of the KSE has been impacted by various macroeconomic variables, including GDP, interest rates, inflation, money supply and this in turn has had an impact on the individual investor perception of the securities market. The stock market has often been turbulent, with the frequently changing oil prices having an adverse impact on individual investment.

The Kuwaiti Society and Culture
The country is predominantly Muslim, with about 95% of the population being Muslims. Most of the country's population is urban, having changed from a nomadic population over the past years. In Kuwait's society, a total of five levels of social stratification can be noted. These classes are mainly based on ownership and control of wealth. The ruling family sits on top of the social hierarchy. They are followed by old merchant families whose history of trade dates back many years ago. Bedouins come in next after the old merchant families. This group consists of desert nomads who settled in the country at the onset of the oil industry. At the fourth level are people of Arab descent from neighboring countries. The last level of the strata is occupied by foreign nationals. Kinship bonds within these social classes play a vital role in maintaining the social structure. The state, cultural factors and social rights perpetuate the social stratification in the country (Heritage, 2015)

The shift from the nomad population to the Islamic population has largely been due to the Islam religion, which resulted to most Kuwaitis settling around Mosques and other religious places. Another important aspect of the Kuwaitis culture is hospitality. The Kuwaitis believe that it is important to be generous to guests, both strangers and non-strangers. They express their affection for each other through their unique daily greetings which consists of a handshake and a kiss on the cheek.

The Diwaniyyah is an important traditional culture observed by all families. It refers to the gathering together of men in a tent or a small room away from the main house where societal issues such as sports, religion, politics and entertainment are discussed. Both the event and the place where the event takes place may be referred by the term Diwaniyyah. The meetings often occur in the evenings, and the members include the male members of a family together with their friends and relatives.

It is estimated that a Kuwaiti man attends an average of 2 Diwaniyyahs in a week. This institution is unique to Kuwaitis and reflects the country's democracy where the people can discuss the issues that affect them most. Women are also allowed to hold their Diwaniyyahs. However, the traditional gatherings are only reserved for women. Modern Diwaniyyahs allow foreign dignitaries and important business partners to attend regardless of their gender.

In the past, political discussions, smoking Shisha, playing traditional card games as well as drinking coffee and tea used to be the main activities during the Diwaniyyah. With developments in technology and increased pace of globalization, modern Diwaniyyahs involve playing of video games, billiard games and watching television. During these meetings, the host will often provide the visitors with refreshments such as tea or coffee and engage them in conversations touching on a variety of topics. One of the major topics that are often discuss is related to the selection of stocks for investment decisions.

So it is timely that a study is conducted to determine social-cultural factors, in particular the Diwanniyah's influence the individual investors' intention to trade in the Kuwaiti Stock Market vis-à-vis other regional stock markets.

Proposed Research Framework

The study employs the theory of planned behavior (Ajzen, 1991) to investigate the various variables that affect investor decisions in Kuwait's stock exchange. Refer Figure 1. The main objective of the study is to investigate the factors that influence the individual attitudes that investors have towards the Kuwait stock exchange market. The specific objectives of the study include;

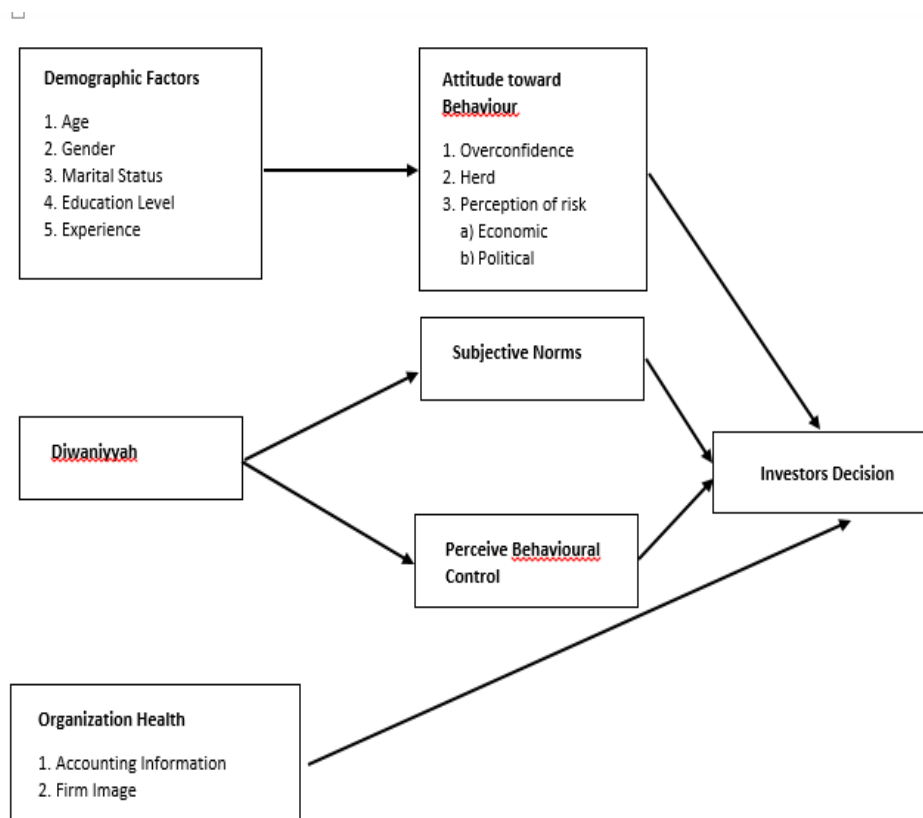
1. To investigate the impact of demographic factors towards attitude of individual investors.
2. To determine the influence of attitude on decision to invest in Kuwait Stock Exchange.
3. To evaluate the impact of Diwaniyyah culture on subjective norms and perceived behavioral control of the individual investors
4. To determine the influence of subjective norms and perceived behavioral control on investors' decision to invest in Kuwait Stock Exchange.
5. To determine the perceived value of financial information and firm's image on the investors' decision to invest in Kuwait Stock Exchange.


Figure 1: Proposed Research Framework

Summary

Kuwait has over 200 shares listed on its Stock Exchange (KSE). The country heavily relies on the production and exportation of oil and oil products, a fact that has brought the stock

exchange under great pressure to diversify. The stock exchange market still attracts both domestic and foreign investors since it provides ways through which other businesses and new investments can be established thereby diversifying the oil-dependent economy. After undergoing privatization and liberalization during the 1990's, the country has seen its stock exchange market grow to the level of allowing foreign investors to take part in the securities exchange. Being an emerging economy with rich reserves of oil, Kuwait is increasing attracting investors in its stock exchange market. However, some investors are still hesitant about investing in the KSE. The attitudes and perceptions of these investors are shaped by different factors, some of which have been mentioned above. This research will help in analyzing the individual investment trends in the Kuwait stock exchange with the main focus being on their perception towards the securities market.

ANALYZING THE VILLAGE FUND EFFECTIVENESS: DOES THE GOVERNMENT PLAN WORK?

Wahyu Ario Pratomo, University of Sumatera Utara, Indonesia
Ari Warokka, Universidad Autonoma de Madrid, Spain
Dwi Citra P Sitompul, University of Sumatera Utara, Indonesia

Abstract

This study aims to analyze the effectiveness of the Village Fund to accelerate local economic development and necessary rural infrastructures. It examined the village fund administered by village government in the context of planning, executing, and controlling the fund. The research used four districts in North Sumatera province (i.e. Langkat, Deli Serdang, Asahan, and Mandailing Natal districts), which were the most active regions in absorbing the fund. To measure the effectiveness level of the village fund policy, it employed regulatory gap analysis. It compared the governance performance to rural people's expectation on the village fund effectiveness. The results revealed that it was ineffective in utilizing the capital, specifically in financing the infrastructures construction, which it did not match with the rural needs. The villager perceived that village administrators were not capable enough to review the village's needs and yet equipped with the necessary skills to manage the village funds.

Keywords: *Village fund, economic development, rural infrastructures*

Background

The Dana Desa (village fund) program, which is the part of the government's large-scale decentralization initiative to diminish economic inequality and poverty, becomes interesting discourse topics nowadays. This program, which covers over 74,000 villages and provides Rp 20.7 trillion (US$ 1.4 billion) grants, will be the accelerated fund to spur the local welfare and develop the necessary infrastructure, including agricultural needs. Nevertheless, despite the potential of future wealth for villages, some experts concern the village administrator's limited capabilities and experiences to manage the fund that can lead to multiple problems, such as a mismatch between the real needs and the resource allocation, corruption, and power abuse (Lewis, 2015; Martinez-Bravo, 2014; Prabowo, 2015; Vel & Bedner, 2015).

The study of Corruption Eradication Commission (KPK) on village financial management practices revealed four weakness aspects to be immediately attended: regulatory and institution, governance, monitoring, and village human resources (KPK, 2015). On the first issue, the study found the three most significant problems. Those issues were the uncompleted regulatory and technical guidance to implement the village financial management, the nontransparent village funds allocation, and inefficient reporting procedures due to overlapping regulations. On the governance aspect, there were five critical issues, such as the fixed budget-disbursement period covered by the report, the unavailability village budget's transparency and accountability plan, and the misuse village-fund allocation since not all community executives have sufficient management skills, specifically in public financial management and priority governance. For example, Village A, whose limited infrastructures and low-level income people, prioritizes the fund to renovate village office rather than to fix up an important bridge connecting the village with the nearest market. On the third aspect, the study highlighted the potential monitoring problems: the low-effectiveness of the regional inspectorate in supervising the village financial management, the ineffective public complaint management, and the unclear supervision and control by the higher administrator (i.e. *camat* – sub-district head). Finally, on the human resource aspect,

the possible problem stems from the experts' power abuse. Those officials are the experts expected to provide technical assistance and project management supervision to community and village administrators, which in many prior cases, they were involved in the village fund's corruption and fraud. Referring to the findings, KPK argues that the village fund good governance should advance and empower rural communities.

The other studies show similar results, such as the enormous increase in funding for village budgets may well strain the capacity of current public financial management (PFM) systems (DFAT & World Bank, 2014; SMERU, 2008; Venning, 2009). The global village PFM processes have settled over the course of many years in the context of quite limited service responsibilities and moderately small amounts of funding (DFAT & World Bank, 2014). In this regard, village procurement is a particular concern. The report of DFAT and Word Bank (2014) apparently claims that village procurement procedures are not clearly set out in regulation and the practices tend to be ad-hoc and nontransparent. Also, the minimal levels of open bidding in tendering processes are less assured (Ashcroft & Cavanough, 2008; DFAT and World Bank, 2014).

As the regulator and the chief controller of the program, the government enacted the Regulation of Minister of Villages, Disadvantaged Regions and Transmigration Number 21 of 2015 concerning the Stipulation of Priorities for Village Fund. The rule determined the fund 2016 should be used to finance programs and local-scale activities concerning village development and people empowerment (Kemenkeu, 2016). The regulation is one of the efforts to deal with uncertain service obligations, fast increasing and relatively massive budgets (Lewis, 2015), poor public financial management procedures, and doubtful control and accountability mechanisms cause specific worry about the potential for corruption at the village level (Shahrir *et al.*, 2014). Corruption has been a substantive matter among Indonesian local governments since decentralization began in 2001 (Henderson & Kuncoro, 2004; Henderson & Kuncoro, 2011).

Even though the study of village fund effectiveness is one of the most intensive discourses in the field of local decentralization, there are still facets, aspects, and consequences to be explored and discussed scientifically (Anggraini, 2016; Asni *et al.*, 2013; Saito, 2003; Saputro, 2015). The study focuses on two research questions: (1) Does the village fund improve the local economic about an increased local revenues and a reduction of rural poverty? (2) Does village fund management meet the local people's expectation on village's good governance? Therefore, the study of village fund effectiveness will contribute, at least, at two important aspects. First, it will provide an objective evaluation of village fund effectiveness to develop infrastructures, such as rural roads, agriculture irrigations, simple bridges, and river wall, enabling more economic activities. Second, it will compare the village fund management performance to the villagers' expectation and analyze whether the village administrators apply good governance or not in the context of proper planning, implementation, monitoring, and transparency aspects.

The paper is organized as follows. First, some background material on village fund and village governance structure in Indonesia is provided. Second, the literature review of village governance and decentralization are described. Third, regulatory gap analysis is used to determine village fund effectiveness. Fourth, it discusses the findings and its implications. The final section of the article summarizes the main results and draws conclusions.

Literature Review

Prior studies on village fund programs revealed that the main challenges were the fund allocation effectiveness and the conformity between the necessary needs and the

implemented programs (Boonperm *et al*., 2007; Davis *et al*., 1994; Jarvis, 2002; Kaboski & Townsend, 2006).

1.   Village Fund Effectiveness

The studies of village fund effectiveness in some countries provide inconclusive findings. Menkhof and Rungruxsirivorn (2011) reported that village fund was successful in reaching and improving the welfare level of lower income households in Thailand rural areas. The work of Boonperm *et al*. (2013) supported the finding, which village fund has a stronger effect on local people income than on expenditure. Meanwhile, other studies in different countries (Bardhan & Udry, 1999; Chandoevwit & Ashakul, 2008; Coleman; 2006; McKenzie & Woodruff, 2008) reported the adverse results. In Indonesia, the majority findings showed that the fund effectiveness was the main concern (Botes & Rensburg, 2000; Harrison & Sayogo, 2014; Hermansyah, 2015; Husin, 2016; Siagian *et al*., 2016).   The scholars identified three main problems, namely, (1) the insufficient knowledge of village executives about what they should do with the village funds, (2) the inappropriate-lead-to-imbalance formulation of allocating the funds, and (3) the common finding of many village funds are simply deposited into rural development banks (Asni, 2013; Cimpoeru & Cimpoeru, 2015; Renzio & Masud, 2011).   Several key factors, such as population size, poverty levels, and unfavorable and uphill geographic conditions become the sources of imbalanced village fund allocation. There is only 10 percent of village fund allocated by considering those factors. Meanwhile, the remaining funds are allocated pro rata per village. Therefore, it is not surprising, which most of the funds are not effective to run the wheels of the local economy.

To optimize the utilization of village fund in improving the local people's welfare, Barrios (2007) argues that the development intervention is critical, specifically to finance infrastructures and community empowerment. The study also claims that the strategic management of natural resources in which rural community actively participates is indispensable for ecological integrity and to support sustainable rural development (Barrios, 2007). The study of Cook (2011) reported that a strong relationship between infrastructures, economic growth and economic development, which led to the rural prosperity. Cook (2011) illustrates the findings by showing the nexus of electrification and local community's entrepreneurial activities. Even the study of Estache and Fay (2007) affirmed that the failure to invest sufficiently in infrastructure is the most reasonable explanation of the differences in growth between the successful East Asian economies and other parts of the developing world. Also, the research of Fan and Zhang (2004) in China revealed some significant findings on the effects of infrastructures and education on rural economic sectors' productivity (i.e., agricultural and non-agricultural sectors). It means that any aid funds or grants for rural economic development are subject to infrastructures and education development. However, Fan and Zhang (2004) also emphasized the critical participation of rural people to be involved actively in the aid funds or grant management process (i.e., planning, implementing, controlling, and monitoring activities). Wong *et al*. (2013) affirmed this argument by testing the cost efficiency of rural infrastructures development in China. They found 101 projects of rural roads were more efficient when local community managed and participated actively in overseeing it. Those prior findings demonstrated the importance of villagers' involvement in running the village fund to accelerate the regional economic development and assure its effectiveness through rural infrastructures improvement.

2.   Village Fund Management – Meeting the Expectation

Village fund scheme is a decentralization platform to make more equitable economic development and professional public service for local regions. Prior findings showed that

decentralized-development at the local level could elevate public service quality, community participation, local wisdom-based policy, and local institutions' representativeness (Antwi-Boasiako, 2010; Jones *et al.*, 2007; Ribot, 2002). However, those findings are still inconclusive due to some reported adverse effects, such as conflicts between the regional government and local people, corruption and power domination by local 'elite' officers (Pattenden, 2011; Nijenhuis, 2003; Bierschenk & Olivier de Sardan, 2003). Moreover, it coupled with low public management capacity, leading to poor public services' performance (Fisman & Gatti, 2002).

The main challenges of Law 6/2014 effective implementation are inadequate village administrators' governance capacity, lack of assistant support from provincial and district governments, and low quality of rural development planning (Hermansyah, 2015). This fact is similar to the findings of Dragoş & Neamţu (2007) in Romania, which points out the process of decentralization is closely interwoven with the development of the administrative capacity of the local units. Meanwhile, referring to the Karanikolas and Hatzipanteli's (2010) finding on the decentralization programs in Greece, the village fund management effectiveness depends on the role of community participation due to the local people's knowledge or understanding of the environment. This community engagement is essential in identifying the development projects, helping to minimize the inefficient resource allocation, and allowing resources to be allocated efficiently for the most needed projects. In other words, to be effective village fund management, it needs a proper delegation of competencies and resources to the actors involved at all local administrative levels, coupled with a renewed awareness of integrated community participation policies.

Research Methods

This research examined five variables of village fund effectiveness in 4 (four) districts (i.e., *Langkat, Deli Serdang, Asahan, and Mandailing Natal districts*). Those communities were located in remote areas, populated with low-income people, and bordered to other provinces. The study employed a survey of 465 respondents, which represented three related groups in village fund management (i.e. headmen, village council members, common villagers).

This study analyzed the comparison to the condition before and after implementation of the village fund on the economic development and the availability of infrastructure to support the society's welfare in rural areas. Furthermore, to evaluate the management of the village fund, then this paper conducted a regulatory gap analysis. The Regulatory Gap Analysis is an analysis tool that used to assess the performance of the government regarding policy/public service by comparing input plan and actual implementation. By this analysis, it will obtain the perceptual comparison between the village government and the society. If the value of the average gap is more than zero, so the policy implementation has been succeeded according to plan and could resolve the society problem. While if the value of the average gap is less than zero, then the policy implementation is still not according to the plan and has not succeeded or failed in addressing the problems in society. To test whether there is a significant gap between the government perceptions' society or not, this study used independent t-test sampling.

Results and Discussion

Village funds are expected to increase prosperity and reduce poverty in the village. It is based on the benefits of village funds were used to build some rural infrastructure such as rural roads, irrigation, roads, sanitation, and others believes that it will have an impact on the economic recovery of the village. In fact, the government considers the impact effect on the acceleration of national economic recovery. This is certainly the hope of all elements of the villagers though still, some have argued that the village fund is not enough to improve the

economy and prosperity to the fullest. Here are the response and the perception of respondents that the Village Fund will provide improvements to the welfare of society.

Based on study results, the village fund has an impact on the improvement of welfare for 57.5 percent of society, while 42.5 percent of other communities has declared that there are no changes for income society. These achievements still cannot be said to be successful in improving the community welfare. The Infrastructure development and community empowerment are not optimal. Therefore, it still cannot increase the local economy. Community income inequality is a result that is not optimal. The study result found that only 25.0 percent of people see an improvement in income inequality between communities.

In the gap analysis when the average value of the difference is greater or equal to zero, then the policy implementation has been succeeded according to plan and was able to resolve the problems that exist in society. While if the average value of the gap is less than zero, then policy implementations are not by the plan and failed to resolve the problems in society. The expected value is the weighted average value of perception given by the village government that is Headman and The Village Consultative Body. Whereas the value of the performance is the weighted mean value of an objective assessment of the public that quantifies each indicator measured.

To test the gap analysis for the village fund policy, there are 5 (five) indicators measured that are planning, execution (the implementation of the village funds utilization), oversight, transparency, and impact on the village fund use. Overall, this study tested the perception gap between village government and society. This test carried out using independent sample t-test, and the t-count results obtained by 4.871. These results indicate a significant difference in differences of perception given by the village government to the society on the effectiveness of village funds for economic development and infrastructure in rural areas. The biggest perception gap is the impact indicator of village funds to the improvement of people's welfare, society involvement in the village development plan and control of the village funds budget. These results indicate that the planning of the village fund is still not on target as the government expected. Although the budget issued by the government is substantial, the government still needs to make an improvement.

Other potential problems, which become barriers to the implementation of the village fund are governance. In the category of governance, there are five issues, namely: (1) The time within village budget management cycle difficult to be obeyed by the village; (2) Unit prices of raw goods / services are used as a reference for the village in compiling Budget Village or what we called 'APBDes' is not yet available; (3) Transparency-use plans and accountability of Budget Village is still low; (4) The accountability report that made by the village has not followed the standards and prone to manipulation and (5) Budget Village drafted, did not show the necessary requirements of the village.

Table 1: The Gap Analysis of the Village Fund Policy For Economic Development and Infrastructure in North Sumatra Province

Variable	Indicator	Expectation	Performance	Deviation
Plan	Preparation of planning documents	4,10	4,10	0,00
	Potential analysis and rural development needs	4,53	4,20	-0,33

	Extra facilities and rural infrastructure	3,80	3,35	-0,45
Average		4,17	3,49	-0,68
t-independent sample test		t-stat 4,871 Sig (0,001)		

Based on the existing regulations, the mechanism of making the APBDes participatory prosecuted for improving the society welfare. However, not always the quality of APBDes formulation produced by the priority needs and the condition of the village. For example, the status of Village A has a minimal infrastructure condition and a large proportion of poor people, precisely prioritize the use of APBDes for the renovation of village office, which is in the right conditions. As another example, Village B which prioritizes the establishment of Village-owned Enterprises (BUMDes) clove trading at stake, whereas the region has a minimum infrastructure. In the second rule, the village was no violation. Expenditure incurred by the rules that have been made, but the substance of the problems in the village cannot be resolved.

There are so many villages that are desirous of establishing village-owned enterprises (BUMDes) to increase the Revenue Villages (PADes) but the main issue is still many villages, which do not have knowledge about BUMDes. The capacity of village officials in developing and optimize the utilization of villages has not been evenly distributed. The local government has a low commitment to the village. The facility function and development of district/city over the village, is still not running at all district level.

Lattermost, on the aspect of human resources, there is a possibility problem, that is assistants potentially fraud using the weakness of village officials. It is likely the previous program, PNPM Rural; whereabout the representatives are supposed to work to help the community and village officials, instead of corruption and fraud.

Conclusion and Policy Implication
The village fund system has played a significant role in the increasing of the income of the citizens. However, this accumulative did not cause the improvement of public facilities for the area but resulting from other factors. The study also found the imbalance distribution in full populations' income still stood at the same level and did not show ant decreasing movement even with the help of central government funding to local authorities. The village monetary policy has the important role in the development of public facilities in its area. Nonetheless, still, this study discovered numerous issues regarding infrastructure improvement agenda. Also, the study found the lack of contribution from the residents in the program. In contrast to National Citizens Prosperity Program, that its design and process involved the citizens directly.

Considering the village fund program is one of the programs of the government, it is highly necessary that everyone should enjoy this policy. It is clear that the participation of citizens in government activities needs to be increased. The Village Consultative Institution as has been tasked as the watchmen for the local activities that designed by the village headman, need to act more enthusiastic in receiving people aspirations. The Ministry of Village and Rural Areas development has issued the policy that related to the guidelines on how to spend the village fund productively and to avoid any bribery activities in exercising the programs. It also consists of the guidance for local government to utilize local natural resource effectively to help the development.

The distribution of the village fund was aimed to tackle the poverty issue in rural areas. Nevertheless, through the result of the agenda, it is relevant to say that the government required finding more ways. The program seems to be designed inadequately and without precise monitoring activities in its operations. The vast amount that has been distributed through physical development (infrastructure) or program, the result shows no significant continuing impact on the residents. The structural issue that appeared is the uncontrollable subordinate connection style between urban city residents and village residents. Village residents have received pressure and under control of big distributors as the village lack of capital, have less knowledge and creativity, small opportunity, and challenging access to market. The modern city controls the commodities price, particularly in agriculture sectors resulted in imbalance profit distribution. What is needed to be done is the village residents should have equal opportunity, knowledge, and creativity to be adequate in managing their agriculture products to increase their income and to add more value.

The government should create a stronger economic, social, and education body. Furthermore, build more public facilities that will increase the independence of economic for rural area residents. Through education and knowledge on how to operate agriculture technology, the government will be required to boost the role of the local financial institution more effectively, which might create the high bargaining power possibility for the residents and to avoid any involvement from greedy business people that might create unequal profit distribution in general.

THE TODA-YAMAMOTO CAUSALITY TEST FOR GOVERNMENT EXPENDITURE AND ECONOMIC GROWTH: CASE STUDY IN INDONESIA

Sigit Harjanto, Brawijaya University, Malang, Indonesia
Setyo Tri Wahyudi, Brawijaya University, Malang, Indonesia

Abstract

This research aims to find out the causality between economic growth and government expenditure. Using Toda-Yamamoto Causality Test, we found unidirectional causality between economic growth and government expenditure in which government expenditure affects economic growth which is in accordance with Wagner's Law. In terms of expenditure by function, we found the relationship that supports Keynesian approach between economic growth and government expenditure by economic function. However, there is no causality between the other functions of government expenditure and economic growth.

Keywords: *Economic Growth, Government Expenditure, Toda-Yamamoto Causality Test*

Background

The success of a country in improving the prosperity of its citizens is measured by the rate of economic growth achieved. The high and low rate of economic growth in a country shows the level of change in the economic prosperity of the citizens. High and stable economic growth from year to year indicates the improving economic prosperity, while economic decline or economic growth which has a negative value shows the decline in economic prosperity. On the other hand, the level of economic growth is also used to evaluate the accuracy of the policies that have been taken with respect to the role of government in the economy.

Failure of the existing economic system requires the government interference in the economy. Market failures due to public goods, externalities, and imperfect competition encourage the government to further enter the market and to intervene. It is the responsibility of government to create economic efficiency and ensure fairness in the attempt. The role of government can be classified into three major categories, namely: (1) the allocation role – ensuring that the allocation of economic resources is efficiently implemented; (2) the role of income distribution and subsidies in an effort to improve people's welfare, and (3) the stabilizing role in the effort of improving economic growth (Musgrave and Musgrave, 1993).

The role of government as the economic stabilizer is very important because economic situation is not always as favored by the government and society. Government efforts to boost economic growth become increasingly significant when the market fails. Shocks in the economy lead to the decline in the level of economic prosperity as a result of the decline in output and employment (Mankiw, 2007).

The form of government invention in economy concerning the allocation role is by fulfilling the needs of the community through the provision of public goods. It occurs since market mechanism is not interested in providing public goods as the purpose of market perpetrator activities is gaining profit whereas the provision of public goods is a kind of non-rival and non-exclusive activity. The consequence of the role of government in allocation is the availability of budget allocation, which is manifested in government expenditure.

According to Keynes (1936) in his book entitled '*The General Theory of Employment, Interest, and Money*', government involves in the economy through the policies that are taken and implemented. Keynes argued that fiscal and monetary policies implemented by the government can influence the output of the nation which in the end will ultimately reduce the number of unemployment and shorten downward trend in economic condition (Samuelson dan Nordhaus, 2004). Indonesian government fiscal policies are depicted through the amount

of the state budget that is implemented. The problem is that the details of the existing policies in the state budget often do not reflect the direction of the policies and are not used as the guidelines so that it provides opportunities for private sector or stimulation for economic activity. Budget allocations have not yet provided the direction of change for the creation of economic growth, instead it shows the government's lack of seriousness in allocating budgets for vital sectors such as education sector and the improvement of the quality of life of all Indonesian citizens as indicated by a large portion of unproductive expenditure for example debt interest payments as well government loans.

Government strives to optimize the function of policies in dampening economic fluctuations or is countercyclical. It means that, in a sluggish economic condition, government expenditure is autonomous, particularly expenditure on goods and services and capital expenditure which provide stimulation to the economy to grow, and vice versa. In the middle of the economic conditions that is heating up due to too high aggregate demand, contractive fiscal policy is used to grease the wheels of economic activity by balancing the demand and supply condition of economic resources. As seen in Figure 1, both economic growth and portion of government expenditure have a fluctuating pattern, but economic growth has a larger deviation than the portion of government expenditure. At one period, economic growth and portion of government expenditure have the same movement direction, but in the next period the movement is in the opposite direction.

Figure 1: Comparison between the Portion of Government Expenditure and Economic Growth in Indonesia in 1971-2013

The relationship between government expenditure and economic growth has become a concern of many previous researchers and generated two opinions on the relationship between the two variables. Keynes and his supporters argued that government expenditure affects economic growth in accordance with the equation identity of open economy. While Wagner's Law states that the improvement in the economy that occurs affects government expenditure. The debate continues as further studies were conducted to determine the actual conditions which occur in the field. Various studies on the relationship between government expenditure and economic growth result in a variety of conclusions which creates supporters for each theory. The diversity of the results obtained is due to the difference in research site, data types, methods of research, as well as the operational definition of each variable used (Peacock and Scott, 2000). The objective of the study is to analyse the relationship between government expenditure and economic growth in Indonesia.

Methods and Materials

This study aims to determine the causality between government expenditure and economic growth. In general, there are two frequently used causality test namely Granger causality test and TodaYamamoto causality test. Granger causality test obtains reliable results if it is used in time-series data which are integrated at the same degree, but it will get an invalid conclusion when applied to data in which the degree of integration varies. Therefore, Toda Yamamoto causality test method was used in this research. The selection of Toda-Yamamoto causality test was based on the nature of time series data which have possibilities to be integrated on the same degree or on the different degree or even not integrated at all. Toda and Yamamoto (1995) developed a causality test which can be applied to data with different degree of integration but still obtain reliable results called Toda-Yamamoto causality test.

Toda Yamamoto causality test method was applied to the function adopted from the research conducted by Samudram *et al.,* (2009) as follows:

$$Y_t = f(X_t) + \varepsilon_t$$

Where in Wagner's Law, Yt = government expenditure and Xt = economic growth. In Keynesian point of view, Yt = economic growth and Xt = government expenditure. Furthermore, according to Pahlavani *et al.,* (2011), the function explained above can be described in the form of equation to be tested with Toda Yamamoto causality method as follows:

$$GROWTH_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GROWTH_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GOVEXP_{t-i} + \varepsilon_t$$

$$GOVEXP_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GOVEXP_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GROWTH_{t-i} + \varepsilon_t$$

where k is the optimum lag, *dmax* is the highest degree of integration, *GROWTHt* is economic growth in period t, and *GOVEXPt* is government expenditure in period t. To test causality of government expenditure by functions covering public service, defense and security, economy and education, government expenditure variable will be substituted by government expenditure based on the selected functions as presented below:

$$GROWTH_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GROWTH_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GENEXP_{t-i} + \varepsilon_t$$

$$GENEXP_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GENEXP_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GROWTH_{t-i} + \varepsilon_t$$

$$GROWTH_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GROWTH_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, DEFEXP_{t-i} + \varepsilon_t$$

$$DEFEXP_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, DEFEXP_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GROWTH_{t-i} + \varepsilon_t$$

$$GROWTH_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GROWTH_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, ECOEXP_{t-i} + \varepsilon_t$$

$$ECOEXP_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, ECOEXP_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GROWTH_{t-i} + \varepsilon_t$$

$$GROWTH_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, GROWTH_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, EDUEXP_{t-i} + \varepsilon_t$$

$$EDUEXP_t = \sum_{i=1}^{k+dmax} \alpha_{1i}\, EDUEXP_{t-i} + \sum_{i=1}^{k+dmax} \alpha_{2i}\, GROWTH_{t-i} + \varepsilon_t$$

where *GROWTH* is economic growth, *GENEXP* is government expenditure by public service function, *DEFEXP* is government expenditure function by security defense and order, *ECOEXP* is government expenditure by economic function, and *EDUEXP* is government expenditure by education function.

Causality test is used to determine whether an exogenous variable can be treated as an endogenous variable. Causality theory states that the X variable affects Y if past values of the X and Y can predict Y better than if just using the past values of Y, and because the future cannot affect the past, the change in X should precede changes in Y (Gujarati and Porter, 2012). Causality between one variable with other variables can be identified by comparing the probability (p-value) with a standard error of 5%. If the probability value is less than 5%, then H0 (no causality) can be rejected. According to Gujarati and Porter (2012), causality can show four possibilities, namely:

1. Unidirectional causality, where economic growth influences government expenditure;
2. Unidirectional causality which is the opposite of point 1, where government expenditure affects economic growth;
3. Bilateral causality (feedback), where economic growth and government expenditure affect each other;
4. Independence / no association between economic growth and government expenditure.

Statistical Findings

In order to analyze the causality between government expenditure and economic growth, there four (4) steps (i) stationary test, (ii) optimal lag length, (iii) cointegration, and (iv) Toda-Yamamoto Causality test. First, the stationary test was conducted to identify whether there is a unit root in the variables studied. Stationary test was carried out using the method of ADF test. Each variable was tested in sequence, ranging from grade I(0) or degree level. When the value of the ADF t-statistic is greater than the critical value, the variable does not have a unit root which means that the data has been stationary.

The results of the ADF test revealed that some variables were stationary at degree level and the others were stationary at the degree of their first difference. GROWTH, GOVEXP, and GENEXP variables can reject H0 (the data is not stationary) at confidence level of 5%, with a value of t-statistic which was greater than the critical value. On the other hand, DEFEXP, ECOEXP and EDUEXP variables can reject H0 at the degree of the first difference with a confidence level of 1%.

Table 1. Stationary Test Results

Variable	Level	Critical Value (Level)	First Difference	Critical Value (1st Diff)
GROWTH	-4.627609***	-4.192337	-	-4.198503 (1%)
GOVEXP	-3.917752**	-3.520787 (5%)	-	-3.523623 (5%)
GENEXP	-4.459207***	-3.191277(10%)	-	-3.192902(10%)

Second, lag length selection aims to determine the time required by a variable in order to respond to changes of other variables. Lag length selection is very crucial because appropriate lag selection will generate residuals which are free from autocorrelation and

heteroscedasticity. Based on table 2, the suggested optimal lag length for equations with growth and government expenditure variables by using the four criteria comprising LR, FPE, AIC and HQ is lag three. The same lag is also recommended for equations which employ variables of economic growth and government expenditure by defense, security and order functions and also for equations with variables of economic growth and government expenditure by economic function, as well as equations with variables of economic growth and of government expenditure by educational function.

Table 2: Optimal Lag Length Selection Results

Endogenous Variable	Lag	LR	FPE	AIC	SC	HQ
Growth	1	13.59265	72.95076	9.964695	10.23133	10.05674
Govexp	2	12.70366	60.2193	9.769811	10.21420*	9.923213
	3	11.19486*	51.09786*	9.598566*	10.22071	9.813329*
Growth	1	16.55231*	14.50183*	8.349186*	8.615817*	8.441227*
Genexp	2	0.739483	17.83725	8.553108	8.997493	8.706509
	3	4.04444	19.53897	8.637235	9.259374	8.851997
Growth	1	37.43216*	0.531768*	5.043364*	5.309995*	5.135405*
Defexp	2	4.818147	0.57093	5.11133	5.555715	5.264732
	3	6.851167	0.565748	5.095217	5.717356	5.309979
Growth	1	65.94808*	7.710226*	7.717458*	7.984089*	7.809499*
Ecoexp	2	5.734581	8.028988	7.754877	8.199262	7.908279
	3	0.180166	10.09651	7.977014	8.599153	8.191776
Growth	1	18.87859*	0.614349*	5.187719*	5.454350*	5.279760*
Eduexp	2	4.554298	0.665419	5.26448	5.708865	5.417882
	3	1.40228	0.801033	5.44297	6.06511	5.657733

Source: Data processed, 2016

Third, cointegration test was conducted to identify whether or not a long-term relationship between the variables of the study exists. If the variable/ series in the study are proven to be cointegrated then there is a stable relationship in the long term. Conversely, if there is no cointegration, it can be said that there is no relationship between the variables in the long term. Cointegration test carried out by using Johansen method in this study generated the following results:

Table 3: Cointegration Test Results

Equation	Trace Statistic	Critical Value 5%
Growth-Govexp	15.64978	15.49471
Growth-Genexp	20.42933	15.49471
Growth-Defexp	21.04305	15.49471
Growth-Ecoexp	19.07369	15.49471
Growth-Eduexp	27.0988	15.49471

Source: Data processed, 2016

Based on the output results of Johansen cointegration test, trace statistic of each variable indicates value greater than the critical value. It means that each pair of variables including economic growth and government expenditure, economic growth and government expenditure by public service function, economic growth and government expenditure by defense and security function, economic growth and government expenditure by economic function as well as economic growth and government expenditure by educational function have a relationship or long-term equilibrium.

Finally, Toda-Yamamoto causality test was used to identify the direction or relationship of the variables studied. Toda-Yamamoto causality test which was conducted comprised selection of the degree of integration using the ADF root test, optimum lag determination based on LR, FPE, AIC, SC and HQ criteria as well as the Wald test to determine the causality between each variable. The null hypothesis which states that there is no relationship between variables can be rejected if the probability value is less than 5%.

Based on table 4, there is a unidirectional relationship from economic growth to government expenditure and from economic function of government expenditure to economic growth with a degree of confidence under 5%. In contrast, for economic growth and government expenditure by public service function, economic growth and government expenditure by defense function, economic growth and of government expenditure by security and order functions, as well as economic growth and government expenditure by educational function, the causality between the variables was not found.

Table 4: Results of Wald Test

Dependent Variable	excluded	Chi-square	Probability
GROWTH	GOVEXP	7.131302	0.0678
GOVEXP	GROWTH	18.11423	0.0004
GROWTH	GENEXP	0.674668	0.4114
GENEXP	GROWTH	0.511768	0.4744
GROWTH	DEFEXP	0.010606	0.9180

GROWTH	EDUEXP	0.060380	0.8059
EDUEXP	GROWTH	0.091092	0.7628

Source: Data processed, 2016

Discussion of Findings

Based on the results of stationarity and cointegration tests, the relationship between economic growth and government expenditure, both in the aggregate or by function, is stationary and has a longterm relationship or balance, so that the causality analysis which was conducted obtained valid and reliable results, not a nonsense regression (Gujarati and Porter, 2012). In contrast, the results of TodaYamamoto causality test revealed unidirectional causality relationship in which economic growth affects government expenditure by economic function and government expenditure by economic function affects economic growth.

In government expenditure by public service, defense and security function and educational functions, each of which has no causality with economic growth at confidence level of 5%. Although using the same object, the results of this study differ from the results of the previous studies, such as Loizides and Vamvoukas (2005), Jiranyakul and Barahmasrene (2007), and Manik and Hidayat (2010) who found unidirectional relationship between government expenditure and economic growth in which government expenditure affects economic growth. According to Peacock and Scott (2000), the different research findings can be caused by proxy differences to variables and data types used.

The different research findings also obtained by Samudram *et al.,* (2009) who found a two-way causality between GNP and government expenditure in administration and health, and

research conducted by Olaiya *et al.,* (2012) found the presence of two-way causality between GDP and economic growth. In addition, Bagdigen and Cetintas (2004) also obtained different result; there is no long-term and causality relationship between government expenditure and economic growth and research by Sinha (1998) in Malaysia which found independency or no relationship between government expenditure and economic growth.

Studies showing similar results to this study include Pahlavani *et al.,* (2011) in Iran, Sukartini and Saleh (2012) in Indonesia and Attari and Javed (2013) in Pakistan that found unidirectional causality between government expenditure and economic growth in which economic growth affects government expenditure. Applicability of unidirectional relationship between government expenditure and economic growth indicates that economic growth affects government expenditure in accordance with Wagner's Law which states that government expenditure will always increase along with economic growth, as shown in the figure 2 below:
Source: Suparmoko in Manik and Hidayat (2010)
Figure 2: Ratio of Government Expenditure to National Income based on Wagner's Law

Manik and Hidayat (2010) pointed out that the role of government in economic activity is largely as a consequence of the increasing complexity and interdependency of modern society. Increased government expenditure is caused by the demand of increasing need for security protection and defense, raising income level of the society, urbanization and economic growth and inefficiency of government bureaucracy that accompanies development. This justification is in line with Dimitrios & Richter *(no date)* in Sukartini and Saleh (2012) who suggested three reasons (justifications) for the enactment of Wagner's law. First, the development of government activity related to administrative functions and functions of the protection of citizens. This condition is also indicated by the changes caused by the increase of population, and the increased flow of urbanization. Such changes would require more provision of public facilities (housing, sanitation, educational facilities, health, etc.) and new regulations that must be provided by the government. Second, along with the increasing individual welfare, as indicated by the increase in demand for better quality of goods, the government provision of education facilities and infrastructures, health and other public services should also be responsive to an increase in the quantity and quality of the society demands. Thirdly, more regulations are needed to prevent monopolistic company as a result of technological improvements and changes in investment patterns.
Source: World Bank, 2013 (data processed)
Figure 3: Development of per Capita Income in Indonesia in 1981-2012

In figure 3, it is proven that the public per capita income tends to rise from one period to the next. It leads to an increase in the quality and quantity of public needs required by the community and that must be provided by the government. Unidirectional relationship between economic functions of government expenditure and economic growth in which government expenditure affects economic growth shows the enactment of Keynes's theory. It means that the policies taken and implemented by the government concerning the economic function of expenditure have reached the goal as a part of efforts to accelerate economic growth by strengthening economic resilience. These results support the research conducted by Samudram *et al* (2009) which revealed that government expenditure is one of the components of fiscal policy and can be used as an instrument to influence economic growth.

Realization of economic function of government expenditure is the realization of the expenditure used to fund infrastructure programs covering transportation, agriculture, irrigation, and energy, which are expected to support the government efforts to accelerate economic growth. It is based on the fact that in developing countries, as in Indonesia, expenditure (investment) in infrastructure will bring many economic benefits for the country (Muthui, *et al:* 2013).

The government continues its efforts to accelerate economic growth. In period 2005-2013, expenditure by economic function increased from IDR 25.9 trillion (1.0 percent of GDP) in 2005, to IDR 118.5 trillion (1.3 percent of GDP) in 2013. The increase in the expenditure by economic function is mainly related to the government's efforts to support the acceleration of quality economic growth.

Meanwhile, in the time period 2006-2011, the actual expenditure on economic function increased on average by 22.0 percent, from IDR 38.3 trillion (1.1 percent of GDP) in 2006 to IDR 103.3 trillion (1.4 percent of GDP) in the APBN-P (state budget changes) of 2011. The increase in the budget realization in the economic function is mainly related to the efforts taken by the government in order to support the acceleration of quality economic growth.

The absence of independency relationship between economic growth and government expenditure by public service function, economic growth and government expenditure by security defense and order function, as well as economic growth and government expenditure by educational function indicates that the functions of government expenditure on public service, security defense and order, and education do not affect the economic growth in Indonesia and vice versa. This can occur because the GDP as a proxy of economic growth is compiled more by private economic activity, such as household consumption, gross fixed capital formation and export activities of goods and services, rather than government expenditure. As shown in table 5, in period 2011-2013, the average value of GDP constituent components of household consumption expenditure reached 55.03 percent, gross fixed capital

formation was 32.09 percent, export of goods and services for 24.79 percent, while government consumption expenditure components had the smallest amount of 9.02 percent.

Table 5: GDP Components by Expenditure Year 2011-2013 (%)

Component	2011	2012	2013
1. Household Consumption	54.63	54.64	55.82
2. Government Consumption	9.02	8.91	9.12
3. Gross Fixed Capital Formation	31.95	32.67	31.66
4. a. Inventory Changes b. Statistical discrepancy	0.95 2.04	2.07 3.27	1.98 3.42
5. Exports of Goods and Services	26.36	24.29	23.74
6. Minus: Imports of Goods and Services	24.95	25.86	25.74
Gross Domestic Product	**100.00**	**100.00**	**100.00**

Source: Central Bureau of Statistics, 2016

Theoretically, government public services to the community directly or indirectly affect the economic activities of the community, but it is not proven in this study. The absence of the relationship between government expenditure by public service function and economic growth may occur due to problems of efficiency and effectiveness in the administration and bureaucracy. Although government expenditure by public service function continues to increase (as described in the previous section), but apparently it has not been able to achieve a clean and transparent governance. Reform of the bureaucracy has been running in some institutions, but overall bureaucracy in Indonesia cannot be declared clean and transparent as proven by many cases of corruption and public dissatisfaction over the services provided. Furthermore, the absence of the relationship between expenditure by public service function and economic growth may occur due to the expenditure on public service function is also used to repay a loan that must be borne by the government and non- targeted subsidies. This study obtained the results that government expenditure by defense, security and order functions does not affect economic growth and vice versa. This may occur because government expenditure by defense, security and order functions has varying effects on the economy. Purchasing the main tools of defense systems and facilities of state defense and security is unproductive expenditure which burdens the budget so that it negatively impacts the economy. On the other hand, the government's efforts to maintain security and public order will give a sense of security to the community. Sense of security in the attempt would encourage economic activity and investments.

The results showed that government expenditure by educational function has no causality with economic growth. It can be occurred because government expenditure in which the constitution mandates the educational function to allocate 20 percent of government budget for the education budget is mainly allocated for formal education such as elementary education, secondary education and higher education (e.g.: in the period 2006-2011 reached 87.5 percent of the allocation function of education) so that the high labor force is not balanced with the skills possessed to enter the working world.

The further impact emerged is the problem of unemployment which hampers economic growth. As shown in the figure below, youth unemployment (15-24 years old) has a higher percentage (average 26 percent) of the labor force in those age range, compared to the total unemployment rate in Indonesia which is also high (average 8.9 percent). It shows that in

Indonesia, many young workforces who have graduated from educational levels but are not able to get a job and become a burden for the national economy.

Conclusion

The results showed that economic growth and government expenditure have unidirectional causality in which economic growth affects government expenditure. This relationship is in accordance with Wagner's law which states that the development of government expenditure is in line with economic growth. This can occur because government expenditure is used as a tool or a policy balancing (countercyclical) to respond to the development or economic cycles which occur. Economic growth and public service function of government expenditure, economic growth and government expenditure by defense, security and order functions, as well as economic growth and government expenditure by educational function have no causality. The results showed that government expenditure by public service function, education function and defense, security and order functions generated outputs that are not directly related to economic growth comprising the creation of a clean bureaucracy, qualified human resources and sense of security in society.

Economic growth and government expenditure by economic function have unidirectional causality in which government expenditure affects economic growth, in accordance with the theory of Keynes. It indicates that the allocation of government expenditure by economic function has been aimed for activities which directly support economic activities such as infrastructure and transportation.

Furthermore, based on the above conclusions, the suggestions which can be given are as follows: First, to support economic growth, the government's attention should be focused on the government administration to establish: (i) more powerful central government for managing the policy process and resolve conflict policy, (ii) a leaner bureaucracy for the realization of improved accountability (iii) improved strategic management of human resources in public administration, (iv) better procedures for planning and budgeting in order to improve the realization of government expenditure.

Secondly, the government is expected to improve the quality of all levels of education and the functions of training centers to close the gap of skilled workers, provide more information for students and graduates on the opportunities in the labor market, make vocational education more responsive to the needs of the market and improve the allocation of education expenditure in formal and non-formal sectors.

Thirdly, for the next research, it is suggested to use a longer period of data and consider the fluctuations in economic conditions, take into account the size of government, and include other variables such as inflation and human development index to identify the relationship between economic growth and government expenditure more comprehensively.

DAU ALLOCATION IN INDONESIA
IS IT FOR GOOD LOCAL GOVERNMENT OR LUCKY ONE?

Ni Made Sukartini, Airlangga University, Indonesia
Albertus Girik Allo, Papua University, Indonesia

Abstract

This study investigates the association of Badan Pemeriksa Keuangan (BPK) audit opinion on the value of government transfer in the forms of equalization fund (dana perimbangan) among districts/cities government in Indonesia. Applying panel data regression to illustrate the role of BPK's audit opinion, value and lag values of: general or block grant (*dana alokasi umum*/DAU), specific grant (*dana alokasi khusus*/DAK), revenue sharing (*dana bagi hasil*/DBH); and Human Development Index (HDI) on the value of equalization fund received by the local government.

Among 249 sample within 4 years (2005-2009), empirical investigation indicates that in several districts or cities government, which receive BPK's audit opinion of value 3 (adverse opinion) or value 4 (disclaimer), but still receive high transfer in the subsequent year. This implies that BPK's audit opinion do not matter for determining the allocation of equalization fund. On the other hand, neither positive nor significant impact of HDI on the DAU allocation, but it is for DAK and DBH. This result implies that HDI formula does not empirically influence the DAU allocations.

Policy implication of this study is central government should provide equalization fund higher in terms of DAK. This is because this grant even though not directly improves the community welfare, but it will influence human capital investment through it leading sector goal; i.e. education and health. In the future, because DAU is recently set up as the biggest share among equalization fund, but it must be redefined for the shakes of efficient and effectiveness issues.

Keywords: *Fiscal decentralization, government expenditure, HDI, Indonesia*

Introduction

Fiscal decentralization and political reform has been implemented in Indonesia since 1990s. These reforms were formally arranged through: 1. Law No. 22/1999 concerns on Regional Government, 2. Law No. 25/1999 concerning for regulation for fiscal balance between central and local government. Recently, these Law is updated into the Law No. 32/2004 and Law No. 33/2004. The introduction of these two Laws mean fiscal decentralization in Indonesia has been implemented de facto and de jure (Bird & Vaillancourt, 1998; Musonda, 2005).

Theoretically, under central government regulation, public goods and public services are provided uniformly with the assumption of homogeneous preference among individual (Musgrave & Musgrave, 1973; Oates, 1999). Globalization and democratization process has put pressure for nations to redefine their development strategy. Democratization process requires that central and local governments are elected through democratic process, which is indicated by transparence and accountable. On the other hand, globalization offers variety of goods and services traded between regions, either internationally or within the nation. This is consistent with Wagner's Law; which indicates that higher government activity for delivering public goods for compensating larger economic activities.

Improving services delivery for the community is the reason for implementing fiscal decentralization (Ahmad, Devarajan, Khemani, & Shah, 2005; Bird & Vaillancourt, 1998). In the case of Indonesia, the implementation of fiscal decentralization means more and larger

autonomy of power. These power applicable both economically and politically, and the power are concentrated on the districts and cities government. To be able provides better public goods and public services, sufficient and sustainable source of fund for districts and cities government. Majority of decentralized countries, especially in developing countries, parts of subnational governments' revenues are from central government transfer. According to Bergvall et al.(2006) disregards of the issues in particular country, the design of the transfer from central to subnational levels are mainly to reduce fiscal imbalances among the local government. In general, priority of subnational spending is determined by the law, and it must be implemented according to national priorities.

In case of fiscal decentralization in Indonesia, subnational governments i.e. district (*kabupaten*) and city (*kota*) annually receipt transfer from central government in the forms of equalization fund (*dana perimbangan*). There are three types of equalization fund, namely: general allocation fund or *dana alokasi umum* (DAU), specific allocation fund or *dana alokasi khusus* (DAK), and revenue sharing fund or *dana bagi hasil* (DBH). *Dana alokasi umum* or DAU is distributed to all districts and cities government according to specific formula, therefore DAU also well known as block grant mechanism. Both DAK and DBH are distributed to targeted districts or cities. DAK is distributed to districts or cities which are: 1.a special autonomy districts or city, such as Yogyakarta and Aceh; 2. Vulnerable to natural disasters such as mount eruption or flooding or broken landscape; 3. Districts with large share of poverty, etc. However, since 2005 all districts and cities receipt DAK and DBH according to rule or determined by the ministry of finance (Yani, 2002).

To improve efficient allocation of DAU, DAK and DBH, deterministic criteria's must be met. Partly, DAU allocation is determined to improve Human Development Index (HDI) and to fulfill horizontal imbalances of sharing revenues, either from taxes or natural resources. On the other hand, DAK allocation is recently determined for improving access to basic infrastructure, health and educational performance (MoF-Indonesia, 2016). Regarding the determinant of DAU, DAK and DBH allocation; it can be inferred that the distribution indirectly will improve Human Development Index (HDI). HDI is calculated as the fiscal gap weighted, while DAK and DBH are weighted for fiscal capacity. Both fiscal gap and fiscal capacity are part of DAU allocation formula. Regarding this formula, it is expected that higher DAU allocation will increase HDI index.

On the other hand, improving accountability and transparency of local government managing their revenues and expenditure, Badan Pemeriksa Keuangan (BPK) conduct financial audit regularly. According to Saparani (2009) BPK's audit reports for period 2005-2009 indicate a growing number of undesirable score regarding local government financial report. In Indonesia, BPK's audit for financial reports of local government are scaled as: 1. Unqualified Opinion (*Wajar Tanpa Pengecualian*/WTP). 2. Qualified Opinion (*Wajar Dengan Pengecualian*/WDP). 3. Adverse Opinion (*Tidak Wajar*/TW). 4. Disclaimer (*Tidak Memberikan Pendapat*/TMP). 5. Unqualified Opinion with Explanatory (*Wajar Tanpa Pengecualian Dengan Paragraf Penjelasan/*WTPDPP). 6. It is not mandatory to prepare and report sub-national budget, it is a new proliferated districts. 7. Audit Report is in progress, and 8. Audit process is being delayed due to force major.

According to Saparani (2009), BPK's audit reports for the period of 2005-2008 indicate a decreasing in quality. Number of districts and cities with government financial report scaled of 3 (adverse opinion) and 4 (disclaimer) has increased significantly. This figure indicates that indicator of good quality and accountability of local government has not achieved. In terms transfer to local government, among transfer expenditure, equalization fund is the largest one. DAU allocation is account approximately 85 per cent of equalization fund. Based on this condition, rationally there should be correlation between BPK audit opinion and DAU

allocation, if good governance in terms of accountability and transparency indicators are applied.

This paper will investigated do larger DAU allocation related to fiscal need, fiscal gap, or BPK's audit opinion, among districts and cities government in Indonesia, for period 2005-2009. If the distribution is met with either fiscal need with low HDI as the main indicator, or low fiscal capacity such as own revenues (pandapatan asli daerah/PAD) then the local government is lucky receiving the transfer. However, when neither fiscal need, fiscal capacity and BPK's audit opinion is met; then the local governments do not satisfy criteria good government. The research question to be answered is what the determinants of DAU allocation are; is DAU distributed for good governance or lucky one? The organizations of this paper as follows. After introduction in the first part, it will be followed subsequently by literature review, data and model empiric, and lastly discussion and conclusion.

Literatur Review
1.   Theoritical background
Following the argument of World Bank (2004, 2008) and Yilmaz, Beris, & Serrano-Berthet (2008); decentralization or precisely fiscal decentralization is a policy which reshape power relationship between citizen, residents which act as consumer and government (central government and local government) which act as producer of public goods and public services. Under centralistic mechanism, central government as the decision makers determine from the stage of planning until implementation of all program for delivering public goods and public services. Assuming the central planner has benevolent characteristics; the distribution of public good and public services should be delivered universally. World Bank (2008) report indicates that there is lack of evidence that either public good or public services distributed universally in all nation. In region of Asia, especially rural areas of South East Asia, Latin America, and Africa, access to public good and public services are relatively very scarce. Poor people can not afford not only privat good but also public good.

Why centralistic government system fail to provide universal public goods and public services? Difference arguments are arises. From supply sides, difficulty in matching the real preference between the planner (producer) and citizen (consumer). For example central planner delivers health facilities but the community need more educational facilities. Geographiccal barriers may also drive down the efficient distribution of the services. Different geographical condition will generate difference cost for produce the services. On the other hand, the government has to set one price for the services. This condition will tend to reduce the quantity of the service in the region where geographically undesirable.

To overcome this situation, decentralization in terms of fiscal, politics and power are proposed. In terms of fiscal decentralization, to fulfill the financial requirement in delivering services, central government has to provide source of revenues for the sub national or local government. In the case of Indonesia, the largest financial transfer from central government to the local; i.e. provinces, districts and cities government in the forms of equalization or balancing fund (*dana perimbangan*). There are three types of equalization fund, namely: general allocation fund (dana alokasi umum/DAU), specific allocation fund (dana alokasi khusus/DAK), and revenue sharing allocation (dana bagi hasil/DBH). DBH furthermore, is classified as DBH taxes (dana bagi hasil pajak) and DBH natural resources (DBH sumber daya alam). Component and formula of equalization fund; DAU, DAK and DBH as follows

A.   General allocation fund (DAU).
According to the Law No. 33/2004; source of DAU is from net domestic revenues, collected by the central government. Part of this revenues, at least 26 percent must be distributed to the

sub national: province, district and cities (MoF_Indonesia, 2004). Government Regulation; PP No. 55/2005 determine the formula of DAU allocation. Basic formula DAU is:

DAU = Fiscal Gap (Fiscal Need – Fiscal Capacity) + **Basic Allocation …(1)**

Fiscal need is calculated index of total regular spending of local government; and it is multiplied by weighted index of: population size, length of areas, construction cost, HDI and GDP regional per capita. Fiscal capacity is calculated from local government revenues, which includes: own-sources revenues (*pendapatan asli daerah*/PAD), revenues sharing tax; including tobacco taxes, and revenues sharing from natural resources. Basic allocation is calculated based on the number of civil or state employment, which determined the spending on wages salary. In general, basic allocations cover all wages and salary spending. Article No. 45 of PP No. 55/2005 and based on formula (1), it can be inferred the allocation of DAU annually as: 1. Region (province, districts and cities) which has fiscal gap positive, will receive DAU for amount of fiscal gap plus basic allocation. 2. Region which has zero fiscal gap, will receive DAU of amount basic allocation. 3. Region which has negative, but the value lower than basic allocation will receive DAU of amount basic allocation minus fiscal gap. 4. Regions will receive zero DAU if their fiscal gap is positive and it is larger than the basic allocation. Among 34 districts in Indonesia, only Jakarta has fiscal gap negative and larger than the basic need. Therefore, since 2009 Jakarta receives zero DAU.

B.   Specific allocation fund (DAK).

DAK was initially distributed for selected regions based on three criteria's: general, specific and technique. Based on Law No. 33/2004; DAK is distributed from at least 10 percent of national income. DAK distributed to economic sector by Ministry of Finance, conditional on matching grant from related Ministry which promoting national development priority. Three criteria as screening process of DAK allocation are: 1. General criteria. Region is eligible for receiving DAK if has fiscal capacity positive or has fiscal capacity lower that national average. 2. Specific criteria. Region which eligible for receiving DAK if determined as special autonomous regions (Papua, West Papua, DI Yogya and DI Aceh); or being disadvantages geographically. Disadvantage region means: being located in coastal/ isolated island/border with other countries; vulnerable to natural disasters; or targeted as food producer and tourist destination. 3. Technical criteria is determined by Ministry of Finance, which sectors will become national priorities.

For the purposes of improving public services, DAK allocation is determined according to basic and non-basic infrastructure and services. Belong to basic infrastructure and service sectors are: education, health, irrigation, safe drinking water and sanitation, transportation and rural energy. On the other hand, non- basic infrastructure and services are: maritime and fisheries, agriculture, local government infrastructure, environment, forestry, family planning, trading infrastructure, and housing.

C.   Revenue sharing fund (DBH).

According to article No. 28 PP No. 55/2005, it is mandated the composition of revenues sharing between central and sub national government. DBH taxes are collected from properties tax, land and building and personal income tax. DBH natural resources are collected from oil, gas, forestry, fisheries, geothermal and mining. The sharing of DBH is as follows.

Table 1: Sharing Composition of DBH

No.	Types of Revenue sharing	Central government	Sub national government	
			Province	District
A.	DBH taxes			
	1. Property tax	10%	16.2%	64.8%
	2. Land and building	20%	16%	64%
B.	DBH natural resources			
	1. Oil	84.5%	3.1%	12.4%
	2. Gas revenues	69.5%	6.1%	24.4%
	3. Mining, geothermal, and forestry	20%	16%	64%

Source: Law No. 33/2004

From theoretical point of view, transfer of equalization fund from central government to subnational level should bring positive impact on the development process. DAU allocation for fiscal need directly weighted HDI and regional gross domestic product (RGDP). This formula implies there should be direct mechanism between DAU allocation and regional economic performance, either monetary (RGDP) and non-monetary (HDI). On the other hand, DAK allocation specifically targeted to sector that could boost human capital investment (health, education, safe drinking water and sanitation), labor productivity (irrigation, transportation and rural energy). These allocation priorities imply direct association with regional development indicator, especially long run productivity of human capital.

The implementation of fiscal decentralization should indicate good government and transparency. In Indonesia, equalization fund count as the largest share of government transfer. Among three equalization funds, DAU and DAK subsequently count for 90 per cent of the total transfer (MoF_Indonesia, 2015). Technically, all equalization funds are distributed based on formula. Good and transparent sub national government should spend the equalization fund as directed by the law.

Empirical Finding

Since the implementation of fiscal decentralization policy since 1990s, some studies reporting various results. Even though the formula of DAU, DAK and DBH allocation are specifically for supporting regional development through human capital investment (DAU), labor productivity (DAK) and rule of government size (DBH), empirical finding do not support the expected outcome. The larger equalization fund is receives by province, the higher is inequality of per capita income among 30 province between 2003-2009 (Savitri, 2013). Similar finding is reported by Wibowo (2011) event utilizing micro data at household level. Wibowo combines Indonesia Family Life Survey (IFLS) wave 1997, 2000, 2007; and Household Socio Economic (Susenas) data 2002, 2004. He find that the larger share of villages receive DAK infrastructure results in higher income inequality at household level.

Applying data at district level, Wibowo, Dendi, and Zulhanif (2010); Wibowo, Muljarijadi, and Rinaldi (2011) find no evidence of DAK allocation could improving development outcome. The authors find there is causality either one way or bidirectional; between DAK on health and educational sector on HDI. DAK on health also does not Granger cause on HDI, but the other way round does exist. The study of Badrudin (2015) also report similar result. District which receive large DAK share has no impact on community longevity, infant mortality rate (IMR) and school attainment.

Data and Empirical Strategy

This study utilize data at district and cities level, which is the documented by World Bank in The Indonesia Database for Policy and Economic Research (INDODAPOER). We employ panel data analysis for the period of 2005-2009 among 430 districts and cities in Indonesia. Our empirical strategy will: analyze the determinant of DAU allocation, does if follows the rule? Does DAU allocation based on criteria good government and transparent? We consider the role of audit opinion from Badan Pemeriksa Keuangan (BPK) as indicator of good government. Our empirical model is defined as:

$$LogDAU_{it} = \alpha_0 + X_{it}'\beta + Y_{it}'\delta + \gamma DA_{it} + a_i + u_{it} \ \ldots(2)$$

Log DAU is the logarithm value of DAU fund received by districts/ cities government (i) at year (t). X is set of variable indicate fiscal need. Vector X includes: population size, region size, HDI, and regional gross domestic product which calculated with or without oil and gas component. Vector Y indicates set of fiscal capacity variable, which include: own-sources sharing (PAD), DBH taxes and natural resources sharing. Notation DA is dummy variable for BPK audit opinion. BPK's opinions are scale from 1 to 8. Scale 1 means unqualified opinion, 2 means qualified opinion, 3 means adverse opinion, 4 means disclaimer, 5 means unqualified opinion with explanatory paragraph, 6 means that new proliferated districts or cities, and it is not required for preparing report, 7 means audits is in progress and 8 means audit is delayed due to force major. Data for BPK audits is only available for the periods 2005-2009. Because audit BPK is our concerns, we prioritize sample period in 2005-2009.

Result and Discussion

Results of empirical model are presented in the following tables. Table 2 in appendixes summarizes value of DAU and DAK by provinces in 2015. The data in 2015 indicate that DAU allocation varies greatly from Rp 2,778.9 million (Riau island) to Rp 35,905.5 million (East Java). DAK on the other hand, varies from Rp 128.5 million (East Kalimantan) to Rp 3,820.9 million (Papua). Without do not put weighting on population on DAU and DAK allocation, so we can- not compare riel differences, unless the magnitude of the DAU and DAK by provinces.

Empirical model summarizes in Table 3 indicate that the determinant of DAU allocation is more related with the value of previous allocation (logarithm value of DAU), socio demographic characteristic (population and area) and fiscal capacity. In general, DAU allocation always increases in the subsequent year. In terms of socio demographic, the larger population and region size, the larger DAU is received. This finding indicates, in general DAU works purely as block grant, every district receive it for granted. Due to weak control or poor data quality, many districts do not report indicator population and size properly, it tends to over estimates in order to get larger DAU allocation (Dirjen-Perimbangan-Keuangan, 2015). It is reported that every year the size of the districts tend to increase, as an effort for getting larger DAU. On the other hand, regarding fiscal capacity, empirical estimation find that districts with the larger contribution of PAD and RGDP with oil and gas tend to get higher DAU. In this case, larger DAU acts as reward for district government who success for generate higher economic revenues (PAD) and productive activity (RGDP).

Estimation for audit BPK is presented in Table 4 and estimated impact of DAU and DAK on HDI is presented in Table 5. We find no evidence that audit BPK has significant impact of DAU allocation. This finding implies that DAU allocation is not distributed based on good and transparent government. District government who success implement good and proper financial report does not differ significantly with those government who do not provide proper report. This finding brings common sense that DAU allocation is purely block grant.

This conclusion is supported by the empirical result in Table 5. There is no evidence that higher DAU and DAK allocation could improve HDI performance. Scatter plot attached in appendixes also supported this argument. Larger DAU allocation does not match with HDI performance. The figure is presented by island.

Conclusion and Policy Recommendation

We investigate DAU allocation based on formula and BPK's audit opinion. Applying data set from Indonesia Database for Policy and Economic Research (INDODAPOER) for period 2005-2009 we find that DAU allocation is not imaging the formula based, but rather than block grant. DAU allocations tend to increase every year. The larger population and region size, the higher DAU is allocated. This implies no DAU is allocated as block grant. Audit BPK is not also matter for controlling DAU allocation. Good and not good governance still receive DAU allocation. For those good governments and those lucky one receive DAU for financing their annual expenditure.

Scatter Plot in appendix indicate has lower HDI performance compare to national average, but always receive higher DAU allocation. Districts or cities scattered in the south east block means that these iatrict receive higher DAU compare to national average during fiscal period 2005-2005, but the HDI performance still below national average.

Policy recommendation for central government and Ministry of Finance is to update and improve quality and transparent based in allocating DAU. HDI performance can be an indicator. Those sub national government who success to improve HDI performance within 5 years could receive higher DAU in the subsequent year.

Table 2: DAU and DAK allocation by Province, 2015 (million Rupiah).

No	Province	Equalization Fund 2015	
		DAU	**DAK**
1	Aceh	13,233.9	1,643.2
2	North Sumatera	20,667.0	2,148.0
3	West Sumatera	12,060.2	1,354.4
4	Riau	6,441.7	513.5

INSTABILITY RUPIAH, IS IT?

Marselina Djayasinga, University of Lampung, Indonesia
Helena Soetikno, University of Lampung, Indonesia

Abstract

The stability rupiah exchange rate is needed for economic growth fast in Indonesia. Because Indonesia is small and open economic country, foreign exchange reserves affects more the stability of rupiah exchange rate, than the interest rate policy targeted, and money supply. The main purpose of this study is to analyze and describe, is rupiah exchange rate stable since uncertainty period such as 2009, 2010, 2015 and whty ? Hodrick Prescott filter is used to analyzes the stability on rupiah exchange rate ,s qualitative analysis and multiple regression with Error Correction Model (ECM) method. The result of this study are, rupiah exchange rate during 2007:Q1-2015:Q4 is unstable in half period (13 period) because the impact of decreasing in international trade, tax revenue tend to decrease significantly, burden of government debt increase. It causes foreign exchange reserves as an external factor has negative and significantly effect on the stability of rupiah exchange rate, while BI Rate has not significant effect but money supply has positive and significantly effect on rupiah exchange rate.

Keywords: *unstable, rupiah exchange rate, foreign exchange reserves HP Filter,*

Introduction

Indonesia is a small and open economic country, it will make Indonesia's economy increasingly integrated with the world economy. Exchange rate has a very important role the more open the economy, Stable, instable, strong or weak of exchange rate of the currency system will effect economic growth . Bank Indonesia as the monetary authority is the competent institutions in maintaining the stability of rupiah. According to Mayer (1982) the stability of exchange rate is basically very expected by all economic actors, including the general public. Excessive exchange rate volatility didn't accordance with the target of long term interest because instability the exchange rate could distort the level of economic competitiveness, reducing the efficiency of resource allocation and increasing uncertainly for economic actors. The problem faced by Indonesia's economy over the last few quarters is quite complex involving unfavorable economic situation outside the country such as activity in export and import. This trade will effect the foreign exchange reserves.

The movement of rupiah against the US dollar since 2007:Q1 until 2015:Q4 is fluctuated especially in the last few quarters increased (depreciates). The phenomenon of the weakening of rupiah against the US dollar figures which touched Rp. 14.657 (the middle rate 30th September 2015) made Indonesian economy increasingly depressed. The weakening of the rupiah against the US dollar is influenced by two factors, which is derived from the external and internal. The external factors is derived from the foreign exchange reserves which is effected directly on the export import activities. Since 2012, the current account balance of payments in Indonesia continued deficit. Balance of payments of deficit is financed by foreign exchange reserves. Therefore, when current account deficit is not immediately repaired, Indonesia's foreign exchange reserves will decrease, so rupiah exchange rate will continue to pressure. In addition, a weak exchange rate of the domestic side also caused by increased demand for foreign currency for debt repayment and dividend seasonally, as well as concerns about slowing domestic economy (Bank Indonesia, 2015). There are several internal factors

that can stabilize rupiah exchange rate, including BI *Rate* set by Bank Indonesia, reserves of Indonesia, and money supply. These factors can be controlled by Bank Indonesia either directly or indirectly. In order to keep the exchange rate remained stable rupiah necessary appropriate policies and effective so that the conditions and the activities of the Indonesian economy can also progressing well. The question are, is rupiah exchange rate stable or not in some focus period ? and how the effects of foreign exchange reserves ,BI *rate,* and money supply to rupiah exchange rate/US dollar*? First* hypothesis , allegedly rupiah exchange rate/US dollar unstabilized in period 2007:Q1-2015:Q4, *second,* foreign exchange reserves, BI rate and money supply have significant effect sto rupiah exchange rate/US dollar.

Literature Review

Exchange rate is the price of one currency into another currency (Miskhin, 2008). According to Mankiw (2006) exchange rate can be differentiated into two, those are the nominal exchange rate and the real exchange rate. Nominal exchange rate is the value that a person uses when exchanging currency of a country by another country's currency. While the real exchange rate is the value that is used when a person bartered goods and services from one country with goods and services from other countries (the price level). A stable exchange rate is described by the exchange rate relatively stable either increase or decrease, and if changing eating less volatile so as not to cause shock to the economy of a country. A stable exchange rate can have a positive impact on the economy, in the sense of providing certainty for all economic actors; boost economic growth; as well an impact on other macro policies so that the stability of rupiah exchange rate is essential to support sustainable economic development and improve people's welfare. The money supply in each country assumed to be determined independently by the monetary authorities of the country concerned. The basic theory is the exchange rate comparisons using the price level in each country..

BI Rate is the interest rate policy which reflects the attitude or monetary policy set by Bank Indonesia and announced to the public. Since July 2005, Bank Indonesia officially implemented Inflation Targeting Framework (ITF) fully. To support implementation of that ITF, Bank Indonesia changed the operational target of monetary policy of money supply (base money/M_0) the target of interest, namely BI Rate Interest rate parity condition states that domestic interest rate equal to the interest rate abroad reduced estimates of the appreciation of the domestic currency or can be expressed by domestic interest rate together with the international interest rate plus the forecast appreciation of foreign currencies. If domestic interest rate higher than interest rates abroad this means there is forecast positive appreciation of foreign currencies which will compensate for the decline in foreign interest rates lower.

Foreign exchange reserves in the concept of International Reserves and Foreign Currency Liquidity (IRFCL) or official reserves assetsis defined as the entire abroad assets that controlled by monetary authorities and also it can be used every time, to finance international transactions such as imbalances in the balance of payments, or in the framework of monetary stability by doing intervention in the foreign exchange market and for other purposes. The more often rupiah exchange rate under pressure due to negative sentiment, the more foreign exchange reserves that must be released. It will lead shortage of foreign exchange a country which in turn can cause economic hardship for the country concerned. Not only the country will be difficult to import goods it needs from abroad, but also it will degrades the credibility of the country's currency. Currency exchange rate at the foreign exchange market will be depressed.

Money supply is the obligation of the monetary system (Central Bank, Commercial Bank, Rural Banks/BPR) the domestic private sector (excluding central government and non-residents). Liabilities that are components of money supply consist of currency held by the public (outside of Central Bank and BPR), demand deposits, quasi money owned by the

domestic private sector, and securities other than shares that published by the monetary system owned domestic private sector with a remaining term of up to one year.Money supply can be defined in a narrow sense (M_1) and in the broad sense (M_2). M_1 includes currency in on hold community and demand deposits (predominates rupiah demand deposit), while M_2 includes M_1, quasi money (cover savings, time deposits in rupiah and foreign currency, and demand deposits in foreign currency) and securities other than shares that published by the monetary system owned domestic private sector with a remaining term of up to one year.

The quantity theory explained the role of money to the economy in general which was first described by Irving Fisher. This theory holds that there is a direct relationship between growth in the money supply with the rise in general prices (inflation). The quantity theory of money illustrates a clear framework the direct relationship that systematic between growth in money supply and inflation. If it refers to the quantity theory of money the main cause of the sole which allows inflation appear is the excess money from the additional money supply in the community. Inflation is purely a monetary phenomenon. Means, changes in the general price index is only caused by changes in the money supply. If the central bank holds the money supply remained stable, the price level will stable. If the central bank increase the money supply rapidly so the price level will rise rapidly (Mankiw, 2006).

Many studies that have been done to determine the effect of BI Rate, foreign exchange reserves and the money supply to rupiah exchange rate. Yanah (2004), in a study entitled The Effect of Interest Rate and Foreign Exchange Reserves to Exchange Rate and Impact on The Price Stability explained that interest rate and foreign exchange reserves as a whole significantly affect the rupiah exchange rate against US dollar. In partially foreign exchange reserves has influence on the exchange rate while the interest rate does not affect the exchange rate.

Yuliyanti (2014), in a study entitled The Effect of Money Supply (M_2), SBI Interest Rate, Import and Foreign Exchange Rate Reserves to Rupiah/US dollar (2001–2013) explained that in the short term money supply and import hasn't significant effect to rupiah/US dollar. But, in the long term money supply and import has positive and significant effect to rupiah/US dollar. In the short term and long term, SBI interest rate and foreign exchange reserves has significant effect to rupiah/US dollar.

Method

This type of study is quantitative descriptive study. The data used in this study is time series which is a secondary data during period 2007:Q1-2015:Q4. Data obtained from Bank Indonesia publications in monthly and quarterly publication.

Hodrick-Prescott Filter (HP filter) is used to analysis the stability of the rupiah by looking the movement of the rupiah exchange rate. Rupiah is called stable if it is fluctuated in restriction level which is declared by Bank Indonesia (BI). BI sets a level stability of macroeconomic indicators which are in $\pm$ 1.stdev (standard deviation).. The cycle component is calculated from the difference between the actual value with the trend component of the indicator. An indicator that a measure of stability more stable if the smaller original series variability with long-term trends, while increasingly instable means greater original series variability with long-term trends. The second analysis is to determine the effect of variable BI Rate, foreign exchange reserves, and money supply to rupiah exchange rate. This study uses an Error Corection Model (ECM).. Engel and Granger (1991) has developed an error correction model for correcting the regression equation between variables individually not stationary in order to return to the equilibrium value in the long term, with the terms of the relationship cointegration between variables in an equation. General model of ECM is as follow:

$\Delta Y_t = \alpha_0 + \alpha_1 \Delta X_t + \alpha_2 EC_t + \varepsilon_t$…………………………………………………….(1)

So the ECM model that assumed in this study is:

$$\Delta NT_t = \alpha_0 + \alpha_1 \Delta BIR_t + \alpha_2 \Delta CD_t + \alpha_3 \Delta JUB_t + \alpha_4 EC_t + \varepsilon_t \dots\dots\dots\dots\dots\dots(2)$$

Where:

	α_0	= Short-term Regression Constants
	$\alpha_1, \alpha_2, \alpha_3, \alpha_4$	= Short-term Regression Coefficients
	BIR_t	= BI Rate (%)
	CD_t	= Foreign Exchange Reserves (Million USD)
	JUB_t	= Money Supply (Billion Rupiah)
EC_t		= Error Correction Term

Result

The result of the unit root test on the level indicates that all variable are not stationary. To obtain the stationary data, data is chaged to first difference level. In the Table 2. shows the result of the unit root test on the first difference level.

Table 2. The Result of Unit Root Test with Approaching of Augmented Dickey-Fuller (ADF) on First Difference Level

Variable	Intercept	Trend and Intercept	None
Exchange Rate	-5.045655***	-5.101381***	-4.889212***
BI Rate	-3.713012***	-3.724352**	-3.771711***
Foreign Exchange Reserves	-3.406818**	-3.412991*	-3.241348***
Money Supply	-1.937631	-6.951232***	-0.063071

Test critical value: *=10%; **=5%; ***=1%
Source: estimated E-views (3rd attachment)

Based on the Table 2. shows that all variables have been stationary at the first difference level, except foreign exchange reserves and. money supply. To avoid spurious regression, these data are changed to second difference level. Table 3. shows the result of the unit root test in second difference level.

Table 3. The Result of Unit Root Test with Approaching of Augmented Dickey-Fuller (ADF) on Second Difference Level

Variable	Intercept	Trend and Intercept	None
Foreign Exchange Reserves	-6.533432***	-6.409756***	-6.650106***
Money Supply	-10.73598***	-10.59915***	-10.88191***

Test critical value: *=10%; **=5%; ***=1%
Source: estimated E-views (4th attachment)

Table 3. shows that foreign exchange reserves and money supply has been stationary on the second difference level. So that all data variables in this study has been separated from spurious regression and can be used for the next analysis.

Cointegration Test

The result of cointegration test using *Engel-Granger* test displayed on Table 4.

Table 4. The Result of *Engel-Granger* Cointegaration Test

	Intercept	Trend and Intercept	None	Information
Residual models	-3.774542***	-3.720432**	-3.829687***	Cointegrated

Test critical value: *=10%; **=5%; ***=1%
Source: estimated E-views (6ᵗʰ attachment)

It shows that there is a cointegration or long-term relationship between rupiah exchange rate with foreign exchange reserves, BI rate and money supply Optimum lag test results are presented in Table 5.

Table 5. Result of Optimum Lag Test

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-1145.969	NA	2.18e+25	69.69506	69.87646	69.75610
1	-987.1393	269.5284*	3.83e+21*	61.03875*	61.94572*	61.34392*
2	-972.3841	21.46218	4.33e+21	61.11419	62.74674	61.66349
3	-959.6093	15.48450	5.95e+21	61.30966	63.66779	62.10310

* : the smallest value AIC, SC, HQ

It indicates that rupiah exchanged rate is influenced by he foreign exchange reserve, BI rate and money supply at 1 (one) quarter or 3 (three) month before.

Stability Test Using Hodrick Prescott (HP) *Filter*
The results of stability tests using the HP *filter* approach shows that rupiah exchange rate against US dollar during the study period generally indicates that rupiah exchange rate against US dollar is unstable with rules $\pm$ 1 stdev (standard deviation) that has been set by Bank Indonesia. Only in some periods rupiah exchange rate against US dollar is in the range 1 stdev (standard deviation) in the long term trend or within the boundary stable.
Source: estimated E-views (9th attachment)
Picture 2. HP *Filter* Long Term Rupiah Exchange Rate/US Dollar

Table 6. Summary of Test Results HP Filters Rupiah Exchange Rate/US Dollar

	STDEV 1 (BI)		
	Undervalued Period	Stable Period	Overvalued Period
Rupiah Exchange Rate/US Dollar	2010(Q2,Q3,Q4); 2011(Q1,Q2,Q3,Q4); 2012(Q1,Q2,Q3,Q4); 2013(Q1,Q2)	2007(Q1,Q2,Q3,Q4); 2008(Q1,Q2,Q3); 2009(Q4); 2010(Q1); 2014(Q1,Q2,Q3,Q4)	2008(Q4); 2009(Q1,Q2,Q3); 2013(Q3,Q4); 2015(Q1,Q2,Q3,Q4)

Source: estimated E-views (9th attachment)

Note:
Stable Interpretation:
1.   Stable if the exchange rate within the limits $\pm$1.stdev
2.   Unstable if the lower limit of the exchange rate pass (< 1.stdev) or the upper limit (>1.stdev)

Based on Picture 2 and Table 6, can be seen the position of rupiah exchange rate against US dollar based restriction 1 stdev (standard deviation) set by Bank Indonesia. So it seems that from the 36 study period recorded the following results: (a) undervalued in the 13 period, (b) stable in the 13 period, (c) overvalued in the 10 period. Under valued of rupiah was happened at 2008 (Q2,Q3,Q4), 2011 and 2012 in each quarter, while in 2013 undervalued it is happened only in Q1 and Q2. Overvalued of rupiah are happened at 2008 and 2009 at Q1,Q2 and Q3 are because the impact of economic crisis globally , while under valued such as at 2011 and 2012 is main caused by the impact of the economic crisis in some Uni Europe countries such Greece, Spain, Italy. It is also caused by the impact of decreasing in international trade, tax revenue tend to decrease significantly, burden of government debt increase. In 2013 only at Q3 and Q4 and 2015, rupiah are over valued. The impact of economic crisis will effect the international trade from Indonesia, it also causes problem in liquidity. Of these results it can be concluded that rupiah exchange rate against US dollar is unstable over the study period 2007:Q1-2015:Q4. It is largely due to the external factors that

interfere especially the central bank monetary policy, United States and other International economic situation, as well as external conditions beyond the risk factors and expectation of a rational society to foreign exchange.

Error Correction Model (ECM)

ECM testing was conducted to determine the possible imbalance in the short-term. ECM test interest adjustment (EC_t) to correct such imbalance. The estimation results show in Table 7. below.

Table 7. The Estimation Result of *Error Correction Model* (ECM)

Variable	Coefficient	Standard Error	t-statistik	Probability
C	-75.19109	103.1322	-0.729075	0.4716
D(BIR)	-164.4533	157.6678	-1.043037	0.3053
D(CD)	-0.034273	0.012174	-2.815314	0.0085
D(JUB)	0.002858	0.000853	3.349222	0.0022
ECT(-1)	-0.859504	0.159294	-5.395724	0.0000
R-Squared	0.694622			
F-stats	17.05973			

Source: estimated E-views (8th attachment)

The negative sign (-) on coefficient EC_t shows valid or the validity of the model specification. ECM estimation results show the value coefficient EC_t is negative and significant at the 95% significance level. Means, the requirements for the estimation of ECM are met and models ECM declared valid. Coefficient EC_t (-1) is 0,85 or 85%, it indicates that the speed of adjustment of the exchange rate variable towards the long-term balance 85%. Based on the results of the estimation, the coefficient of determination R^2 is 0,694622 indicating that short-term independent variable BI Rate, foreign exchange reserves, and money supply can explain and affect the dependent variable rupiah exchange rate by 69% and the remaining 31% is influenced by other variables not included in the model or equation.

The Effect of BI *Rate* to Rupiah Exchange Rate

ECM estimation result obtained by the value of variable coefficients BI Rate is -164,4533. Negative sign on the ECM estimation result consistent with the hypothesis of study stating BI Rate has negative effect. However, based on the results of the partial testing in the short term, statistically BI Rate hasn't significant effect to rupiah exchange rate. However, in the long term BI Rate showed significant effect to rupiah exchange rate. It shows changes in the BI Rate has not responded directly by the exchange rate, rather it requires time (lag) of 1 (one) quarter or (three) months after the change of BI Rate.

The increase of BI Rate will push up the difference between the interest rates in Indonesia with interest rates abroad. With the widening of the interest rate differential encourage foreign investors to invest in financial instruments in Indonesia such as Indonesian Bank Certificate (SBI) because they will get a higher rate of return. This foreign capital inflows will in return drive the rupiah exchange rate.

The Effect of Foreign Exchange Reserves to Rupiah Exchange Rate

ECM estimation results obtained coefficient value of foreign exchange reserves is -0,034273. Coefficient -0,034273 means that in the short-term, if the foreign exchange reserves rise by 1 million USD, it will cause a decrease in rupiah exchange rate of Rp. 0,034273. Based on the results of the partial examination, statistically foreign exchange reserves variable has significant negative effect to rupiah exchange rate with a confidence level of 95%. These

results correspond with the study hypothesis which states that foreign exchange reserves has significant negative effect to rupiah exchange rate. In addition, in the long-term, foreign exchange reserves variable also showed a significant effect with rupiah exchange rate.

The increase of foreign exchange reserves in the balance of payment provide a stimulus to make the rupiah appreciation. Then a large amount of foreign exchange reserves held then the foreign trust with the ability of our country to overcome external shocks will increase so that a country will be able to withstand the exchange rate of a currency of foreign currency depreciation.

The Effect of the Money Supply to Rupiah Exchange Rate

ECM estimation result obtained by the value of the variable coefficients money supply is 0,002858. The coefficient 0,002858 means that in the short term, if the money supply increased by 1 million rupiah, it will cause a rise in rupiah exchange rate is Rp. 0,002858. Based on the results of the partial test, statistically money supply variable has significant positive effect to rupiah exchange rate. These results correspond with the study hypothesis which states that money supply has significant positive effect to rupiah exchange rate. In addition, in the long term, money supply variable also showed significant effect to rupiah exchange rate.

Based on the Purchasing Power Parity theory that the increase in money supply will cause the inflation in the country against foreign inflation, it will cause export prices of goods and services in the country become relative more expensive and not be able to compete with foreign goods from abroad. In this case Indonesian exports are likely to decline while imports from other countries are likely to increase. Impact, rupiah exchange rate will be under pressure and depreciated or the US dollar will appreciate against rupiah exchange rate.

Conclusions

1.   Based on the HP Filter approach is seen that from 36 studies recorded the following result: (a) undervalued in the 13 period, (b) stable in the 13 period, (c) overvalued in the 10 period. Of these results it can be concluded that rupiah exchange rate /US dollar is unstable over the study period 2007:Q1-2015:Q4. It is largely due to the external factors that interfere especially the central bank monetary policy, United States and other International economic situation, as well as external conditions beyond the risk factors and expectation of a rational society to foreign exchange.

2.   BI Rate, foreign exchange reserves, and money supply significant influence simultaneously to rupiah exchange rate /US dollar, but partially, in the short term, foreign exchange reserves has negative effect and significant to rupiah exchange rate /US dollar. The greater the amount of foreign exchange reserves of a nation then the foreign trust in the ability of domestic to cope with external shocks will increase so as to appreciated the domestic currency, BI Rate hasn't significant effect to rupiah exchange rate /US dollar. Whereas in the long term, BI Rate has significant effect to rupiah exchange rate /US dollar, money supply has positive effect and significant to rupiah exchange rate /US dollar. An excess money supply in the economy of a country will raise the price of goods as measured by (term of money) so as to put pressure on the exchange rate of its currency against foreign currencies.

DO HIGHER INTEREST RATES RAISE OR LOWER INFLATION?

Sri Fatmawati, YKPN School of Business, Indonesia

Abstract

Inflation and interest rates are two important macroeconomic indicators in economy. The aim of this research is to examine the existence of Fisher Theory for Indonesian economy, by regressing interest rate on rate of inflation in period 1980-2013. With co-integration and error correction technique, the results indicate that an increases of one percent in inflation rate lead to increase in interest rate at 0,133 percent in short-run and at 0,93 percent in long-run. This research can't confirm the existence of Fisher Theory in Indonesian economy in short-run, but this effect exists in long-run.

Keywords: *Fisher Theory, Co-integration Approach, Error Correction Model*

Introduction
1.   Background Research

Rate of inflation is a picture of the price movement of goods and services in general in one periode. High price reflect in high inflation, while relatively stable prices reflect in low inflation.

The uncontrolled inflation can have a negative impact on the economy. In periods of high inflation rate would disrupt banking efforts in the deployment of public funds. High inflation caused real interest rates to be down. This condition thereby reducing the desire people to save so that the growth of banking funds sourced from the public will decrease. In addition, real interest rates are relatively low compared to real interest rates abroad could cause outflow capital abroad.

The unstable prices are able to create unstable environment for economic decision makers. If consumers estimate the rate of inflation in the future is higher, it will encourage them to make purchases of goods and services on a large scale at the present time than to wait when the price has risen again. Similarly, banks or other lending institutions. If they suspect that the inflation rate will rise in the future, they will charge high interest rates on loans as a measure of protection in the face of declining real incomes and wealth (losses of real income and wealth) (Bradley, 1985).

Associated with the effect of this inflation, McKinnon (1973) suggests that inflation tends to lower the real interest rate, causing an imbalance in the capital market. This will cause the fund to offer an investment declines and depressed as a result of private sector investment to the bottom level of balance due to the limited offer of loanable funds (loanable funds). Therefore, during the inflationary effect in the direction of real interest rates are low and there is an imbalance in the equity markets, inflation adversely affected the decline in investment and economic growth.

Rising prices (inflation) can occur through three causes, namely the increase / boost charge (cost-push), increase / pull request (demand-pull) and structural stiffness (structural inflation) (Nanga, 2001). If there is a rapid increase in production costs exceed the productivity so that efficiency of the company will reduce the supply of goods and services to the market. The increase in fuel prices and electricity tariff can improve production costs. Demand pull inflation can occur because aggregate demand is too large compared to the aggregate production. The goods to be reduced due to the utilization of resources has reached a maximum level. The increase in civil servants' salaries can increase demand (purchasing

power) of aggregate. If supply can not keep pace with the increase in public demand for goods and services, then prices will rise.

The interest rate is a macroeconomic variable that could explain the relationship between the goods market (real sector) to the money market (financial sector). In the goods market, the interest rate has an influence on the investment company. A high interest rate reflects the high cost of borrowing and the resulting decline in interest in the company to borrow money for the purpose of investment. In other words, the increase of interest rate, the interest of companies to invest will be reduced. While in the money market, interest rates have an influence on the demand for cash by the public. High interest rates led to lower demand for cash, otherwise low interest rates led to demand for cash by the public is high.

The development of interest rates can be directly interfere with the development of banking. Higher interest rates on one hand can increase people's desire to save money so that the amount of funds banks will increase. Meanwhile, on the other hand high interest rates resulted in a decrease in production activities in the country. This resulted in the emergence of the problem of where the funds will be channeled. In the banking sector, with high interest rates, the bank is able to raise funds to be distributed in the form of credit to businesses. Conversely, if a decline in interest rate, which is lower than the interest rate abroad, will reduce people's desire to save money and encourage the transfer of funds abroad. So the bank will have difficulty in raising funds. But on the other hand, these conditions can trigger production and investment activities as a result of the low cost of credit for companies. Thus, to overcome these problems, monetary policy should be set in such a way that the interest rate can be maintained at an ideal level so it is still quite attractive for people to save their money in banks and not to burden the business world. Also the interest rates should be at a competitive rate than interest rates abroad.

Research Purposes

It has been explained previously that the rate of inflation and the interest rate is an important economic indicators in an economy. How big is the existence of inflation affect the interest rate? The linkage between the interest rate to the inflation rate formulated by Fisher hypothesis. This hypothesis states that if there is an increase of one percent of the expected inflation rate, the nominal interest rate will be increased by one percent as well. Is the influence of the inflation rate to the interest rate in Indonesia in line with the Fisher hypothesis? Given the high rate of inflation is accompanied by interest rates could pose problems for the government's macro and policy makers. This study aimed to analyze the Fisher hypothesis on the Indonesian economy. This research use Co-Integration and Error Correction Model.

Literature Study and Development Hypothesis

1.   Literature Study

This study aimed to analyze the Fisher effect on the Indonesian economy. Fisher effect states that there is a relationship between the interest rate to influence inflation. The increase of one percent rate of inflation led to a rise in interest rates by one percent. This study used a regression model with interest rates as the dependent variable and the rate of inflation, money supply, and the government's budget deficit as an independent variable.

Inflation effect on interest rates. Almilia and Utomo (2006) conducted a study on the effect of inflation on interest rates on deposits in Indonesia using quarterly data 1999-2003 period. Results of these studies show that inflation is positive and significant effect on the rate of interest on deposits. Kandel's research (1996) showed a positive relationship between inflation and nominal interest rates

Berument and Malayali (1999) analyzed the behavior of interest rates associated with the Fisher hypothesis framework in the country of Turkey. The study obtain empirical evidence that inflation changes are expected to trigger an increase in interest rates. After considering the risk factors, the results of the analysis states that the decline in interest rates as a result of increasing levels of inflation. Fahmy studies and Kandil (2003) does not support the Fisher effect in the short term because of the inflation is not expected to affect the short-term interest rates. On the other hand, the correlation between macro variables proved to be extremely high when analyzed in the long term. Pelaez (1995) used co-integration analysis of the data quarterly inflation rate and the expected inflation rate, which is assessed on the interest rate of three-month treasury bill. The results showed that both variables, inflation and interest rates, is to be co-integration. Kolluri and Change (1982) uses some methodology approaches to the data in the USA in 1953-1978. They concluded that in this period, there is a strong relationship between the nominal interest rate to the expected inflation rate. Instead, that correlation was different when using the time period of 1953-1960.

Coppock and Poitras (2000) conducted a study on the Fisher effect in Brazil and Peru. Their results did not fully support the existence of the Fisher hypothesis.. After considering risk factors, they concluded that the interest rate is not always changed due to changes in inflation. Choudry et. al. (1991) stated that the Fisher effect was so great by monitoring the economic developments in the early 1980s. Mitchell-Innes (2008) conducted a study whether the Fisher effect occurs during periods of inflation targeting in South Africa 2000-2005. The study concluded that in the short run Fisher effect does not show its existence for a period of inflation targeting. Researchers believe there was the ineffectiveness of the policy set by the South African central bank (SARB) in controlling short-term interest rates. However, in the long term, this effect was partially influence.

Some other results were by Lee (2007), Fama and Gibson (1982), Hizing and Mishkin (1986), and Kandel et al (1996) found a partially Fisher hypothesis between inflation and interest rates, but it is not based on a one-for-one analysis. Panpoulou (2005) using the 14 OECD countries utntuk examine the Fisher effect and found that this effect exists between the interest rate and inflation-based one-to-one. Westerlund (2008) using panel data co-integration to test the Fisher effect in some OECD countries. Results of the study of the influence of these effects in its analysis. Johnson (2005) concluded that the inflation rate and the interest rate is to be co-integrated although the Fisher effect is not entirely have an influence. Lungu (1998) using the error-correction models to detect the influence of the Fisher effect in the UK. The final analysis showed that these effects occur in the long term

2.   Hypothesis Development

Based on the description above, this research is the first to formulate hypotheses about the effects of inflation on interest rates is as follows:

        H1: The inflation rate positively affects the interest rate

Noegroho research results (2002) about the influence of money supply to the level of deposits in Indonesia relationship using the data in the period 1999-2001 shows that the money supply significantly and negatively related to the interest rate on deposits. Similarly, research conducted by Almelia and Utomo (2006) on the effect of money supply on the interest rate on deposits in Indonesia using quarterly data 1999-2003 period. The study succeeded in obtaining empirical evidence that the money supply significantly and negatively related to the interest rate on deposits. Research conducted by Noviari (2008) on the effect of money supply on the interest rate savings using monthly data in the 2003-2007 period resulted in empirical evidence that the amount outstanding and significant negative effect on the level of interest on savings.

Obi et. al. (2009) investigated the Fisher hypothesis on the economy of Nigeria using the data in the time period 1970-2007. One variable that is supposed to influence the interest rate is the amount of money in circulation. Results of these studies to obtain empirical evidence that the money supply is positive and significant impact on the level of interest. Based on the above formulated the hypothesis of this study on the effect of money supply on interest rates is as follows:

H2: The money supply negative effect on the interest rate

Government budget management organized in many developed countries and in developing countries is to adopt a policy of budget deficit. Deficit budget policy means government spending is greater than government revenues. According to Hyman (2005) the government budget deficit is the excess of government spending of government revenue from taxes, fees, levies and charges obtained by the government. The amount of the deficit is determined as a percentage of Gross Domestic Production in the fiscal year concerned. By using this way to obtain information held government debt burden to national income.

If the government cover its budget deficit through the issuance of debt securities, it will have an impact on interest rate hikes. Funding needs by the government to cover the budget deficit the government led to the demand for funds (money) in the community increases. The interest rate is the cost (price) to borrow funds. If demand for funds in the community improve there will be an increase in the interest rate (Kunarjo, 2001).

Maryatmo research results (2004) indicate that the policy of the government budget deficit could raise interest rates. Burney and Yasmeen (1998) in his research on the effect of the government's budget deficit interest rates find empirical evidence that government budget deficits financed through borrowing on the national banking system and significant positive impact on the nominal interest rate. These results together with the results of other studies, such as Cebula (1998), Hoelscher (1986) and Khan (1988) in their study that also found empirical evidence links government budget deficit with a high interest rate. Based on the above hypothesis formulated three studies on the effect of the government's budget deficit to the level of interest is as follows:

H3: the government budget deficit positive effect on interest rates

Research Methods
1.   Research Design
This study uses data interest rates, inflation, money supply, and the government's budget deficit in 1980-2013. Interest rate data used in this study is the level of investment interest calculated from the average value in one year. The inflation rate is calculated from the percentage change in the consumer price index. The money supply used is the amount of money circulating in the strict sense, is the sum of currency and demand deposits. Government budget deficit is percentage of the government budget deficit to the gross domestic production.

2.   Research Sample
Data on interest rates, inflation, money supply, and the government's budget deficit is sourced from Indonesia Statistics published by the Central Bureau of Statistics, Bank Indonesia Reports and Financial Memorandum and Articles of Revenue and Expenditure published by the Department of Financial Year 1980-2013.

3.   Research Model
Model functional relationship between the interest rate with the factors thought to influence later transformed into an econometric form as in equation (1) below:

$$TBT = \beta 0 + \beta 1 INFt + \beta 2 JUBt + \beta 3 DEFt + \varepsilon\_t .... (1)$$

TBT is the interest rate in year t, β0 is constant and the regression coefficient β1adalah inflation rate in year t (INFt), β2 is the regression coefficient of money supply in the year t (JUBt), β3 is the regression coefficient government budget deficit in year t (DEFT), and ε is the error terms.

Observation data is processed to obtain a regression equation estimated using a model of ordinary least squares (OLS). Interest Rate (TB) as the dependent variable, while the inflation rate (INF), the money supply (JUB), and the government budget deficit (DEF) as independent variables as in equation (2) below:

$$TB\_t = b0 + b1INFt + b2JUBt + b3DEFt + \mu \_t \quad\text{...................... (2)}$$

where (TB_t) is an estimate of the interest rate in year t, b0 are constants, and b1, b2, b3: regression coefficient estimates INFt, JUBt, DEFT, and μ: residual.

This study uses time series data in 1980-2013. Time series data used in the study can be stationary and not stationary. The regression model is a regression model estimates derived from data that is stationary. The regression model estimates derived from data that is not stationary can generate spurious regression model estimation (spurious regression). Spurious regression model is usually marked by the fulfillment of the requirements of a good regression model, the independent variables that are used most of the significant Stats, a high coefficient of determination and F test were statistically significant. However, the value of the Durbin-Watson statistic is low and is usually lower than the coefficient of determination of the equation. (Nuchrowi and Usman, 2006).

Results and Discussion

Analysis of research data starting from stationary test, test the degree of cointegration, error correction model making, and then test the classical assumption, namely normality test, multicollinearity problem, test the problem of heteroscedasticity, and autocorrelation test. Stationarity test data is calculated using the test unit roots. The calculations show that the interest rate data series (TB), the rate of inflation (INF), and the money supply (JUB) is stationary at degree level. This is indicated by the count value for the regression coefficient t absolute TBT-1 (δ) = |-3,296291| greater than the critical value MacKinnon absolute significance level (α) 5% = |-2,963972|, the calculated value of t the absolute regression coefficient INFt-1 (δ) = |-4,782845| greater than the critical value MacKinnon absolute significance level (α) 5% = |-2,963972|, and the absolute value of t count for the regression coefficient JUBt- 1 (δ) = |-3,053658| greater than the critical value MacKinnon absolute significance level (α) 5% = |-2,963972|. However, for the data series the government budget deficit (DEF) is not stationary at degree level. This is indicated by the count value for the regression coefficient t absolute DEFT-1 (δ) = |-1,185608| smaller than the critical value MacKinnon absolute significance level (α) 5% = |-2,963972|.

Stationarity test data on degree-level lead to the conclusion that the interest rate (TB), the rate of inflation (INF), the money supply (JUB) in the study period is stationary. While the data series for the government budget deficit is not stationary at degree level. Therefore, the test continued to test the degree of cointegration for the government budget deficit data series. Based on statistical values it can be concluded that the series of data variables government budget deficit (DEF) is stationary on the degree of the (first difference). This is indicated by the count value for the regression coefficient t absolute DEFT-1 (δ) = |-7,756403| greater than the critical value MacKinnon absolute significance level (α) 5% = |-2,963972|. Likewise, the probability value (Prob.) Variable DEF = 0.0000 smaller than α = 5%.

Stationary result against the data series of all the variables observed and proved that the interest rate (TB), the rate of inflation (INF), and the money supply (JUB) stationary at degree

level, while the data series for the variable DEF stationary on the degree of the (first difference) , The research data were not stationary at the same degree. This indicates that the model is not a good estimation model. For the purposes of analysis necessary to test the possibility of long-term equilibrium relationship of observed variables. To perform the test against the long-term balance is done through cointegration test

Cointegration test is done by testing the stationary residuals. If the residuals from a regression model estimation is stationary shows that the regression model is a regression model the long term, which is a model that describes the relationship (cointegration) between the interest rate (TB), the rate of inflation (INF), and the money supply (JUB) in long-term. Residual stationarity testing regression model estimation using Augmented Dickey-Fuller Test

The calculation result of the data series residuals of the regression model estimate values obtained to calculate the absolute t lag regression coefficient = |-4,811065| residual is greater than the critical value MacKinnon absolute significance level (α) 5% = |-2,960411|. The probability value (Prob.) = 0.0005 is smaller than α = 5%. The test results reject the null hypothesis that the regression model estimation residuals have unit roots. Therefore it can be concluded that the regression model estimation residuals are stationary. Thus the estimate obtained regression model is a model of long-term equilibrium.

Cointegration test results showed that the regression model generated estimates of the long-term regression models. To obtain a short-term equilibrium model required a coefficient that corrects the parameters in the estimation model long-term, the error correction coefficient. Error correction coefficients obtained from the model error correction (error correction model / ECM). In other words, a discrepancy between the balance of short-term and long-term balance corrected through error correction mechanisms. So error correction mechanism is a tool to reconcile short-term behavior of an economic variable with the long-term behavior. (Gudjarati, 2003).

Error correction model (ECM), which describes the relationship between the interest rate effect (TB) with the rate of inflation (INF), the money supply (JUB), and the government budget deficit (DEF) used the following equation:

$$D (TB)_t = \beta_0 + \beta_1 D (INF)_t + \beta_2 D (JUB)_t + \beta_3 D (DEF)_t + \beta_4 (INF)_{t-1} + \beta_5 (JUB)_{t-1} + \beta_6 (DEF)_{t-1} + \beta_7 ECT$$

The magnitude of the regression coefficient of error correction term (ECT) = 0.946950 as required, which is positive, lies between 0 and 1. Therefore, it can be concluded that the regression model generated estimates are valid, so it can be used as an indication of the relationship (cointegration) long-term and short-term between the interest rate (TB) with the rate of inflation (INF), the money supply (JUB), and the government budget deficit (DEF).

Least squares models were used to analyze the cost effect relationship between variables were observed to obtain a good estimation model requires the fulfillment of the assumption of normality, non multicollinearity, homoskedasticity, and non autocorrelation. Therefore, the resulting ECM necessary to test the normality of the residuals obtained from the model.

Jarque-Bera calculated value = 1.160315 smaller than the critical value χ^2 = 5.991 (at α = 5% and df = 2). The probability value (Probability) calculation results of 0.559810 is greater than α = 5%. These results show that the residuals of ECM obtained meet the assumptions of normal distribution.

The next step is testing for the possibility of multicollinearity problems. Multicollinearity problems arise when the independent variable of the other independent variables have a strong linear correlation. The results show the value of the probability F all auxiliary regression equation is smaller than α = 5%. This indicates a problem multicollinearity in ECM. Client's rule of thumb states that if R^2 auxiliary regression R^2 is smaller than the total in the regression

model estimates have multicollinearity problem, then the problem can be ignored multikolinearitas. The calculations show regression R2 auxiliary2 (AUX2) and 3 (AUX3) is lower than the total R2 = 0.557664. However, the regression R2 auxiliary1 (AUX1) higher than the total R2. Thus the problem multikolinearitas in ECM can not be ignored.

The estimated regression equation containing multicollinearity problems resulting regression equation becomes invalid. It is therefore necessary treatment. One who recommended to tackle the problem of multicollinearity is to throw one of the variables that have a multicollinearity problem. For that we need independent testing of the correlation between the variables. The correlation between the variables independent test results showed that there is a significant correlation between the rate of inflation (INF) and money supply (JUB). This is indicated by the probability value (Prob.) 0.0031 is smaller than the 5% significance level. While the variable rate of inflation (INF) and the government's budget deficit (DEF) and between the money supply (JUB) with the government's budget deficit (DEF) did not correlate significantly. Thus to eliminate the problem of multicollinearity in the ECM must eliminate one of the variables are correlated. This research will eliminate the variable of money supply (JUB), because the purpose of this study was to test the Fisher hypothesis, namely the influence of the relationship between the interest rate (TB) and inflation (INF).

To ensure that the ECU generated a good estimation model, necessary to test the normality of the residuals obtained from the model. Jarque-Bera calculated value = 0.374482 smaller than the critical value $\chi 2$ (at $\alpha = 5\%$ and df = 2) = 5.991. The probability value (Probability) calculation results of 0.829244 is greater than $\alpha = 5\%$. These results show that the residuals of ECM without JUB acquired meet the assumption of a normal distribution.

Error correction model that is not involved in money supply (JUB) tested the possibility of multicollinearity problems. The results show the value of the probability F all auxiliary regression equation is smaller than $\alpha = 5\%$. This indicates a problem multicollinearity in ECM. Client's rule of thumb states that if R^2 auxiliary regression R2 is smaller than the total in the regression model estimates have multicollinearity problem, then the problem can be ignored multikolinearity. The calculations show the auxiliary regression R2 = 0.451541 lower than the total $R^2 = 0.540953$. Thus the problem of multicollinearity in the ECM can be ignored.

Testing for heteroscedasticity problems in the ECM using Breusch-Pagan-Godfrey Test. To test the null hypothesis states that there is no regression model estimate heteroscedasticity problem. The calculation result of observation data obtained by $n * R^2 = 1.875258$ with a probability value of 0.8661. With $\alpha = 5\%$ and the degree of freedom5, the critical value $\chi 2 = 11.07$. The value of $n * R^2 = 1.875258$ smaller than the critical value $\chi 2 = 11.07$, so the decision is to accept the null hypothesis testing are stated in the regression model contains no heteroscedasticity problem. This test can also be done by comparing the probability value with α used. The calculations show a probability value (Prob. Chi-Square) = 0.8661 is greater than the significance level used, namely 5%. The test results accept the null hypothesis that the regression model estimation does not contain heteroscedasticity problem. Therefore it can be concluded that the estimated regression model (ECM) obtained without a variable amount of money in circulation (JUB) is free from the problem of heteroscedasticity.

Testing autocorrelation problem in the regression model estimation is done using Breusch-Godfrey Serial Correlation LM Test. To test the null hypothesis states that there is no regression model estimates the autocorrelation problem. The calculation result of observation data obtained by $n * R2 = 1.006038$ with a probability value is 0.6843. With $\alpha = 5\%$ and a degree of freedom, the critical value $\chi 2 = 3.841$. The value of $n * R^2 = 1.006038$ smaller than the critical value $\chi 2 = 5.991$, so the decision is to accept the null hypothesis testing are stated in the regression model contains no autocorrelation problems. This test can also be done by

comparing the probability value with α used. The calculations show a probability value (Prob. Chi-Square) = 0.6843 is greater than the significance level used, namely 5%. The test results accept the null hypothesis that the regression model estimation does not contain the autocorrelation problem. It can be concluded that the estimated regression model (ECM) obtained free of problems autocorrelation.

The test results of the classical assumptions of the regression model estimates the conclusion that the regression model estimates meet the classical assumption, that the model is non multicollinearity, homoscedasticity, and non autocorrelation. Thus the estimated regression model (ECM) obtained valid used for analysis.

Activities subsequent analysis is testing of the estimation model (ECM) are obtained, which test the effect of each independent variable on the dependent variable (t test), test the ability of all independent variables explain the variation in the dependent variable (F test), and measuring the ability of variation values the dependent variable that can be explained by all the independent variables in the regression model estimation.

Test of the significance of the influence of the independent variable on the dependent variable in the ECM performed using the t test. Based on the test results will not be known whether the constants and the regression coefficients of each independent variable in the ECM is statistically different from zero (significant).

T test results showed regression coefficient for the independent variable changes ECM inflation rate (INF) and changes in the government budget deficit (DEF) differs significantly from zero. This is indicated by the value of the t-Statistic for the regression coefficient D (INF) = 2.659131 and D (DEF) = 3.220279 is greater than the value of the t-table (5%) = 1.645. Therefore the results of these tests reject the null hypothesis that changes in inflation and changes in the government budget deficit does not affect the interest rate. In other words, the test is able to prove that the rate of inflation (INF) and the government budget deficit (DEF) effect on the level of relationship (TB).

Error correction model (ECM) which is well demonstrated by the coefficient of error correction term (ECT) between 0 and 1 and ECT affect the level of interest (TB). The test results of the regression coefficient of error correction term (ECT) ECT shows the regression coefficient is 0.913891 as required, which is positive, lies between 0 and 1 and significant on α = 5%. Because the t-Statistic value = 4.051402 is greater than t-table = 1.645. Therefore it can be concluded that the regression model generated estimates are valid for use estimation.

In the error correction model (ECM) there is more than one independent variable, ie the inflation rate, the government budget deficit, the inflation rate lag, lag the government budget deficit, and error correction terms. Error correction model which is well demonstrated by the ability of all independent variables in explaining changes in the value of the dependent variable. For the purpose of the test F, in testing the null hypothesis states that all independent variables in the regression model estimation (ECM) is not able to explain variation in the dependent variable.

The calculations show that the calculated value F (F-statistic) = 5.892121 with a probability value (Prob. F) = 0.000993. F table value for α = 5% was 2.21. The calculated value F (F-statistic) = 5.892121 is greater than the value of F table (α = 5%) = 2.21. The test results decided to reject the null hypothesis states that all independent variables in the regression model estimation (ECM) is not able to explain variation in the dependent variable. That is, the results of testing to obtain evidence that changes the rate of inflation (INF), changes in the government budget deficit (DEF), lag inflation (INFt-1), a lag government budget deficit (DEFT-1), and the error correction term (ECT) is together can explain changes in interest rates (TB). If the test is done by comparing the value of the probability of F statistics with α

will get the same results. The probability value (Prob. F) = 0.000993 smaller than α = 5%, so that the decision in this test is to reject the null hypothesis.

Independent variables used in the ECM needs to measure how its ability to explain the variation changes the value of the dependent variable. The coefficient of determination shows the percentage change in the value of the dependent variable variation can be explained by all the independent variables in the regression model. The calculation result shows that the coefficient of determination (R2) is 0.540953. This suggests that the variation of interest rates can be explained by the change in the change rate of inflation (INF), changes in the government budget deficit (DEF), lag inflation (INFt-1), a lag government budget deficit (DEFT-1), and the error correction term (ECT) is 54.0953 percent. While that can not be explained by all the independent variables is equal to 45.9047 percent.

Behavioral relationship between constant and independent variables with the dependent variable short-term and long-term behavior can be explained by the ECM. Short-term behavior and constant relationship between the independent variables with the dependent variable may know of constants and coefficients of regression estimation, namely β 0, β 1, β 2, and 3 β. ECM in the estimation model, the magnitude of the constants (β 0) = -0.100027 and the probability is 0.9315. At α = 5%, the constants are not statistically significant.

The magnitude of the regression coefficient changes in the inflation rate (β 1) = 0.128947 and probability value of 0.0135. At α = 5%, in the short term inflation rate (INF) positive and significant impact on the level of interest (TB). The increase in the inflation rate of 1 percent, ceteris paribus, will raise the interest rate by 0.13 percent. Conversely, a decrease in the rate of inflation of 1 percent, ceteris paribus, will lower the interest rate by 0.13 percent.

The magnitude of the regression coefficient changes in the government budget deficit (β 2) = 1.056873 and probability value of 0.0035. At α = 5%, in the short term the government budget deficit (DEF) positive and significant impact on the level of interest (TB). Based on changes in the value of the regression coefficient government budget deficit (β 2) = 1,056873 indicates that if there is an increase of 1 percent the government budget deficit will result in a rise of 1.06 percent the amount of interest rate changes.

Regression coefficient error correction term (ECT) shows the speed of adjustment towards the long-term equilibrium. ECT is the magnitude of regression coefficients with a probability value amount 0.913891 0.0004. At α = 5% regression coefficient in the ECM ECT statistically significant. ECT regression coefficient of .913891 shows that about 91 per cent discrepancy in changes in the interest rate period has been correlated in subsequent periods by term equilibrium, so that the direction of the influence of the independent variables in the short term is expected to be consistent with the direction of the influence of the independent variables in the long term.

Long-term equilibrium constants and the relationship between the independent variables with the dependent variable is corrected using the coefficient of error term. Regression coefficients from the regression model estimated long-term value t count low, -0.647627 to 0.707095 for inflation and government budget deficits. With α = 5%, all independent variables have no effect on the dependent variable. That is, in the long term, the inflation rate lag (INFt-1) and lag the government budget deficit (DEFT-1) does not affect the interest rate. Long-term regression coefficient lag inflation rate (INFt-1) of 0.94960 indicates that there is an increase of 1 percent each inflation, then in the long run will raise interest rates by 0.95 percent. Long-term lag regression coefficient government budget deficit (DEFT-1) of 1.15582 indicates that each an increase of 1 per cent of the government budget deficit, then in the long run will raise interest rates by 1.16 percent.

Conclusion and Recommendation

This study aimed to get empirical evidence for the Fisher hypothesis on the Indonesian economy. Fisher hypothesis states that the inflation rate positively affects the interest rate. The increase in the inflation rate of 1 percent would result in a rise in interest rate of 1 percent. The model used to analyze the effect of inflation on interest rates is a multiple regression model with the dependent variable is the interest rate and the independent variable is the rate of inflation, money supply, and the government's budget deficit.

The analysis of the model estimates obtained indicate a strong correlation between the independent variables and variable inflation in the money supply. In a regression model estimation in which two independent variables have a strong linear correlation shows the estimated regression models have a multicollinearity problem. To obtain a good estimate of the regression model, one of these variables must be issued in the regression model. This study aimed to examine the effect of inflation on interest rates. Therefore, in the subsequent analysis of independent variables in the regression model consists of only two, namely inflation and the government budget deficit. Based on results of this study can be concluded as follows:

First, in the short term, this research could not find the Fisher hypothesis on the Indonesian economy. The results showed in the short term, the increase in the inflation rate of 1 percent, ceteris paribus, lead to an increase in interest rate of 0.15 percent. Conversely, a decrease in the rate of inflation of 1 percent, ceteris paribus, will lower the interest rate by 0.15 percent. While the Fisher effect states that a 1 percent increase in the rate of inflation will raise interest rates at 1 percent as well.

Second, in the long term, this study managed to find the Fisher effect on the Indonesian economy. The results showed in the long term, the increase in the inflation rate of 1 percent, ceteris paribus, lead to an increase in interest rate of 0.957 percent (approximately 1 percent). Conversely, a decrease in the rate of inflation of 1 percent, ceteris paribus, will lower the interest rate of 0.957 percent (approximately 1 percent). Fisher effect stated that a 1 percent increase in the rate of inflation will raise the interest rate by 1 percent.

This study concluded that the rate of inflation and government budget deficits and significant positive effect on the level of interest. It means that the increase in inflation will affect interest rate. Likewise, the increase in the budget deficit the government will have an impact on interest rate hikes. The interest rate will determine the national investment and the investment needed to create jobs. Based on the results of this study suggested to the government to control inflation low and reduce the government's budget deficit. With inflation and government budget deficits are lower then interest rate will also be lower. Low interest rates greatly are needed by the economy to drive investment.

MODEL OF SUPPLY AND DEMAND THEORY BASED THEOANTHROPOSENTRIC

Supawi Pawenang, Universitas Islam Batik Surakarta, Indonesia
Burhanuddin Ahmad Yani, Universitas Islam Batik Surakarta, Indonesia

Abstract

Focus of this paper is to criticize Marshall's supply and demand theory. That theory was identified by strengths and weakness, so be looked up solution to make a perfect that theory. The result of analysis describe that Marshall's theory is a basic of most theory in study of economics. Monetary theory, consumer behaviour theory, fiscal theory, etc., was developed from that theory. On the other hand, Marshall's theory has some weaknesses if looked up from morality or religious perspective, because morality and religious value absent from theory. Therefore, some weaknesses of theory be repaired by inserting axis and reflector ordinate, which can be used to controlling outcome transaction from morality and religious value perspective. The new supply and demand theory is named universal-ethics supply and demand theory.

Keywords: *Marshallian, supply and demand theory, moral and religious value, universal-ethics.*

Introduction

1. Background

Curve of Supply and Demand Marshall very dominant in economics learning. Even the study of this curve is compulsory for economics students. The reason is because from this curve appear economic models used to analyze the economic activities. This is in line with the statement Mankiw (2000) which says that anyone that understand theory of demand and supply means already understand half of economics. A child if know well the theory of demand and supply can explain economic activity too.

Supply and demand curves Marshal is not without drawbacks. There are some findings that are contrary to the curve. First, Giffen, that his findings are famous as Giffen Paradox, stated that there was a situation where the increase in the prices of goods causes a person to consume more goods (Giffen and Lindsey, 1984, p.188-192; Nicholson: 1995, p .114). Second, Ernst Engel, that his findings are famous as Engel's Law, said that on the moment increasing income, on the other hand, there proportion down of expenditure on food (Nicholson: 1995, p.102). Third, The Production Possibility Frontier theory which says that the supply and demand curves Marshall assumes unlimited production (Nicholson: 1995). Whereas, in reality can be very limited production. These findings are of course opposed to the supply and demand curves of the Marshal. This differences according to Nicholson's theory is reasonable, because every theory has weaknesses of each. The weakness of the theory usually arise from a critique of the assumptions underlying the theory. Third opinion of the underlying theory of the Marshall also viewed from the assumptions on which became theoretical basis. As for Milton Friedman (1953) said that the theory should not only be seen from the assumption, since many theories developed by unrealistic assumptions. Supposedly, it is viewed from an ability to predict.

When viewed from the ability to explain or predict, curve of supply and demand Marshall has good power analysis. The curve may explain changes in demand, supply, prices, producer surplus, consumer surplus, oversupply, and so forth. Of course, basic assumptions, is ceteris paribus, remain in use. Analysis power can explains not only the course of microeconomics,

but macroeconomics also can be explained. Regarding the impact of tax policies, subsidies, interest rate, money supply, investment, foreign trade, can also be explained and predicted, although seeing it only from the tendency (trend) and not the value in numerical terms.

Another advantage of the supply and demand curves can be developed into economic models. Some economic models developed on the basis of this curve, such as the IS-LM, indifferent curve, the curve of production, the cost curve, and so on. Because of the flexibility and power of this development, the demand curve and supply the basis that must be learned in economics. However, because the philosophical basis of this theory is positivistic, which ignored the elements of religiosity, the model of curve is also characterized by ignoring the results of the element of religiosity. Of course, if it is analyzed by the values and ethics of religiosity there will be some shortcomings and this deficiencies are very significant in determining the well-being and harmony in life. Whereas, the nature of human religiosity is inherent in every human soul. It can't be ignored, because if there is an element of religiosity in economic theory be neglected it will have bad effect on the behavior of economic. In other words, if the economic theory that is formed ignore religious values, then the economy will behave ignore religious values. Whereas, religion is used to create harmony. Because disregard for the values of religiosity, it is natural that the main problems the economy until now have not been able to overcome.

The purpose of this article is to find the underlying weakness of supply and demand curves, then explain repairs to get supply and demand curves are new, that named Curve of Supply and Demand Based *Theoanthroposentric*. The new curve is equipped with an analysis of the ethical and religiosity so that the character does not merely materialistic and *homoeconomicus*, but also be spiritualistic and *homoreligious*.

Overview Theory
1. Character of Curve of Supply and Demand Marshall
Supply and demand curves Marshall has its own characteristics. Some things can clarify the character, among others, the curve: 1) using the key variables that can explain the outcomes, in particular the price and quantity, 2) the assumption of ceteris paribus, 3) each variable tend incrementally, 4) contain concepts utilities, 5) to apply the theory of marginal utility, 6) can be used to analysing of reality, 7) use deduction method, 8) is a theoretical abstraction in the form of models, 9) each variable have a notation clearly. Completeness of these characteristics led to supply and demand curves which initiated by Marshall became the main analytical tool in economics.

2. Weaknesses of Curve of Supply and Demand Marshall
Marshallian's Model of Curve of Supply and Demand is followed and developed by many economists until rose up the new model, primarily used in conventional economic studies to date. Even so, that does not mean it is fully demonstrated perfection. Various weaknesses in the theory of supply and demand can be identified as follows: 1) Model of Supply and Demand is only using an economic approach, so the approach is not comprehensive, only partially only. Because, human behavior is not just a mere economic character. There are other variables that are dominant in influencing human behavior, such as religious doctrine, ethics and morality, and so forth. This factor is not described in the model. 2) The philosophy underlying this theory is utilitarian Benthamian. With a philosophy like that, axiology this theory leads to a practical level individualistic and tends to produce *homoeconomicus*. Basic philosophy utilitarianism tend to individualistic and only emphasizes the economic motive, it will lead to patterns that are a zero sum game with a tendency to lead to the hedonistic behavior. Two weakness shows subsequent weakness. 3) The lack of social awareness. Social care tends to be ignored and replaced with transactional interests. The third weakness could

impact was terrible, because it can loosen the vertices of sociality, which means it is contrary to the teachings of religious morality. In reality, people life generally attention to the religious side, naturally *psicosional*. Neglect of religious values will result alienated human identity.

Research methodology

This study is a literature study (library research), with a focus on criticism of the Theory of Supply and Demand that used in economics. The methodology used in the study and this paper is the economic philosophy research methodology. This method uses the methodology of philosophy with the scope of the discussion about the economy, with the object under study is the Theory of Demand and Supply. Analysis approach use content analysis, along with critical analysis to uncover patterns *theoanthroposentric*, which indicated the existence of ethics, morality, and values of religiosity. Data of this study consisted of three things: 1. Formulation of the theory of dialectical process of the Supply and Demand, especially in graphical analysis model. This data is data that exist in the various references. 2. The theories of ethics, morality, and values religiosity that needs to be attached to the theory of demand and supply. This data also the data contained in the various references theorists, mainly about ethics and morality. 3. Data relating to the ontology, epistemology, axiology, and data about theory of demand and supply is patterned *theoanthroposentric*. This data is the result of a synthesis (point one and point two) with a theoretical approach. Thus, the type of data used is dominated by secondary data, with qualitative data.

The data analysis of this study refers to an interactive model, starting from: 1. criticism on the Supply and Demand Marshalian theory, which applies now. Then proceed with 2. Identify the theory of Ethics, Morality, and religiosity that can be integrated into the Theory of Demand and Supply. Then, the last stage produces 3. New Theory of Supply and Demand with analysis is more comprehensive with *theoanthroposentric* character, which can be explained with epistemology, ontology, and axiology.

Results and Discussion

1. Epistemology of Curve of Supply and Demand

Demand and supply curves Marshall did not emerge from a vacuum, but was inspired by the dialectic of previous economic thoughts. Economic thought of Adam Smith, David Ricardo, Karl Marx, and W.S. Jevon helped provide inspiration for Marshall to bring a new paradigm in economic analyzes. The new paradigm is characterized by changing the political economy become economics. Thus, the position of economics equivalent to mathematics, physics, biology, equally governed by nature and not by policy. With this paradigm, the economic thought Marshall has a biological economic character, and not dynamics economic. The basic assumption underlying the Marshall's thought same as that used by Adam Smith and David Ricardo, it is the natural freedom coupled with a model of the evolution of thinking of theorists, such as Charles Darwin, Herbert Spencer and William Graham Sumner. With the pattern of this view, the individualist pattern, perfect competition, and the market economy makes the hallmark of Marshall's thought. Patterns of Marshall's thought can be looked from the various things that was him thought, such as the principle of supply and demand, determination of price, cost of production, the theory of the behavior of producers and consumers, short term and long term *equilibrium*, and so on.

Marshall's thoughts are actually a lot reinforce the ideas of Adam Smith and David Ricardo that based on universal prosperity and natural freedom. For example, a discussion of the value of a product. Smith and Richardo equally say that the value of a product is determined by the cost of production. However, this opinion was opposed by the School (marginal) Austria which argued that the value of a product is not determined by the cost of production, but rather by a utility such products. This utility which raises demand with a certain standard of

value. The last two arguments are synthesized by Marshall. Marshall explained that the cost to produce a product can be classified as real costs and the absolute cost. Especially for real cost does not depend on the utility. But consumers also determine the value of a product through its utility assessment. This synthesis of which is then described in curve of demand and supply.

Demand and supply curve shows the combination of ideas, among others, Cournot's thought that states that demand is influenced by the price (Qd = f (P)). Cournot's thought was described by Marshall became axis (Y = P) and the ordinate (X = Q) in the curve. The demand curve, which is depicted as a line of demand, which drawn sloping from the left top to the bottom right shows the behavior of consumers. Base of rationale is similar to the idea of utility is often stated by the school of marginal, like Jevon, Menger, Walras. While the supply curve, which is described as a line of supply, which increased from the lower left to the upper right shows the behavior of producers. This thoughts adopted the pattern of theory of Richardian costs.

Marshall combine the two curves like work of scissors, to indicate the point of balance that describes the price. On the demand and supply curves, Marshall to give the ceteris paribus assumption. This assumption said that consumer incomes are fixed, substitution commodity prices also remain, as well as expectations also remain. In essence, this assumption is limit the discussion only on the objects discussed only. Things that are not covered considered fixed. This assumption is to strengthen the argument of the curve. However this assumption is confirmed that the characteristic of curve is partial *equilibrium* and short term.
Figure. 1.
Curve of Equilibirium Supply and Demand

The balance point (*equilibrium*) that occurs as a picture of a meeting between supply and demand is formed by the rationality of choice of consumers and producers. The rationality of choice arise from the assumption of limited resources in the transaction, so it appears a series of alternative ideas for utilization. This behavior is then led to the rationality of choice, which is expressed in an effective and efficient decisions. Rationality of choice boils down on individual prosperity. Pull attract individual prosperity between producers and consumers, like as there are those who organize, but did not appear (the invisible hand), which issue the price. Marshall's reasoning like a real inspired by Adam Smith.

Supply and demand curves, in which depict the price, actually contains the concept of marginal cost and marginal value. These two concepts contained in the slope of the curve. For example, the supply curve depicted obliquely from bottom left to top right shows that the incremental cost of production due to the addition of production, and vice versa. However, in the supply and demand curves, Marshall does not assume a limited production and the absence of other products that will be chosen by the consumer. So that the curve can only explain a transaction on one product and could not explain where many products currently on

the market. These limitations were later criticized and improved by Frontier, then became the concept of production possibility frontier that underlie the emergence of general *equilibrium* models.

Although there are drawbacks, but the theory of supply and demand was initiated by Marshall, as outlined in the shape of this curve, is very powerful and can be used to show the behavior of the market. Even able to predict events that will happen. On the strength of this theory, Milton Friedman, Samuelson, Mankiw (2000), Sukirno (2002), appreciate it properly, so it is natural when curve of Supply and Demand Marshall is used in the teaching of basic science of Economics.

2. Ontology of Curve of Supply and Demand

Demand and supply curves were first introduced by Marshall. The curve, as shown above, explaining that the quantity demanded (Q) is a function of the price of the item (P). The demand curve illustrated with line D (read: demand). These curves as a representation of the law of supply. When prices of goods decreased, assuming ceteris paribus, then the quantity demanded will increase. Similarly, the opposite applies. While the demand curve described by a line S, which is a representation of the law of demand. When the market price increases, assuming ceteris paribus, the number of items offered will increase. Likewise, the opposite applies. The meeting between supply (supply) and demand (demand) shows the equilibrium price or *equilibrium*. The curve that later became famous to this day, as many economists use models of this curve to perform economic analysis, as well as explaining the theory of monetary economics, international trade theory, the theory of monopoly, the theory of fiscal policy, and so on, all developed on the model of demand and supply curves.

The theory of supply and demand of Marshall has a strong characteristics. There are several things that can be associated with his character, such as: 1) using a key variable that could explain the outcome in particular, 2) using the assumption of ceteris paribus, 3) each variable described has a character incremental, 4) use the concept of utility, 5) combining the theory of marginal utility curve (supply and demand), 6) explanation of reality requires example, 7) use deduction method, 8) capable for abstracting a theory into the form of models, 9) of each variable denoted. Completeness of these characteristics that led to the theory of supply and demand Marshall is like to be the main analytical tool in economics.

Strength of characteristics of this theory able to be developed further. Therefore the few next economists many who developed theories with Marshallian patterns like that. A number of economists, among others: Frank H. Knight (1959) an American economist, succeeded in developing a theory of Marshall in the theory of total production. In theory it contains other theories, such as the theory of marginal product and average product, as outlined in the form of graphs Marshallian analysis.

Furthermore, Knight's thought inspires Jacob Viner (1892-1970), known as the pupil Knight. Viner gave rise to the theory of perfect competition were also analyzed graphically Marshallian like his teacher. Similarly, Edward Chamberlain and Joan Robbinson also develop with the same pattern to analyze the monopoly market and oligopoly market (Truet & Truet: 1987).

3. Axiology of Curve of Supply and Demand

These weaknesses in demand and supply curves Marshall, as described (in point B.2.) on the above, when described in terms of the image will be more evident. In the figure, the demand curve is represented by a line indicating the downhill slope from top left to bottom right has been acceptable with logical reasoning. The reality is so. Moreover, the theory of this demand even be appreciated and be referred to as the law of demand. Similarly, what happened on the theory of supply, and the theory of supply was recognized to be the law of supply. Figure a

line with a slope slanted from bottom left to top right is able to explain the normal behavior of the offering. Nevertheless, under certain circumstances this theory can't correspond to the original format. In reality that is not normal, such as when the trend, it could be just the supply theory and demand theory has a discrepancy with the law. But in some time then, the condition will become normal again. For example: the trend of the sale of shares in the capital market. When a blue cheap stock prices decline, based on the theory of demand, sum of demand for the stock should be rise. The demand curve is supposed to be getting away from the Y axis and getting closer to the horizontal line (Q). But it could be, it will not increase demand, but on the contrary demand will turn into deals. Similarly, what happened on the supply side, when the price falls, it will be more and more deals. This trend however is valid only for a moment. The market will take immediate corrective action and the condition will become normal again, and the theory will work again. Regarding the trend itself is already anticipated by theoretical with assuming ceteris paribus. Determination of this assumption is actually a way to break the shutdown effort to this theory.

Ceteris paribus assumptions that inherent in this theory is quite strategic, it's just that these assumptions and other characters from the theory of supply and demand can't explain about morality. By using graphical analysis, meetings between the supply and demand will indicate the price as a form of balance. If the offer of fixed and demand increases, the demand curve shifts to the right, thus point meeting with the supply curve will show a new equilibrium price is higher than the original price. Conversely, if the decline in demand while supply remains, the demand curve will shift to the left, and the equilibrium price would be lower (Sukirno: 2000; Mankiw: 2000).
Figure. 2.
A Shift in the Demand Curve

If happened is fixed demand while the supply decreases, the supply curve shifts to the left top, thus point meeting the demand curve will show the new price increases. Conversely, if demand remains and supply increases, the supply curve shifts to the right below, and the equilibrium price will be lower than the original price before.
Figure. 3.
A Shift in the Supply Curve

Like what is shown in the supply and demand curve (Fig.2) above, the addition of demand will shift curve upward. This shift has meaning that the increase was only for individual perpetrators of such requests. Social benefits can't be demonstrated by the shift of the curve. Because, the offender requests only consider the benefits for themselves.

Judging from the usefulness of a product that could give rise to the demand, the product could be useful for social and beneficial to the individual, it can also be beneficial for individual products but it is not beneficial to society. There is also the social goods that benefit but does not benefit the individual. However, in a review of social life, what is beneficial for social must be considered as benefit to the individual. This last condition must be understood, as the basis of social life that is concerned with public interests above personal interests. Regarding the usefulness of products as described above, in the supply and demand curves it is ignored. Besides, take into account the usefulness of a product, especially for socially very important, for the sake of harmonization.

As an illustration, the increase in demand for liquor, or drugs (drugs), and other items that could disturb the public. When the offer fixed then would shift the demand curve upward. This upward curve shift, in economic terms can be defined as an increase in economic growth. Although it could also be interpreted as inflation. However, due to the triggers is a demand, it can be interpreted as a trigger of the wheels of the economy. After the economic system adjusting then there is the expansion of the economy. What is defined as economic growth is actually inversely proportional to the benefit perceived by society. Security becomes prone to be disturbed, the nation's morality can be degraded, and also religious values be ignored. Under these conditions, personal interests inversely with social interests. When it should be, the interests of individuals positively correlated with social interests. If that happens like this last condition, economic growth really reflecting the welfare of society. Growth process such as this is actually expected, not economic growth that ignores morality and values of religiosity as described at beginning.

4. Curve of Supply and Demand based Religious-Morality

Absence aspects of morality and values religiosity as in the theory of supply and demand is the weakness of this theory. This weakness should be addressed to complete the theory, so

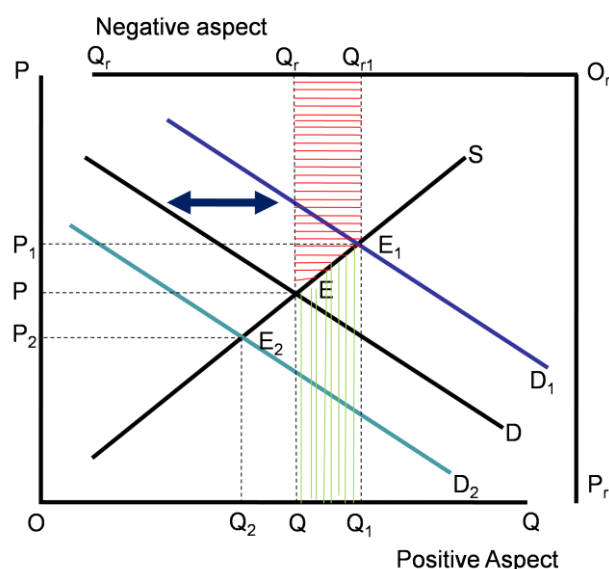
that it axiological benefits can really guarantee the fulfillment aspect of morality and religious values. As a form of repair this weaknesses, then was made up the new curve as follows:


Figure. 4.
Shift of Demand Curve with benefit Overview

The curve above is given additional Qr axis that shows the reflector of the axis Q, and Pr axis which is the axis P. The function of reflector axis is for view and measure the impact of behavioral activity, which is the standard size is a benefit to society. If the benefits of economic transactions was negative for society, which is characterized by neglect aspects of morality and values religiosity, then the impact is measured through Q-axis reflector (Qr). Conversely, if the positive benefits for social community, then the impact is measured from the axis Q usual.

Based on the above image can be exemplified, for example, an economic transaction price increases due to fixed supply but demand is increasing, it can be analyzed by two viewpoints. First, if an increase in demand from D into D1 does not cause negative excesses to people's lives, which is marked by the fulfillment aspect of morality and values of religiosity, the impact is also positive. Economic increase commensurate area EE1QQ1 . The transaction should be supported because there benefit for many people generally. Second, if the increase in demand from D to D1 will lead to excess negative to people's lives, which is characterized by the non-fulfillment aspect of morality and values of religiosity, which is an example of real such as transactions financed out of the proceeds of corruption, financed from the result of illegal deforestation , consumption goods and services that forbidden by religion, deals with the political hidden agenda as money politics and so on, need to be seen from the origin point reflector (Or). When viewed from this point, although economic transactions increased (when viewed from the origin point (O)), which actually happened was a decrease in the values of the economy itself. The decline amounted EE1QrQr1 area. Thus, such transactions do not need to be supported.

Similarly, what happened on the supply side. Figure 5 below, which shows a shift in the supply curve is based on a review of benefits, explaining that the supply can be increase and also can be reduce. Addition of supply will shift the supply curve to the right side, while the reduction will shift the curve to the left. All related to price. When the number of deals

decreased while demand remains then the price will increase, and if the supply is increases while demand remains, price will come down. The mechanism can be described as follows:
Figure 5.
Shift of Supply Curve with Benefit Overview

On the market that amount of demand is fixed, the price of goods could rise because of the number of deals decreased. Decreasing this offer can be caused by two things: first, a mechanism that occurs naturally, duly, and without any engineering (usually this happens there is a perfectly competitive market). Second, the mechanisms involved in engineering with the aim of raising prices. Things like this usually occurs in monopolistic market conditions (read: monopoly bidders allowed to do).

On the first mechanism, the price increase would reduce consumer surplus, and the surplus was transformed into the benefit of the seller. Surplus area which transformed commensurate with area P1E1EP. Consumer surplus diminishing commensurate it, and area of surplus producer be increase commensurate it. Throughout the mechanism that is natural, it does not matter. Because of something that happens naturally in the review of moral or religious reasons is legal. But if that happens is because of the role of engineering to raise the price of goods, in addition to reduced consumer surplus area covering earlier, the seller actually suffered a real losses. Precisely due to the (seller's) behavior, they has decrease morality commensurate with Pr1E1EPr area. What is gained from the economic benefits of actions was not comparable with the decline of morality as a result of his actions. The economic benefits to be temporary, but the decline of morality can be very long, even must be accountable to God, in the afterlife. Therefore, Religion teaches that the behavior that leads to tyranny, as do sellers in this discussion, must be avoided. Because it was included destructive behavior.

As a result of her destructive behavior, actually does not have to just wait for accountability in the Hereafter, but its impact in the world can be directly felt. In a perfectly competitive market, for example, a seller who does such behavior like this would soon be abandoned by consumers. When the seller abandoned by consumers, then the destruction of businesses already occurred. In the monopoly market there is a dependency of consumers against the seller. But the monopoly behavior itself is already constrained by rules that prohibit monopolies, such as the law on anti-trust, the establishment of commission for competition oversight, and the like.

Discussion Philosophically

In reality, human beings can't be separated from the role of religion, be it religion that is classified as heavenly religions nor non-divine religions are often termed civil religion. The role of religion is important for humans because as underlying of belief about supernatural power, and by human was termed as the Lord. Known as the supernatural power, because that power is the source of all power, including the power that is in man. Therefore, humans are generally subject to the power of the supernatural. However, this submission is generally associated with consciousness. When the man was aware of the presence of the One who supernatural, then people would obey. But if consciousness is decreasing, even if up to the point of unconsciousness, then it is not perceived supernatural powers. Thus, the underlying issue is the awareness of God's presence.

Human consciousness toward God is generally highest when the human being is in the area of religion. When the man was outside a religious context, for example in the areas of politics, economics, law, and so on, often people do not realize that God is always present. On this sort of thing, as if happens dichotomy that religion is at *theocentrism* context, and non-religious are at *anthroposentrism* context. Whereas, in the reality human can't be separated from God. Therefore, the two contexts should be integrated into a single concept, namely *theoanthroposentrism*. So people #always realize that God is who created man, therefore, humans must worship him. The use of reason in life is always framed by the worship of God.

Accordingly, Islam has demonstrated great teaching that underlined this *theoanthroposentrism*. Lord with all his powers provide an opportunity for man to use his reason to act, and his actions will be accountable. Forms what will be accounted for by humans has been demonstrated based on divine revelation conveyed by the Prophet Muhammad, which noted in the Al-Quran and Al-Hadith. Human actions framed by a vision of rahmatan lil'alamin. This means, that any human activity should lead to the responsibility before God Almighty.

In the context of the theory of the Supply and Demand Marshallian above, this theory simply laid on anthropocentric position, which seems out of context of human moral values and religious teachings. As a result of human behavior that is detached from the teachings frame of this religion, the economic aspects size is only limited to the size of the monetic character. Never measured based on moral values and religious teachings. Thus, on the theory of supply and demand Marshallian it clearly showed a separation between economics and religion. The impact is, human behavior was entirely accounted for by the man himself, so the size is right or wrong only about the size of a useful or not for the man himself. The more that a lot of useful, then it is a good action. Because the standard size is monetic value, then goodness is simply measured by the accumulated value monetic as much as possible. This mindset is the style of capitalism, which corresponds to the teleological-individualistic behavior.

The impact of teleological-individualistic behavior is the emphasis on achieving the objectives for the pleasure of the individual alone, regardless of social interest. This kind of behavior is usually referred to as hedonistic. Of course this is different from the teachings of Islam's emphasis on the balance between individual interests and social interests. Individual interests should be sought, but social interests should not be ignored. There is a communitarian values that should be considered. Thus, all behavior in Islam leads to harmonization, between individual and social, between humans and other creatures, as well as between man and God. This harmonization is a form of equilibrium, which also means minimizing conflict.

Marshall's theory is teleological-individualistic, this actually could also be oriented to social. However, the nature of sociality that is displayed will be patterned utilitarianism-Benthamian which has credo "the greatest happiness of the greatest number" (Suseno, 1997). This creed

when embodied in the policy will overlook the minority, because only oriented to the interests of the majority. Of course this is different from the Islam that obliging Muslims to empower minority parties.

The discovery of weaknesses in Marshallian's theory that does not mean to close all the forces in the theory. The strengths of theory still be recognized, and that weakness to be overcome. By addressing weaknesses like the discussion above, it means that has brought the Marshallian's theory of supply and demand have become theory of supply and demand universal-ethical. That is, this theory can be used universally by promoting ethical values, which derived from moral values and teachings of Islam. Therefore, the thoughts of Marshall still adopted, although there are additional reflector axis.

Conclusion

Marshallian's theory of demand and supply is the result of a long dialectic through various discussions conducted by previous thinkers. It therefore has the power that can be used universally. Only, his character which is anthropocentric led to the theory stop at the level of teleological-individualistic that ignore the social aspect. Although basically the theory of Marshall could be implemented in the review of social, but the ends of the stops on utilitarian theory that ignores the role of the minority. Character as it causes weakness in the theory of Marshall there on a moral aspect, especially if judged by the teachings of Islam. Due to the maturity of Marshall's theory is not in doubt, the weakness in the moral side of this, by the author, repaired with theoanthropocentris paradigm that takes into account the moral values and teachings of Islam. The shape of the correction is done by entering the reflector axis. The presence of reflector-axis is able to look at the role of moral and religious teachings. Thus the new supply and demand curves follow universal-ethical pattern.

PROBIT LOGIT ANALYISIS ON ECONOMIC CRISIS INDICATOR
CASE STUDY: INDONESIA

Senna Gumilar, Universitas Indonesia, Indonesia

Abstract

In regulation of law no. 4. 2008 on Financial System Safety Net (FSSN/JPSK in Indonesia) Chapter I Article 1 Paragraph 2 state that financial crisis is a financial condition that has failed to effectively carry out its function and role in the national economy. Economic crisis in Indonesia is an event that indicates that mitigation aspects that play a role in preventing crises have failed to carry its preventive measures. This study tried to propose an early warning system that can predict the incidence of the economic crisis as crisis prevention efforts. The economic crisis that is discussed in this study is the financial crisis, banking crisis and debt rescheduling. Model development of early warning systems is done by binary logit regression method. Crisis dating also selected in order to make validation tools of crisis dating. In the process of model development, this study uses data from the macro economy 1986Q1-2008Q3 year. The independent variable is the economic indicators of some previous studies derived from macro-economy. The dependent variable of the model is the 24-month crisis signals derived from the economic crisis dating method by KLR (Kaminsky and Reinhart Lizondo), Zhang, KLR modified and Zhang modified. Parameter estimation process performed by using the enter method, stepwise backward, and Stepwise forward. Selection of the best models take into account the number of variables included in the model, the goodness of fit, the error value, and hit ratio.

Of the 26 economic indicators, only 13 indicators were used as independent variables to estimate the model. Results in each model predictions indicate that there are four variables included in the model (the financial crisis), 8 variables included in the model predictions of the banking crisis, and the 13 variables included in the debt crisis predictions model. The model was validated using a sample hold-out as many as 23 observation data and produce a level of 87.1% hit ratio for the financial crisis, 72.3% for the banking crisis, and 75.45% for debt rescheduling crisis.

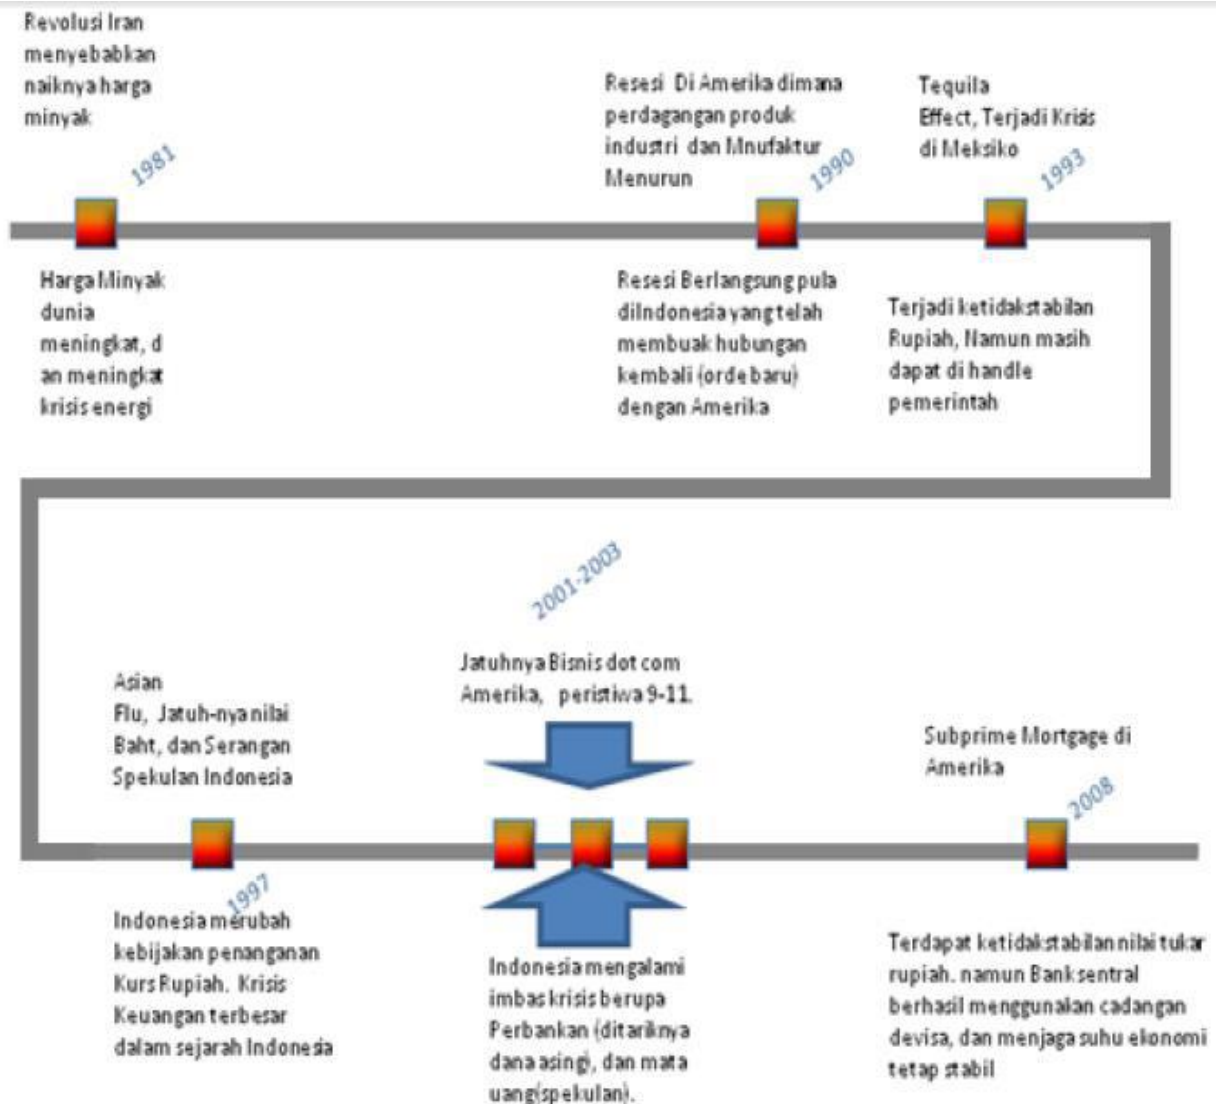
The best crisis dating chosen is KLR method. Selections of crisis dating methods are performed by comparing the signal to noise ratio (signal to noise ratio). KLR method selected with a value of 6.7.

Keywords: *Early Warning System, Economic Crisis, Binary Logit Regression, Crisis Dating*

Background

In the 1990s, the world has experienced four times the wave of crisis. Causing downturn in economic activity (recession America, Tequila Effect, the Asian Flu, and "9-11"). The same is repeated in the 2000s caused by Subprime Mortgage, an incorrect application on mortgage loans in the United States who have a spread impact to not only housing, but also the financial markets, industrial sectors to the government in the United States that indicated with their massive bail out by the government in the industrial sector. Some of World Bank Records that many events indicating the event of economic crisis as shown in the time line pic below.

Time Line Krisis (Dunia)
Crisis is a dating of condition where financial condition has failed to effectively perform its functions and its role in the national economy (Regulatory Act of 2008 FSSN 4 Chapter I Article 1, paragraph 2/ Undang-undang JPSK No.4 Tahun 2008 Bab I pasal 1 ayat 2 (ind)). While the economic crisis is an event where the economic system are no longer capable of sustain its healthy activities (Borg, 1996).

It can be seen in Figure 1.2 that Indonesia have occurred eight crisis times. But the perceived worst crisis occurred in 1997. As the impact of this crisis, economic activities became paralyzed because as more and more companies are closed as well as rising unemployment. This is compounded by the natural disaster that comes in repeatedly, namely the failure of the rice because of drought the worst over the last 50 years, pests, forest fires massively in Kalimantan, and riots (reforms) that hit much of the city in mid-May 1998.


Interestingly, in June 1997 Indonesia was in a condition that far from the crisis. In contrast to Thailand, Indonesia have low inflation, trade surplus of more than 900 million USD, the currency supply outside the huge, more than 20 billion USD, and the bank sector were good (worldbank.com). The crisis in 1997 began with an attack originating from the country of Thailand this was further compounded by structural weaknesses in Indonesia's economy. Domestic trade regulations are rigid and the import monopoly that makes economic activity becomes inefficient is an example of such weaknesses.

At the same time the lack of transparency of financial data makes the occurrence of uncertainty, so that the entry of foreign funds that pass through a weak banking system is not detected (Tarmidi, 1999).

From the table below, it is shown that a sizeable foreign exchange reserves and the realization of the budget still shows a slight surplus is a good indicator of economic conditions at the time. All the causes of the crisis can be sustained by the current economic structure. Money market turbulence that occurs so sudden yet at massive scale in July 1997, when Thailand floated the baht, rupiah began making strong attacked in August.

	1990	1991	1992	1993	1994	1995	1996	1997

On August 14, 1997, floating-exchange regularly exchanged with floating exchange-free. In the state of Rupiah falls, IMF helps with 23 billion USD aid package. But the amount still fell deeper due to investor panic, a low amount of sales, and demand for the US Dollar higher. Rupiah and the Jakarta Stock Exchange touched its lowest point in September 1997. Such conditions lead to economic collapse in Indonesia.

Finally, BI said Indonesia was in a state of crisis on August 14, 1997. Furthermore, BI was forced to lose-free the rupiah exchange rate against foreign currencies (US Dollar) so that the value of the rupiah during the free fall of USD 2450 per USD to USD 13 513 per USD. This crisis occurred when the economic fundamentals in the period was otherwise well and lauded by the World Bank according to the World Bank report for Developing Countries (1997) and Hollinger (1996). Indonesia's economic fundamentals expressed both quite high due to the economic growth, controlled inflation rate, unemployment rate is relatively low, and the overall balance of payments surplus despite the current account deficit, but still controllable.

The government has done a lot of effort in order to overcome the crisis. Those efforts can be divided into two groups based on the time and purpose, namely curative and preventive. Curative measures is the effort made after the crisis and aims to improve the situation were broken when the crisis is over. Preventive efforts are made before the crisis and aims to minimize the impact that would be caused by the crisis. As in good example in preventive measures, Singapore is the only country that did not experience any problems when the crisis in 1997 (Lestano, 2003), at which time all other countries in Asia are experiencing a crisis (that's why it was named ASIAN flu). This is because in addition to Singapore has a good

banking and monetary structure. Another cause is also because the Singapore Government had previously predicted the possibility of a crisis (Straits Times, 1999).

Based on these experiences, Government as represented with Central Bank requires an system system that able detect the occurrence of the financial crisis, the banking and debt rescheduling, as an effort to increase the nation's readiness in the face of economic crisis.

Later on we will mention it as Early Warning System (EWS). The concept of EWS which is a system that consists of a precise definition of the crisis and its mechanism in predicting the crisis (Edison, 2003). This concept needs to be applied to both the economic system that runs. It aims to increase the readiness to detect the onset of the economic crisis long before the crisis took place, making it easier to take preventive measures and recovery plans before the crisis occurred.

Type of crisis discussed in this study are three, namely; the financial crisis, banking, and debt rescheduling. The financial crisis is a crisis of the most common. This crisis is characterized by an increased index of price pressures in the money market ended at currency inflation. The banking crisis occurs in the banking system that will have an impact on the real sector sustainability as the backbone of the economy. The banking crisis can to be stated as an indication of a financial crisis. Rescheduling debt crisis (debt crisis) due to the inability of a country to conduct its foreign debt payments on schedule. The debt crisis can be said to be indicators of problems occurring in a country on its ability to pay its foreign debt.

Theoretical Background
1. Economic Crisis
The essence of macroeconomics is how running / functioning of a country's economy as a unified whole (Blanchard, 2000). Beside the interaction between GDP, unemployment rate, and the index of the prices in order to understand how the economy works the failure of the system should make into concerns. According to Bordo, et.al. (2001), the economic crisis is a situation where the economic system is not failure by one economic system to do its job correctly.

According Dumitrescu (2009) crises are categorized into four parts, namely, the banking crisis, the financial crisis, the double crisis, and crisis of all. However, the most common is the financial crisis over the termination of the Bretton Woods system. Until 1930, most of the focus of economics are in the industry and the company. But when the great depression (big depression) attack the United States in the year, and then supported by the development of the concept of national income and statistical science, scientific macro economy began to grow. According to Mark (1986) described by Blanchard (2000) At the time of the initial ideas for the macro economy comes from J.M Keynes, which uses the concept to explain fluctuations in aggregate demand for between output and unemployment. The economic crisis resulted in losses on the macro economic situation, in which entities at the macroeconomic consists of governments, communities, businesses, and overseas. In this section will discuss the history of the crisis in Indonesia, the definition of the crisis are discussed in this study and the indicators that influence the onset of the crisis.

2. Crisis Definition
In this research will be discussed about the economic crisis that consists of a Financial Crisis, Banking Crisis, and Debt Crisis. Currency Crisis (CC) According to Kaminsky, et.al. (1997), which was mentioned again by Tambunan (2002), crisis is defined as situations where the impact of an attack on a country's currency against the sharp depreciation in the value of the currency, a large decline in foreign exchange reserves, or a combination of both. While the crisis according to the laws and legislation FSSN in Chapter I of Article 1, paragraph 2, states

that the financial crisis is a condition that has failed to effectively perform its functions and its role to sustain the stability national economy.

In the measurement, many economists has done efforts in developing methods to measure the pressure of currency, and dating on the financial crisis. Eichengreen, et.al. (1996) are some of the economists that measure pressure as the base currency crises calendar. Definition dating on the research is inspired by the monetary model Girton and Roper (1997) where the value of an index that consists of weighting the relative changes in the exchange rate, foreign exchange reserves, and interest rates that exceed certain limits. In this study, the probability of occurrence is considered independent to the time of crisis.

Dating methods by Eichengreen, et.al. (1996) is widely criticized so many other alternatives calendar methodology is the development of this method. Kaminsky, Lizondo and Reinhart (1998), and Kaminsky and Reinhart (1999) following the methods generated by Eichengreen, but by eliminating the element of lower interest rates because interest rates have been regulated by the Central Bank in the study sample (sample in 1970s until 1980s). Significant changes are also made by Zhang (2001) in the context of the crisis calendar. Zhang (2001) conducted a dating method by imposing limits on the indicator as great influence each other and independent of time.

In this study conducted a comparison of four types of calendar according Lestano and Jacob (2003) is the best dating methods. The method then will be called KLR, KLR modified, Zhang and Zhang modified methods. The use of the word "modified" in previous research is to take into account interest rate index as the determinants of price pressures. Banking crisis (BC) Is the crisis that occurs when there is a decrease in bank capital and ther repairing costs for the stability is high (Caprioand Klingebiel, 1996). Lindgren et.al. (1996) defines banking problems as "significant extensive short unsoundness of crisis" where the banking problems are localized regional problem and does not require great effort in his healing. The banking crisis means that their event where the failure of the banks, or a change in the portfolio have impacts on the collapse of financial institutions, or government interference. This study made a list of the banking problems of know-1980s to mid- 1996 and included 181 members of the IMF.

Dermirg¨uc¸-Kunt and Detragiache (1997) defines a banking crisis as an incident in which the ratio of the pressure of banking assets that do not work in excess of 10 percent and recovery costs exceed 2 percent of GDP. Kaminsky and Reinhart (1999) marked a banking crisis as an event where; (i) the failure of banks leading to the closure, merger or acquisition by one or more financial institute. (ii) the existence of a massive bail out support from government on one or more financial institutions, followed by the subsequent assistance. The crisis is stopped until the completion of the government's intervention to the issue.

Scheduling Crisis Debt/Debt Crisis (DC) The crisis is interpreted as an approval of the debt crisis in the rescheduling of debt payments, or negotiation, the remaining debt and unpaid debt, and the IMF agreement with a country (Lestano, 2008). This crisis indicate that there is something wrong in a country, so that the country can not pay its debts as well. Some studies used a combination of the definition of the debt crisis, others use a single event, or even measuring the amount of debt that is scheduled, or remaining debt on a country. Berg and Sachs (1988), Lee (1991), the Balkans (1992), Lanoie and Lemarbre (1996), and Marcessi (2003), has a similar definition of the debt crisis is an event where there is a debt rescheduling of a debtor country to the creditor.

More broadly, debt rescheduling is defined as the mechanism by which the debtor offers to creditors, a new contract that allow the debtor does not perform a default. It could be by extending maturities, and delayed payments, debt relief, reduction of budget ceiling; and others. The approach used by McFadden, et.al. (1985) and Hajivassiliou (1989.1994) is to include all three elements in the crisis of debt rescheduling. It is the existence of unpaid debt

from interest payments, as evidence of the problems of a country in debt. Besides the event of a rescheduling of debts, the intervention by the IMF related to debt payments, and the amount of arrears that exceed the minimum limit.

3. Economic Crisis In Indonesia

Economic crisis that occurred in Indonesia, began to be documented in 1980. The causes of these crises and timeline can be seen in Figure 1.2. The picture shows the incidence of crisis is starting to look and had enough impact on Indonesia condition. Previous events did not show a significant impact on the macro-economic conditions of the state of Indonesia, so it is not included on the timeline. In 1981, the revolution happened in Iran impact on declining oil production. This causes the oil production in the country and other countries in the Middle East to be very high. Countries with a high level of industrialization and requires supply of fuel also affected. The decline in production and price volatility in developed countries provide immediate impact on developing countries including Indonesia. (Meyer, 1990).

Up Until 1997, external noise doesn't seem to have impact on economic condition in Indonesia. Besides the impact is not so great in the ASEAN countries, the government was still able to stabilize the currency turmoil that occurs with high foreign exchange reserves. One crisis was in Indonesia timeline marker is no longer buffered by the enactment managed-float system on the real price of the currency. In 2011, the biggest crisis occurred because of an epidemic of the so-called Asian flu in Asia. Starting from the collapse of the financial system of Thailand, and Indonesia also affected. 2008 was the year the financial crisis in Indonesia. Attacks that cause these events are examples of external attacks that caused the crisis in Indonesia. It started in the United States with the subprime mortgage cases. It caused panic and withdrawal of foreign capital, especially from America. The impact of this is significant panic that caused the suspense of JCI /IHSG (ind-red) for some time due to a fall in some stock prices sharply due to panic investors.

4. Economic Crisis Indicators

Basically, the calculation of the effect of macro-economic indicators in developing countries more by GDP than the GNP (Ghafari, 2007). This reason is an indicator of the various sectors that affect economic growth in Indonesia. Based on the International Standard Industrial Classification (ISIC) economy sector is included. That means Agriculture, Mining, Refining Industry, Electricity, Energy, Water, Building, Trade in Services and Hospitality, Transportation & Communications, Financial Institutions, Leasing and Business Services and others are included.

The state budget has three functions, namely allocation (to provide public goods are not supplied by private), distribution (role in lowering the income gap between the layers of society), and stabilization (by maintaining macroeconomic stability and high growth that adequate employment opportunities). Balance of payments, illustrates the relationship of payment for trade, services, and capital between countries to another for a given period (IMF, 2006). Generally have the following structure; Current Account, the balance of trade (exports, imports of goods) and the balance of services (production factors remuneration to be paid and obtained from abroad). Capital Account, calculate capital inflows and capital out of capital both government and private capital. Monetary Movement, the total number of BOP, if negative, the surplus, if positive then the deficit. In this study, the economic indicators that affect financial crises are grouped into four sectors according to studies conducted in crisis detection. In the Appendix A it described macroeconomic indicators that considered having the strong significance with crisis events. The first three columns show the name of the indicator and the reasons why the selected indicators. The next column shows the indicators of the study who gained. The last three columns show hypothetical indicators on the financial

crisis, banking, and debt rescheduling. A plus sign (+) indicates a strong correlation to the economic crisis instead (-) indicates a weak correlation to the crisis is concerned. The last column is from research which found indicators.

5. Multivariate Analysis / Binary Logit Regression

Multivariate analysis is the application of statistical methods in order to analyze multiple variables associated with the object being studied. Application of multivariate analysis is there in different fields, one of the problems that often use this type of analysis is the classification. Problems concerning the classification of frequently encountered in everyday life, the problem may be related to the fields of marketing, finance, operations, and others (Hair, et. Al., 2006). In multivariate analysis, there are two commonly used classification methods, namely discriminant analysis and binary logit regression. Kurt (2006) as cited by Permana (2009) mentions that a binary logit regression classification method is quite good compared with discriminant analysis, at least when there are metric or parametric as the independent variables formulated.

Binary logit regression is a form of regression is used to predict a category and binary dependent variable. It will generate a binary logit equation with multivariate relationship between several independent variables and the dependent variable. The dependent variable (Y) in the form of two categories denoted by 0 and 1, while the independent variable (x) are variables that can predict the probability of occurrence of Y. In binary logit regression, the dependent variable can be either metric or non-metric, for the case of independent variables has more than two categories, which can be used multinomial logistic regression to find a solution. Besides the size of the sample, the Hair (2006) suggested the number of samples to perform binary logit regression is 400 observations / sample and each category has at least 20 observations.

The use of binary logit regression is commonly used in fields such as medicine, marketing, and others. In the marketing field for example, the formula can predict whether a person would want to make a purchase or not. The dependent variables in such cases are define to when someone who bought a similar product (Y = 1) and one will not make a purchase (Y = 0). Independent variables used relating there to, for example, income, age, gender, and occupation. Binary logit regression model the dependent and independent variables through the transformation of the dependent variable into logit variable as the natural log of the odds ratio. So, if the dependent variable is represented by (Y) and the independent variable number n is denoted by x '= (x1, x2, x3, ... xn). Probability results denoted by P (Y = 1 / x) = (x). Equation 2.3 and Equation 2.4 shows the logit equation of logit regression and logit regression models and π (x) is a great probability of the occurrence of an event.

$$g(x) = \ln \frac{P\ event}{1 - P\ event} = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_3 x_3 \ldots + \beta_k x_k \quad \ldots\ldots (2.3)$$

$$\pi(x) = \frac{e^{g(x)}}{1 - e^{g(x)}} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (2.4)$$

Where
G(x) = Logit Equation
Π(x) = Probability occureance of an event (Dependent Variable (y) equal to 1)
X = Independent variable
B = logistic discriminant coefficient logit form
Binary logit results in the form of binary numbers (between 0 and 1), requires that the output is at 0 and 1. Therefore, the relationship between π (x) and the independent variables

expressed in logit curve that has the shape of a curve like the letter s, called sigmoid curve. The lower the value of the independent variable, the closer probability occurrence to 0, the larger, the more corresponding curve approach to 1. If the probability value is above the cut-off value (this research will use 0.5), then the output will be ranked on the dependent variable = 1, otherwise if the dependent variable is close to 0, it will be classified on the dependent variable = 0. Economic Crisis The essence of macroeconomics is how running/ functioning of a country's economy

Problem Statement

Based on the background, we need to find a best-fit early warning system in such extent to a model that can be used to detect the financial crisis, banking, and debt rescheduling in Indonesia in order to increase preparedness in the face of external attack
Questions then evolved into:
• What kind of Crisis researched this study? How to determine the event that crisis?
• What are the indicators that involved in this research?
• What are Variables that influence the incidence of the crisis?
• How binary logit regression method can be done in the search for a model detectors economic crisis in Indonesia?
• What kind of models generated from these methods?
• What is the application of the model in the form of early warning system, and what kind of implementation?
• In what ways have these applications can improve government readiness in the face of external attack?.

Research Object and Methodology

The research methodology in this thesis is made in the logic order of problem solving in a systematic and clear ways. Every stage of the research is very important to conduct scientifically accountable and easily understood.

1. Research Design

Broadly speaking, the research carried out by the method of literature study, data collection, implementation of the entire indicator model of economic crisis, as well as modeling early warning system for the Economic Crisis. The whole scheme of this study illustrated in the diagram below:

2. Research Implementation
A. Literature Study

The literature study was conducted to understand the theories and troubleshooting tools that are required in the study. The theories were studied include macroeconomic theory, economic crisis, and the Early Warning System. In addition, the application of the theory of SPSS as a data processor and the dashboard concept as data publishers has also been studied. Results from studies conducted literature can be found in theories.

B. Research Variable Indications

After the study of literature and field research, then we move towards to more technical studies. At this stage, we indicate variables that expected to affect the onset of economic crisis in Indonesia. The variables of this research are the collection of reliable indicator affects the crisis that comes from several studies on the economic crisis. Lestano (2003) and Dumitrescu (2009) is a reference in determining what variables can be given more attention in the context of predicting the incidence of crises.

C. Data Collection

Because the study focuses on understanding, models, and indications of anomalies in the economic system, then the data requirement is considered important. The validity and accuracy of data is a top priority at the step of this research. In this study collected economic data which will be processed into indicators of the economic crisis. The data will became the basis for the determination of the occurrence of a crisis.

International Financial Statistics (IFS), a collection of financial statistics of states, created by the International Monetary Fund (IMF), is one of the sources used in this study. Due to limited data because the number of missing data, the modeling of the data used is limited to the 2008 second quarter.

D. Variable Reduction for Crisis Determination

The reduction process variable is done in two ways. The first, it carried out due to lack of observational data, perform data processing beginning to look for arrangement allowing for regression analysis. These heuristic methods produce economic indicators used as independent variables.

The second process is carried out by factor analysis of each variable. Apparently due to data shortage, The results of factor analysis was not possible to be implemented the binary logit regression model in this study.

E. Model estimation

This part of the researches will describes the steps in building and designing prototype models in.

1. Data Processing and Modeling Crisis

Data processing associated with crisis models generation done by collecting economic data, contained on paper (Kaminsky et al, 1998 and Dermirg¨uc¸-Kunt and Detragiache, 1997) that discussed the indicators of crisis. The basis of measurement models of this crisis more emphasis on indications in the Indonesia's balance of payments. Analysis were made of factors that indicate an effect on the financial crisis occurrence. Before performing the analysis, there are several stages to go through as described in Theory. The stages are as follows:

● Crisis Dating Crisis definition as the application of economic crisis is one of the issues that needed to be clear in this study. This process is hoped to able to distinguish between crisis and no crisis condition. Later it will be needed for signaling process to be more valid, based on the historical data available.

● Definition of Data Needed To perform the analysis of the characteristics and the measurement crisis risk level, the data relevant to define and influence the occurrence of a crisis is necessary. Macroeconomic data are pieces o will be used in conducting the analysis. To facilitate processing of data, these data need to be structured and categorized in advance. The data used is based on the sources of previous studies regarding detection.

● Data Sourcing and Preprocessing At this stage, we collect, filter, and transform the data. Data filtering is done to solve the data that has no value or data that does not make sense, while the data transformation processes include processing and calculations need to be done so that the data can be used as inputs into the model were designed. In addition to the treatment of missing data was done, one of them with a hot-cold imputation to fill the data needed (example of World oil price/WOP data).

2. Alternative Evaluation and Selection Model Prediction for Early Warning System: The binary logit regression

In this phase, we evaluate and select of alternative models that will be used to predict the crisis in the early warning system to be designed. We had two major steps in this research, the first characterization of the crisis process that uses multiple models dating the crisis and the process of getting the signal crisis of crisis. Then, we formulate the economic crisis model by using variables generated and used in the first step.

● Crisis Characterization Crisis characterization is made to determine the behavior of crises that have occurred in Indonesia. The use of this model aims to divide the indicators which are likely to affect the crisis. In this scheme, there are three stages to be made are: (i) identification of calendar crisis, (ii) a decrease in the calendar to get a signal crisis of crisis, and (iii) the classification of economic indicators into classes based on the crisis. In practice, there are several methods that can be used as mentioned in the Background Theory.

● Crisis Warning Model There are two stages to be carried out in designing a crisis warning models, namely the determination of the variables used in measuring the crisis and the detection process of the crisis. The determination of the variables that will be used to measure dealing with the crisis conducted by examining the correlation of variables will be considered in the measurement of crisis. This phase is done with the treatment of several scenarios of predict income variables in the model calculations. The output of this stage is getting the right composition of variables to build the model of crisis. The second stage is to build a model of crisis by using binary logit regression method. This method was chosen because of the many advantages that have been described in theories. The output of this stage is the emergences of models that can be used to detect the crisis, based on the variables in this case are economic indicators

3. Model Verification and Validation

In this stage we tested the design in accordance with the expected bank researchers and parties. This testing includes verification and validation. This process is carried out as mentioned in theories. Hold-Out Samples used in this process. The results will be compared with the model that has been built to see if the model is valid or not.

Analysis

At the beginning of the data collection process, We collected data from IFS IMF output edition August 2010. The data is taken from financial data for the state of Indonesia, which is marked with the code 62, of the time in 1960 Q1 to 2010 second quarter. While the data collected include the exchange rate, financial condition, liquidity internationally (including reserves), the state of the Central Bank, the state of the real sector recorded state), derivatives of money, interest rates, foreign exchange flows, balance of payments, foreign investment and the financial situation of the Indonesian government.

The number of observations obtained is 200 data. However, because of the data incompleteness, we used 190 observational data, from 1961 first quarter to 2009 fourth quarter. These data have not been revealed to be macro-economic indicators. These data are incomplete from IFS that cultivated filled from the World Bank. For global economic data, we took IFS code for the United States Treasury Bill Rate, and the exchange rate of the USD, while the price of world oil obtained from oilprice.net.

1. Data Processing

In the data processing activities, we compiled form previously obtained data. From the study found 26 variables indicating an indicator of the economic crisis. For the assessment of current account, we used Real Exchange Rate (REX), Export Growth (EXG), and Import Growth (IMP), Term of Trade (TOT), and Current Account Year (CAY) (Kaminsky et al.

(1998); Berg and Pattillo (1999); Kamin et al. (2001); Edison (2003); Dermirg¨uc¸- Kunt and Detragiache (2000); Lanoie and Lemarbre (1996); Marchesi (2003)). For External Sector (Capital Account), we used Ratio of M2 to Exchange Reserves (MFR), and Growth of Foreign Exchange Reserves (GFR) (Kaminsky et al., (1998); Berg and Pattillo (1999); Kamin et al. (2001); Edison (2003); Dermirg¨uc¸- Kunt and Detragiache (2000);). Financial Sector Mengginalan Growth in M1 (GM1), growth of M2 (GM2) Multiplier M2 (MMM), ratio between Domestic Credit to GDP (DCT), The remaining balance of M1 (ERM), Interest Rate Annual (RIR), The ratio of Love Flowers Borrow and Save (LDS), Commercial Savings Bank (CBD) and the ratio of Reserve Bank (RRA) (Berg and Pattillo (1999); Edison (2003), Kamin et al. (2001)). Indicators used to represent the real sector, which is the ratio of tax to GDP (FBY), Public Debt to GDP (PBY), Growth of Industrial Production (GIP), Changes in Stock Prices are integrated (CSP), Value Inflation (INR), GDP per capita (YPC), as well as the growth of national savings (NSR) (Kamin et al., (2001); Lanoie and Lemarbre (1996); Berg and Pattillo (1999)). Global Growth sector indicated with world oil prices (WOP), American interest rates (USI), and the growth of world industrial (ICY) (Edison (2003); Kamin et al. (2001)).

In a previous study Real exchange rate are used deviation from trend as transformation. However, in this study the real exchange rate of the currency is a real value. This is because at some observations currency values are the same (on 1969Q1-1970Q1, 1970 Q3-1971Q2, and on 1971Q3- 1978Q3). So it does not give the actual value at the time of the trend seen (usually per month).

2. Crisis Dating

The process of the financial crisis dating are used to select the best methods of research results (Dumitrescu, 2009), which states that the method Kaminsky Lizondo Reinhart (hereinafter referred as KLR), Zhang, and the second dating method that has been modified by Lestano (2003) is a dating method best in detecting crises, KLR method is a method of measuring pressure of the crisis which was designed by Kaminsky, Lizondo and Reinhart (1998). This method uses the price of the currency market with a relative change of the ratio of foreign exchange reserves. KLR modified model (KLRm) according to Lestano (2003) is a modified model using interest rates as variables are discussed. Zhang method is dating method created by Zhang (2001). The uniqueness of this method is that this method uses dynamic threshold value. This method is one method that is considered the best by Dumitrescu (2009). The fourth method used is a method in which Zhang has been modified to use the timeframe is two years behind (t-8).

Meanwhile, to measure the incidence of banking crises and a crisis of debt rescheduling, this study used data from several previous studies on the incidence of the crisis is concerned. Additional data requested to complete. from sources that can be trusted, such as news and other similar studies. News searches conducted by the basic theory described in the dating crisis theories. The result of the banking and debt rescheduling crisis generate 13 times frequency of the events that can be seen in the following table:

Tanggal	Kejadian
November tahun 1992	Jatuhnya Bank Summa yang juga menjatuhkan tiga bank lain
November tahun 1997	Pemerintah Melikuidasi 16 Bank
Desember tahun 1997	Bank Indonesia Mensubsidi Likuiditas bank komersial sebesar 5% dari GDP
Januari tahun 1998	Pemerintah Menjamin Simpanan Deposito Nasabah 100% terkecuali Bank International
April tahun 1998	Pemerintah menutup tujuh bank swasta : Bank Surya, Bank Subentra, bank Istimarat, Bank Pelita, bank Hokindo, Bank Deka, dan Bank Centris
Mei tahun1998	BCA diambil alih oleh Pemerintah. Bank Nusa Int'l, Bank Angkasa, dan Bank Nasional Komersial di merger menjadi Bank Nasional
Agustus tahun 1998	Pemerintah menutup tiga Bank Swasta: Bank Umum Nasional, Bank Modern, Bank Dagang Nasional Indonesia. Dan mengambil alih, Bank Danamon, Bank BCA, PDFCI, dan Bank Asia Tara. Bank Jaya Int'l , Bank Arta Media, dan Bank Ciputra, di merger menjadi Bank Mashill
Oktober 1998	Bank Dagang Negara, Bank Bumi Daya, Bank Pembangunan Indonesia, and Bank Exim merger menjadi Bank Mandiri .
Maret 1999	Pemerintah Memuutp 38 Bank Swasta Nasional
Juni 2000	Bank Danamon Merger dengan 8 bank swasta
Oktober tahun 2000	Pemerintah menutup dua bank swasta nasional , Bank Prasidha Utama dan Bank Ratu
September tahun 2002	Pemerintah Melakukan Merger 5 bank nasional : Bank Bali, Bank Patriot, Bank Universal, Bank Prima Express, dan Bank Artha Media
Juli 2009	Pemerintah dan Bank Indonesia melakukan *Bail Out* pada Bank Century dalam upaya pencegahan krisis

Penjadwalan Hutang	Kejadian
Desember 1966	*Re-schedule* Hutang negara
Oktober 1967	*Idem*
Oktober 1968	*Idem*
April Tahun 1970	*Idem*
Juni tahun 1998	Persetujuan restrukturisasi 80,23 milyar Dolar
september tahun 1998	Bantuan penyembuhan krisis
April tahun 2000	Penjadwalan ulang pembayaran hutang disesusaikan dengan harga pasar. Hutang diatas 15 tahun diberikan kelonggaran hingga 2-3 tahun . Dan hutang diatas 20 tahun diberikan kelonggaran hingga10 tahun
April tahun 2002	*Idem*

3. Selection of Crisis Indicators as Independent Variables

In order to ensure the validity of research data, the chosen few indicators of a crisis has been discussed as an independent variable. Availability of data become one of the filter. Availability of data illustrated as table below.

No.	Var	Pengertian	Rata-rata	Std. Deviasi	Jumlah data
1	REX	Real Exchange Rate	2962,0783	3525,87522	162
2	EXG	Export Growth	,1623	,33919	171
3	IMP	Import Growth	,1482	,25205	171
4	TOT	Term of Trade	,0477	,21335	164
5	CAY	Current Account to GDP	,1918	2,59126	106
6	MFR	M2 to Foreign reserve	-,0220	,16606	49
7	GFR	Growth of Foreign Reserve	,1934	,47414	158
8	GM1	Growth of M1	,1819	,11746	50
9	GM2	Growth of M2	,1853	,16330	50
10	MMM	M2 money multiplier	-,0419	,07275	50
11	DCY	Ratio of Domestic credit to GDP	-,1547	,09585	23
12	ERM	Excess Real M1 balance	2.8712	3.23247	23
13	RIR	Domestic Real Interest rate	175,2006	149,56499	131
14	LDS	Lending and Deposit rate Spread	,6597	,14682	83
15	CBD	Commercial Bank Deposit	,0169	,03859	19
16	RRA	Ratio Bank to Reserve Asset	,2180	,03531	23
17	FBY	Ratio fiscal balance to GDP	-,0150	,02836	30
18	PBY	ratio of public debt to GDP	40,7946	122,88466	162

Due to data limitations, we did heuristic efforts in determining which variables to estimate parameter model prediction of the crisis.. Basically this is done by selecting an amount variable combination with the amount of data required to estimation the process. This process

is done to some scenarios the existence with valid and assumptions-filled results. This process done as a basis of the scenario selections of independent variables.

4. Model Compilation

From these measurements we drafted some modeling scenario that have been mentioned earlier. In brief selection of methods is illustrated as table below Obtained from the previous process, we compiled independent variables used to estimate the parameters of the prediction model is the result of Scenario 2 (Step 3) and Scenario 5 which contains selected economic indicators. The variables were entered into the model are: REX, EXG, IMP, CAY, GFR, RIR, LDS, GIP, INR, YPC, NSR, USI, ICY. The independent variable results of Scenario 5 were used to compare the performance of the model selected.

No	Skenario	Variabel Digunakan	Metode	Hasil
1	Skenario 1	Seluruh (1961 - 2008)	Regresi Logit Biner Metode: enter Penanggalan: KLR	Tidak Ada (Kurang Data)
2	Skenario 2		Regresi Logit Biner Metode: Stepwise Backward Penanggalan: KLR, Zhang	
2.1	Skenario 2. 1	REX, EXG, IMP, TOT, CAY, MFR, GFR, GM1, GM2, MMM, RIR, LDS, RRA, FBY, GIP, INR, YPC, NSR, USI, ICY	Regresi Logit Biner Metode: Stepwise Backward Penanggalan: KLR, Zhang	Tidak Ada (Redundant/Kurang Data)
2.2	Skenario 2. 2	REX, EXG, IMP, CAY, MFR, GFR, GM1, MMM, RIR, LDS, GIP, INR, YPC, NSR, USI, ICY	Idem Step 1, Multikoleniaritas GM2, DCY thd GM1	Tidak Ada (Redundant/Kurang Data)
2.3	Skenario 2. 3	REX, EXG, IMP, CAY,GFR, RIR, LDS, GIP, INR, YPC, NSR, USI, ICY	Idem Step 1, Penghapusan Data Yang kurang	Model Scenario 2
3	Skenario 3	Seluruh (1961 - 2008)	Reduksi Data dengan Faktor Analisis; Idem Skenario 1 (Lestano, 2003)	Tidak Ada (Solusi Tidak Unik)
4	Skenario 4	REX, EXG, IMP, CAY, INR, YPC, NSR, USI, ICY	Pengeloimpollan Variabel dalam Empat Sektor penyebab Krisis Ekonomi (Faktor Analisis)	Tidak Ada (Solusi Tidak Unik)
5	Skenario 5	LDS, WOP, TOT, GFR, CAY	Listwise Regression pada 5 Variabel	Model Scenario 5

The dependent variable used in the construction of the model is a signal of the financial crisis (with the KLR, KLRm, ZHANG, and ZHANGm methods), a banking crisis, and the crisis of debt rescheduling. Detailed observation data are used as many as 89 time period of data. The data is divided into 66 pieces of data for the prediction model parameter estimation and 23 data to perform validation methods hold out. The results of the scenario still are used to analyze what happens when the data are used to estimate the parameters of the data added. The data used in the estimation process are 75 pieces of data. As for the validation sample used 33 data.

5. Crisis Detection Model

Selection of the best model according to Gujarati (2003) are selected based on variables included in the model, the model of which contain significant variables. So in any model estimation method parameter (enter, stepwise forward and stepwise backward), the last step suggested used. In the last step, the model contains the most significant variables. Katz (1999) states that a model with fewer variables is preferable than on that has too many. This is done to minimize multicollinearity, apart from ease of explanation of the model so that it can be understood by various parties. Here are the results of parameter estimation model used on any type of crisis. Alternatives models are built based on three types of parameter estimation method, is enter, stepwise forward and stepwise backward. Step colored column is the end where the opinion Gujarati (2003) is applied.

A. Financial Crisis (KLR)

In the table above, the best model is selected from enter methods Step 1st and Step 10th from backward methods. Goodness of fit value between the two models are not too different. But the model BW Step 10th selected for this model since it has fewer variables and test value HL close to unity rather than a model from the enter method.

Metode	Step	jumlah variabel	(-2LL)	Cox& snell	Negel kerke	HL Test	Hit Ratio		Total Prediksi
							krisis = 0	krisis = 1	
Base		0	80,970				100,0%	0,0%	69,7%
ENTER	1	13	34,114	0,508	0,719	0,285	95,7%	85,0%	92,4%

BW	8	6	37,824	0,480	0,679	0,720	93,5%	80,0%	89,4%
BW	9	5	39,594	0,466	0,659	0,992	89,1%	70,0%	83,3%
BW	10	4	42,013	0,446	0,631	0,979	87,0%	70,0%	81,8%

B. Financial Crisis (KLRm)

The following table contains a summary of the model parameter estimation method. Seen on table below there is one estimation of enter method, two estimation methods forward and 11 backward estimation method. Alternative model chosen is a method enter Step 1st, Step 2nd forward method, and the method of backward Step 11th. In the table above, the best model is selected enter method Step 1st and Step 11th of backward methods. Values goodness of fit between the two models is not too different. But the model BW Step 11th is selected for this model discount fewer variables and test value HL close to unity rather than a model on the enter method.

metode	Step	jumlah variabel	(-2LL)	Cox& snell	Negel kerke	HL Test	Hit Ratio		Total Prediksi
							krisis = 0	krisis = 1	
Base		0	62,586				100,0%	0,0%	81,8%
ENTER		13	29,525	0,394	0,643	0,554	98,1%	75,0%	93,9%

D. Financial Crisis (Zhangm)

There was no difference in the results produced by the dating method of Zhang and Zhang modified. In the table above, the best model is selected enter method Step 1st and Step 8th backward methods. The goodness of fit between the two models is not too different. But this time it will have a method with the enter Step 1st.

metode	Step	jumlah variabel	(-2LL)	Cox&snell	Negelkerke	HL Test	Hit Ratio krisis = 0	krisis = 1	Total Prediksi
Base		0	89,975				100,0%	0,0%	57,6%

BW	1	13	0,000	0,746	1,000	1,000	100,0%	100,0%	100,0%
BW	2	12	16,039	0,676	0,906	0,999	94,6%	96,6%	95,5%
BW	3	11	18,052	0,666	0,893	0,990	91,9%	96,6%	93,9%
BW	4	10	20,222	0,655	0,878	0,988	91,9%	96,6%	93,9%
BW	5	9	21,930	0,646	0,866	1,000	91,9%	93,1%	92,4%
BW	6	8	24,625	0,632	0,846	0,620	91,9%	89,7%	90,9%

The results of the chosen model that built from backward method Step 6th. Selection of the banking crisis prediction model is best done by selecting three alternative methods enter, forward stepwise method step 6th, and backward stepwise method step 6th. Those selection process is taken from the model produced by the estimation method that uses a backward step 6th that include 8 variables in the model. Because the models produced by the enter method, the resulting classification has tremendous value/polar. At the time of validation, the results were not sensitive enough to predict the occurrence of crisis. The purpose of the model is to detect what is the probability of a crisis. With this model, the probability of always reaching 100% or 0%. This does not make decision makers able to distinguish precisely on the result and will made a lot of wrong classification performed in this model (proven in the signal to noise ratio is smaller than the best model). So this leaves two alternative models. Of the two

alternatives have the best model is the model Backward, this is the reason that instead of the Forward, Backward method has the advantages of the various indicators even the number of variables is almost the same.

F. Debt Rescheduling Crisis

Metode	Step	jumlah variabel	(-2LL)	Cox&snell	Negelkerke	HL Test	Hit Ratio		Total Prediksi
							krisis = 0	krisis = 1

BW	12	6	0,000	0,690	1,000	1,000	100,0%	100,0%	100,0%

There was an interesting finding on evaluation of predictive models for reschedule its debt crisis. The results shown from the selection method is the same between forward and backward method. It is claimed that composition of 6 variables on the outcome of forward and backward method is the most optimal choice. So based on the above table, also from the outcome variables included in the model, the model chosen is the result of the model parameter estimation method backward.

For the methods of selecting a predictive model of rescheduled debt crisis, the three selected alternative is the method enter, step 6th of forward stepwise method, and step 12th of backward stepwise method. The process of selecting an alternative model of financial crisis made by visualized at the value of goodness of fit, hit ratio, and the number of variables.

In the estimation process prediction models reschedule its debt crisis, a result of the forward and backward stepwise method showed the same value in terms of the accuracy of the model. This suggests that at some observation, prediction model is able to exactly 100% distinguish a

state of crisis and normalcy. In the validation process capability model in detect crisis turned out to be only 75%. All the best model selection based analysis using ratings from Gujarati (2003), Katz (1999), Assessment Goodness Of the fit of the model (-2LL, R2, Hosmer and Lemeshow test), and hit ratio. This is done because the model validation showed no anomaly of the resulting model.

6. Model Validation

Cut-off values used on all models is a 0.5 as recommended by Hair (2006). Cutoff values used to determine a potentially economic situation can be called a crisis or not. When the crisis occurrence probability value stated above 0.5, then it will be considered a crisis. Otherwise not be considered a crisis. There are no studies that explain exactly how the cut off is ideal in order categorization of a crisis in Indonesia. Then default this study using 0.5 as the cutoff values. Alternative models are validated using hold out samples as many as 23 data. These samples were taken at random at a complete observation, and not used in model development. Hold out samples consists of data crisis and not a crisis for all types of crises. Composition of crisis events of the sample data is shown in Table.

jenis krisis	Krisis	Tidak Krisis
KLR	10	13
KLRm	8	15
ZHANG	10	13
ZHANGm	10	13
Bank	10	13
Debt	7	16

From those dating method, we classified signal to noise ratio with the results as followed.

(prediksi/ aktual)	krisis keuangan				Banking	Debt
	KLR	KLRm	Zhang	Zhangm		
(1,1)	9	1	5	5	6	4
(1,0)	2	1	4	4	2	1
(0,0)	11	13	9	9	11	15
(0,1)	1	7	5	5	4	3
Total	87,3%	52,7%	59,6%	59,6%	72,3%	75,45%
S/N	6,7	1,8	1, 6	1, 6	2,8	4,8

We chose three best models that had been validated. This model was chosen from the best models of the four methods of dating the financial crisis, and the best model of alternative prediction models of banking and debt rescheduling crisis. Selection of the best models on the financial crisis is analyzed from the ratio of signal to noise.

7. Crisis Dating Method Selection and Analysis

Referred to Edison (2001), one of the aspects of a good early warning system is to define the crisis we want to monitor. So during the implementation, an early warning system will capable of detecting the crisis. The reasons why a crisis is defined and characterized in the form of a mark on one observation has important step in this research. The dating of the financial crisis on the research done by four methods as Dumitrescu (2009) became the best crisis dating methods. The dating method is a method of dating KLR, KLR m, Zhang and Zhang m. The letter m indicates the method has been modified that also indicated on the

method performed by Lestano (2003). It basically adds an element of interest rate into account currency market pressure index (Exchange Market Pressure Index / EMPI).

The dating of the crisis on the banking crisis and debt rescheduling is done by marking the presence of a second event that indicates the occurrence of the crisis. Understanding of the banking and debt is less stringent than the financial crisis. In this study, the dating of banking crises and debt rescheduling is limited to incidents that are public are marking something happens. As in the banking crisis, this study only discusses events on mergers, nationalization, bank closures, and any strong issues that rise up to the media. As for the debt rescheduling crisis news about their country and the IMF agreement and how the debts were paid that serve as a basis for a crisis event.

We aware these methods will cause confusion about which is called the crisis and which is not? For the banks, whether the banking crisis happen? Is it just the crisis that is localized just happened? To reschedule its debt crisis, whether the country is still unable to pay arrears to certain restrictions but is already considered the debt crisis? There is anxiety beta error occurs. It will be explained how the dating of the financial crisis, the banking and debt rescheduling best selected and used in this study.

The indicator that shows the financial crisis is expressed in the EMPI. This index becomes a portrait on an observation, whether at the time of the crisis to the size of a particular observation time. For KLR and KLRm method, called the crisis a positive identification when EMPI exceeds a certain threshold (using boundary beta 2 and -2). Limits the value used in the method of Zhang identify crisis is 3 times sigma to exchange rates and interest rates (on Zhang modified), and -3 times sigma for foreign exchange reserves of observation EMPI.

Selection of crisis-dating methods done by comparing each of dating method's results, since dating method that will either signal yielding good results. When the signal is good, then a good model can be constructed. From the logic of this research, we chose the best model (model with a signal to noise ratio is high) as an indicator in determining the best dating methods. Indicators have been selected for addition to representing the truth of classification, this ratio also compares how well the model of comparative classification of right and wrong. The election results dating the crisis best are dating the crisis which was conducted by KLR. The results of the model constructed by this method generates value signal to noise ratio that quite convincing, ie 6,67 (table of signal to noise ratio).

This value is considered the greatest, when considered from the comparison of the value of the model derived from the calendar with three other methods namely; 1.75 (KLR m), 1.55 (Zhang), 1.55 (Zhang m).

Conclusion and Future Research
1. Conclusion
In this study, we had has defined several types of economic crisis. The economic crisis that is discussed in this study are: the financial crisis, banking crisis, and the crisis of debt rescheduling. The financial crisis is a situation in which there is the impact of an attack on a country's currency on sharp depreciation in the value of the currency, a large decline in foreign exchange reserves, or a combination of both.

The banking crisis is the event where; (i) the failure of banks leading to the closure, merger or acquisition by one or more financial institute; (ii) the existence of a bail out from government on one or more financial institutions, followed by the subsequent assistance. Crisis of debt rescheduling is considered as an incident in a country where the debt is not paid from interest payments, as evidence of the problems of a country in debt, event of rescheduling of debts, the intervention by the IMF related to debt payments, and the amount of arrears that exceed the limit minimum.

The best crisis-dating methods were selected from the four best method according Lestano crisis and Jacob (2008) is the method of KLR, KLR modified method, Zhang and Zhang are modified. Dates crisis based on the best signal to noise ratio is KLR method that does not use interest rates as an instance variable in determining the onset of the crisis. Statistical approach using discriminant analysis can help in developing predictive models of economic crisis. This model can be applied in the detection of early warning system of economic crisis. In the context of multivariate discriminant analysis, binary logit regression form as a form of regression is used to predict a binary dependent variable that is based on the independent variable. In this study, the dependent variable is the signal of the crisis in the next eight quarters after observation. The process of getting a signal indicating the crisis will be a crisis or a crisis will not happen. Construction of the model is done by considering the macro-economic variables that are considered influential in the event of a crisis in studies that have been done before. The development of the model is done by using methods enter and stepwise, where Stepwise conducted using forward and backward. Obtained from this process models to predict the financial crisis, banking crisis and debt crisis Scheduling as shown in Equation 6.1, 6.2, and 6.3.

o Financial Crisis-Prediction Model:

$$G(t) = -1,1705 - (7,681 * USI) + (39,764 * YPC) - (4,818 * GFR) - (0,001 * REX) \ldots\ldots\ldots (6.1)$$

o Banking Crisis-Prediction Model:

$$G(t) = 3,52 - (0,13 * ICY) - (24,781 * USI) (93,372 * YPC) - (34,02 * INR) - (11,55 * GIP) - (18,68 * LDS) (13,33 * GFR) - (22,04 * IMP) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (6.2)$$

o Debt Rescheduling Crisis-Prediction Model:

$$G(t) = 302,72 + (0,6783 * ICY) - (86,73 * USI) - (21,554 * NSR) + (1137,8 * YPC) - (807,44 * INR) - (165,2 * GIP) - (662,9 * LDS) - (0,14 * RIR) - (85,1 * GFR) + (1,412 * CAY) - (209,88 * IMP) + (86,14 * EXG) + (0,0125 * REX) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (6.3)$$

From the models, we obtained a significant variable in predicting the financial crisis, banking, and debt rescheduling. Ie: REX, EXG, IMP, CAY, GFR, RIR, LDS, GIP, INR, YPC, NSR, USI, ICY contained in the above mentioned model. Binary logit regression methods assume that there is no relationship between one observation to the other, the application of the monthly data can be made similar to those carried out in this thesis. It is expected to use the same method with different data (monthly) can produce better models in predicting the crisis.

2. Future Research

The application of this model requires data to be updated periodically to correct validity of the model. It should be placed at an application with fast and accurate data access. One suggestion is the application placement on Bank Indonesia as central bank monetary sector, such as balance of payments bureau and the bureau of economic and monetary policy.

The variables included in this study are very limited. This happens because of the extremely limited information (mainly public) the recording of financial statistics. This limitation resulted in the selection process needs to be holding back the independent variables used for the reason the number of observations and add unnecessary processes in the processing of the

data if it is incomplete observation data. It is expected that implementing this model can perform better recording on the statistics of the financial system so that the parties can conduct research in order to better detection of crisis.

Testing directly by RDG has not been done, but the felt by comparing the decisions taken without and with the model needs is sufficient for the model. Tests with models can be simulated with the decision-making process at the time that has passed as in 2010-2016. The method in predicting the crisis is not only covered in the multivariate analysis, ANN (Artificial Neural Network) or artificial neural networks can be implemented with an excess of the failure by the application to update the model according to historical data.

CONSUMER'S PERCEPTIONS TOWARDS E-MARKETING: A SCALE DEVELOPMENT STUDY

Satinder Kumar, Punjabi University, India
Rajwinder Singh, Punjabi University, India

Abstract

World is changing at a remarkable pace and so does the world of marketing. The limited options to communicate with the target audience have been widening. Even the technology has profoundly changed the way consumer process communication. As we entered the twentieth century, the Internet became the hottest marketing channel ever known. The overall objective of this research is to examine the perceptions of respondents towards E-marketing and its implications thereof. In this study both quantitative and qualitative research methods had been adopted but more emphasis was laid on the quantitative research. The research required the study of individuals who were exposed to E-marketing. The study involved the analysis of primary data collected through sample from one of the prosperous states of India i.e. Punjab and Union Territory of Chandigarh.

A non-disguised structured questionnaire was used for data collection. Questionnaire was pre-tested and as a result of pre-testing it was modified and revised suitably. The sample of 568 respondents was drawn by using non-probabilistic Judgmental sampling Technique. The factor analysis technique applied on perceptions of the respondents regarding the various attributes in E-marketing revealed specific factors, which clearly define the perceptions of the respondents. The results indicated that the Respondents prefer Varieties in the products to be purchased online as they are free to take decisions regarding choice of product and services they want based on their previous experience and product information they got through the process of E-marketing. The respondents also understand the risk aspect in E-marketing and their decision to buy online is based on the website reputation and personal information's protection provided by the merchants. The path analysis conducted using Structural Equation Modeling technique revealed that the most of the variance in the perceptions toward E-marketing is explained by the two different variables (factors) "Product Variety" and "Desired facilities". In nutshell it can be said in order to develop positive attitude of consumers toward E-marketing the marketers, must focus on these qualitative attributes of E-marketing. As far as the *"Perceived Risk"* factor having least variance, respondents consider E-marketing as more risky as they do not feel security in online transactions.

Keywords: *Privacy, Spamming, Spyware, E-mail Safety, Security, Risk.*

Introduction

The rapid acceptance of the Internet as a commercial medium has caused firms/marketers to try out with the innovative ways of marketing thus changing the shape of selling schemes. As far as traditional marketing is concerned "Marketing is human activity aimed at filling the need and want through the exchange process" (Kotler, 2004). Dibb et al. (2001) have produced a wider definition of marketing, according to them, "Marketing consists of individual and organizational activities that facilitate and expedite satisfying exchange relationships in a dynamic environment through the foundation, distribution, packaging and pricing of commodities, services and ideas". The motive of marketing remains the same satisfying consumers by making a strategy to deliver the proper message to the correct people, the only thing has changed is the means of communication, as Smith and Chaffey (2001) have remarked that E-marketing is Achieving marketing objectives through applying digital

technologies. Though commercial enterprises will go forward to attain utilization of traditional marketing methods, such as advertising, sales promotion, personal selling, direct mail and Public Relationship, E-marketing adds a whole new element to the marketing mix. According to Strauss and Frost (2001) E-Marketing is the employment of electronic data and applications for planning and carrying out the conception, distribution and pricing of ideas, goods and services to create exchanges that meet individual and organizational goals. E-marketing campaigns not only create product awareness, but as well reflect a generation of advertising with benefits such as self-selectiveness, interactivity, full integration of several media and marketing capabilities targeted towards specific individuals, states or cultures (Wehling, 1996).

E-marketing has become a critical part of the overall marketing efforts, and begun to make measurable results (Haines, 2001). In today's competitive business environment, losing clients is very easy as the competitor is just a click away. Implementing E-marketing strategy, hence, requires an adequate understanding of changes in the way customers think and act on the World Wide Web. In other words, in a dynamic business environment, E-marketing is capable of hacking through the clutter to provide a valued chance for commercial enterprises to improve accessibility to the world and thrive (Mainardi, 1998). Present Paper studies the perceptions of respondents towards E-Marketing and their implications for the marketers thereof.

Review of Literature

It is universally acknowledged fact that good research cannot be made without critically studying what already exists in relationship to it in the form of general literature and specific work done by the researchers. The review of related literature, therefore, is considered as a perquisite to actual planning and execution of research work. Hence, for proper discernment of the research work, sincere efforts have been constituted to review the associated literature. In the present study an effort has been made to tabulate and summarize the results of the surveys taken in charge by various researchers on different aspects of E-marketing.

Table 1. Classification of Factors and Variables Concerned with E-marketing:

Factors	Variables	Researcher(s)
Product Variety	Products Offered	S. Jarvenpaa (1997), EC (2012), Arnold et al. (1980), Louviere and Gaeth (1987), Anderson (2009), Quelch and Loisa (1996), Vijayasarathy (2002), Tonita Perea et al. (2004)
	Customer service	Ho and Wu (1999), Jedd (2000), Anderson (2009), Sara Rodriguez (2009)
	Product's information	Kleinmuntz and Schkade (1993), Alba et al. (1997), Zack (1993), Coleman and Levine (2008), Syed and Norjaya (2010), Peishih and David (2004), Tonita Perea et al. (2004), Kuo (2003)
	Previous experience	Pine and Gilmore (1998), Dillon and Reif (2004), D. Gefen et al. (2003), R.A.Shang (2005), Gefen and Straub (2000), Tonita Perea et al. (2004), Syed and Norjaya (2010)
	Choice and availability	Arnold et al. (1980), Louviere and Gaeth (1987), EC (2012), Coleman and Levine (2008), Syed Shah et al. (2010)
	Freedom of choice	Coleman and Levine (2008), Syed Shah et al. (2010), Quelch and Loisa (1996), Jarvenpaa (1997), Vijayasarathy (2002)
Perceived Risk	Privacy Protection	Robert and Anne (2001), Wang and Wang (1998), Guangying (2009), Prema Nakra (2001), Ponnurangam and Lorrie (2006),

		David and Dane (2006), Mohsen and Ilja (1999)
	Website reputation	Jarvenpaa et al. (1999), Syed and Norjaya (2010), Doney and Cannon (1997), Anderson and Weitz (1989), Ganesan (1994), Pavlou (2003), Keen (1999)
	Email Safety	Chaffey et al. (2003), Buckner and Gillham (2000), Satinder and Rishi Raj (2012)
	Children protection	Deborah (2007), Mohsen and Ilja (1999),
	Guarantee of Reimburse	Special Report (2007)
User Friendliness	Time saving	Mohsen (1999), Mohamed and Vanessa (2007), P.L. Alreck and R.B. Settle (2002), Rajasree et al (2009), Hoyer (1984), John (2008)
	Ease of use	Davis (1989), Guangying Hua (2009), Childers et al. (1997), Chao Wen el al. (2011), Bhattacherjee (2001), Reedly et al. (2000), Ghose and Dou (1998), John (2008)
	Convenience	Mohsen Attaran (1999), Li, H et al. (1999), Zhang and von Dran (2000), Mohamed and Vanessa (2007), B. Kidwel, and R. Jewel (2003), John (2008), Quelch and Loisa (1996)
	Save money	Sara Rodriguez (2009), Civic Consulting (2011), Quelch and Loisa (1996), EC (2012)
Desired Facilities	Return policy	Civic Consulting (2011), Jarvenpaa and Todd (1997), Vijayasarathy and Jones (2000), Maes (1999), EC (2012), Unsigned (1999), Davis et al. (1995)
	Guarantee of Safe delivery	First Data report (2008), Syed Shah et al. (2010), Dall'Olmo et al. (2005), Bhatnagar et al. (2000)
	Lower Handling Fees	Hess, Chu and Gerstner (1996), Jupiter Communications (2000)

Arnold et al. (1980) and Louviere and Gaeth (1987) found order to satisfy the heterogeneous customer preferences, the online marketers must offer a variety of products and services relevant to the dynamics of their heterogeneous customers' segment. They must place their products in a manner that the customer feels that it is for them alone. Granting to the account of the EC (2012), consumers buy online for a number of causes ranging from cheaper product availability to the determination of the best quality merchandise. The basic intent of online shopping seems to be flexibility and convenience in ordering the merchandise from anywhere and at whatever time. It also emphasized upon the relief of finding various products involved. The basic influential factors for online market appear to be product quality and product quantity.

Product quality means consistency between the quality specification of Internet shopping mall and real character of the physical product. Variety is concerned with the assortment or a range of goods available from a shop. Customers are also more likely to prefer trade centers on web with several products available (S. Jarvenpaa, 1997). According to Anderson (2009) online shopping decrease the distribution costs, including reduced spending on physical stores, rents and shelf spaces. Variety of items sold online can be further extended as a result; online buyers can select best suited products at ease. Jarvenpaa (1997), Vijayasarathy (2002) and Tonita Perea et al. (2004) revealed consumers attitude towards E-marketing may be influenced by quantity of products offered by the online marketers.

In order to convert potential customers into real ones and retain them for a long time marketers need to depends, on the *customer services* they offer and the satisfaction that consumers perceive to gain (Ho and Wu, 1999). Jedd (2000) revealed web marketers often see more client satisfaction due to better delivery time or client services. The velocity at which ordered items are delivered is important for online consumers. Anderson (2009) opined web marketers must provide different forms of services to consumers like decrease the distribution costs, including spending on physical stores and shelf spaces with information technology. Sara Rodriguez (2009) indicated that the that the time invested in searching for online savings as percentage of a product buying strategy help the customers to economize money. They feel more filled and positive about their purchases that are created online by them.

The manner in which product's information is displayed influences decision processes by affecting the ease of carrying out different processing operations (Kleinmuntz and Schkade, 1993). Alba et al. (1997) and Zack (1993) opined unique feature of online shopping environments that is very high degrees of interactivity. The latter is a multidimensional construct, the key facets of which include reciprocity in the exchange of information, availability of information on demand, customization of content and real-time feedback. Coleman and Levine (2008) opined that consumers are more likely to shop online, use web based free applications to get first-hand experience and information for a particular product of interest.

Syed and Norjaya (2010) are of the view that word of mouth and quality information appear to have a significant relationship with online brand trust. Peishih and David (2004) revealed web marketers want to present potential customers with the detailed right information at the right time. Differences in product type may lead to differences in waiting time before arriving at a purchase. Tonita Perea et al. (2004) brought out the attitudes of consumers toward online shopping and intention to shop online depend upon the key factor like availability of required information for online shopping. On the other hand, Kuo (2003) emphasized that online fashion retailers are losing consumers and sales because the colors on e-commerce sites often do not represent accurately the real colors of the merchandise being sold.

Pine and Gilmore (1998) stressed upon the customer's *previous experience*. According to him, it has its unparalleled importance and is thought to be a critical part of any online purchase. Dillon and Reif (2004) is also of the view that the consumer's previous experiences with online shopping have a significant influence on their next time online purchasing decisions.

Gefen et al. (2003), Shang (2005) and Gefen and Straub (2000) discovered that the previous online buying experience is a crucial factor of behavior. The beliefs and behavior of consumers may switch with time as they earn more knowledge and experience from previous online transactions. Tonita Perea et al. (2004) and Syed and Norjaya (2010)stressed upon the former experience of online shopping. The researchers thought that the online experience and brand reputation appear to deliver a confident relationship.

Syed Shah et al. (2010) establish that product variety and choice and availability are the central elements which determine the consumer's satisfaction of online shopping. Arnold (1980) and Louviere and Gaeth (1987) disclosed to satisfy various customer preferences, marketers must display varying products to its aspects so that they can select products according to their demands. Coleman and Levine (2008) supposed that nowadays consumers are taking more sophisticated online searches to support a daily purchase decision, expecting easily available info about products and services.

Also, Coleman and Levine (2008) opined that online consumers are more concerned with online market since they are expecting easily availability of products and *freedom of choice*. Syed Shah et al. (2010) found that consumers' online shopping satisfaction is influenced by freedom to select and deliver performances as they are the central elements which determine

their conclusions in addition to reliability and product diversity. Quelch and Loisa (1996) revealed Internet use has more utility for clients because they can get on the Web site and quickly find out where to find the lowest prices for a specific product or service. Consumers benefit from the online shop because it reduces search costs for products, product related information and freedom of selection. Jarvenpaa (1997) and Vijayasarathy (2002) revealed online trust antecedents that relate to the user's Web site experience may be impacted by the freedom to choose the product and purchase it.

Robert and Anne (2001) revealed information about consumer's private life is more promptly usable and more easily captured on the Internet as compared to offline technologies. Wang and Wang (1998) opined with a rising involvement in online shopping, privacy protection concerns has been debated to be the greatest barrier to shopping online. Guangying (2009) revealed perceived ease of usage and privacy policy has a significant influence on the user's acceptance of online banking. Perceived ease of usage is of less importance than privacy and security. Protection is the most important factor influencing user's acceptance. Businesses pertaining to Consumer privacy rights have become more dangerous as the nature of information exchanged over the Web begins to cover sensitive areas such as health, taxation and social security records.

Vendors have a legal responsibility to take up steps to protect not just the data, but also the privacy rights of their customers (Prema Nakra, 2001). Ponnurangam and Lorrie (2006) took an exploratory survey to earn an initial understanding of attitudes about privacy among the Indian high tech work force. The results revealed an overall deficiency of awareness of privacy issues and less worry about privacy in India than has been found in similar studies carried in the United States. David and Dane (2006) found that the kind of data and the type of privacy policy statement play a lively part in determining consumer willingness to provide personal information via the net. They also advised that legally mandated privacy statement would be no more effective than strongly worded voluntary policies. In a survey taken by the (FTC) Federal Trade Commission and reported to congress in 1998, it is found that only few websites provide notice of their information collection practices to consumers (Mohsen and Ilja, 1999).

Jarvenpaa et al. (1999) conceived the web reputation to be the indicators of trust. The most investigated component of most examples on e-commerce's trust is trust in the online merchant. Surveys have established that the size and reputation of an online merchant greatly influence consumer trust (Syed and Norjaya, 2010). Doney and Cannon (1997), Anderson and Weitz (1989) and Ganesan (1994) rivalled reputation of the online merchant has been indicated as key factor that lead to consumer trust in a seller organization.

The better the seller's reputation, the more likely would be consumers' trust on that internet site. Pavlou (2003) exposed the online business and web marketers not just depends on the consumer's perception of the cartel in the internet transaction as a means of online shop but also on the reputation of the web based retailer as reliable marketers. Keen (1999) revealed amount of information an online consumers gets plays a very crucial role in the influence of the decision of the consumer. In number, insufficient information about the uncertainty could mean a fiscal responsibility to the job as it is a big risk factor in reputation and consumers are less likely to engage in business proceedings.

Chaffey et al. (2003) opined E-mail has become an important marketing tool to construct and maintain closer relationships with guests as well as expectations. Hence, e-mail marketing has become a popular alternative for several online companies. Buckner and Gillham (2000) looked at the natural actions and practices of social email us. It was found that contact frequency by email resembled that of telephone use more closely than conventional mail. Text quantity of emails tended to be less viable than posting communications and email usage less time dependent than telephone use. Satinder and Rishi Raj (2012) revealed E-mail is a new

innovative communication tool that substitutes the fax and telephone to remove the barrier of distance, but along with this commercial email is a great problem for the online customers, hence emails are less secure. Most of the respondents delete spam emails without reading. Security and threats are considered most important concerns for the use of Email and Internet. Deborah (2007) opined Congress enacted the Children's Online Privacy Protection Act to address privacy and safety hazards created when children under 15 years of age use the Internet. To protect children, the Act imposes requirements on operators of websites or online services directed to minors, and other operators with actual knowledge that they have collected personal data from minors. Mohsen and Ilja (1999) stressed upon the filtering software programs to enable family members to be restricted from the sites that may not be age appropriate. Parental controls are also available through online services. Moreover, kids need to be advised so as not to give out real information in chat rooms and encourage them to post messages only under supervision.

In E-marketing consumers demand Guarantee for the reimbursement of money in case of non delivery of merchandise or any loose from marketer side (Special Report, 2007). If the traffickers are not capable to present the product to consumers or there is a loss due to marketers' negligence, it becomes the responsibility of marketers to reimburse the funds to consumers.

According to Mohsen (1999), the online consumer market is developing tight and offers convenience as well as saves time. Mohamed and Vanessa (2007) identified transaction efficiency and time savings as important online shopping factors that are utilitarian. P.L. Alreck and R.B. Settle (2002) revealed online shopping media has been watched as a more timely savior than traditional media of shopping. Rajasree et al (2009) emphasized that consumer is less likely to abandon their shopping cart as waiting time is increased. This might indicate that consumers may not be deterred by slight delays towards the close of the online shopping procedure. Time stressed consumers are less concerned with the price and tend to use simple tactics such as buying what they purchased last time (Hoyer, 1984). John (2008) revealed internet users' attitudes about online shopping are not wholly uniform. They are willing to shop online because it is convenient and a time-saver, but they too do not like posting personal or credit card data over the net.

Ease of use is defined as the individual's perception that using the new technology will enhance or improve their performance (Davis, 1989). Guangying Hua (2009) opined perceived ease of habit has an significant impact on consumers' adoption of online banking. Childers et al. (1997) discovered the degree of interactivity that a Web site offers is a strong element in online shopping, because experiential consumers usually find more comfort in interactive environments. Chao Wen et al. (2011) developed an integrated model by examining perceived ease of use and perceived enjoyment factors that directly or indirectly influenced consumers' continuance intention in the context of online shopping.

Bhattacherjee (2001) empirically examined that an individual is more likely to be intended for continued usage when such usage is perceived to be useful. Easy to use the web for shopping is an important determinant of e-selling. Web based activities that are ascribed to factors such as usefulness, information on e-marketing, convenience, easy to use and website quality must be integrated with the overall marketing strategy in order to hold the corporate aims of the e-marketing (Reddly et al., 2000). John (2008) revealed that internet users are willing to buy online because it is convenient and easy to use, but they also do not like posting personal or credit card data over the net. Ghose and Dou (1998) found that websites that are more interactive and easygoing to use are perceived to be of more value by consumers.

Li. H et al. (1999) establish that clients who purchase through the cyberspace are more convenience oriented and less experience oriented. These consumers regard convenience as the most important factor in purchase decisions during shopping, because they are time

constrained and do not mind buying products without touching or feeling them if they can save time in this room. Mohsen Attaran (1999) revealed online consumer marketplace is getting fast, although online shopping offers convenience and keeps time. Zhang and Von Dran (2000) made an effort to appraise the quality of website on the basis of users' satisfaction and dissatisfaction. Their studies revealed convenience as the website design feature that can be regarded as hygiene and motivator factor contributing towards user satisfaction with a web site. Mohamed and Vanessa (2007) identified after-sale service, convenience, cost and time savings as the important online shopping usefulness factors. B. Kidwel, and R. Jewel (2003) opined when facing time pressure, confidence in products and convenience play important roles in the buying decision. John (2008) revealed online consumers are willing to transact online because it is convenient, but they too do not like submitting sensitive information over the net. Quelch and Loisa (1996) revealed consumer's feels more of ease with the growth of E-marketing as they can search and make purchases on the Web in a more conducive and convenient way.

Sara Rodriguez (2009) opined consumers indicate that the time spent in searching for online savings as percentage of a product buying strategy help them to keep money and researching products online made them feel more positive around their purchase decision. Consumers estimate that they keep open more in the online purchase than to buying the same product in a shop (Civic Consulting 2011). Quelch and Loisa (1996) stressed that with the growth of the internet, consumer gets more empowered because he can go on the Web and quickly find out where to find the lowest prices for a special product or service which become the grounds of laying aside money. Consumers benefit from the Internet because it reduces search time for products/services and linked information. EC (2012) reported the principal movement of consumers shop online is low priced good quality merchandise. The basic factor for shopping online seems to be savings in money and the flexibility in ordering any time of the daytime.

Civic Consulting (2011) reported delivery and concerns regarding returning a product or replacing and repairing a faulty product are the issues ruling, followed by concerns regarding abuse of payment card details and personal information. The *return policy* must be displayed on the web. Jarvenpaa and Todd (1997) and Vijayasarathy and Jones (2000) revealed online consumers have shown their concerns over delivery and return of merchandise purchased online. Maes (1999) revealed Consumers have little or no information as well as knowledge about the reputations of web merchant. Policies and procedures such as returns, shipping/handling and extra support are hazy at best. E-commerce Survey Project (2000) found online consumers said return policies influence their decision to shop with web vendors. Unsigned (1999) and Davis et al. (1995) revealed online shopping websites have done plenty to give customers the same assurance in their return policies as traditional merchants do. Return policies of any online shopping company can work as an important repurchase strategy.

First Data report (2008) found consumers indicated that online marketers' assurance of quality and purchase will match quality expectations and best online price are effective motivating factors. Syed Shah et al. (2010) found that product diversity and delivery performances are the key factors which influence consumers' satisfaction of online shopping. Dall'Olmoet al. (2005) revealed web marketers have found out that if they can shorten the perceived risk of purchase by facilitating returns, offering guarantees, Safe delivery, lowering shipping costs and charging competitive prices, the consumer is often willing at least to try buying online. Bhatnagar et al. (2000) revealed consumers consider apparel products to be risky to purchase on the network because of doubt about color, fabrics, and convulsion.

Hess, Chu and Gerstner (1996) examined the strategic role of non-refundable shipping fees to mitigate returns by catalog consumers. Consistent with the hypothesis, empirical analysis suggested that fees increase with the value of the merchandise ordered, even when prices

remain constant. Lewis (2005) estimated how shipping fees affect order size and site traffic. He found that free shipping gets more customers, but lower average order sizes. Incentives that offer lower shipping fees on larger orders as well increase the order value. Free transportation is considered the most efficient marketing tactic in e-tailing. Customer dissatisfaction with shipping fees is highlighted by survey results that indicate over 60% of online buyers have abandoned a shopping cart at checkout when shipping fees are added and 50% of online consumers list shipping fees as their principal complaint about Internet retailing (Jupiter Communications (2000).

Research Methodology
To study the perceptions of respondents towards E-Marketing convenience sampling is used to collect data from individuals who could reasonably interpret the E-marketing and form ethical viewpoint to issues in E-marketing, hence in the present study those individuals has been included who are educated and exposed to E-marketing. The study has been conveyed via electronic mail and face-to-face interviews. A total of 640 survey questionnaires had been sent out, to which 598 questionnaires received. Apiece of the responses received has been screened for errors, incomplete or absent answers. Attempts have also been taken to contact the affected respondents through e-mail for clarification and corrections, especially for missing or blank answers. Nevertheless, responses that had more than 25% of the questions in the survey questionnaire left unanswered or incorrectly answered has been tossed away from data analysis. For those responses that caused a few blank answers (less than 25% of the questions) and which involved 5-point interval-scaled questions has been ascribed with a midpoint scale of 3. Later on the screening process carried out, only 568 responses have been considered complete and valid for data analysis. This represents a success rate of 94.66%, which is reckoned to be good in view of time and price constraints.
To study the causal relation existing between the variables in the present study, the following null hypothesis was framed:

Ho: There is no significant association between the explored factors of the respondents regarding E-marketing with their perceptions towards the phenomenon of e-marketing as a whole.

1.   Data Analysis
The factor analysis technique applied on perceptions of the respondents regarding the various variables (attributes) in E-marketing revealed specific factors, which clearly define the perceptions of the respondents. Four factors extracted from the eighteen variables explained 66.072% of variance and each component was defined by at least three scale items. These specific factors extracted were *Product Variety, Desired facilities, Perceived Risk* and *User friendliness*. These factors explain the perceptual attributes of e-marketing which were considered to be significant by the respondents.

2.   Scale Development and Refinement
A scale was developed to identify the factors revealing the perceptions towards E-marketing. The literature for the same was reviewed as shown in literature survey and variables were selected to obtain the perceptions of the answerers. During the discussion, with the experts in the area of E-shopping or marketing, many details were appended and edited. The final of 18 items were selected for survey and these items were to be rated on a five point Likert scale by the respondents.

Item wise reliability analysis was executed on selected variables to keep back and delete scale items for preparing a reliable scale. The scale generated for this objective was refined and purified for reliability validity and unidimentionality. Inter item correlations and Cronbach's alpha statistics were used to conduct reliability analysis and to know extend to which items were correlated with a lot of items under consideration.

3.   Factor Analysis Results

Exploratory factor analysis was conducted as a means of data reduction, to ascertain if the face validity of the items held (Pallant, 2001). The particulars of the attitude scales were subjected to principal component analysis (PCA) using SPSS. Prior to performing PCA the suitability of data for factor analysis was evaluated. The correlation matrix revealed many coefficients of .3 and above as shown in Table 3.

The Kaiser-Meyer-Olkin (KMO) measure was 0.921 surpassing the recommended value of.6 (Tabachnick and Fidell, 1996; and Kaiser, 1974) and the Bartlett's Test of Sphericity (Bartlett, 1954) reached statistical significance, supporting the factorability of the correlation matrix. PCA revealed the presence of four components with Eigenvalues exceeding 1, explaining 66.072 percent of the variation. The variance explained by each component is presented in Table 4.

Table 2. Scale Reliability Analysis (E-marketing)

Variables	Communalities		Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Mean	Std. Dev.
	Initial	Extraction

% Variance	43.255	9.506	7.751	5.558
Cumulative % Variance	43.255	52.762	60.513	66.072
Scale Reliability alpha (Cronbach's Alpha)	.865	.857	.848	.837
Cronbach's Alpha= .922, Kaiser-Meyer-Olkin Measure of Sampling Adequacy= .921, Bartlett's Test of Sphericity (Approx. Chi-Square= 5269.048 , Df= 153, Sig=0.00, Mean=63.31				

The value for communalities using principal component analysis ranged from .535 to .781 (Table 2). Here, it is apt to mention that commonality >0.5 is sufficient for the explanation of constructs (Hair et al., 2009). All these values show factors analysis has extracted good quantity of variance in the items. Hence, all the requisites of reliability, validity and unidimensionality are met.

Pearson Correlation Analysis

Pearson's Correlation Coefficient (Pearson's *r*) is a method of calculating the relationship between variables. Correlation analysis was used to measure the degree of relationship between the 18 main independent variables of E-marketing. The principal aim to conduct correlation analysis was to assess whether the eighteen main variables were independent from each other or not. As a regulation of thumb, if a correlation coefficient value of r indicates 0 in.2, there is a weak relationship between the variables. If *r* values of .3 to .6, generally considered moderate, and .7 to 1 is strong (Dancey and Reidy, 2007). Granting to the scale used if all the 18 items get a rating of 5 each, the total score would be 90. The average score of the respondents was 63.31 (Table 4). The correlation matrix was calculated as indicated in Table 3. The mean correlation was .398 and it varies from .258 to .698 with a range .439. There was a sufficient correlation to go ahead with factor analysis.

4.   Extraction of Factors

In order to identify the underlying dimensions of E-marketing, exploratory factor analysis was employed. The respondents were asked to rate eighteen variables, on a five point Likert scale, ranging from strongly disagrees to strongly agree. All the factors having loading more than 0.5 were considered good and in the present concern the loading ranged from .627 to .823. Items with factor loadings <0.5 were removed. The four factors, so generated have Eigen values ranging from 1.001 to 7.786. The factor analysis results are validated as shown in table 5.

A.   Product Variety (F1)

The first factor alone has explained 43.25% of the total variance in the factor analysis solution and has been labeled as *Product Variety.* It includes six variables; i.e. Various *Products, Choice and availability, Previous experience, Product's information, Freedom of choice and Customer service*. The results indicated that the online marketers must offer varieties in the products to consumers as they free to take decisions regarding choice of product and services they want from them based on their previous experience and product information they got

through the process of E-marketing. In order to convert prospects into consumers, web marketers must take care of the products quantity in online malls. The Scale reliability alpha of this factor is .865 and factor loading ranges from .627 to .802. *The various Products variable* has highest loading in this component. The inter item correlation ranges from .623 to .749 and item to total correlation ranges from .610 to .659. It covers 7.786 of the Eigenvalues.

B.   Perceived Risk (F2)

Five variables are loaded on the second factor. This factor is labeled as *Perceived Risk* as based on five variables consumers revealed there is no *Email Safety*, *Privacy Protection, Children protection and Guarantee of Reimburse*; moreover marketer's *Web site reputation* influence the decision of customers either to go or not for the online purchase. The results revealed consumers consider E-marketing more risky as they are not safe online. Hence to frame favorable perception marketers must insure the consumers should not face any kind of risk in E-markets. Online marketing planners can overcome the barrier of perceived risk if they find the techniques to generate sufficient trust among their potential customers. Online marketers should be able to understand the problems the customer faces, and take adequate steps to build trust in order to overcome them. This factor has explained 9.506% of the total variation in the factor analysis. The factor loading ranges from .699 to .823. The inter item correlation ranges from .628 to .751 and item to total correlation ranges from .554 to .600. It covers 1.711of the Eigen values.

C.   User Friendliness (F3)

Factor third is developed with another four variables; i.e., E-marketing offers *Convenience, Save money, Time saving and Ease of use* benefits to consumers. It has been labeled as *User Friendliness*. This category's results indicated that it is important for online marketers to create user friendly websites by adding features in it which are attractive for consumers. As far as the web sites of the merchants were concerned consumer prefer these websites to be user friendly, convenient and easy to use. This factor has explained 7.751% of the total variation in the factor analysis and indicates the importance of this factor in online shopping behavior. The factor loading ranges from .727 to .819. The inter item correlation ranges from .638 to .738 and item to total correlation ranges from .565 to .620. It covers 1.395 of the Eigen values.

D.   Desired Facilities (F4)

Factor fourth *Desired Facilities* developed from the three variables i.e. *Guarantee of Safe delivery, Return policy and Lower Shipping/Handling Fees*. The results indicated that respondents demand facilities from the merchants in the form of Guarantee of Safe delivery, Lower Shipping/Handling Fees etc. All these elements were considered as the predominant predictors of consumers' purchasing decisions. This factor has explained 5.558% of the total variation in the factor analysis. The factor loading ranges from .735 to .801. The inter item correlation ranges from .686 to .726 and item to total correlation ranges from .599 to .653. It covers 1.001of the Eigen values.

5. **Validation of Factor Analysis Results**

Taking Table 5 into account, an attempt has been made to validate the factors analysis results by calculating "Correlation between summated scales" and "Correlation between representative of factors and summated scales".

Table 5: Validation of Factor Analysis Results for E-Marketing

Table 5 (a) Correlation between summated scales

Factors	Product Variety	Perceived Risk	User friendliness	Desired Facilities
Product Variety	1			
Perceived Risk	.447**	1		
User friendliness	.456**	.476**	1	
Desired Facilities	.489**	.461**	.404**	1

**Correlation is significant at the 0.01 level (2-tailed).

Table 5 (b): Correlation between representative factors and summated scales

Factors/Variables	Product Variety	Perceived Risk	User friendliness	Desired Facilities
Various Products	.821**	.397**	.487**	.509**
Website Reputation	.446**	.839**	.361**	.389**
Save Money	.428**	.435**	.838**	.372**
Guarantee of Safe Delivery	.534**	.369**	.430**	.878**

**Correlation is significant at the 0.01 level (2-tailed).

The score of the correlation between the four factors in E-marketing was < .489, therefore they are independent from each other, and multi-collineality is not occurring at all. The Pearson correlation matrix (Table 3) was used to express the relationship between the variables in the research model and exemplify the relationship between the factors (Table 5) constituting the overall attitude variable, and the other overall variables used for this work. Preliminary analysis was performed to ensure no infringement of the assumptions of normality, linearity and homoscedasticity. The values for communalities range from .535 to .781. Here, it is apt to mention that Eigenvalue > 1.0 and communalities > 0.5 are sufficient explanations of constructs (Hair et al., 2009). The factor analysis results were valid as the correlation among summated scales and representative variables was high (> 0.5) and it was low among summated scales (p< 0.5).

6. **Confirmatory Model of Factors Affecting Consumer's Perceptions toward E-Marketing**

SEM (structural equation modeling), which includes measurement model and path analysis, is an effective way to determine the causal relationships between constructs and their underlying measurement suitability; and Amos software with maximum likelihood estimation is applied to implement SEM. Confirmatory factor analysis is used to examine the reliability and robustness of the questionnaires after collecting the data again.

The loading factor values of each manifest variable are higher than 0.6, the suggested threshold value is 0.6 (Bagozzi & Yi (1988), indicating that internal consistency and convergent validity are good; composite reliability (Construct reliability) and the Cronbach's

α value of each construct are higher than 0.8 (the suggested threshold value is 0.7), also the average variance extracted of each construct is greater than 0.5 (Table 4), indicating good reliability.

Table 6: Fit Indices and Guidelines for Model Analysis (E-marketing)

Fit Index	Guidelines (Recommended)	Model Values
Chi Square		367.237
CMIN/DF	Between 1 and 5	2.825
NFI	>0.9	.931
TLI	>0.9	.946
GFI	>0.9	.935
AGFI	>0.9	.914
RMSEA	<0.05	.052
P	<0.05	0.000

For the overall assessment of the measurement, multiple fit indexes are reported in Table 6 from which we can see that the model is reasonably consistent with the data, with all the fit indexes better than the recommended values.

7.   Structural Model: Path Analysis

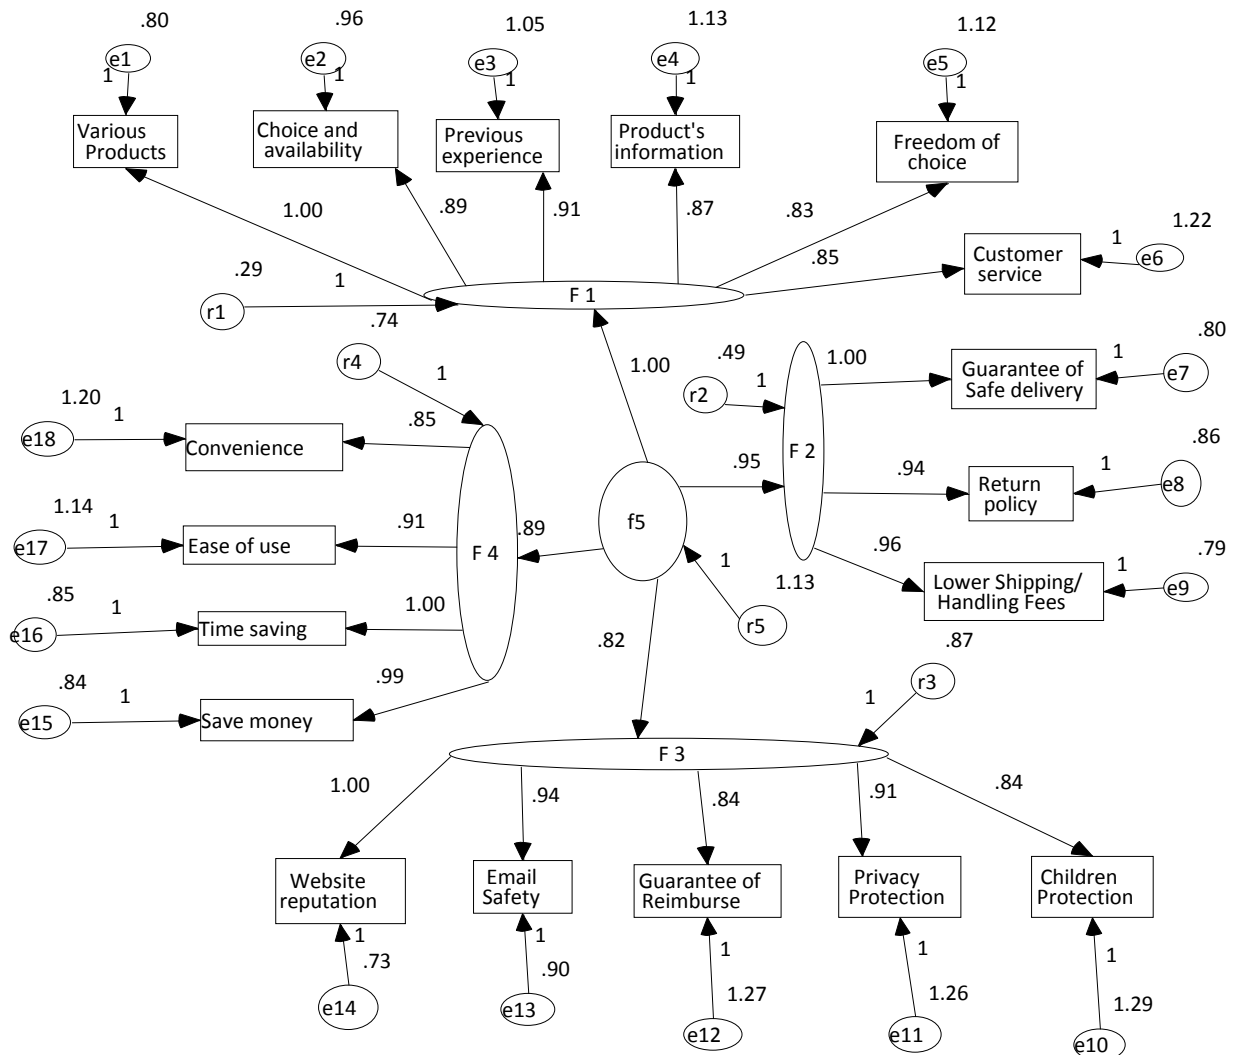
Overall fit indexes are reported in Table 6, which shows that the model is reasonably consistent with the data, with all the fit indexes better than the recommended values. Figure 2 indicates the path loadings in addition to t values for each path.


Figure 1: Proposed Structural Relationships of Perceptual Factors and Consumer's Perceptions towards E-Marketing

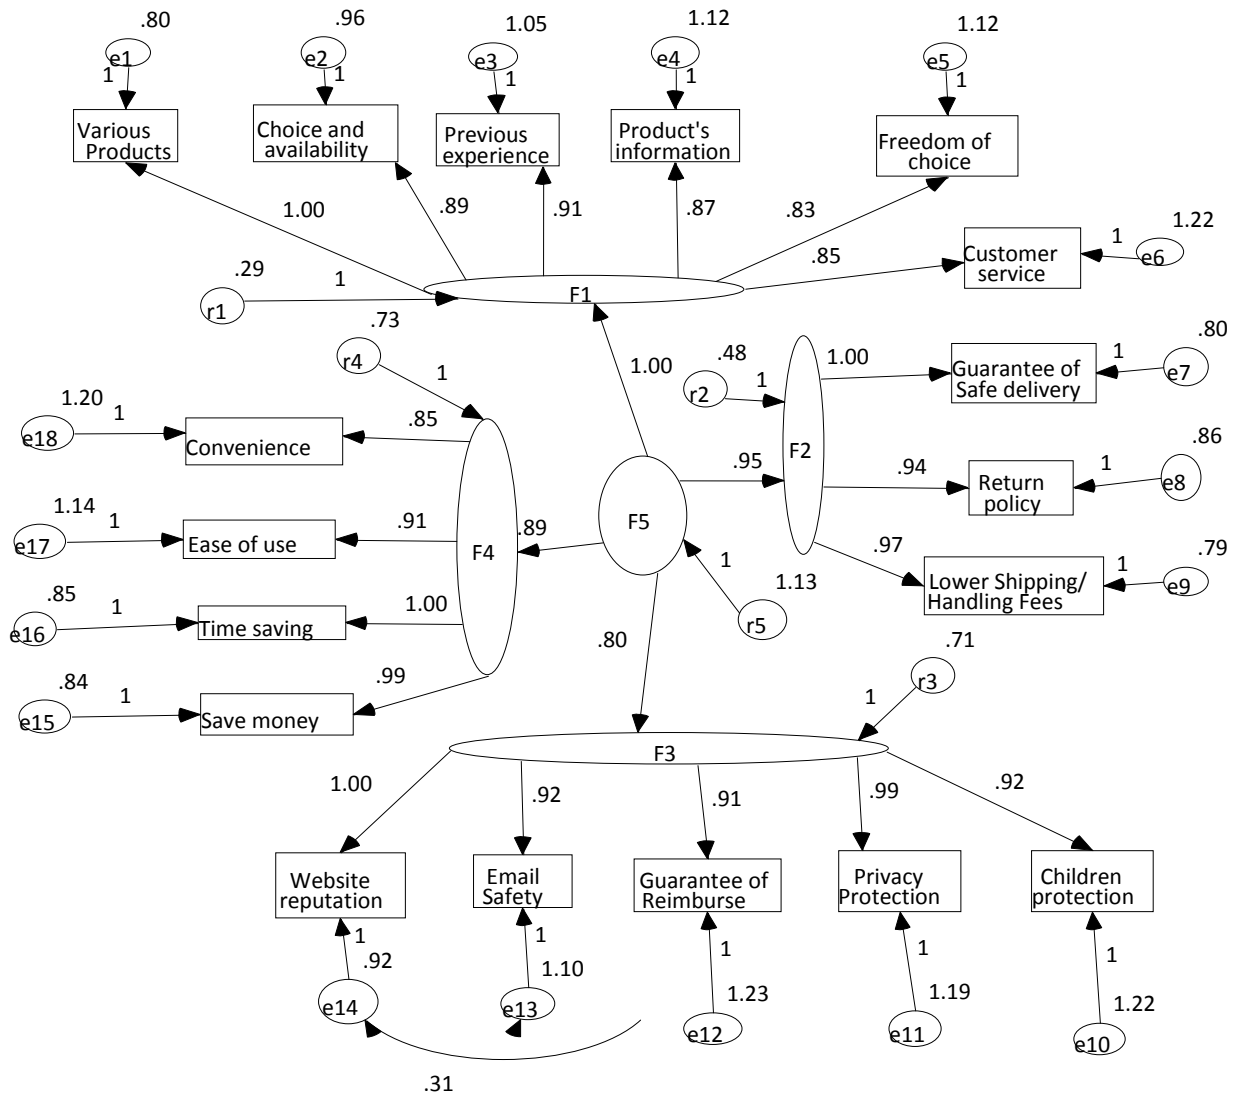
The suggested model (Fig 1) has the RMR greater than the five as it should be <0.5 according to the guidelines set up by the different experts. Hence the necessary modification was performed based on modification index, standardized residual values, regression weights and so on Finally, the model was modified as shown in figure 2. The values for various fit indices, chi-square, level of significance and outcome of factors/items on E-marketing are shown in table 7. In case of Modified structural relationships two variables (web site reputation and E-mail safety) of "*perceived risk*" factor have influence on each other. After suggesting the relationship among both these two variables, the model has been found significant.


Figure-2: Modified Structural Relationships of Perceptual Factors and Consumer's
Perceptions toward E-Marketing

F1- Products Variety   F2- Desired Facilities   F3-Percived Risk
F4-User Friendly   F5-Perceptions towards E-marketing

Discussion of Results

The results in figure 2 show that path loading on *Product Variety* (coded-F1) factor ranged from .83 to 1.0. The path loading of 1.0 for *various products* and 0.91 for *previous experience* show that these items play a more important role for this construct as comparing to other items. The basic influential factor for online shop appears to be product variety. Variety is concerned with the assortment or a range of goods available from a shop as customers are likely to impose an Internet center with several products. Dillon and Reif (2004) revealed shopper's previous experiences with online shopping or purchase has a significant influence on their next time online purchasing decisions. Here, it is important to note that the path loading of *Product variety* factor is 1.00 which is higher as comparable to other three factors. In order to develop the favorable attitude of consumers, marketers must focus on the quantity of products as per the need of consumers.

The other variables in this factor are *the Choice and availability, Customer services, Product information and freedom of choice;* all these are loaded significantly. The path loading on *Desired Facilities* (coded-F2) factor has the range from .94 to 1.00. There are three items in this factor with significantly loaded. The maximum loading is for the *Guarantee of safe delivery* (1.0) and *Lower Shipping/Handling Fees* (.97) showing the variance for this factor. The path loading of this factor on perception towards *E-marketing* (Code F5) is .95 which is second highest among all factors. In this factor it is suggested, online marketers should provide adequate services to consumers regarding safe deliver of ordered product as well as return policy if product delivered to consumer is damaged or not according to customer's order. Moreover, online marketers must charge less Shipping/Handling Fees.

The *Perceived Risk* (Coded F3) factor has path loading from .91 to 1.00. The results indicate that the loading of *website reputation* (1.00) played more dominating role for this factor. All the loadings are different and sufficient to explain this factor. Here we note that *Email safety* and *Children Protections* have the same loading of 0.92, indicating the closeness of these constructs. The path loading of this factor on perception towards E-marketing is 0.80 which is least as compare to other factors. Robert and Anne (2001) revealed information about their private life is more readily available and more easily captured on the Internet as compared to offline technologies. Consumers have negative online behavior due to risk concern in E-marketing like there is no guarantee of Reimburse for Losses, no children protection online, no protection to consumer's personal information as well as no Email safety. Email marketing is becoming the cause of Spam. Here it is important to note that website reputation and Email safety both are influencing of each other. To some extend the children protection is based on the website reputation as the loading of Email safety and children protection is same.

The path loading on *User friendliness* (coded-F4) factor has the range from .85 to 1.00. There are four items in this factor with significantly loaded. The maximum loading is for *time saving* (1.0) and *save money* (.97) showing the dominance of this factor. The path loading of this factor on perception towards *E-marketing (Code F5)* is .89. This category's results indicated that it is important for web merchants to create user friendly websites by adding features in it which are attractive for consumers. The Ho hypothesis has been rejected as the all the extracted variables have significant loading to reveal the attitude towards the phenomenon of e-marketing as a hole.

Effect Estimates of Factors and Variables
Here the effect estimates of factors and their variables have been identified for consumer's Perceptions toward E-Marketing. A comparison can be made among proposed model and modified model based on the values of Fit indices given in the Table 7.

Table 7: Effect Estimates for Perceptual Factors Affecting Consumer's Attitude toward E-Marketing

Factors/Variables affecting consumer's Perceptions toward attributes of E-marketing	E-marketing Decisions Effect Estimates			Comparison of Models	
	Total	Direct	Indirect	Figure 4.1	Figure 4.2
Product Variety	1.000	1.000	0.000	Chi square= 394.71, DF=131, RMR= .097, RMSEA= .060 GFI= .930, AGFI= .909, PGFI= .713, NFI= .926, RFI= .914, IFI= .949, TLI= .941, CFI= .949, Significance Level= 0.000 The model is not significant as RMR is very high	Chi square= 367.24 DF= 130 RMR= .056 RMSEA= .052 GFI= .935 AGFI= .914 PGFI= .812 NFI= .931 RFI= .919 IFI= .954 TLI= .946 CFI= .954 Significance Level= 0.000 The model is good even RMR is around .05 (DF difference is 1)
Desired Facilities	.951	.951	0.000		
Perceived Risk	.800	.800	0.000		
User Friendly	.892	.892	0.000		
Various Products	1.000	0.000	1.000		
Choice and availability	.894	0.000	.894		
Previous experience	.913	0.000	.913		
Product's information	.867	0.000	.867		
Freedom of choice	.828	0.000	.828		
Customer service	.850	0.000	.850		
Website reputation	.800	0.000	.800		
Email Safety	.738	0.000	.738		
Guarantee of Reimburse	.729	0.000	.729		
Privacy Protection	.791	0.000	.791		
Children protection	.736	0.000	.736		
Save money	.884	0.000	.884		
Time saving	.892	0.000	.892		
Convenience	.758	0.000	.758		
Ease of use	.808	0.000	.808		
Guarantee of delivery	.951	0.000	.951		
Return policy	.893	0.000	.893		
Lower Shipping Fees	.918	0.000	.918		

A comparison can be made among proposed model and modified model based on the Fit indices values given in the Table 7. The path analysis conducted using a Structural Equation Modeling technique revealed that the most of the variance in the perceptions toward E-marketing is explained by the two different variables (factors) "*Product Variety*" and "*Desired facilities*". The total effect estimate showed that this effect was high for "*product variety*" (1.000) and "*Desired Facilities*" (0.951). It was least for "*Perceived Risk*" (.800). Here, it is also interesting to note that items total effect was very high for *Various Products* (1.000) and *Guarantee of Safe delivery* (0.951); hence, these items play a more important role in developing consumer online behavior as compared to other items. The other items also have a significant loading on E-marketing concerns. The results indicate that in order to develop positive attitude of consumers toward E-marketing marketers must focus on attributes of E-marketing given in Table 4.6. It can be inferred that respondents demand facilities from the marketers in the form of Guarantee of Safe delivery, Lower Shipping/Handling Fees etc. All these elements have been considered as the predominant predictors for developing perception towards E-marketing. The respondents also demand, online marketers must offer huge quantity of products to consumers as they free to take decisions regarding choice of product and services they want from them based on their previous experience and product

information they got through the process of E-marketing. In a nutshell it can be said in order to develop positive attitude of consumers toward E-marketing or to convert prospects into consumers, the marketers must focus on above stated attributes of E-marketing.

Limitations and Further Research Directions of The Study

As this is the first ever research conducted on Punjab and Chandigarh data, it has set the basis for further inquiry. Firstly, random sampling techniques are not employed in this research; the ability of the piled up information to understand the total population is thinned out because only consumers in principal cities of Punjab and UT Chandigarh were sampled. A random sample covering the whole of Punjab and UT Chandigarh should be applied to test whether the results from this study are replicated. Secondly, the sample size was relatively modest. A larger sample should be used to implement any future research in this area. The respondents claimed were both online and offline customers and the legal age of attendees were college-educated, students or employees in serving industries, so the samples may be overly concentrated in some particular consumer groups, rendering bias in measuring the consumers online shopping experience and lifestyle. Thus, the results obtained may reflect only these groups' characteristics. It is proposed that future research could possibly diversify into more consumer groups so that the outcomes can be employed more broadly.

Conclusion

In the light of the above analysis and discussion the conclusion drawn there from implies that the E-marketing is a powerful selling technique, which bears a substantial impact upon the perceptions of the consumers. The results indicated that the Respondents prefer Varieties in the products to be purchased online as they are free to take decisions regarding choice of product and services they want based on their previous experience and product information they got through the process of E-marketing. The respondents also understand the risk aspect in E-marketing and their decision to buy online is based on the website reputation and personal information's protection provided by the merchants. Respondents also demand facilities from the merchants in the form of Guarantee of Safe delivery, Lower Shipping/Handling Fees etc. The path analysis conducted using a Structural Equation Modeling technique revealed that the most of the divergence in the perceptions toward E-marketing is explained by the two different variables (genes) "Product Variety" and "Desired facilities". As far as the "Perceived Risk" factor having least variance, respondents consider E-marketing as more speculative as they do not feel secure in online transactions.

CRONOLOGICAL ANALYSIS OF BRAND TRUST:
A CONSTRUCT PROPOSITION

Afif Zaerofi, Sekolah Tinggi Ekonomi Islam Tazkia, Indonesia
Popy Rufaidah, Universitas Padjadjaran, Indonesia

Abstract

"Brand trust" is the fundamental concept in customer relationship management. To make it understandable, both academics and practitioners conceptualise the term in the form of definition. However, the scholars define it differently and seems inconsistently. This fact has led to various perception and partial understanding on it. To help with this issue, around twenty five papers which contain or discuss on definitions are selected and examined. The journals are chronologically analyzed by decades. Descriptive qualitative approach is used in this research. From literature investigation, it is found that although they have various definitions, the key words refer to the same or similar meaning such as: confidence/confident, belief, willingness to rely on feeling of security. However, further analysis suggests that chronologically, the definition of "brand trust" has been evolving and can be categorized into three phases, before the year of 1990, between 1991 to 2010 and 2011 till now.

Keywords: *Brand Trust, Chronological, Definition*

Introduction

In this global market, building and maintaining a relationship with customers are the key success to win the competition (Alhaddad 2015) and brand trust is the foundation to build the relationship (Chaudhari & Holbrook 2001, Fischer & Gartner 2015). Research on brand trust also suggests the importance of the factor. It has an impact on brand loyalty (Chaudhari & Holbrook, 2001), purchase intention (Herbst, et al 2013) and customer commitment (Morgan & Hunt 1994, Ballester 2000). Researches have been conducted on the issue (Hosmer 1995) both theoritically and empirically (Fischer & Gartner 2015). However, in defining the term, they have different opinions (Hawass 2013, Fischer & Gartner 2015), incomplete and inconsistent definition (McKnight 2002).

The differences have to be analysed further since the differences could make researchers difficult to compare one research result to others (McKnight, et al 2002) and integrate the different perspectives on trust and find an agreement on its nature (Ballester 2011). Some scholars from different fields (psychology, sociology, economics, management, marketing) have investigated on the concept of trust (Ballester 2011). There are three approaches on trust conceptualization. Personality psychologists assert trust as an individual characteristic, while social psychologist believe that trust is an expectation of a specific transaction and the individual with whom someone is transacting. In contrast, economists and sociologists consider trust as an uncertainty reduction of institutions which lead to trust associated with transaction (Lewicki and Bunker 1995).

The study of Lewicki and Bunker (1995) indicate that different disciplines impact the concept of trust. This study goes further by deepening the concept from different angel, that is from chronological analysis. To make it more systematic, the research problem of this paper could be formulated as follows: 1). How is the development of brand trust definition from 1970's till now? and 2). What is the proposed construct of brand trust?

Literature Review
1) 1971-1980

Trust is firstly defined as "the confidence that one will find what is desired from another, rather than what is feared (Deutsch 1973). He considers *trust* as a belief that someone will receive what is expected. In an interaction, someone is always wondering what they will get from others. He/she always expects the benefit or positive impact of the interaction. In line with Deutsch's concept, Worchel (1979) declares that *trust* is the confidence that they will obtain as expected. The expectation must cause a positive outcome, despite the possibility that it may cause a negative one. The possibility between positive and negative outcome is called risk. In this decade, *trust* is understood as the social interaction or individual relationship.

2) 1981-1990

Trust is essential in business and social interaction. *Trust* is defined as "confidence in the face of risk" (Lewis and Weigert 1985). Broader definition is suggested by Schurr and Ozanne (1985). As cited in Ruparelia (2010), they define *brand trust* as "a belief that an exchange partner is reliable and will fulfil the perceived obligations of the relationship". Similar to Schuur and Ozanne, Costa and McCrae (1987) define *Brand Trust* as "willingness to rely on an exchange partner in whom one has confidence". These last two definitions imply that trust should be mutual. Trust is the bonding of business interaction.

While the previous author use partners in their definition, Anderson and Weitz (1989) use party instead. They, as cited in Tan, et al (2013) define *Brand Trust* as "one party's belief that its needs would be fulfilled in the future by actions undertaken by the other party". In line with that definition, Anderson and Narus (1990) define *brand trust* as "the firm's belief that another company will perform actions that will result in positive outcomes for the firm as well as not take unexpected actions that result in negative outcomes". Anderson and Narus (1990) focus on the perceived outcome in defining *brand trust*. In this decade, *brand trust* is defined in a wider scope. If in the previous decade, *brand trust* refers to one or person (personal relationship), in this decade, *brand trust* is considered as mutual belief between partners or parties (organizational relationship).

3) 1991-2000

Brand trust is defined as "a condition linking certain optimistic opportunity about another's intention with respect to oneself in risky state of affairs" (Boon and Holmes 1991). *Brand trust* reflects the compared condition level between opportunity and treat as the consequence of interaction. Moorman et al (1992) define *brand trust* as "a willingness to rely on an exchange partner in whom one has confidence". In line with Moorman, Morgan and Hunt (1994) define *Brand Trust* as "when one party had confidence in an exchange partner's reliability and an integrity". Both definitions of trust highlight the psychological aspect of confidence/reliability while integrity relates to attributes such as consistent, commitment, fair, responsible, and honest. Less complicated definition is suggested by Hess (1995). *Brand Trust* means "the consumer's brand perceptions: altruism, honesty and potential performance of the product". He mentions three dimensions of brand trust; altruism, honesty and product performance. Mayer et al (1995) asserts that *brand trust* means "the willingness of a party to be vulnerable to the actions of another party". Vulnerable means the uncertain condition of the future which is called risk. Rousseau et. al (1998) defines brand trust as "a psychosomatic state comprising the intention to recognize susceptibility based upon constructive prospect of the intentions or behavior of another person".

4) 2001-2010

Chaudhuri and Holbrook (2001) defines *Brand Trust* as "willingness of the average consumer to rely on the ability of the brand to perform its stated function". This definition stresses on the concept of willingness which refers to an intentional behavior and reliance. This definition

also implies that *trust* is comparing the brand performance and promised function. The stated function leads to consumers' expectation. Consumers will trust the brand when the brand meets their expectation. Ballester & Aleman (2001) provides support for this notion. They conceptualized *brand trust* as "a feeling of security that the brand will meet consumption expectations". Brand does not only refer to a product but also partnership relation between a product and consumers but also the relation between personal character and social interaction (Ballester & Aleman, 2001). Ballester (2003) defines *Brand Trust* as "the confident expectations of the brand's reliability and intentions". Reliability dimension is based on the belief that the brand will fulfill the promised values. While intention dimension refers to consumers' belief that the brand will respond to their interest when consumption in their best interests when unexpected problems with product consumption arise Cristau (2006) as cited in Bouhlel et al (2011) defines *Brand Trust* as "a feeling of security that is held by the consumer that the brand will meet their consumption expectations". The feeling of security comes from their prior experiences with the brand or other recommendation. This definition pararrells with Ballester and Aleman's definition. Afzal, et al (2010) defines *Brand Trust* as "dependency on other parties at the level of risk with their own willingness". Ruparelia et al. (2010) believes that the awareness of brand attributes will positively impact the business, whether online or traditional one. By focusing on activities contributing to build and maintain brand trust, marketing resources can be optimally and effectively used.

Brand trust correlates with two dimensions, first, credibility and second, performance satisfaction. Credibility reflects honesty and compliance between product, advertisement and other communication. Performance satisfaction refers to product delivery whether the product quality is as expected (Reast 2005).

5) 2011-now

Ballester (2011) defines *brand trust* as "Feeling of security held by the consumer in his/her interaction with the brand, that it is based on the perceptions that the brand is reliable and responsible for the interests and welfare of the consumer". He further suggests two dimensions of brand trust, viability and intentionality. Viability reflects technical dimension in nature. It concerns the perception that the brand can fulfill the consumers' need. Intentionality dimension refers to the consumers' confidence that the brand will help and care with the problems that might arise in the future. The brand will not take advantage of the consumer vulnerability. Miao & Lee (2012) defines *brand trust* as "a consumer psychological state of confidence and positive expectations from a brand". *Brand trust* can be seen as a factor of two dimensions, brand reliability or cognitive-based trust and brand intentionality or emotion-based trust (Hawas 2013). Ulfat et al (2015) defines *brand trust* as "'consumers' perception' instead of 'consumer behavior', keeping in view all the items associated with this head". Brand trust is consumer perception, comparing to consumer behavior. Brand trust relates to what people think.

Methodology

This study adopts descriptive qualitative approach. The author investigates the literature from various reputable journals. Definitions proposed by scholars are analyzed chronologically by decades to find out the development concept of brand trust. It is assumed that the changes of definitions represent the change of the environment both in academic world and practical one.

Findings and Discussion

The definition of brand trust is changing from time to time. The following table describes the development of brand trust definition and its dimensions.

Table 1
Definitions of Brand Trust and their Dimensions

Decades	Author, Year	Definition	Dimension
B E F O R E 1 9 9 0	Deutsch (1973)	the confidence that one will find what is desired from another, rather than what is feared	1. performance
	Worchel (1979)	expectation, which may cause a positive outcome, despite the possibility that it may cause a negative outcome	1. performance
	Schurr and Ozanne (1985)	a belief that an exchange partner is reliable and will fulfil the perceived obligations of the relationship	1. belief 2. reliable 3. perceived obligation
	Lewis and Weigert (1985).	confidence in the face of risk, not a mere predictability	1. confidence 2. risk
	Costa and McCrae (1987)	willingness to rely on an exchange partner in whom one has confidence	1. rely on 2. Confidence
	Anderson and Weitz (1989)	one party's belief that its needs would be fulfilled in the future by actions undertaken by the other party	1. belief 2. fulfilled need in the future
	Anderson and Narus (1990).	the firm's belief that another company will perform actions that will result in positive outcomes for the firm as well as not take unexpected actions that result in negative outcomes	1. belief 2. perceived outcome
1 9 9 1 - 2 0 1 0	Boon and Holmes (1991)	a condition linking certain optimistic opportunity about another's intention with respect to oneself in risky state of affairs	1. Optimistic opportunity 2. Intention 3. Risk
	Moorman, et al (1992)	a willingness to rely on an exchange partner in whom one has confidence	1. rely on 2. Confidence
	Morgan and Hunt (1994)	when one party had confidence in an exchange partner's reliability and an integrity	1. Confidence 2. Reliability 3. Integrity
	Barney and Hansen (1994)	the mutual confidence that no party to an exchange will exploit another vulnerability.	1. Confidence 2. vulnerability
	Hess (1995)	the consumer's brand perceptions: altruism, honesty and potential performance of the product	1. Reliability 2. altruism 3. honesty
	Mayer, Davis, and Schoorman (1995)	the willingness of a party to be vulnerable to the actions of the another party.	1. Willingness 2. Risk
	Rousseau et. al.,1998).	psychosomatic state comprising the intention to recognize susceptibility based upon constructive prospect of the intentions or behavior of another person	1. Intention 2. Constructive Prospect
	Chaudhuri and Holbrook (2001)	willingness of the average consumer to rely on the ability of the brand to perform its stated function	1. brand performance

	Ballester & Aleman (2001)	a feeling of security that the brand will meet consumption expectations".	1. A feeling of security 2. Brand expectation
	Ballester et al (2003)	the confident expectations of the brand's reliability and intentions	1. reliability 2. intentions
	Cristau (2006)	a feeling of security that is held by the consumer that the brand will meet their consumption expectations	1. a feeling of security 2. brand expectation
	Afzal, et al (2010)	dependency on other parties at the level of risk with their own willingness	1. dependency 2. risk
	Ballester (2011)	Feeling of security held by the consumer in his/her interaction with the brand, that it is based on the perceptions that the brand is reliable and responsible for the interests and welfare of the consumer	1. viability 2. intentionality
	Miao & Lee (2012)	a consumer psychological state of confidence and positive expectations from a brand	1. Consumer confidence 2. Positive expectation
	Ulfat et al (2015)	consumers' perception instead of consumer behavior, keeping in view all the items associated with this head	1. Consumers' perception 2. Consumer behavior

From the above table, it can be clearly seen that although they have various definitions, they have similar key words in meaning such as: confidence/confident (Deutsch 1973, Morgan and Hunt 1994, Ballester 2003, Lin and Lee 2012), belief (Anderson & Weitch 1989), willingness to rely on (Costa & McCrae 1998, Choudhuri & Holbrook 2001), and feeling of security (Cristau 2006, Ballester 2011). However, it is interesting to know that, chronologically, the conceptual definition of brand trust can be divided into three phases: First, before the year of 1990, *brand trust* refers to personal or social interaction (Deutsch 1973, Schurr and Ozanne 1985, Costa and McCrae 1987 and Anderson & Weitz, 1989). Second, between 1991 to 2010 some authors define *brand trust* as personal relationship or parties (Morgan and Hunt 1994, Boon and Holmes 1991, Moorman, et al 1992). Some other scholars define brand trust as the relationship between consumers and product (Chaudhuri and Holbrook 2001, Ballester 2003 and Cristau 2006). One author, in this decade, defines brand trust as the relationship between consumers and brands (Hess 1995). The last, between 2011-now, brand trust is defined as the relationship between consumers and the brand (Ballester 2011, Miao & Lee 2012 and Ulfat et al 2015).

Conclusion

Drawing from the above discussion, it is evident that the definition is evolving from year to year. The development is supposed as the reflection of the social and business changes both in academic and empirical world. In the beginning (in and before 1990), trust is defined as personal and social relationship. In the second phase (1991-2010), trust is considered as the confident perception to parties and product or brand. While in the last phase (in 2011 and after), trust refers to a belief between consumer and brand.

Consistent with the above findings, the authors propose the construct of brand trust as *consumers' belief or perception to the reliability of given products and integrity of persons,*

parties or brands in fulfilling their expectations based on their stated promises or their own experiences and confidence that the brand will care to the problem that may arise. This definition covers the previous conceptualization of brand trust which consists of three dimensions, psychological, cognitive and intentional dimensions. Belief or perception is emotional based trust dimension which is quite personal and situational. Cognitive-based trust dimension of this definition refers to consideration of consumers in deciding whether the brand could meet their expectation and intentional dimensions means a belief that the brand will not take the advantage to the consumers

EXPLORING TECHNOLOGY SWITCHING PHENOMENA IN CAPITAL INTENSIVE MARKETS

Osama Sam Al-Kwifi, Qatar University, Qatar

Abstract

This paper explores the factors that lead to technology switching in capital intensive markets. This issue is critical for rapidly changing technologies because consumer demands have to defined accurately to avoid their switching to competing products. In this study, MRI research centers are used to track the switching process globally and product innovativeness was monitored using the online patent system and through interviews. Interviews with industry experts and lead users were conducted to study the technology switching phenomena and its antecedents. Findings reveal that product innovativeness is the main cause behind technology switching, which is deemed essential to sustain competitive advantage.

Introduction

Users, as individuals and organizations, switch from an old technology to a new one in the hope of achieving a better competitive advantage in the market and ensuring long-term success. In this research we emphasize the notion of technology switching rather than brand switching, because switching of high technology products is done to obtain better technological capabilities rather than to become associated with a specific brand. Although the literature uses the concept of brand switching for a wide range of products and services to examine the process and associated factors that cause the replacement of one brand by another, we believe that the case is different in the matter of switching high technology products.

In rapidly changing market users' requirements are difficult to define (Krieg, 2004; Bhattacharya et al., 1998), the significance of advanced product capabilities becomes critical for users. Research has shown that in such markets, lead users can be integrated in the innovation process to assist in identifying the right product features and preferences (Lettl at al., 2006; Thomke and Von Hippel, 2002). Therefore, firms should identify those users and incorporate them in the product development process using an open innovation platform, in order to enhance product innovativeness and the market value of products (O'Cass and Heirati, 2015).

Literature Review

Different theories were used to explain the switching behavior of consumers and buyers, including consumer behavior, consumer satisfaction, organizational learning, social networking, social exchange, consumer behavior, decision making, migration, consumer resource allocation, and equity theory (Low and Johnston, 2006). These theories are deemed effective in establishing a concrete argument to elucidate switching behavior based on the perspective they take into account. For instance, if switching behavior is judged as replacement in the relationship between users and firms to generate more profit, then it is best described using social exchange theory. However, the context in which each theory is selected is highly dependent on the nature of the product or service being investigated. For example, Money (2004) used a social network approach to elucidate the process of assessing banking and insurance services, and their influence after purchase.

The decision to replace a technology is reached if the new technology can generate sufficiently more capabilities than the old one. New technological capabilities are derived from product innovativeness as new product features (Al-kwifi and McNaughton, 2011).

Thus, the theoretical foundation of this research is established in the dynamic capabilities theory, where changes in technological capabilities can occur as changes in organization capabilities (Helfat, 2000), which would impact the behavior and overall performance of the organization. This condition puts significant pressure on an organization to adopt more innovative products to sustain its competitive advantage, because this product encompasses special capabilities that offer exceptional competences for the organization (Eltantawy, 2016). Some studies have however evaluated switching behavior at the organizational level by monitoring different products: service providers (Yanamandram and White, 2006), computer workstations (Heide and Weiss, 1995), banking (Wathne et al., 2001), financial industry (Liu et al., 2005), telecommunication services (Low and Johnston, 2006), and hardware retailers (Ping, 1997). Since products used by organizations are more specialized so as to meet certain needs and are more technology-intense (John et al., 1999; Glazer, 1991), organizations are keen to focus on long-term relationships and engage in cooperative activities that result in greater benefits for both partners (Flint et al., 2002). This has led to greater focus on relationship marketing that is built on commitment and trust (Morgan and Hunt, 1994), where different marketing activities should be directed toward establishing, developing, and maintaining successful relationship with customers (Palmatier et al., 2006; Rauyruen and Miller; 2007).

The study emphasized that the most influential and significant element in reaching the verdict to move to a new technology is product features that enhance a user's capabilities, followed by product variety, research collaboration, and product service. Subsequently, Al-kwifi et al. (2014) repeated the same study on mass market users of medical imaging technology, and concluded that when making the choice to switch to a new technology, product features is still the critical element in order to help organizations sustain competitive advantage or achieve a more competitive position.

Al-kwifi and McNaughton (2013) pioneered the concept of partial and complete switching, which highlights the significance of technology switching at the organizational level. In this concept, organizations who are in danger of losing competitive advantage and who, for various reasons, are not able to surrender the old technology will choose to implement partial switching by keeping the old technology and adding another new technology, and operating them simultaneously. In this way, the organization avoids taking a major risk that disturbs its operation and commitment. On the other hand, when other organizations feel the need to terminate their relationship with the old technology, and when their survival depends on more advanced technology, then they implement complete switching by completely replacing the old technology by a new one.

The significance of the product innovativeness does not come from creating a robust and low-cost product only (Wu and Chyu, 2004), but also from empowering it with the right capabilities to enhance current user competencies and influence new users towards adopting it (Yang and Jiang, 2006; Danneels, 2002). The concept of product innovativeness was first introduced by Booz-Allan and Hamilton (1982), where a two-dimensional map was developed, "Newness to the Market" with "Newness to the Company". Later, Kleinschmidt and Cooper (1991) used product innovativeness to measure its impact on market performance. They found that product advantages, derived from innovative product features, is the number one factor in market success for new products, which is consistent with recent findings for the factors behind brand switching of high technology products (Msaed et al., 2016; Al-kwifi et al., 2014). Kleinschmidt and Cooper (1991) emphasized that innovative products offer unique customer capabilities and differentiate these customers from other users, thereby increasing the product's attractiveness and success in market.

Product innovativeness to the firm can be based on the extent of a firm's R&D activities and resources to produce new technology for the firm, including something that is patentable, and

differentiate the company position among competitors. On the other hand, product innovativeness for the market (user) is perceived differently, as users are looking for product superiority (based on the new product features), which offers dramatic improvements over existing product features (Fang, 2008; Im and Workman, 2004). Some researchers prefer product innovativeness at the market level because product success is measured mainly by user acceptance and increased market share. Firms might claim that they produce cutting-edge innovations, but those might not secure market success when introduced. Also, innovations that are new for the firm may not be novel to the market, because companies try to imitate the features of competitors. However, exploring both dimensions of product innovativeness might provide deeper insight into the factors behind product success.

Determining lead users will have a critical influence on product innovativeness, as they can speed the innovation process by providing important insights into market needs. Lettl et al. (2006) demonstrated that highly motivated users and an open innovation process are important to the early innovations phases of the medical equipment industry, especially when those users come from diverse competencies and are integrated in a supportive environment (Shaw, 1985). In medical technology markets, the development of innovative products with the right features requires high levels of collaboration with lead users of such markets, because they have special performance requirements and quality standards, unlike users of other markets. Those users are important for testing and verifying the reliability of new product features on patients, and determining if the product meets safety standards.

Morrison et al. (2004) explored the importance of asking lead users to test and verify the validity of different applications, ensuring a faster adoption by mass-market users who look for a reliable and tested application. Numerous studies have demonstrated the value of integrating lead users to increase product innovativeness and market success (Johnson et al., 2006; Bonner and Walker, 2004).

Many companies worldwide have created special programs to integrate lead users in the product development process (Bilgram et al., 2008), through open innovation programs and virtual communities. The open innovation programs allow leading-edge users to access and modify the product features to enhance their performance, and even to build new advanced features (Gassmann et al., 2010). The virtual communities are an online community-based innovation, which are created by the firm to connect users that have similar interests (Hienerth and Lettl, 2011; Fuller et al., 2006), in order to exchange ideas and identify important issues for further improvement.

Method

Three secondary sources are used, namely, International Society for Magnetic Resonance in Medicine (ISMRM) conference proceedings (ISMRM, 2015) and US Online Patent Office (USPTO, 2015). The first source was used to track technology switching of MRI research centers worldwide, and the third was used to determine product innovativeness at the firm level. The primary source includes interviews with MRI research centers and industry experts. The collected information is used to confirm the relationship between product innovativeness and technology switching, and determine the impact of lead user integration on enhancing product innovativeness. We decided to interview industry experts and some lead users who have intensive experience using the three technologies. These interviews are essential to determine the product innovativeness at the market level and its impact on technology switching. Accordingly, we interviewed three MRI industry analysts and twenty MRI scientists, each with over 20 years' experience in the MRI field.

Results

Figure 1 shows technology switching that took place in MRI research centers (university hospitals) worldwide from 1995 to 2015. In 1995, 387 research centers utilized GE-MRI technology, while 196 and 98 centers operated Siemens and Philips technologies, respectively. As research centers began to grow their clinical and research activities by updating or by purchasing another MRI technology, more research centers started to use Siemens-MRI technology in their functions, with the number of centers operating Siemens technology approaching 422 over 20 years, or 213% increase over the 1995 number. On the other hand, the number of centers operating Philips-MRI technology also rose steadily, to reach 204 centers, or 182% growth over the 1995 number. Nonetheless, the number of centers operating GE-MRI technology continued to decrease over the same period to a low of 321 centers, representing 17% decline in the number of research centers reported in 1995. This substantial change in market share of different firms indicates that some technologies were more captivating by motivating MRI research centers to adopt them. Tracking the process of technology switching using conference database provides strong evidence that this behavior is occurring within MRI research centers around the world.
Figure 1. MRI technology switching

Table 1 shows the list of product innovative capabilities deemed essential by study participants to make an MRI technology attractive and motivate its adoption (by switching). These capabilities represent combined attributes that make the operation of research centers more effective and efficient, leading to better competitive advantage in the market (Al-kwifi and McNaughton, 2011). Participants emphasized that the decision to switch to a new MRI technology is based on evaluating and ranking these capabilities across different firms, in order to select a technology that has an acceptable performance for the overall capabilities. Although no technology provides a perfect functionality in all the listed aspects, each

participant rated the list of product capabilities for the three MRI technologies based on a scale of from 1 to 5 (as least preferred to most preferred). The final ranking based on the aggregated mean value of the list came as follows: Siemens (most preferable technology), Philips, GE (least preferable).

Table 1. **List of product innovativeness capabilities**

Product innovativeness capabilities
1- Advanced applications
2- Image quality and speed
3- Reliability (low down time)
4- Effective product service
5- User friendly interface
6- Patient-comfort features (ease of in-out, noise)

Discussion

Figure 1 provides clear evidence that technology switching is taking place in the MRI market among the major MRI firms. In this study, the behavior is documented for a 20-year period using a reliable source of data. The fact that this behavior is occurring in the research centers segment (lead users) indicates that the product capabilities of one technology are not able to meet the requirements of those users (AL-kwifi et al., 2014), and a critical decision is therefore made to switch to another technology to sustain the competitive advantages.

Therefore, when a new technology is adopted, the following aspects have to be considered carefully to ensure smooth and effective exploitation of the new technology: (1) MRI technologists must undergo training to control the new technology proficiently; (2) engineers and scientists (an important element in the research centers) should become familiar with the new software design, in order to integrate and test new research ideas; (3) clinical operations downtime during the switching process must be carefully assessed, which demands transferring critical patients to nearby hospitals; and (4) the building configurations must be adjusted to fit the specifications of the new technology.

Technology switching toward Siemens scanner, however, was the dominant behavior over the past 20 years. This represents a clear indication that Siemens technology was offering superior product innovativeness to users, to motivate them to switch despite the high switching costs (Shi et al., 2015). This claim is supported by participants' ranking of different MRI technologies based on their overall product innovativeness capabilities. Although the product innovativeness at the firm level for Siemens is close to that for GE in terms of the registered MRI patents, participants believe that these patents are basically new discoveries rather than actual capabilities, unless they are integrated as product features that address users' demands in meaningful ways (Franke et al., 2009).

To overcome the challenge of defining users' needs and changing preferences, Siemens was successful in utilizing a dynamic open innovation system that increases the level of interaction and collaboration with lead users (Ades et al., 2013), and integrates them in the product development process (Ngo and O'Cass, 2013). This is a critical step, as the development cycle of MRI technology entails close cooperation between research centers and MRI firms, in order to test and validate new applications on patients (Lettl et al., 2006). In practice, each MRI development needs an FDA approval before being launched to market, to ensure its safety on human subjects, a condition that encourages a strong collaboration between MRI firms and research centers to enhance the innovation cycle of MRI technology. Our research confirms that the level of product innovativeness can be enhanced by sustaining a strong relationship with lead users (Lettl at al., 2006). Interestingly, lead users in the MRI research

centers are acting as external research hubs for firms and a rich source of market information. Thus, sustaining a strong relationship with them would enhance the innovative capacity in generating new product features (Franke et al., 2006).

Future Research Directions

More research is needed to investigate new schemes to define and integrate lead users, in order to involve them in the product innovation process, even if they are spread globally. Knowledge for building high technological capabilities is not limited to just one geographical location but can be spread across different regions. Therefore, there is a need to find ways to detect the most talented users and adopt a system that links them into the product development process. Firms need to look behind local boarders to seek knowledge that is not accessible in regional centers and universities; such external knowledge can be essential to enhance the innovative capacity of firms (Laursen and Salter, 2006). We propose to investigate the role of new online interaction technologies in linking users worldwide (Fuller et al., 2006), such as social networks and discussion boards where user feedback and comments from various regions could add significant information to describe personal experiences and unique product capabilities. The importance of ranking talented users can also be explored, where active users who have shown a keen interest and provided useful information will have higher status in the online system. Such users can be monitored closely to review and examine their inputs, or asked to test and review new product features.

THE RELATIONSHIPS BETWEEN ATTITUDES TOWARD COUNTERFEIT BRANDED LUXURY PRODUCTS AND SOCIAL STATUS INSECURITY WITH STATUS CONSUMPTION AND VALUE CONSCIOUSNESS AS MODERATORS

Norizan Kassim, University of Dubai, United Arab Emirates
Mohamed Zain, University of Dubai, United Arab Emirates
Naima Bogari, King Abdulaziz University, Saudi Arabia

Abstract

We examine the relationship between social status insecurity of Malaysian consumers, which influences their attitude toward counterfeit branded luxury products as well as the effects of the relationship that are moderated by consumers' status consumption and value consciousness. The result indicates that consumers' social status insecurity, status consumption, and value conscious are significant predictors of their attitudes toward such products. Customers' social status insecurity has a direct influence on their attitude toward counterfeit branded luxury products. If they were very concerned about their social status or if they were value conscious they would have a favorable attitude toward such products. Also, if they were feeling highly insecure about their social status combined with low value consciousness, they would also have a favorable attitude toward such products. Some variations in the moderation or interaction effects of consumers' social status insecurity on their attitude toward counterfeit branded luxury products were found at different values of status consumption and value consciousness. Some implications of the findings are also discussed.

Introduction

Counterfeiting of products is defined as "any unauthorized manufacturing of goods whose special characteristics are protected as intellectual property rights (trademarks, patents and copyrights" (Chaudhry *et al.*, 2005, p. 60). Counterfeiting is an important and growing worldwide problem, occurring both in developed as well as less developed countries since the 1970s (Bian and Veloutsou, 2005; de Matos *et al.*, 2007; Geiger-Oneto *et al.,* 2013; Yoo and Lee, 2012). Counterfeit products are goods that appear the same to genuine products except that the brand labels they use are copied from the genuine product labels (Cohen, 2005). For example, trademark counterfeiting is now considered as the most serious problem by many multinational corporations doing business in China (Chow, 2003). China is now considered as the world's largest source of counterfeits products (Chapa *et al.,* 2006). Counterfeit products can be classified as either "deceptive" and "non-deceptive" (Zhang and Zhang, 2015). Deceptive counterfeits are typically non-genuine products packaged and sold as genuine brand named products with the intention that consumers may buy them without realizing they are in fact counterfeits. In contrast, non-deceptive counterfeits are also typically non-genuine products in which the consumers, at the time of purchase, are aware that they are buying counterfeit products (Hoe *et al*., 2003). The markets for these products have been growing rapidly, particularly within the past few decades (Phau and Teah, 2009). Despite the fact, that many countries have signed agreements to protect intellectual property rights, counterfeit branded luxury products are still readily available in the world markets (Hung, 2003). For example, a report published in 2015 by the European Union's law enforcement agency, Europol, called Malaysia as one of the main "countries of provenance for counterfeit goods" and "home of piracy" (Europol, 2015; Ng and Choy, 2012). As reported by Abraham and Toh (2015), there were 1,811 cases of confiscated goods worth more than $3 million in Malaysia in 2013. In addition, during the months of January to March of 2014, a total of 11,704

premises were raided nationwide, involving 235 cases and seizures of about $250,000 worth of counterfeit items. These figures are indicative of the increased efforts made by the Ministry of Domestic Trade, Cooperatives and Consumerism of Malaysia to combat product counterfeiting and piracy.

Despite the abundance of studies on understanding consumers' behavior pertaining to purchasing of counterfeit luxury products, the seriousness and growth of counterfeiting product markets persists. Although other factors have been found to affect consumers' ATT, the scope of the current research is confined to the examination of consumers' social status insecurity (SSI), value consciousness (VC), and status consumption (SC) pertaining to counterfeit branded luxury products. We believe that individuals form strong connections to the ATT as the responses to their SSI, VC, and SC. Thus, the objective of this study is to test the relationships between SSI on ATT with SC and VC as moderators. It should be noted here that this paper focuses only on the perceptions of Malaysian consumers towards non-deceptive counterfeit branded luxury products.

Theoretical Background and Hypotheses

1.   Attitude toward Counterfeit Branded Luxury Products (ATT)

According to the theory of planned behavior (Ajzen, 1991), purchase behavior is determined by purchase intention, which in turn is determined by attitudes (Fishbein and Ajzen, 1975). Previous studies have found that a person's attitude toward a behavior instead of toward a product is a better predictor of the behavior (Fishbein and Ajzen, 1975; Penz and Stöttinger, 2005). Consumers' intentions to buy counterfeit products depend on a number of factors including their attitudes toward the products, their perceptions about the risk involves with the products, whether they have purchased counterfeit products before, as well as on their subjective norm, integrity, price-quality inference, and personal gratification (de Matos *et al.,* 2007). For digital products, an attitude of "It is a theft but not a crime" seems to prevail among the millions of people who acquired illegal copies of records, movies and software, or even making their own copies at home (Balestrino, 2008). To a lot of people, buying and/or selling counterfeit luxury brands is not regarded as a serious offence as compared to other illegal acts (Phau, Sequeira, and Dix, 2009). In one study, Bian and Veloutsou (2005) found that about one-third of consumers would knowingly buy counterfeit products if their prices and quality are right and 29 percent would not consider product counterfeiting as harmful as long as the products do not endanger the life of the buyer. Phau, Sequeira, and Dix (2009) found that integrity is the only factor that influences a consumer's attitude toward counterfeits, but it does not necessarily decrease his willingness to purposely buy counterfeit luxury brands. They also found that the useful life of a counterfeit luxury brand significantly influences a consumer's willingness to buy such a brand. In another study on Singapore consumers, Phau, Teah, and Lee (2009) found that consumer attitudes toward counterfeit luxury products play an important role in affecting their purchase intention. In addition, they found that the social influence of consumers plays an important role in their intention toward purchasing counterfeit goods. Despite their stable income, price and quality of CBL products relative to their genuine ones still represent an incentive for them to opt for the CBL products. However, this is not the case for Vietnamese consumers where, according to Ha and Tam (2015), this group has less support and intention to purchase counterfeiting products.

2.   Social Status Insecurity (SSI) and ATT

Social status insecurity (SSI) refers to "the degree to which an individual is concerned with appearing low-class or feels uncertain about his or her social standing" (Wyatt *et al*., 2008, p. 361). In other words, consumers may conspicuously consume certain products just to avoid social anxiety (i.e., the fear of being judged and evaluated negatively by other people, leading

to feelings of inadequacy, inferiority, embarrassment, and humiliation). Some consumers may consume luxury products to reflect their self-identity, group-identity, and/or social status (Strizhakova *et al.,* 2008, 2011). Phau, Sequeira, and Dix (2009) found that the extent to which consumers consider a brand as symbolic or functional would influence their willingness to buy counterfeit luxury brands. They also found that symbolism and prestige play an influential role in consumers' knowingly buying counterfeit luxury products. Sometimes, the need for some consumers to show off their status to others as if they were well to do and could afford to purchase luxury goods could be due to their feeling of insecurity about their social status or simply to avoid of being regarded by others as low-class (Geiger-Oneto *et al.,* 2013). Thus, this feeling of insecurity could make them buy luxury products/brands in their effort to alleviate the feeling. Thus, our first hypothesis is:

 H_1: SSI has a direct positive influence on ATT.

3. Status Consumption (SC) and ATT

Consumption behavior of consumers can be influenced by status and prestige considerations (Baek *et al.,* 2010; Goldsmith *et al.*, 2010). Many people conspicuously consume luxury products to signal their wealth to others (Nelissen and Meijers, 2011). Owning status goods could boost consumers' ego as well as repair their psychological wounds, especially for those with low social esteem (Sivanathan and Pettit, 2010; Twenge and Campbell, 2002). The term luxury or status goods is defined as "goods for which the mere use or display of a particular branded product reflects prestige onto the owner, apart from any functional utility" (Grossman and Shapiro, 1986, p. 3) In other words, people consume luxury products because the products convey certain luxury status. Thus, if they could not afford to buy genuine products which are usually expensive, they might resort to buying counterfeit ones if such products exist in the market (Phau and Teah, 2009), particularly if the products are almost the same as the genuine ones. Furthermore, McFerran *et al.* (2014) pointed out that there is a paradox in luxury consumption. They observed that when consumers purchase luxury brands, they might want to show heightened feelings of accomplishment (not arrogance), but to others, they instead might signal arrogance (rather than accomplishment). Also, Nwankwo *et al.* (2014) and Sharif and Kassim (2015) found that Muslims are not fundamentally different from western consumers with regard to predispositions toward luxury consumption. In addition, Perez *et al.* (2010) found that by consuming counterfeit luxury goods it enables consumers to construct an image of "savvy" individuals who are able to optimize their resources, able to have fun and adventure, and able to fool others without getting caught. However, results from previous studies have shown that individuals seek status by buying luxury brands because they believe those brands could enhance their influence and status in social relationships (Nelissen and Meijers, 2011; Ridgeway and Erikson, 2000). Therefore, we next hypothesized:

 H_2: SC has a direct positive influence on ATT.

4. Value Consciousness (VC) and ATT

Value consciousness (VC) is a concern for paying lower prices, subject to some quality constraint (Lichtenstein *et al.,* 1990). Smart shoppers perceive buying counterfeits as value for money (Mohd Nordin *et al.*, 2013). It is evident from previous research (Ang *et al.*, 2001; Phau, Teah, and Lee, 2009) that consumers who are more value-conscious will subsequently have a positive ATT. A possible explanation for this finding may be due to the assumption that high SSI and SC consumers may pay more attention in wanting to fulfill their need to be equal to those in higher social class, but they do not have the financial ability to do so (Wee *et al*., 1995). Hence, our next hypothesis is:

H_3: As the VC of consumers increases, their ATT become more favorable

However, as the importance given to SC increases, the likelihood of a consumer choosing a genuine luxury product increases more than the likelihood of him/her buying a counterfeit one (Geiger-Oneto *et al*., 2013). As a result, they will more likely choose genuine luxury products over their counterfeits. Alternatively, for consumers who feel concerned about their social status but lack the financial capability, they will likely choose counterfeits (for them, it is the only way to own such brands) over genuine luxury products because the visible luxury attached to the counterfeits serves to fend off the negative perception of others on them (Charles *et al*., 2009). Thus, we expect SSI and status SC to influence their brand type choice. This leads us to the following hypothesis:

H_4: Higher SC strengthens the influence of SSI toward favoring their ATT ($SSI_i \; x \; SC_i$)

Alternatively, the relationship between SC and ATT may be moderated by VC. Thus, we assume that the dependence of consumers' ATT on SC may likely depend on their level of VC. For example, consumers who choose genuine luxury products over counterfeits are not particularly concerned about their value. However, when both VC and SC are high, the consumers would opt for counterfeits over genuine luxury products for their value (Geiger-Oneto *et al.,* 2013). Thus, we hypothesized:

H_5: The strength of the relationship between SC and ATT depends upon VC, such that SC is strongest when VC is high and weakest when VC is low ($SC_i \; x \; VC_i$).

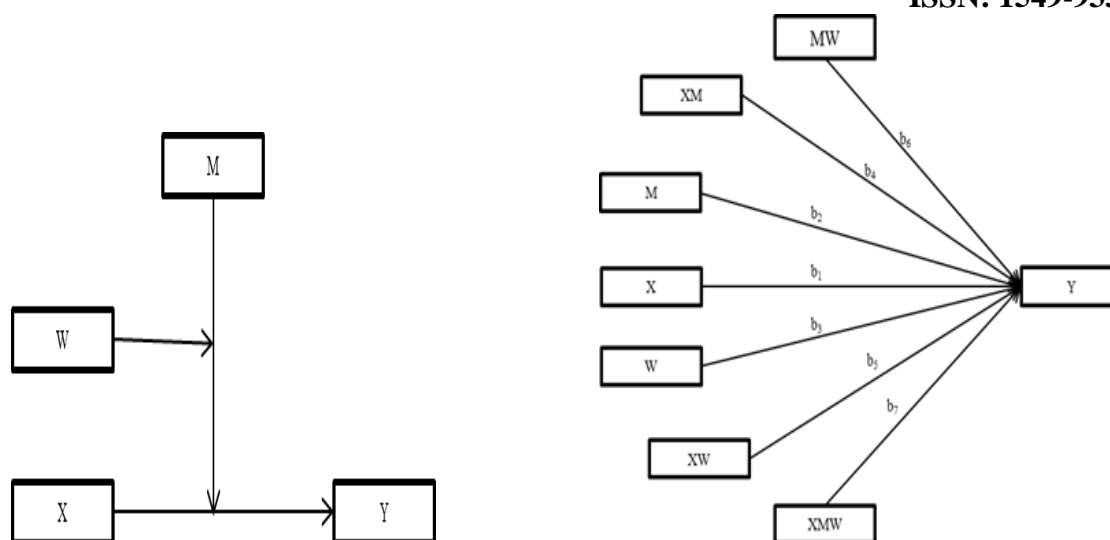
H_6: The strength of the relationship between SSI and ATT depends upon VC, such that SSI is strongest when VC is high and weakest when VC is low ($SSI_i \; x \; VC_i$)

H_7: The strength of the relationship between SSI and ATT depends upon SC and VC, such that SSI is strongest when SC and VC are high and weakest when SC and VC are low ($SSI_i \; x \; SC_i \; x \; VC_i$)

In summary, the above hypotheses can be tested by comparing the conditional effect of X on Y by M and W as moderators (in this case, Y is ATT, X is SSI, M is SC, and W is VC). This model includes age as the control variable (covariate). Of interest is the relationship between ATT and SSI with SC and VC as moderators that can be depicted as:

$$Y = i_Y + b_1X + b_2M + b_3W + b_4XM + b_5XW + b_6MW + b_7XMW + e_Y,$$
where the conditional effect of X on Y is

$$\theta_{X \to Y} = b_1 + b_4M + b_5W + b_7MW$$

Therefore, based on the above hypotheses, the proposed theoretical framework of this study is depicted in Figure 1.


Legend: M = SC; W = VC; X = SSI; Y = ATT

Method of Data Collection and Analysis
1.   Variable Measures and Validation
All items in the survey questionnaire were adapted from established studies (Lichtenstein et al., 1990; Wu, 2001; Wyatt *et al.*, 2008; Eastman *et al.*, 1999; Ang *et al.*, 2001). The items were measured using a six-point Likert scale (1= "Strongly disagree", 6 = "Strongly agree"; and 1 = "Not at all", 6 = "Definitely will"). We used a force-point Likert scale because the surveys were conducted in conservative markets where there is a tendency for the respondents to opt for "safe" or middle ground answers (Garland, 1991). The questionnaire was translated from English into two languages, -- Arabic and Malay (Bahasa Malaysia). To ensure that the two versions of questionnaires have the same meaning in both languages we used Brislin's (1986) back-to-back translation method. The Cronbach's alphas are all greater than 0.70 (Bagozzi and Yi, 1988), which indicate good reliability.
    A.   Social Status Insecurity (SSI)
We employed the same measures developed by Wu (2001) and Wyatt *et al.* (2008) of social status insecurity (two items): "Others view me as second class", and "People bias against me". We found these scales to have good reliability of $\alpha = .797$.

    B.   Status consumption (SC)
We assessed SC using Eastman *et al.* (1999)'s four-item SC scales. The following example illustrate how each of the four items is worded: "I a buy product because it has status", "Interest with new product with status", "Willing to pay more for product with status", and "Valuable product has snob appeal". From the assessment, we found that the items displayed good reliability ($\alpha = .822$).

    C.   Value consciousness (VC)
The VC seven-item scale was based on Lichtenstein *et al.* (1990): "Lower prices with quality", "Compare prices of different brands for best value", "Check prices at different stores for best value", "Concern about low price and quality", "Compare prices with the brand I

normally buy", "Maximize the quality with the price", and "Getting my money's worth". We found this scale to have good reliability ($\alpha = .788$).

D.   Attitude Toward Counterfeit Branded Luxury Products (ATT)

We employed Ang *et al.*'s (2001) measures of attitude towards counterfeit luxury products or services. This measure contains evaluations of attitudes towards the products ("…to buy counterfeit luxury brand products", "luxury counterfeit products benefit the society", "without counterfeit brand products many people cannot enjoy luxury products", "the original luxury brand product outlets are not available", "outlets are easily accessible", "I do not feel guilty" and "…exactly what I needed"). We found this scale to display a good reliability ($\alpha = .796$).

2.   Data Collection and Analysis Methods

We hired a professional service provider to distribute the survey questionnaire conveniently from the Kelang Valley (Kuala Lumpur and its surrounding areas) of Malaysia. We used descriptive statistics and moderated moderation three-way interactions model in SPSS with PROCESS program by Andrew Hayes (2016) (www.afhayes.com) to test the hypotheses and SEM was used to conduct CFA, using the IBM SPSS version 20 and IBM AMOS version 22 software, respectively.

Results

A total of 346 completed and useable questionnaires were collected. The data consisted 67.6 percent female and 32.4 percent male respondents between the age of 25 to 34 years old (41.9 percent), followed by 36.1 percent between the age of 18 to 24 years old, and 22.0 percent who were 35 or more years old. The education levels of the respondents were almost evenly split between diploma holders (40.2 percent) and college graduates (bachelor's degree holders, 43.1 percent), and only 16.8 percent were high school graduates. The vast majority of the respondents' monthly income were below RM3,000 (70.5 percent), whilst 21.4 percent were between RM3,001 to 5,000, followed by 8.1 percent whose incomes were RM5,000 and above. (Note: 1USD = 3.57 Ringgit Malaysia (RM)). It can be argued that the group with incomes below RM3,000 could be biased because of its over-representation relative to other groups in the sample. However, previous studies have found that consumers' income is not a significant factor affecting their purchases of counterfeit products, particularly if they are in lower income brackets (Ha and Tam, 2015; Norum and Cuno, 2011). For example, in the US, Norum and Cuno (2011) found that income is a significant factor that reduces the intention to purchase counterfeit products, only if it is above $100,000 per annum. Thus, we can now conclude that there is no sampling bias occurred in this study.

The independent variables that are predicted to influence ATT are SSI, SC, and VC. In addition, respondent's age was included as a control variable. The descriptive statistics and correlation matrix for the independent variables are shown in Table 1.

Table 1. Descriptive Statistics Assessment of Reliability, Convergent Validity and Discriminant Validity, and Correlation Matrix for the Independent Variables

Independent variables	CR	AVE	MSV	ASV	SSI	SC	VC	Age
Social status insecurity (SSI)	0.800	0.667	0.102	0.080	3.341 (.995)			
Status consumption (SC)	0.816	0.690	0.068	0.051	.185**	3.397 (.989)		
Value consciousness	0.835	0.718	0.090	0.065	.261**	.172**	4.831 (.646)	

(VC)				
Age		.154**	0.089	.154**	1.860 (.750)

Significant at $p < 0.01$**

SD = Standard deviation; CR = Composite reliability; AVE = Average variance extracted;
ASV = Average shared variance; MSV = Maximum Shared Variance.
Note: Reliability and validity thresholds (Hair *et al*. 2010): Reliability =CR > .70; Convergent validity = AVE > .50; Discriminant validity = ASV < AVE or MSV < AVE (Hair *et al*., 2010). Diagonal elements are means and standard deviations (in parentheses) and non-diagonal are correlation elements.

Next, we established the convergent and discriminant validities, as well as the reliability of the data by doing a confirmatory factor analysis (CFA) using IBM AMOS version 22 software, before moving on to test the hypotheses. A summary of the CFA result is shown in Table 1, which indicates a good fit for the model comprising the SSI, SC, and VC (χ2 (16) 62.19, p =.001, GFI = 0.96, CFI = 0.95, RMSEA = 0.09). Preliminary analyses were conducted to ensure no violation of the assumptions of outliers, normality, linearity, multicollinearity, homoscedasticity, and independence of residuals. No case that violates the assumptions was found.

1.   Moderated Moderation (Three-Way Interactions Model)

The results in Table 2 show that the model fits the data well [F (7, 346) = 10.268, $p < 0.000$, $R^2 = 0.144$]. Low R-squared value of 14.4 percent is expected in any field that attempts to predict human behavior, such as in this study, which typically has R-squared values lower than 50 percent (Frost, 2013).

The first three hypotheses predicted a relationship between SSI, SC and VC on ATT. The results in Table 2 indicate that the main effects — SSI [b = .207, *t-value* (345) = 4.36, $p<.000$], SC [b = .139, *t-value* (345) = 2.59, $p<.009$] and VC [b = .196, *t-value* (345) = 2.70, $p<0.006$] — are statistically significant predictors of ATT. Thus H$_1$, H$_2$, and H$_3$ are supported. Interestingly, none of the interactions effects are significant (except for the second interaction effect, i.e., int_2 between SSI and VC, which is significant). Thus, H$_4$, and H$_5$, are not supported, but H$_6$ is marginally supported [b = -.124, *t-value* (345) = -1.86, $p<.063$]. The following section discusses in details the conditional effect of SSI on ATT at values SC and VC.

Table 2. Model Summary [n-346]

Model = 3   Y = ATT; X = SSI;   M = SC;   W = VC
Statistical Controls: CONTROL= Age
Outcome: ATT

int_4	.005	1.918	337.000	.167

Source: The output of the analysis

As shown in Table 3, the effect of SSI on ATT is also likely to depend on the importance an individual places on SC and VC. A summary of the results in Table 3 is summarized in Table 4. The following paragraphs discuss the conditional effects of SSI on ATT at each level of importance given to SC and VC.

2.   VC_low; SC_low; SC_average, and SC_high.
When VC and SC of an individual is low, SSI was found to have insignificant relationship with ATT [t-value (345) = 1.185, $p < 0.170$]. As shown in Table 4, as the SC increases and the VC remains constant, SSI was found to have a significant positive effect on ATT [t-value (345) = 3.920, $p < 0.000$]. Similar effect occurred, i.e., when SC increases to a high level, SSI was found to have a significant effect on ATT [t-value (345) = 4.762, $p < 0.000$].

3.   VC_average; SC_low; SC_average; and SC_high.
Results in Table 4 indicate that at an average level of importance an individual places on VC and low level given to SC, SSI was found to have marginally predicted ATT [t-value (345) = 1.579, $p<.072$]. The influence of SSI on ATT was found to be positively significant when average [t-value (345) = 4.256, $p<.000$] and higher levels [t-value (345) = 4.586, $p<.000$] of importance were given to SC.

High	.646	Low	-.989	.120	1.304	.141	SSI does not predict ATT
High	.646	Ave	.000	.127	2.291	.018*	SSI predicts ATT
High	.646	High	.989	.135	1.816	.080	SSI marginally predicts ATT

***$p < 0.001$; **$p < 0.01$**; $p < .05$*

Note: Values for quantitative moderators are the mean and plus/minus one SD from mean.

4.   **VC_high; SC_low; SC_average; and SC_high.**

Results in Table 4 show that at high level of VC and low level of SC, the relationship between SSI and ATT was found to be insignificant [*t-value* (345) = 1.304, $p < 0.141$]. As expected, as value of SC increases (i.e., average level), the relationship between SSI and ATT was found to be statistically significant [*t-value* (345) = 2.291, $p < 0.018$]. Finally, when higher level of importance was given to SC, SSI was found to have marginally predicts an individual's ATT [*t-value* (345) = 1.816, $p < 0.080$].

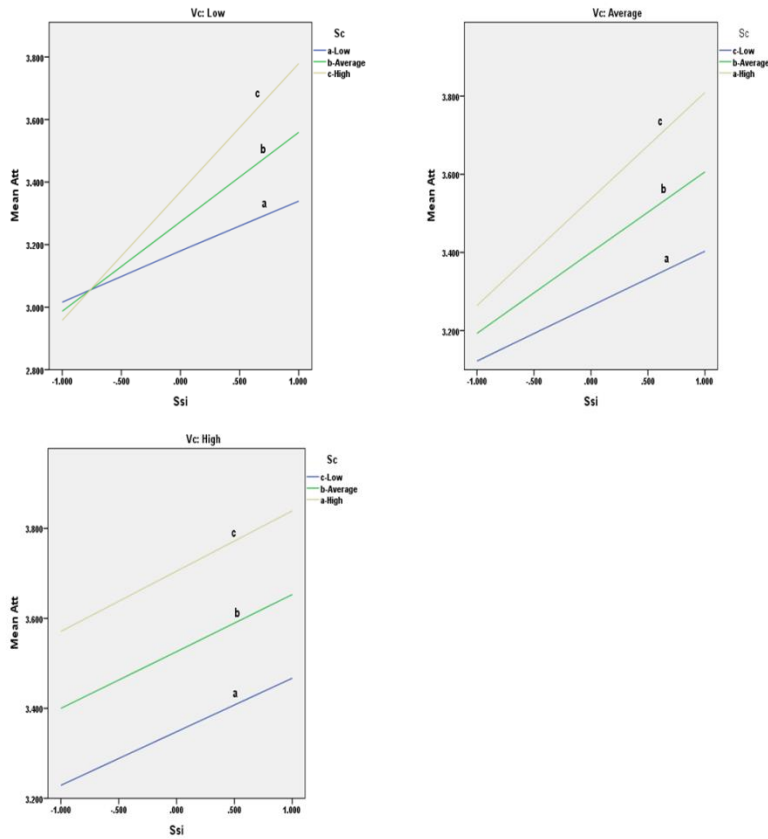
In summary, the effect of SSI on ATT was found to have similar pattern when different levels of importance an individual places on SC and VC as depicted in Figure 2. Thus, H$_7$ is not supported.


**Figure 2. Conditional Effect of SSI on Attitude Toward Counterfeit Branded
Luxury Products with SC and VC as Moderators**

Discussion and Implications

In this study, we examine the relationship between the social status insecurity of Malaysian consumers that resulted in them having a favorable attitude toward counterfeit branded luxury products. We also examine the effects of the relationships that are moderated by consumers' status consumption and value consciousness. Based on the results of our hypothesis testing, the consumers' social status insecurity, status consumption, and value conscious were found to be significant predictors of their attitudes toward counterfeit branded luxury products. However, the interaction effect between social status insecurity and value conscious was found to be marginally significant.

The results provide support for four of the seven hypotheses. First, customers' social status insecurity has a direct influence on their attitude toward counterfeit branded luxury products. Thus, if the customers were feeling insecure about their social status, one way in which they could alleviate this feeling is by buying counterfeit branded luxury products in order to show to their social group that they could afford to buy "branded luxury products". Second, if the customers were very concerned about their social status, they would have a positive attitude toward counterfeit branded luxury products, indicating that by owning such products it would increase their status in the society. Third, if the consumers were value conscious, i.e., they prefer to save money by opting for products that are lower in prices (subject to certain quality constraint) then they would have a favorable attitude toward counterfeit branded luxury products. This means that they would be willing to purchase such products. Finally, if the consumers were feeling highly insecure about their social status combined with low value

consciousness, they would have a favorable attitude toward counterfeit branded luxury products.

Interestingly, after scrutinizing further the interaction or moderation effects of consumers' social status insecurity on their attitude toward counterfeit branded luxury products at different values of status consumption and value consciousness, we found some variations in the moderation effects. Firstly, there is an interaction effect that is moderated by customers' value consciousness between customers' social status insecurity and their attitude toward purchasing the counterfeit branded luxury products. In other words, the strength of the relationship between the two depends on the strength of the customers' value consciousness. Secondly, an increase in consumers' status consumption coupled with a constant value consciousness result in the consumers having significant effects on their attitude toward counterfeit branded luxury products. Finally, a reasonable increase in the level of consumers' status consumption (but not at the high level), combined with a constant or average level of their value consciousness result in a significant influence of social status insecurity on the attitude towards counterfeit branded luxury products. Thus, our findings extend the findings by previous researchers by examining some factors that moderate the influence of consumers' social status insecurity on their attitude toward purchasing counterfeit luxury products.

Our analyses have generated several meaningful findings that present some implications for marketing managers and researchers. Our results show that Malaysian consumers would go for counterfeit luxury products when they are feeling socially insecure, when they are going for status consumption and when they have low value consciousness. Indeed, their status consumption and value consciousness play very important roles in predicting the relationship between their social status insecurity and attitude toward purchasing counterfeit branded luxury products. Thus, with this understanding, marketing managers who market authentic branded luxury products in Malaysia or in other countries with a similar environment to that of Malaysia will be able to design appropriate marketing strategies in their attempt the attract customers to purchase their products instead of the counterfeit of such products.

Finally, our study is not without any limitations. Firstly, our use of convenience sample represents a weakness of this study. Secondly, our data came only from the Klang Valley of Malaysia. Hence, future research should cover a wider spectrum of the population of the country.

THE EFFECT OF KNOWLEDGE ON CONSUMER RIGHTS TOWARD COMPLAINTS DELIVERY ON CELLULAR TELECOMMUNICATION PRODUCTS IN BANDAR LAMPUNG.

Dorothy Rouly Haratua Pandjaitan, Universitas Lampung, Indonesia
Dwi Asri Siti Ambarwati, Universitas Lampung, Indonesia
Rehulina, Universitas Lampung, Indonesia

Abstract
Consumer knowledge of their right to deliver complaints to businesses (services) and presentation of the complaint is indeed protected by the law, in this case the law No. 8 of 1999 on Consumer Protection on article 4 point d entitles consumers to deliver complaints, if the provider do not provide services as they have of the agreement. The research methodology using SEM analysis using the sample of respondent of provider users in Bandar Lampung. The analysis shows that there are three models: first model, shows that before adding moderating variable, the result acquired does not obtained significant value. The second model shows that after moderating variable consumer knowledge were added, the results are significant. The third model, indicates that the interaction between the quality of service and customer knowledge variables to provide additional impact is not too large. This means that the interaction between Service Quality and Consumer Sciences only provide great influence on the intention to give the complaint. This tentative conclusion is obtained that the socialization of education about consumer knowledge has been done and the results show that respondents are not fully aware of their rights to make complaints.

Keywords: *Quality of Service, Consumer Sciences, Complaint Intention*

Background
Rapid telecommunication development in Indonesia has enable communication to be easier, with the capability of service from various telecommunication support, thus exploring internet with high speed has become an added value from telecommunication in Indonesia. Cellular telecommunication development has proven to gives enormous effect to every party and even leverage the economy. With the developing cellular technology and considerable amount of users, hence the telecommunication infrastructure to increase. However, the revolutionary breakthroughs' rapid growth from cellular telecommunication is not followed with the knowledge about right and responsibility of a consumer toward the telecommunication products chosen.

Dependency towards telecommunication and the convenience to acquire the product has made the product excessively consumed, even if they are aware of that matter and what they not realize is the rights which obtained by consuming the respective telecommunication products. Consumer ignorance on their rights when consuming a product may affect after the product purchase. Consumers who unaware of a product' terms and their rights will certainly unable to file a report if the product they consume is not corresponding to their expectations, focus of this research is the telecommunication products which is substantially consumed and possess considerable amount of terms and condition which is occasionally not written clearly.

Table 1.1 Top Brand Telecommunication Product Index

Brand	TBI	TOP

Simpati	34.6%	TOP
XL Prepaid	14.1%	TOP
IM3	14.0%	TOP

Table 1.1 shows that in Indonesia, there is three Top Brand telecommunication products which is Simpati, XL and IM3. These three provider were compete each another with each respective superiority they possess, yet Simpati is still become the primary Top Brand which allegedly because Simpati is a provider with the latter experiences on serving the consumer in Indonesia compared to other providers.

Table 1.2 Consumer Respond

No	Questions	Answer		Amount
		Yes	No	
1	Are you satisfied with the service of provider you use?	12	8	20
2	Are you incline to convey a complaint?	13	7	20
3	Are you aware of your rights as a consumer?	3	17	20

Table 1.2 shows that a part of consumer feels dissatisfy to the provider they use and they are inclined to file a complaints to telecommunication producer, yet they are unaware of their rights as consumer. Consumer ignorance are caused by the lack of education from producer on a product especially communication product which typically the terms and conditions is not written in detail. Several cases experienced by consumers is the consumer are not served with the appropriate service corresponding to their rights to be appropriately served which one of them is customer service' regards, greets and smile, as well as no acquiring the clear information concerning to the product before purchasing. Majority of consumers understand the terms and conditions of a product with their own experience when consuming the product, not from producer' education.

Fair education is required to make customer acknowledge the rights they possess when consuming a product and the terms owned by the product itself. If the customer were not acquiring the adequate education, there will be considerable amount of matter like a customer who has a perception of quality of a product but when it is consumed, it not live up to their expectations, as a customer with lack of education from the producer, the consumer will always have higher perception about quality of a product. The ignorance of certain terms of a product and rights they possess, will surely limit the latitude of the consumers itself.

On the other side, with the fair education from producer, there will be mediation between producer to consumer by incoming complaints to producer, which will be responded and properly solved to preserve the rights of consumers and enables product innovation by following the consumer apparent needs.

The importance of consumer education on a product are purposed to make consumer become more critical on rights they possess, especially toward products in telecommunication sector, because of that, the research regarding to consumer protection especially telecommunication product is essential.

Consumer ignorance is caused by lack of education from the producers on a product, especially telecommunication product which the terms and conditions is not thoroughly written. On the other side, with fair education from producer, there will be mediation between producer to consumer by incoming complaints to producer, which will be responded and

properly solved to preserve the rights of consumers and enables product innovation by following the consumer apparent needs.

The importance of consumer education of a product is purposed to make consumer more critical on the rights they possess, especially on telecommunication products. Therefore, it is necessary research about the effect of knowledge upon consumer rights towards complaints delivery on cellular telecommunication products in Bandar Lampung. The methodology which will be utilized is descriptive verification. The data will come from questionnaire and literature, meanwhile the source of data are consumers of telecommunication products resided in Bandar Lampung.

On one year period, the researcher will finalize the research until research result seminar with finishing several stages of proposal organizing, data collection, data input, data calculation, calculation result analysis and research report organizing. On the second year of research, it will later be expanded as an output in the form of educating socialization for consumers, partnering with YLKI as body with is purpose to increase the critical awareness of consumers about their rights and responsibilities, enabling the consumers to secure their self and the environment.

Consumer Protection Law

Az. Nasution explained that consumer law is the whole principle or regulation of law which manage the relation and problems between various parties each another related with goods and/or consumer service, in social life. While consumer protection law is part of the consumer that includes the principles or rules which regulates, and also contains properties that protect consumer interests.[1] So the consumer protection law is the law governing the protection of consumers against the transaction which conducted. Consumers themselves means that the end user of a products and services. Among consumers can not be called as a consumer, but is referred to as business operators.

Business actors are makers of finished products or parts and also produces natural products and *services provider.*[2] Businessman purposed on this article is businessman in service sector which is telecommunications service provider known as providers. In Indonesia a lot of telecommunications providers service, (after the era of the free market), but this article only specified on 3 major providers in Indonesia, namely, Telkomsel, Telecomindo and Indosat.

General provisions on consumer protection in the field of Indonesian law regulated in Law No. 8 of 1998 on Consumer Protection (hereinafter referred to as the Act PK). Article 4 BFL listed consumer rights, namely:

a. The right to comfort, security, and safety in the consumption of goods and / or services;

b. The right to choose and obtain goods and / or services in accordance with the exchange rate and conditions and guarantees promised;

c. The right to correct, clear and honest information about the condition and guarantee of the goods and / or services;

d. The right to be heard about opinions and complaints on goods and / or services used;

e. Entitlement to advocacy, protection and mediation in appropriate consumer protection;

f. The right to receive guidance and consumer education;

[1] Ahmadi Miru and Sutarman, 2011, *Hukum Perlindungan Konsumen,* Jakarta: RajaGrafindo Persada, page.

2. [2] Husni Syawali and Neni Sri Imaniyanti, Ed, Hukum Perlindungan Konsumen, Mandar Maju, Bandung, 2000, page. 45 italic is additional from the writer.

g. The right to be treated or serviced properly and honestly and not discriminatory;

h. The right to obtain compensation, compensation and / or reimbursement, if the goods and / or services received are not in accordance with the agreement or not as it should be;

While businesses have rights and obligations set out in Article 6 and 7 of BFL. Article 6 BFL declare their 5 rights for businessmen namely:

a. The right to receive payment in accordance with an agreement on condition and exchange of goods and / or services traded;

b. The right to legal protection of consumer action with bad intention;

c. The right to proper self-defense in the judicial settlement of consumer disputes;

d. The right for rehabilitation of goodwill if it is proved that the consumer loss is not caused by the goods and / or services traded;

e. The rights stipulated in other laws and regulations.

In addition to article 6, paragraph 7 of BFL listed on the obligations of businessmen, namely:

a. Acting in good intention in conducting its business activities;

b. Providing accurate, clear and honest information about the condition and guarantee of the goods and / or services and explain the usage, repair and maintenance;

c. Treat or serve customers properly and honestly and not discriminatory;

d. Guaranteeing the quality of goods and / or services produced and / or traded under the provisions of the quality standards of goods and / or services are applicable;

e. Giving consumers a chance to test and / or try the goods and / or services as well as the guarantee and / or warranty on goods manufactured and / or traded; f. Compensation, indemnity, and / or replacement if the goods and / or services received or used by consumer if it is not in accordance with the agreement.

Article 4 point d of this law clearly entitles the consumer to present the complaints of discontent on the services provided by the provider. and businesses are obliged to listen and provide solutions to any inconvenience felt by consumers, it is as confirmed in Article 7 point d stating that businesses have an obligation to guarantee the quality of goods or services which are traded based on the provisions of the quality standards of goods and services applied. Of a product (service) in which consumers feel aggrieved, article 7 point f gives the order for the business to provide compensation, indemnity and or replacement if the goods or services received or used by consumer is not in accordance with the agreement.

Research Methodology

The population of this research is all the providers in Bandar Lampung, the sample used is active users of Telkomsel, XL and Indosat providers. Provider respondents which used were 151 people which is a combination of the Telkomsel, XL and Indosat provider. Data analysis using Structural Equation Model with SPSS statistical tool. The initial step will be seen first whether there is a relationship between the Quality of Service and Complaints intentions variables from users of the provider, after which it will be add a moderating variable namely Consumer Knowledge about their rights, which will eventually seen that the interactions between the Quality of Service and Intention to give complaint.

Research Result and Managerial Implications

In the analysis of respondent data it can be inferred that of 151 active provider users, active users of the three providers were dominated by women between the ages of 18-23. The active user is also dominated by the students where the Education Socialization of Consumer Rights were held for three sessions during this research period. The frequency distribution of respondents from the user side is dominated by the Telkomsel provider, in which the Telkomsel provider is the earliest to be known by Lampung people, followed by XL and Indosat.

1. Respondent Distribution Frequency Based on Telkomsel Operator User
A. Consumer Knowledge

Knowing the Provider Service Outlet Location

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Very Not Knowing	1	1,1	1,1	1,1
	Not Knowing	4	4,5	4,5	5,6
	Enough Knowing	22	24,7	24,7	30,3
	Knowing	40	44,9	44,9	75,3
	Very Knowing	22	24,7	24,7	100,0
	Total	89	100,0	100,0	

Frequency distribution of Telkomsel provider users shows that almost all respondents knew the location of the service provider' outlets, but there are 20% of respondents who feel that the information on the location of the outlets is still not well established. This is presumably due to a lack of knowledge of the provider about the service provider location outlets.

In the table of frequency distribution knowing service provider' phone number showed a fairly good value that is known by the Telkomsel provider users. This shows that the majority of consumers allegedly to ever have phone call on this service provider.

Knowing Consumer Rights

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Not Knowing	7	7,9	7,9	7,9
	Enough Knowing	31	34,8	34,8	42,7
	Knowing	35	39,3	39,3	82,0
	Very Knowing	16	18,0	18,0	100,0
	Total	89	100,0	100,0	

On the frequency distribution table shows that the Telkomsel provider users already know their rights as consumers. This is presumably because it was their awareness of their Knowledge because of Education Socialization to the Telkomsel provider users about their rights in submitting the complaint if there are deficient in service felt from provider.

Knowing Responsibilities as Consumer

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Not Knowing	6	6,7	6,7	6,7
	Enough Knowing	36	40,4	40,4	47,2
	Knowing	36	40,4	40,4	87,6
	Very Knowing	11	12,4	12,4	100,0
	Total	89	100,0	100,0	

On this distribution table shows that Telkomsel provider user already acknowledge their responsibility as consumer. This is presumably because the existing awareness about responsibility from Education Socialization to Telkomsel provider users about their responsibility in giving complaints if there is deficient in service felt from provider.

Knowing the Content of Consumer Protection Act

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Very Not Knowing	26	29,2	29,2	29,2
	Not Knowing	19	21,3	21,3	50,6
	Enough Knowing	20	22,5	22,5	73,0
	Knowing	19	21,3	21,3	94,4
	Very Knowing	5	5,6	5,6	100,0
	Total	89	100,0	100,0	

On this distribution table shows that Telkomsel provider users already know the content of Consumer Protection Act. This is presumably because it was their knowledge of the contents of the Consumer Protection Act. This is presumably because the knowledge is acquired from Education Socialization to provider users in delivering complaints if there is deficient in service felt from provider.

2. Service

Available Facilities

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Netral	12	13,5	13,5	13,5
	Setuju	58	65,2	65,2	78,7
	Sangat Setuju	19	21,3	21,3	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that the provider Telkomsel users feel that the facility is available from the provider Telkomsel has been well perceived. This is presumably because consumers have felt the service was good in terms of facilities consisting of comfortable lounge chairs available, toilets were clean, room VIP services and their queue numbers corresponding to the service to its customers.

Cleanliness in Service Outlets

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	14	15,7	15,7	15,7
	Agree	55	61,8	61,8	77,5
	Very Agree	20	22,5	22,5	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that the Telkomsel provider users felt that the cleanliness of Grapari is already well. This is presumably because the consumer has to see that the waiting room at the service Customer Service is good and in a state that is clean and well maintained so that consumers feel comfortable in delivering complaints.

Employees in Service Outlets were Properly Dressed

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	8	9,0	9,0	9,0
	Agree	61	68,5	68,5	77,5
	Very Agree	20	22,5	22,5	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that the Telkomsel provider users feel that the existing Grapari employees perceived is well dressed. This is presumably because consumers have noticed that the appearance of employees in Customer Service has been perceived both in appearance as well as friendly and courteous in serving consumers, so that consumers feel comfortable in delivering complaints.

Employees in Service Outlets

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	10	11,2	11,2	11,2
	Agree	57	64,0	64,0	75,3
	Very Agree	22	24,7	24,7	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that the Telkomsel provider users feel that employees in Grapari are felt to be reliable in serving consumers. This is presumably because the consumer has the feeling that the employees in the Customer Service is very eager to serve the consumer, so that consumers feel comfortable in delivering complaints.

Service Outlets Conserve the Queuing Culture for Consumer

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	7	7,9	7,9	7,9
	Agree	56	62,9	62,9	70,8
	Very Agree	26	29,2	29,2	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that the Telkomsel provider users feel that the existing queing culture in Grapari has been very good. This is presumably because Telkomsel has a queue system in the form of numbers through a machine that is used in accordance with

the needs of consumers, so that consumers feel comfortable in delivering complaints. In addition, the Quick Service for consumers who just ask a few questions that are biased directly solved by special officers without going through Customer Service.

Employees in Service Outlets were Punctual in Serving Consumer

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	2	2,2	2,2	2,2
	Neutral	10	11,2	11,2	13,5
	Agree	61	68,5	68,5	82,0
	Very Agree	16	18,0	18,0	100,0
	Total	89	100,0	100,0	

On this frequency distribution table shows that the Telkomsel provider users feel that the employees in service outlets are punctual in serving consumers. This is presumably because consumers have felt that the queue number services takes only about 10-15 per consumer, so that consumers feel the waiting time is not too long to deliver complaint.

Employees in Service Outlets were Friendly in Serving Consumers

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Neutral	9	10,1	10,1	10,1
	Agree	65	73,0	73,0	83,1
	Very Agree	15	16,9	16,9	100,0
	Total	89	100,0	100,0	

On this frequency distribution table shows that the Telkomsel provider users feel that the employees at the service outlets is friendly in serving consumers. This is presumably because consumers have felt that the employees are very friendly and responded with alacrity to consumer complaints, so that consumers feel comfortable in delivering complaints.

Employees in Service Outlets Willing to Accept Suggestions from Consumers

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	2	2,2	2,2	2,2
	Neutral	9	10,1	10,1	12,4
	Agree	65	73,0	73,0	85,4
	Very Agree	13	14,6	14,6	100,0
	Total	89	100,0	100,0	

On this frequency distribution table shows that the Telkomsel provider users feel that the employees at the service outlets were friendly in serving consumers. This is presumably because consumers have felt that the employees are very friendly and responded with alacrity to consumer complaints, so that consumers feel comfortable in delivering complaints.

Services Provided were Proper to the Promises

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Very Disagree	1	1,1	1,1	1,1
	Disagree	1	1,1	1,1	2,2
	Neutral	9	10,1	10,1	12,4
	Agree	68	76,4	76,4	88,8
	Very Agree	10	11,2	11,2	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that the Telkomsel provider users feel that the services provided are proper to the promises. This is presumably because consumers have felt that the service is very suitable to face a consumer complaint, so that consumers feel comfortable in delivering complaints.

Employees in Service Outlets were Trying to Understand Consumer Needs

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	1	1,1	1,1	1,1
	Neutral	9	10,1	10,1	11,2
	Agree	65	73,0	73,0	84,3
	Very Agree	14	15,7	15,7	100,0
	Total	89	100,0	100,0	

On this frequency distribution table shows that the Telkomsel provider users feel that the employees at the service outlets are trying to understand the needs of consumers. This is presumably because consumers have felt that the employees are very friendly and responded with alacrity to the needs of consumers, so that consumers feel comfortable in delivering complaints. The perceived needs of consumers, among others, the ignorance of consumers on the product, bad signal or a SIM card that cannot be used. The perceived consumer complaints can be well resolved by Telkomsel.

3. Complaint Intention

Will Complaint if there are Services which are not Compatible

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	1	1,1	1,1	1,1
	Neutral	7	7,9	7,9	9,0
	Agree	31	34,8	34,8	43,8
	Very Agree	50	56,2	56,2	100,0
	Total	89	100,0	100,0	

On this frequency distribution table shows that consumers are not reluctant to make complaints when there are services which are not deemed compatible. It is suspected that the socialization of education play a good role in providing knowledge to consumers in the intention to make complaints.

Will Try to Get Compensation Incompatible Service

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Disagree	3	3,4	3,4	3,4
	Neutral	16	18,0	18,0	21,3
	Agree	33	37,1	37,1	58,4
	Very Agree	37	41,6	41,6	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that consumers will try to get compensation if there are services that are incompatible. It is suspected that the socialization of education play a good role in providing knowledge to consumers in the intention to make complaints. Compensation can be souvenirs, prize draw or toll-free from Telkomsel.

Will Forget Unpleasant Experiences

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Very Disagree	54	60,7	60,7	60,7
	Disagree	12	13,5	13,5	74,2
	Neutral	12	13,5	13,5	87,6
	Agree	10	11,2	11,2	98,9
	Very Agree	1	1,1	1,1	100,0
	Total	89	100,0	100,0	

At this frequency distribution table shows that consumers are not going to forget the unpleasant experience if it is felt that there are services that are incompatible. It is suspected that the socialization of education play a good role in providing knowledge to consumers in the intention to make complaints. A less pleasant experience here can be in the form of no solution in delivering the complaint or the waiting time which is too long.

Data Analysis

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.130ᵃ	.017	.010	.45711	.017	2.557	1	149	.112
2	.256ᵇ	.066	.053	.44713	.049	7.724	1	148	.006
3	.293ᶜ	.086	.067	.44378	.020	3.241	1	147	.074

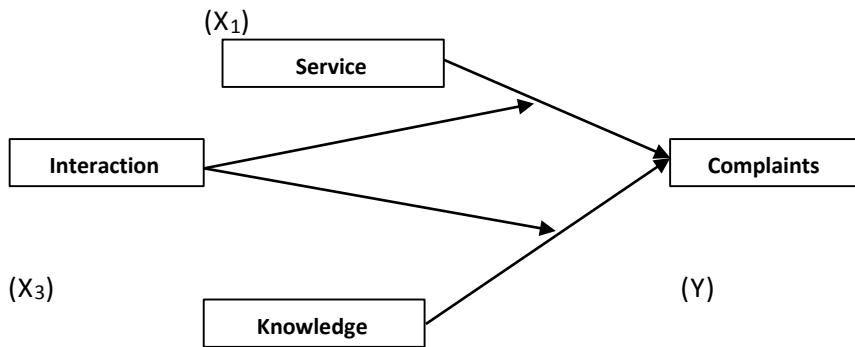
a. Predictors: (Constant), Pelayanan
b. Predictors: (Constant), Pelayanan, Pengetahuan Konsumen
c. Predictors: (Constant), Pelayanan, Pengetahuan Konsumen, Interaksi

The analysis shows that there are three models in the test phase of dependent and independent variable as well as moderation variable in this study which shown through the following framework:
Model Analysis Stage:

1. (X₁) (Y)
$Y = a + b_1 x_1 + et$
$Y = 2.808 - 0,152 x_1 + et$
$\qquad (p = 0,112)$
$Adj - R_2 = 0,10 \ (10 \ \%)$
$P = 0,112$

In this model the stages of statistical analysis showed that the Quality of Service of the three provider has not provide a significant influence on the intention to give the complaint. Quality of Service consists of several dimensions: TERRA and complaints intentions when there are services that are incompatible, the intention would be to try to get compensation from the service that is incompatible as well as consumers will forget the unpleasant experience from the service provider.

2. (x_1)
$Y = a + b_1\, x_1\ + b_2\, x_2 + et$
$Y = 3,211 + 0,201\, x_1 - 0,173\, x_2\ + et$
$\qquad\qquad (0,35) \qquad (0,006)$
$Adj - R^2 = 0,53\ (5\%)\ ,\ \ P= 0,006$

At the stage of this model, statistical analysis showed a significant result. The existing consumer knowledge moderation variable provide very good additional influence on the intention to give complaint on the provider users, especially users of Telkomsel provider. Adding an additional moderation variable increase complaint intention as much as 53% for the provider. Consumer knowledge on whether consumers knows the location of the outlets, determine the number of service providers, aware of consumer rights, aware of consumer rights to know the contents of the Consumer Protection Act.


$\qquad\qquad X_2$
$Y = a + b_1\, x_1\ + b_2\, x_2 + b_3\, x_3 + et$
$Y = -570 + 1,142\, x_1 + 0,985\, x_2 + et$
$\qquad (10,031)\ \ (6129)\ \ (0,074)$
$\qquad Adj - R^2 = 0,67\ (67\%)$
$\qquad (P = 0,074)$

At the stage of this model, statistical analysis showed significant gains, but only provide additional influence which is not too large. The result of the interaction between consumer knowledge and quality of service only provides an additional effect of 67% from the previous which was 53%. Anticipated additional effect that are not too big were caused by consumer provider that has not been previously informed about his rights provisions in delivering the complaint.

Conclusion and Recommendation

Conclusions obtained in this study is that the quality of service have a significant influence on the intention to make complaints through consumer knowledge as a moderating variable.

Additional influence felt is not too large allegedly due to lack of consumer knowledge about the rights of consumers and their respective ideologies of Consumer Law Protection. Socialization has been done to provide additional knowledge for users of providers and recommendation for further research is to add more study variables, the factors that influence consumers to make complaints and the existing intervening variable namely respondent characteristics i.e gender, income and level of education were allegedly will influence consumers to make complaints intentions.

THE IMPACT OF POLITICAL CONFLICT 2013/ 2016 ON TOURISM BUSINESSES' MARKETING PERFORMANCES: THE CASE OF LIBYAN SMES

Sabri Elkrghli, University of Benghazi, Libya

Abstract

The current study seeks to attain the following objectives: (1) to develop a comprehensive construct to measure marketing performance of Libyan Tourism Businesses; (2) to investigate Libyan managers' attitudes towards their businesses' Marketing Performances; (3) to identify the effect of Libyan political crisis 2013/ 2016 on Libyan Tourism Businesses' marketing performances; and (4) to introduce some key recommendations and implications for theory and practice.

In terms of research methodology, a comprehensive construct was developed based on literature review to collect the required data. A number of (15) components and (82) items were generated to capture the marketing performance domain. This construct was reviewed and assessed by a pool of (8) academicians at Management Schools of Libyan universities. Top management nominees in Libyan tourism businesses in Benghazi City were targeted in two different occasions: the pilot-study and actual field work. A number of (65) tourism agencies, (7) hotels, (3) airlines representatives has been targeted in this research. Out of (400) questionnaires circulated, only (113) questionnaires were returned with (98) deemed valid for data analysis.

The key finding of the study is that there is noticeable decline in marketing performance of Libyan tourism businesses. The Libyan Political Crisis (2013 – 2016) has negative effect on businesses' marketing performances as well. Furthermore, demographical and institutional factors demonstrated to have no significant impact on the research results.

The key value of this research is that it is conducted under crisis circumstances, and it might be the first work to concentrate on measuring marketing performance of Libyan tourism businesses. Additionally, the focus was placed in particular on the crisis's effect. Therefore, this article enriches international marketing literature with findings from the Arabic and North African region. Practically, the paper demonstrates the consequences of (exceptional events) political crises on tourism industry's performances. Therefore, foreign businesses, Libyan decision makers and tourism businesses' managers should take advantages from the results of this research. Finally, the paper concludes with limitations and future research.

Keywords: *Marketing Performance, SMEs, Libyan Political Conflict*

Introduction

The Libyan Political Crisis 2013/ 2016 refer to the dispute that has erupted among the three Libyan political bodies: the elected authorized Parliament named Libyan House of Representatives, the old one called Libyan General National Congress and the newly formed body named the Presidential Council.

This conflict has developed to a grinding war reflected negatively on the State of Libya. These transformations in Libya from the Libyan Transition Council to General National Congress to Libyan House of Representatives to the recently established body Presidential Council (2016) have occurred as a result to the failure in building the Libyan State.

The failure of General National Congress in establishing and stabilizing the Libyan state has caused several negative aspects such as lack of security, spread of chaos, emergence of organised crimes, assassinations, close of public and private educational institutions, destructions of airports, delay of airlines services and affects all economic activities in general. In this study, the focus was placed on the impact of this crisis on the marketing

performances of Libyan Tourism businesses.

Reviewing the extant literature has proved that Tourism marketing is an important component of income for several economies. Similar to other important sectors, this sector can be affected by instability and bad political environment at crisis's times. Generally speaking, the tourism marketing is considered as the most important sector that contributes in developing the economies of several countries in the world. This industry is ranked fifth of the exports of more than 80% of the countries in the world, where those countries are visited by millions of tourists every year.

According to United Nations Word Tourism Organization (UNWTO) Report (2012), London was visited by 17 million tourists; Paris was visited by 16 million tourists, and New York was visited by 15 million tourists. In addition, the spending on tourism marketing costs huge amount of money and generates millions and billions of revenues.

Tourism marketing is also a source of competitive advantages to numerous countries. It is an important source of national income, a source of foreign currency, employment of citizens, and reduction of inflation rate. The tourism industry generates more than 250 billion U.S. dollars for countries in which there are potential tourism activities. In the United States alone, tourism marketing creates more than five million jobs, and slightly more in Europe. The situation in Africa is different. This continent was described as one of the fastest regional tourism in the developing world (Chaudhary, 2010). For instance, since the beginning of the first eight months of the year (2012) the rate of tourists in Africa was 6% higher than the global average 4%, which made the UNWTO increase its expectations to double the number of international tourists in Africa by 2030 to reach 134 million instead of 50 million currently. This, in turn, reflects the importance of national and international scientific research in tourism marketing field.

Research Problem

As explained above, the importance of the tourism marketing as a major component of economy is critical to both developed and developing countries, especially those that have the potential of tourism pillars such as seas, beaches, rivers, mountains, deserts, entertainment, national attractions, and services in general.

In the Arab world and the African continent especially the Middle East and North Africa, it can be noted the importance of tourism marketing in Turkey, Jordan, Egypt, Tunisia, Morocco, Lebanon, and Syria, which relies heavily on tourism field as a major supplier of income. It also creates approximately millions of jobs for citizens. These countries have been affected by what is called the Arab Spring revolutions that swept through these countries recently as mentioned in the Global Competitiveness Report (Schwab, 2013).

By looking at Libya as one of the Arabic and African countries, it is observable that Libya possesses an enormous tourism wealth stretches along the country, but the governmental interest in the tourism marketing sector as one of governmental institutions is very weak as evaluated by global indicators.

Libya was ranked 104 out of 130 countries in the world, according to the World Economic Forum Ranking in 2008, and ranked 112 out of 133 countries in 2009/2010. Libya was out of rank in the years 2010 up to 2013 due to Libyan 17th of February Revolution and no data was available.

The country ranked 108 out of 148 countries in the year 2013/ 2014 and ranked 126 out of 144 countries surveyed in the year 2014/ 2015 according to the Global Competitiveness Report (Schwab, 2015).

This backwardness is due to several reasons: the sharp decline in the number of tourists, the lack of airlines services, the shortage of excellent hotels, the decrease in services' quality of local hotels, the absence of strategies for the tourism programs and recreational services, the

abuse and mistreatment of guests, the lack of reliable public transport services (Trains; Taxis; Buses), the poor communication system (Internet Services; Landlines; Mobile Phones), the absence of reliable financial services (Money Transfer; Money Exchange; Cash Machine; Visa Card Services), barriers of language etc. (Elkrghli & Elgimati, 2013).

The aforementioned motivations were a stimulating power to conduct the current paper to measure the extent to which the Libyan Political Crisis 2013/ 2016 has an effect on the marketing performance of Libyan tourism businesses.

Research Objectives
The current paper aims to achieve these key objectives:

- To design a comprehensive marketing performance construct captures broader range of marketing domain.
- To determine the extent to which the Libyan Political Crisis 2013 / 2016 has an effect on the Libyan Tourism Sector from participants' perspectives;
- To determine to what extent demographical factors affect the research results;
- To determine to what extent institutional factors affect the research results;
- To put forward some theoretical and empirical implications contribute to the marketing literature and practices during crises' times from non-western countries' perspectives.

Literature Review
In his speech to the world in the World Tourism Day (17 / September / 2016: Tourism For All – Promoting Universal Accessibility), the United Nations Secretary- Ban Ki-moon stated that "Tourism has become a powerful economic sector, a passport to prosperity and peace, and a transformative force improving millions of lives as almost 1.2 billion people travelling abroad each year over the world". This statement highlights the influential role of tourism on countries' economies.

The literature on political crisis effect on tourism sector has gone through significant developments in recent years. Several hospitality businesses, travel agencies and airlines companies in the world faced critical circumstances in which they experienced different crises. For instance, natural disaster of the Deadly Indian Ocean Tsunami in 2004 is a clear example of natural catastrophe. The attack of 11 September 2011 in the USA and the 2008 global economic crisis are also examples of such crises (Laws, Prideaux, and Chon, 2007, Kritayanavaj, 2009). These crises have a very significant negative effect on the marketing performance of tourism businesses.

In his study in Fiji Island, Singh (2009) found severe impact of political environment on tourism marketing efficiency in the country. The study revealed proliferation of malicious groups and political unrest. This has an impact on the image of the country, which consequently discouraged tourists to plan their visits. This also has an effect on the international relations with other countries who have been immensely contributing to the revenue from tourism industry. Ultimately, this has negatively affected the marketing efficiency.

In their studies in Thailand, Silk 2008; Chachavalpongpun, 2009; Shen, 2009 and Smeral, 2010 revealed that the political conflicts and turmoil have a severe effect on tourism industry.

In other studies, Hani (2006) and Basu, et al., (2012) outlined that the ongoing political instability in the Middle East has affected the International Tourism to Jordan, Lebanon and Egypt.

In Turkey, Tekin (2015) examined the impacts of political and economic uncertainties on tourism market. Based on tourist arrivals and statistics on tourist flows, the study revealed that the tourism market in Turkey is indirectly affected by the political instability and following economic crisis in Russia. Furthermore, the domestic and regional political instabilities surrounding Turkey have negatively affected the tourists' flows.

Recently, several countries in the Middle East and North Africa such as Palestine, Syria, Lebanon, Turkey, Iraq, Egypt, Yemen, Saudi Arabia and Libya have been experienced critical crises caused sharp decline in international tourist arrivals. This, in turn, has affected the tourism marketing returns.

The previous reviewed studies have conclusively showed the impact of political crises on tourism sector performance in various countries of the world, including developing countries in Asia and Africa.

The marketing performance of tourism sector is considered one of the most important aspects that have been dramatically affected by the political and economic crises in the world.

Performance, as generally defined, is the end result of an activity (Wheelen and Hunger, 2002), and the initial interest in marketing performance was prominent in the 1960s (e.g. Sevin 1965; Feder 1965).

Reviewing the extant literature in this field demonstrated that marketing performance and its measurement is a problematic and complex issue.

Business performance monitoring provides managers with enormous ways for planning, controlling, and improving their businesses' performances. This issue is always fraught with difficulties and no agreement has been reached yet on how to perfectly measure performance using unified methods that can be used at all times (e.g. Dess and Robinson, 1984; Rhyne, 1986; Chakravarthy, 1986). In their extensive survey, (Jimenez-Zarco, et al., 2006) reviewed the performance measurement literature. They concluded that the emphasis was exclusively placed on the achievement of limited number of key financial measures, based on the information provided by the financial or accounting offices (e.g. Crosby and Johnson 2001; Neely et al. 2000). This has been one of the main reasons why several studies have highlighted increasing dissatisfaction with traditional methods of performance measurement (e.g. Brignall and Ballantine 1996; Ghalayini and Noble 1996). A great deal of the criticism comes from the following critical points: (1). they have short term orientation (Dekimpe and Hanssens 1999). (2). they have limited diagnostic power (Day and Wensley, 1988). (3). there is no agreement on measures that need to be used (Clark, 1999). (4). there are difficulties in making comparisons between companies (Clark, 1999). (5). they fail to measure and monitor multiple dimensions of companies' performance (Eccles, 1991).

In addition, the use of financial measurements only reflects the traditional emphasis on the accounting and financial aspects of companies' work. A wide variety of studies has also recognised the significance of non-financial measures such as customer satisfaction (Szymanski and Henard 2001), customer loyalty (Gurviez 1997), brand equity (Keller, 1998) and human capital (Srivastava et al. 1998) as indicators of the degree of success. Therefore, interest in the analysis of intangible assets has increased considerably. This, in turn, opens the door for several new dimensions that have not yet been considered.

Furthermore, the financial measures disregard other internal and external dimensions that are essential for adapting the company to the new competitive environment. Moreover, performance is highly influenced by other environmental elements, such as market, technology, competition, customers, economic conditions, organizational learning ability...etc. Hence, throughout the 1980s and 1990s, different approaches emerged that recommended the use of marketing measurements such as market share or customer orientation as indicators of business profit or market success (e.g. Rust et al. 2000; 2003).

Additionally, the complexity of business environment in which firms operate, causes a great

challenge. Hence, developing integrated systems that contain financial and non-financial measures are recommended (e.g. Waggoner et al. 1999; Yeniyurt 2003). For this reason, throughout the past three decades different methods have been established such as Strategic Measurement Analysis (SMA), Performance Measurement Questionnaire (PMQ), developed by Dixon, Nanni and Vollmann in (1990), Balanced Scorecard (BSC) proposed by Kaplan and Norton in the early (1990s).

The later has been viewed as a pioneering approach; this approach has served as a basis for the development of subsequent approaches such as those of Ittner et al. (2000), Edvinsson (2002), and Lev (2002). This method identifies the weaknesses and vagueness of previous measurement approaches, and offers a clear description of what companies should measure in order to balance the financial view. This method enables organizations to clarify their vision and strategy, and translate them into action.

In earlier time (1987), Walker and Ruekert perceived that marketing literature focused on three dimensions: efficiency (sales growth, market share, effectiveness (low cost), best performance (profit, return on investment), and adaptability. In addition, Clark (1999) stated that several large businesses depend on $(50 - 60)$ items to measure their performances. This is in line with Ambler and Roberts, (2005) argument that marketing performance is essentially a multi-dimensional construct.

After a decade, Amber and Kokkinaki (1997) reviewed (150) article of performance measurement during $(1991 - 1995)$, and they found three common metrics out of nineteen. Financial and non-financial measures were used in the literature surveyed. In another research, Ambler et al., (2001) developed a generalized framework of marketing measurement consists of six categories: financial, competitive, consumer behavior, consumer intermediate, direct trade customer and innovativeness. However metrics usage is substantially moderated by size and sector, which also moderates the association between orientation and performance. Furthermore, Ambler, et al., (2004) identified 19 metrics that could be regarded as primary, and might serve as a short-list for initial selection. However, the sector was also proved to importantly moderate that selection.

In an earlier study, Clark (1999) indicated that marketing managers are dissatisfied with traditional marketing measures. This is due to the difficulty in making accurate assessment. Hence, they asked for non-financial measures to be used. This is also the recommendation of Ittner and Larker (2003), and Rajagobal (2008) who specified that businesses should not restrict the measurement process to financial measures only. Pond and Show (2003) reviewed (46) articles on marketing performance measurement. They found that (63%) of published papers deployed subjective assessment approach, (36%) used a combination of subjective and objective assessment methods, while the remaining (1%) studies utilized the objective assessment.

In a recent study, Osullivan, et al., (2009) suggested using the subjective assessment on condition making accurate comparisons with the closest competitor in the market. In another study in Libya, Elkrghli (2010) used objective and subjective performance assessment, and he detected strong positive correlation between them. Hence, using one of which would be sufficient to give an indication about businesses performances evaluation. These conclusions have been reached in previous research as well (Maines et al., 2002).

In summary, the literature reviewed above confirms that critical events and political crises have severe influence on marketing performance of tourism sector businesses. In addition, several approached can be used to evaluate marketing performance. Subjective and objective can be successfully used as strong positive correlation was found between them. That means using one of which would be sufficient to assess marketing performance. Other institutional and environmental factors were noticed to have an influential impact on marketing performance as well.

Research Hypotheses

For the purpose of achieving the goals of the study, it was necessary to refer to the relevant literature and put forward the following hypotheses:

- There is no relationship between the Libyan Political Crisis 2013 / 2016 and the marketing performance of tourism businesses in Libya;
- There is no difference among participants' views regarding marketing performance of tourism businesses according to demographical factors;
- There is no difference among participants' views regarding marketing performance of tourism businesses according to institutional factors;
- There is no difference among participants' views regarding the Libyan Political Crisis's effect on marketing performance according to demographical factors;
- There is no difference among participants' views regarding the Libyan Political Crisis's effect on marketing performance according to institutional factors.

Research Methodology

To achieve the research objectives, a structured procedure was adopted as follows:

1.   Research Variables

Marketing performance and Libyan Political Crisis are the main variables of the study. The effect of some demographical factors (qualification; experience and organisational position) has been tested. Business size (Institutional factor) effect on research results has been examined as well in the study.

2.   Measurement & Scaling

As discussed in the literature review, measuring business performance in general and marketing performance in particular is always fraught with difficulties and no agreement has been reached yet among scholars on certain construct that should be used for all businesses (e.g. Dess and Robinson, 1984; Rhyne, 1986; Day and Wensley, 1988; Eccles 1991; Brignall and Ballantine 1996; Gurviez 1997; Srivastava et al. 1998; Dekimpe and Hanssens 1999; Clark, 1999; Neely et al. 2000; Crosby and Johnson 2001; Yeniyurt 2003).

Due to the issue of confidentiality of financial data, and after extensive revision to marketing literature, a comprehensive construct was developed to measure marketing performance. This newly developed construct consists of 82 items distributed into 15 sub-components covers wide range of marketing performance aspects. These (82) items were tested in the pilot-study and purified in the actual field work and reduced to (70) items with strong internal consistency.

Additionally, the Libyan Political Crisis construct has been developed as well. The construct consists of 7 items reflects the effect of Libyan Political Crisis on Tourism Businesses' marketing performances. The full instrument was reviewed by (8) management academicians. This step was taken as an essential phase to ensure greater validity degree and reliability (Churchill, 1979).

Validity means the degree to which a measurement tool can measure what it is supposed to measure (e.g. Anastasi and Urbina, 1997; Hair, Babin, Money and Samouel, 2003; Oluwatayo, 2012.). The reliability refers to the internal consistency of questionnaire items and its ability to represent the concept to be measured and the possibility of replication (e.g. Jack and Clarke, 1998; Cavana et al., 2011). Five-point Likert Scale has been adopted. This choice was made due to its common use in marketing research (e.g. Anderson, 2002; Hair et al, 2003; Malhotra and Peterson 2006; Dawes, 2008), and for its appropriateness to the Libyan culture. Table (1) presents the reliability analysis process.

Table 1. Reliability Analysis

Frequency	Marketing Performance Component	No. of Items	Cronbach's Alpha	Items Removed
1	Marketing Expenditure	4	0.89	-
2	Marketing Planning	6	0.84	1
3	Marketing Organisation	5	0.87	-
4	Marketing Staff	6	0.83	1
5	Marketing Mix	8	0.78	4
6	Marketing Environment Response	6	0.90	1
7	Customer Management	5	0.76	2
8	Marketing Information System	3	0.67	-
9	Marketing Technology	3	0.62	-
10	Market Segmentation	4	0.81	-
11	Purchasing & Storage Management	3	0.71	-
12	Marketing Contribution in Production Development	4	0.85	1
13	Marketing Contribution in Profit	5	0.88	2
14	Marketing Mentoring	5	0.84	-
15	Marketing Competitive Power	3	0.69	-
	Overall Marketing Performance	70	0.96	
	Libyan Political Crisis's Construct	7	0.73	-

From table (1) above it can be noticed that Cronbach's alpha values for marketing performance construct ranged from (0.67 to 0.96). These values are suitable and pass the lower acceptable level suggested in the literature (e.g. Churchill, 1979; Nunnally and Bernstein, 1994; Hair, et al., 2005; Cavana et al., 2001; Shelby, 2011). Hence, all items with Cronbach's Alpha values less than (0.65) and with weak correlation less than (0.20) this procedure was taken to guarantee high degree of validity and reliability (e.g. Streiner and Norman, 2003; Rattray and Jones, 2007).

3.   Sampling

A comprehensive survey was conducted to target all tourism businesses located in Benghazi City. A number of (65) business acting in tourism, airlines and hospitality were counted. Only businesses' owners, managers and officers were targeted in the safe areas of the city, while those located in unsafe areas were inaccessible. Questionnaires were distributed through two phases: pilot study and actual field work. Using face-to-face method, the distributions process was undertaken with the help of postgraduate students at University of Benghazi and the Academy graduate students. As a precautionary procedure, (400) questionnaires were distributed. Out of this number, only (113) retrieved with (98) deemed valid for analysis.

Data Analysis

After collecting the data, it has been necessary to resort to the most appropriate statistical techniques. SPSS has been used as shown below:

1.   Descriptive Analysis

The next section of analysis depicts the results obtained from participants in the Libyan tourism businesses acting in Benghazi City.

2.   Business Size

Business size is one of the key factors that might affect the research results. For that reason, businesses' data were collected and analysed in the table below.

Table 2. Businesses' Size (Number of Employees)

Number of Employees	Frequency	Percentage %
< 50 employees	86	88
50 up to < 250 employees	6	6
≥ 250 employees	6	6
Total	98	100

Table 2 shows the size of tourism businesses in Benghazi. Employees' numbers were chosen as indicator for business size. The table explains that 88 % of businesses are small-sized, 6 % of businesses are medium-sized, and 6 % of businesses are large-sized. Therefore, the results are mainly relevant to small businesses acting in Benghazi City in Libya.

3.   Participants' Qualifications

Qualification is one of the most important elements upon which the recruitment process is based especially for high-rank positions. This is the reason that leading businesses pay more attention to educational issues at work. More details can be found in Table 3.

Table 3. Participants' Qualifications

Qualification	Frequency	Percentage %
Master/Ph.D.	8	8
Bachelor / High Diploma	51	52
Tertiary School	35	36
Secondary School and Less	4	4
Total	98	100

From Table 3 it can be seen that most of the participants (60.4%) hold a high degrees. This might be taken as a positive indication on the recruitment policies in place in the tourism businesses under investigation. In addition, this mzight increase the confidence in the data collected.

4.   Organisational Positions

The organisational positions of participants are important elements as the views of individuals and their perceptions might be different. This difference might affect the research results. To that end, Table 4 shows the organisational positions of participants.

Table 4. Participants' Organisational Positions

Organisational Position	Frequency	Percentage %
Owner / General Manager	39	40
Manager / Director	30	31
Bureau officer	6	6
Others	23	23
Total	98	100

Table 4 shows that 77 % of participants occupy high positions in their businesses as owners and managers. Hence, they might have different views on the key issues under investigation. In addition, their organizational positions imply that their answers should be considered more valuable than any other lower-rank people at work.

5.　　　　　Work Experience

The experience is important element that might be used as a sign of confidence indication in participants' information provided. The long experience is a good indicator of practical knowledge of the work at business. Experience will have a great impact on peoples' attitudes and practices. This issue was investigated and the results presented in Table 5.

Table 5. Participants' Experience

Experience	Frequency	Percentage %
< 5 years	42	43
5 up to < 10 years	47	48
≥ 10 years	9	9
Total	98	100

Table 5 shows that the vast majority of participants (91%) have small to moderate experience at work as their experiences did not exceed 10 years. This might not be deemed as an excellent indication of reliable information gathered from participants. In addition, this might be interpreted that the tourism sector is newly developed business and its early stages.

6.　　　　　Marketing Performance Evaluation

The personal views of individuals at organizational positions might be different, and this might affect their perceptions towards diverse organizational issues. To that end, marketing performance was evaluated based on decision makers' views at businesses. The results are presented in table 6.

Table 6. Marketing Performance Means

Marketing Performance Component	Mean	SD
Marketing Expenditure	2.51	0.19
Marketing Planning	2.70	0.77
Marketing Organization	2.50	0.91
Marketing Staff	2.35	0.98
Marketing Mix	3.03	0.56
Marketing Environment Response	2.68	0.84
Customer Management	3.31	0.68
Marketing Information System	3.23	0.77
Marketing Technology	2.18	0.71
Market Segmentation	2.72	0.55
Purchasing & Storage Management	2.32	0.90
Marketing Role in Production Development	2.09	0.76
Marketing Contribution in Profit	2.36	0.70
Marketing Mentoring	2.56	0.90
Marketing Competitive Power	2.55	0.57
Overall Marketing Performance	2.69	0.56

Table number (6) shows an evident decline in overall mean scores of marketing performance and its sub-components. The overall average marketing performance mean score reached (2.69) out of (5) points on Likert Scale, while the mean scores of sub-components ranged between (2.09) to (3.31). This decline reflects a decrease in marketing performance of tourism companies operating in Benghazi city.

7.   Libyan Political Crisis & Marketing Performance

To identify the extent to which the Libyan Political Crisis has an effect on marketing performance, a group of questions directed to respondents and the results are presented in Table 7.

Table 7. The Correlation between Libyan Political Crisis & Marketing Performance

Items	Mean	SD	Pearson Correlation R	Significance
Marketing Performance	2.69	0.56	-	-
Libyan Political Crisis	3.76	0.64	-	-
The Correlation		-	0.48	0.000

From table (7) it can be clearly noticed that the mean score of Libyan Political Crisis' factor reached (3.76) out of (5) points on Likert Scale. This increase in the mean score illustrates the noticeable negative influence of the Libyan Political Crisis on marketing performances of Libyan tourism businesses as revealed by participants.

To increase the emphasis on research objectivity, it was reasonable to resort to Pearson correlation, which revealed the existence of significant relationship as P-value was less than (0.05). This significance came as a result to the existence of negative medium correlation between the two variables: marketing performance and Libyan political crisis reached (-0.48). This result supports the views of participants regarding the effect of the crisis on marketing practices. Hence, the first null hypothesis, which states that "there is no relationship between the Libyan political crisis and the marketing performance of Libyan tourism companies ", will be rejected.

8.   Demographical & Institutional Factors' Effects

To test the effects of personal factors (qualifications, job experience and organizational positions), and the institutional factors (the company's size measured by number of employees) on the research results, it has been necessary to resort to One-way Analysis of Variance (ANOVA) and display the results in table 8.

Table 8. Analysis of Variance

Essential Factors	Political Crisis			Marketing Performance		
Demographical & Institutional Factors	Decision	Result	P-Value	Decision	Result	P-Value
Qualification	Accept	No Differences	0.54	Accept	No Differences	0.06
Experience	Accept	No Differences	0.25	Accept	No Differences	0.20
Organisational Positions	Accept	No Differences	0.44	Accept	No Differences	0.09
Number of Employees	Accept	No Differences	0.83	Accept	No Differences	0.13

From table (8) above, it can be noticed that analysis of variance did not display any significant differences between participants' responses that might be attributed to demographical or institutional factors. This is due to P-values, which are greater than alpha value ($\alpha = 0.05$). Therefore, it has not been possible to reject the remaining four null hypotheses: "There is no difference among participants' views regarding marketing performance of tourism businesses according to demographical factors"; "There is no difference among participants' views regarding marketing performance of tourism businesses according to institutional factors"; "There is no difference among participants' views regarding the Libyan Political Crisis's effect on marketing performance according to demographical factors", and finally "There is no difference among participants' views regarding the Libyan Political Crisis's effect on marketing performance according to institutional factors".

In other words, all participants at different organisational levels with their different qualifications and experiences in tourism businesses shard the same attitude and perception towards the effects of the Libyan political Crisis on Marketing Performances.

Discussions and Conclusions

In reference to the procedural analyses shown above, general conclusions might be drawn as follows:

1.   Key Findings

The key findings of this research are there is an evident decline in marketing performance of tourism companies in Benghazi City. This deterioration can be attributed to the weakness in marketing practices. In addition, the decline in marketing performance can be attributed to the negative effect of the Libyan Political Crisis as evidenced in the field work of the current research. Hence, there is a negative significant correlation between the Libyan political crisis and the marketing performance of tourism businesses surveyed. This results are in line with previous research conducted in several parts of the world (e.g. Laws, Prideaux, and Chon, 2007, Silk 2008; Kritayanavaj, 2009; Singh, 2009;; Chachavalpongpun, 2009; Shen, 2009 and Smeral, 2010; Hani, 2006 and Basu, et al., 2012; Tekin, 2015).

Furthermore, no substantial differences among participants' perceptions were spotted regarding marketing performances of the responded businesses. Qualifications, organizational possessions, and empirical experiences proved to have no effect on participants' responses. This, in fact, implies that all participants, regardless of their demographical composition, agree on the negative effects resulted by the Libyan Political Crisis. Finally, business size is confirmed to have no effect on the results of this study. This means that all targeted SMEs, regardless of their sizes and date of establishments, have been negatively affected by the

Libyan Political Crisis.

2.   Implications

The current study is of high-value for academicians and practitioners in the field of marketing for the following reasons: (1) This study can be classified within the rare Arabic and African studies dealing with marketing issues in Libya especially during crisis' time; (2) The study can be viewed on the basis of being a new contribution to the marketing literature in developing countries and transitional countries in the field of tourism marketing performance, and how it has been affected by the Libyan Political Crisis (2013/ 2016); (3) Decision makers in the Libyan government and tourism institutions might benefit from the findings of this research to enhance marketing practices and performances ;and (4) International bodies and foreign businesses (investors) interested in the Libyan tourism sector might also benefit from the results of this research. This will provide a good background about the tourism marketing practices in Libya and how the external environment has an influential impact on the marketing performance.

3.   Limitations and Future Research

As is the case in scientific research, there is no research claiming perfection and this work is not an exception. Several challenges face researchers such as time constraints, cost and scope of study. This research has encountered some of these limitations as it has not been possible to target all tourism companies in the whole country. Tourism businesses in Benghazi City only were included in this survey. This, in fact, means that the results might not give indications to generalise marketing challenges to the whole tourism businesses in Libya. Therefore, future work funded by the State or public research institutions might reuse the construct of the current study to target tourism companies in Libya and make a comparative study. Another intriguing future research is to use concrete financial data taken from financial statements of tourism companies to measure their financial performances and compare that with the results of this study. This intriguing future research should add to the marketing literature as no research has been done, to the best of the researcher's knowledge, using this approach in Libya. Finally, the current paper has been undertaken under crisis' conditions. Hence, several businesses could not be reached due to the state of war and instability in Benghazi City. It would be a great research opportunity to replicate this research after stabilizing the city over the coming years.

USER GENERATED CONTENT ANALYSIS OF TOURISM INDUSTRY OF INDONESIA

Sahil Raj, Punjabi University, India
Tanveer Kajla, Punjabi University, India

Abstract

Indonesia is becoming the favorite destination of many international tourists and there is a need to analyse the hidden patterns of information in the online content generated by these tourists. This study is about unfolding the user generated content related to top tourism destinations of Indonesia with the assistance of unstructured data taken from twitter. In this study the popularity of tourism sites will be revealed by using twitter as social media platform. The tweets will be collected related to the identified tourism sites and they will be calculated to check the popularity of the particular destination. The data collection will be done with the help of open source software R. R software will be used to fetch the tweets from the twitter and these tweets will be stored in the distributed file system of Hadoop. Apart from checking the popularity of the tweets, sentiment analysis and emotion classification of tweets will also be done to check the hidden opinions of the tourists about the tourist destinations. This study also attempts to solve the various issues faced by tourists on the selected destinations. Comprehensive analysis will be done with the help of Wordcloud, which gives the most prompting words in the form of visualization. Wordcloud helped to find the most trending words in the text. INTRODUCTION

There is lot of growth in tourism industry and it is one of the fastest growing sectors in the world. It is one of the components of economic and social growth in a region. For many developing countries, it is the main component of the employment generation and is the source of income also. Decades ago, tourism is limited to the regions of Europe and America. But now lot of new destinations have emerged in addition to these regions. According to UNWTO, around 500 million tourists travel between the months of May and August 2016. This puts a lot of scope for the other tourist destinations to attract lot of tourist. Indonesia is also a very popular tourism destination located in South East Asia and it comprises of almost thirteen thousand islands.

The total population of Indonesia is around 215 million covering almost 200 ethnic groups. The national language of Indonesia is Bahasa Indonesia. The reason why Indonesia is popular as tourist destination is because of its location on the globe. Indonesia is close to the equator and is gifted with the rich flora and fauna. The diversity ranges from rich paddy fields to grasslands and snow covered peaks. The destinations in Indonesia are Sumatra, Java, Bali, Kalimantan, Sulawesi, Maluku and Nusa Tenggara.

Social media is considered as a very important online networking tool. Wikipedia defines social media as computer-mediated tools that allow people, companies and other organizations to create, share, or exchange information, career interests, ideas, and pictures/videos in virtual communities and networks.

Social media is used for communicating with other people by putting reviews and other user generated content. Apart from communication, it is also used for gathering information about a particular tourist place. There are various social media platforms like Facebook, Twitter, Google+ where users can share their views or suggestions with other users who are on the same social media platform.

The social media platforms for tourism industry provide internet users with rich knowledge about any tourist place from the visitor's perspectives. It also provides the reviews about

particular hotels so that the visitors can pick the right hotel according to their choice. The research published by Simms (2012) concluded that the user generated content is the most preferred medium by majority of travellers who are visiting the tourist place for the first time. This research clearly appreciates the value of user generated content in the tourism industry.

With the new techniques for text analytics, this content can be analysed to gain some insights from this data. The most widely technique used in text analytics in sentiment analysis and emotion classification.

Sentiment is the expression of view or behavior. Sentiment analysis is a technique in text mining, where the gathered text is classified into various sentiments like positive, negative and neutral sentiments. Various algorithms are also available for classifying text into different emotions such as anger, surprise, disgust, sadness, joy, happiness.

Sentiment analysis technique is widely used to find the attitude of customers on any defined topic or issue. Hotel industry also uses sentiment analysis on the collected reviews to find the mood of their customers towards their services. (Bollen et al.)

Zeng & Gerriston (2014) discussed lot of issues in context of social media. English is a very dominating language around the globe and on internet but it is a big disadvantage for non-English speaking countries. There should be some multi language platform where information from different sources can be shared.

According to Gartner, Big data is high-volume, high-velocity and/or high-variety information assets that demand cost-effective, innovative forms of information processing that enable enhanced insight, decision making, and process automation.

Hadoop is a framework to handle the big data using the java based programming. Hadoop is having two major components, HDFS and MapReduce. MapReduce is used for parallel programming and HDFS uses scale out architecture which provides scalable storage with lot of reliability on commodity hardware.

Hive is a data warehouse layer on top of HDFS. It is mostly used to analyse the structured data by various organizations who are handling Big Data. Hive is the project of Facebook and later on it came under the Apache foundation and became open source. Hive uses databases and tables to store the data in HDFS. HiveQL is the SQL like language which is used to perform queries over the stored data. The queries typed in HiveQL automatically get converted to MapReduce so that parallel processing of data takes place.

Review of Literature

Estela Marine-Roig & Salvador Anton Clave (2015) studied the online image of Barcelona with the assistance of social media by using big data analytics. The author had considered the travel blogs and online travel reviews by tourists to support smart destinations. The four main stages of their methodology included web hosting selection, data collection, pre-processing, and the last stage is analytics. Batch processing is used in their methodology in which the data is collected first and then analyzed. The study concluded that the UGC analytics is an important asset to develop marketing strategies and in applying analytics to destination management. They also determined the ability of Barcelona to develop as a smart city with the aid of big data analytics.

Cristian Bucur (2015) in this paper the author proposed a platform for extraction and summarizing of opinions expressed by users in tourism related online platforms. The researcher also clarifies that extracting opinions from user generated reviews, regarding aspects specific to hotel services, are useful for both clients looking for accommodation, and also hotels trying to improve their services. The proposed system in the study extracts hotel reviews from internet and classifies them, using an opinion mining technique. The platform is evaluated by the author using a manually pre-classified dataset of user reviews. In the paper

the efficiency of algorithms is also analyzed using text mining domain specific measures, and these are also the proposed methods for improving the results.

Alan S. Abrahams et.al (2012) In this research, the author applied text mining approach on the online discussion forums created by vehicle enthusiasts. The researchers used sentiment analysis approach which they found to be insufficient for complaint detection of the customers. So they invented a new system known as Vehicle Defect Discovery System which is a very reliable and generalized defect discovery system. The author discovered the SMOKE words which are related to other automotive industry and they validated their words on other brand also. Their findings suggest that this system is very useful for doing sentiment analysis of customer complaints but when it comes to vehicle defect discovery then this technique should not be used. The major implication for researchers is that they may have to find domain specific words for other industries.

Alžbeta Kiráľová & Antonín Pavlíčeka (2014) did their study on development of social media strategies in tourism destination. In their study the researchers discussed that social media is a vital aspect in connecting the tourists with their destinations with the assistance of internet. The study also focused on the usage of social media, forms of campaigns and how to execute those campaigns. The result of the study clearly indicates that the social media should be used by the destinations to remain competitive. The authors also recognized the vital features of successful social media strategy in their research. The paper is concluded that an effort to implement new software for the purpose of branding is valuable although the implementation is a very laborious task.

Amir Gandomi & Murtaza Haider (2016) in their study tries to explore the meaning of big data through the academicians and practitioners by defining the three V's of Big Data i.e. Volume, Velocity and Variety. The main emphasis of the researchers is to explore the analytical methods related to big data. The various techniques discussed for the big data analytics in their research were text analytics, audio analytics, social media analytics, video analytics and predictive analytics. The authors also highlighted the fact that big data constitutes mainly comprises of 95% of unstructured data. The research also found that present analytical techniques were used to analyze the small datasets, and in the coming era, real time analytics could be an upcoming technique due to the growth in social media and mobile apps. Their study also focused on devising new predictive analytics techniques for the structured data.

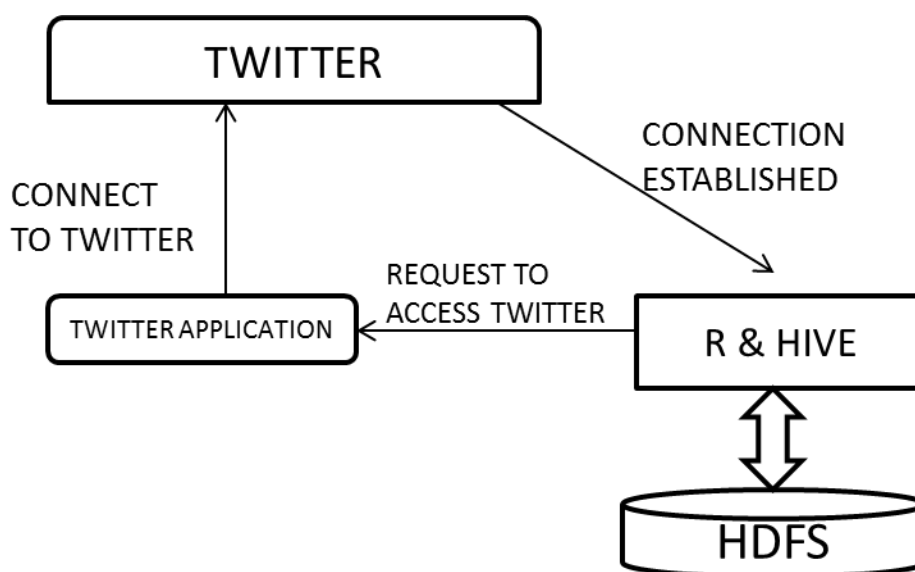
Robert P. Schumaker et.al (2016) The research is about the tourism of Italian city Cilento. In this research the author used geo tagged social media data from twitter. This data is used to characterize the spatial, temporal and demographic features of the flow of tourists in the city of Cilento. The research questions answered in this research were related to demographic profiles of the tourists to determine the movements of various demographic groups, patterns of flow of tourist in the region and the factors which differentiate the tourist destination from others in the region. The findings gave insight on the tourists visited the city Cilento. The domestic tourists dominated the tourism of the city. The study also suggests that the destinations on coastline are very popular and these locations are well connected because of the good transport facility.

Raissa Uskenbayeva et.al (2015) proposed a data integration model. In the paper, the researchers presented various approaches to connect HADOOP database with R. Hadoop database consists of libraries in HDFS which is the storage component of HADOOP and R is a very popular statistical tool. The various ways to integrate R and HADOOP and also presented the benefits and limitations of each approach. The authors also discussed various approaches for performing complex and simple MAPREDUCE jobs.

Saifuddin Ahmed et.al (2016) twitter is a very popular social media tool and it is widely used as an election campaign tool especially in developed western countries. The authors explored

the use of twitter as a campaigning tool in lesser developed countries like India. The researchers investigated the use of twitter in the 2014 general elections. In their study 98,363 tweets were collected from the official accounts of the eleven political parties. The researchers also measured the contribution of first time voters by keeping in mind the internet availability in the states. The researchers also investigated that some major parties which are established used twitter to criticize their opponents and to supplement their offline strategies whereas the new and upcoming party used twitter for their own promotion. The authors in their research concluded that the twitter is positively associated with the success of the political parties and it is a very appealing social media tool for engaging first time voters also. This research is limited to the tweets that were in English language only and the tweets in regional languages were excluded from the research.

Objectives
- To check the popularity of the tourist destination with the help of twitter Analysis.
- To perform sentiment analysis to get insights from social media data.
- To perform in-depth analysis of tweets using advanced visualization techniques

Research Methodology
The tweets related to the selected tourist places were extracted from the twitter website. To fetch the tweets, twitter developer account needs to be created. With the help of developer account, twitter application will be created to mine the text from twitter. The application provides the access token and keys for the authentication. The software used for mining the tweets from twitter is R. R is a very popular statistical tool but due to its popularity in the field of text analytics, it is used in this research to extract the tweets from twitter. All the user generated content from the twitter will be saved in HDFS. HDFS is the Hadoop distributed file system which is used to save the voluminous data irrespective of any schema in the data unlike the traditional RDBMS. Rhdfs package is used to connect R to HDFS. With this connectivity there is no shortage of storage space for the data as Hadoop gives the opportunity to save enormous data by using scale out architecture.


After the creation of big data framework and collection of data, sentiment analysis and emotion classification techniques will be performed to analyze the collected text. In the sentiment analysis the text is categorized into positive text and negative text. The text which does not fall into any of the categories will fall under neutral category. The text is also classified into various emotions to find the mood of the twitter users. The prominent words in the text will be found with the advanced visualization techniques like word cloud.

By using Apache Hive, popular hashtag were found to check the trending topics on twitter. The influential users, follower's count and friend's count and the popular time zones were also found with the help of Hive to get the holistic view of the collected data

Analysis and Discussion

The tourism places selected were Indonesia as a whole, and Bali and Jakarta from within the Indonesia. The total numbers of tweets collected from these places were shown with the help of the bar graph.

Table 1
Indonesia

A total number of 20,869 tweets related to Indonesia have been collected from twitter. The word cloud of the tweets is made from which some of the prominent words are highlighted. By analyzing the word cloud of the tweets, it is analyzed that the words like 'Jakarta', 'Bali', were right at the center of the cloud. But word cloud is not specifying the significance of these words used in tweets, rather it is prompting to the most used words. To analyze the impact of these words, sentiment analysis and emotion classification of the tweets is done. The following diagram shows some of the tweets related to Indonesia with their respective emotions and sentiments.

428	you are the creator of your life work hard and travel...	unknown	positive
430	disability inclusive education in indonesian islamic e...	unknown	positive
432	throwing spray at lagundri bay lagundri nias lagund...	unknown	positive
433	indonesia indon are on the level of th century europ...	unknown	positive
434	you are the creator of your life work hard and travel...	unknown	positive
435	my trip to lombok indonesia taken by oneplus onepl...	unknown	positive
436	my trip to lombok indonesia taken by oneplus onepl...	unknown	positive
438	you are the creator of your life work hard and travel...	unknown	positive
439	indonesia indon are on the level of th century europ...	unknown	positive
441	indonesia indon are on the level of th century europ...	unknown	positive

Figure 2

Figure 3

The sentiment analysis of the tweets indicates a very positive relation with the twitter users. Majority of the tweets belong to the positive category. Major chunk of the tweets in positive category are related to the tourism only. This analysis gives a very clear picture of importance of tourism in Indonesia. Very less amount of tweets belongs to neutral category. Although, negative tweets are less in number, but in future it can still hamper the social media image of Indonesia, provided the strategy is not implemented to counter these negative tweets.

Table 2

The tweets related to the tourism, especially the tweets in which the word 'Bali' is used belong to the joy and surprise category. This clearly indicates that the Indonesia is having a good and positive image because of the tourism sector.

Table 3

Bali
Tweets related to Bali were collected with the help of R software. 10,961 tweets were collected from twitter to do social media analysis of Bali. The word cloud of Bali suggests the words like "happiness", "push award skathniels", "amazing", which puts Bali in the 'joy' category in the emotion classification. The tweets having these words are giving a positive impact to Bali in sentiment analysis.
Figure 4
Some of the tweets related to Bali are shown in the diagram below:

	text	emotion	polarity
1	my heart is crying from rewatching my favorite film ...	joy	neutral
2	bali looks amazing ◆◆◆◆◆◆◆◆◆◆◆◆◆◆...	surprise	positive
3	usa hot dealsbali comfort revolution frontclose shap...	joy	positive
4	hrc at asean amp east asian summit in bali	unknown	positive
5	thx lora saving it to read soon	unknown	positive
6	samahan natin ang aking baba i wish you happiness...	joy	positive
7	internet is a luxury many dont have	unknown	positive
8	from pottie baba bal bali love and now my tangi ◆...	joy	positive

11	bali is my second home ◆◆◆◆◆◆◆◆◆◆◆◆...	unknown	positive
12	subak an ancient irrigation system in use today in b...	unknown	positive
13	bali looks amazing ◆◆◆◆◆◆◆◆◆◆◆◆◆◆◆...	surprise	positive

Figure 5

Sentiment analysis of Bali suggests the positive image of the islands. This positive image is due to the scenic beauty of these islands. The negative tweets were due to some local issues prevailing in the islands like Rabies, drought situations, drugs etc.

Table 4
Although lot of tweets are falling into 'unknown' category, but still the graph clearly suggests the joyous mood of the twitter users towards the Bali Islands. There are push awards by ABS-CBN which are putting the native people and tourist of Bali in joyous mood.

Table 5

Emotion Classification of BALI
Since Bali is a popular tourism place in this research, further analysis is also done with the help of Hive. Social Capital of twitter account/user is also calculated with hive by finding the number of followers, friends and re-tweet count from the twitter.

Popular time zones were also found with Hive. The graph given below gives a clear understanding of the popular time zones where Bali is very much talked about. Popularity of the time zones is reported through the number of tweets coming from their respective zones. From the graph, the Pacific Time (US and Canada) time zone is very popular as lot of web traffic is coming from these zones. Jakarta is at second place. It is also observed that Bali is also a talked about destination in Beijing also. But the Eastern Time zone is giving very less attention to Bali as very less number of tweets was coming from Bali.

Table 6
The diagram below gives the list of popular hash tags from the tweets of Bali. These hash tags were found by running queries in Hive. The graph shows that 'bali' is a very popular hashtag. Other hash tags were 'Balitoday', 'aldubikawlang', 'Gianyar', 'mtwikathniel', 'karangasem'.

'balitoday' is related to any news or happening in bali.

'gianyar' is a regency in the province of Indonesia and Bali islands.

'mtwikathniel' are Indonesian celebrity.

'karangasem' is a regency in Indonesia. It covers the eastern part of Bali.

Table 7
Popular re-tweets counts were also found by using Hive. Re-tweets are those tweets which are reposted. The below graph shows the twitter users who are very popular, because when they

put any tweet, then that tweet is re-tweeted most of the times. Here some information is given about the popular twitter users.

'MartinGarrix' is the record producer, musician and DJ by profession.

'marshmellowmusic' is also a music producer and DJ.

'Emirbheb' relates to movies and celebrities.

'TravelVSCO' is the account where tweets related to travel destinations were posted.

'KaDsPasay' is also related to KathNiel.

Table 8
After that, the users with most number of followers will be found. The graph shows the top 6 users having highest follower's count. This confirms that Maliq Music is very popular according to Friends Count as they were having close to 37,000 followers for their account. The account 'Balitoday' is also getting attention here because lot of twitter user are following their account.

'MaliqMusic' is music band based in Jakarta

'Balitoday' is related to any news or happening in Bali.

'gran_tourismo' are travel and food writer from Combodia.

'jasonsentell' is a scuba diver

'Just1WayTicket' is a travel blog

'arieparikesit' is the CEO/Founder of Kelana Rasa Culinary Solutions.

Table 9

Popular Twitter Users according to Follower's Count
*1e+05 = 10,000, 2e+05 = 20,000, 3e+05=30,000

The graph given below will shows the list of users who are having the most number of friends in their account. The list is shown in decreasing order. It shows that 'Jasonsentell' is the most popular user/account because it is having maximum friends.
'balitoday' is related to any news or happening in Bali
'jasonsentell' is a scuba diver
'gran_tourismo' are travel and food writer from Cambodia.
'BolaBanget' is a website where sports news were shown
'chandruok' is s a person from Tanzania
'kiddibeatz' is a very famous BeatBoxer from Canada

Table 10

Popular Twitter Users according to Friend's Count
Jakarta

The word cloud of the Jakarta is highlighting the words 'hotel', 'discount'. The significance of these words will be seen in the sentiment analysis and emotion classification.

Figure 6

Tweets searched for the Jakarta are shown in the diagram below with their respective emotions and sentiments:

	text	emotion	polarity
7	happybirthdaymaggiegrace nothing but love for you...	joy	positive
28	this is the time when i was busy in my own world �...	joy	positive
43	live on periscope we r in jakarta ���������...	joy	positive
44	hotel jakarta reddoorz near ragunan zoo onlyidr bef...	joy	positive
45	hotel jakarta reddoorz near ragunan zoo onlyidr bef...	joy	positive
46	live on periscope we r in jakarta ��������...	joy	positive
50	hotel jakarta reddoorz near rs fatmawati onlyidr bef...	joy	positive
58	good food with no filter latepost culinary jakarta sin...	joy	positive

106	good evening jakarta jakarta sudirman bunderanhi ...	joy	positive
111	great northern maple syrupjakarta bogor depok tan...	joy	positive
130	live on periscope we r in jakarta ��������...	joy	positive
141	love this pict ���������������...	joy	positive
142	jakarta with hemmy pic	joy	positive
162	happy international peace day peaceday peaceday ...	joy	positive

Figure 7

Sentiment analysis suggests that lot of tweets fall into positive category. All the tweets falling into the positive category were due to the tweets mentioning the discounts in the hotels. Whereas the negative tweets are due to the congestion in Jakarta. Some users mentioned in their tweets that it is difficult to breathe in Jakarta.

Table 11
Emotion classification suggests high percentage of tweets in joy category, whereas other categories are in the same proportion. Anger among people is due to the congestion in Jakarta.

Table 12

Emotion Classification of JAKARTA
Suggestions

According to the collected data, there are some negative tweets related to terror alerts in Indonesia. These kinds of tweets can decline the tourism rate in Indonesia. This can directly affect the GDP of the country as the tourism is the major source of income in Indonesia. Tweets related to terror alerts can also cause panic among the tourist and native population of Indonesia. So whenever these tweets were posted on twitter, either the government or tourism ministry should give assurance to the tourists and native population or they should provide some helpline numbers to counter these kinds of tweets. With this people can get the official status of the issue that has been emerging on social media. One issue related to orang-utan is coming in the content collected from twitter. It is perceived that there will be extinction of orang-utan due to the palm oil production. On social media orang-utan are very popular, so there needs to be a check on the population of orang-utan as it is an attraction among tourist coming to Indonesia. Tweets related to bullet trains in Indonesia are also gaining positive attention on twitter. According to the content this project is in collaboration with the Chinese firm. This project needs to be kick started by the government as it is getting good response on the social media.

In the word cloud of Jakarta, most of the positive tweets related to Jakarta are from the discount offers given by the hotels of the Jakarta. Some tweets are also pointing to the flash floods in Jakarta. The government can also plan disaster management in future for the floods. If the disaster management is planned through twitter also, then it can be successful. In some tweets, users compared the Jakarta to the concrete jungle and showed some anger by saying that it is difficult to breathe in Jakarta. Some strategies can be made to curb the traffic problem so that natural beauty remains intact with the image of Jakarta.

People are praising the beauty that is lying within the Bali islands. The beauty in Bali is attracting them the most. The tourism sites of Indonesia are attracting the tourist by showing them the picturesque views from Bali. This is a very good strategy to attract the tourist and

they should continue with these strategies. From the collected data, it is analyzed that drugs is also an issue in rural parts of Bali. This is hampering the image of Bali islands as many countries have raised a war against drugs. So in order to tackle this situation, the government should come with some anti-drug campaigns also. There are lot of negative tweets about people tweeting about the arrest of man who is playing music for disabled child. This is putting a negative impact on the government of Bali. One man also posted images of fake eggs in Bali and many people are disturbed by watching this image. Government needs to higher their food standards to cover up these kinds of food issues. According to the collected there are some deaths due to rabies. The Indonesian government should think about the stray dogs so that they cannot trouble the tourists as tourist are the main source of revenue in the country. Some vaccination camps can be setup for the stray dogs or they should caught and put at some place under the surveillance. Lot of people are talking about the drought situation in Bali. Government should ensure that there will not be any drought situation and if there is any, then they should provide comfortable stay to the tourists who are arriving in the country. The government should inform the social media users through tweets about their new policies or new initiatives taken, so that there should be an assurance for the tourists who are arriving in their country.

When the analysis of time zones is done from the tweets having Bali as keyword, then it is realized that majority of the tweets were coming from the Pacific Time Zone where as less number of tweets were from Eastern Time Zone. If Bali Tourism wants to focus on new tourism packages then it can directly target the Pacific Time Zone as Bali is already popular is this Time Zone. To increase the magnitude of their tourism industry, the ministry can build new advertisement strategies where the Bali is less popular by considering the amount of tweets that particular time zone is generating.

It is suggested that the influential users should be targeted to spread any information, news or promotional message as the twitter user getting more number of re-tweets is considered as an influential user having high social capital. Their tweets posted on twitter will get extensive viewers that mean they are engaging more number of users with their tweets. The users having more number of friends and followers on twitter are having larger social media base. These users can also be targeted for any dissemination of information. If any mis-happening is there then these people having high social capital can be engaged to spread the warning or preventive messages as they are having broader coverage on twitter. The popular hash tags should be used to get the trending topics on a particular keyword.

Future Work
This big data framework can be extended to any kind of user generated content and it just finishes the limitations of storing the types and amount of unstructured data. The large amount of data can be handled by increasing the cluster size of HADOOP. This proposed framework is capable of storing the vast amount of unstructured data. The structured data from databases of various organisations can also be stored in this framework.

Conclusion
To conclude this broader research on social media, it can be easily said that analytics plays a remarkable role to get some insights on social media. The selection of appropriate tools in analytics is very essential to dig down this complex chunk of unstructured data. These tools help the analyst to collect this vast amount of data to have a 360˚ view of the situation.

IS MALAYSIAN ISLAMIC HOME FINANCING BAY' BITHAMAN AL-AJINL ('BBA') COMPATIBLE WITH ISLAMIC LAW? A CRITICAL EXAMINATION ON THE ISSUE OF 'BENEFICIAL OWNERSHIP'

Nuarrual Hilal Md Dahlan ACIS, Universiti Utara Malaysia, Malaysia
Fauziah Mohd Noor, Universiti Utara Malaysia, Malaysia
Mohd Sollehudin Shuib, Universiti Utara Malaysia, Malaysia

Abstract

Islamic Banking has been established since 1980s in Malaysia. It was initially commenced with the incorporation of Bank Islam Malaysia Berhad ('BIMB') in 1983. Until today, Islamic Banking has robustly developed in Malaysia. Various Islamic Banking products have been introduced and practiced in Malaysia. Among the products are: Bay' Bithaman al-Ajil (BBA), Musharakah al-Mutanaqisah (MM), Commodity Murabahah and Ijarah. Nonetheless, there are many issues in these products. One of the issues is the issue of beneficial ownership in BBA. It is evident that, the application of BBA is proven to be defective and contains many flaws, if involves pending completion housing development projects. This paper discusses beneficial ownership issue through the sharia doctrinal and qualitative case study research methodologies. The outcome of this paper will help the Islamic banking industry in dealing with issues arising from 'beneficial ownership' in transaction involving houses pending completion in Malaysia.

Keywords: *Beneficial Ownership of House Pending Completion; Bay' Bithaman al-Ajil (BBA); Issues; Purchasers' Grievances, Proposal for Reform.*

Introduction

It is a trite practice in Malaysia that those who wish to purchase houses, particularly involving transaction that fall under the purview of Housing Development (Control & Licensing) Act 1966 and its regulations (Act 118), to apply for home financing from Islamic banks. Normally the purchasers will enter into housing contracts with the housing developers purchasing the pending completion houses. Once the relevant documents are signed, the purchasers will then apply to Islamic bank to finance the balance purchase price via any Islamic home financing products, normally BBA (Md Dahlan & Aljunid, 2011; Md Dahlan & Aljunid, 2010).

In BBA, the purchasers are required to sign two (2) agreements *viz* Property Purchase Agreement (PPA) and second Property Sale Agreement (PSA). The first agreement i.e. PPA states that the purchaser agrees to sell the purported house, being the house that the purchaser bought from the vendor developer, to the Islamic Bank. The price must the same price as that used between the purchaser and the vendor developer (Md Dahlan & Aljunid, 2011; Md Dahlan & Aljunid, 2010).

The second agreement is PSA. Under this agreement, the said house purchased by the Islamic Bank will be re-sold back to the purchaser at a marked up price (the price being higher than the purchase price that was used by the purchaser and the vendor developer and between the purchaser and the Islamic Bank effected via PPA). The purchaser is required to repay the whole marked up price to the Islamic bank in installment for certain duration until full settlement. The Islamic banks will get profit between the difference of the price stated in the PPA and the price stated in the PSA (Md Dahlan & Aljunid, 2011; Md Dahlan & Aljunid, 2010).

The above transaction, between the purchaser borrower and the Islamic Bank, is called *Bay' al-Inah* (Bank Negara Malaysia, 2009). Apart from *Bay' Inah*, in the opinion of the authors,

BBA also consists of *Murabahah* transaction as it involves selling price at a marked up rate as profit by Islamic banks effected via PSA.

It should be emphasized here that the theory and practice of *Bay' al-Inah* is still subject to debate between the *fiqh* schools of law as the transaction may fall into *riba'* (difference of prices involving duration) or helah (trick) to justify riba' in transaction (al-Zuhayli, 1988).

Majority of Islamic Jurists reject *Bay' al-Inah* as the transaction is a void transaction. To Abu Hanifah, *Bay' Inah* is permissible if it involves a third party as an intermediary premised on Istihsan supported by the story of Zayd bin Arqam *(Arab-Malaysian Finance Berhad v Taman Ihsan Jaya Sdn Bhd & Ors (Koperasi Seri Kota Bukit Cheraka Bhd, third party)* [2008] 5 MLJ 631; al-Zuhayli, 1988).

According to Islamic Jurists, *Bay' Inah* transaction can fall into prohibited business activities based on a hadith of the Prophet Muhammad (PBUH)– 'there will come a time where people permit riba' in business' (al-Zuhayli, 1988).

In the opinion of Assohibayn (Abu Yusof and Muhammad al-Shaybani), Hanafi, Maliki and Hanbali schools, *Bay' al-Inah* will be avoided if there is a proof that shows an intention to commit sins (*riba*) on the ground of the principle of *sadd zarai'ik*. Secondly, they argued on the story of Zayd bin Arqam where Aishah R.A did not approve a transaction of buying and selling slaves via *bay' al-Inah*. Thirdly, on the reason that there exist payment and ownership in the first transaction. Further, the jurists argued on the basis of *a* hadith of the Prophet Muhammad (PBUH) which prohibits *Bay' al-Inah* (al-Zuhayli, 1988)

Nonetheless, majority of the jurists such as Shafie and Zohiri schools allow it but detestable/ abominable (makruh). Abu Hanifah is of the same opinion with Shafie and Zohiri schools on *Bay' al-Inah*, *viz* it is valid as it complies with the contract pillars -- offer and acceptance (*ijab* and *qabul*). These two schools do not emphasize on intention (i.e intention to use trick *(helah)* in order to justify *bay' al-Inah*) as only Allah knows what is the intention of each individual. According to these schools, *Bay al-Inah* is valid if there is no plan to apply time period of excessive price volatility. If otherwise, the application of *Bay' al-Inah* is void. To these schools, the hadith of the Prophet disallowing *Bay al-Inah* is not rejected by Imam Shafie and secondly, Zayd bin Abi Arqam himself did not follow it (al-Zuhayli, 1988; Bank Negara Malaysia, 2009; Bakar. 2009; *Malayan Banking Bhd v Ya'kup bin Oje & Anor* [2007] 6 MLJ 389 (High Court at Kuching); al-Shawkani, 1357H).

Dr. Wahbah al-Zuhayli himself is the same opinion with the majority of the jurists i.e Bay' al-Inah is void (al-Zuhayli, 1988).

Research Methodology
The authors used sharia and legal research methodology to explain the issues, problems and proposal in this academic paper. The sources of research are the al-Quran and al-Hadith. The authors also look into the opinions of the jurists on issues raised in this paper. The legal research is in a form of hybrid in nature. It consists of applied research, academic research, analytical/critical research, descriptive research, library-type and experimental study. The research activities under this heading include the discovery of the principles, rules and case law in order to explain and resolve the identified problems guided by the set objectives (Zahraa, 1998).

The second methodology is the social research methodology using a case study. The authors chose a qualitative case study as they wish to examine in detail issues and discussion in BBA that involved abandoned housing projects. Qualitative methodology is concerned with exploring people's life, histories or everyday behavior that quantitative research is unable to grasp. By using the qualitative method, information gathered will be more and enriching as it involves an in-depth and deeper understanding and study of a particular matter. The sources of data are from the accessible files of KNM Consulting Services, Jalan Medan Tuanku,

Kuala Lumpur ('KNM'). KNM is a private agency set up with a purpose to resolve issues arising from abandoned housing projects and to help aggrieved purchasers. In addition, the authors also interviewed the purchaser involved, sharia advisors of Islamic banks, lawyers and bank officers as a way to achieve triangulation and multiple evidences and thus can ensure reliability and validity of the research undertaken (Silverman, 2000; Yin, 1994; Yin, 2000).

The Governing Law of Islamic Banking and Finance In Malaysia

Islamic banking and finance in Malaysia is governed by the Islamic Financial Services Act 2013 (Act 759) ('IFSA'). The obligation to comply with *sharia* (Islamic Law) in all the activities of the institutions carrying out Islamic banking business is clearly spelt out in section 28 of IFSA (Duty of Institution to Ensure Compliance with *Sharia*). An institution carrying out Islamic banking business is under a responsibility to do certain acts once it found that the business that it carries out has contravened the *sharia* (section 28(3) IFSA).

Sharia Advisory Council ('SAC') is a council established by the Bank Negara Malaysia (Central Bank of Malaysia) pursuant to section 51 of the Central Bank of Malaysia Act 2009 (Act 701) (Establishment of *Sharia* Advisory Council) ('CBM'). The SAC shall be the authority for the ascertainment of Islamic Law for the purpose of Islamic financial business (section 51 CBM). It is a duty of the Bank Negara Malaysia and Islamic Financial Institutions to consult the SAC pursuant to sections 55(1) and 55(2) of CBM in respect of Islamic financial business and conducting its affairs. The purpose of consulting, referring and seeking advice from the SAC is to make sure that the Islamic financial business and its affairs are conducted in accordance with the requirements of *Sharia* (section 55(2) CBM). Apart for sections 51 and 55, sections 56(1), 57 and 58 of the CBM also prescribe that the rulings and advice of the SAC shall bind the IFIs, the Bank Negara Malaysia, the *Sharia* Committee, the court of law and the arbitrators on matters pertaining to Islamic financial matters.

Thus, the rulings and advice of the SAC shall bind the IFIs, the court of law, the arbitrator and the *Sharia* committee. In other words, the new provisions inserted in the CBM in relation to the SAC, serve as ouster clauses to oust any jurisdiction and power of the court of law, any other *Shariah* committee of the IFIs and any other persons to challenge the rulings and advice of the SAC in respect of Islamic financial business and affairs (Md. Dahlan & Aljunid, 2010; Md Dahlan & Aljunid, 2011).

Apart from complying with the *sharia* and the SAC, the IFIs carrying out Islamic financial business must follow the standards set out by the Bank Negara Malaysia and the SAC (section 29 IFSA).

Similarly, all persons, including the IFIs, are duty bound to comply with the directions (written circulars, guidelines and notices) of the Bank Negara Malaysia on any *Sharia* matter relating to the Islamic financial business. These directions are made in accordance with the advice of the SAC. Any person who fails to comply with any of these directions, commit an offence and shall, on conviction, be liable to a fine not exceeding three million ringgit (MYR: 3,000,000.000) (USD 750,000.00) (section 59(1)(2)(3) CBM).

In addition to the above, the IFIs must also comply with the advice of its internal *Sharia* Committee (section 30(1) IFSA). IFIs must also establish their own *Sharia* Committee to advise its business, affairs and activities in order to ensure that they comply with the *Sharia* (section 30(1) IFSA). The duties and functions that the *Shariah* Committee carries out must also be consistent with the standards prescribed by the Bank Negara Malaysia (section 32 IFSA).

The superiority and hegemony of the SAC over the court, the IFIs, the arbitrator and the *Sharia* Committee in relation to the Islamic financial business and affairs has been given judicial support and recognition by recent cases namely *Mayban Trustees Bhd v CIMB Bank Bhd and other appeals* [2012] 6 MLJ 354 (Court of Appeal at Putrajaya), *Mayban Trustees*

Bhd v CIMB Bank Bhd and other appeals [2012] 2 MLJ 187; [2012] 6 MLJ 354 (Court of Appeal at Putrajaya), *Mohd Alias bin Ibrahim v RHB Bank Bhd & Anor* [2012] 1 ShLR 23; [2011] 3 MLJ 26 (High Court of Malaya at Kuala Lumpur), *Tan Sri Abdul Khalid bin Ibrahim v Bank Islam Malaysia Bhd* [2012] 1 ShLR 1; [2012] 7 MLJ 597 (High Court of Malaya at Kuala Lumpur), *Tan Sri Abdul Khalid bin Ibrahim v Bank Islam Malaysia Bhd* [2013] 3 MLJ 269 (Court of Appeal at Putrajaya), *Tan Sri Abdul Khalid bin Ibrahim v Bank Islam Malaysia Bhd and another suit* [2009] 6 MLJ 416 (High Court of Malaya at Kuala Lumpur), *Kuwait Finance House (M) Bhd lwn Teknogaya Diversified Sdn Bhd dan lain-lain* [2012] 9 MLJ 433 (High Court of Malaya at Kuala Lumpur), *Mayban Trustees Bhd v CIMB Bank Bhd and other appeals* [2012] 6 MLJ 354 (Court of Appeal at Putrajaya), *CIMB Islamic Bank Bhd v LCL Corp Bhd & Anor* [2012] 3 MLJ 869 (High Court of Malaya at Kuala Lumpur), *Bank Muamalat Malaysia Bhd lwn Kong Sun Enterprise Sdn Bhd dan lain-lain* [2012] 10 MLJ 665 (High Court of Malaya at Johor Bahru) and *Bank Islam Malaysia Bhd lwn Rhea Zadani Corp Sdn Bhd etc.* [2012] 10 MLJ 484 (High Court of Malaya at Kuala Lumpur).

case law

There are reported cases that have dealt with BBA in Malaysia. Among the cases are as follows:

1)   *Bank Islam Malaysia Bhd v Azhar Osman & Other Cases* [2010] 5 CLJ 54 (High Court of Malaya at Kuala Lumpur)(issue involving the demand of the bank for full sale price);

2)   *Bank Kerjasama Rakyat Malaysia Bhd v. Brampton Holdings Sdn Bhd* [2015] 4 CLJ 635 (High Court of Malaya at Kuala Lumpur)(Issues on the liability of the defendant debtor who failed to make repayment under the BBA facility to the bank financier);

3)   *Malayan Banking Bhd v. Marilyn Ho Siok Lin* [2006] 3 CLJ 796 (High Court of Sabah & Sarawak, at Kuching)(Issue on the claim of the bank for full sale price from the customer debtor even though the BBA facility was terminated prematurely);

4)   *Malayan Banking Bhd v. Ya'kup Oje & Anor* [2007] 5 CLJ 311 (High Court of Sabah and Sarawak at Kuching)(Issue on the claim of the bank for full sale price from the customer debtor even though the BBA facility was terminated prematurely); and,

5)   *Arab-Malaysian Finance Bhd v. Taman Ihsan Jaya Sdn Bhd & Ors; Koperasi Seri Kota Bukit Cheraka Bhd (Third Party) and Other Cases* [2009] 1 CLJ 419 (High Court of Malaya at Kuala Lumpur)(Issue on the rate of profit from BBA transaction may have contravened Islamic Law).

The Case Study

The case study involves a customer/purchaser by name of Ahmad Ismadi Bin Mat Husin and Ana Marlina Binti Sarian ('purchaser') and Bank Islam Malaysia Berhad ('BIMB'). The purchaser bought a unit of apartment known as parcel No. B-8-10, Block B, Level 8 which is also known as Indah Heights (Service Apartment), Pulau Indah, Klang with a measurement of 733 square feet ('the said property'). The said property has no separate issue document of title. The said property is held under a Title Master No. EMR 7847, Lot No. 5740 and EMR Lot No. 7848, Lot No. 5741, Pulau Indah, Mukim dan District of Klang, Selangor. The land on which the said property is erected is owned by one Mokhtar b. Ahmad dan Siti Mariam bt. Ahmad. The address of the said property is Parcel No. B-8-10, Level 8, Block B, Indah Heights, Pulau Indah, Klang, Selangor. The developer of the project is known as Simpulan Cemerlang Sdn Bhd (No. 355877-P). The said property was sold to the purchaser at the price of RM 98,000.00 (Ringgit Malaysia: Ninety Thousand Only) (USD 24,500.00). The purchaser

paid the deposit. While BIMB finances the balance of RM 88,200.00 (Ringgit Malaysia: Eighty Eight Thousand Two Hundred)(USD 22,050.00) effected through BBA(KNM Consulting Services, n.d).

The said housing development project was terminated and became abandoned. There is no construction activities and constructed building on the said land. Nevertheless, BIMB paid to the vendor developer the progressive payment amounted to RM 26,700.00 (Ringgit Malaysia: Twenty Six Thousand and Seven Hundred)(USD 6,675.00) being payment for work done for stage 2(b) - 'being a work of commencement the work below ground level including piling, pile cape and footing of the said building comprising of the said parcel'. The payment was made by BIMB after they received an architect certificate and a request of the vendor developer. After knowing that the said housing development has become abandoned, the purchaser stopped making installment payment to BIMB. As a consequence, BIMB commenced a legal action against the purchaser for an amount of RM 239,945.72 (Ringgit Malaysia: Twenty Hundred Thirty Nine Thousand Nine Hundred Forty Five and Seventy Two)(USD 59,986.43) being the full sale price stated in the PSA and cost incurred by BIMB. This happened in 2005. Finally, on 22 February 2011, the purchaser settled BIMB demand by making settlement payment of RM 30,000.00 (Ringgit Malaysia: Thirty Thousand)(USD 7,500.00) (KNM Consulting Services, n.d).

Analysis

In the transaction above, the purchaser bought the said property from the developer vide an agreement of sale and purchase (find this agreement). Later the purchaser applied to BIMB for financing the balance purchase price. This was done through BBA. There are three documents involved:

1)   Sale & Purchase Agreement between the vendor developer and the purchaser dated 9 September 2002 ('S&P');
2)   PSA dated 1 November 2002 ('PSA');
3)   PPA dated 1 November 2002 ('PPA'); and,
4)   Deed of Assignment dated 1 November 2002 ('DoA').

Through these legal documents the purchaser is called the beneficial owner of the property. Beneficial owner is a legal term where specific property rights ("use and title") in equity belong to a person even though legal title of the property belongs to another person (Black's Law Dictionary, 2001). This often relates where the legal title owner has implied trustee duties to the beneficial owner. In practical sense, in respect of the sale and purchase of property in Malaysia is concerned, beneficial owner refers to the purchaser who paid the deposit (normally 10%) of the purchase price to the vendor, without having paid the total purchase price and that the title to the property is not yet transferred into the name of the purchaser pending full settlement of the purchase price.

In other words, referring to the above case study, the purchaser through the purchase of the said property vide sale & purchase agreement dated 9 September 2002, from the developer, the property of which was still pending completion, becomes the beneficial owner of the said property as the said property has not yet fully bought, the purchase price is still not fully paid and title has not yet registered into the name of the purchaser. His position as the beneficial owner still subsists even when the purchaser entered into the BBA contract vide PPA. This can be seen in the preamble of the PPA dated 1 November 2002 of the case study above. Through PPA also, pursuant to clause 5 (passing of beneficial ownership and/or rights), the beneficial owner of the said property was shifted to BIMB. Later through PSA and Deed of Assignment (DoA) dated 1 November 2002, pursuant to clause 4 (Passing of Beneficial Ownership and/or rights) and clause 1, respectively, the beneficial owner was re-shifted back to the purchaser. Through PSA also and by the fact that the purchaser is again becoming the

beneficial owner, the said property is charged to BIMB through the Deed of Assignment (DoA).

The issue is this: What is the Islamic law view on beneficial ownership?

Under Islamic law, a contract is called *al-'aqdu*. *al-'aqdu* is defined as 'the obligation which is the result of an offer given by a party and the acceptance given by the other party, in a way where its legal effect is expressed on the thing contracted upon' (Ibn 'Abidin, 1966).

According to Mejelle, pursuant to article 103, *aqdu* is defined as 'the two parties taking upon themselves and undertaking to do something. It is composed of the combination of an offer (ijab) and acceptance (qabul)'.

According to Qamus al-Wasit, *al-aqdu* means 'an agreement between two parties with a purpose that the respective parties have to execute their obligations as agreed'.

There are many Quranic verses and Hadith of Prophet Muhammad (PBUH) mentioning on contract. For instances are the followings:

1)   Surah al-Maidah 5:1: "O ye who believe! fulfill (all) obligations. Lawful unto you (for food) are all four-footed animals, with the exceptions named: But animals of the chase are forbidden while ye are in the sacred precincts or in pilgrim garb: for Allah doth command according to His will and plan."

2)   Surah al-Baqarah 2:282: "O ye who believe! When ye deal with each other, in transactions involving future obligations in a fixed period of time, reduce them to writing Let a scribe write down faithfully as between the parties: let not the scribe refuse to write: as Allah Has taught him, so let him write. Let him who incurs the liability dictate, but let him fear His Lord Allah, and not diminish aught of what he owes. If they party liable is mentally deficient, or weak, or unable Himself to dictate, Let his guardian dictate faithfully, and get two witnesses, out of your own men, and if there are not two men, then a man and two women, such as ye choose, for witnesses, so that if one of them errs, the other can remind her. The witnesses should not refuse when they are called on (For evidence). Disdain not to reduce to writing (your contract) for a future period, whether it be small or big: it is jester in the sight of Allah, More suitable as evidence, and more convenient to prevent doubts among yourselves but if it be a transaction which ye carry out on the spot among yourselves, there is no blame on you if ye reduce it not to writing. But take witness whenever ye make a commercial contract; and let neither scribe nor witness suffer harm. If ye do (such harm), it would be wickedness in you. So fear Allah. For it is Good that teaches you. And Allah is well acquainted with all things. If ye are on a journey, and cannot find a scribe, a pledge with possession (may serve the purpose). And if one of you deposits a thing on trust with another, let the trustee (faithfully) discharge his trust, and let him Fear his Lord conceal not evidence; for whoever conceals it, - his heart is tainted with sin. And Allah know eth all that ye do".

3)   Hadith of the Prophet Muhammad (PBUH): "Muslims are bound by their condition" (al-Bukhari, 1934).

Under Islamic law there is no specific topic discussing on 'beneficial ownership'. What is clear is that 'beneficial ownership' denotes not an absolute ownership. The issue is, whether Islam allows beneficial ownership in contract?

First of all, in Islamic law there is a caution by a Hadith of not to involve in non or incomplete ownership and non-possession-ship of subject matter.

For example, al-Tirmizi reported that a man questioned the Prophet Muhammad (PBUH) that a man came to see him and he wanted to buy from him some goods. He had no such goods. He went to the market and purchased the goods and then sold them to the man. The Prophet

Muhammad (PBUH) responded to the question by answering "do not sell what you do not have" (al-Tirmizi, 1937). The report indicates that it is not allowed for a person to sell an object which he does not own or possess.

Imam al-Bukhari also reported a hasan hadith which prohibits of selling the foodstuff which was previously bought without taking into possession (al-Bukhari, 1934).

To Ahmad Hidayat Buang, the above mentioned contract is prohibited because the seller cannot guarantee that he is able to deliver the object of the sale physically and legally. In physical term he cannot guarantee the object will be available in future and in legal term he is not yet the lawful owner of the object (Buang, 2000).

Be that as it may, it is submitted that, Islam provides certain elements of contract. In the event that any of these elements is absent, then the contract can be void. The elements are as follows:

1)   The subject-matter must exist;
2)   The subject-matter can be delivered;
3)   The subject-matter can be ascertained; and,
4)   Suitability of the subject-matter.

1)   The Subject-Matter Must Exist

Islamic law emphasizes that the subject matter of a contract must exist at the conclusion of the contract. Thus, if the subject-matter is absence, the contract is void. Due to the absence of the subject-matter, the contract becomes a *gharar* contract (fraudulent/perilous contract), which is a void contract. The authority that requires the existence of the subject matter and prohibition of *gharar* contract is as follows:

Al-Quran:

a)   Chapter IV (Surah An-Nisa'), Verse 29: "O you who have believed, do not consume one another's wealth unjustly but only [in lawful] business by mutual consent. And do not kill yourselves [or one another]. Indeed, Allah is to you ever Merciful".

b)   Through the above Quranic verse, Islam prohibits all categories of wealth acquisition or profit through unlawful ways which it terms batil. Unlawful way includes gharar contract (Buang, 2000).

c)   "Muslims are brothers. It is not permissible for a Muslim to sell a thing which contains faulty elements/flaws/defects (aib) to his fellow brother (Muslim) except if he discloses it" (al-Shawkani, 1357H).

d)   It was reported that the Prophet Muhammad PBUH while he was passing a vendor selling foods, and became attracted to the bunch of foods before him. He put his hand into the bunch and found the part below the foods were wet. He asked the seller: What is this? The seller replied: the foods were wet because they were poured with rain water and to prevent public from knowing this fact, he put the wet foods at the bottom part of the bunch. On hearing of this, the Prophet PBUH said: 'He who cheats us, is not from us.' (Imam Muslim, n.d)

e)   The Prophet Muhammad (PBUH) said: "It is not permissible for someone to sell a thing except after he has explained about it, nor is it permissible for a person who knows such a state of condition of a thing, except he explains about it" (al-Shawkani, 1357H).

f)   Yahya related to me from Malik from Abu"r-Rijal Muhammad ibn Abd ar-Rahman ibn Haritha from his mother, Amra binti Abd ar-Rahman that the Prophet (PBUH), forbade selling fruit until it was clear of blight. Malik said: ' Selling fruit before it has begun to ripen is an uncertain transaction (gharar).' (Imam Malik, 2016).

The position of Islamic law is clear on contracts involving a non-existent subject-matter. Islamic law lays down a condition that the subject matter must actually exist at the conclusion of the contract. Hence, if the subject matter does not exist, generally, the contract is void even though it could probably exist thereafter, or even if it is established then that it would exist in the future but the existence is still to the detriment of any party to the contract. A contract which involves a non-existent subject matter is prohibited pursuant to a hadith, whereby the Prophet Muhammad (SAW) prohibited a person from selling an animal fetus yet to be born while it is still in the mother's womb, when the mother was not part of the sale (al-Zayla'i, 1393H). Similarly is the selling of milk whilst it is still within the udder of the animal. This sale is void as there is a possibility of the udder being perhaps void of milk, and instead, only containing air (al-Kasani, 1328H). In one hadith, the Prophet Muhammad (PBUH) prohibited the act of stopping the milk of udder of the female goat for a certain duration for the purpose of enticing the public to purchase the female goat on the pretext of it containing a lot of milk (al-Shawkani, 1357H). Prophet Muhammad (PBUH) too prohibited the sale of things which one does not own (Abu Dawud, 2009).

However, Muslim jurists allow the contract of a non-existent subject matter, as one of the exceptions to the above, relating to the sale of agricultural products before they become ripe. However, this is subject to the knowledge that the products have already appeared even before the signs of ripeness are shown. Further, this type of contract is allowed if the purchaser immediately harvests them. The position is the same in respect of the sale of fruits and agricultural products, which yield successively one after another during one harvest as in the case of water melons and egg-plants. In this particular case, Muslim jurists in general have agreed to allow the sale of fruits which have already appeared but will disallow the sale of fruits which are yet to appear (Al-Kasani, 1328H). This contract falls under the category -- 'the subject matter exists in essence, then comes into existence thereafter' (Nawawi, 1999; Al-Sarkhasi, 1384H; Ibn Juzay, 1974; Ibn Qudamah, n.d).

As regards the subject-matter which did not exist at the time of contract and it is established that it also could not exist in the future, Muslim jurists do not accept this kind of contract as this contract contains the element of *gharar* (Nawawi, 1999; Al-Sarkhasi, 1384H; Ibn Juzay, 1974; Ibn Qudamah, n.d). A transaction containing the element of *gharar* is prohibited based on the verses of the Quran above and the hadith of the Prophet Muhammad (PBUH), for instance Ibn Umar to have said that the Prophet (PBUH) prohibits sales involving *gharar* elements (al-Bayhaqi, 1971). Majority of the jurists are also unanimously of the opinion that the contract which its subject matter generally could not be surrendered to the parties at the conclusion of the contract or at the promised date, is a gharar contract and thus it is void, not binding and having no legal effect (al-Zuhayli. 1988).

harar is forbidden in Islam as its existence would harm the well-being, rights and interests of contractual parties and cannot ensure satisfactory outcomes, justice and fairness in their contractual dealings (Abdul Rahman, 2016). It is also forbidden by the Sharia because this element typically causes enmity, dispute, hardship, injustice and losses to the parties.

Hence, referring to the issue of 'beneficial ownership' in the above case study, it is clear that, the subject matter, i.e. the completed house does not exist as the time the contract was entered into and when the contract was concluded. There seems no possibility, based on the case study, that the subject-matter can be possibly existed at the conclusion of the contract and even today. This is because the vendor developer terminated the construction of the house and abandoned it and there is no plan for rehabilitation altogether to ensure the construction completed, to the detriment of the purchaser. It follows that, the 'beneficial ownership' that the purchaser owned during the subsistence of the agreement of sale with the vendor developer and the subsistence of PPA with BIMB was a defective ownership and cannot be

existed to date. Thus, it is opined, the agreements (agreement of sale and PPA) are void contracts.

2)   The Subject-Matter Can Be Delivered

Islamic law requires that the subject-matter can be delivered, regardless whether there exist beneficial ownership or legal ownership. What is important, the subject-matter can be delivered to the rightful parties to the contract. Even though the ownership is beneficial, not being absolute, in nature, yet if the parties can ensure the delivery of the subject matter including the ownership, the contract is recognized under Islamic Law and is valid. This is the opinion of the majority of the jurists (al-Zuhayli, 1988).

3)   The Subject-Matter Can Be Ascertained

It is necessary according to Islamic Law that the subject matter can be ascertained so as to prevent disputes, hardships and losses to the parties. According to Hanafi and Hanbali Schools, knowledge and ascertainment of the subject matter can be made by pointing out the place where the subject-matter is placed, even if it is hidden (al-Kasani, 1982; Ibn Qudamah, n.d). However, according to the Maliki School, there is no valid contract unless parties can see the subject matter visually, except it is impracticable, then in this situation the subject matter must be ascertained by description (al-Hattab, 1992). On the other hand, Shafie School opined that the knowledge of the subject matter can only be attained only by visual sight of the subject matter, whether or not the subject matter is actually present at the meeting of the parties (al-Sharbini, 1370H).

Following the above elaboration, the subject matter of the case study is the pending completion house. Thus, at the time of the contract, it cannot be seen. Neither can it be seen after the conclusion of the contract. There is no term in the sale agreement, PPA, PSA and DoA that require the responsible parties to ensure that the house can be rehabilitated and be brought into existence. What is available are the descriptions of the property (subject matter) which are provided in the sale agreement between the vendor developer and the purchaser, in the PSA, PPA and DoA. For example, the descriptions of the houses are on information regarding the material construction, measurement, land description, duration of construction and right to defect liability period. As the house (subject-matter) does not exist i.e. abandoned, and it cannot be seen visually and further there is no term that require the responsible party to rehabilitate the abandoned house, these facts have rendered the subject matter unascertainable and thus the contract is void.

This is in line with the opinion of Hanafi School which maintained that the subject matter should be determined in a manner which can dispel serious ignorance, thus, the terms of the contract should define the genus, species quality and quantity. In addition to this, to Hanafi School, immaterial lacking of knowledge does not invalidate the contract, because the party has the right of 'option on inspection' (al-Kasani, 1982). Similarly, this is also the opinion of Maliki School, except that Maliki School is of the opinion that contract by description is lawful and it is not necessary to allow 'option on inspection', different from Hanafi School's view (al-Hattab, 1992). Hanbali School if also of a similar view, where they opined that the subject-matter may be determined by description in a way which defines its exact identification. Prior inspection of the subject-matter is sufficient to conclude a contract, provided that it is not a kind which normally changes between the inspection date and the date when the contract is concluded. In other words, the descriptions of the subject-matter must tally with the actual features of the subject-matter upon delivery (Ibn Qudamah, n.d; Ibn Qayyim, 1950).

Hence, referring to the case study above, the subject matter being the incomplete and abandoned house even though it has been fully described in the sale agreement (S&P), PPA,

PSA and DoA, it is still failed to be delivered to the purchaser by the developer and/or the Islamic bank. It follows that, by the failure to deliver the subject matter (duly completed house), the vendor (BIMB) and the developer have breached the descriptions (S&P, PPA, PSA and DoA). The aggrieved purchase is also entitled to right of option on inspection, following Hanafi and Hanbali Schools, and if warranted, he can void the contract.

4)   Suitability of The Subject-Matter
The subject matter must be suitable in commercial value and fit for transaction purpose. This is the opinion of Ibn Abidin, al-Sharbini, al-Dardir and al-Kasani (Ibn Abidin, 1966; al-Sharbini, 1370H.; al-Dardir, 1972; al-Kasani, 1982).
Thus, as the subject matter in the case study was abandoned, cannot be delivered and cannot be occupied by the purchaser, the subject matter, it is submitted is not suitable for commercial value and unfit for transaction and use. Thus, the contract, it is opined, is void.

Conclusion and Recommendations
It is submitted that the beneficial ownership as illustrated in the above case study and discussion does not   guarantee, protect and preserve the interests and rights of the stakeholders for instance the aggrieved purhasers in abandoned housing projects. Thus, the BBA documentations must be provided with additional terms that can provide adequate protection to the rights and interests of the purchasers. The current BBA terms involving beneficial ownership, it is submitted, are inadequate that can lead to gharar and evidently, has failed to fulfill the elements of contract as discussed above. Additional terms should be considered such as terms providing liability and responsibility of the bank and/or housing developer vendor to rehabilitate or compensate the aggrieved parties in the event of abandonment. Alternatively, there should have a special mechanism that can ensure all relevant stakeholders are shielded from any losses and grievances consequentical to housing abandonment, for instance the vendor/bank and/or housing developer should possess housing development insurance to cover the situation where housing project is abandoned and specific terms, either in the S&P and BBA documentations, on the liability and responsibility to rehabilitate abandoned housing projects. Further, the system of full build and sell should be practised in Malaysia to avoid the problems of abandoned housing projects and their consequential losses altogether.

M-BMT AS A PRODUCT INNOVATION FOR BAITUL MAAL WAT TAMWIL (BMT)

Ahmad Fajri, Politeknik Negeri Semarang, Indonesia
Veronica Putri Anggraini, Politeknik Negeri Semarang, Indonesia
Iwan Budiyono, Politeknik Negeri Semarang, Indonesia

Abstract

With subsequent development of societies by technology to make transaction free be quickly and light in weight, necessary product innovation by Islamic microfinance institution (IMFI) like Baitul Maal Wat Tamwil. The one of appropriate innovation with technology development is mobile banking (in this case is M-BMT), generally this product only used by financial institution like banking, with the aims to increase the services and customer satisfaction, because the part of society have a certain view that microfinance institution is financial institution which is support less in information technology field. This paper aims to introduce the product innovation of M-BMT to Islamic microfinance institution like BMT. Finally, this study showed that with M-BMT will increase the revenue for BMT and also will increase the servicies and customer satisfaction.

Keywords: *M-BMT, Islamic microfinance institution, Product innovation.*

NOMENCLATURE
BMT   : Baitul Maal Wat Tamwil
IMFI   : Islamic Microfinance Institution
M-BMT   : Mobile-BMT

Introduction

Baitul Maal wat Tamwil (BMT) is one of the Islamic microfinance institutions in Indonesia, Arief (2009) mentions that BMT is a microfinance institution that seeks to develop productive enterprises and investment with sharing system (profit sharing) to improve the quality of economy of the small entrepreneurs in the effort to alleviate poverty by applying the principles of sharia[2].

BMT developments in Indonesia is evolved significantly. With the largest Muslim majority, the growth of BMT has the potential to develop a system of financial services are increasingly promising (Muzdalifah and Titinni, 2015)[3].

However, with the development of increasingly advanced technology, BMT should be able to fulfill the needs of the community in the transaction quickly and transaction free. It is an opportunity for the development anticipation of BMT, BMT developments which can not be separated from the various obstacles that must be faced. According to Heri Sudarsono (2013) explains that the existence of BMT can be sustained through a strategy of improving human resources (HR) competent, good marketing management, product innovation, improving the quality of services, and in cooperation with the Islamic Banks in terms of capital[4].

Service quality of BMT becomes the crucial factor in the success of the costumer's business. Therefore, is need for improvement of product innovation in accordance with technological

developments. According to Ahmad et al (2013), technology is one of the factors that influence the development of the banking sector in each country. Technology is an electronic device that is an integral to the human activity in the world currently, including the banking sector. Then the corresponding product innovation with the development of technology is mobile banking.

Conventional banking industry first uses Internet technology and Mobile Banking from the Islamic banking industry especially in microfinance institutions. In Indonesia, the existence of Islamic microfinance institutions very much, but the lack of product innovation in accordance with technological developments such as mobile banking. As a financial institution that is managed professionally, BMT cannot be managed with just high motivation alone. Economic and financial management aspects should be employed optimally. BMT Management should be able to follow the development of the technology in the environment, and not outdated that may reduce customer's interest to join. Product innovation should continuously be improved in order to seize the market. Therefore, the aims of this paper is to introduce the product innovation of M-BMT to Islamic microfinance institution like BMT.

Material and Methods
1. Software Development Methods
Development method used to create applications "M-BMT" based mobile using Android Studio starts from the process of analysis and design using the Waterfall method.

In developing this apps, the author is analyzing the application of M-BMT. Application is a program that people use to do something on the computer system. Mobile can be interpreted as an easy transfer from one place to another. System mobile application is an application that can be used even if users move easily from one place to another without termination or interruption of communications.

2. Software Application
Android Studio is an IDEs for Google Android Development introduced at the Google I / O 2013. Android Studio is a development of the Eclipse IDEs, and is based on the popular Java IDEs, IntelliJ IDEA is. Android Studio is the official IDEs for Android application development. As the development of Eclipse, Android Studio has many new features compared to Eclipse IDEs. In contrast to the Eclipse that use the Ant, Gradle as Android Studio using the build environment.

References Citations
1. Baitul Maal Wat Tamwil (BMT) Basic Concept
Baitul Maal Wat Tamwil (BMT) derived from two words Baitul Maal which means the socially-religious oriented financial institution whose main activities are accommodating and distributing community wealth in the form of Zakat, infaq, and shadaqah (ZIS) based on the terms defined in the Qur'an and Sunnah of His Prophet. While Baitul Tamwiil means financial institution whose main activities is to raise public funds in the form of savings and deposits and then channel them back to the community in the form of Sharia financing through a common mechanism in the banking world[5]. Thus the conception of BMT is an institution includes two types of activities: 1) activities to raise funds from various sources such as zakat, as well as other shadaqah infaq and shared/ distributed to the beneficiary in order to overcome poverty, and 2) Productive activities in order to create new value-added to economic growth

and develop human resources[6].

2. Mobile Banking

Mobile Banking is treated as an information system service from the banks of the most important are able to produce financial information covering the check balances, transfer funds, credit card bill information, payment of bills, etc.

Service Quality in Islamic financial institutions should improve the perception of consumers that use of mobile banking should provide convenience for customers. In the journal Ahmad Nurul Huda and Sri Wahyu quoted from the American Society for Quality Control in Lupiyoadi (2001) quality is a whole traits and characteristics of a product and services in terms of its ability to fulfill the needs that have been determined or latent.

Future Foundation in the study (2011) said "85% of those using mobile phone banking think that technology (including online and mobile phone) helps them manage their money more efficiently. While the data from Republika.co.id mention mobile banking users can reach 90%, it can be expected due to growth in transactions using 'mobile banking' in 2014 increased threefold[7]. This is in line with the number of users of mobile phones (cell phones) in Indonesia reached 297 million people (Communications, 2012). Meanwhile, the year 2019 is predicted to mobile banking users reached 1.75 billion (Sarifah. 2014).

Result and Discussion
1. M-BMT

"M-BMT" is a mobile application that allows users to conduct banking transactions. This application is equipped with a variety of features, such as transfers, check balances, pay bills, building, souvenirs, and photographers can be ordered through this application. So this allows the user can conduct online transactions.

Architecture design system application of "M-BMT" users load applications, and also the flow of data on the application. Applications "M-BMT" there are two users, namely clients and admin. Consumers after registering can use various features available in the application. Suppose that consumers want to see balance information, pay bills, make transfers and purchases pulses.

2. Use Case

The purpose of the system design is to know everything that is needed by the system. In designing system used the use case to provide an overview of the functions provided by the system. After the identification of actors and users, it can be made use case that is used to describe what is done by the user.

3. M-BMT Apps

  A.   System Engineering
     This stage begins with searching the needs of the whole to be applied in the form of software. The data collected can include information about income, number of customers and products offered. Where the System Engineering is also connected with an internet connection, making it easier to access other data such as information about BMT, its products and all the information about the contents of the application from Mobile Banking
  B.   Design

[7] Maharani, Esthi. 2015. "Pengguna Mobile Banking Diperkirakan Meningkat Tajam". www.republika.co.id, online, accessed on 10 Oktober 2016.

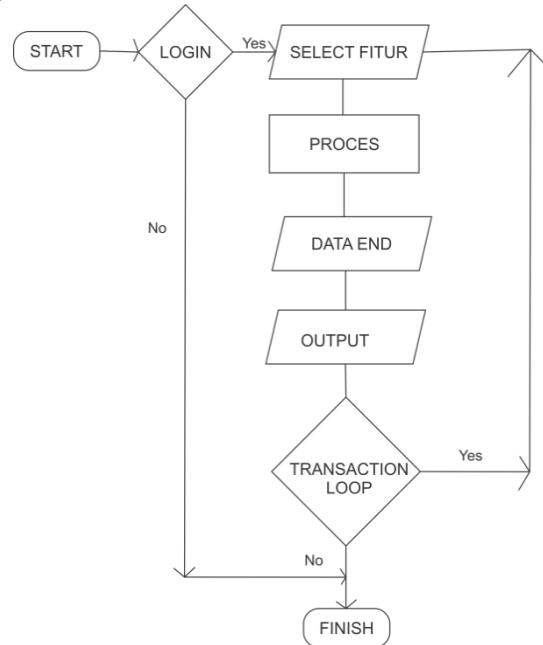
In the second phase is designing, where designing is done by determining the final outcome of the application to be made, the product application system design, database and other than Mobile Banking. At this stage also made use case design and manufacturing applications such as in the following figure. In addition to Design the designing application also using CorelDRAW or Photoshop to design the look of the application to make it look more perfect and able to be read by the user. And the designing shown in Fig. 1


Figure 1. Designing M-BMT Apps

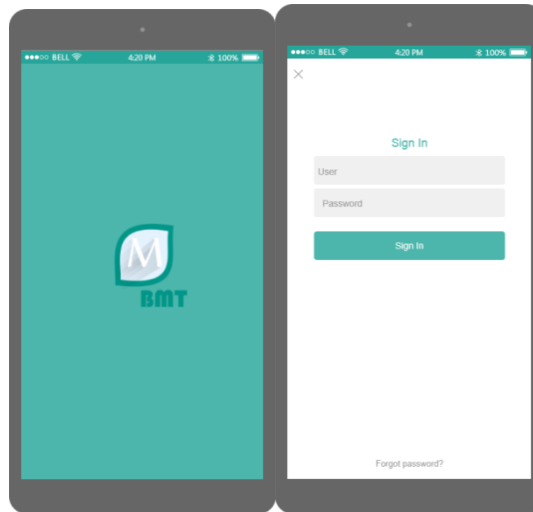
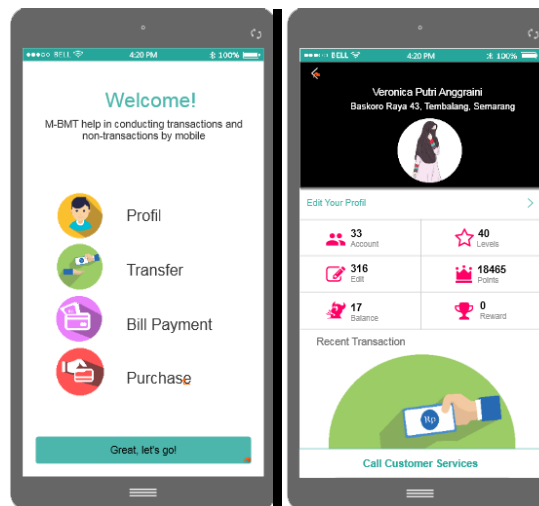
C.   Testing

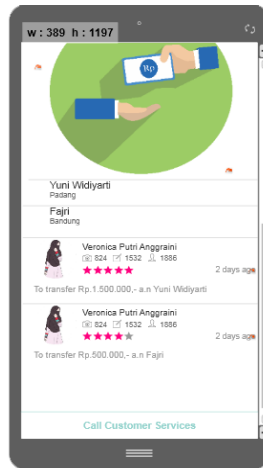
The next step is to try the accuracy of Mobile Banking product before uploaded or posted to the customers so that it can be used in the long term. The test is performed by taking a sample of customers. If the results show a positive and acceptable it will be launching stage, but otherwise it will be tested again to fix the result of the application of this Apps.

D.   Launching

The stage of completion in the manufacturing process of this application is to launch Sharia Mobile Banking Products and dissemination of products to its customers. In this case can be through the services of the Google Play Store or services are similar.

4. Prototype M-BMT


Front display of the M-BMT is start and on About us menu. On the menu of about us BMT contains brief profiles as well as the products it offers, not only that, in this menu are also discussed in detail about the products offered by BMT.


On the main menu there are four sub menus that balance information, transfers, payments and settings. In M-BMT, the main difference when compared to mobile banking is generally used by banks is its easily understood by the public (customers), this is because the fatherly easier for customers to use the product M-BMT.


Conclusion

With the development of increasingly advanced technology, BMT should be able to fulfill the needs of the community in the transaction quickly and transaction free. It is an opportunity for the development anticipation of BMT, BMT developments which can not be separated from the various obstacles that must be faced. "M-BMT" is a mobile application that allows users to conduct banking transactions. This application is equipped with a variety of features, such as transfers, check balances, pay bills, building, souvenirs, and photographers can be ordered through this application. So this allows the user can conduct online transactions. Finally, this study showed that with M-BMT will increase the revenue for BMT and also will increase the services and customer satisfaction.

DEVELOPING AND TESTING MEASUREMENT SCARE OF TRANSACTIVE MEMORY SYSTEM

Neuneung Ratna Hayati, Universitas Gadjah Mada, Indonesia
Amin Wibowo, Universitas Gadjah Mada, Indonesia
Ertambang Nahartyo, Universitas Gadjah Mada, Indonesia

Abstract

In recent years, the importance of studies on transactive memory system (TMS) - a mechanism of individual memory system combined with communication, is increasingly recognized by researchers in organizational behavior. Various empirical studies conducted either experimental or field research with the majority using a measurement scale designed by Lewis (2003). Based on the issue of the validity of the measurement scale with consideration of different contexts (scale was created in the United States and most of the empirical studies conducted in Western cultures), the study was conducted in order to have confidence when using instruments on TMS studies in Indonesia. This study was designed using two stages: the first stage produces six items that were previously not covered by the scale of Lewis (2003). Subsequently, in the second stage, the results of testing the hypothesis not supported allegedly because of variations in the type of work teams and the adequacy of the sample size.

Keywords: *Transactive Memory Systems (TMS), Measurement Scale, Work Team*

Introduction

In line with the conditions on a practical level, study focus on work team process conducted by researchers both conceptual and empirical ones has been developing rapidly (Kozlowski & Bell, 2013; Mathieu et al., 2008). One of them is the construct transactive memory systems (TMS). TMS is defined as "a set of individual memory systems in combination with the communication that takes place between individuals" (Wegner, 1987; Wegner et al., 1985). TMS becomes a mechanism of how the knowledge stored in the individual memory collectively encoding, then storage and retrieval paralel with communication interactions taking place between individuals.

The use of TMS concept evolved from a dyad (e.g, Hollingshead, 2000; Wegner et al., 1991; Wegner, 1987; Wegner et al., 1985) to the group or team level (eg. Peltokorpi, 2014; Mell et al., 2014 ; Huang et al., 2013; Choi et al., 2010; Michinov & Michinov, 2009; Faraz & Sproull, 2000) still have problems related to measurement and levels of analysis (one of criticism from Peltokorpi, 2008). There are three studies conducted by Faraj and Sproull (2000), Lewis (2003) and Austin (2003) that develop instruments to measure the construct of TMS. Ren and Argote (2011) proposed that for knowledge accumulation, researchers need to use a universal measurement. It is important to note that the process in validating the construct is never complete; there is no measurements are fully validated (Bennett & Robinson, 2000). Only studies conducted continuously and supported by strong arguments completed with good evidence (Nunnally, 1978; Schwab, 1980 in Bennett & Robinson, 2000) could create better instruments with high credibility.

The main objective of the study is to develop and examine the content of TMS measurement instruments as a part of the overall research design. This study is expected to increase confidence in the results of research in using TMS instrument for future studies.

Measurement Scale of Transactive Memory Systems

The study focuses on the development of a measurement scale from Lewis (2003) because the scale has been developed to be used in both field study and experiments. Based on the results

of a literature review, this scale is more widely used than Faraj and Sproull (2000) and Austin (2003). The American Psychological Association (1985) in Hinkin (1995) states that a measurement scale must demonstrate content validity, criterion-related validity, construct validity, and internal consistency so that scale can be used in various research conditions.

Scale developed by Lewis (2003) has a weakness that can lead to inaccuracy of the test results. Kozlowski and Bell (2013) state that the use of this instrument has not directly tested the distributed memory structure while one the other perspective, TMS is categorized in a group of compilational construct (Kozlowski & Chao, 2012). The issue arise are: first, is it true that the dimension used in Lewis (2003) is a manifestation of TMS? Second, whether it is treated unidimensional or multidimensional? Two different approaches are used; (a) combining all dimensions into a single construct or (b) testing every dimension as a separate construct and connect them with each criteria variable. In addition, various empirical studies doing aggregation causing the constructs would be more appropriate if grouped in compositional rather than compilational construct. So that, the construct validity will become a problem in interpreting human behavior using measurements of aggregation approach of Kozlowski and Chao (2012).

Research Design

This study was designed in two stages. The first stage focuses on the development of items for measurement scale by assuming that (a) TMS construct will have multidimensional characteristics in accordance with components suggested by Wegner et al. (1985) and Wegner (1987); and (b) the new measurement items as a result of contextual factors. Then, in the second stage, in the second stage, a scale of measurement derived from the first phase of the study will be tested using samples of work teams to test the consistency of the instrument. Further, at this stage, the connection between TMS with the team's performance using measurement instruments from Conger, Kanungo, and Menon (2000) was tested. Therefore, the hypothesis is: Transactive memory system is positively related to team performance. Each phased of study used different respondents.

Result

1.   Study 1

The first study includes a pre-test and pilot study 1 conducted at the individual level with different respondents. Pre-test was conducted by distributing 180 questionnaires using open questions. The total response rate was 63.3% and there were 92 questionnaires can be used (effective 51.1% response rate). Respondents work in various sectors: banks, government, public accounting firms, universities, textiles, food industry, IT, hotels, publishing, management consultants, and architects. The characteristics of respondents were 59 men (64.2%) and 33 women (35.8%) with 77.2% were in the age ranged from 21-40 years old. A total of 60.6% experienced a process of succession in the membership team for 3-4 times (70.6%). In addition, 67.4% agreed to keep using teamwork in their work.

Then, the answers were selected using criteria of Farh, Zhong, and Organ, 2004: (a) the item must have a clear meaning in Indonesian; and (b) the item must be related to the attitude and behavior of employees: 277 answers received, 15% were not considered in the next screening stage. After that, we identify form of response that shows the attitude or behavior. The answers of the respondents were then grouped into eleven points and then gained six new statements to be tested in the pilot study 1. The items of the statement are:

a)   Planned coordination through meetings, discussions, and written procedures is more helpful for our teamwork.

b)   Each member of the team often takes initiatives one another to coordinate in finishing the job.

c) Our team always needs the role of the team leader to complete the work.
d) Each team member can always understand the duties properly.
e) It is often that the team members want to be more outstanding than the others.
f) I continuously feel reluctant to ask for information from other team members to complete the work.

The next stage was the pilot study 1 involving respondents with primary criterion was an individual working in the organization and has been involved or is incorporated in our team. At this stage, it was obtained 130 out of 200 targeted respondents with 11% of the unselected fault or negligence questionnaires. While the respondents consisted of 64 males (55.17%) and 52 women (44.83%) and 62.93% are involved in a service organization. From the aspect of age, 83.62% were in the age ranging from 21 to 40 years old with the majority of undergraduate (S1) as many as 73 people (62.93%).

The first phase of data analysis is to use analysis factor of the 21 items TMS resulted from pre-test. Then, an analysis factor was tested three times until it was obtained the most optimum component groups and items to meet the acceptance criteria. The third test provided a firmly confirmation that optimal formation of the four components consisting of nineteen items. At the stage of testing the suitability model using AMOS software, one component was not included because it did not meet the criteria of the number of items for each dimension. Sixteen item questionnaire form three components after the two-stage modification and were able to show that the models tested met the criteria (Table 1). Cronbach's Alpha value of the respondents' answers to 16 TMS statement points is 0.917 indicating that the instruments used was reliable (Nunnally & Bernstein, 1994).

Table 1. Result Comparison of *Goodness-of-fit* Testing

	Before modification	Modification 1	Modification 2

CFI > 0.90	.849	.968	**.99**
RMSEA < 0.08	.110	.052	**.03**

2. Study 2

This stage was conducted to ensure the available responses were not too varied between periods of time so that whenever the measurement was made, it can be trusted. Hair et al. (2010) states that it relates to the testing of the internal consistency degree on measurement variables. To determine the team size as the sample, taxonomy of Hollenbeck et al. (2012) was employed; a small team n = 2, and a large team n ≥ 5. While Colquitt, Lepine and Wesson (2009) states that the teams in the organization was formed having two or more members. Samples are teams (as a unit of analysis) at various work units with criteria (1) the respondents actually were in a work team, and (2) in doing their work, they used more

cognitive element. The number of questionnaires returned and can be processed as many as 34 work teams consisting of 164 respondents. The majority of them were female (68.3%) with 60.9% under the type of service organization. While 74.4% were in the age ranged from 21 to 40 years old with undergraduate (S1) as many as 103 people (62.8%).

The calculation of Kaiser-Mayer-Olkin measures of sampling adequacy was generated at 0.861 and Bartlett's test of Sphericity which was found to be significant ($\chi 2$ (136) = 1068.097; p <0:01). This means that the data can be used to perform factor analysis. Then, the results were extracted using principal component analysis and varimax rotation towards the answer of 21 items of questions. It showed consistency with the test results in study 1: 16 points of statements for TMS were grouped into three different factors and 5 points of statement on the team's performance. The results of the factor analysis consistently demonstrated that the item statement could represent what to measure. The test results on the fit model showed that the model of 3 factors ($\chi 2$ (93) = 95.7, p> 0.05, GFI = 0.636, CFI = 0.99, RMSEA = 0.015) can meet the acceptability. The value of Cronbach's Alpha on the respondents' answers for 16 points of TMS statements was 0.896; meanwhile, for the other 5 point statement on the team's performance was 0.750. These results indicated that the instruments used were reliable (Nunnally & Bernstein, 1994).

As a form of construct in the property category of configural unit, Kozlowski & Klein (2000) suggested that they are less focused on the assumption of isomorphism, but rather on complex discontinuity and nonlinear processes. The author uses quadratic regression tests as one of the form of non-linear regression. TMS has a positive correlation but not significant with the team's performance (r = 0352, p = 0. 129). This suggested that the increased mechanization of TMS has a positive correlation with the increase of the team's performance even though it has slight significant value above standard.
Figure 1. Model 3

Before testing the hypothesis, the whole data were checked whether it have outliers data (out-of-range scores). If there were data with the scores more than the threshold value 3 standard deviations above the mean (Z> 3. 00), so, this data can be categorized as outliers and were not used in the analysis. Based on the criteria, there is one sample (teamwork number 32) has a value of z-scores for 3.522, thus, it was excluded from the analysis. Visually, the scatter plot of relation between TMS and team's performance was illustrated in Figure 1 indicating the distribution of variation using the quadratic form (Value fstat = 2.191; p = 0.051). The test results demonstrated the hypothesis that memory systems Transactive positively related to team performance was not supported with R^2 = 0.124. When the result of testing the hypothesis is not supported, the justification was made carefully. Conceptually, it can be explained that there could be possibilities of other factors having a strong/weak impact relationship which can be explained by moderating variables in the future studies.
Figure 2. *Scatter plot* with *quadratic regression*

In addition to these factors, another weakness of this study was related to the taxonomy of the type of team involved. In this study, the types of teams used were not controlled. The criteria of the teamwork using cognitive factors were simply applied such as: decision-making, producing creative and innovative products, and requires the exchange of knowledge. The other important thing to note for further research is the sample size representative. If the instrument is used for further studies, by total parameters of 21 statements, the rule of thumbs of Hair, Black, & Anderson (2010) can be used mentioning that the ratio of minimum respondents are five times from the number of parameters. So that, the adequate sample size would be a minimum of 105 work team.

Conclusions

This study has the main objective to develop and test the content of the TMS measurement instruments (Lewis, 2003). The study focuses on the construct transactive memory systems which are still identified as compilational construct, multilevel, and multidimensional. The results showed that different level of knowledge of the team members is a key element of this configurational construct type integrated with the coordination process. Contextual influences were predicted to cause a strong or weak discrepancy relationship between transactive memory system and the performance of the team. This is supported by results of exploration on the study 1 and the reason why the hypothesis is not supported.

Study 1 provided the initial assumption that the forms of media communication can provide different effects on the mechanism of transactive memory system on the team performance. Some of the issues arise at this stage are: a multilevel process, consider the contextual factors, and complex analysis process at the team level. Empirical evidence supports the definition of Wegner, 1987; Wegner et al., 1985 mentioning that TMS as "a set of individual memory systems in combination with the communication that takes place between individuals". Additionally, transactive memory system was supported as a multidimensional construct. Study 2 tested the instruments developed in study 1, and demonstrates the robustness of the instrument to be used in further studies. The limitations of the study is the fulfillment of the adequacy of the sample size and the type of work teams that will be one of the improvements in the future.

HOW AUTHENTIC LEADERSHIP IN FAMILY BUSINESS DEFINES THEIR LEADER-MEMBER EXCHANGE RELATIONSHIP

Elminda Sari, Universitas Indonesia, Indonesia
Budi W. Soetjipto, Universitas Indonesia, Indonesia

Abstract

Discussion of family business is always associated to the founder, the man behinds the gun. Susan (2003) stated that although the founder is most often called an entrepreneur, when this founder spearheads the development of ideas and resources (especially human resources) into reality and success, then the entrepreneur can also be considered a leader. The leadership style of the Leader will influence their follower and the follower will duplicate this style to their follower but the authenticity of the founder will remain authentic. With this background, it is interesting to learn how the founder in a family business develop his style of leadership which will be duplicated by his followers, and define the exchange or relationship quality between leaders and members in the organization to achieve company's goal and establish a sustainable strategy growth.

Keywords: Family Business, Leadership, Authentic Leadership, Leader-Member Exchange

Introduction

Authentic Leadership became an interesting topic and people tried to relate this type of leadership to relationship of follower-leader and performance of the followers, when Gardner and Schermerhorn (2004) published a conceptual piece that explains when authentic leaders actively involve and develop followers, two positive organizational outcomes should result; follower job commitment and high in-role performance. HR practitioner also have a serious discussion on how the employees submit their resignation letter because they don't feel engaged with their leader or they don't feel supported by their leader. Liden, Sparrowe, & Wayne (1997) stated how the prevalence of empirical evidence surrounding the quality of the leader-follower relationship has led researchers to conclude that this relationship is one of the most important an employee has, and potentially one of the most important predictors of workplace outcomes. Simon (2009) convey that to improve employee's trust and attachment to organization influenced by employee perception that written values and vision statement of the leader are corresponding to the behavior of the leader. Therefore, a leader needs to "walk the talk" to prove that he has done what he said. This trust has to be built by the leader to the all organization members through credibility and integrity of his leadership.

Leadership not only found in big organization or in a company with hundreds of employee, but leadership can be found since the founder started his business or when he started to transform his vision into a reality. Susan (2003) underlines that creating and sustaining a successful new business venture demands not only vision and financial capital, but also leading others to transform that vision and financial capital into a successful reality. Although the founder of a new venture is most often called an entrepreneur, when this founder spearheads the development of ideas and resources (especially human resources) into reality and success, then the entrepreneur can also be considered a leader. Researchers also have recognized the role of organizational leaders as pivotal in the study of entrepreneurship, since business founders are responsible for the creation of goods and services and the leveraging of opportunities (Chandler and Hanks, 1994).

With this background, it is interesting to study how a founder of big family business develop his authentic leadership reflected in four authentic leadership dimension; Self Awareness, Relational Transparency, Balanced Processing and Internalized Moral Perspective, and which

occasionally will influence the exchange quality of leader-member relationship among his followers in the organization.

Family Business and Family Business Leadership
To have a similar understanding about family business, we refer to Astrachan and Shanker (2003), using three modes of family involvement, which provide three operational definitions of family firms. Their broad definition uses the criteria of family's retention of voting control over the strategic direction of a firm. In addition to retention of such control by the family, the mid-range definition includes firms with direct family involvement in day-to-day operations. The most stringent of definitions classifies firms as family firms only if the family retains voting control of the business and multiple generations of family members are involved in the day-to-day operations of the firm. Using these definitions, these researchers estimate between 3 to 24.2 million family firms in the United States that provide employment to 27–62% of the workforce, and contribute 29–64% of the national GDP.

PriceWaterhouseCooper (PwC) on November 2014 published a survey report of family business in Indonesia that 95% of companies in Indonesia is categorized as family business. Family business in Indonesia contributes 25% to national GDP, represents of 2% of Indonesia citizen and has total wealth of 134 trillion US$. In South East Asia, 60% of public owned company in is family business and inheritance of ownership is still major priority of the company. PwC defined a business as family business if the business has the founder or the ownership acquisition (spouse, parents, children or inherited) still has the major "voice", at least one of family is still involved as representation in management or company executive. For public company (tbk), the owner or the ownership acquisition still has 25% of shares through capital investment and has at least one of the family involved in company board of executives.
According to Bohn & Grafton (2002) Leadership is a way to create a vision for the organization and followers, and encourages followers with self-confidence and trust through coordination and communication. As a key component of organizational culture, leadership has critical influences on organizations (Kotter & Heskett, 1992). Leadership in family business is hold by the Founder, the one who uses and monitors all resources, decides level of specification and integrity, facilitates and coordinates all communication channel, including decision making to choose the leader of the company to inherit his kingdom.
With these high spectrum in controlling the business to achieve the company vision and mission, it is clear that leadership style in family business is related to the founder, inherited by the next generation and adapted by the other members and employees of the organization. Hence it is also clear that the founder will be a genuine leader for the business, or defined by Avolio & Gardner (2005) as the authentic leader who thought to encompass many of the fundamental aspects of each of these forms of leadership. As its name suggests, authenticity is at the core of authentic leadership, and is based upon the ancient Greek maxim "to thine own self be true." Authentic leaders lead from their convictions, and remain true to their personal values and beliefs, even during times of stress and challenge, when inauthentic leaders may be more likely to compromise their personal convictions (Avolio & Gardner, 2005).

Authentic Leadership
1. Approach
Being the leader, being the founder, and being the one who built the company, they must be always aware of how they think and act, as their followers will perceive it as the values/moral perspective of the company. They disclose their personal values and motives, and show openness to their followers. Also, they provide positive role modeling of honesty and moral/ethical, future-oriented development of leader-follower relationships. This Authentic

leaders is "deeply aware of how they think and behave and are perceived by others as being aware of their own and others' values/moral perspectives, knowledge, and strengths: aware of the context in which they operate; and who are confident, hopeful, optimistic, resilient, and of high moral character" (Avolio, Luthans, & Walumbwa, 2004).

Gardner et al., 2005; Shamir & Eliam (2005) stated that authentic leadership, at its most fundamental level, is the congruence of a leader's self-concept and his or her actions, and authentic leadership is proposed as the root component of the positive and effective leadership needed to encourage employees' self-confidence and to create employees' trust in management and co-workers (Avolio, Gardner, Walumbwa, Luthans, & May, 2004). Furthermore, authentic leadership focuses on building positive psychological capacities and a highly developed organizational context that affect leaders' and followers' behaviors (Luthans & Avolio, 2003).

2. Theory

Authentic leadership is thought to encompass many of the fundamental aspects of each of these forms of leadership (Avolio & Gardner, 2005). As its name suggests, authenticity is at the core of authentic leadership, and is based upon the ancient Greek maxim "to thine own self be true." Authentic leaders lead from their convictions, and remain true to their personal values and beliefs, even during times of stress and challenge, when inauthentic leaders may be more likely to compromise their personal convictions (Avolio & Gardner, 2005). Authentic leadership, at its most fundamental level, is the congruence of a leader's self-concept and his or her actions (Gardner et al., 2005; Shamir & Eliam, 2005).

Authentic leadership is defined as "a process that draws from both positive psychological capacities and a highly developed organizational context, which results in both greater self-awareness and self-regulated positive behaviors on the part of leaders and associates, fostering positive self-development" (Luthans & Avolio, 2003, p. 243). The four dimensions of authentic leadership that are most commonly used in conceptualizations and measures of the construct are self-awareness, relational transparency, balanced processing, and an internalized moral perspective (Avolio & Gardner, 2005; Gardner, et al., 2005; Neider & Schriesheim, 2011). Authentic leader shows hope, trust, positive emotions, optimism, relational transparency, and a moral and ethical orientation towards the future (Avolio et al., 2004). In 1998, Walumbwa, Avolio, Gardner, Wernsing, and Peterson identified and validated four components to describe authentic leadership:

(1) *self- awareness*, which refers to understanding not only their own strengths and limitations, but how they affect others. As authentic leader with self-awareness, - leaders are aware of their motives, emotions, and values; this awareness is holistic in nature, with authentic leaders being equally able to identify their weaknesses as well as their strengths (Gardner et al., 2005). Self-awareness refers to knowing one's strengths and weaknesses and to understanding how one makes meaning of the world. This heightened sense of self-awareness is instrumental to a leader's ability to process information in a balanced manner (Avolio & Gardner, 2005; Michie & Gooty, 2005). Leaders must be able to understand their own motivations and emotions, and how their personal perspective will shape the way in which they react to a given situation. The leader's self-awareness and self-regulated behaviors positively impact followers. Through confronting issues and retaining a sense of community, authentic leaders are theorized to provide positive leadership (Avolio et al., 2004; Luthans & Avolio, 2003).

(2) *Relational Transparency*, which refers to showing one's authentic self to others and this behavior promotes building trust between a leader and followers. Relational transparency is believed to entail the leader presenting his or her authentic self to followers. By relating openly to others, the leader's behavior promotes trust through

open disclosure of thoughts and feelings without inappropriately expressing emotion (Kernis, 2003; Walumbwa et al., 2010). Such disclosures and open sharing of information in an appropriate manner are key aspects of the authentic leader (Walumbwa et al., 2010).

(3) _Balanced Processing_ refers to a rational decision-making process that is done based on objective analysis and relevant data (Gardner, Avolio, Luthans, et al., 2005). Balanced processing includes objectively analyzing all information before coming to a decision and includes soliciting views that challenge firmly held positions (Walumbwa et. al, 2010, Walumbwa et. al, 2008; Kernis, 2003; Gardner et al., 2005). This third dimension enables a leader to make decisions outside of information not immediately within his or her purview.

(4) _Internalized moral perspective_ refers to the internalized form of self-regulation (Ryan & Deci, 2003). Thus one's behavior and decision-making are expressed consistently with internalized value (Avolio & Gardner, 2005). Internalized moral perspective is the leader's internal moral standards and values as the basis for decision-making and behavior, rather than allowing group, organizational, or societal pressures to influence him or her (Gardner et al., 2005; Ryan & Deci, 2003; Walumbwa et. al, 2010; Walumbwa et. al, 2008).

Authentic leaders show to others that they genuinely desire to understand their own leadership to serve others more effectively. They act in accordance with deep personal values and convictions to build credibility and win the respect and trust of followers. By encouraging different viewpoints and building networks of collaborative relationships with followers, they lead in a manner that followers perceive and describe as authentic. (Walumbwa et al., 2008, p. 96). Authentic Leader has been found to statistically predict job satisfaction, job performance, organizational citizenship behavior, organizational commitment, and satisfaction with supervisor (Walumbwa et al. 2008, Walumbwa et. al, 2010). In this regards, author has underlined the statement that authentic leader statistically predict to satisfaction with supervisor, which will define the interaction between leader and member in the organization.

Leader-Member Exchange
1. Approach
Interpersonal Definition that Leadership is created by leaders and followers together (Eagly, 2005). Leaders need to obtain "buy in" from followers, Intended outcomes achieved only when followers identify leader's values and Leaders create change when they adapt their message to followers' values. Lewis (2011) conducted an empirical study and found that authenticity was strongly related to leadership effectiveness and Leader-Member Exchange mediated the relationship between authenticity and leadership effectiveness. Leaders who were viewed as authentic and responsible were better able to form positive relationships with their direct reports and, therefore, were viewed as efficient and effective.

2. Theory
Leader-Member Exchange leadership theory has evolved into a dyadic approach to understanding leader-follower relationships (Howell and Hall-Merenda, 1999). According to the vertical dyad linkage approach (Dansereau et al., 1975), leaders and followers develop dyadic relationships and leaders treat individual followers differently, resulting in two groups of followers: an in-group and an out-group. The in-group consists of a number of trusted followers who are derived from expanded and negotiated role responsibilities with the leader. The out-group includes the remaining followers with whom the relationship of the leader remains more formal. A higher quality relationship results when leaders and followers exchange greater physical resources, information and enjoyable tasks (Liden and Maslyn,

1998). This reflects the assumption that leaders have limited time and energy and associated inability to give equal attention to all followers.

Leader-Member Exchange theory suggests that leaders do not use the same style in dealing with all subordinates, but rather develop a different type of relationship or exchange with each subordinate (Dansereau, Graen, & Haga, 1975; Graen & Cashman, 1975; Liden & Graen, 1980; Graen, Novak, & Sommerkamp, 1982; Graen & Scandura, 1987). These relationships range from those that are based strictly on employment contracts (i.e., low Leader-Member Exchange, or "out- group") to those that are characterized by mutual trust, respect, liking and reciprocal influence (i.e., high Leader-Member Exchange or "in-group;" Dansereau, et al., 1975). Theoretical support for the multidimensionality of Leader-Member Exchange derived from role theory and social exchange theory. Leader-member exchange theory (Leader-Member Exchange) focuses on dyadic exchange relationship between manager and employees, and attempts to build sound relationships in the organization [6, 8-12]. This Leader-Member Exchange perspective characterizes the superior-subordinate relationship as a dyadic social exchange process where relationships can be ranged on a continuum from low to high Leader-Member Exchange. It is argued that there is higher exchange between managers and employees in organizations that have a social focus in their daily work, and these relationships may develop stepwise over time.

3. Leadership in Family Business of Company-X In Indonesia

Research of Tyson and Jackson (1992) about leadership model stated that a leader with good leadership style is capable to create a good leader-member relationship which impact to the business. Founder of the family business of company X in one of the interview mentioned that when he selected and prepared his followers to be a leader in his company, then knowledge and skills are not the primary one, but the leadership potential and individual character. The character becomes an important part for the judgment of the founder, because for him, skills and knowledge are something that can be learnt and developed, but character is what makes the person the way he is now. The character will refer to authenticity of the leader, and as its name suggests, authenticity is at the core of authentic leadership, and is based upon the ancient Greek maxim "to thine own self be true." Authentic leaders lead from their convictions, and remain true to their personal values and beliefs, even during times of stress and challenge, when inauthentic leaders may be more likely to compromise their personal convictions (Avolio & Gardner, 2005). Authentic leadership is thought to encompass many of the fundamental aspects of each of these forms of leadership (Avolio & Gardner, 2005). This is in line with Bryman (1992), an authentic leader is capable to bring a major changes to individuals in the organization or to the organization by reinventing characters of the followers.

Consider that an authentic leaders have strong influence and impact to their followers, Avolio and Gardner (2005) suggested that a leader-follower relationship need to have an authentic relationship, as the authentic relationship will promote open and honest communication due to deeply held shared values, thereby promoting the pursuit and attainment of shared goals. Avolio and Gardner (2005) Authentic relationships will also describe the relationships between leaders, followers, and others. The mutually reciprocal relationships allowed for follower and leader self-development, as well as an understanding of the interrelatedness of their professional association.

Furthermore regarding this type of leadership and leader-follower relationship, Lewis (2011) conducted an empirical study and found that authenticity was strongly related to leadership effectiveness and leader-member exchange mediated the relationship between authenticity and leadership effectiveness. Leaders who were viewed as authentic and responsible were better able to form positive relationships with their direct reports and, therefore, were viewed

as efficient and effective. From the business side, Dirks and Ferrin (2002) asserted followers who have a high level of trust in their respective leader tended to have higher levels of job satisfaction, organizational commitment, professional behaviors, and job performance. These positive organizational outcomes are said to contribute to sustainability and overall organizational effectiveness.

From a survey conducted to managerial level of employees of company-X, some interesting fact has revealed to connect between authentic leadership of the founder with leader-member exchange of the other members of company-X. The type of leadership of the founder has inspired the other leaders in the company by duplicating it to their leadership behaviors. The respond here is from their answer of "agree" to "strongly agree" from 6 scales of choices of "strongly disagree to strongly agree". About 51.9% of the respondent agreed that the founder listens intently to different opinions before making a decision and 46.3% of subordinates stated their direct leader also listens intently to their opinion before making a decision. 63.9% agreed that the founder always makes decision according to his own core values, which then subordinates confirmed that 47.2% of their leaders also do the similar things. 32.4% stated that the founder seeks inputs to increase interactions with other people while 45.4% of subordinates agreed that their leader also asks for input to increase the interaction between them. From a work perspective, 41.7% of the member of company also agreed that the founder accurately describes how others perceive his abilities, and the subordinates saw that 35.2% of their leader also can describes how they perceive his abilities.

How they appreciate the behaviors of their leaders is reflected to the quality of relationship between leader-member in company-X. The questions in authentic relationship survey related to how the employees of company-X respond to questions in leader-member survey. To show how interaction of leader-member relationship has influenced their organizational commitment, professional behaviors, and job performance can be described from the their respond that 44.4% of them agreed that they will work for their manager that goes beyond what is specified in their job description, 59.3% of them stated that they are willing to apply extra efforts, beyond those normally required, to meet their manager's work goals, and 53.7% of them indicated that they do not mind working their hardest for their manager. The quality of their relationship described impressively from their respond to the survey questions that 39.8% of them stated they like their manager very much as a person, 38.9% of them agreed that their manager is the kind of person they would like to have as a friend and 47.2% of them stated that their manager is a lot of fun to work with. From professional perspective shown that 47.2% of them said that they are impressed with their manager's knowledge of his job, about 60.2% of them respect their manager's knowledge of and competence on the job and 48.1% of them admire their manager's professional skills.

Conclusions

The fact that the founder has influenced the leadership style of the leaders in his organization, which will construct the quality of relationship between leader and member in the organization, to gradually affect the levels of job satisfaction, organizational commitment, professional behaviors, and job performance.

CHALLENGES FACING HUMAN CAPITAL RETURN ON INVESTMENT (HCROI) IN MENA REGION

Moetaz Jamil Soubjaki, Al-Jinan University, Lebanon

Abstract

The Middle East and North Africa (MENA) region is currently experiencing low level of productivity from its workforce due to behavioral structures that are in place. On the economic front, the low level of human capital productivity in the Middle East and North Africa (MENA) has been attributed to inequality in individual merits and qualifications which could point back to the importance of education in developing of human capital. Socially, factors such as racial, ethnic and gender discrimination issues play an important role in the low level of human capital productivity in the Middle East and North Africa (MENA). According to Weiss (2012), measuring the return on investment on human capital becomes essential when the information gathered is used in strategic decision making and also during the struggling phase of a business as there is need to justify the costs incurred in human capital development. This paper adopt systematic literature review methodology to presents a technical assessment of the benefits that accrues to the companies that makes direct investment in human capital which are the major assets for every business with specific focus on companies located in the MENA region. The current study concluded that those companies which are on the vanguard of efforts in promoting direct investment in their human resource tend to be more profitable and successful financially, strategically and have less employee turnover and generally their employees are more motivated as compared to those companies that are less aggressive in direct investment on human capital. Furthermore, this paper induce Human Resources professionals in the Mena Region to go in depth in that filed and discover more strategies and give more solutions for challenges in developing Human Capital.

Keywords: *Developing Human Capital; Enhancing ROI; Investment in People; High Retention, Low Turnover, Grow Business Profitability*

Introduction

Employees' performance is an important factor in leveraging profits for many organizations. Employees who form the human capital in an organization are intangible assets and many organizations are finding the need to determine their relative contribution to the business. According to Fitz-enz (2000), human capital productivity is essential for any organization to generate value from its passive resources. This is basically attributed to the knowledge, skills and innovations that the employees or persons in an organization bring on board. Organizations have realized the need to invest in their human capital as a means of increasing the effectiveness and efficiency of their workforce. However this is usually accompanied by costs that the organization incurs and these may include continuous development costs, training costs as well as career management (Phillips, 2005). The costs incurred in the development of human capital are essential in the determination of the company's profits and justification of human capital development process. This then increases the necessity for organization to develop methods of measuring investments in human capital. Return on investments is one of the methods that have been widely adopted as an approach in determining the economic value of employees' performance. According to Weiss (2012), measuring the return on investment on human capital becomes essential when the information gathered is used in strategic decision making and also during the struggling phase of a business as there is need to justify the costs incurred in human capital development.

Human capital development is affected by several factors that could either be political, economical, or social in nature. In the Middle East and North Africa (MENA) for instance, Cinar (2000) argues that there is a high rate of undeveloped human capital basically due to gender disparities. While gender disparities remains a big issue and factor influencing the rate of human capital return on investment in the Middle East and North Africa (MENA), other factors such as the investment strategies such as education tend to play a big role. According to Behdad (2003), the Middle East and North Africa (MENA) is currently experiencing low level of productivity from its workforce due to behavioral structures that are in place. On the economic front, the low level of human capital productivity in the Middle East and North Africa (MENA) has been attributed to inequality in individual merits and qualifications which could point back to the importance of education in developing of human capital. Socially, factors such as racial, ethnic and gender discrimination issues play an important role in the low level of human capital productivity in the Middle East and North Africa (MENA). Based on the existence of a multitude of factors affecting the development of human capital in the Middle East and North Africa (MENA), it is therefore a necessity for many organizations to focus on human capital development. In order to do this, it is therefore necessary to analyze the returns from human capital investment and more particularly on the impact it has on company performance.

Literature Review

In most economies, the level of education is an important attribute used to evaluate or measure human capital. Investing in education is one way of developing human capital and research has established that a positive relationship exists between economic development and human capital (Mazoouz, 2013). According to a World Bank publication, Countries in the Middle East and North Africa (MENA) region have realized an increase in the rates of quality and quantity of human capital and this has been attributed to investment in education over the past decades (World Bank, 2008). The fact that analysis of return of investment to human capital is based mostly on education is based on the argument that this type of investment is the most important part of human capital as argued by Mazoouz (2013). One of the major factors determining the level of economic growth based on returns from investment in education in human capital in the Middle East and North Africa (MENA) is gender. Torabi and Abbasi-Shavazi (2015) in their research, argue that there exists a positive correlation between investment in women education and economic development in the Middle East and North Africa (MENA). Increase in share of working age population witnessed in the MENA region is the contributing factor for economic growth according to Bloom, Canning and Sevilla (2001). With the realization that investing in women's education in the Middle East and North Africa (MENA) region contributes in economic development, organizations are increasing efforts to invest in the same with the hopes of obtaining maximum returns. However it is important to note that the huge investment in education by MENA countries as seen through use of public resources has done little in terms of developing the human resource in most of these countries. This is attributed to lack of or existence of incentives to leverage on returns to investment in human capital. Another important argument is based on the fact that countries in these regions educational attainment in the global sense tends to score below average (Salehi-Isfahani & Dhillon, 2008).

Apart from education as a means of developing human capital, there are other methods that countries such as Lebanon, Oman, Qatar and United Arab Emirates have employed and these include labor market initiatives and reforms targeted at improving the skills of the population. Furthermore according to Gonzalez et al (2008), most of these countries have focused on diversification of their human capital in different sectors of the economy but evaluating the success of these reforms still remains a big problem. The high rates of unemployment in

countries belonging to the Middle East and North Africa (MENA) region has been attributed to skills mismatch and limited focus on development of soft skills. According to Barclay (2010), increasing the efficiency of human capital in the Middle East and North Africa (MENA) could be achieved through strengthening of transition systems, focus more on strengthening education through increased spending and laying an emphasis on soft skills development.

Organizations are increasingly concerned with maximizing the benefits of investing in their human capital resources. Al-Ghazawi (2012) provides compelling argument that human resource development activities such as training and employee incentives do have a direct impact on the returns accrued from human capital investment. According to Huang and Lin (2011), evaluation of the return on investment in human capital is one of the ways that human resource management use to obtain data on the value of human resources at their disposal as well as their contribution to the performance of an organization.

Human Capital Return on Investment (HCROI) is an important factor in determining the performance of organization. The facets of the organization that are central to development of human capital include strategic, financial, employee retention as well as motivation. On the strategic front, companies usually rely on the results of ROI in order for the management to make decisions in supporting strategic aims targeted towards achieving cost advantage or differentiation advantage (Kesti, Syväjärv, Stenvall & Rivera, 2014). Furthermore, an improvement of human competencies by organizations may help these organizations to distinguish themselves from others and underscore the importance of human resource management role in realizing the strategic decisions of the company (Kesti et al, 2014).

The financial performance of organizations is in many ways related to return on investments in human capital. This is because costs are incurred by companies that undertake human capital development protocols. The competitive HCROI levels may be difficult for companies to sustain in economies where salaries are constantly rising ("Key Trend in Human Capital" 2012). The financial performance of organization influences aspect such as investment in human capital development. While it is necessary for any organization to invest in its human capital, this may not be feasible at times because of the costs involved and poor financial performance in certain cases. In other cases, strategic decisions linked to cutting costs after obtaining the results of HCROI may necessitate the need to cut down on human capital development (Law and Kesti, 2014).

A research by Al-Ghazawi (2012) indicates that no direct relationship exists between investment in human resources and turnover rate. In instances where employees are either fired or more are hired, research by Kesti (2011) has established that increased competence in either case is attributable to increased company performance. The research suggests that turnover rate does not impact on the returns on human investment but suggests that staff increase may indicate a decrease in the returns on investment in the initial phases. This, according to Kesti (2011) is based on the fact that costs tend to increase as more staff is hired.

Human capital development and the returns accrued from it are directly influence employees' performance which is dependent of motivation. The returns on human capital development may be an indicator of the motivation levels of employees or personnel with an organization. According to Healthfield (2011), employees are able to develop their personal knowledge and skills and ability through human capital development. Since return on investments indicate the profits derived from investing in human capital development as argued by Mathis et al (2013), a motivated workforce may result in high rates of returns. This motivation is likely to result from the company investment in human capital development as employees derive an intrinsic value in that the company strives to develop them. Human capital return on investments could be one of the indicators of employee performance and hence act as a

strategic decision making tool for human resource management to focus on employee motivation.

Methodology

The research adopted a systematic literature review type of study where a specific search protocol was used in identifying appropriate research articles to be used in the study. Searching for relevant articles involved searching for articles on human capital development and return on investment focusing on the Middle East and North Africa (MENA) region. Research databases JSTOR, Google Scholar and Research gate as well as printed research papers were utilized in identifying the preliminary articles before establishing the inclusion and exclusion criteria. The literature search involved searching for research papers published from 2002.

1. Eligibility Criteria

The preliminary eligibility criteria in determination of the sources to be used in the literature review involved screening for the relevant titles in determination of their contribution to the study. Key factors in identifying articles with appropriate titles for inclusion involved accessing the relevance of the study in contributing to information related to human capital investment and returns in Middle East and North Africa (MENA) region. The next step in the screening process to determine the eligibility criteria involved reading through the abstracts in order to exclude the research articles that did not contribute much to the research questions of this study.

2. Inclusion and Exclusion Criteria

The inclusion criteria for the relevant articles took into consideration several factors that included the language used focusing on research articles written in English, German, Spanish and Japanese as well as Arabic. Apart from English, articles that used the other four aforementioned languages were assessed for the availability of their translated English version. The publication type was other criteria used for inclusion and exclusion criteria. The inclusion criteria based on the publication type focused on original peer reviewed research papers while excluding unpublished manuscript, letters, dissertations and conference papers. The study design used in the respective research papers was another important factor in determining the articles to be used in the study whereby those utilizing qualitative and non-systemic literature review were excluded taking into consideration research papers that utilized systematic literature reviews, quantitative studies, Meta analysis studies, cohort studies and case control studies. Following this step, the selected articles full text were obtained followed by data extraction and interpretation using both narrative and statistical analysis technique.

3. Validity and Reliability

The advantages associated with systematic literature review are that biasness is limited as explicit methods are used by the researcher. Furthermore, according to Gopalakrishnan and Ganeshkumar (2013), this approach is helpful in minimizing research delays and also serves to improve the generalizability and consistency of the results. However several limitations associated with systematic literature review and analytical techniques employed with this method is that the approach may be subject to duplication of information as well as loss of information that could have been important outcome in particular research and could also be subjected to publication bias. With publication bias, it is more likely that studies with positive results are the ones chosen for the study especially in cases where the researcher

inappropriately sifts the studies and may be influenced in one way or another to lean towards studies that portray a positive or significant outcome.

Results and Discussions

The results obtained from this systematic literature review cover offer insight to the relationship between socio demographic factors and HCROI in the MENA region as well as the relationship between HCROI and company performance in the Middle East. From the analysis, it was evident that despite significant gains in the working age population in the Middle East region, women human capital and labor remains low in most Middle East countries as shown in the graph below.
Figure 1. Male and Female Labor force participation in the Middle East region

From the graph above it is evident that women labor force participation in most Middle East countries is low compared to that of male. Since investing in human capital correlates with increase in economic growth, significant gains in terms of increased economic growth are likely to be gained with increased investment in women human capital. In the Middle East, there have been increased efforts targeted towards investing in women's human capital with most strategies linked toward education and reduction of fertility rates. According to research by Karshenas et al (2015), despite the gains realized in these countries in terms of investment in women's human capital, there is little contribution by the women in terms of labor participation and this negatively influences economic growth in most of these countries. Gains made in economic growth can be estimated through HCROI and in countries in the Middle East where socio demographic factors play a major role in determining women's participation in the labor force, it is only natural that economic growth is limited by existing social factors and gender inequality that limit women's participation in the labor force. Since there exists a positive association between women's human capital and economic growth as shown by Torabi and Abbasi-Shavazi (2015), it can be deduced that socio demographic factors that limit women participation in the labor force despite increased investment in women human capital in most Middle East countries are to blame for slow economic progress in these countries.

There exists a special relationship between HCROI and performance of organizations in the Middle East and North Africa (MENA). The literature review was able to highlight some of the positives aspects attributed to investment in human capital in relation to company

performance. Financial institutions in most countries of the Middle East and North Africa (MENA) have benefited financially in terms of profits generated from investment in human capital mainly through education and training. The number of employees is not a factor when accounting for the profitable financial returns since companies with minimum number of employees have reaped high returns on human capital investment through massive investment in their human capital. The research by Al-Ghazawi (2012) indicate that the return on investments could be as high as 92.4 in the case of Jordan banks and the researchers arguments supports the claim that even with a minimum number of employees, higher returns is realizable in companies in the Middle East countries through investing in their human capital.

The investment in human capital in most countries of the Middle East and North Africa (MENA) has been mainly achieved through education. However when the returns obtained from this investment over time tends to diminish in most economies as argued by Montenegro and Patrinos (2014). An important relationship between education investment in human capital and economic performance of Middle East and North Africa (MENA) countries exists where this is negatively correlated. The high investment in human capital through education has contributed little in terms of addressing the high unemployment rates in most Middle East and North Africa (MENA) countries. This high rate of unemployment negatively influences the economic performance of most countries and in turn those of most companies. An important aspect concerning this type of human capital investment as it relates to Middle East and North Africa (MENA) countries is that there is an observable difference in the rate of returns from education when men and women are analyzed differently. The economic performance of Middle East and North Africa (MENA) countries have been boosted by investing in women human capital through education as shown by the research by Psacharopoulos and Patrinos (2002). Investment in human capital through education has received major boost in the Middle East and North Africa (MENA) countries over the last four decades through increased spending by most countries that has seen this spending eclipsed countries in other regions (Iqbal, 2006). The trend observed in most Middle East and North Africa (MENA) countries over the years is as indicated in the graph below;
Figure 2. Education spending in the MENA region from 1950 to 2010.

From Figure 2 above it is evident that over the past four decades, human capital educational investment in the MENA region has received a major financial boost from as low as low as $

25 per capita to around $180 per capita. Overall, however the gains made from this investment over time tend to diminish and the observed differences in the rate of returns only point out to the existing social cultural barriers that hamper high returns from human capital investment in the Middle East and North Africa (MENA).

Enhancing employees' motivation and maintaining a low turnover rate within an organization mainly falls under the function of the human resource personnel. Companies in most countries in the MENA region that have instituted measures to improve on employees loyalty especially through increased benefits tend to have higher returns. The results of this literature review indicate that lack of investment in human capital by most organizations in the Middle East and North Africa (MENA) region ranks among one of the important factors contributing to the high turnover rates of in companies in the Middle East and North Africa (MENA). According to research, results obtained from a poll indicated that about 20.3% of employees who have recently left their jobs are inclined to seek further job opportunities that tend to provide them with a chance of enhancing their skills ("Employee Motivation in the Mena", 2013). Skill development in part is related to human capital development and organizations that do not focus on investing in their human capital therefore risk losing out on other companies that have these programs in place. Furthermore, these programs play an important role in enhancing employee motivation and hence improve performance which would then relate to higher rates of return that could be traced back to a company's investment in human capital.

Several challenges related to human capital development and return in the Middle East and North Africa (MENA) region as obtained from the results of the literature review consists of both social and economic factors. Social factors contribute to a larger percentage as far as human capital development in MENA countries is concerned. One particular challenge is that there is a mismatch between investment in human capital and utilization of human capital. The patriarchal nature of most MENA nations hinders women involvement in economic growth. Considering that women form half of the population in most of these countries, there is a shortage of human capital even if massive investment is done. High unemployment rates especially when women are concerned there tends to slow down economic growth since research has established that women human capital is essential in promoting economic growth in the MENA (Torabi & Abbasi-Shavazi, 2015).

Another challenge as far as human capital development and return in the MENA is concerned is that the existing social institutions place major restrictions on utilization of human capital.

Recommendations and Conclusions

This research has attempted to establish the impact of human capital return on investment as a tool of improving company or organization performance. The focus of the study is in Middle East and North Africa (MENA) companies and based on the results of the systematic literature review, conclusions that can be withdrawn from the present study is that the results of human capital return on investments have benefited majority of companies in making important strategic decisions. Furthermore, it has also been established that companies in the Middle East and North Africa (MENA) that have invested in their human capital have seen an increased level of productivity associated with high returns. The impact of investment on human capital in these organizations has been associated with increased employee motivation and low turnover rates. In spite of all the achievements gained by organizations, economic development in the Middle East and North Africa (MENA) remains low because of the under utilization of the existing human capital as well as existing social cultural factors that contributes to this under utilization. Based on this argument, several reforms to address the existing problems would include;

a)   Instituting legal reforms to address the problems of gender inequality since this contributes to the existing under utilization of human capital. According more employment opportunities to women as well as investing in women human capital would go a long way in improving the economies of most countries in the Middle East and North Africa (MENA) thus increased returns to organizations as shown by research (Torabi & Abbasi-Shavazi, 2015).

b)   Secondly there is need for increased utilization of human capital. In order to do this, organizations including those in the private sector should be encouraged to higher more Skilled Professionals and youth as well as focus more on developing human capital provided by these individuals. The private sector should be encouraged to be willing to assist the government in creating more employment opportunities while also taking into consideration the negative impact that laws such as inheritance laws impact not only on the general economy but also on the performance of the organizations as well.

Limitations and Future Research

The limitations of the current study is that based on the methodology applied, causal conclusions could not be derived. Systematic literature review draws on past researches to come up with conclusions but may not be effective as experimental designs in developing causal conclusions. The implications for future research is that focus should be on establishing ways of minimizing the impact social structures in order to increase utilization of human capital in the Middle East to leverage on the returns.

THE ROLE OF INFORMAL SECTOR ABSORP LABOR AND INCREASE INCOME
(CASE OF STREET VENDOR IN PADANG CITY)

Erni Febrina Harahap, Bung Hatta University, Indonesia

Abstract
The existence of the informal sector is a lifesaver of labor that help economy of low society face the difficulties of life when they experience the problem of unemployment. In general, the informal sector absorb labor force in agriculture, trade and social services. Street vendors, which is one of the informal sector provides employment opportunities for anyone who wants to be involved in it. However, the wage rate is very varied and depend on the activity of street vendors themselves. This study sampled 225 street vendors in eight traditional markets in the city of Padang. Purpose of this study are to identify the characteristics of the informal sector that use analysis of percentage and to see the factors that affect the income and welfare PKL used multiple linear regression analysis The result of study showed that omzet and capital first and the cost is very influence to income, and income affect the welfare of street vendors which will affect the welfare of the people of Padang City.is.

Keywords: *informal sector, employment opportunity, income, revenue, welfare*

Introduction
The informal sector in Indonesia as an economic activity is often said to be a mass of suburb for a weak economy. Its existence is often seen as a source of problems, especially for local government authorities in charge of cleanliness and order. But the existence of the informal sector is basically a lifesaver of labor even considered as an effective safety valve for the economy of low society face the difficulties of life when they experience the problem of unemployment. Despite being a savior, the informal sector is considered less qualified in the perspective of employment. In general, the informal sector absorb labor force in agriculture, trade and social services.

One of the informal sector that we often encounter are street vendors (PKL) in urban of Indonesia. They trade on pavements, in parks, on the pedestrian bridge, even on the road. The city government has repeatedly disciplined them are suspected to be the cause of a traffic jam or damage the beauty of the city. Such efforts sometimes cause clashes and physical resistance from street vendors. Together with the other components of society, not infrequently the street vendors are also do demonstration to government. PKL problem is mentioned as a form of government's failure to provide jobs for the poor. This shows that workers in the informal sector as street vendors have a high vulnerability due to not having adequate protection both in terms of economic, social and political.

Theory Background
The term informal sector sourced from an econom in Ghana, Africa, namely Keith Hart, who observed activity of the population in the city of Accra and Nima, and divided them into three categories: formal, informal legitimate and illegitimate informal. These categories are based on the level of income, regularity way of working, the outpouring of time, and legal status. The first topic from informal sector is a marginal that become the main characteristics of this sector.

Furthermore, the second characteristics are conflict to formal sector. The formal sector is used in the sense of a number of jobs that are interconnected, which is part of an interwoven

structure of work and very well organized, the work was officially registered in the economic statistics, and protected by law. Economic activities that do not meet these criteria then included in the term informal sector is generally called entrepreneurship "self-help". This is the kind of employment opportunities that are less organized, hard enumerated, and therefore not registered in the official census, and rarely accessed by the rule of law.

There is also that defines the informal sector as workers who are self and if is helped by family workers that unpaid and does not require skill. It shows the opportunities that exist in the informal sector do not require specific requirements where everyone free entry and exit in this sector.

Based on some of these criterion can be concluded that the informal sector is a term that includes the notion of various business activities that run own business. This is the type of employment less organized as a source of self-employment, but can absorb them particularly in urban areas that the percentage of workers in the informal sector grow bigger

The amount of absorption is a reflection of the inability of the formal sector to absorb the labor force, so that it can be assumed that if people cannot work in the formal sector, and there are no vacancies in the formal sector, then the person find or create employment opportunities in the informal sector, in addition informal sector is easily done by anyone even with low education can go in and get income from the sector, is also able to meet community needs. An approach that emphasizes the individual units to interpret the notion of informal sector as workers who work in sectors that are unprotected sector. The difference of the formal and informal sectors are as follows:

Table 1. The Difference of the Formal and Informal Sector

No	Characteristics	Informal	Formal
1	Capital	Little	Middle - big
2	Business Feasible	Fairly	There and Pursued
3	Organization	Family	Bureaucracy
4	Labor Union	Not Role	Role
5	Subsidies	Nothing	Important to Run
6	Inventory	Little and unstable quality	Most and high quality
7	Capital Aid	Illegal institution	Legal Institution
8	Work Relationship	Mutual Trust	Contract Basis
9	Business Planning	By doing	Continue
10	Scale Enterprises	Small and unincorporated	Middle – Big and Corporate
11	Turnover	Slowly	Fast
12	Legal Protection	Unprotected	Protected
13	Business Permit	Illegal	Legal
14	Business Unit	Variable	Fixed
15	Skills	Natural	Educated
16	Business Characteristics	Free Entry	Difficult to entry
17	Place of Business	Narrow and easily switch	Wide and Permanent

Source : Harahap, 2016

1.   Wages Relationship with Manpower Absorption

Wages for entrepreneurs can be seen as a burden, because the greater the wages paid to employees, the smaller the proportion of benefits for employers (Simanjuntak, 1985). The rise in the wage rate will increase production costs so will increase the prices per unit of goods produced so that consumers reduce consumption levels. As a result many unsold goods production, and forced producers cut output, this term referred to the effect of production

scale. If the wage rate rises (assuming the price of capital goods others unchanged) then the employer there who prefer to use capital-intensive technology for the production process and replace the need for manpower with the need for capital goods such as machinery called labor substitution effect.
Source: Mankiw, 2003
Figure 1. Changes in Labor Demand and Wage Rate Changes

2.   Productivity Relationship with Manpower Absorption

According Mankiw (2003), employers demand to labor different with consumer demand for goods and services. Employers hire someone because someone is helping to produce goods or services for sale to the consumer society**.** Request for an entrepreneur to a factor of production is done not to obtain immediate satisfaction but they expect results from them. Labor productivity can be seen from the value of production. The value of production is the production rate or overall amount of goods that are the end result in the production process of a business unit which would then be sold or until to the consumer**.**
Source: Mankiw, 2003
Figure 2. Partial Labor Productivity Curve

Increasing and decreasing of market demand for products from the companies concerned affect labor absorption. If the request for production of the company or industry increases, manufacturers are likely to increase its production capacity. For that purpose, the manufacturer will increase the use of its workforce.

Method

   1.   Regression Analysis

The regression model used in this research is to analyze multiple linear regression model, because it involves a dummy variable (Gujarati, 2012). Regression analysis was conducted on factors affecting revenue and the role of street vendors or the revenue contribution to the welfare of street vendors. To analyze the factors that affect the income of the street vendors, the regression model is used as follows:

$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \beta_3 X_{3i} + \beta_4 X_{4i} + \beta_5 X_{5i} + \beta_6 X_{6i} + \beta_7 X_{7i} + \beta_8 X_{8i} + \beta_9 X_{9i} + \beta_{10} X_{10i} + \beta_{11} D_{1i} + \beta_{12} D_{2i} + \beta_{13} D_{3i} + \beta_{14} D_{4i} + \beta_{15} D_{5i} + e_i$

Where are:

Y_i = Income of PKL-i (Rp/month)

X_{1i} = Omzet PKL-i (Rp/month)

X_{2i} = Time of work PKL-i (jam/day)

X_{3i} = Capital early PKL-i (Rp)

X_{4i} = Place of business PKL-i

X_{5i} = Capital work PKL-i (Rp/day)

X_{6i} = Legal Retribution PKL-i (Rp/day)

X_{7i} = Illegal Retribution PKL-i (Rp/day)

X_{8i} = Wage PKL-i (Rp/day)

X_{9i} = Internal Cost PKL-i (Rp/day)

X_{10i} = Long time of Business-i (years)

D_{1i} = Kinds of Business PKL-i

D_{2i} = Location (strategic, no strategic)

D_{3i} = (Male, Female)

D_{4i} = (Padang, outside Padang)

D_{5i} = (Clean, Dirty)

e_i = error term, standard error, -i

Revenue PKL indirect effect to urban development through the improvement of the welfare of the PKL's family. In this case PKL income will directly affect the welfare of street vendors who reflected on the highest level of education achieved PKL family members, health and consumption. To assess the contribution or the role of street vendors to the economy of the city, the regression model is used as follows:

$Z_i = \beta_0 + \beta_1 Y_i$

Where:

Z_i = Welfare PKL (education, health, and consumption respondent-*i*)

Y_i = Income of PKL -*i*

Results and Discussion

Secondary data that released official market of Padang, the number of street vendors in the city of Padang as many as 2644 people, spread across 8 traditional markets in the city of Padang. Of the total population, the researcher took a sample 225 of people. PKL identification is seen from several aspects, one of which is age of the business is operating (Table 2). It seems clear that the effort PKL running dominant in the long term that is more than ten years, there are even more than 20 years. This shows that the perpetrators of street vendors enjoyed their businesses and are reluctant to switch to other jobs.

Table 2. Long Time of Running Business PKL in Padang

Long Time of Running Business	Amount	Percentage
≤ 1 year	2	4.3
1 - 3 Years	3	4.7
3 - 5 Years	25	12.2
5 - 8 Years	17	6.3
8 - 10 Years	31	13.3
≥ 10 Years	147	59.2
Total	**225**	**100**

Source: Data 2016

Meanwhile, when seen from PKL revenue (omzet) of these businesses are also deemed sufficient to cover the needs of daily living and to pay of school their family members (Figure 3). There seems to be 20.8 percent of respondents who earn sales turnover exceeding five hundred thousand rupiah per day. Although there was 2.4 percent with turnover of less than Rp. 50,000 / day, while the most dominant of these classifications was 23.5 percent with a turnover of between Rp. 250,000 - Rp. 400,000 per day.
Source: Data 2016
Figure 3. Revenue (Omzet) PKL per Day in Padang City

When viewed from the data processing, in the model summary appears that the correlation between the dependent variable (income) with 15 independent variable of 0.669, or 66.9 percent, 44.8 percent determination coefficient, and the coefficient of determination that has been corrected is 40.8 percent, meaning that variations in revenue actors PKL city of Padang can be explained by variations in turnover, start-up capital, working capital daily, the number of stalls, long running of business, cost, hours of work, the value of the location, retribution, legal and illegal, sex, origin PKL, wages, and cleanliness. Meanwhile, when viewed from the ANOVA table then the model is said to be fit or suitable due to the error rate or a probability of 0.000 means comprehensively independent variables are able to explain the change in the dependent variable (income) street vendors.

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.669[a]	.448	.408	17.827	1.801

a. Predictors: (Constant), turnover, start-up capital, working capital daily, the number of stalls, long running of business, cost, hours of work, the value of the location, retribution, legal and illegal, sex, origin PKL, wages, and cleanliness

 b. Dependent Variable: Revenue

ANOVA[a]

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	53922.938	15	3594.863	11.312	.000[b]
Residual	66420.724	209	317.803		
Total	120343.662	224			

a. Dependent Variable: revenue

b. Predictors: (Constant), turnover, start-up capital, working capital daily, the number of stalls, long running of business, cost, hours of work, the value of the location, retribution, legal and illegal, sex, origin PKL, wages, and cleanliness

Analysis of residuals statistics show that the 225 data with some predictions that starts with the predicted value of up centered leverage value based on the minimum, maximum, mean and standard deviation.

The regression results are shown in the coefficients that of the 15 independent variables are used, then very significantly affect revenue PKL is the turnover, working capital and cost all of which were also positive. This means that the higher the turnover received, the greater the daily working capital increased operating costs incurred so will the higher the income received PKL. While wages, levy illegal, and the initial capital does not affect the income of the perpetrators of street vendors. This is because the wages of workers PKL many are not given their owner, and workers is owner in this business so it does not need to receive a daily wage.

a.   Dependent Variable: Revenue

Illegal retribution is not significant but negative that meaning to informal charges will reduce the income street vendors but not significant because of the 225 street vendors surveyed are not all charged illegal fees, only a few people. But the official levy imposed on PKL will reduce revenue with 79 percent significance level. The early capital business shows the results of the analysis are not significant at the 95 percent, but significant at 86 percent, which means the greater the initial capital used to start a business informally by actors PKL will increase its revenue, it is seen from the slope of her positive. Meanwhile place of business is negative slop means that more than one shanties that owned is not increase revenue but decrease revenue. This show that profit is not increasing, but the cost is greater. The street vendors have stalls more than one (two) only 6 per cent, while that has one stall is 78 percent, and that does not have a stall was 15 percent. Long running of business in this sector was also no significant effect on the increase in the income of the street vendors. This clearly shows that enterprises in the informal sector do not indicate the need to have special skills to participate in this field. Although the longer engaged in it does not mean that will increase revenue, but it only made the workers survive to survive in meeting the needs of life.

Dummy variables include the type of business, the value of the location, gender, regional origin and hygiene are also not significant in affecting revenue at 95 percent. It is seen that type of business, location and value of location, gender significantly in 73 percent, 56 percent and 83 percent. While the regional origin and cleanliness significance is far from a normal number is used as the standard analysis. Based on analysis of the classical assumption of

normality, multicollinearity, and autocorrelation heterokedastisitas, all the conditions are met, which means this model can be used as an analysis.

a. Dependent Variable: Welfare
b. Predictors: (Constant), Revenue

Further analysis of the results of study is welfare influenced income that the increase in revenue of PKL can improve people's welfare representing the city of Padang in general. Where the results of this analysis are very significant and positive (see coefficient and a model summary).

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-.068	.684		-.100	.921
	Pendapatan	.885	.014	.974	63.896	.000

a. Dependent Variable: Welfare

Conclusion

This research can draw the conclusion that the informal sector is represented by 225 samples of PKL can play a role in absorbing labor trouble to finding work in the formal sector. There are several things that can increase revenue of PKL which the most significant is the sales turnover, working capital daily, and costs. However, work of this business in a long time not been shown to increase revenue, meaning that the longer the work in the informal sector does not mean will make the perpetrators skilled and increase revenue. While the dummy variables such as regional origin, gender and type of business that is run do not affect revenue significantly. This means that anyone and any type of business in the informal sector can be followed by anyone (free exit and free entry). When viewed on the analysis for the welfare of informal sector, clearly show that the increase of income of this sector will improve the welfare of them, which means society PKL enjoys his job and can meet their needs. They can fund family members to either increase education or maintain their health.

IMPACT OF ECONOMIC STIMULANT FOR THE SMALL SECTOR INDUSTRIES OF FOOD, BEVERAGES AND TOBACCO (FBT) IN NORTH SUMATRA

Eko Wahyu Nugrahadi, Medan State University, Indonesia
Indra Maipita, Medan State University, Indonesia
Chandra Situmeang, Medan State University, Indonesia

Abstract

Economic growth performance of North Sumatra Province in last five year is not equal with level of income inequality. The Previous study has identified that the small industries of food, beverages and tobacco (FBT) is an optimal alternative model that can be used as one solution. The objective of this study aims to determine how the impact of economic stimulant FBT sector on economic performance of North Sumatra Province. The analysis result indicates that (1) Small industries sector of FBT is still capital intensive, but its contribution is lower than the Large and Medium sector of FBT, (2) Small industries sector of FBT has contributed to the income households low categories in the city, and (3) Impact of economic stimulant (ie, increased investment into both sectors of FBT) indicated of total output is relatively greater for Small sector of FBT. Similarly, if done equally to both sectors FBT and combined with income redistribution from households top categories in the city to a farm worker households, the results the same thing.

_____
Key Words*: Small sector of FBT, Large and Medium sector of FBT, SAM*

Introduction

The achievement of high economic growth is main target which normally would be pursued in an economy in order to create a fair and prosperous society welfare. The economic growth of North Sumatra Province measured from Gross Regional Domestic Product (GDP) at constant prices in 2000, from 2010 to 2014 experienced a significant increase (in Figure 1).
Source: BPS, 2010-2014

Figure 1. The Gross Domestic Product (GDP) North Sumatera (billion Rupiah)

Within five years the economic average growth rate of 6.11%. This indicates that the welfare of the people of North Sumatra has increased. Especially when it comes to the situation of poor people in this area during that period decreased from 11.31% (2010) to 11.39% (2014). Although the number and percentage of poor people from time to time has decreased, but the poverty rate at the end of the observation of 1.4164 million people or 11.39 percent of the poor in North Sumatra still too high. One of the basic problem causes of poverty in Indonesia, especially North Sumatra is the increasing disparities due to the uneven distribution of income

among households groups, so that the gap between the rich class households and poor households widened. One measure in determining the household income inequality is the Gini ratio index.

During the period of 2010-2014 the development of North Sumatra Gini Ratio index has increased (from 0.350 in 2010 to 0.354 in 2014) so that the income inequality between groups of households in North Sumatra trend to increase. Besides that, the amount of the Gini ratio shows that in this period the condition of household income inequality between groups is relatively high. This indicates that the economic growth of the North Sumatra high and the tendency to increase is not fully enjoyed by the whole society, thus leading to the creation of the income gap between groups of households and poverty. Thus the outcome measures of economic development can not only be reflected by high economic growth and the amount of local revenue, but also includes the following among the things related to human development, gap of income, amount of poverty and un employment. Therefore, in designing an economic development strategy that is not only aimed at economic growth, but also need to be followed by improvement in addition to decreasing the number of poor people and reduce unemployment as well as to the distribution of income.

The previous studies (Nugrahadi, 2015) finds that there are six sector is the leading sector, one of which is the Industry Food, Beverages and Tobacco (FBT). So the next study still (Nugrahadi, 2016) identified that a small FBT industry has a better role than medium and large FBT. The research question is needs further analysis to completed information on the role of small sector of FBT. Of Course, This study aims to determine how the impact of economic stimulant from the small sector of FBT to contribute of the economy performance of North Sumatra Province.

Empirical and Theoretical Review

Todaro (2000) stated that the development process should be able to bring humanity beyond the primacy of material and financial aspects of their daily lives. Therefore, the size of the result of economic development can not only be reflected by high economic growth and national income, but also how it can be overcome include income in equality. The problem of income inequality, which is often called the gap, be it between individuals, households, groups, sectors or regions, an issue that is always there in every country, not least in North Sumatra Province, Indonesia. In the Theory of Kuznets Hypothesis said in this hypothesis that in the short term there is a positive correlation between growth in income per capita and income inequality. But in the long term relationship between the two becomes a negative correlation. This means that in the short term increase in revenue will be followed by the increasing income inequality, but in the long term increase in revenue will be followed by a decrease in income inequality. This phenomenon is known by the name of the inverted U curve hypothesis Kuznets (Todaro, 2000).

Since the 1970s era until now many empirical studies that attempted to test this hypothesis Kuznets. Some who accept the hypothesis, and some others rejected. Furthermore, the issue of the pro and contra of the relationship between economic growth and income inequality can also be found in a debate that confirmed the existence of income inequality in the pursuit of economic growth, and some are blaming (Todaro, 2000; Kangas, 2001). The basic argument justifying inequalities in income, is the individual's income and the income group is Necessary condition for saving that enables investment and grow the economy through a mechanism such as the Harrod-Domar model. If the rich people save and invest in a sizable proportion of the income, while the poor spend all of their income on consumer goods, and if the rate of growth of GNP (Gross National Product) is directly related to national savings, it was obvious economy marked with income inequality can save more and grow faster than the economy with a fair distribution of income.

There are a number of ways and technique to measure the degree of inequality in income distribution that can be divided into two groups of approaches, namely the axiomatic approach and stochastic dominance (Tambunan, 2004). But there is also the approach divides into statistical approaches and empirical approach (Esmara, 1996). Besides that generally in any study of income inequality used measuring devices in equally Gini ratio index, which measures inequality based on the Lorenz curve area. For the various types of approaches, household income inequality can be analyzed through the SAM model approach. To understand the role of the economy and its relation to the distribution of income can be done through the analysis tools included in the theory of general equilibrium balance. This Model viewed economics as a system (Dixon et. Al., 1992). There is a general equilibrium models that can be used in the preparation of plans for economic development. Jhingan (2003) states that one of the planning model is a model of Input-Output (IO). Nazara (1997) stated that in addition to IO, other analysis tools developed for economic planning is the Social balanced sheet Matrix (SBM) or called the Social Accounting Matrix (SAM).

Model SAM is an extension of IO models, where the model is potrait of the economy at any given time. The scope of the SAM models much more extensive and detailed than the IO models. IO Model presents only the flow of economic transactions from the production sector to sector of production factors, households, government, and foreign companies, whereas in the model of SAM, these things on the disaggregation in more detail. Similar to IO models, models of SAM also is a square matrix consisting of columns and rows. Column describes the transaction expenses and line describes the transaction receipt. Total transaction value in the column should be equal to the total value of transactions on the line in order to balance the requirements are met (Sadoulet and de Janvry, 1995). There are six types of balance in the model SAM (Thorbecke, 2001), namely the balance sheet: production activities, commodities, production factors (labor and capital), domestic institutions (households, companies and governments), the capital and the rest of the world.

Studies related to sectoral economic development policy and how it impacts in an integrated way in addressing the problem of income inequality between groups of households, poverty and unemployment, particularly in North Sumatra, is relatively small. Several studies conducted among others by Arndt et al (1998), Halder and Thorbecke (1989), Bautista et al (1999), Hafrizianda (2007) and Nugrahadi (2008) even have discussed it, but research conducted elsewhere and analysis only covers the macro aspects have not done micro. Similarly from Nugrahadi studies (2007, 2013 & 2015) still limited associated with sectoral economic policy development and impact on poverty and employment in North Sumatra, as well as the performance of the sector in general FBT.

Research Method

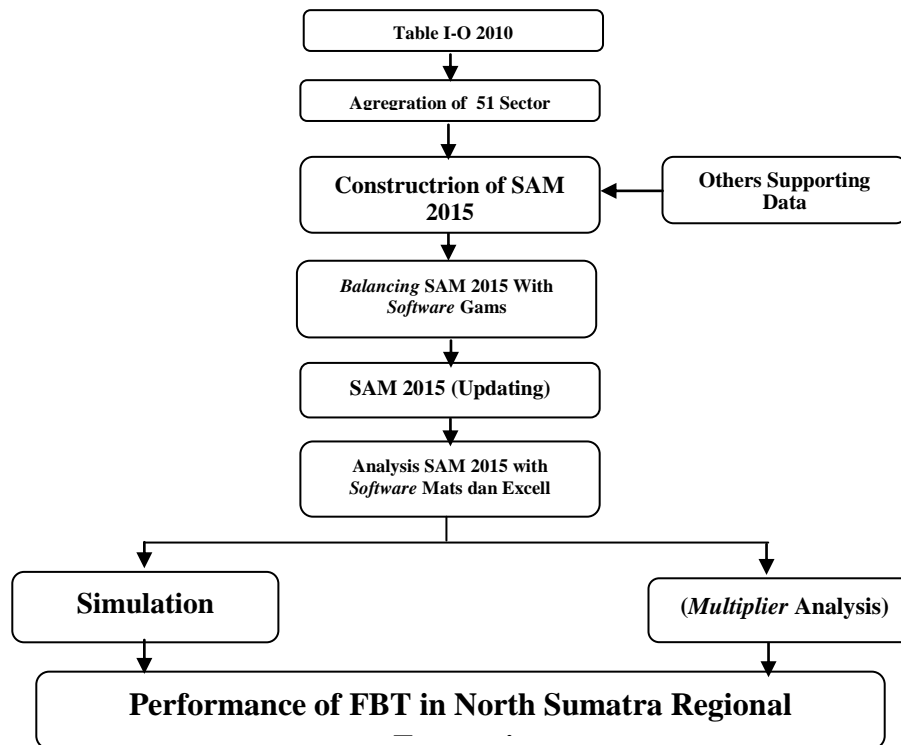
Based on the concepts and empirical research that has been described in the study as well as referring to the Objective of literature research, framework in this study is schematically shown in Figure. 2


Figure 2. Framework

SAM Model is extended of I-O model, where the model is portrait the economy at any given time. The scope of the SAM models much more extensive and detailed than the IO models.

IO Model presents only flow of economic transactions from the production sector to sector of production factors, households, government, and foreign companies, whereas in the model SAM aggregated these matters in more detail. For example, households may aggregated by income level or a combination of income and settlements and so on.

Besides that, the model of SAM can be inserted several macroeconomic variables, such as taxes, subsidies, capital and so on, so that the model can describe the entire transaction SAM macroeconomic, sectoral and institutions as a whole in a balance sheet. Another advantage of the model is that the model SAM is able to describe the flow of income distribution in the economy. With an analysis based on the model will be known SAM sectoral economic performance. In this case will be found that the sector is the leading sector that impact on the reduction of income inequality. To obtain the answers to the objective of research analysis approach based SAM model. For the purposes of analysis: (1) correlation and (2) multiplier. The second analysis used in this study refers to the concept that has been said Isard et.al. (1998). Furthermore, based on the rank of the sequence of sectors which occupies the top position to the lowest measured from the coefficient multiplier (bruto output, labor and household income) and linkage (direct and indirect) forward and backward then assigned a weighting where the sector is ranked first awarded the highest score and so on until the lowest

ratings given score 1. Then the scores for each sector aggregated by categories (multiplier and linkage) then sorted, where the sector has the highest total score is set as a rank first. Based on the ranking of the performance of the model will be known how the Economic Development sector FBT

Analysis and Discussion

    1.   Decomposition multiplier

Described on the previous results have identified that the Small FBT an optimal alternative models of economic development policy FBT sector. In connection with that, the multiplier decomposition analysis of the following discussion focuses on the sector of the Small FBT compared to large and medium sector. The results of these five sectors multipliers decomposition presented as shown in Table 1 (for small FBT) and Table 2 (for Large and Medium FBT).

Based on Table 1 it can be argued that the injection of 1 billion rupiah in Small FBT will increase the acceptance of production factors of capital, which amounted to 0.97 billion, which is larger than the workforce. This indicates that the Small FBT is more capital intensive.

Table 1. Decomposition of FBT Small

Origin	Injection Impact in other balance	Injection	Transfer	*Open Loop*	*Closed Loop*	Total
Small FBT	Agricultural Workers			0.09	0.04	0.13
	Industry Workers			0.13	0.05	0.19
	Other workers			0.02	0.08	0.10
	Capital			**0.59**	**0.38**	**0.97**
	Farmer			0.07	0.03	0.10
	Small land farmer < 1.0 Ha			0.07	0.05	0.12
	Large land Farmer ≥ 1.0 Ha			0.09	0.06	0.15
	Low income in villages			0.01	0.01	0.02
	High income villages			0.03	0.03	0.06
	Low income in city			0.09	0.06	**0.14**
	High income in city			0.07	0.06	0.13
	Small FBT	1	0.09		0.15	1.24
	Agricultural		0.47		0.18	0.65
	Other		0.11		0.36	0.47
	Total of Production	1	0.72		1.04	2.76

Sources: SAM North Sumatra Province, 2015 (Analyzed)

The increase in capital receipts Small FBT 0.97 billion is a contribution of multiplier impact of cross (open loop) at 0.59 billion and a multiplied effect closed loop of 0.38 billion. In other meaning, an increase in revenues of 1 billion rupiah in FBT Small (e.g., as a result of increased exports) will increase the acceptance of the factors of production capital of 0.59 billion after the impact injection through the whole system block production factors and institutions, and by 0,38 billion after injection through the whole other blocks and return to the original block.

Against the household income, injection of the Small FBT will provide the revenue impact lower class households in the larger villages, namely 0.15 billion, compared with the reception of other household groups. The magnitude of the impact on the acceptance of injection Small FBT lower class household in the village is dominated by the multiplier effects of the cross. That means contributions impact of cross towards increased acceptance of lower class household in the village is greater than the impact of closed loop multiplier.

Against other production sectors, injection Small FBT will provide the revenue impact greater agricultural sector, amounting to 0.65 billion compared to Other sectors, that is equal to 0.50 billion. This indicates that the linkage (linkage) between Small FBT sector with the

agricultural sector is greater than the other sectors. The magnitude of the impact of injection Small FBT sector is dominated by a multiplied effect the transfer.

Based on Table 2 can be argued that the injection of 1 billion rupiah in FBT Large and Medium will increase the acceptance of production factors of capital, i.e., respectively by 1:03 billion, which is larger than the workforce. This indicates that the sector FBT Large and the other are capital intensive (larger than Small FBT). The magnitude of the impact injection FBT Large and Medium sector is dominated by the multiplier effects of the cross. It means contributing to the improvement of cross impact of capital receipts from the sector FBT Large and Medium greater than closed loop multiplier impact.

Table 2. Decomposition of FBT Large and Medium

Origin	Injection Impact in other balance	Injection	Transfer	*Open Loop*	*Closed Loop*	Total
Large and Medium FBT	Agricultural Workers			0.31	0.05	0.35
	Industry Workers			0.01	0.07	0.08
	Other workers			0.01	0.09	0.11
	Capital			0.55	0.48	1.03
	Farmer			0.20	0.04	0.24
	Small land farmer < 1.0 Ha			0.11	0.06	0.17
	Large land Farmer ≥ 1.0 Ha			0.09	0.08	0.17
	Low income in villages			0.02	0.01	0.03
	High income villages			0.04	0.03	0.07
	Low income in city			0.05	0.07	0.12
	High income in city			0.06	0.07	0.13
	Large and Medium FBT	1	0.03		0.01	1.04
	Agricultural		0.09		0.58	0.67
	Other		0.06		0.45	0.50
	Total of Production	1	0.20		1.31	2.51

Sources: SAM North Sumatra Province, 2015 (Analyzed)

Against the household income, injection of 1 billion rupiah in both Large and Medium FBT sector, will provide the revenue impact class households farmhand greater, respectively amounted to 0.24 billion, compared with the acceptance of other household groups. The magnitude of the injection sector of the Medium and Large FBT the reception class household farm workers are dominated by cross multiplier impact. It means contributing to the increasing impact of cross reception class household farm labor is greater than the impact of closed loop multiplier.

Against other production sectors, Medium and Large FBT injection will provide the revenue impact greater agricultural sector, amounting to 0.67 billion compared to Other sectors, that is equal to 0.50 billion. This indicates that the linkage (linkage) between the Large and Medium FBT sector with the agricultural sector is greater than the other conditions. Where sector is relatively larger than Small FBT. The magnitude of the impact injection FBT Large and Medium sector is dominated by a multiplied effect the transfer.

FBT Model Simulation

To get a draft model of economic development policy FBT sector in addressing income inequality analysis simulation model based on SAM as well. As described in the previous chapter simulate the impact of economic stimulus in question in this case is an increase in investment and income of low-income households. Then Small FBT an optimal alternative models of economic development policy FBT sector. In the condition argue, the analysis of the economic stimulus impact on output in the following discussion focuses on the FBT sector. The results of the simulation analysis of the impact of increased investments (both

sectors FBT), low-income household income and the combination of the output in North Sumatra province are shown in Table 3.

Table 3. Impact Stimulant to Output

Based on Table 3 are shown, first, the impact of increased investment of 1 trillion rupiah to each sector FBT (simulation 1 and 2) showed normal results. An increase of 1 trillion rupiah in the sector of Small FBT (simulation 1) will increase the income of the sector itself larger. The same pattern was shown also on the impact of increased investment of 1 trillion rupiah in the sector FBT Large and Medium (simulation 2). Of the two, the simulation results 1akan grow relatively greater total output, i.e., 0.49 percent. This indicates that the increased investment in one sector, namely Small FBT, can spur economic growth in North Sumatra Province is relatively larger than the output in the coming period.

Second, the impact of increased investment of 1 trillion rupiah were more evenly distributed across the whole sector FBT (simulation 3) shows the output growth sectors Small FBT relatively larger, i.e., 1:29 per cent, compared to growth of output sectors FBT Large and Medium (0.09 percent). Then the total output will grow by 0:45 percent, where the growth rate is relatively smaller than the simulation 1, but is relatively larger than the growth of output generated from the simulation 2. This confirms the previous results shows that Small FBT has contributed to encourage economic growth in the province of North Sumatra is relatively larger than the output side when investments are distibuted equally to the two sectors FBT.

Third, the impact of income transfer to the farm worker households amounted to 1 trillion rupiah (simulation 4) showed a relatively different, that foster Small FBT sector output is relatively larger than the Large and Medium FBT sector. Its growth rate is based on the simulation results 7 is relatively larger, i.e. 0.43 per cent, compared with the results of the simulation 2. Then the aggregate output growth is relatively lower compared with the simulation results 1-3. This indicates that the stimulus in the form of transfer payment (an effort to increase household income lower class) are of low quality in order to boost the growth rate higher output in the province of North Sumatra.

Conclusions and Recommendations
Based on the analysis that has been described in previous chapters, it can be drawn some conclusions as follows below:
1. Both FBT sector is capital intensive, but from both sectors FBT Large and Medium weight are greater than Small FBT sector.
2. Sector Small FBT further contribute to lower household income groups in the city, but otherwise FBT Large and Medium sector further contribute to the household income bracket over the city.
3. The impact of increased investment in both sectors FBT (simulation 1 and 2) show the results of simulation 1 (Small FBT investments to the sector) will grow relatively larger total output. Likewise, the results show the same thing when done equally to both sectors FBT and combined with redistribution of income from the upper class household in the city households to farm workers (simulation 3 and 4).

Based on the findings of this study showed that of the second group FBT sectors that showed large role in North Sumatra is the Small FBT sector. Thus the sector is one sector leaders (leading sector). This implies that in spurring economic growth accompanied by income distribution in North Sumatra province next to sector I should be prioritized to small FBT. From some Small FBT is categorized as agro-industry sector. Therefore, the strategy agro-industrialization (agro-industrialization strategy) is an options strategy industrialization policies are applied in order to realize economies of North Sumatra resilient in the future. In line with the results of the study Tambunan (1992), Daryanto (1999), and Benerjee and Siregar (2002) states that the development of agro-industries, namely agriculture-based industries, giving a major role in the economy.

THE ROLE OF THE GOVERNMENT READINESS IN ENHANCING COMPETITIVENESS SMES, SMES DEALING IN ASEAN ECONOMIC COMMUNITY (AEC) (CASE STUDY IN BATAM MSME)

Cahyo Budi Santoso, Riau Islands University (UNRIKA), Indonesia

Abstract

The participation of the government and the readiness of micro, small and medium enterprises (SME) in improving its competitiveness in the face of the ASEAN Economic Community (AEC) in the city of Batam. The purpose of this study were: 1) Determine the role of government and the readiness of SMEs in Batam in improving the competitiveness of SMEs in order to face the AEC; 2) to analyze internal and external factors; and (3) Develop a strategy and prioritize the strategies to improve the competitiveness of SMEs in Batam. By using SWOT analysis method to determine the strengths, weaknesses, opportunities and threats. The analysis showed that in the face of the AEC, the government and SMEs need to improve the quality and standard of products, access to finance, human resources, supported by training and technology.

Keywords*: participation, competitiveness, government, SMEs, AEC*

Introduction
1.   Background of the study

In late 2015, the Indonesian government has determined that Indonesia is part of the ASEAN Economic Community, or better known as AEC, in implementation of the ASEAN Economic Community (AEC) will be a challenge for the Indonesian nation with the transformation of ASEAN into a single market and production base, as well make ASEAN a more dynamic and competitive.

Enforcement of AEC can also be interpreted as the expectations of the prospects and opportunities for economic cooperation between the regions in a wider scale, through the regional economic integration of Southeast Asia, which is characterized by the free flow (free flow): goods, services, investment, labor, and capital.

The Government of Indonesia continues to increase its commitment to support the optimization of competitiveness to spur productivity and quality economic growth, it is marked by the issuance of Presidential Decree No. 6 of 2014 on 1 September 2014, on Enhancing National Competitiveness in the framework Facing the ASEAN Economic Community (Association Of Southeast Asian Nations).

Through Presidential Decree, the President instructed the government officials throughout Indonesia, to take the necessary measures in accordance with the duties, functions and authority of each in a coordinated and integrated to improve national competitiveness and preparing for the implementation of AECs.

The instruction is expected through increased competitiveness can be improved, mainly by putting forward some basic strategies contained in 14 principal development in order to increase competitiveness.

One of the 14 principal development in order to increase competitiveness, one containing the second letter number (9) of the Development of Micro, Small and Medium Enterprises which focus on:

   a) Improvement of Competitiveness of Micro, Small and Medium Enterprises Financing from the side;

b) Competitiveness Development of Micro, Small and Medium Enterprises in the framework of Eligibility and Capability Improved Competitiveness of Micro, Small and Medium Enterprises;

c) Encouraging Empowerment Real Sector and Competitiveness of Micro, Small and Medium Enterprises;

d) How to Batam directly adjacent to the member countries of the AEC, strategy what will be done, and what factors can improve the competitiveness of SMEs in the city of Batam in AEC implementation?

Given that Batam is a very strategic area for international trade lanes, in fact is one of the entry gates member AEC products to Indonesia. Batam could act as a transit area of products, as well as the area of product marketing countries AEC, thus there will be a variety of products circulating in the city of Batam, which is certainly not just a product of industrial / large businesses that enter and circulate in Batam, but including small and medium business products, thus will be a challenge for the products of SMEs in Batam.

According to data from the Department of Community Development, Markets, Cooperatives and SMEs Batam in 2014 there were 1,006 SMEs in Batam which are all incorporated in the container cooperatives spread over 12 districts.

Table 1
Data Actors of Small and Medium per Subdistrict 2014

No	Districts	Amount UMKM/Cooperation
1	Sekupang	182
2	Batu Aji	108
3	Bulang	19
4	Galang	35
5	Sei Beduk	79
6	Belakang Padang	40
7	Bengkong	72
8	Batu Ampar	61
9	Nongsa	41
10	Sagulung	137
11	Batam Kota	189
12	Lubuk Baja	43
Total		1.006

In 2015, the Batam City Government through the Department of Community Development, Markets, Cooperatives and Small and Medium Enterprises, has implemented and intermediation Financing SME Expo Rp. 119,280,175 or by 82.72% of the existing budget ceiling is Rp. 144,200,000, - funding is very minimal compared to the number of SMEs in the city of Batam.

As the above description, the author felt the need to examine how the competitiveness of SMEs in order to compete in the AEC, in particular SMEs in the city of Batam. The authors are interested in doing research titled "Participation of Government and Readiness of MSMEs in Batam in Improving Competitiveness of SMEs in Facing ASEAN Economic Community (AEC)".

2.   Scope of the problem

As described above, in general, the authors try to limit the problem to be studied in the form of strengths, weaknesses, opportunities and threats facing SMEs in the era of AEC, in

particular this research is intended to obtain a clear picture of the factors increasing the competitiveness of SMEs.

3. Formulation of the problem

Based on the identification of the above problems, the authors put forward some of the issues to be studied more deeply, namely:

1. How is the government's role in improving the competitiveness of SMEs in AEC enforcement of the moment?
2. How is the readiness of SMEs in the face of competition, especially on products that are similar in terms of human resources, product price, product quality, innovation, and technology?

4. Research purposes

Generally, this study intends to obtain a clear picture of an effective strategy to increase the competitiveness of SMEs. In particular, it is also to know about the basic concept of SMEs, the basic concept of AEC, SMEs SWOT analysis, and strategies undertaken to increase the competitiveness of SMEs in the face of the MEA.

5. Benefits of research

While the benefits of this research are expected to provide an overview for SMEs in order to increase its competitiveness in the current era of AEC. So that SMEs can compete and can survive in the free trade deal with the enforcement of AEC s. Not only to compete in the domestic market but also the international market.

Literature Review

1. Understanding Competitiveness

The definition of competitiveness according to Big Indonesian Dictionary (KBBI) is the ability of living creatures to be able to grow (evolve) normally among other living beings as a competitor in the habitat (in one line of business, etc.); KBBI.

There are two sides posed by competition, namely the success to encourage companies to be more dynamic and competitive in providing products and provide the best service for the market, so competition is regarded as the opportunity to motivate. While the other side was a failure because it will weaken the companies that are static, fear of competition and not able to produce a quality product, so the competition is a threat to the company.

The competitiveness of the operation is a function of operations that are not only oriented to the (internal) but also out (external), which respond to market their business objectives by proactively.

Based on the above understanding, the competitiveness of SMEs in the context of competition in the era of AEC describes the ability of SME products Indonesia (Batam) in facing the challenges of the implementation of AEC s in order to continue to grow and develop normally in various conditions. The higher the competitiveness of MSME products Indonesia (Batam), the more superior products SMEs Indonesia (Batam) in the face of MSME products of ASEAN countries.

2. Micro, Small and Medium Enterprises (SMEs)

As contained in Law No. 20 Year 2008 on Micro, Small and Medium Enterprises, the basis for the issuance of the Act is intended to create a just society prosperous based on Pancasila and the Constitution of 1945, to be realized in the empowerment of Micro, Small and K, should be organized as a whole, optimal and sustainable through the development of a favorable climate, the provision of business opportunities, support, protection, and business

development broadly, so as to improve the position, role and potential of Micro, Small and Medium enterprises in realize economic growth, equity and improvement of people's income, job creation, and poverty alleviation.

Some general rules of the law on micro, small and medium enterprises are as follows:

1. Micro is a productive enterprise belonging to individuals and / or entities that meet the criteria of individual businesses Micro.
2. Small Business is an economic enterprise productive stand-alone, conducted by an individual or business entity that is not a subsidiary or branch of the company is not owned, controlled, or be a part either directly or indirectly from or Medium Enterprises Large Enterprises that meet Small Business criteria.
3. Medium Enterprises is an economic enterprise productive stand-alone, conducted by an individual or business entity that is not subsidiaries or branches of companies owned, controlled, or be a part either directly or indirectly by the Small Business or Large Business with the amount of wealth net or annual sales revenue.

The principles and objectives of the micro, small and medium enterprise are familial, economic democracy, togetherness, efficiency with justice, sustainability, environmental friendliness, independence, balance of progress and national economic unity.

While the purpose of Micro, Small and Medium Enterprises aims to foster and develop the business in order to build a national economy based on fair economic democracy.

3. ASEAN Economic Community (AEC)

AEC is a community of ASEAN (ASEAN Community) in Economics or ASEAN Economic Community (AEC) which was endorsed at the Summit (Summit) ASEAN 9th in Bali in 2003, otherwise known as Bali Concord II. The community building initiated by the Heads of State of ASEAN after the 1997 economic crisis region of Southeast Asia.

AEC is expected to realize the achievement of a region that is stable, prosperous and highly competitive with balanced economic growth and reduced poverty and socio-economic gap. Bali Concord II not only agreed on the establishment of the AEC, but also agreed to establish an ASEAN Community in the field of security politics (ASEAN Political-Security Community) and the Socio-Cultural (ASEAN Socio-Culture Community).

12th ASEAN Summit in Cebu in January 2007, has agreed a "Declaration on the Acceleration of the Establishment of an ASEAN Community by 2015". In this context, the ASEAN Economic Ministers has instructed the ASEAN Secretariat to compile a "Blueprint for the ASEAN Economic Community (AEC)". The AEC Blueprint provides a strategic work plan in the short, medium and long up to 2015 towards the establishment of ASEAN economic integration, namely:

1. Towards a single market and production base (current free trade for the goods, services, investment, skilled labor, and capital);
2. Towards the creation of regional economies with high competitiveness (regional competition policy, IPRs action plan, infrastructure development, ICT, energy cooperation, taxation, and the development of SMEs);
3. Towards a region with equitable economic development (region of equitable economic development) through SME development and programs of the Initiative for ASEAN Integration (IAI); and
4. Towards the full integration of the global economy (a coherent approach in external economic relations and to encourage participation in the global supply network).

4. SWOT analysis

SWOT is an acronym for strength (Strength), weakness (Weakness), opportunities (Opportunities) and threats (Threats) of the company's internal and external environment.

According Jogiyanto (2005), SWOT be used to assess the strengths and weaknesses of the resources of the company and the opportunities for internal and external and the challenges faced.

All organizations have strengths and weaknesses in the functional areas of business. No company is as strong or weak in all business areas. Strengths / weaknesses internal, coupled with the opportunities / threats from external and a clear mission statement, the basis for goal setting and strategy. Goals and strategies set out with the intention of utilizing the internal strengths and overcome weaknesses.

5. Strength

Strength is the resources, skills or forte-forte else related to the company's competitors and the market needs that can be served by companies that are expected to be served. Strength is a special competition which gives the company a competitive advantage in the marketplace.

6. Weakness

Weaknesses are limitations or deficiencies in resources, skills, and capabilities that effectively inhibit the performance of the company. These limitations may include facilities, financial resources, management capabilities and marketing skills can be a source of weakness of the company,

7. Opportunities

Opportunities are important favorable situation in the corporate environment. Important trends are one source of opportunities, such as the change in technology and the growing relationship between the company and the buyer or supplier is a picture of opportunities for the company,

8. Threats

The threat is critical of unfavorable situation in the corporate environment. The threat of a major nuisance for the current or desired position of the company. The existence of government regulations that are new or revised can be a threat to the company's success.

9. SMEs in AEC

Regional cooperation to develop SME policy guided by the ASEAN blueprint for the development of SMEs 2004-2014. Built with a continuous process, ASEAN SME development strategic plan 2010-2015 includes commitment to regional development of SMEs adopted from SMEWG in 2009 and supported by the Senior Officials Meeting of Trade SEOM 2010 to improve the competitiveness and flexibility of the progress of SMEs as a key market and production base in ASEAN.

The work plan includes strategic work program, policy and output indicative implemented by ASEAN SME Working Group (formed by SME organizations from all member countries of ASEAN) with institution / body of SMEs and the private sector. In particular there are 5 main targets SMEs under the umbrella of the AEC Blueprint, namely the development of: (a) a common curriculum for entrepreneurship ASEAN countries Indonesia and Singapore as examples (2008-2009); (b) the overall SME service center with regional and sub-regional relations in countries member, with Thailand and Vietnam as examples of countries (2010-2011); (c) SME financial facilities in each Member State with Malaysia and Brunei Darussalam as an example of state (2010-2011); (d) the scheme, the scheme future regional training for staff exchange and training visits to Myanmar and the Philippines as examples of state (2012-2013); (e) help the development of regional SMEs as a source of funding for SMEs doing business in ASEAN with Laos and Thailand as examples of state (2014-2015).

Funding in SME activities remains a challenge, to date, some results of SMEs agreements have been implemented on the basis of self-help approach (self-help) or mutual aid among members of ASEAN (ASEAN helps) where the member states to mobilize their resources to carry out development projects SMEs or to facilitate the participation of other ASEAN member countries on this project.

In order to strengthen SMEs face Asian Economic Community (AEC) by 2015, some efforts need to be done, including:

1. Improving the quality and standardization of products similar SMEs in the ASEAN region;
2. Expanding and improving access to finance for SMEs;
3. Improving the quality of human resources and entrepreneurship to SMEs;
4. Strengthening and improving access to and transfer of technology for SMEs for the development of innovative SMEs;
5. Facilitating SMEs related to access to information and promotion abroad.

Thus SMEs at the forefront of national economic growth. Ultimately expected to be able to compete in the era of economic integration of ASEAN is a region that is stable and prosperous.

10. Previous research

Research on competitiveness conducted by researchers, among others: Tyas, and Vita (2014), Armi and Kasmirudddin (2014), and Y. Sri Susilo (2011). Ari Anggarani Winadi Prasetyoning Tyas and Safitri (2014) conducted a study entitled Strengthening Sector SMEs as Strategy Facing MEA 2015. Cintya and Kasmiruddin (2014) conducted a study with the title SWOT analysis as Strategies to Increase Competitiveness in Business Enterprises Shoes (Case Shoe Stores Stars Marpoyan Pekanbaru branch), Susilo (2011) conducted a study with the title Strategy Improving the Competitiveness of SMEs role in Facing CAFTA and MEA,

Research Methods
1. Types of research

This research is a descriptive qualitative study of research is descriptive and tend to use the analysis. Processes and meanings (subject's perspective) are highlighted in this study. The theoretical basis used as a guide to focus research in accordance with the facts on the ground. Besides the theoretical basis is also helpful to provide an overview of the background research and as a discussion of research results.

Qualitative data analysis process starts with examining all available data from various sources, i.e. interviews, observations that have been written in the field notes, personal documents, official documents, images and so on. Once reviewed, the next step is the reduction of data, preparation of the unit, categorization and the last is the interpretation of the data.

2. Location and Time Research

This research was conducted in the city of Batam, Cooperatives and SMEs Batam City and SMEs in Batam. The time required to conduct research less than 2 (two) months starting from May 2016 until June, 2016.

3. Informant

In a qualitative study population did not use, because qualitative research departs from particular cases that exist in certain social situations and the study results would not be imposed on the population, but is transferred to another place on the social situation in the

cases studied. Samples in qualitative research is not called the respondent but speakers, participants or informants (Sugiyono, 2012: 216).

4.   Type of data

The type of data in this study is divided into two categories as follows:

1. Primary data, i.e. data obtained directly from the source either in the form of observations, questionnaires or interviews, supported by documentation.

2. Secondary data, i.e. data obtained through intermediaries such as Internet media, Books, Websites and other references that can support the research.

5.   Data collection technique

Sugiyono (2012) qualitative research methods named as the new method. Because of its popularity recently, so named because the method is based on the philosophy post-positivistic post-positivism. This method is also known as an artistic method, because the research process is more art (less patterned), and is referred to as an interpretive method for the data research results more concerning the interpretation of the data found in the field. Qualitative data collection techniques in general there are four kinds:

a. Observation

Nasution, in Sugiyono (2012) states that, observation is the basis of all science. Scientists can only work based on the data, the facts about the world of reality obtained through observation. Data was collected and often with the help of various tools are very sophisticated, so the objects are very small (protons and electrons) or very much (space objects) can be observed clearly.

b. Interview / interview

Esterberg, in Sugiyono (2012) defined the interview as follows: "a meeting of two persons to exchange information and ideas through question and responses, the resulting in communication and joint construction of meaning about a particular topic." The interview is a meeting of two people to exchange information and ideas through questions and answers, so it can be constructed meaning in a particular topic.

c. Document

Sugiyono (2012), expressed his opinion about the document, the document is a record of events that had passed. Documents can be in the form of text, images, or the monumental works of a person.

d. Triangulation

Sugiyono (2012), Triangulation is defined as data collection techniques that are combining of various data collection techniques and data sources that already exist. When researchers collecting data by triangulation, the actual researchers collected data as well as test the credibility of the data, i.e. checking the credibility of the data with a variety of data collection techniques and data sources.

6.   Data analysis technique

Technical analysis of the data in this study using SWOT analysis, SWOT Analysis is a strategic instrument of planning a classic. By using the framework's strengths and weaknesses and external opportunities and threats, this instrument provides a simple way to estimate how best to implement a strategy. The tool helps planners what can be achieved, and what are the things that need to be considered by them.

According Rangkuti (2006) SWOT Analysis is an analysis that is based on the logic that maximizes strength (strengths) and opportunities (opportunities), but simultaneously can minimize your weaknesses (weaknesses) and threats (threats). Aiming to determine a realistic

effort, according to the company and are therefore more easily achieved any company can use the SWOT analysis techniques.

7. SWOT matrix

SWOT matrix is a tool that is used to draw up strategic business factors. This SWOT matrix can clearly describe how external opportunities and threats facing the business and can be tailored to the strengths and weaknesses that are owned by a business that can be applied right competitive strategy.

According to Jatmiko (2003) SWOT Matrix is an important tool that can help managers develop the type of strategy that consists of four possibilities, namely a blend of Strength-Opportunities (SO), the Convergence between Weaknesses-Opportunities (WO), The combination of Strength-Threat (ST), and the combination of Weaknesses-Threats (WT).

8. Objective of the Analysis Data

To illustrate the results of the competitive analysis, weaknesses, opportunities and threats the company as a whole which is used as a base or foundation for preparing the objective and strategy of the company in the corporate planning.

A list of questions

Participation of Government	SMEs
1. How is the role of government as a facilitator? 2. How the role of government as a regulator? 3. How is the role of government as a catalyst?	1. How to get the capital / financial? 2. The availability of raw materials? 3. Human Resources? 4. Marketing product? 5. The technology used?

Results and Discussion

1. General description

Batam is an island located between the waters of the Straits of Malacca and Singapore Straits. No literature can be a reference to the name of Batam where it was taken, a clear Batam Island is a large island and 329 islands in the city of Batam. The only source that clearly mention the name of Batam and can still be found today is the Treaty of London (1824).

The original inhabitants of Batam estimated are Malays, known as People or People Sea Strait. The residents at least have occupied the area since the time of the kingdom of Temasek (now Singapore) in the end of 1300 or early 14th century. Instead, and other records, the possibility of Batam Island has been inhabited by sea since the year 231 AD that at the time of Singapore called Ujung Island.

In its heyday the Kingdom of Malacca, Batam Island under the authority of Admiral Hang Tuah. After the fall of Malacca, power over Batam Island neighborhood held by Laksamana Hang Nadim domiciled Bentan (now P. Bintan). When Hang Nadim died, the island was under the rule of the Sultan of Johor until the mid-18th century.

2. Batam City Government

The formation of the Government of Batam as an executive agency carrying out the wheels of government and community development, a hope to be able to answer any problems or

challenges that arise in accordance with the development of socio-economic, socio-cultural, political and others in the community.

Batam Municipal Government established based on Government Regulation No. 34 of 1983 and was inaugurated on December 24, 1983 which is chaired by the Mayor of the Administrative rank pari passu with the regency / municipality level II more. Its existence is under and directly responsible to the Governor of the Province of Riau Islands.

Batam City Government has the vision and mission of "Realization Batam as Bandar Madani. The Competitive World, Developed, Prosperous, and Dignified"

3.   Office of Community Development, Markets, Cooperatives and SMEs Batam

As the vision and mission of Batam City Government, Department of Community Development, Market, SMEs Batam has a vision and a mission of its own with the mission of "Improving Capability Institutional, Human Resources Quality and Capital Structure and Financing SMEs to become entrepreneurs strong, healthy, strong and independent" ,

The key task of the Department of Community Development, Markets, Cooperatives and SMEs Batam in accordance with the Regulation of Urban Batam No. 12 of 2007 concerning the composition of the Organization and Work Procedure of the Regional Office of Batam has the tasks of decentralized authorities in the field of Community Development, Markets, Cooperatives and Small and medium.

Research result

1.   ASEAN Economic Community (AEC)

Every major pillar has its own purpose. The purpose of the AEC is to improve economic stability in the ASEAN region, with the establishment of the ASEAN economic region is expected to overcome the problems in the economic field between ASEAN countries, and for in Indonesia is not expected to occur again as the 1997 crisis.

There are several factors that affect the economic growth that is the human factor, the factor of natural resources, science and technology factors, cultural factors and power factor capital. Then we can see how these five factors have been optimally managed, in fact there are several countries in the Southeast Asian region is still underdeveloped in the management of some of these factors although we can also see some of the other countries is quite able to manage it well.

The question is, to what extent the government's participation and readiness of SMEs in Indonesia to face the MEA?

2.   Participation of the Government of Batam

From the research, either by observation, interviews and documentation in the field, the government's role would be particularly important for SMEs to deliver in order to compete with other businesses in utilizing the AEC. Some of the government's role in efforts to empower SMEs are:

3.   The role of the Government as Facilitator

The role of the Office of Community Development, Markets, Cooperatives and SMEs in developing SMEs Batam in Batam by facilitating the development of SMEs in the city of Batam. Assistance provided such assistance in the form of appropriate equipment, industrial synergy HR development program, as well as product distribution facilities. The purpose of this provision of facilities and infrastructures is to develop human resources qualified industry, proportional and high technical capabilities to support an increase in industrial production.

4.   Government's Role as Regulator

The role of the Office of PMP-SMEs government as a regulator here is to protect the movement / behavior of SMEs. hemonis so intertwined relationship between businessmen and the government as coaching, following government regulations relating to Micro, Small and Medium Enterprises:

5.   Government's Participant as Catalyst

The government's participant as a catalyst through activities that include the provision of information support of capital for SMEs and organizing SME Product Promotion. In this case the Department of Cooperatives and SMEs have a goal held this program that the managers of SMEs in Batam increasingly Active and selective in presenting its products with the quality, design and price are increasingly competing with products from other regions, and even from state another it both in national and international markets.In these days of credit schemes are well known in the community is the People's Business Credit (KUR), which is specifically designed for SMEs with a decent business category, but do not have sufficient collateral in order to banking requirements. KUR is credit / financing to SMEs and cooperatives that do not currently accept credit / financing from banks and / or who are not currently receiving the Credit Program of the Government at the time of application for credit / financing proposed. The final goal is the KUR program was launched to improve the economy, poverty alleviation and employment.

6.   Readiness of Micro, Small and Medium Enterprises in Batam

Table 2. Characteristics of Micro, Small and Medium Enterprises

Size of business	Characteristic
Micro business	- The type of goods / commodities are not always fixed; can be changed at any time. - The business is not always settle; any time can be moved. - Not to perform even simple financial administration. - Do not separate the family finances with business finances. - Human resources (entrepreneurs) do not yet have sufficient entrepreneurial spirit. - The average level of education is relatively low. - Generally not yet access to banks, but some have access to non-bank financial institutions. - Generally do not have a business license or other legal requirements, including TIN. Example: Trading businesses such as street.
Small business	- The type of goods / commodities are cultivated generally already fixed are not easily changed. - Location / place of business generally have settled not moving. - In general, is already doing though still modest financial administration.

	- Financial companies have started separated with the family finances. - It makes the balance of the business. - Already have a business license and other legal requirements, including TIN. - Human resources (entrepreneurs) have experience in business berwira. - Much has access to banking capital purposes - Most have not been able to make such good business management with business planning. Example: Traders in the wholesale market
Medium-sized enterprises	- Has the management and better organization, with a clear division of tasks, among others, the finance department, marketing department and production department. - Have done by implementing a financial management accounting system by making it easier to regular auditing and assessment or examination included by banks. - Have done any rules or management and labor organizations. - It has legal requirements, among others permission neighbors. - Already have access to the sources of bank funding. - In general, already have human resources trained and educated. Example: Mining the mountain stone for construction and artificial marble.

7. Pros and Cons Small and Medium Enterprises

Advantages of Small and Medium Enterprises (SMEs):

As well as SMEs in other cities, SMEs in Batam has several advantages in running their business, which of course, this advantage into force and the capital of SMEs to compete in the ASEAN Economic Community (AEC), while the strength of the SMEs in Batam, as follows:

1. Innovation in technology that can easily occur in product development.
2. Relationship human intimacy of the smaller companies.
3. Flexibility and ability to adapt to changing market conditions quickly compared to large-scale enterprises in general bureaucratic.
4. There is a dynamism of managerial and entrepreneurial roles.

8. Weaknesses of the Small and Medium Enterprises (SMEs):
a. Marketing difficulties

Some SMEs are successfully interviewed, there are similarities answers regarding the difficulty marketing of products produced, there is even SMEs are marketing only through social media such as a page on Facebook, which is certainly in fashion marketing such as this is limited to those that exist in friendship on the page, because most of the resulting product is a product made in the home such as cake products, handicraft (souvenir), which is certainly its

marketing was carried out of the house. While to get a display-display required considerable expense.

b. Financial constraints

From some of the SMEs interviewed by investigators, in general, that the capital being owned an equity capital / private course very limited, so let's keep up or increase their efforts to survive it is still very difficult, the expectations of capital support from governments of both banking and non-banking time was minimal.

SMEs crafts Capital Menik who were interviewed said that the source of funds / capital is owned their own savings, while aid from the government up to now has not been obtained**.**

Limitations of capital caused by a lack of information for SMEs in obtaining loans disbursed by the government, as it also still are SMEs that do not have requirements that must be met as a loan recipient, even there are SMEs that have not been registered at the Department of PMP-SMEs as trained partners, so that this is an obstacle in the loan portfolio.

c. Limitations of Human Resources (HR)

Human Resources SMEs in Batam is still a serious obstacle, many SMEs have only precarious employment or just a part-time worker "part time" as SMEs engaged in convection in Batu Aji Perum Griya Asri, Mr. Convection SMEs owners. Juwair said the convection industries not yet have a permanent workforce, this is due to get a tailor reliable in Batam is very difficult, it can be said that the professional workforce in the field of convection very rare / difficult, because to be a seamstress needed expertise, and that expertise can be obtained with their training, whereas up to now there has been no Batam City Government program as to provide the training.

Data analysis

1. Triangulation Data

The researchers used as a triangulation technique to check the validity of the data. Where in the sense triangulation is a technique that utilizes data validity checking something else in comparing the results of interviews of the research object.

Triangulation by comparing and checking the source of meaning behind the degree of confidence the information obtained through time and different tools in qualitative research. As to achieve that trust, then taken the following steps:

1. Comparing the observed data with data from interviews.
2. Compare what people are saying in public what was said in private.
3. Compare what people say about the situation of research in what he says all the time.
4. Comparing the situation and perspective of someone with different opinions and views of people from different classes.
5. Comparing the results of interviews with the contents of the documents related.

2. Data reduction

The data collected in the field is quite a lot, it is necessary to note carefully and in detail. Data reduction means: summarizing, choose things that are basic, focusing on things that are important, look for themes and patterns and discard unnecessary. Reduced data will provide a clear and facilitate researchers to conduct further data collection, and look for it when necessary**.**

Reduction of data from the above results, as illustrated in the following table:

Table 3. Government Participation Source: Interviews and documentation

Participation of Government	Interview	Documentation
as a facilitator	Doing exhibitions, provide appropriate assistance tools, training	SMEs Expo, support equipment, training in sewing
as Regulator	Ease of business licenses, access to business credit	Rules still tends to weigh on SMEs
as catalyst	People Business Lending, Community Revolving Fund	The information is not conveyed properly to SMEs

Table 4.8. Readiness of MSMEs Source: Observations and Interviews

Readiness of SMEs	Observation	Interview
Advantages of SMEs	Innovations in technology, human relations, flexibility and adaptability, dynamism managerial	Technology is still traditional, labor relations with managerial still with familial patterns,
Deficiency	Difficulty sale, financial, material, human resources, technology	Need government support in facilitating all the flaws

Discussion
1.   SWOT Analysis
From these results, the following SWOT analysis to identify the internal factors that Strength and Weakness was external factors that Opportunity and Threat SMEs in Batam in the era of AEC as follows:

2. Strength
- The product price is relatively affordable and stable
- The production quality is maintained
- Having a close relationship between employers and workers

3. Weakness
- Limited capital
- Promotions are not optimal
- Part-time labor
- The technology used is still traditional
- Trademarks are still owned mostly SMEs
- Raw materials readily available

4. Opportunity
- The market share is very open
- The public need to be product

- The purchasing power of consumers who tend consumptive
- Free Trade Area (AEC)

5. Threat
- Competitors from home and abroad
- Public perception of the brand abroad
- Lack of government support
- Lack of protection for SME products
- The lack of a workforce training

6. SWOT analysis
a. SO strategy
In the SO strategy (the power-chances) SMEs should take advantage of internal strength to take advantage of opportunities from the external environment, as mentioned in the above table of SMEs in Batam taking advantage of opportunities at the time of enactment of the AEC in order to do the following:
a. Improve the quality and standard of products
b. Supply of products that follow the development of consumer tastes
c. Expand your market share

b. WO strategy
This strategy is based on the utilization of existing opportunities in ways that minimize weaknesses. Sometimes there are opportunities for the external environment, but the company faced internal weaknesses that hinder the company to exploit those opportunities.
a. Improve access to finance
b. Promotion optimization of online media
c. Increase access to and transfer of innovative technologies for SMEs

c. ST strategy
In the box ST strategy, SMEs in this position should use its power to avoid or reduce the impact of external environmental threats. But this does not mean that the company's strong organization should always face the threat of direct external environment, following the results of a SWOT analysis of the ST strategies:
a. Opening space for promotional information access facilities abroad
b. Wake up people's perception to love domestic products
c. Establish a good relationship with the Government

d. WT strategy
In the box WT strategy, SMEs in this position should have a survival strategy that is directly geared to reducing internal weaknesses and avoid external environmental threats. A business organization dealing with a number of external threats and internal weaknesses that make it possible for the company in a precarious position, or critical, following the results of a SWOT analysis of the WT strategies:
a. Improving the quality of human resources by trainings
b. Establish a good relationship with the consumer
c. Registration of a trademark on IPR.

Conclusions and Recommendations
1. **Conclusion**
    a. **Improving the Quality and Standard Products**
        In order to take advantage of opportunities and market potential in the ASEAN region and the global market, the products produced by SMEs must meet the quality and standards in accordance with the ASEAN agreement and the country of destination. Within that framework, the SMEs should begin facilitated with quality requirements and product standards required by the ASEAN and outside ASEAN. The role of technological support for improving the quality and productivity as well as the introduction of design to the SMEs who want to take advantage of the ASEAN markets is urgently needed.
    b. **Improving Access of the Finance**
        So far, not many SMEs can take advantage of the scheme of financing provided by banks. Some of the problems faced by SMEs in gaining access to finance, among others: (1) there are SMEs that do not have legality, (2) credit schemes prepared by the banks does not correspond to the type of SME, (3) the data of the SMEs, which should be financed, is not presented properly. Hence the need for capacity building for human resources of SMEs, banking, and companion SMEs. On the other hand, should also be given extensive information about the financing schemes owned by banks.
    c. **Improving Quality of Human Resources**
        In general the quality of human resources SMEs in Indonesia is still low. To strengthen the quality and entrepreneurial SMEs in Indonesia especially in Batam, needed education and skills training, management, and other appropriate technical training, in accordance with needs. Entrepreneurship development also needs to be improved.
    d. **Strengthening and Improving Access and Technology Transfer for SMEs**
        Access to and transfer of technology to SMEs is still a challenge faced in Indonesia. There should be cooperation between research institutions, and the cooperation between research institutes and universities and the business world for the transfer of technology should be encouraged. Cooperation or partnerships between large companies, both from home and abroad with SMEs should be encouraged to transfer of technology from large enterprises to SMEs.
    e. **Facilitating SMEs Regarding Access to Information and Promotion Abroad**
        The most important part of the production process is a matter of the market. No matter how good the quality of the products, if the society or the market does not know, then it will be difficult marketed products. In this regard, not only the quality and design of products that must be considered, but also about the quantity and continuity of its products.

2. **Suggestion**
    a) Eliminate all artificial barriers to growth that are SMEs, for that government policies must be neutral towards any type or scale of business.
    b) There is nothing wrong government implemented a policy of protection against small-scale businesses emerging, but the time period must be clear and not long and this policy should be learning.
    c) Improved performance of the apparatus at all levels and the Regional Center.
    d) SMEs must improve its productivity if it is to compete in the arena of AEC.
    e) Increase the expertise of SMEs with trainings, do not depend on government programs.

   f) Establish cooperation with major companies, and if possible not only with domestic companies but with foreign companies as well.

DOES SHEEPSKIN EFFECT MATTER? STUDY CASE ON RETURN TO EDUCATION IN INDONESIA

Nenny Hendajany, Universitas Gadjah Mada, Indonesia
Tri Widodo, Universitas Gadjah Mada, Indonesia
Eny Sulistyaningrum, Universitas Gadjah Mada, Indonesia

Abstract

This paper explains the return to education in Indonesia by using the data of Indonesia Family Life Survey (IFLS) 2000, 2007, and 2014. We use the full cross section of data. The purpose of this paper is to estimate the rate of returns to education in Indonesia with special concern on sheepskin effect associated with the completion of certain education stages. Mincer specification related to income and education has the form of continuous function which means that marginal of return to education is constant; however sheepskin effect makes the equation discontinuous in the year where there is graduates of education level. This paper is made in three different models; there are: 1) the addition of dummy variable for year of graduates of education level 2) discontinuous spline function and 3) step function. The results of the study provide strong evidence of the presence of the sheepskin effect on return to education.

Keywords: *education, return to education, sheepskin effect*
JEL codes: I26, J30

Introduction

The positive correlation of individual income in labor market with the year of education completion has been widely demonstrated in numerous studies. Generally, this phenomenon is a part of human capital investment in education. This correlation explains that high income reflects high productivity of workers due to an increase in education. Education is an individual investment when people study at school and get the return when they get into work field. The amount of private return obtained by a person from his education investment is generally known as return to education. Research on return to education regarded from human capital perspective develops after Mincer (1974) made the specification of income equation[8].

Economic theory of education provides different explanation of why there is a strong relation between individual who has higher education level and the amount of income earned. The first explanation is based on the human capital theory that emphasizes the role of learning in determining returns to education. Another explanation is obtained from educational screening theory. This theory states that individual with higher education earns higher income because the education works as credential letter (certificate) which is a signal of high productivity (Weiss, 1995).

The testing to differentiate human capital theory and education signal theory is indeed difficult to be formulated. One of the ways to test education signal theory is by looking at the difference in individual income that has certain qualification with counterfactual. Counterfactual is a group of individual where the number of year of education and characteristic is the same but it does not have certain qualification. This is generally what we call as sheepskin effect[9]. Sheepskin effect in return to education has been investigated by the

---

[8] Mincer Specification is an income equation related to education and working experience.
[9] Sheepskin as a phrase speaks about "an official document occasionally made from animal skin (usually sheep skin)". This paper deals with certificate of graduate of highest education level achieved.

researchers including (Hungerford and Solon, 1987; Belman and Heywood, 1991; Shabbir, 1991; Jaeger and Page, 1996; Schady, 2001; Pons, 2006; Silles, 2008; Xiu and Gunderson, 2013).

Income specification by Mincer (1974) implies that each additional year of education provides constant additional income. The equation of Mincer specification is drawn continuously for each additional year of education. This interpretation is consistent with human capital theory. While according to screening theory, there is different increase for each education level achieved.

The purpose of writing this paper is to test the hypothesis of sheepskin in return to education in Indonesia. This research is motivated by two things. First, the researcher would like to determine the condition of marginal return in Indonesia, especially in the level of junior high school that is included in 9 years compulsory education program and how the relationship between the compulsory education program and sheepskin effect. Second, there is no research that focuses on hypothesis testing of sheepskin in return to education for the case in Indonesia. Son (2013) supports the sheepskin effect in the number of school enrolment for each level of school in time of shock by using IFLS data wave 2 and 3.

This paper scheme is started from introduction; the next is chapter two that describes education system and labor system in Indonesia. Chapter three discusses the literature review and chapter four discusses empirical strategy. Following is chapter five that describes the data and statistical summary, chapter six describes the result of regression analysis and chapter seven is the conclusion.

Education System and Labor System in Indonesia

1.   Education System

Line of education in Indonesia is divided into three main types; there are formal education, informal education, and non-formal education. Formal education is education run at school while informal education and non-formal education are run outside the school. Formal education is divided into three levels; they are primary, secondary and tertiary.

Table 1 Education Level and Years of Schooling

Years of schooling	Education Level
6	Elementary School
9	Junior High School
12	Senior High School
14	Diploma Degree
16	Scholar/Master Degree

Primary education consists of elementary school or Madrasah Ibtidaiah and junior high school or Madrasah Tsanawiyah. Secondary education consists of senior high school, Madrasah Aliyah and vocational school. Based on Law No. 20 year 2003 on Indonesian education system, school duration (school duration in year) of each education level is presented in Table 1.

2. Labor System

Labor market in Indonesia according to the definition of Central Bureau of Statistics (Badan Pusat Statistik, BPS) described by National Labor Force Survey (Survei Angkatan Kerja Nasional, SAKERNAS) is divided into 10 business fields; they are food crop, plantation,

fishery, animal husbandry, other agricultures, manufacture industry, trade, service, transportation and others.

There are many workers in Indonesia who have low education. Based on BPS data, the number of worker by education level is presented in Table 2. The number of worker by low education level (Elementary and below) is higher than the number of worker with high education level. For example in 2013, the workers who have elementary education or less are more than 47 percent (total of 54.62 million people).

The condition of workers in Indonesia has increased on the status of employment/ worker. Table 3 shows the Indonesian worker by status of main job. Employment status according to the definition of BPS is divided into seven categories; they are working alone, working alone with the help of temporary worker, working alone with the help of permanent worker, employees, agricultural free worker, non-agricultural free worker and unpaid worker. The increasing employment status of worker/employee is about 3 percent each year.

Table 2. Worker Age 15 Years and Over Who Work According Attainment Education, 2011-2014 (million people)

Attainment Education	2011	2012	2013	2014
(1)	(2)	(3)	(4)	(5)
Elementary School and Less	55.12	55.51	54.62	55.31
Junior High School	21.22	20.29	20.29	21.06
Senior High School	16.35	17.20	17.77	18.91
Vocational School	9.73	9.43	10.18	10.91
Diploma I/II/III	3.32	3.12	3.22	3.13
University	5.54	7.25	7.94	8.85
Total	111.28	112.80	114.02	118.17

Literary Review

1.   The Reason Why Sheepskin Effect Matter

The relevance of sheepskin effects for understanding the returns to education may possibly be increasing over time. As a greater proportion of the population enrolls in post-junior high school the importance of credential effects is thus likely to rise.

Sheepskin effects are also of research and policy attention because they provide estimates of the value of completing educational programs. If sheepskin effects were unimportant we would place as much emphasis on obtaining an additional year of junior high schooling for someone who would otherwise exit junior high school at the end of grade 9 as for someone who would exit at the end of grade 10. Similarly we would place as much emphasis on obtaining an additional year of senior high school or university education. Nevertheless policies are often directed at program completion that reducing the number of high school dropouts.

Sheepskin effects are also in theory important because they provide information about the way the labor market functions. Certainly, the existence and magnitude of sheepskin effects have been essential to the debate over "human capital" versus "signaling/screening" theories of the role of education in the economy.

Sheepskin effects are also consistent with graduates having learned more in school than non-graduates with the same years of schooling. Such a finding accords with human capital theory if employers observe employees' skills but researchers do not observe these skills, and with signaling theory if employers do not observe employees' skills but use graduation as a predictor of skills.

2.   Previous Research

Hungerford and Solon (1987) began to test the existence of sheepskin effect in return to education. Hungerford and Solon used Current Population Survey (CPS) data to estimate sheepskin effect. Hungerford and Solon used spline function and step function to show discontinuous functions in the year of education where a person usually completed education

[11] http://www.bps.go.id/brs_file/naker, date 10/9/2016

level. Hungerford and Solon found a positive effect and statistically significant on the 16th year of education for both of the functions.

Further, the research was conducted by Belman and Heywood (1991). Belman and Heywood investigated the existence and the magnitude of sheepskin effect on women and minorities in public sector/private sector and union/non-union. Belman and Heywood model receive the support from Frazis (2002) which confirms sheepskin effect is more possible as signaling model where one does not sure about its productivity and get a signal from the education.

Jaeger and Page (1996) with using CPS data and additional data of certificate ownership showed significant sheepskin effect on graduates of senior high school for some of demographic groups. Return private of year of school became relatively smaller in estimation of sheepskin effect because the existence of graduation data. Jaeger and Page found little evidence of the existence of difference race and gender group on the estimation of sheepskin effect on senior high school graduation and bachelor degree graduation.

Research on sheepskin effect was also developed in the developing countries. Shabbir (1991) had estimated sheepskin effect for the case in Pakistan by using additional dummy, spline function and also step function. Shabbir found the evidence of the existence of sheepskin effect for the three estimation methods. Schady (2001) found the evidence of large difference of private return based on education level. Based on the data of male education in Philippines, Schady used spline method and semi parametric specification in proving the existence of sheepskin effect.

Son (2013) provided the support in the form of evidence about the existence of sheepskin effect seen from the high rate of dropout at school in times of crisis in Indonesia. Son tested whether negative shock influences the number of applicant differently for each education level. Son proved the existence of a fairly strong negative shock influence in junior high school and senior high school graduates; this demonstrated the support of the existence of sheepskin effect in Indonesia.

Pons (2006) found that the evidence of sheepskin effect is only perceived by female worker and it does not apply on male worker in Spain, while in the previous research, Pons and Blanco (2005) found sheepskin effect or graduation effect that can only be perceived in government sector (public) and it cannot be found in private sector.

Silles (2008) used data of age 16 years old in 1974 and 23 years old in 1981 that review sheepskin hypothesis on senior high school level with using test scores for men and women who leave the school in England in early age. He did not find enough evidence to accept the hypothesis of sheepskin effect because there was no additional return on the ownership of formal certificate in senior high school level.

Xiu and Gunderson (2013) used China Household Income Project (CHIP) data in 1995 and 2002 to describe return to education in China by separating graduation effect from the duration of year of school. Xiu and Gunderson obtained evidence of sheepskin effect with using human capital model, credential model and hybrid model.

3. Empirical Strategy

Sheepskin hypothesis testing simply ask whether return to education increase discontinuously in the year where there is graduation in education level. Proposing a methodology to determine it is by modifying Mincer specification. Mincer specification is known as income function (generally using natural log) which involves year of school completion, experience in labor market and the square of experience. Mincer income function can be written as follow:

$$\text{Log } w_i = \beta_0 + \beta_1 S_i + \beta_2 E_i + \beta_3 E_i^2 + \varepsilon, \quad (1)$$

where Wi is income of individual i. Si is the year of school completion of individual i, and Ei is working experience of individual potency i. The important implication in equation (1) is the level of school return is constant (δLogwi/δSi=β1).

When the value rate of return is different for each level of education, it means that the marginal return is also different. This condition causes the equation (1) changes from continuous to discontinuous. To make Mincer equation to be discontinuous can be conducted in three ways, first, adding dummy variable that shows the year of graduation of education level. This makes the value of marginal return will be different in the year of graduation of education level if the dummy variable is significant. Model of additional dummy variable implies marginal return outside year of graduation of education level that is considered the same. Second, modifying model of additional dummy is by adding interaction between dummy variable of year of graduation of education level and the difference between year of school completion and year of graduation of certain education level. Implication of this model results the marginal return after year of graduation of education level experiencing the difference if the interaction variable is significant. Third, modifying Mincer specification by replacing education variable which originally consists of one factor which is year of school completion with dummy variable as many as the year of the highest school completion achieved by the respondent. Then, the researcher conducts test of average difference gradually for year of school completion of t to t-1. This condition shows the difference in marginal return for each year of school completion.

Empirically, all three of the ways above are depicted in three models, there are dummy of graduation, discontinuous spline function model and step function model.

5. Model I. The use of Dummy variable

This model adds dummy credential (graduation) in Mincer equation. The addition of dummy variable D9, D12, D14 and D16 in the human capital function reflects school year in which an individual graduated the education of junior high school, senior high school, diploma and bachelor degree. This first model has a form of

$$\log W_i = \alpha_0 + rS_i + \alpha_1 D9 + \alpha_2 D12 + \alpha_3 D14 + \alpha_4 D16 + \delta E_i + \gamma E_i^2 + X_i\beta + u_i. \quad (2)$$

D9, D12, D14 and D16 are dummy variable (0.1) where D9 = 1 if S $\geq$ 9, D12 = 1 if S $\geq$ 9, D14 = 1 if S $\geq$ 14 and D16 = 1 if S $\geq$ 16. If the parameter of D9, D12, D14 and D16 in the regression estimation is significant and positive, then the equation indicates the existence of sheepskin effect. Xi as control variable is a characteristic vector of individual i.

The equation (2) divided five segments from S variable which consists of $0 < S < 9$, $9 < S < 12$, $12 < S < 14$, $14 < S < 16$ and $16 < S < \infty$. The rate of marginal return (γ) in S area is presented in the following table:

Table 4 Marginal Rate of Return across the Domain of S for Model 1

Years of Completed Schooling (S)	Marginal Rate of Return
$S < 9$	r
$S = 9$	$r + \alpha_1$
$9 < S < 12$	r
$S = 12$	$r + \alpha_2$
$12 < S < 14$	r
$S = 14$	$r + \alpha_3$
$14 < S < 16$	r
$S = 16$	$r + \alpha_4$
$S > 16$	r

6. Model II. Discontinuous Spline Function

Model II states that the relationship between income log and school has a form of discontinuous spline function where discontinue occurred in the year of graduation of education level. This model has the equation as follow:

$$\log W_i = \alpha_0 + rS_i + \alpha_1 D9 + \alpha_1'(D9)(S-9) + \alpha_2 D12 +$$
$$\alpha_2'(D12)(S-12) + \alpha_3 D14 + \alpha_3'(D14)(S-14) + \alpha_4 D16 + \alpha_4'(D16)(S-16) + \delta E_i + \gamma E_i^2 + X_i\beta +$$
$$u_i. \tag{3}$$

As in Model I, sheepskin effect in model 2 is implied in the significant and positive coefficient value of dummy variable. The difference of model 1 and model 2 is on the marginal return.

Marginal return in model 2 is made in the form of parameter for the entire of domain S presented in the following table.

Table 5 Marginal Rate of Return across the Domain of S for Model 2

Years of Completed Schooling (S)	Marginal Rate of Return
$S < 9$	r
$S = 9$	$r + \alpha_1$
$9 < S < 12$	$r + \alpha_1'$
$S = 12$	$r + \alpha_1' + \alpha_2$
$12 < S < 14$	$r + \alpha_1' + \alpha_2'$
$S = 14$	$r + \alpha_1' + \alpha_2' + \alpha_3$
$14 < S < 16$	$r + \alpha_1' + \alpha_2' + \alpha_3'$
$S = 16$	$r + \alpha_1' + \alpha_2' + \alpha_3' + \alpha_4$
$S > 16$	$r + \alpha_1' + \alpha_2' + \alpha_3' + \alpha_4'$

7. Model III. Step Function

Model III is a function to investigate the impact of school completion in the relationship between school and income conducted step by step. This model treats log of individual income as step function on each year of school completion, it has the equation as follow:

$$\log W_i = \alpha_0 + \sum_{j-1}^{K} \alpha_j Sj_i + \delta E_i + \gamma E_i^2 + X_i\beta + u_i \tag{4}$$

where K is year of highest school completion, Sji is dummy variable with the value of 1, if individual i has S = j. estimation of regression coefficient αi can be calculated as step measure

in the form of marginal return rate on the addition of school year. The case of the existence of sheepskin effect can be seen by comparing the measure of step for certain year of graduation and step measure that is appropriate with each year that leads to the graduation year.

Data and Statistical Summary

This paper uses the data of Indonesian Family Life Survey (IFLS) wave 3, 4, and 5. IFLS is a large-scale longitudinal observation of individual level and households to socio-economic and health surveys. Data used has the criteria of worker in the age between 15 years old to 65 years old, has the last education data and not at school.

The researcher does not use hourly income as dependent because there is no direct question that leads to hourly income in IFLS data. The researcher needs to involve some of other questions in IFLS questionnaire to obtain hourly income. If this is performed, the researcher is afraid that it will lead to bias due to measurement error. Therefore, the researcher uses income per year. Income in this paper is the income obtained from working (main and side job). This information is obtained in IFLS questionnaire Book 3A TK section.

Variable income made in real terms in which the year 2000 as the base year. The average income is Rp 5,780,131 with the deviation standard of Rp 7,614,323. The amount of this deviation standard indicates great imbalance in income system in Indonesia.

Education variable is made in two types of measurement; they are measure of duration of individual in completing the school (in year) and measure in the form of dummy of year of school completion. School duration data is in IFLS and in Book 3A DL section. The description of education duration in this research is consistent with the IFLS questionnaire and education rules. The result is presented in Table 6.

The average of school duration is 8.5021 years with the standard deviation of 4.4417 years; this indicates that the average respondents are at junior high school. Respondents who do not graduate elementary are nearly 21.04 percent and the respondents who have higher education level are approaching 19.42 percent. This indicates that the quality of labor seen from education level still lack. The existence of respondents who have the year of the highest school in the year where it is not the year of graduation of education level (below 4 percent) indicates the existence of respondents who are dropouts. This problem must become special concern for the government in making the policy in order to decrease the rate of dropouts.

Experience variable is the number of year from starting to work measured through an approach $(a - s - s0)$, where a is the age, s is the school duration and s0 is early age of school. It is usually call potential experience. The definition of experience in this regard is not only working experience, but also life experience outside the school and in the beginning of school. Almost all the researches in return to education use this approach. Age variable refers to book 3A; school duration is in accordance with education variable, while the early age of school is 7 years according to education age in Indonesian education system. The average of respondent experience is 21.5836 years with the deviation standard of 13.9828 years. This indicates the high variation in respondent working experience.

Control variables are used in this paper includes marital status, dummy of city, gender and dummy of employment status. Employment status is adjusted with the IFLS questionnaire that is divided into 8 types, they are working alone, working alone with the help of temporary worker, working alone with the help of permanent worker, governmental worker, private sector employee, agricultural free worker, non-agricultural free worker and unpaid worker. The researcher measures the outcome in the form of income so that the status of "unpaid worker" is not included as the respondent.

Table 6 Duration of Schooling

Educational Attainment	Duration of Schooling (years)
No Schooling	0
Did not Complete/Have not Completed Primary School	1,2,3,4,5
Primary School	6
Packet A	6
Did not Complete/Have not Completed Junior High School	7,8
Junior High School (General)	9
Junior High School (Vocational)	9
Packet B	9
Did not Complete/Have not Completed Senior High School	10,11
Senior High School (General)	12
Senior High School (Vocational)	12
Packet C	12
Diploma I/II	14
Academy/Diploma III	15
University	16
Master/PhD	20

Note: Packet A, B, and C are the informal school

Male respondent is 62.21 percent and 76.7 percent of respondent have marital status. The respondents who live in urban area are 57.09 percent. Employment status mostly had by the respondent is private worker or labor of 40.19 percent. Then, status of working alone (Sta_1) is 30 percent and status of working with the help of temporary worker (Sta_2) is 19.56 percent. Status of government worker is 8.29 percent. While the least employment status of respondent is working with the help of permanent worker (Sta_3), it is only 1.96 percent. This indicates that the interest of legal entrepreneurship of respondent is still low.

In addition, this paper also controls the province of individual residence in the form of dummy province. There are 20 provinces of respondent residence in IFLS 3 and 22 provinces of respondent residence in IFLS 4 and IFLS 5. This number of province is expanded from 13 provinces of respondent residence in the first wave of IFLS. This is due to two things; the first is the existence of province development conducted in 2000. The second is the presence of migration conducted by respondent in previous wave of IFLS. In this case, the researcher only makes 14 dummy provinces and an additional dummy of other province because the number of respondent beyond the 14 provinces is very small. In the regression model, the researcher uses dummy of DKI (Special Capital Region) province as base.

The respondent live in Java Island about 58.94 percent with the details as follow: 14.72 percent live in West Java, 14.04 percent live in East Java, 12.98 percent live in Central Java, 8.02 percent in DKI (Special Capital Region), 5.71 percent in DIY Province (Special Region of Yogyakarta) and 3.47 percent live in Banten province. While the remaining 41.06 percent spread in various provinces. North Sumatera Province is the highest residence province outside Java Island of 6.53 percent, while the residence province of respondent outside the 14 dummy provinces is only 1.76 percent.

Table 7 Definition of Variable and Statistic Summary

Variable	Definition of Variable	Mean	Standard Deviation	Min	Max
W	Individual income from work per year (in rupiah)	5,780,131	7,614,323	35,463	92,100,000

Result of Regression Analysis: Dummy of graduation, Discontinuous Spline Function and Step Function

The result of estimation model of dummy graduation is presented in Table 8. Model of additional dummy graduation provides significant result for all additional dummy graduations except D6. This indicates that marginal rate of return to education is not the same for each additional year of education in the level of junior school above. There is an increase in each the year where an individual graduates education level. For example, a person who has education level of junior high school above obtains the return of 14.2 percent higher than those who do not graduate from junior high school. Marginal return for people who do not graduate senior high school (S=8) are 3.16 percent and those who has graduated above junior high school are 17.36 percent (14.2 + 3.16). while the people who have minimum graduated from Senior High School obtain marginal return of 26.06 percent higher than those who do not graduate Senior High School (S=11) and so on. The impact of graduation in return to education is significant for all education level. Null hypothesis stated that there is no sheepskin effect (to test all five dummies simultaneously equal to zero), it is rejected on the level of 0.01 (F test statistic = 627.15).

Model of discontinuous spline function is presented in Table 9. This model does not only show the surge of return in the year where the people graduated education level, but also the existence of marginal changes for each education level. At the primary school level (D6) no surge in marginal returns and also no change in the slope of marginal return (dummy variables and interactions were not significant). At the education level of junior high school (D9), it is proven that there is a surge compared to education below junior high school (S=8) and an increase of return per year is not different (where the interaction variable is not significant). The high school level has surge return and also there is an increased return per year. The diploma one and two have not surge return but there is a decrease in returns per year. Graduates of university degree above (D16) provides a surge and increase of marginal return compared to those who have year of education of 15 years (S=15). This evidence of discontinuous spline function model supports the existence of sheepskin effect.

Estimation result of step function model is presented in Table 10. This result indicates that year of schooling of one to three years have no different return with those who do not go to school. Beginning in year of education over the 4th, the return has positive value and significant at 5 and 1 percent except S5, S7, S8, S10, S11, S13 and S15. The calculation of step size is conducted by making a difference between coefficient S_j and S_{j-1}. The error standard is obtained from different test by modifying the equation of Model III. The result shows strong significant on S9, S12, S14 and S16. This shows the existence of a surge in all levels of education. The evidence of estimation model of step also supports sheepskin effect.

All the control variables are significant at 1 % except Banten of dummy of regional is significant at 10 %.

Conclusion

The evidence of sheepskin effect or graduates effect for five level of education in Indonesia, namely primary school, junior high school, senior high school, diploma, and bachelor degree is more appropriate with the view of screening than the view of human capital in the role of education. The evidence that graduates as a signal of a person in completing the study is an important determinant of a person's income. However, it is not only graduates that has a role because after controlling the years of graduate, coefficient value of education (S) is still significant although it has smaller value than Mincer equation (M1). It is interesting because significant dummy of elementary graduates shows that 9 years compulsory education has not been fully implemented and labor market has not responded it.

The evidence of this research has an implication that in Indonesia, education has important and significant influence on individual income. By the significance of sheepskin effect or graduates effect, so the potency of education as a source of increasing worker productivity is decreased, moreover for higher educational level. So, the allocation of education should be more emphasized on primary and secondary education.

PROJECT RISK MANAGEMENT FOR PROFITABILITY

Rajwinder Singh, Punjabi University, India
Satinder Kumar, Punjabi University, India

Abstract

Project management is the area where managers face the new activities and processes. The knowledge of these processes and activities shall help us to understand and manage them for better productivity or output. In this paper an attempt has been made to classify the risks associated with projects. A structured questionnaire was developed with the consultation of practitioners and literature support. The scale reliability and validity was conducted to find the refined list of risks associated with the real estate project. These include; the social risks, financial risks, technical risks, personnel risks, cultural risks, new product development risks, reputational risks, procedural risks, and structural risks.

Key words*: Project Management, Project risk, social risks, financial risks, technical risks, personnel risks, cultural risks, new product development risks, reputational risks, procedural risks, and structural risks.*

Introduction

Projects turn dream into reality. A project is budget based, time framed, resource constrained and a unique endeavor undertaken to meet customer requirements. It accomplishes short-term and long-term goals of the organization to earn profits by harvesting market opportunities. The success of project is linked with the success of an organization preventing financial losses, maintaining customer goodwill, competitive advantage, and improved market share. However, there is a difference between the expectations and achievements resulting in project risk (Essinger and Rosen, 1991).

Project risk remained the major area of interest for the practitioners and researchers. It is due to the complex, dynamic environment of projects needing a systematic method to identify risks and uncertainty related to project constraints of cost, schedule, and quality (Zhang and Fan, 2014). The traditional definition of project risk focuses on the negative consequences (Ward & Chapman, 2003; Barber, 2004; Leihtiranta, 2014). However, the risk could have both positive as well as negative consequences. These may include opportunities and threat.

Risk management protects resources and mitigate risks (Nickson, 2001, p. 25). It needs technical approach, tactics, operations and compliance, to cope with the potential technical threats that influence the profitability and project success (Elahi, 2013). The organizations need to focus on the internal and external risks involved with projects. These risks may include external environment risks (political, social, market, integration, force majeure and legal), operational (technical), internal-technical (schedules, budgeting and finance) and internal non-technical (issues management, integration, coordination, cross-functional orientation, and team as well as administrative management) (PMI, 2009; Jaaffari, 2001; and Wideman, 1992). The technical risks are the biggest threat to profits and project success (Zhang & Fan, 2014). However, the main focus of risk management is on costs and operations using competitive strategy, tactics, operations and compliance requirements (Elahi, 2013; Hopkin, 2013). The ultimate objective of risk management is better organizational performance for profitability.

The literature survey revealed a low rate of project success. The success rate is 10% in the large software projects (The Standish Group, 2013). It is due to the fact that the software projects are mostly affected by the technical risks, and the way of doing organizational

working, i.e., organizational risks (Sanderson, 2012). The construction projects also fail at a high rate (Krause, 2006). According to Global Construction Owner's Survey, 2015 revealed that in the past three years only 31% of their projects came within 10% of budget, and just 25% within 10% of original deadlines. There is improvement in planning and risk management by project owners. However, more is needed to reduce project failures, and bring projects on time and within budget (KPMG International, 2015).

The organizational working is linked with the people and people are subjected to maximum uncertainty, contributing major risk to run organizations (Thamhain, 2013). These risks (internal and external) influence the project performance in terms of cost, quality and time in the constructive and destructive manner. The internal and external risks may appear because of the dynamic environment, design, logistics, operational, legal, construction, and financial (Akintola *et al.,* 1997). These risks have ignited the spirit of researchers and practitioners to focus on project risk for better organizational performance.

In this paper an attempt has been made to focus on the risk elements of real estate risks and organizational performance. The first section focuses on the literature survey where research gaps were highlighted. In the next section, i.e., research methodology the results were analyzed with the help of suitable tools and techniques. Finally, the future scope was discussed to extend this study.

Literature Survey

The diversity of construction projects lies in the way to address societal problems that run deeper into the construction. The construction projects help to find a solution to a variety of problems resulting the means to classify projects. Gary and Larson (2008) classified eleven engineering projects as compliance, operational, strategic or organizational. The compliance projects (must do) focus on the regulatory requirements. The operational projects (low level of urgency) focus on the improvement of operations for efficiency and effectiveness and strategic projects focus on the achievement of long-term and short-term objectives of the organization. The interaction with project managers revealed projects as small (less than 4 weeks), large (more than 4 weeks), routine, disaster, construction, research and development, government, private, national and international projects. The understanding of projects shall help project managers understand the risks associated with them.

Risk is defined as the effect of uncertainty of an event or happening to the project objectives (ISO, 2009). It has both positive as well as a negative effect on the project performance. The researchers and practitioners view risk from different angles. Many researchers have focused on 'risk factors' which is a situation germinating risk and increasing chances of risk happening, however, it don't cause to miss a schedule, product or resource target (Benaroch et al., 2006), sources of risk or uncertainty factors (Aloini et al., 2007), and critical success factors or risk drivers or risk items (Tiwana and Keil, 2004). The sources of risk may include schedule, resource, quality, cost, scope, material, machinery, equipment, legal, stakeholders and technology. Also, sector wise the risks and factors of risks are stated in different ways.

Tah and Carr (2001), revealed that in construction sector risk factors don't affect risk directly but through the risks. The construction sector uses financial, organizational, and contractual aspects/means to manage risks. The financial aspects focus on the use of bonds, insurance, etc., for financial protection. Organizational aspect executes project strategies through combining the system of program management, portfolio management, and project management (PMI, 2013).

1.   Classification of Real Estate Project Related Risks

Project managers face inevitable risks. These risks may be internal (labor demands, safety issues, quality issues, and financial problems, etc.) and external (natural disaster, policy

change, and uncontrollable issues etc.) associated with the projects (Lee et al., 2009). In this section the following project risks are selected with the help of practitioners and literature:

A.   **The social risks**: These are major obstacles before the proponents and financiers of big projects. Tong and Zhang (2007), defined the social risk as the risk in any field that influences the society as a whole resulting social turbulence and unrest. Social risks are classified into the following categories as per the views of the real estate project practitioners and researchers:

a.   **Stakeholder risk**: Project risk management in the social context, closely focuses on the management of stakeholders including; contractors, employees, community and the public (Aaltonen, 2011; de Bakker et al., 2010). Project managers revealed compensation related issues with the land holders and property dealers. They also pointed; increased product cost, quality, availability of easy and low interest finance, and the timely delivery are the issues associated with the customer. The project employees revealed the problems of long working hours, difficult targets, slow economy, layoffs, job security, shrinking future employment opportunities, reduced order of suppliers and stressful working environment. The investors admitted, real estate is a risky business as the customer base has been reduced and input supply costs are increasing. Also, the trade barriers and acquisition of material inputs pose difficulties. The community members revealed the problems of noise and air pollution, heavy traffic resulting difficulty in commuting, social interference, increased stress and small job opportunities. It was also revealed that people recommended for the job by politicians create a nuisance.

b.   **Value Risk**: Value risks focus on the value for money using resources efficiently and effectively. Uncertain valuation and lack of communication are the main issues leading to low business value of projects. According to INFOQ (2016), the uncertain valuation results due to: lack of project value, unknown project value, and failures to deliver expected value. They also added that project communication related issues involve-project delivering the wrong value and no involvement of investors in the investment process. Value risk management focuses on how project managers use value engineering to deliver better value to the customers (Michael, 2006). Many project managers revealed focus on the valid scores for assessment of business and technology value, and risk for technology and business value. Project managers calculate risk value as a product of probability of risk and cost of risk.

c.   **Environmental Risk**: The environmental risks include the risks from the environment and risks from the projects. Project managers revealed, the risks from environment include natural disasters, legal, political, economic and social disturbance. The internal risk may include social disturbance, water level and its pollution, etc. These risks are connected from the source to different project domains (de Bruijn et al., 1999). They may occur simultaneously and are spread over wide areas of the globe. It is difficult to evaluate exactly these risks. They shall be transmitted through society, air, water, soil, and through human contact or interaction. Environmental risks are the result of natural or man-made disasters (Cameron, 2006).

d.   **Information Risk**: Information risk management focuses on identifying, assessing, and controlling risks related to information systems. Information related risk may include; privacy, records and information management, information security, and e-discovery. High quality information is needed to reduce information risk resulting better organizational efficiency, better customer service and company image (Iron, 2002). Project managers revealed that organizations must provide the quality information to the customers, otherwise, the chances of litigations may be there. Many

researchers revealed the corporate frauds with misleading information resulting overall collapse of the organization (Ranikin, 2003; Michaels, 2002). Troy and Heather (2007), in their information construct focused on individual information management risk factors. They classify them as; records in the organizational structure, staff and training needs, creation and capture, vital records and disaster management, physical storage, disposal, control, maintenance, electronic document management, paper record keeping systems, and electronic record keeping systems. Managers need to focus on the information risk for gaining profits.

e.   **Organizational Risk**: Organizational or business risks appear, if the projects fail to deliver the customer specifications or counter change resistance. Many researchers revealed resistance to change as a major organizational risk (Kim, 2011; Rivard & Lapointe, 2012; Lundy & Morin, 2013). Resistance is a complex phenomenon resulting due to; stress, threats, uncertainty, innate conservatism, and lack of involvement or felt needs (Hirschheim & Newman, 1988; and Marakas & Hornik, 1996). Simon et al. (2015), in their study of software project management collected the sources of resistance from various studies as; lack of top management commitment, past outcomes, perceived threats, organizational politics, directs costs, capability gaps, collective action problems, myopia, conservatism, reactive mindset, incommensurable beliefs, groupthink, speed and complexity, and lack of perceived value.

f.   **Physical Risks**: Physical risks are linked to tangible components of project completion like raw material, equipment, water and land, etc. The managers need to focus on the factors that shall be affected by climate change such as supplies to a project. They also involve accidents, natural disaster, and death, etc., resulting threat to the project progress (CDC, 2016, p. 7). Physical risks are major risk in the infrastructure projects (Miller & Lessard, 2001).

g.   **Subcontractor related Risks**: Nowadays, subcontractor risks are quite dominant. It is due to high involvement of the subcontractors in project activities. Many project managers revealed that the economic downturn has impacted many construction projects with strain in the balance sheet of subcontractors and contractors (Bredillet, 2008). Project stakeholders generally overlook these risks (Zavadskas et al., 2010). These risks are critical components of project governance.

B.   **Financial Risks**: These risks are the most fundamental to ensure the project progress. The project managers face with inflation, fluctuating rate of interests and exchange rates, accidents resulting need for insurance, credit availability, rules and regulations demanding project money, etc. (Kolhatkar & Dutta, 2013).

C.   **Technical Risks**: The technical risks are also the biggest threat to the project success (Zhang & Fan, 2014). Project managers revealed that these risks are related to information, technology and constraints that help project managers to grab better market share. Project managers need to develop competency to face the technical risk for rewarding results (Browning, 2006)

D.   **Personnel Risks**: Personnel risks are part of human resource management (HRM) remained the subject of interest in the field of project management (Dey, 2000; Jaafari, 2001). The risk management and HRM are very closely knitted fields. Nickson (2001), quoted, "Risk management is about mitigating risk and protecting resources. What is the most valuable resource of any company? Its people." Ryanes et al. (2002), revealed the core HR areas; management practices (leadership, employee involvement,

motivation, performance management, and HR roles, etc.), general employment practices (performance appraisal, legal issues and employee attitude), training and development, staffing (recruitment, career planning and selection), compensation and benefits (pay structures, compensation strategies and effectiveness). The knowledge of these risks shall help to better manage human issues.

E.   **Cultural Risks**: The knowledge of culture is very important for project managers. Hofstede, (2008, p. 9), defined culture, "the collective programming of the mind which distinguishes the members of one group or category of people from another."Culture risk remained the difficulty area for the project managers (Chan & Raymond, 2003; Fellows, 2010) impacting economic performance of the construction industry (Casson, 1993; Fellows, 2010). It affects the way risk is perceived and resolved in projects (Zwikael and Ahn, 2011). Culture shall be divided into individual, organizational, regional and national (Hu et al., 2011). The sub-cultures of a culture also exist. The individual culture has professional ethics, language differences, recognition between local and outsider (Fellows & Liu, 2013). The sub-cultures unite as the move is there from the individual, to the national culture. Different countries have different attitude, experiences, legal, social, cultural aspects, and patterns of response resulting conflicts among stakeholders working together from the different areas (Liu & Wu, 2008; Hofstede et al., 2010; Hu et al., 2011). The organizational cultures are embedded in the national culture, with elements of organizational culture, procedure and employees' attitude or expectation (Kogut & Singh, 1988). The national cultural differences outweigh the effectiveness and intensity of the risk management process (Zwikael & Ahn, 2011). There is variability of culture from society to society, making, mandatory for project managers assess related risks (Hofstede et al., 2010).

F.   **New Product Development Risks**: New product development (NPD) poses difficulty for project managers in understanding interdependencies between risk involved and stakeholder initiatives to identify risks. The risks in NPD projects shall vary from assignment to assignment. For example, power generation projects face the network implication which differs in voltage and frequency, supply chain transmission reliability to build longevity in the solution. This uncertainty results into delays and cost overrun (Ackerman et al., 2014). NPD is also the biggest challenge for project managers.

G.   **Reputational Risk**: The reputation of a company is strongly associated with future growth or success of ongoing or future projects. Lost reputation shall drastically fail projects. Rebecca et al. (2016), in their green project study in Australia and China show that reputation risk is significant in both countries, however, the ethical risk of assessment experience and fairness is critical in China. The traditional conservative and reactive behavior of stakeholders is a major risk for building green projects (Bullen & Love, 2010). Managers need to understand risk and innovate informed risk management plans to reduce risks (de Bakker et al., 2012).

H.   **Procedural Risk**: This risk appears in case of no accountability and inefficient procedures and steps taken to complete project activities. It shall result in frauds, inefficient performance and conflicts. These risks are quite visible in the infrastructure projects (Harwood & Warburton, 2004).

I.   **Structural Risk**: These risks appear due to faulty structure to handle dangerous inputs, their processing or handling and storing. These risks may appear across

group of projects and potential interdependence components (Aritua et al., 2009). The project managers need to focus on these type of risks (PMI, 2013).

Research Methodology

This research is an effort to understand the risks associated with real estate projects. A structured questionnaire was developed in consultation of project professionals and literature support. Later, a pilot survey was conducted by randomly selecting 250 respondents from the real estate sector at the level of managers and above with receipt of 50 (25 project managers, 10 finance managers, 5 Architectures, 5 purchase managers, and 5 marketing managers) responses leading to 20 percent response rate. A 7 point Likert scale was used to rate the responses. The scale was tested for reliability using scale reliability coefficient Cronbach's Alpha greater than 0.07. Also, the item-to-total correlation of greater than 0.5 and inter-item correlation greater than 0.3 was used to retain only valid variables on the scale (Hair et al., 2009). The results obtained after scale reliability and validity were used to calculate response mean. The mean values were again discussed with then project professionals for identification of potential risks in the each category. The results are discussed in the following sections.

Data Analysis and Interpretation

The data were digitized on SPSS software and analysis was conducted. The results show the need to understand risks for better project execution. The detailed discussion is as follows:

1. **The social risks**: These are major obstacles before the proponents and financiers of big projects. Social risks highly relate to the social security and stability. The analysis shows the major types of social risk as follow:

1.1.1 **Customer Risks**: The results of customer risks are shown in Table 1 below. These risks include seven risk components. The results show that the product quality, easy loan availability, and increasing product cost are the major threats to the real estate sector. This scale has scale reliability coefficient Cronbach's alpha of 0.893 showing significance to accept this scale (Hair et al., 2009) with mean 35.24 if all seven risks were rated on the 7 point Likert scale shows 71.91 percent construct explained.

Table 1: Scale statistics for customer risks

Customer risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Increasing product cost (CR1)	.670	.758	5.1600	1.05676
2. Product Quality (CR2)	.781	.906	5.2000	1.04978
3. Loan availability (CR3)	.773	.895	5.2000	1.04978
4. Rate of interest (CR4)	.640	.614	4.8000	1.17803
5. On-time delivery (CR5)	.604	.583	4.6800	1.33156
6. After sale maintenance (CR6)	.711	.900	5.0800	1.17526
7. Employee Behavior (CR8)	.700	.902	5.1200	1.13641
Cronbach's Alfa=0.893, Inter-item-correlation (Mini=0.342, Max=0.554), SD=6.245, Mean=35.24, Variance=39.9, No of variables=7				

1.1.2 **Employee Risks**: The results of employee risks are shown in the Table 2 below. It shows a mean of 36 on the 7 point Likert scale showing 64.3 percent construct explained with

the scale reliability coefficient Cronbach's Alpha of 0.913. The results show the long working hours and difficult targets as the major risks for the employees.

Table 2: Scale statistics for employee risks

Employee risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Long working hours (ER1)	.682	.958	5.9200	1.67624
2. Difficult targets (ER2)	.749	.947	5.3800	1.49680
3. Slow economy (ER3)	.887	.952	5.1000	1.32865
4. Fear of layoff (ER4)	.898	.886	4.6000	1.16058
5. Job security (ER5)	.846	.728	4.2800	1.12558
6. Stressful environment (ER7)	.583	.747	3.5000	1.23305
7. Dim future employment opportunities (ER8)	.531	.828	3.3800	1.24360
8. Trade barriers (ER9)	.653	.752	3.8400	1.21823
Cronbach's Alfa=0.913, Inter-item-correlation (Mini=0.083, Max=0.864), SD=8.34, Mean=36.0, Variance=69.5, No of variables=8				

1.1.3 Investor Risks: The results of investor risks are shown in the Table 3 below. The results show mean of 43.82 on the 7 point Likert scale showing 69.6 percent construct explained with the scale reliability coefficient Cronbach's Alpha of 0.920. The results show the feeling of risky investment, political pressure, reducing customer base and increasing project costs are the major risks for the investors.

Table 3: Scale statistics for investors' risks

Investors Risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Risky investment (RFE1)	.739	.994	6.520	1.48791
2. Reducing customer base (RFR2)	.894	.992	5.820	1.32002
3. Increasing project costs (RFE3)	.956	.981	5.000	1.27775
4. Stressful investment (RFE4)	.903	.995	4.280	1.35586
5. High competition (RFE5)	.736	.996	3.560	1.56701
6. Political pressure (RFE6)	.483	.833	6.280	1.84103
7. Politically recommended employee behavior (RFE8)	.560	.548	4.680	1.42055
8. Risk tolerance for stakeholder satisfaction (RFE9)	.772	.839	4.280	1.44335
9. Risky stakeholder turnover for project (RFE10)	.559	.697	3.400	1.56492
Cronbach's Alfa=0.920, Inter-item-correlation (Mini=0.102, Max=0.962), SD=10.417, Mean=43.82, Variance=108.5, No of variables=9				

1. 1.4 **Community Risks**: The results of community risks are shown in the Table 4 below. The results show mean of 20.68 on the 7 point Likert scale showing 59.1 percent construct explained with the scale reliability coefficient Cronbach's Alpha of 0.938. The results show the feeling of noise disturbance, heavy traffic, and stressed life are the major three risks for the community.

Table 4: Scale statistics for community risks

Community Risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Noise disturbance (RTE1)	.846	.808	4.5600	1.63083
2. Air pollution (RTE2)	.843	.759	3.8800	1.42342
3. Heavy traffic (RTE3)	.874	.817	4.4000	1.52530
4. Social interference(RTE4)	.861	.766	3.6800	1.37678
5. Stressed life (RTE5)	.762	.682	4.1600	1.62078
Cronbach's Alfa=0.938, Inter-item-correlation (Mini=0.629, Max=0.843), SD=6.78, Mean=20.68, Variance=46.22, No of variables=5				

1.2. **Value Risk**: Value risk focuses on the value for money using resources efficiently   and effectively. The major value risks are discussed as follow:

1.2.1 **Uncertain valuation Risks**: The results of uncertain valuation risks are shown in the Table 5 below. The results show mean of 16.08 at the 7 point Likert scale showing 76.6 percent construct explained with the scale reliability coefficient Cronbach's Alpha of 0.803. The results show the lack of project value and unknown project value are the major risks for uncertain project valuation.

Table 5: Scale statistics for uncertain valuation risks

Uncertain Valuation Risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of project value (UV1)	.731	.802	5.6000	1.12486
2. Unknown project value (UV2)	.826	.823	5.4800	1.12920
3. Fail to deliver expected value (UV3)	.432	.242	5.0000	1.14286
Cronbach's Alfa=0.803, Inter-item-correlation (Mini=0.365, Max=0.893), SD=2.877, Mean=16.08, Variance=8.279, No of variables=3				

1.2.2 **Communication related risks**: The results of communication related risks are shown in the Table 6 below. The results show mean of 55.82 at the 7 point Likert scale showing 79.7 percent construct explained with the scale reliability coefficient Cronbach's Alpha of 0.93. The results show the lack of focus on the right frequency, time and point; team involvement; lack of right communication; and lack of community communication are the major risk associated with project communication.

Table 6: Scale statistics for communication related risks

Communication risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Communicating wrong value (IRR1)	.791	.662	5.560	1.34255
2. Not involving investors (IRR2)	.814	.705	5.540	1.35842
3. Lack of team involvement (IRR3)	.610	.635	5.740	1.02639
4. Focus on right: frequency, time and point (IRR4)	.927	.931	5.760	.89351
5. Record keeping and authorized circulation (IRR5)	.791	.680	5.580	1.26314
6. Lack of competitive communication (IRR6)	.529	.517	5.480	1.43200
7. Miscommunication results conflicts (IRR7)	.845	.776	5.420	1.65480
8. Not aligning communication with project objectives (IRR8)	.797	.664	5.540	1.41724
9. Lack of community communication (IRR9)	.789	.662	5.580	1.29505
10. Lack of right communication method (IRR10)	.761	.638	5.620	1.19335
Cronbach's Alfa=0.93, Inter-item-correlation (Mini=0.36, Max=0.815), SD=10.46, Mean=55.82, Variance=109.5, No of variables=10				

1.3 **Environmental Risk**: Environmental risks focus on the internal and external environmental components of the risk. The major environmental risks are discussed as follow:

1.3.1 **Risks from the environment**: The results of risk from the environment are shown in the Table 7 below. The results show mean of 31.6 at the 7 point Likert scale of 90.2 percent construct explained with the scale reliability coefficient Cronbach's Alpha of 0.835.

The results show the natural disaster, legal risks of non-compliance, social disturbance and economic fluctuations as the major four risks from the environment.

Table 7: Scale statistics for risk from the environment

Risk from the environment	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Natural disaster (ERO1)	.611	.930	6.7200	.90441
2. Legal risks of non-compliance (ERO2)	.741	.944	6.6400	.92051
3. Social disturbance (ERO3)	.608	.435	6.3600	1.17387
4. Economic fluctuation (ERO4)	.698	.532	6.1000	1.51523
5. Political environment (ERO5)	.724	.603	5.8400	1.89909
Cronbach's Alfa=0.835, Inter-item-correlation (Mini=0.328, Max=0.955), SD=5.18, Mean=31.6, Variance=26.92, No of variables=5				

1.3.2 **Risks to the environment**: The results of the risks to the environment are shown in the Table 8 below. The results show mean of 28.24 at the 7 point Likert scale of 80.7 percent

construct explained with the scale reliability coefficient Cronbach's Alpha of 0.977. The results show the transportation hurdles, noise pollution, and social disturbances are the main risks to the environment.

Table 8: Scale statistics for risk to environment

Risk to environment	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Social disturbance (ERI1)	.900	.865	5.5800	2.30430
2. Affected water levels (ERI2)	.926	.896	5.4400	2.65852
3. Air pollution (ERI3)	.960	.938	5.4400	2.65852
4. Noise pollution (ERI4)	.975	.979	5.7800	2.19731
5. Transportation hurdles (ERI5)	.968	.972	6.0000	1.81827
Cronbach's Alfa=0.977, Inter-item-correlation (Mini=0.830, Max=0.986), SD=11.23, Mean=28.24, Variance=126.145, No of variables=5				

1.4 **Information Risk**: Information risk management focuses on identifying, assessing, and controlling risks related to information systems. The major information related risks are shown in Table 9. The results show mean of 55.8 for 7 point Likert scale explaining 79.71 percent of the construct with scale reliability coefficient Cronbach's Alpha of 0.939. The major information risks include information management, information security, not maintaining individual records, corporate frauds and no e-discovery focus.

Table 9: Scale statistics for information related risks

Information related risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. No privacy of business opportunities (IRR1)	.791	.662	5.5600	1.34255
2. No updated records (IRR2)	.814	.705	5.5400	1.35842
3. No information management (IRR3)	.610	.635	5.7400	1.02639
4. Lack of information security (IRR4)	.927	.931	5.7600	.89351
5. No e-discovery focus (IRR5)	.791	.680	5.5800	1.26314
6. Not maintaining information quality (IRR6)	.529	.517	5.4800	1.43200
7. Not providing right information to stakeholders (IRR7)	.845	.776	5.4200	1.65480
8. Information dissatisfaction (IRR8)	.797	.664	5.5400	1.41724
9. Corporate frauds (IRR9)	.789	.662	5.5800	1.29505
10. Not maintaining individual records (IRR10)	.761	.638	5.6200	1.19335
Cronbach's Alfa=0.939, Inter-item-correlation (Mini=0.361, Max=0.815), SD=10.5, Mean=55.8, Variance=109.5, No of variables=10				

1.5 **Organizational Risk**: Organization risk also play an important role in the business success. The major organizational risks are shown as follow:

Table 10: Scale statistics for customer specification related risks

Customer specification risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Failure to deliver as per specification (CS1)	.844	.902	4.4800	2.42639
2. Not involving stakeholders in the specification design and communication (CS2)	.662	.582	4.6600	1.98577
3. Incorrect interpretation of specification (CS3)	.596	.440	4.8400	1.62078
4. Documentation error (CS4)	.428	.312	5.0200	1.39225
5. Selection of wrong method and procedures (CS5)	.949	.972	4.1600	2.33308
6. Lack of integration (CS6)	.710	.541	4.1400	2.53152
7. Lack of coordination & Collaboration (CS7)	.773	.697	3.9000	2.49285
8. Organizational structuring (CS8)	.821	.784	3.9000	2.49285
9. Disruption by merger & acquisition (CS9)	.805	.719	3.9800	2.41162
10. Delay in approval process (CS10)	.898	.912	4.0600	2.35961
11. Lack of control (CS11)	.890	.912	4.1400	2.33876
Cronbach's Alfa=0.947, Inter-item-correlation (Mini=0.283, Max=0.955), SD=19.9, Mean=47.28, Variance=399.78, No of variables=11				

1.5.1 **Customer specifications related risks**: The results of customer specification risks are shown in the Table 10 below. It has mean value of 47.28 rated on a 7 point Likert explains 61.4 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.947. The results show the documentation error, incorrect interpretation of specifications, and not involving stakeholders in the specification design and communication are the major risks.

1.5.2 **Resistance to change risks**: The results of resistance to change risks are shown in the Table 11 below. It has mean of 38.8 rated on 7 point Likert scale with 79.18 percent construct explained and the scale reliability coefficient Cronbach's Alpha of 0.895. The results show the resistance to change, innate conservatism and lack of direction and High change cost are the major risks in this construct.

Table 11: Scale statistics for resistance to change risks

Resistance to change risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1 Resistance to change (RTC1)	.606	.435	5.8000	1.26168
2. Innate conservatism and lack of direction (RTC2)	.509	.318	5.7800	1.25014
3. High change cost (RTC3)	.682	.494	5.7000	1.26572
4. Reactive mindset, beliefs and groupthink (RTC4)	.669	.484	5.5600	1.34255
5.Past project outcomes (RTC5)	.800	.680	5.4800	1.50156
6. Lack of top management commitment (RTC6)	.882	.809	5.4000	1.69031
7.Organizational politics (RTC7)	.767	.649	5.1600	1.98319
Cronbach's Alfa=0.895, Inter-item-correlation (Mini=0.282, Max=0.807), SD=8.186, Mean=38.8, Variance=67.0, No of variables=7				

1.6 **Physical Risks**: Physical risks are linked with tangible inputs to the projects. The analyses of physical risks are shown in Table 12, with a mean value of 31.44, on 7 point Likert scale explaining 74.86 percent of the construct, with Cronbach's Alpha at 0.851. Risks include accidents, raw material, and machinery and equipment.

Table 12: Scale statistics for physical risks

Physical Risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Accidents (PHR1)	.632	.533	5.4800	1.47413
2. Raw material (PHR2)	.517	.372	5.3200	1.40611
3. Machinery and equipment (PHR3)	.797	.661	5.3200	1.40611
4. Low water quality (PHR4)	.594	.391	5.1600	1.43371
5. Substandard land quality (PHR5)	.777	.649	5.1600	1.54339
6. Climate and geography (PHR6)	.526	.444	5.0000	1.65369
Cronbach's Alfa=0.851, Inter-item-correlation (Mini=0.219, Max=0.700), SD=6.76, Mean=31.44, Variance=45.76, No of variables=6				

1.7 **Subcontractor related Risks**: Subcontractor risks are due to the dependency on subcontractors to complete projects. The data analysis results of subcontractor related risks are shown in Table 13. It has a mean value of 38.9, rated on 7 point Likert scale explains 61.74 percent of the construct with scale reliability coefficient Cronbach's Alpha of 0.923. The major risks include: bad relations, economic slowdowns, no qualifying criteria, and lack of responsibility.

Table 13: Scale statistics for subcontractor related risks

Subcontractor related risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Bad relations (SRR1)	.561	.996	4.6000	1.47080
2. Economic slowdown (SRR2)	.686	.996	4.5200	1.35887
3. No qualifying criteria (SRR3)	.815	.804	4.4800	1.28158

4. Lack of responsibility (SRR4)	.799	.801	4.3600	1.25779
5. Improper method of selection (SRR5)	.686	.521	4.2400	1.31801
6. Using improper and undefined work procedures (SRR6)	.770	.718	4.2000	1.44279
7. Not maintaining contingency (SRR7)	.808	.908	4.1600	1.58256
8. No definite and time bound decisions (SRR8)	.715	.733	4.1600	1.48956
9. Lack of collective knowledge of financing agencies, insurer, surety brokers, and joint venture partners (SRR9)	.711	.780	4.1800	1.40973
Cronbach's Alfa=0.923, Inter-item-correlation (Mini=0.225, Max=0.984), SD=9.96, Mean=38.9, Variance=99.15, No of variables=9				

2. **Financial Risks**: These risks are the most fundamental to ensure the project progress. The data analysis results of financial risks are shown in Table 14. It has a mean value of 33.14, rated on 7 point Likert scale explains 67.63 percent of the construct with scale reliability coefficient Cronbach's Alpha of 0.911. The major risks include: inflation, fluctuating rates of interest and exchange rates, accidents resulting need for insurance, and no credit availability.

Table 14: Scale statistics for financial risks

Financial risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Inflation (FR1)	.566	.645	5.0000	1.69031
2.fluctuating rate of interests and exchange rates (FR2)	.741	.716	4.9400	1.60878
3. Accidents resulting need for insurance (FR3)	.853	.802	4.8800	1.56022
4. No credit availability (FR4)	.928	.874	4.8200	1.54774
5. Not following rules and regulations (FR5)	.623	.485	4.5600	1.59284
6. Inefficient forecasting (FR6)	.728	.685	4.5000	1.76416
7. Resource shortfall (FR7)	.721	.757	4.4400	1.94999
Cronbach's Alfa=0.911, Inter-item-correlation (Mini=0.248, Max=0.870), SD=9.48, Mean=33.14, Variance=89.91, No of variables=7				

3. **Technical Risks**: These risks are the biggest threat to profits and project success. The data analysis results of technical risks are shown in Table 15. It has a mean value of 37.74, rated on 7 point Likert scale explains 59.9 percent of the construct with scale reliability coefficient Cronbach's Alpha of 0.945. The major risks include: lack of technical competency, lack of IT, and Lack of technical infrastructure (tools, machines and equipment).

Table 15: Scale statistics for technical risks

Technical risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of IT (TR1)	.700	.584	4.3000	1.97174
2. Lack of technical competency (TR2)	.812	.692	4.3400	1.92311
3. Lack of technical infrastructure (tools, machines and equipment)	.800	.729	4.2600	1.87148

(TR3)				
4. Inflexible architecture (TR4)	.788	.814	4.1800	1.85923
5. Infeasible architectures (TR5)	.721	.596	4.1000	1.88712
6. Inflexible designs (TR6)	.802	.676	4.1400	1.94842
7. Infeasible design (TR7)	.762	.722	4.0600	1.99397
8. Non-scalable technology and unreliable components (TR8)	.854	.809	4.1800	1.94506
9. Operational difficulty of adopted technology (TR9)	.827	.800	4.1800	1.88105
Cronbach's Alfa=0.945, Inter-item-correlation (Mini=0.483, Max=0.831), SD=14.39, Mean=37.74, Variance=207.34, No of variables=9				

4. **Personnel Risks**: These risks are part of human resource management. These risks are explained in the following sections.

4.1 **Management practices related risks**: The results of management practices related risks are shown in the Table 16. It has mean value of 23.8 rated on a 7 point Likert explains 68.0 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.881. The results show the lack of leadership, lack of employee involvement, and lack of employee motivation are the major risks.

Table 16: Scale statistics for management practices related risks

management practices related risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of leadership (MP1)	.691	.513	4.9600	1.91620
2. Lack of employee involvement (MP2)	.734	.557	4.8600	1.82958
3. Lack of employee motivation (MP3)	.750	.563	4.7600	1.79068
4. Lack of Performance management system (MP4)	.728	.546	4.6600	1.80261
5. No HR Roles (MP5)	.677	.493	4.5600	1.86438
Cronbach's Alfa=0.881, Inter-item-correlation (Mini=0.498, Max=0.662), SD=7.58, Mean=23.8, Variance=57.47, No of variables=5				

4.2 **General employment related risks**: The results of general employment related risks are shown in the Table 17. It has mean value of 20.56 rated on a 7 point Likert explains 73.42 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.886. The results show the destructive employee attitude, lack of training and development, and failure to handle legal issues are the major risks.

Table 17: Scale statistics for general employment related risks

employment related risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of performance appraisal (GEP1).	.725	.658	5.0600	1.76601
2. Failure in handling legal issues (GEP2).	.671	.623	5.1000	1.76416
3. Destructive employee attitude (GEP3).	.792	.807	5.2600	1.65134
4. Lack of training and development (GEP4).	.680	.769	5.1400	1.73805
Cronbach's Alfa=0.866, Inter-item-correlation (Mini=0.435, Max=0.876), SD=5.58, Mean=20.56, Variance=34.57, No of variables=4				

4.2 **Staffing related risks**: The results of staffing related risks are shown in the Table 18. It has mean value of 19.2, rated on a 7 point Likert explains 91.42 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.862. The results show improper recruitment policy and lack of career planning as the major risks.

Table 18: Scale statistics for staffing related risks

Staffing risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Improper recruitment policy (STR1)	.821	.675	6.6400	1.43939
2. Lack of career planning (STR2)	.722	.571	6.3200	1.81198
3. Undefined selection policy (STR3)	.706	.535	6.2400	1.84678
Cronbach's Alfa=0.862, Inter-item-correlation (Mini=0.611, Max=0.749), SD=4.54, Mean=19.2, Variance=20.62, No of variables=3				

3.3   **Compensation and benefits related risks**: The results of compensation and benefits related risks are shown in the Table 19. It has mean value of 19.2, rated on a 7 point Likert explains 91.42 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.862. The results show the lack of well defined pay structures as a major risk.

Table 19: Scale statistics for compensation and benefits related risks

Compensation and benefit risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of well defined pay structures (CB1)	.721	.520	4.2400	2.11467
2. Lack of compensation strategies and policies (CB2)	.721	.520	3.9000	2.25198
Cronbach's Alfa=0.837, Inter-item-correlation (Mini=0.721, Max=0.721), SD=4.05, Mean=8.14, Variance=16.4, No of variables=2				

5. **Cultural Risks**: The knowledge of culture is very important for project managers. These risks are explained in the following sections.

5.1 **Individual culture related risks**: The results of individual culture related risks are shown in the Table 20. It has mean value of 14.86, rated on a 7 point Likert explains 70.76 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.788. The results show that lack of ethics, lack of understanding of language differences, and lack of knowledge recognition local and outsider as the major risks.

Table 20: Scale statistics for individual culture related risks

Individual culture risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of ethics (ICR1)	.648	.443	4.960	1.47025
2. Lack of understanding of language differences (ICR2)	.678	.471	4.980	1.44970
3. Lack of knowledge recognition local and outsider (ICR3)	.562	.317	4.920	1.41190
Cronbach's Alfa=0.788, Inter-item-correlation (Mini=0.49, Max=0.641), SD=3.63, Mean=14.86, Variance=13.18, No of variables=3				

5.2 **Organizational culture related risks**: The results of organizational culture related risks are shown in the Table 21. It has mean value of 23.4, rated on a 7 point Likert explains 83.57 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.888. The results show that lack of understanding of organizational culture, lack of understanding of policies and procedures of the organization, and employee attitude as the major risks.

Table 21: Scale statistics for organizational culture related risks

Organizational culture related risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of understanding of organizational culture (OCR1)	.741	.557	5.860	1.87366
2. Lack of understanding of policies and procedures of the organization (OCR2)	.797	.635	5.960	1.73746
3. Employee attitude (OCR3)	.748	.564	5.820	1.88105
4. Over expectation of employees (OCR4)	.738	.548	5.780	1.90905
Cronbach's Alfa=0.888, Inter-item-correlation (Mini=0.630, Max=0.700), SD=6.4, Mean=23.4, Variance=41.06, No of variables=4				

5.3 **Regional cultural risks**: The results of regional cultural risks are shown in the Table 22. It has mean value of 23.4, rated on a 7 point Likert explains 83.57 percent of the construct with the scale reliability coefficient Cronbach's Alpha of 0.888. The results show that lack of understanding of regional differences and lack of knowledge of regional motivational means as the major risks.

Table 22: Scale statistics for regional cultural risks

Regional cultural risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of understanding of regional differences (RCR1)	.458	.257	5.9600	1.26103
2. Lack of knowledge of regional motivational means (RCR2)	.511	.264	5.9000	1.23305
3. Lack of regional ethics and attitude (RCR3)	.446	.242	5.8000	1.24540
4. Lack of understanding regional languages (RCR4)	.632	.402	5.7600	1.33340
Cronbach's Alfa=0.722, Inter-item-correlation (Mini=0.229, Max=0.480), SD=3.74, Mean=23.42, Variance=14.04, No of variables=4				

5. **New Product Development Risks**: New product development poses difficulty for project managers in understanding the risk involved. The results of NPD risks are shown in the Table 23. The mean of 40.2 with rating on 7 point Likert scale explains 82.04 percent construct with Cronbach's Alfa of 0.906. The major risks include lack of inter-firm design sharing, lack of knowledge regarding strategic change, and lack of customer involvement or customer expectation knowledge.

Table 23: Scale statistics for new product development risks

New product development risks	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lack of inter-firm design sharing (NPD1)	.679	.563	5.900	1.31320
2. Lack of knowledge regarding strategic change (NPD2)	.700	.571	5.880	1.30368
3. Lack of customer involvement or customer expectation knowledge (NPD3)	.700	.509	5.780	1.28238
4. Lack of concurrent engineering and collaborative planning and forecasting (NPD4)	.802	.658	5.720	1.34073
5. Issues management (NPD5)	.780	.673	5.640	1.43939
6. Sourcing risks NPD (NPD6)	.725	.649	5.560	1.57998
7. Unavailability of high skill manpower (NPD7)	.666	.461	5.720	1.51240
Cronbach's Alfa=0.906, Inter-item-correlation (Mini=0.431, Max=0.763), SD=7.83, Mean=40.2, Variance=61.347, No of variables=7				

5. **Reputation Risks**: The reputation of a company helps future growth of projects. Lost reputation shall drastically fail projects.. The results of reputation risks analysis are shown in the Table 24. The mean of 62.26 with rating on 7 point Likert scale explains 88.94 percent construct with Cronbach's Alfa of 0.915. The major risks include: lost reputation, unethical risk assessment, lack of experienced manpower, and project failure.

Table 24: Scale statistics for reputation risks

Reputation risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Lost reputation (ReR1)	.673	.621	6.320	1.09619
2. Unethical risk assessment (ReR2)	.738	.673	6.300	1.09265
3. Lack of experienced manpower (ReR3)	.711	.558	6.260	1.12141
4. Not meeting the commitments (ReR4)	.649	.430	6.220	1.14802
5. Outside organization risk control (ReR5)	.669	.452	6.200	1.19523
6. Lack of understanding of stakeholders (ReR6)	.648	.435	6.160	1.25129
7. Reputation-realty gap (ReR7)	.638	.483	6.080	1.54972
8. Changing beliefs and expectations (ReR8)	.619	.460	6.220	1.25014
9. Weak internal coordination (ReR9)	.753	.587	6.240	1.20475
10. Project failure (ReR10)	.837	.712	6.260	1.13946
Cronbach's Alfa=0.915, Inter-item-correlation (Mini=0.321, Max=0.719), SD=9.125, Mean=62.26, Variance=83.258, No of variables=10				

6. **Procedural Risks**: These risks appear due to lack of accountability and inefficient procedures to complete project activities. The data analysis results of procedural risks are shown in the Table 25. The mean of 23.28 with rating on 7 point Likert scale explains 66.51 percent construct with Cronbach's Alfa of 0.936. The major risks include lack of accountability, inefficient procedures and steps taken to complete project activities, and inefficient performance.

Table 25: Scale statistics for procedural risks

Procedural risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1, Lack of accountability (PrR1)	.705	.805	4.7200	1.27839
2. Inefficient procedures and steps taken to complete project activities (PrR2)	.843	.880	4.7000	1.21638
3.inefficient performance (PrR3)	.854	.966	4.6400	1.19112
4. Frauds (PrR4)	.882	.998	4.6200	1.19335
5. Conflicts (PrR5)	.869	.999	4.6000	1.21218
Cronbach's Alfa=0.936, Inter-item-correlation (Mini=0.558, Max=0.993), SD=5.436, Mean=23.28, Variance=28.55, No of variables=5				

7. **Structural Risks**: These risks appear due to faulty structure resulting project failure. The data analysis results of structural risks are shown in the Table 26. The mean of 24.96 with rating on 7 point Likert scale explains 89.14 percent construct with Cronbach's Alfa of 0.810. The major risks include faulty structures are risky to operate and dangerous inputs to projects are risky.

Table 26: Scale statistics for structural risks

Structural Risk	Corrected Item-Total Correlation	Squared Multiple Correlation	Mean	Std. Deviation
1. Faulty structures are risky to operate (SR1)	.513	.305	6.380	1.21033
2. Dangerous inputs to projects are risky (SR2)	.701	.495	6.300	1.19949
3. Inefficient layouts and handling results into accidents (SR3)	.647	.447	6.180	1.25666
4. Lack of authority and responsibility shall result in project risk(SR4)	.657	.476	6.100	1.38873
Cronbach's Alfa=0.810, Inter-item-correlation (Mini=0.390, Max=0.621), SD=4.04, Mean=24.96, Variance=16.32, No of variables=4				

Implications and Scope for Future Research

The main limitations of this research is the failure to survey sufficient number of project managers and higher officials. The time and cost constraints were the main hurdles. Despite these hurdles we were able to understand the risks associated with real estate projects. Also, it was needed to extend the area of survey to other parts of the country. However, the effort here is not to statistically validate the results rather to provide insights for the managers to better manage real estate business.

The understanding of real estate risk alone is not sufficient to run the business. Future research is needed to understand the link between real estate risks and organizational performance variable as well as strategies to improve project performance. The structural models shall help to understand the gap between the intensity of risk and the organizational performance as well as strategies to counter risks.

CASH PROFITABILITY AND THE CROSS SECTION OF STOCK RETURN EMPIRICAL EVIDENCE FROM INDONESIA

Andrianto Pujihantoro, Universitas Indonesia
Buddi Wibowo, Universitas Indonesia

Abstract

This study aims to test the predictive power of cash profitability in predicting the cross section of stock return in Indonesia's Capital market, based on the findings of Ball et al. (2016) that cash profitability outperforms other profitability measures in predicting stock returns in the US. Indonesia is chosen as the sample county because despite the fact that IDX is currently the 12th biggest capital market in Asia and have experienced positive price trend in recent years, the market efficiency is relatively low compared to developed capital markets. Due to different development stage, fewer market participants, fewer availability of information and strict impediments to trading. Thus it is interesting to see whether cash profitability is considered by the market in valuing firm stock prices. Using two pass sixty month rolling window Fama – Macbeth (1973) regression, I found that cash profitability predicts stock returns better than accrual based profitability and accruals.

Keywords: *Operating profitability, Cash flows, Accruals, Cross-section of stock returns, Emerging market, Working paper, Student paper*.

There has been many empirical findings that show company profitability are positively related to stock return (E.g, Haugen and Baker, 1996; Cohen, Gompers, Vuolteenaho, 2002; Fama and French, 2006, 2008, 2015) and also predicts cross section of stock returns (e.g, Novy-Marx, 2013; Ball, Gerakos, Linainmaa, and Nikolaev, 2015). This paper will cover the issue regarding how company's stockholders value information regarding profitability in the market, and what they deem as the true measure economic profitability of a company.

One of studies that have attempted to explain this relationship between profitability and returns is Fama and French (2006). They explain this relationship through derivation of the dividend discount model of Modigliani and Miller (1961).

In the dividend discount model, the market value of stock is the present value of expected future dividend.

$$M_t = \sum_{t=1}^{\infty} E(D_{t+\tau})/(1+r)^{\tau} \quad (1)$$

expected long term return, or more spesifically the internal rate of return of expected future dividend.

If firm implement clean surplus accounting, then the Dividend at time t, is profit allocated to equity per share, Yt minus change in book equity dBt = Bt − Bt-1. If both side of equation (1) and (2) is divided by Book equity, then:

$$\frac{M_T}{B_t} = \frac{\sum_{t=1}^{\infty} E(Y_{t+\tau} - dB_{t+\tau})/(1+r)^{\tau}}{B} \quad (2)$$

It is clear to see that holding everything else constant, the higher the stock price, Mt the higher the required return will be lower, the higher the expected profitability, Yt then the expected return, r will be higher, and the bigger is the change in book equity the lower the required return. In other words Value firm (low M/B, high B/M) will get higher expected return than

growth firm (high M/B, low B/M). The higher the profitability of a company the higher its expected return, and the bigger is the amount that is invested in equity the lower the return.

Fama and French (2006) stated that if we refer to rational pricing. Then the effect from book-to-market, profitability, and investment is due to the difference of risk: Controlling every other variable, the higher the profitability and the book-to-market ratio of a company, then the higher its risk, and firms that grow faster have less risk. .

Fama and French (2006) found that mixed relation between profitability and returns. Ther cross-sectional regression result show that earnings are positively related to returns. But their portfolio sorts show that taking account profitability, does not add to prediction of average returns incremental to the prediction provided by size and book to market ratio.

Ball, Gerakos, Linnainmaa, and Nikolaev (2015) explain this relation between profitability and returns in a different way. They stated that the positive relation between profitability and returns emerge because profitability and returns have a common economic determinants (e.g. risk). If the priced factor is not accounted in the expected return model (such as the CAPM), then the variables will be estimated with errors, and profitability proxy for that error and helps predicts returns.

The economic intuition of Ball, Gerakos, Linnainmaa, and Nikolaev (2015) was explained using this equation:

$$E_t(r_i) = \alpha\, E_{t-1}(r_i) + \eta_{i,t} = \alpha \left(\frac{\mu_{i,t-1}}{BE_{i,t-1}} - \rho_{i,t-1} \right) + \eta_{i,t} \quad (3)$$

The intuition of equation 3 is as follows. Assume that company I invest shareholder wealth, $BE_{i,t-1}$ to acquire profit $\mu_{i,t-1}$ at an average return on equity (ROE), $\mu_{i,t-1}/BE_{i,t-1}$. ROE can be decomposed into the firms opportunity cost of equity capital and a quasi-rent component $\rho_{i,t-1}$. If we ignore the difference between the firms opportunity cost of capital and investors required return t $E_{t-1}(r_i)$ at the time of the investment due to factors such as taxes on dividend distributions and transaction costs, then $\mu_{i,t-1}/BE_{i,t-1} = E_{t-1}(r_i) + \rho_{i,t-1}$. The evolution of expected return over time then can be described by equation (3). Past profitability thus is correlated with expected returns and can also be informative about the error of expected return (Ball et al 2015).

However, the empirical result of studies that investigates the relationship between stock returns and profitability is very sensitive to the choice of profitability proxy and measurement chosen to measure profitability.

For example, Fama and French (2006) found that profitability proxed by net earnings has a weak relation to expected returns. Changing the profitability proxy from net earnings (Fama and French, 2006) to gross profitability, Novy-Marx (2013) shows that profitability significantly predict stock returns. He stated that this happens because although the measurement that Fama and French used to measure profitability measures the economic profitability of a company, it excludes expenses that undoubtedly have a contribution to the company's future profitability, such as marketing and R&D expenses. He posit that gross profitability, is the purest profitability measurement because items lower down in the income statement are polluted.

However, Ball et al. (2015) showed that gross profitability is not the best measurement to proxy profitability. They showed that the reason why gross profit has more power in predicting returns compared to net earnings in Novy-Marx's (2013) research is because is gross profit was deflated by total assets, whereas net earnings by book equity. When the profitability measures is consistently scaled-down by the same deflator, they showed that

gross profit is no better than net earnings in predicting returns. Their main result was that operating profitability that includes research and development expense has more predictive power compared to gross profit and net earnings in predicting returns.

All research findings mentioned above used profitability measurement that still includes accruals. Accruals are adjustment made by accountants to facilitate periodic measurement of firm performance (Dechow, 1994). Revenue and expenses recorded generally differs from the amount of cash received and paid during the period. Accountants accrue firm revenue as the value of goods and services delivered during the period, based on the expected cash receipt of the deliveries. Similarly, they also calculate expenses as the cost of resources consumed in producing the delivered goods and services, based on the expected value of cash payments for the resources used. That is why accounting earnings are defined as accrual based revenue minus accrual based expenses, and earnings represent the accounting estimate of the value added by the firm products and services delivered to customers during the period (Ball et al, 2016).

FASB mantains the superiority of accrual based earnings over cash flows as the measurement to evaluate the expected future cash flow of a company. However the flexibility inherent in the generally accepted accounting principles provide managers with the opportunity to use accruals to manipulate income to suit their own purposes. (Cheng and Schaefer, 1997). As a result, analyst often matches operating cash flow to net earnings to measure the quality of those earnings (Bernstein, 1993).

Despite its reliability questions as the relevance of cash flows from operations limits to its usefulness as indicator of a firm value. Many accruals, ignored in cash flow computations are clearly value relevant. Because it is clearly difficult to argue that the market does not value a dollar of sales that results in a receivable equally to a dollar of sales currently collected in cash. Same arguments can also be made for accounts payable and other accruals (Cheng, and Schaefer, 1997).

Sloan (1996) found a negative relation between accruals and average returns, which is now widely known as the accrual anomaly. They stated that accrual anomaly surfaced because investors did not realized that accruals is not as persistent as cash flows, so that the market price of a company did not reflect its true value. The notion that investors think that accruals is as persistent as cash flow, then they will be negatively surprised when accruals did not persists, which explains the negative relation between accruals and returns. However Ball et al., (2016) observe otherwise, accruals have no explanatory power over cash-based profitability.

Ball et al (2016) motivated by Sloan (1996) and Ball et al (2015) findings, investigates the relationship between stock returns, accruals, accrual-based profitability and cash-based operating profitability. They found that cash profitability outperforms accrual-based profitability and accruals in terms of its explanatory power in explaining stock returns. They found that accruals have no incremental explanatory power when controlling for cash profitability, and in their analysis increase in profitability that is solely due to accruals has no relation with the cross section of returns. They also found that operating profitability component that is orthogonal to cash based operating profitability does not predict returns. In short they have empirically proof that firms with high accruals earn lower future return because they are unprofitable on a cash basis.

In addition, Fama and French (2016) have also found that by replacing their accrual based profitability factors (RMWo) with cash-based profitability factor (RMWc) based on the measurement and findings of Ball et al., (2016) improve the power of the five factor model in explaining stock returns.

In short, past research have shown that the choice of measurement to proxy profitability is non-trivial, and cash based profitability is by far the best measurement to proxy profitability.

Sutrisno and Ekaputra (2016) tested the Fama-French Five factor model (Fama and French, 2015) in Indonesia. Their findings are rather mixed, although they found that Fama and French five factor model can explain stock returns of subset portfolios better than the original three factor model. Their spanning regressions indicate that the value, profitability and investment factor is redundant in Indonesia. It is interesting to see whether constructing the profitability factor with cash based profitability can make the profitability factor perform better in Indonesia. Although interesting, that subject is outside of the scope of this paper. That issue is being addressed in a different research that I currently conduct. Nonetheless this paper can contribute as a good starting point.

This study aims to test the predictive power of cash profitability in predicting the cross section of returns in Indonesia. Indonesia has been an attractive market for quite some time. Indonesia stock exchange (IDX) is currently the 12th biggest stock market in Asia, and in recent years it has also experienced a positive trend in prices. According to IDX statistical report, in the first quarter of 2016, IDX have reached Rp. 5.143.453 Billion in market cap, 305.248 million shares in trading volume, 348.152 billion in trading value and its trading frequency reached 14.455.547 times increased from 13.977.651 times in the first quarter of 2015. (Indonesia Stock Exchange, 2016).
Figure 1. IDX Composite 1990 - 2016

Despite that fact, theoretically the market efficiency of IDX should be significantly lower compared to NYSE, AMEX, and NASDAQ due to its fewer market participants, lower availability of information, and its higher impediments to trading (strict restrictions on short selling) (CFA Institute, 2015). Therefore, it is interesting to see whether Ball et al (2016) findings holds up if it is tested in Indonesia.

This research found that although only statistically significant at 10 percent level and only in all-but microcaps sample, cash based profitability predict cross section of returns better than accrual based

profitability and accruals. This research also show that Book-to-market is positively related to returns and predicts cross section of returns.

However I found an unusual result, size is positively related to returns and mostly significant in most regressions. Whether that this positive relationship is an actual fact in Indonesia capital market or just a misleading and biased inferences caused by the method or the data used in this research which is very volatile and skewed is still unknown. To my knowledge,

there has not been any research in Indonesia that investigates this relationship using cross sectional Fama-Macbeth (1973) regression of all stock returns that rolled forward the estimation period every month, most of the research that I have read use static explanatory variables in their Fama-Macbeth (1973) regression. I intend to investigate this further in my future research using various method. Because due to its crucial and rather unusual nature, determining this relationship is not enough by just using one econometric technique.

The Data

The sample used in this study is all listed and delisted companies on IDX from July 2000 to June 2016 excluding companies from financial sectors, with non-missing data and is available in the Thomson Reuters Datastream database. Despite being the 12th biggest capital market in Asia, Indonesia is characterized with thin trading and thus leads to nonsynchronous trading due to the fact that there are many illiquid stocks in the market. Although it is a powerful econometric tool, Fama-Macbeth (1973) regression is very sensitive to the data used in the regressions. Therefore to avoid misleading inferences, I exclude illiquid stocks from the sample. To minimize biases in inferences caused by illiquid stocks and still preserve sample size, I define illiquid stocks as stocks that was not traded in the market for more than 31.96% of the time. To calculate the measurement I observe the number of months that the stock was not traded (NNM), and divide it by the total number of months the stock is outstanding (MSO). 31.96% is obtained from the 89th percentile of the ratio's distribution of the whole sample. The details of the percentile can be seen in Table 1.

Table 1. Distribution of NNM/ MSO ratio and the number of illiquid stocks excluded

Percentile	MAX NNM/ MSO	Excluded illiquid stocks
97TH	57.34%	14
89TH	31.96%	46
79TH	16.49%	99
69TH	8.32%	148
59TH	3.16%	195
49TH	1.03%	237

I take monthly stock returns and annual accounting from Thomson Reuters Datastream terminal of Universitas Indonesia. Monthly returns are matched against the annual accounting data and lag annual accounting information by six months. So this study assumes that the annual accounting from December will be available to the public by the end of the following June.

The sample consists of firms with non-missing market value of equity, book-to-market, gross profit, book value of total assets, current month returns, and returns for the prior one year period. I split firms into All but Microcaps and Microcaps, and trimming all independent variables to the 1st and 99th percentiles, following Ball et al (2016). Microcaps are defined as stocks with a market value of equity below the 20th percentile of IDX market capitalization distribution. After excluding firm with illiquid stocks, missing data, and extreme values of the explanatory variable, the total sample size is 357 firms.

I calculate operating profitability, cash based operating profitability, and accruals by following the computations of Ball et al (2016):

Operating Profitability = Revenue – Cost of Goods Sold – (Sales General and administrative expense – Research and Development Expense)   *(4)*

Cash-based operating profitability = *Operating profitability –   Account Receivable –   Inventory –*
Prepaid Expense +   Deferred Revenue +   Trade accounts payable
+   Accrued expense.   *(5)*

Accruals =   *Current Assets –   Cash – [Δ Current liabilities –   Debt in Current Liabilities –*
income tax payables] – Depreciation.   *(6)*

Size is calculated as number of shares outstanding multiplied by the current market price, Book to market is calculated as shareholder equity minus preferred stock plus deferred tax, divided by market capitalization.

The Model

In this section, i will show the model that is used in this research and briefly explain how the two pass Fama Macbeth (1973) regression works. In the the first pass of Fama Macbeth (1973) regression, the regression will estimate time series slope coefficients, to estimate the time series relationship between the dependent variable and the regressor. Then the estimated time series slope coefficients from the first pass regression will be used as explanatory variables in the second pass cross-sectional regressions, the idea is that if a regressor variable is significantly related to the dependent variable, then the slope coefficients should be statistically significant and on average consistent in the cross sectional regressopm. The first pass estimation period is then rolled forward by a predetermined interval and the process continues until the end of the sample period.

In Fama and Macbeth (1973) original paper the estimation period is rolled forward by four years due to the lack of computing power available at that time (Brooks, 2014). More recent studies such as Ball et al. (2016) would update the explanatory variable for the second pass cross-sectional regression monthly to facilitate time varying coefficients. Therefore if the number of sample firms is 300, the observation period is 192 months and we choose 60 months as the width of first pass estimation period, assuming that all firms have complete data during all observation period, then the output of the two pass Fama-Macbeth (1973) regressions will be based on approximately 40,033 linear regressions for each model.

The average slope coefficients estimates of Fama Macbeth (1973) regressions can be interpreted as monthly returns on strategies that traded on that part of variation in each regressor that is ortoghonal to other regressor in the regression model. Therefore the t-values is proportional to the Sharpe ratios of these strategies (Ball et al., 2016). In comparing the explanatory power of the profitability measures and accruals, I focus on the t-values. Following Ball et al. (2016), I recompute the explanatory variables every month. Due to insufficient observation period and sample companies, I estimate the explanatory variables using 60 month of past data rather than 120 as in Ball et al (2016), and the estimation period is rolled forward by one month. The models used in the first pass Fama-Macbeth (1973) regression are as follows:

$$R_{i,t} = \beta_1 OP_{yr-1} + \beta_2 Log\left(\frac{BE}{ME}\right)_{yr-1} + \beta_3 Log(ME)_t + \beta_4 r_{1,1,t} + \beta_5 r_{12,2,t} + e_{i,t} \tag{7}$$

$$R_{i,t} = \beta_1 OP_{yr-1} + \beta_2 Accrual_{yr-1} + \beta_3 Log\left(\frac{BE}{ME}\right)_{yr-1} + \beta_4 Log(ME)_t + \beta_5 r_{1,1} + \beta_6 r_{12,2} + e_{i,t} \tag{8}$$

$$R_{i,t} = \beta_1 OPcb_{yr-1} + \beta_2 Log\left(\frac{BE}{ME}\right)_{yr-1} + \beta_3 Log(ME)_t + \beta_4 r_{1,1} + \beta_5 r_{12,2} + e_{i,t} \tag{9}$$

$$R_{i,t} = \beta_1 Accrual_{yr-1} + \beta_2 OPcb + \beta_3 Log\left(\frac{BE}{ME}\right)_{yr-1} + \beta_4 Log(ME)_t + \beta_5 r_{1,1} + \beta_6 r_{12,2} + e_{i,t} \tag{10}$$

$$R_{i,t} = \beta_1 OP_{t-1} + \beta_2 OPcb + \beta_3 Log\left(\frac{BE}{ME}\right)_{yr-1} + \beta_4 Log(ME)_t + \beta_5 r_{1,1} + \beta_6 r_{12,2} + e_{i,t} \tag{11}$$

Thus, the model used in the second pass Fama-Macbeth (1973) regression are:

$$R_{i,t} = \gamma_1 \beta_{OP_{yr-1}i,t} + \gamma_2 \beta_{Log\left(\frac{BE}{ME}\right)_{yr-1}i,t} + \gamma_3 \beta_{Log(ME)_t t} + \gamma_4 \beta_{r_{1,1},ti,t} + \gamma_5 \beta_{r_{12,2},ti,t} + e_{i,t} \quad (12)$$

$$R_{i,t} = \gamma_1 \beta_{OP_{yr-1}i,t} + \gamma_2 \beta_{Accrual_{yr-1}i,t} + \gamma_3 \beta_{Log\left(\frac{BE}{ME}\right)_{yr-1}i,t} + \gamma_4 \beta_{Log(ME)_t i,t} + \gamma_5 \beta_{r_{1,1}i,t} + \gamma_6 \beta_{r_{12,2}i,t} + e_{i,t} \quad (13)$$

$$R_{i,t} = \gamma_1 \beta_{OPcb_{yr-1}i,t} + \gamma_2 \beta_{Log\left(\frac{BE}{ME}\right)_{yr-1}i,t} + \gamma_3 \beta_{Log(ME)_t i,t} + \gamma_4 \beta_{r_{1,1}i,t} + \gamma_5 \beta_{r_{12,2}i,t} + e_{i,t} \quad (14)$$

$$R_{i,t} = \gamma_1 \beta_{Accrual_{yr-1}i,t} + \gamma_2 \beta_{OPcb_{yr-1}i,t} + \gamma_3 \beta_{Log\left(\frac{BE}{ME}\right)_{yr-1}i,t} + \gamma_4 \beta_{Log(ME)_t i,t} + \gamma_5 \beta_{r_{1,1i}i,t} + \gamma_6 \beta_{r_{12,2}i,t} + e_{i,t}$$
$$(15)$$

$$R_{i,t} = \gamma_1 \beta_{OP_{yr-1}i,t} + \gamma_2 \beta_{OPcb_{yr-1}i,t} + \gamma_3 \beta_{Log\left(\frac{BE}{ME}\right)_{yr-1}i,t} + \gamma_4 \beta_{Log(ME)_t i,t} + \gamma_5 \beta_{r_{1,1}i,t} + \gamma_6 \beta_{r_{12,2}i,t} + e_{i,t} \quad (16)$$

Where :

$R_{i,t} =$ current period monthly return.
$OP_{yr-1} =$ Prior one year accrual based operating profit, scaled by total asset of $yr-1$.
$Accrual_{yr-1} =$ prior one year accrual, scaled by total asset of $yr-1$.
$OPcb_{yr-1} =$ Prior one year Cash based Operating profit, scaled by total asset of $yr-1$..
$Log\left(\frac{BE}{ME}\right)_{yr-1} =$ Prior one year natural logarithm of book to market equity.
$Log(ME)_t =$ Current natural logarithm of market cap.
$r_{1,1} =$ Prior one month return.
$r_{12,2} =$ Prior one year return skipping the last month.
$\gamma_j \, (j: 1,2, \dots n) =$ Cross sectional slope coefficients.

The time series average of γ, $\hat{\gamma}_{j,t}$ and the standard deviation of $\hat{\gamma}_j, \hat{\sigma}_j$ are calculated as:

$$\hat{\gamma}_j = \frac{1}{T_{FMB}} \sum_{t=1}^{T_{FMB}} \hat{\gamma}_{j,t} \quad (17) \qquad\qquad \hat{\sigma}_j = \sqrt{\frac{1}{T_{FMB}} \sum_{t=1}^{T_{FMB}} (\hat{\gamma}_{j,t} - \hat{\gamma}_j)^2} \quad (18)$$

Where T_{FMB} is the number of cross-sectional regression used in the second pass. So that the t-statistic of $\hat{\gamma}_j$ is simply calculated as: $\sqrt{T_{FMB}} \, \hat{\gamma}_j / \hat{\sigma}_j$ (19)

Descriptive Statistics
Table 2 shows the descriptive statistics of the data. We can see from Panel B of the table that there are no multicollinearity in the explanatory variables; no two variables has a correlation of more than 0.80 As documented in Ball et al. (2016), Accruals are positively related to accrual based profitability and negatively related to cash based profitability.

It appears that the positive relationship between cash based profitability and accrual based profitability is not as high as documented in the US. Even though the correlation is quite high, it is only 0.62 compared to more than 0.80 in the US. From panel A we can see that although the data has been trimmed for extreme values, the distributions of explanatory variables still exhibit outliers, especially for all but profitability measures.

Fama-Macbeth Regression

Table 3 shows the average slope coefficient estimates and their t values from Fama Macbeth (1973) regressions of monthly stock returns on cash based profitability, accrual based profitability and accruals. Following Ball et al (2016) some controls variable are included in the regressions : natural logarithm of market capitalization, natural logarithm of book to market ratio, past returns for the prior month and past retruns for prior one year skipping the last month.

Panel A shows the result for the all-but-microcaps sample, the t-values associated with each regressor is the numbers in a square bracket. Following Ball et al. (2016) I trim all the explanatory variables in the 99th and 1st percentile on a consistent table by table basis so that the regression coefficients is comparable across columns. In addition I also exclude illiquid stocks that is defined as stocks that was not traded in the market for more than 31.96% of the time, to address nonsynchronous trading in Indonesia.

In column 1, 4 and 5 of panel A, we can see that the t values associated with operating profitability is not statistically significant (0.52, -0.58, and 0.62 respectively), thus accrual based profitability measure does not predict stock returns associated with all-but-microcaps firms in Indonesia. Column 3 and 4 also shows that accruals does not predict stock returns (t-values of -0.69 and -0.31 respectively). However we can see from column 2 and 3 that the t-values of cash based profitability are mostly statistically significant in the 10% level and that trading strategy that trades on cash profitability will earn approximately 0.5% and 0.32% a month, showing that cash based profitability component that is orthogonal to accruals and other control variables not including accruals based profitability marginally predicts stock returns associated with all-but-microcaps firms in Indonesia. However when cash based profitability is controlled by accruals based profitability, cash based profitability lose its predictive power, showing that cash based profitability that is orthogonal to accruals based profitability component does not predict stock returns of all-but-microcaps firms.

Meaning that cash profitability still have accrual components in it and help it predict returns. Considering column 3 shows that cash based profitability that is orthogonal to accruals marginally predict returns, at first glance this result will look puzzling. However we can see that the formula (equation (5) and (6)) used to calculate accruals in this research2 calculate the accrual variable and the accrual used in the calculation of cash based profitability differently. Considering that, then perhaps this result is because there are differences in policies between Indonesia accounting principle (Pernyataan Standard Akuntansi Keuangan (PSAK)) and the US GAAP regarding the classification of the accounts that is used in equation (5) and (6). Thus, this result show that although accruals when used by itself in a regression does not predict stock returns, it still have a role in predicting stock returns in Indonesia. Nonetheless, because it is very unlikely (and for some instances improper) that two profitability measures is considered in the same regression model or a trading strategy, the fact that cash profitability alone can marginally predict stock returns better than accrual based profitability and accrual is a useful insight.

Panel B shows the result for the microcaps sample. In all columns we can see that none of the profitability measures or accruals predicts stock returns of microcap stocks, their t-values is not statistically significant even in the 10% level.

	[-0.5296]	[-0.3271]	[0.0782]	[-0.2307]	[-0.2838]
Adjusted R Squared	9.03%	7.54%	8.63%	8.23%	8.42%

Panel A shows that book-to-market ratio is positively related to returns and consistently predict stock returns of all-but-microcaps firms, we can see that the t-values associated with book-to-market ratio is statistically significant in 1% and 2% level, and trading strategy that trades on book-to-market earn approximately 7.45% to 11.87% a month. However panel A also shows that size is positively related to returns and consistently predict it. The t-values related to size is mostly statistically significant in the 1 percent level, with an average monthly return that is also economically significant.

Panel B also shows that book-to-market ratio is positively related to returns and predict stock returns of microcaps. Despite that fact, it can be seen that this relationship is weaker in microcaps, the t-values associated with book-to-market ratio is only statistically significant in 10% level with average returns ranginf from 8% to 9% a month., and is not statistically significant in column 1. As in panel A, Panel B also shows that size is positively related to returns, but like the book-to-market ratio the relationship is weaker in microcaps. The t-values related to size is only statistically significant in the 10% level in column 1, 5% in column 4, 1% in column 3 and not statistically significant in column 2 and 5.

Whether this positive relationship between size and returns is an actual facts that happens in Indonesia capital market or just a misleading and biased inferences caused by the method or the data used in this research which is very volatile and skewed (See table 2) is still unknown. To my knowledge, there has not been any research in Indonesia that investigates this relationship using cross sectional Fama-Macbeth (1973) regression that rolled forward the estimation period every month, most of the research that I have read use static explanatory variables in their Fama-Macbeth (1973) regression. I intend to investigate this relationship further in my future research using various method to make more robust inferences.

Conclusion

There has been many empirical findings that show company profitability are positively related to stock return. However, the empirical result of studies that investigates the relationship between stock returns and profitability is very sensitive to the choice of profitability proxy and measurement chosen to measure profitability.

For example, changing the profitability proxy from net earnings (Fama and French, 2006) to *gross profitability,* Novy-Marx (2013) shows that profitability significantly predict stock returns. However, Ball et al. (2015) showed that gross profitability is not the best measurement to proxy profitability. They showed that the reason why gross profit has more power in predicting returns compared to net earnings in Novy-Marx's (2013) research is because is gross profit was deflated by total assets, whereas net earnings by book equity. When the profitability measures is consistently scaled-down by the same deflator, they showed that gross profit is no better than net earnings in predicting returns. Their main result was that operating profitability that includes research and development expense has more predictive power compared to gross profit and net earnings in predicting returns.

Ball et al. (2016) motivated by Sloan (1996) and Ball et al. (2015) findings, investigates the relationship between stock returns, accruals, accrual-based profitability and cash-based operating profitability. They found that cash profitability outperforms accrual-based profitability and accruals in terms of its explanatory power in explaining stock returns. In addition, Fama and French (2016) have also found that by replacing their accrual based profitability factors (RMWO) with cash-based profitability factors (RMWc) based on the measurement and findings of Ball et al (2016) improve the power of the five factor model in explaining stock returns.

In short, past research have shown that the choice of measurement to proxy profitability is non-trivial, and cash based profitability is by far the best measurement to proxy profitability.

Sutrisno and Ekaputra (2016) tested the Fama-French Five factor model (Fama and French, 2015) in Indonesia. Their findings are rather mixed, although they found that Fama and French five factor model can explain stock returns of subset portfolios better than the original three factor model. Their spanning regressions indicate that the value, profitability and investment factor is redundant in Indonesia. It is interesting to see whether constructing the profitability factor with cash based profitability can make the profitability factor perform better in Indonesia. The findings from this research can serve as a good starting point.

This research found that although only statistically significant at 10 percent level and only in all-but microcaps sample, cash based profitability predict cross section of returns better than accrual based profitability and accruals.

Based on regressions on all sample, accrual based profitability measure and accruals does not predict stock returns in Indonesia. Regression on all-but-microcaps sample show cash based profitability component that is orthogonal to accruals and other control variables not including accruals based profitability, marginally predicts stock returns associated with all-but-microcaps firms in Indonesia. However when cash based profitability is controlled by accrual based profitability, cash based profitability lost its predictive power. Implicating that the component of cash based profitability that is orthogonal to accrual based profitability component does not predict stock returns of all-but-microcaps firms. Meaning that cash profitability still have accrual components in it and help it predict returns. At first this result will be puzzling considering column 3 of panel A shows that cash based profitability that is orthogonal to accruals marginally predict returns. However we can see that the formula (equation (5) and (6)) used to calculate accruals in this research calculate the accrual variable and the accrual used in the calculation of cash based profitability differently. Perhaps this result is because there are differences in policies between Indonesia accounting principle (*Pernyataan Standar Akuntansi Keuangan* (PSAK)) and the US GAAP regarding classification of the accounts that is used in equation (2) and (6). Thus, this result show that although accruals when used by itself in a regression does not predict stock returns, it still have a role in predicting stock returns in Indonesia. Nonetheless, because it is very unlikely (and for some instances improper) that two profitability measures is considered in the same regression model or a trading strategy, the fact that cash profitability alone can marginally predict stock returns better than accrual based profitability and accrual is a useful insight.

In regressions on microcaps sample however, none of the profitability measures or accruals predicts stock returns of microcap stocks, their t-values is not statistically significant even in the 10% level.

This research have also shown that book-to-market ratio is positively related to returns and consistently predict returns of all-but-microcaps stocks. The t-values associated with book-to-market ratio is statistically significant in 1% and 2% level. However panel A shows that size is positively related to returns of all-but-microcaps stocks and consistently predict it. The t-values related to size is mostly statistically significant in the 1 percent level.

Regression on microcaps shows that book-to-market ratio is positively related to returns and predict stock returns of microcaps. Despite that fact, it can be seen that this relationship is weaker in microcaps, the t-values associated with book-to-market ratio is only statistically significant in 10% level, and is not statistically significant in column 1. As in the regression on all-but-microcaps, regression on microcaps also shows that size is positively related to returns, but like the book-to-market ratio the relationship is weaker in microcaps. The t-values related to size is only statistically significant in the 10% level in column 1, 5% in column 4, 1% in column 3 and not statistically significant in column 2 and 5.

Whether this positive relationship between size and returns is an actual fact in Indonesia capital market or just a misleading and biased inferences caused by the method or the data used in this research which is very volatile and skewed (See table 2) is still unknown. To my

knowledge, there has not been any research in Indonesia that investigates this relationship using cross sectional Fama-Macbeth (1973) regression of stock returns of all stocks that rolled forward the estimation period every month, most of the research that I have read use static explanatory variables in their Fama-Macbeth (1973) regression.

I intend to investigate this relationship further in my future research using various method to make more robust inferences. The most feasible and robust method that I can think of is perhaps using the five factor model (Fama and French, 2015) in a Fama-Macbeth (1973) regression of all stock or subset portfolio returns and make a correction to the standard error using Shanken correction (Shanken, 1992) to address Errors in Variables (EIV) problem. Any suggestions regarding this issue will be very appreciated.

STOCK VALUATION OF HOLCIM INDONESIA COMPARED WITH SEMEN INDONESIA AND INDOCEMENT TUNGGAL PRAKARSA

Luke Sekar Andari, Institut Teknologi Bandung

ABSTRACT

Holcim Indonesia is top biggest three cement company in Indonesia. In 2015, Holcim gross profit decrease 23% and net income decrease 68%. Decreasing net income of Holcim is caused by demand of cement decreases and the operational costs in the company increases. The decreasing of company performance caused by the decrease in company stock price into Rp995 in the end 2015. In the middle of the decreasing of company performance. Holcim did expand in Tuban in order to increase the company production capacity.This research has four objectives. First, to know the company's value at the end 2016 by projecting the financial statement; second, to know the stock valuation based on discounted cash flow valuation; third, to give recommendation for the investors regarding stock price of Holcim Company; lastly to give recommendation for management of Holcim based on SWOT analysis.

The result of this research using financial statement projection with company's revenue is projected to increase into Rp13,073,775 and net income is projected to increase into Rp533.750 in 2016.

Stock valuation is using absolute valuation method is the discounted cash flow and free cash flow to Firm (FCFF). While the relative valuation method using price earnings ratio (P/E raatio) and EV / EBITDA. Based on the method that has been used, it is concluded that a target share price SMCB is Rp3.262,9 with a potential upside is 201%.

Based on the analysis result, the recommendation for investor is to buy the stock with target price is Rp3.262,9 . The recommendation for Holcim management is to expansion of new plant, prmotion and marketing brand of Holcim and strengthen sales of products to foreign countries.

Keywords: *financial statement projection, absolute valuation, relative valuation, SWOT analysis.*

Introduction

Holcim Indonesia is one of the cement companies in Indonesia, established in 1971. In 2014, Holcim ranks 18th as one of the 25 best companies according to Fortune magazine Indonesia. Holcim is currently competing with state-owned enterprises (BUMN), Semen Indonesia and private companies, Indocement Tunggal Prakarsa. Performance of a company affect the company's share price, this can be seen if the company's share price rising further indicates that the company's performance is good and vice versa.

Holcim stock price movement is sluggish compared to its competitor, Semen Indonesia and Indocement. The value of stock of Holcim is decrease 56% from Rp2,275 in 2013 to Rp995 in 2015 while Semen Indonesia and Indocement stocks are stable. Semen Indonesia stock price is decrease 19% from Rp14,150 in 2013 to Rp11,400 in 2015 although Indocement stock price is increase 11.6% from Rp20,000 in 2013 to Rp22,325 in 2015.

During in 2015, Holcim suffered substantial losses caused by several factors including the high operational costs. The increasing of operational costs include raw materials price is above 30%, labor costs rise into 27%, distribution cost increased about 17% and electricity costs have increased continuously about 22% (Sukirno, 2015). Because of the

substantial losses in 2015, the stock price of Holcim is decreasing and it can be detrimental shareholders of Holcim.

Business Issue : Cement industry in 2015 has suffered lost as a result of the decreasing demand of cement. The slowdown of economic growth in Indonesia that affected by global economic has caused the decreasing of cement demand. Holcim is one of the companies that suffer the decreasing sales due to the low level of demand. Holcim financial statement shows Rp668.8 billion net income in 2014 while net income in 2015 is Rp175.2 billion. Beside of the decreasing sales, Holcim operation cost has increased thus lead to low net income.

In the middle of decreasing net income , Holcim decided to do expansion by built factory in Tuban namely Tuban II in order to increase production capacity. The factory development started in 2013 in Tuban II and spent humongous cost which is Rp3,170 trillion. Besides the development cost of the factory, Holcim also has to expended more for cement production machine. Compared with Semen Indonesia and Indocement, Holcim share price was the lowest. Holcim share price has reached Rp900 in 2016 and it is the lowest price since last 6 years while the highest Holcim stock price is Rp3.950 in 2013. This final project will analyze the stock valuation to inform investor about the stock price projection in 2016 and compared the financial performance between Holcim and Semen Indonesia and Indocement.

Methodology

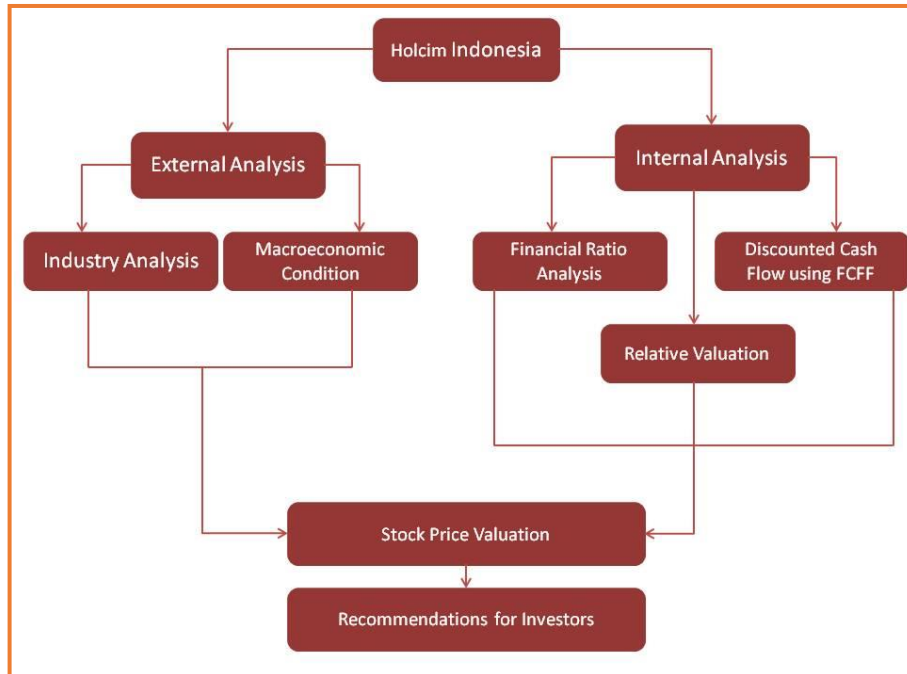
1)   Compound Annual Growth
Compound annual growth rate (CAGR) is an average growth rate over a period of several years. The CAGR shows the average year over year growth rate for a given period (Rist, 2014). Compound annual growth rate over a given period is always a better indication than the use of single year's change.

$$CAGR = \left(\left(\frac{Ending\,value}{Starting\,value}\right)^{\frac{1}{number\,of\,periods}}\right) - 1 \qquad (3.1)$$

2)   Valuation
Valuation is an estimation of the value of an asset by using variables and comparisons with other similar assets that are considered to be associated with an investment in the future. Stock valuation begins with a thorough analysis of the subject company's principal business activities. The activity is divided into three parts: operating, investing and financing (Lundholm, 2007). To do a valuation on the company can be done by using three approaches (Damodaran, 2006) as following:
1.   Discounted cash flow valuation relates the value of an asset to the present value of expected future cash flows on assets.
2.   Relative valuation, estimates the value of an asset by looking at the pricing of comparable assets relative to a common variable like earnings, cash flows, book value or sales.
3.   Contingent claim valuation, uses option pricing models to measure the value of assets that share option characteristics

Business Issue Exploration Conceptual Framework

Conceptual framework is a theoretical structure of assumptions, principles, and rules that holds together the ideas comprising a broad concept (Business Dictionary, 2016). Conceptual framework in figure 1 will identify business issue by using internal and

external analysis. External analysis consist of industry analysis and macroeconomic condition, and SWOT analysis which strength and weakness as internal factor and opportunity and threat as external factor. On internal analysis consist of financial ratio analysis, discounted cash flow and relative valuation. The result from external and internal analysis will be analyzed as a recommendation for investor and Holcim.


External Analysis

1) **The Summary of PESTEL**

As one of the private companies, Holcim Indonesia should follow the policies issued by the government related to a decrease in the price per sack of cement which is applied to company owned by BUMN as Rp3,000 per sack. By this price reduction, it affected the price company had to lower their price as well in accordance with the cement price that owned by the government.

In economic situation, the failing at global growth on 2015 affected Indonesia's growth only amounted as 4.8 percent which was lower than previous year, 2014, as 5%. The financial ministry estimated in 2016, Indonesia will have economic growth as 5.3% (Worldbank, 2016).Bank of Indonesia lowered the benchmark rate of interest as 25 basis points became 7% from 7.25% in January 2016. Bank of Indonesia will also lowered the deposit interest become 5.23 and interest of debt for facilities as 7.75% which is as 25 basis point. By this reduction, it affected the growth of credit as 10% (Bank Indonesia, 2016).

In social situation, the social segment is concerned with a society's attitude and cultural values. The change of social trends will impact on the demand of corporate products. If the standard of living in the society increases, demand for products will also increase and vice versa.

In technology segment, as the technology system is now growing rapidly, there is also economic growth reflected in cement industry. Cement companies compete to develop the technology in order to promote their company. Some technologies have been successfully developed are Technology Enterprise Resource Planning (ERP), Technology WHRPG (Waste Heat Recovery Power Generator), Technology ICS (Indoor Climate Solution).

Environmental factors closely related to the level of pollution resulting from the production of products, waste recycling considerations and environmental conditions round the factory. The cement industry is currently the biggest polluters in the world.

Legal factors that must be considered by the cement companies, according to the Law of the Republic of Indonesia No.23 of 1997 regarding Environmental Management and according to the Regulation of the Minister of Industry of the Republic of Indonesia Number 82 / M-IND / PER / 9/2015 on The Indonesian National Standard Cement Compulsory.

2) **The Summary of Porter's Five Forces**

ASEAN Economic society is a single market in which ASEAN member countries to sell goods and services easily to other ASEAN member countries in order to make competition between countries will become more stringent. The entry of new players cause a medium threat because foreign companies can easily enter into the Indonesian market. In the cement industry, competition is concentrated in regional level because the competitor are separated in several region depend on production area. Company are prefer to distribute near from the production plant. Competitive rivalry has a low to medium level.

In 2015, the cement industry experienced excess supply of cement due to the declining demand for cement by 3.3 percent and in 2016 predicted the demand will be increase until 4 % - 6% regarding to infrastructure projects in 2016.

Cement is the basic material used for all construction and there is no direct substitute for this product. Therefore, threat of substitute is low.

Since, the basic raw material in the manufacture of cement is limestone, bargaining power of suppliers can be categorized as low as raw materials derived from natural resources.

Internal Analysis

1) **Financial ratio analysis**

Author compared the financial ratio of Holcim Indonesia (SMCB), Semen Indonesia (SMGR) and Indocement Tunggal Prakarsa (INTP) to know financial perform of each companies and compared by using ratio of industry.

Based on financial ratio analysis, liquidity ratio of SMCB is the lowest compared with SMGR and INTP. INTP has maintain a highest liquidity ratio which means INTP has greater degree of liquidity and INTP has a strong cash balance to fund the capital expenditures.

The average collection period of SMCB in 2015 rose 5% from 45.34 times in 2014 become 47.79 times. SMCB average collection period is the lowest than SMGR and INTP. INTP has an average collection per day 49,79 times which is have a longer time in collecting the account receivable compared to SMCB has an average collection per day 48,41 times.

Debt analysis ratio shows SMCB average debt ratio is 0.4 times it means that more than one third of its assets financed by debt and the rest is from equity. SMCB's debt to equity ratio is higher than competitor. The average ratio of SMCB is 0.69 times which is higher than average industry is 0.39 times. The value indicates more than a half of its assets financed with debt.

Overall, financial ratio of SMCB decreased due to the economic slowdown that occurred from 2014 to 2015. The economic slowdown affects the company's financial performance led the company decreased performance. The decreases in revenue the company is also experienced by SMGR and INTP. The reduced demand for cement by

3.3 percent effect on the company's financial performance. In the middle of an economic slowdown, SMCB expand by building a factory in Tuban to increase cement production capacity thereby increasing competition among the other competitors.

Business Model Analysis

Table 2. Analysis SWOT

Strength	Weakness
1. Product – With different kinds of product, Holcim is more superior than the other competitors. 2. Targeting – Accordance to RAPBN 2016, increasing of infrastructure are the target of cement industry. 3. Strong Promotion - Holcim conduct a vigorous campaign to introduce the brand to the consumer	1. Price – Holcim product price are relatively more expensive when compared with other companies. 2. Number of factories – Holcim's factories is fewer than the competitors factories and its slightly affected the production capacity of Holcim. 3. Location of port – Holcim currently has only one port in Lampung. In order to make deliveries of cement by sea, Holcim has to pay extra cost.
Opportunity	**Threat**
1. Decreasing of Inflation and interest rate – The decreasing of inflation and intereset rate will stimulate economic growth and make company optimistic regarding to demand of cement. 2. The increasing of infrastructure – Government's plan to develpo the infrastcruture will increase the demand of cement. 3. Market outside Java Island – Holcim has a chance to dominate market outside of Java Island because just few of cement company has operates outside Java. 4. Export – Bangladesh is one of the country that choose to import cement because Bangladesh just have one factories.	1. New Entrants – AEC (Asian Economic Society) has been started and Indonesia part of the AEC and causing the competitor becoming strict. 2. Electricity tariff – Increasingly the basic electricity tariff, will be increasing the cost. 3. Competitor – In 2016 the number of players cement industry as many as 19 companies.

Finding and Analysis

1) Financial Statement Projection

Financial statement projection began with the prediction to industry sales growth affected by macroeconomic factors in cement industry. After applied the sales growth projection, company do cost of good sales estimation, depreciation, and amortization, interest expense, long term loan, and others using assumption related to company condition, government policy, interest rate, and macroeconomic condition. Forecasting of financial statement will be using compound annual growth rate (CAGR) assumption based on data from 2010 until 2015.

Table 3. Financial Statement Projection

SMCB	Financial Statement Projection										
	2015	2016 F	2017 F	2018 F	2019 F	2020 F	2021 F	2022 F	2023 F	2024 F	2025 F
Revenue	9.239.022	13.073.775	15.599.458	18.613.070	22.208.873	26.499.338	31.618.664	37.726.978	45.015.338	53.711.714	64.088.117
COGS	7.099.577	10.046.331	11.987.151	14.302.913	17.066.049	20.362.987	24.296.851	28.990.686	34.591.308	41.273.898	49.247.477
Net Income	199.488	533.750	870.603	1.277.594	1.767.932	2.358.418	3.069.165	3.908.417	4.920.711	6.140.502	7.608.996

Source : Analysis, 2016

Revenue - Holcim revenues determine by the sales of product. Revenue of Holcim Indonesia consist of three primary business segment, sales of cement, ready-mixed concrete and aggregate. The first step to do to forecasting the revenue is forecasting for the demand by using CAGR of production capacity. The data of production capacity can be obtained from annual report of Holcim. The next step is forecasting the market share, sales volume, and price of cement. Holcim production capacity increased by 40% in 2015 into 15 million tons. In addition, the author uses the assumption that a market share of 14.2% following the market share in the prior year. Market share is used to determine the company's sales volume.

Cost of Good Sales - Holcim primary business segment is cement, ready mixed concrete and aggregate. In the annual report, Holcim explain the cost for each production process started from raw material, manufacturing cost, work in proggres, andn finished good. To projection cost of good sold, author using growth from business segment of Holcim.

2)   Earning per Share Projection

Earnings per share according to Houston and Brigham (2007) is the company's ability to distribute the income to shareholders. Net income divided by shares outstanding will result in earnings per share. By using net income which has been projected on the three companies, the author will compare the EPS for each company.

Table 4. Earning per Share of SMCB, SMGR and INTP

Company	Earning per Share										
	2015	2016 F	2017 F	2018 F	2019 F	2020 F	2021 F	2022 F	2023 F	2024 F	2025 F
SMCB	23	70	114	167	231	308	401	510	642	801	993
SMGR	762	999	1.117	1.250	1.377	1.551	1.749	1.971	2.220	2.447	2.521
INTP	1.183	1.622	1.833	2.089	2.384	2.725	3.118	3.627	4.205	4.860	5.604

Source : Analysis, 2016

SMCB has the lowest value when compared to SMGR and SMCB. The value of each company's EPS is strongly influenced by the company's net income. If the net income of the company increased the EPS will also increase and shows that the company succeeded in running their business.

3) Discounted Cash Flow (DCF) Valuation

Discounted cash flow will estimate the future cash flow on the asset, discounted back at a rate that reflects the riskiness of the cash flows. Discounted cash flow can be done through two approaches (Damodaran, 2006) : (1) For the overall valuation of businesses are started from existing assets and assets that will evolve and called the firm valuation, (2) For the valuation of the company's shares and is called equity valuation.

Formula for Discounted cash flow is :

$$Value\ of\ a\ firm = \sum_{t=1}^{t=n} \frac{Expected\ cash\ flow}{(1+r)^t} + \frac{Terminal\ value_n}{(1+r)^n} \qquad (3.2)$$

Table 5. Stock Price Target of SMCB

DCF Valuation of SMCB	
Firm Value	28.806.124,4
Net Cash	(1.802.548,8)
Intrinsic Value (Rp)	25.003.575,7
Number of shares (mn)	7.662.900.000,0
Price Per Share (Rp)	**3.262,9**

Table 5. Stock Price Target of SMGR

DCF Valuation of SMGR	
Value of firm	68.925.007
Net Cash (Debt)	(11,464.403)
Intrinsic value (Rp)	68.913.612
Number of shares (mn)	5.931.520.000
Price Per Share (Rp)	**11.618,2**

Table 5. Stock Price Target of INTP

DCF Valuation of INTP	
Value of firm	57.200.845,3
Net Cash (Debt)	(5.749.338,2)
Intrinsic value (Rp)	62.950.183,5
Number of shares (mn)	3.681.231.699,0
Price Per Share (Rp)	**17.100,3**

4) Price Earning Ration and EV/EBITDA Multiple

There are two components required is to value assets on a relative basis, the price should be standardized, usually by converting prices into multiples of some common variable. The second component is to find similar assets, the which is challenging since no two assets are exactly alike. To forecast Holcim stock price for late 2016, it will begin by compare the price earning ratio (PER) between Semen Indonesia and Indocement as competitor. The objective from compare the PER to obtain the target price of Holcim stok price. Data for calculating target stock price is from annual report both of competitor.

Table 6. Price Earning Ratio

Peers	PER						
Company	2011	2012	2013	2014	2015	2016F	Target Price
SMCB	15,7	17,2	18,3	26,8	38,2	**23,3**	**1.623,6**
SMGR	17,1	19,1	15,7	17,2	14,9		
INTP	17,5	17,4	14,7	17,4	19,0		
Average	17,3	18,2	15,2	17,3	17	**17**	

Premium/Discount	-9,3%	-5,5%	20,4%	54,7%	125,5%	37,1%	
Potential Upside							49,6%

EV/EBITDA ratio is financial ratio which measure enterprise value divided by EBITDA (earnings before interest and tax, depreciation and amortization). The objective of EV/EBITDA ratio is to compare similar company and to know which company that is suitable to buy or acquire by investor.

Table 7. EV/EBITDA Multiple

Peers	EV/EBITDA						
Company	2011	2012	2013	2014	2015	2016F	Target Price
SMCB	7,41	9,05	7,02	8,83	5,53	**7,6**	**523,6**
SMGR	12,59	13,04	10,31	11,45	9,31		
INTP	13,1	12,47	10,77	13,71	13,99		
Average	12,85	12,75	10,54	12,58	11,65	**12,1**	
Premium/Discount	-42,3%	-29,1%	-33,4%	-29,8%	-52,5%	-37,4%	
Potential Up/downside							-51,7%

Based on PER, the result show the potential upside is 49,6% with the target price is Rp1.623,6 and the recommendation for investor based on PER is buy the stock of SMCB. For EV/EBITDA, the target price is Rp523,6 with the potential upside is 382,6% and the recommendation for investor is buy the stock of SMCB.

Conclusion

The value of the stock of Holcim is decrease about 56% from 2013 until 2015. Holcim Indonesia as a public companies, has expanded in 2015 to increase production capacity by 40 percent. As a result of expanding company is expected to increase production capacity in order to fulfill market demand. Increasing production capacity give the expectation that it will increasing revenue and profit for Holcim Indonesia.

From the results of forecasting revenue, in 2016 revenue of Holcim increased from Rp9.239 trillion to Rp13.073 trillion in 2016.There are negative and positive sentiment that influence stock price of SMCB. Author using valuation method to obtained the target price in 2016. By using absolute dan relative valuation method. Absolute valuation consist of discounted cash flow valuation and free cash flow to firm (FCFF) valuation. Relative valuation consist of price to earning ratio (P/E ratio) and EV/EBITDA multiple. Target price of SMCB is Rp3.262,9 with potential upside is 201%.

THE APPLICATION OF GRAVITY MODEL IN SCENARIO BASED FORECASTING FOR AIRPORT FEASIBILITY STUDY

Rolan Mauludy Dahlan, Institut Teknologi Bandung and Ametis Institute, Indonesia
Santi Novani, Institut Teknologi Bandung, Indonesia

Abstract

Airport Industry is very dynamic. It often appears many new plans from the internal and from the environment. To anticipate the various possibilities outcome that may occur in the future we need scenario-based forecasting for the number of passengers. Here the authors use a gravity model which is implemented in the spatial landscape. To get the best results, the parameters are optimized by compare the result with empirical data through numerical analysis approach. The verification process in the Western part of Java Island showed that this model provide a good result when compared with empirical data. After optimizing the parameters, we may create a scenario-based projections by determine airport capacity and growth rates at specific time. Projections of the number of passengers will affect the business feasibility and future development strategies.

Keywords: *Business Dynamics, Strategic Change, Strategic Role of Locations, Scenario-based Forecasting, Spatial Analysis, Gravity Model.*

Introduction

The western part of Java Island, which consists of the province of West Java, Jakarta and Banten, is the most densely populated areas in Indonesia. In 2014, the area of 45,700 square kilometers is inhabited by 68.15 million people or about 1,491 people per square kilometer (BPS, 2014). After the Asian crisis in 1998, the number of middle class grew significantly and encourages purchasing power (Budiman, Chhor, Razdan, & Sohoni, 2012). The combination of the huge number of population and increased purchasing power creates new challenges, including in the air transportation industries.

In this region, the number of passenger increased very rapidly. It rose from 11.88 million passengers per year (2001) to 61.54 million passengers per year (2014), or an average of 13.99% per year (BPS, 2015). They are only served by three airports, namely Soekarno-Hatta (CGK), Husein Sastranegara (BDO) and Halim Perdanakusuma (HLP). This is very difficult to fulfill the passenger growth. The Indonesian government has been tried to resolve this problem by making a lot of plans that will be run simultaneously. The first plan is to enlarge the existing airport capacity. The second plan is to encourage state-owned enterprises and the private investors to build a new airport, such as Kertajati (XX1) and South Karawang (XX2).

This parallel development plans increase the level of uncertainty for investors. They are faced with a number of questions. What would happen if the rival airports are built? What happens if the rival airport increases its capacity? What happens if the rival airport development delayed for several years? What happens if the development of the rival airport is canceled? To anticipate the various possibilities outcome that may occur in the future we need scenario-based forecasting (Greenwood-Nimmo, Nguyen, & Shin, 2013) for the number of passengers. Projections of the number of passengers will affect the business feasibility and future development strategies. If the number of passengers is below the threshold then the business is not feasible to be implemented. The dynamic of passengers will affect the airport development strategy, for example design capacity at early stage, timing, and design capacity in the next stage and the integration between the early stage and the next stage.

The purpose of this research is to create a scenario based passenger projections. This spatial approach is constructed based on the gravity models that mimic gravitational interaction as

described in Isaac Newton's law of gravity. Gravity models are used in various social sciences, for example the gravity model of international trade (Nello, 2009), trip distribution (Levinson & Kumar, 1995) and gravity model of migration (Rodrigue, Comtois, & Slack, 2009). In this study the parameter of the gravity model is optimized by using numerical analysis on empirical data.

Theoretical Foundations
1. GIS for Transportation (GIS-T)
Geographic information system (GIS) are interconnected hardware, software, data, people, organizations and institutional arrangements for collecting, storing, analyzing and communicating particular types of information about the earth. GIS-T is one of the most important applications of GIS (Miller & Shaw, 2001). GIS-T application covers much of the broad scope of transportation, from infrastructure planning, public transit operation, traffic analysis and control to hazard mitigation. The format of the spatial data storage varied, from vector data (represent features as discrete points, lines, and polygons) to raster data (represent the landscape as a rectangular matrix of square cells) (Peuquet & Marble, 1990).

2. Distance
There are many concepts of distance in mathematics, for examples Euclidean distance, spherical Distance, Manhattan distance, Chessboard distance, Hamming distance and so on. In this study we use spherical distance or the minimum distance between two points on the surface of the spherical object (Rowland, 2016). Euclidean distance or the minimum distance between two points in Euclidean space (Deza & Deza, 2009) is not realistic to describe the distance on the earth's surface. We don't use Manhattan distance or the total distance that connect the segments between two points in space (Barile, 2016) because of data limitations.

3. Numerical Analysis
Numerical analysis is the branch of mathematics which is used to find approximations to difficult problems such as finding the roots of non−linear equations, integration involving complex expressions and solving differential equations for which analytical solutions do not exist (Karris, 2007). There are many mathematical problem cannot be solved by analytic methods. Sometimes we have to use numerical analysis or study of algorithms that use numerical approximation for the problems of mathematical analysis. The invention of the computer also influenced the field of numerical analysis, since now longer and more complicated calculations could be done.

4. Gravity Model
Gravity models that mimic gravitational interaction as described in Isaac Newton's law of gravity are used in various social sciences. This approach is used to measure the interaction between two separate things based on economic mass and spatial distance. The gravity model illustrates the macroscopic relationships between places. The Economic mass increase the interaction between the two regions, while the distance reduces the interaction between the regions. There are many application of gravity model in spatial problem, for example the gravity model of international trade (Nello, 2009), trip distribution (Levinson & Kumar, 1995) and gravity model of migration (Rodrigue, Comtois, & Slack, 2009).

5. Related Research
Tobias Grosche, Franz Rothlauf and Armin Heinzl used gravity models for the estimation of air passenger volume between city-pairs in European countries (Grosche, Rothlauf, & Heinzl, 2007). Their models showed a good fit to the observed data and are statistically tested and

validated. Fengjun Jin, Fahui Wang and Yu Liu also used gravity models for the estimation of air passenger volume between cities in China (Jin, Wang, & Liu, 2004). But unfortunately these two models only explore the interaction between cities or airports, not the relationship between the distributions of the population to the airports.

Methodology

In this study we tried to examine the relationship between the distributions of the population to the airport. About 68.15 million people in the western part of the island of Java inhabit 7,735 desa (villages) or kelurahan (urban communities). Map of villages or urban communities (i) are in polygons format (ρ).To be analyzed further, it needs to be transformed (T) into a point or centroid (p) or geometric center of a plane figure is the arithmetic mean ("average") position of all the points in the shape.

$$T: \rho_i \rightarrow p_i \tag{1}$$

Where:

$$T: \rho_i(x_0^i, y_0^i; x_1^i, y_1^i; \dots; x_{N-1}^i, y_{N-1}^i) \rightarrow p_i(\bar{x}^i, \bar{y}^i) \tag{2}$$

The transformation process assumes that the two-dimensional polygon has a uniform density. Centroid can be calculated by (Worboys & Duckham, 2004):

$$\bar{x}^i = \frac{1}{6L} \sum_{n=0}^{N-1}(x_n^i + x_{n+1}^i) \cdot (x_n^i \cdot y_{n+1}^i - x_{n+1}^i \cdot y_n^i) \tag{3}$$

And

$$\bar{y}^i = \frac{1}{6L} \sum_{n=0}^{N-1}(y_n^i + y_{n+1}^i) \cdot (x_n^i \cdot y_{n+1}^i - x_{n+1}^i \cdot y_n^i) \tag{4}$$

L is the area of the polygon, where:

$$L = \frac{1}{2} \sum_{n=0}^{N-1}(x_n^i \cdot y_{n+1}^i - x_{n+1}^i \cdot y_n^i)$$
Fig. 1. 7,735 villages or urban communities in the western part of the island.
Fig. 2. The spatial distribution of the population in the western part of the island of Java.

Total number of passengers (W) at time t grow at rate rt.

$$W_t = W_{t-1} \cdot (1 + r_t)$$
(6)

We assume the number of passengers (w) of a villages or urban communities (i) is directly proportional to population (q) and income per capita (π), or:

$$w_{i,t} \sim q_{i,t} \cdot \pi_{i,t} \qquad (7)$$

Where

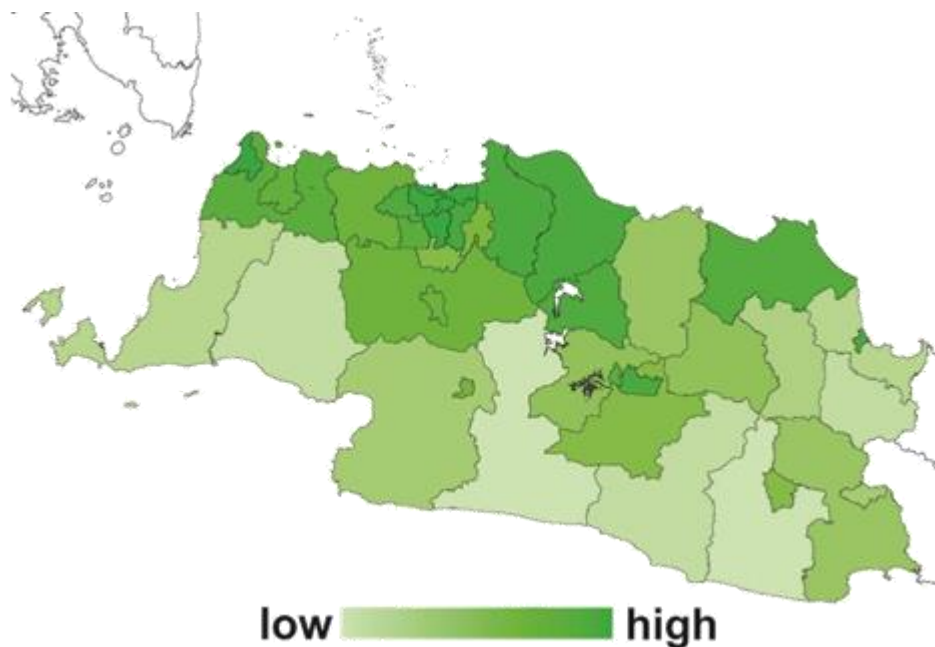
$$W_t = \sum_{\forall i} w_{i,t} \qquad (8)$$


Fig. 3. The spatial distribution of the income per capita in the western part of Java Island.

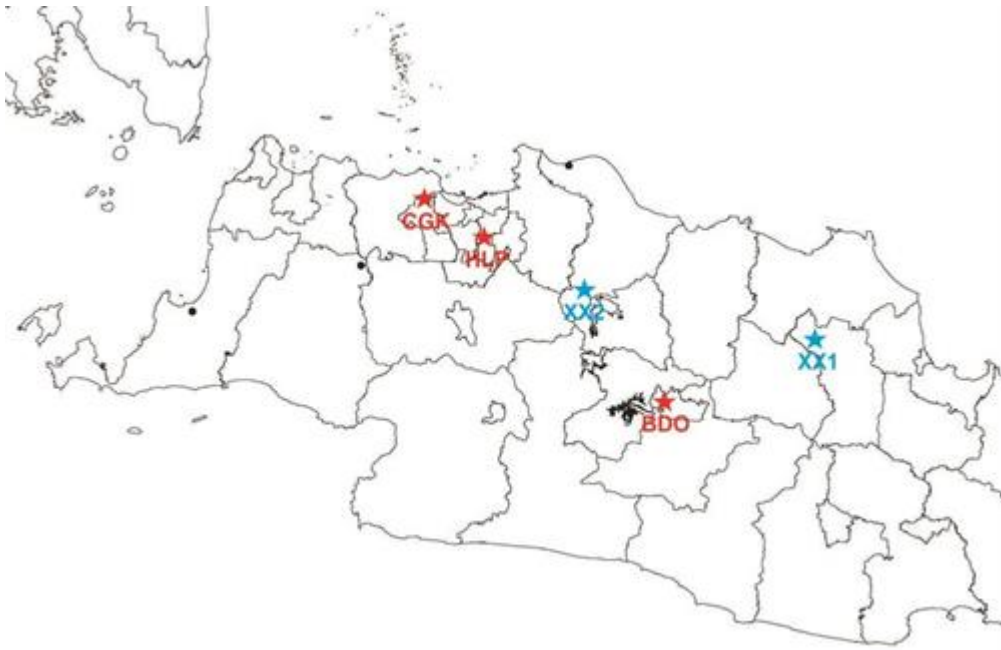
There are three existing airports, namely Soekarno-Hatta (CGK), Husein Sastranegara (BDO) and Halim Perdanakusuma (HLP). There are also two candidates of new airport, namely Kertajati (XX1) and South Karawang (XX2).


Fig. 4. 3 existing airport and 2 candidates of new airport in the western part of the island of Java.

The interaction force (F) between passengers in a villages or urban communities (i) and airport (j) is calculated through gravity models, which simply:

$$F_{i,j,t} \sim \frac{c_{j,t}}{d_{i,j}{}^k} \tag{9}$$

Where c is capacity of the airport, d is spherical distance between villages or urban communities (i) and airport (j) and k is power coefficient of spherical distance. The number of passengers at airports j at time t ($\omega j,t$) is calculated using the following pseudo algorithm:

```
For i=1:I
        Search i*j* where F_{i*,j*,t} = max(F_t)
        ω_{j*,t} = ω_{j*,t} + w_{i*,t}
        For j=1:J
                F_{i*,j} = 0
        End
        If ω_{j*,t}>c_{j*,t}
                For i=1:I
                        F_{i,j*} = 0
                End
        End
End
```

There are 2 possible outputs: if $\sum_{\forall i} c_{i,t} \geq W_t$ then $\sum_{\forall i} \omega_{i,t} = W_t = \sum_{\forall i} w_{i,t}$ and if $\sum_{\forall i} c_{i,t} < W_t$ then $\sum_{\forall j} \omega_{j,t} = c_{j,t} < W_t = \sum_{\forall i} w_{i,t}$.

The power coefficient of spherical distance (k) in gravity model is optimized by using numerical analysis (Karris, 2007) on empirical data. Figure 5 show the mean absolute percentage error of the power coefficient of spherical distance (k) compared with empirical data of passengers in 2015. The smallest value of mean absolute percentage error (MAPE) is 4.75% when $k=2.0$.
Fig. 5. Mean absolute percentage error of the power coefficient of spherical distance (k) compared with empirical data of passengers in 2015.

Result

After optimizing the parameters, we can predict the number of passengers at specific airport in certain scenarios by determine airport capacity $(c_{j,t})$ and growth rates (r_t) at specific time. In this case there are millions possible scenarios. We tried to implement this model in case of planninf new airport in Kertajati (XX1). XX1 was targeted to serve 5 million passengers per year in 2018, 10 million in 2020 and 20 million in 2026.

Scenario 1:

The XX1 feasibility study was made in 2013 without information about XX2 airport. CGK's capacity will increase 40% after the operation of a third runway in 2022. HLP will be expanded to reach 11.5 million passengers per year in 2020. They assumed that BDO can be closed in 2020. The economic situation is very bright after a very explosive passenger growth from 2001 to

2012. The number of passengers is expected to increase by 7% per year. This situation is called scenario 1.

Scenario 2:

In early 2016 there was new plan of XX2 airport that can serve 20 million passengers per year and will be operational in 2023. The operation plan of the third runway at CGK will be accelerated into 2019. No change of plan in HLP. Because of public resistance BDO will not be closed. After economic slowdown in 2012-2015, passenger growth is corrected at only 6% per year. This new situation is called scenario 2.
Fig. 6. The calculation results of the number of passenger for scenario 1 and scenario 2 compared to its design capacity.

This model can be used to make scenario-based projections of passengers. Figure 6 show the calculation results of the number of passenger for scenario 1 and scenario 2 compared to its design capacity. Due to limited capacity of the airports in Greater Jakarta, in scenario 1, the number of passengers in XX1 will increase significantly after 2025 However in scenario 2 the significant increase will not appear because the development of XX2. Utilization of installed capacity will be less than 60% in 2027.

Amendment of airport planning by the government will affect the competitive landscape of business. This method will be beneficial for the government and investors to anticipate the new plans through the revision of the old and irrelevant strategic plan.

Conclusion

Airport industry is very dynamic especially in the long term. It often appears many new plans from the internal and from the environment. The strategic plan that was created before is become irrelevant. We need the forecasting method that can be adapted easily in many possible scenarios. To anticipate the various possibilities outcome that may occur in the future we need scenario-based forecasting for the number of passengers.

Scenario-based forecasting is needed to anticipate the dynamic airport industry situations. Gravity model can be used to make projections of passenger based on scenarios. To get the

best results, the parameters are optimized by compare the result with empirical data through numerical analysis approach. In the case of the western part Java Island, the mean absolute percentage error (MAPE) of this model is only 4.75%, meaning that this model provides a relatively good estimation value.

After optimizing the parameters, we can create a scenario-based projections by determine airport capacity ($c_{j,t}$) and growth rates (r_t) at specific time. The result of this projection is very important for the government and investors to construct a new strategic plan.

INTEGRATED QUALITY DIRECTING AS DRIVER TO ENCOURAGE PRINCIPALS OF QUALITY MANAGEMENT

Ahmad Ikhwan Setiawan, Sebelas Maret University, Indonesia
Intan Novela, Diponegoro University, Indonesia
Reza Rahardian, Sebelas Maret University, Indonesia
Datien Eriska Utami, State Institute for Islamic Studies Surakarta, Indonesia

Abstract

Purpose: This research aims to construct a model of integrated quality directing in order to fill the research gap between quality responsibility and production performance. This research model involves a number of other important supporting variables such as technological learning capacity, market dynamic recognizing and production performance

Design/Methodology/approach: At the beginning, 245 companies, which produce several printing products in Indonesia, were contacted for the study using a purposive sampling technique. To achieve normality of data distribution, it was 182 respondents selected to be processed using SEM AMOS.

Finding: Our research indicated that number of the goodness parameter for the model meets the necessary conditions. Integrated quality directing has an important role for driving quality management practices. To deploy the integrated quality directing requires support from two main quality management activities, technology learning capacity and market dynamic recognizing.

Research implication: Manager could coordinate all of company divisions to involve in improvement of production quality. Production department should obtain not only production skill but market trend knowledge also as basis to produce high quality products, which suitable with consumer needs.

Originally/value: Integrated quality directing as the novelty of this study contributed towards enhancing the body of theoretical knowledge of the quality management.

Keywords: *Integrated quality directing, quality responsibility, technological learning capacity, market dynamic recognizing and production performance*

Introduction

The quality of the production process is the heart of the company, which operates based on the orders from customers. Companies which are able to meet the quality of the order have major opportunities to expand the business (Ilkay & Aslan, 2012; Solis, Rao, Raghu-Nathan, Chen, & Pan, 1998). Even though, the characteristics of the product hardly depends on the specifications that consumers want, but these attributes of products which meet the quality standards is having guidelines that are standard, relatively. Products of certain industries have uniformity contained in national standards of the industry. Each industry must fulfill those standards if the product wants to be marketed in the area of jurisdiction, in which the national standard applied (Charles W. & James S., 2001).

The qualified products ensure a reasonable business climate and protect consumer interests. Products which meet industry standards are produced through the production process that is accepted by the mill (Kaynak & Hartley, 2005). Each stage is considering the safety and quality fulfillment requiring reasonable production costs. If there is an inappropriate production cost then this condition may be caused by the actions that are not desired by particular production specialists, such as reducing the quality of materials (Trentin, Perin, & Forza, 2012), reducing production intensity (Phan, Abdallah, & Matsui, 2011) or weakness in supervising the final product (Sarah J. Wu, 2015). Qualified products showed

producers' concern to consumers about the comfort and satisfaction. Companies that seek to improve the quality of its products represent the company's attention to the aspects of functionality, safety, comfortable and esthetic.

Achieving quality of production is goal of quality management (Yeung, Cheng, & Kee-hung, 2005). There are many factors which determine practices of quality management related to consumer, staff and leadership (Sarah J. Wu, 2015). The main aspects of quality management influence the production quality are focus to consumer, quality responsibility and process orientation (Samson & Terziovski, 1999). The deployment of quality management requires some complement factors such as technology and knowledge (D. I. Prajogo & Sohal, 2006). Companies need these aspects of quality management to convince all of parts follow the right tract (Zeng, Anh Phan, & Matsui, 2015). Application of quality management must pass some stages that spend time and effort so that manager should oversee and control every step (Sun & Ni, 2012).

The responsibility of companies in producing quality products becomes an important commitment of the company. The qualified product is one of the company's competitive advantages which are achieved through consistency of the production process in a long time, relatively (Sun & Ni, 2012). Creating quality products affect the expectations of the company's success because these efforts can build a reputation in the field of products (Kaynak, 2003). Even though creating quality products is not an easy work to do, but the more difficult step is maintaining the consistency of the production process quality. Maintaining the quality of the process requires the direction from the manager and awareness throughout the company for this significant activity requires cooperation across part of the company. Manager and staff could enact a shared commitment to accomplish each challenge of mission.

The high linkage between the quality responsibility and production performance gains support from both theoretical and practical. Many researchers mention that the experienced production team was able to avoid defective products due to operator error (Kaynak & Hartley, 2005; Prabhu, Appleby, Yarrow, & Mitchell, 2000). Production employees who are able to well-used technology deliver products which meet the required quality standards (Kafetzopoulos, Psomas, & Gotzamani, 2015). Cooperation is among production employees, who understand the standard operating procedure in generating maximum production output. Companies, which often involve employees in a wide range of performance improvement training, are better prepared for the pressures due to the changes in consumer demand (Leonard & McAdam, 2004). Various efforts to internalize the values of quality in the process of socialization of the leadership of the company to its employees obtain a measurable response in the form of improved production results (Sun & Ni, 2012).

There are different opinions regarding the relationship between the quality responsibility and production performance. Companies, which have a complex organizational structure, show the inability of quality responsibility affects production performance (Anderson & Jerman, 1998). This condition is not caused by employees who are a lack of experience or technology used behind but due to weak coordination between sections (Yeung et al., 2005). A company has several employees who have a high-quality responsibility, but this positive situation is not able to deliver tangible benefits for the company's because the policy of companies spread the positive values is not effective. Quality responsibility does not run optimally on companies that have interest conflict between function. In some cases of the quality orientation from the part of the production, which requires prevention costs, is unsuccessfully run. It is caused by the finance department does not financially full support.

The contradiction results of research on the impact of the quality responsibility to production performance are attractive to be studied deeply. Constructive activities are not fully obtaining an optimal response to the employee if the implementation of such activities

are not accepted and supported by all the companies concerned (Solis et al., 1998). Quality commitments, which have been agreed, need to be escorted by the leaders through the implementation of the coordinated cross-section (Zeng et al., 2015). This coordination is sized to organizational, namely the involvement of the parties concerned, to share information, and support activities that involve intensive collaboration between departments. The coordination is devastating when leaders take over in directing the activities actively and immediately take the necessary solution-making action.

This model examines the technological learning capacity as an internal resource which is necessary to encourage internalization process quality. Experts agree that technological learning is a prerequisite of companies to improve processes and organizational output (Mikalef & Pateli, 2017; Sánchez-Rodríguez & Martínez-Lorente, 2011). Moreover, companies, which do not have a good technological learning, do not have the power to create competitive advantage (McGuinness & Morgan, 2005). Technological learning capacity is closely related to the ability of innovation, continuous improvement, and product quality improvement. Companies that are operating on the basis of technological capabilities such as printing industry, telecommunications and chemistry choose to learn capacity as the primary ability to survive.

The consumer-oriented company stresses to all parts of market dynamic recognizing. Even though each section has a different function, but they have the same goal, namely how to achieve a certain level of sales. A common goal drives every part to improve the quality of its work to achieve customer satisfaction (McGuinness & Morgan, 2005). This concept also applies to the operation part in which its main function is to produce products that meet the aspects of productivity and customer preferences. Market dynamic recognizing is an important antecedent variable in constructing internalization quality process readiness.

Printing business in Indonesia has decreased the rate of profit (Tetsu, 2013). The growing of the printing business in the three-year is, indeed, experiencing a significant increase (KPMG, 2015). The numbers of SMEs' that join the business are escalated quickly every year due to the increasing demand. As a result of fierce competition, many companies are lowering prices with consequence as reduced product quality (Herdian, 2014). If this condition is abandoned, there will be consumer dissatisfaction occur that potentially lower sale. This study seeks to provide input to the printing business people so that they pay more attention to the quality of production in order to avoid the fancy defective products. If the product attributes that consumers want to be fulfilled, the company can maintain customer loyalty, increasing sales and improving profits.

There are three main objectives of this study. First, develop a model internalization process quality through testing relationships between important variables such, as recognizing dynamic market, technological learning capability, market responsibility, and integrated quality directing and production performance. Second, testing how important the role of integrated quality directing as the novelty of this study that is mediating influence between quality commitment and production performance. Third, providing recommendations for the development of the printing business that became the subject of research

Literature Study
1.   **Integrated quality directing and Production performance**
An effort to fulfill production quality achievement requires commitment from all parts of the company. Companies need to create mechanism links of production parts and another part so that the involvements of the parts are not regarded as an intervention but as an effort of coordination. In accordance with the value in ISO 9001 that quality fulfillment process is the responsibility of all parts of the organization, companies need to create a job description for each section and determine how far the interaction between parts (Prabhu et al., 2000). It is to

achieve the company's performance (D. Prajogo, Huo, & Han, 2012). Issues of the production part such as the raw material supply sustainability, the completion of the production schedule, and the achievement of product attributes are regarded not merely a burden for production, but it is becoming a communal business plan that requires the support of many parties.

Integrated quality directing defined as information management and sustained participation from every the critical part of the organization, in the process of achieving the attributes that have been a determined production company. Even though the smoothness of production is the responsibility of the production part, but production performance can be achieved optimally if there is cooperation between the production with the essentials such as a division of the company's financial, marketing and human resources (Leonard & McAdam, 2004). Management needs to share production information to other parts so that each part is able to prepare and determine the activities that support the achievement of the production productivity (Lee & Peccei, 2008). In addition, management needs to design the interaction of parts production and other parts so crucial issues that arise in production can be completed simultaneously (Sun & Ni, 2012).

Companies need to manage information sharing within the parts company about the development of production quality achievement. The activities, not only as a form of supervision but also encourage the active participation of all parts of the enterprise (Lee & Peccei, 2008). The Company may hold regular meetings to discuss the progress of the production. If the production process overcomes very complex problems, management can involve other parts of determining solutions together (Yeung et al., 2005). Activities focused on the sharing of production information, such as the progress of production, fulfillment of product quality, and design changes can be supported with information technology so that strategic decisions can be done immediately (Kaynak, 2003). On the projects with high valued, the company can create a task force involving representatives from each section to maximize the completion of the task.

The meeting, which is discussed the increasing excellence attributes in the production process that involves whole companies, needs to be done regularly . The main problem overcome order-based producing manufacture is the delivery of products that suit the customer both in terms of quality assurance, the exact quantity, and timeliness (Phan et al., 2011; Zeng et al., 2015). The regular meetings in addition to evaluating the achievement of the quality the production process also avoid misunderstandings and facilitate cooperation between the parts. Therefore, the evaluation brought together representatives from all parts of the company leader's role in directing objectives and targets are very salient activities (Prabhu et al., 2000). Conflicts of interest in the meeting are possible that technical guidance on achieving quality can be emphasized.

Production performance is the level of achievement of the production process output. Production performance can be seen from how much the achievement of product attributes (Trentin et al., 2012). The production process that complies with industry standards produces a quality product. Production performance can also be measured by how many products can be categorized as a good product (Ilkay & Aslan, 2012). If production only produces the number of defective products is relatively few, the production can be resumed. Conversely, if the production yield the number of defective products exceeds the tolerance then the company should immediately evaluate the problem and find solutions.

The order-based producing company can observe the quality of the production based on the extent to which parts of the production schedule for completing the order. The production quality is not solely be seen from how many products meet the quality, but also how the proper completion of the product (Trentin et al., 2012). If the company can undergo innovation in production, the production system engineering can be done to meet the production schedule. Discussion of performance in full production includes production

capability to produce quality products, lower levels of product damage, and fulfillment of the production schedules that consider the delivery time of goods to consumers.

The company's ability to manage the involvement of parts of the company affects production performance. Production problems are not always due only to suboptimal production employee's work (Sánchez-Rodríguez & Martínez-Lorente, 2011). Often, the solution to the problem can be solved with the support of other parts. The inability of production to produce quality products in accordance with customer expectations can be determined by solutions based on feedback from the marketing department which knows better consumer preferences (D. I. Prajogo & Sohal, 2006). Completion of product orders for the large amounts and having a specification that requires complex coordination amongst the intensive (Solis et al., 1998). Especially in a situation where a very tight construction schedule, a variety of orders can be met if the co-operation between the parts are very solid.

Improved coordination among parts companies reduces the potential for damage to the goods. Damaged goods can be minimized through continuous improvement of production processes (Kaynak & Hartley, 2005; Sánchez-Rodríguez & Martínez-Lorente, 2011). Production errors due to lack of information about support for other parts of the completion of the product can be avoided if there were intensive meetings (Fang, Li, & Lu, 2016). If these efforts require the authority of certain part, then the production department can explain what kind of support is required (Phan et al., 2011; Sarah J. Wu, 2015). Basically, there are three types of support that may be given another part, that support information (Sánchez-Rodríguez & Martínez-Lorente, 2011), employee (Kaynak & Hartley, 2005), or finance (Lee & Peccei, 2008). Through the support of these, companies can take steps in improving the production process of preventive and curative. The argumentative thinking supports the following hypothesis:

H_1: The increasingly integrated quality directing the greater production performance

2. Quality responsibility

Activities that have an impact on the excellent companies' characteristics achievement can be sustained if the commitment to the quality has become a culture work (Lemmink, 1996). Before employees are doing positive activities, the company leadership has initiated to epitomize (Solis et al., 1998). Various messages in the importance of applying the quality found strategic places on the company to remind the importance of honoring the achieving activity process. Employees who make mistakes or who did not complete the work in accordance with the level of certain work ethic should be willing to accept suggestions for improvements from the leaders or fellow employees with equanimity (Sun & Ni, 2012). The company is willing to benchmark with similar companies on the application of certain work quality to achieve quality standards which are expected by companies.

Quality responsibility is defined as organizational awareness regarding the implementation of activities that encourage achievement of designated companies production attributes. Quality consciousness arises because of the internal impetus for achieving the efficiency and productivity of production. This production system is capable of supporting the achievement of cost leadership through the minimization of production costs (Lee & Peccei, 2008). Quality awareness could also arise because of the force of the desire of consumers who require goods or services they consume to fulfill certain quality (Prabhu et al., 2000). Companies can evaluate the achievement of production attributes to determine the performance of each indicator. If it is necessary, the company may change the standards achieving each attribute in accordance with the requirements of the market needs.

An understanding of the attributes of product excellence is a form of corporate concern about product attributes. There are two words that are important in maintaining the business: adaptation (Leonard & McAdam, 2004) and changing (Sarah J. Wu, 2015) .

Companies are excelling if it able to capture signals shift in consumer preferences and do any form of adjustment. Moreover, companies can learn from the competitors about how far the intensity of such adjustments is made (Yeung et al., 2005). Adjustment understanding of product quality can also be done by the company to respond to the desires of consumers and the development of competition. The production department can request the help of the marketing department to collect such strategic information.

Risks of new technology implementation can be anticipated in the company through the process of socialization. The improper use of technology not only results in damage to companies' facilities, it has also weighed on the cost of production. One of the new technologies is a process of socialization through various training such as the selection of raw materials, controlling production processes, and sorting failed product. Socialization of new technology also reduces the resistance behavior of employees who feel the potential advantages are not able to adjust to the new policies. Various forms of training are not seen as only the company's financial expenditure, but it becomes an investment to anticipate future changes (Lee & Peccei, 2008). Companies can manage the training program on an ongoing basis through the transfer of knowledge of a particular company structure to the structure below.

Companies that have responsibility for the implementation of the quality of production seek to involve the internal parts that are involved in efforts to synchronize the important role of each of those sections. The production quality is a derivative of the quality of the company in general which is usually in the objective strategic level meeting delivered by top-level managers (Solis et al., 1998; Sarah J. Wu, 2015). In spite of each has a derivative management functioned different objectives but at the level of practice, there is a close correlation between parts (Sarah Jinhui Wu, Zhang, & Schroeder, 2011). As a simple example that the purpose of the production department to produce product attributes require financial certainty in sustainability efforts procurement of quality raw materials, in which this issue should be of concern to the financial sector (Lee & Peccei, 2008). Therefore it cannot be denied that awareness of production on achieving quality production requires the intervention of top level managers to involve other parts. This argument is encouraging the following hypothesis:

H_2: The increasingly quality responsibility the greater integrated quality directing

The production department which has liability in achieving production quality seeks to achieve production performance that already established by companies. Product attributes specified by the customer easier to be achieved if the company has the correct instructions to produce them (Phan et al., 2011; Sun & Ni, 2012). Various damage products can be avoided by monitoring the quality in each stage of production starting from raw material control, strictly monitoring the production process, and final product inspection (Kafetzopoulos et al., 2015). Companies that have a high-quality culture that emphasizes each division in the production process to be responsible independently of the quality of the output produced (Jung, Su, Baeza, & Hong, 2008; Sarah J. Wu, 2015). Each division input avoids flawed, imperfect process, and not optimal quality output (Laszlo, 1999). Theoretical and practical support for supporting the delivery of the following hypothesis:

H_3: The increasingly quality responsibility the greater production performance

4. Technological learning Capacity

Companies should implement various smart strategies to get through each stage of the business lifecycle. The life cycle of the company through various stages, the period of introduction, development, maturing and declining. The future introduction is the most challenging time for the company to coordinate internal resources that have not managed neatly to face stiff competition environment (Bolívar-Ramos, García-Morales, & García-

Sánchez, 2012) Companies that are not able to synchronize the main parts of the company will face the risk of failure. Meanwhile, companies are able to collaborate on internal resources are still to be tested for their ability against all threats from environmental companies, such as the pressure of competitors, changes in consumer tastes, limited supply, and overtaken technology. The important thing for the company is not to avoid the appearance of any pressure but how to overcome and deal the pressure at every stage of life.

Companies need to increase the technological capacity to develop self-learning and confront all challenges. Technological learning capacity is the ability of the company to accept, understand, and utilize technology that has never been used before to improve enterprise business processes which are reflected in the main function of management: marketing, production, resources, and finance. Companies that have a solid team and adaptive character have the ability to learn new technologies (D. I. Prajogo & Sohal, 2006). The team was able to predict production technology affect the company's competitive advantage. Companies can rehearse core teams to accelerate the adoption and internalization of new technologies.

Anticipating the demands of the new production technologies application, companies need to learn methods of the production process to be more efficient. Companies are able to achieve production efficiency with the appropriate technology which can achieve cost advantages (Kitapçi & Çelik, 2014). Despite these technologies require an additional investment that cost the company but in general the cost of the product will decrease if the company is able to achieve a certain production capacity. Therefore, corporate leaders need to evaluate the extent current productivity of production systems. In addition, they are always open to the development of technologies that support improved production.

Adoption of new production methods requires technological and organizational readiness. The presence of new technologies that are expected to improve the performance of production cannot be achieved if the company did not immediately implement the technology (McGuinness & Morgan, 2005). The delay is caused by the company did not have a team which is able to operate the new technology. The application of the new method is also often not able to be applied properly because there is a part of a corporate structure that does not accept the technology wholeheartedly. The attitude of the resistance arises because they feel threatened by the presence of new technologies. Companies need to conduct training and the use of a gradual introduction to the parts of the requested management oversees the implementation of new technologies.

Companies are able to master the new technologies that shaped the methods and tools to encourage managers and employees to engage in improving the quality of production (Trentin et al., 2012). The new technology contains the complexity of larger features than the previous technology. The application of new production technologies requires more detailed information for the production process capable of producing the desired output quality (Bolívar-Ramos et al., 2012). To meet the completeness of the information, resources may not be sufficient only be obtained from a single part but from several parts of the company concerned. Through coordination between parts of companies, certain production quality targets can be achieved. Big company that has various divisions such as marketing, human resources, finance, and production division will integrate the production of any role of the division to select and implement appropriate new technologies in order to achieve improvement of the quality of the company's performance. Based on these considerations, the hypothesis that a very relevant are:

H_4: Increasingly technology learning capacity the greater integrated quality directing

Companies that are able to master a variety of relevant technologies to the business have the awareness to do the improvement of production processes and produce higher quality products. It is perceived new technologies as a medium that has greater advantaging features

than the previous technology. The use of new technologies intended to gain a lot of benefit such as the achievement of better production the quality than the practices of existing production (Perez-arostegui & Barrales-molina, 2015). Skills to use various technologies are realizing the experts that they are able to produce goods with attribute superior products available (D. I. Prajogo & Sohal, 2006). Empirical reality has prompted the following relationship:

H_5: The increasingly technology capacity the greater quality learning responsibility

5. Market dynamic recognizing

The successful launch of new products is determined how big the attributes of these products meet consumer desires. A product created based on two major considerations, namely the pull of companies' technology and encouragement market needs. In spite of each product is designed by taking into account technological developments and the characteristics of the target consumer, but the production process-oriented consumer needs better ensure the success of new products (Narendra Wankhade & Dabade, 2007). Before the product is made, the manufacturer through the marketing research should find out what customers expect. Information on consumers from the marketing department becomes the input for the production of parts to determine the specifications of the product in accordance with the target market.

Market dynamic recognizing is the company's ability to follow and respond to the development of a business related to changes in the core activities of the environment constituents, such as consumer tastes, supplier policies, and strategies of competitors. Understanding the market dynamics is in the broad sense concerning all constituents business environment that influences company policy (Charles W. & James S., 2001). Companies not only need to understand the development of consumer taste but also follow the movements of competitors who seek to undermine the market share of the company (McGuinness & Morgan, 2005). Understanding the market dynamics also requires that companies understand the behavior of suppliers to ensure the availability of raw material supply. Despite this dynamic market activity recognizing, the order-based business can be focused on the company's ability to understand the desire of consumers that are very specific.

Companies that care about the success of the product sought information about consumer expectations of product quality. Each product should have certain characteristics to reach the quality standards specified by the industry that has been determined by the certified institution (Yeung et al., 2005). While the product is produced according to orders have special specifications, according to customer demand. Companies need to synchronize between industry certification requirements with the needs of consumers for products accepted by the market. Companies need to expand knowledge about the development of product quality requirements associated with making materials, production processes and finishing of products. This information can be obtained directly through intensive communication with the target consumer. Companies can also independently 'dig' this knowledge through exploration in online or offline media accordingly.

Ability to set priorities desired needs of consumers in production planning greatly affect the success of a product launch. Consumers have the unique preferences of the order of importance attribute (Pavlou, 2004). According to business experience that the company has been dealing with, the production manager should have general instructions regarding the priority level of the various characteristics of the products that consumers want. Attributes of the goods printouts should have certain characteristics such as the quality of the writing, the power of binding, and neatness print size. The quality can be achieved through appropriate procurement of raw materials, strict supervision, and control of the printing process prints carefully.

Companies should respond to the development of consumer desire relatively changed in accordance with the trend of consumer tastes (McGuinness & Morgan, 2005). Businesses that contain elements such as printing technology and art books are very dynamic because of the level of quality characteristics are developed following the advances in technology and changes in consumer tastes. Companies should prepare to adjust all the changes through the increasing skills of employees and the use of new technologies. Speed in responding to market becomes the competitive strength of companies because consumers prefer a company that is more adaptive to new trends. In how many levels of characteristics that the company is able to adjust are also considered by consumers. In the end, consumers prefer companies that are able to respond to all desires quickly.

Companies which are able to understand the development needs of consumers have greater responsibility in producing a quality product (Kafetzopoulos et al., 2015). The company has a customer satisfaction orientation because they are aware of the products produced in the end to satisfy consumer desires (Narendra Wankhade & Dabade, 2007). Production managers strive to produce products in accordance with the specifications provided by customers. Production employees will control the production process so that the product quality in line with expectations. Awareness of the importance of understanding consumer encourages corporate leaders to internalize constructive policy that all parts of the company responsible for producing quality products. This thought became the basis for determining hypothesis as follows:

H_6: The increasingly market dynamic recognizing the greater quality responsibility

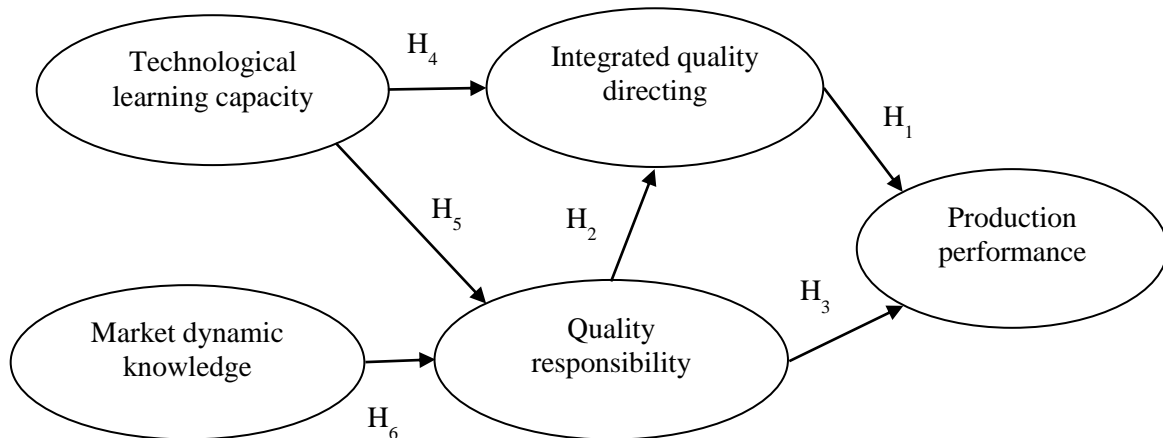
Based on these empirical and theoretical considerations, the research model can be built in their entirety. Relationships between variables were developed based on previous research. The model is built based on the stages of production, namely input, process, and output. Variables that serve as the input are technological learning capacity and market dynamic recognizing. Variable that acts as the process is the quality responsibility and integrated quality directing. While the variable that acts as the output is the production performance. Detailed models can be seen in figure 1.


Figure 1. Research Model

Research Methodology

1. Data collecting

Respondents of this research are printing companies located in major cities in Indonesia such as Semarang, Surakarta, and Yogyakarta. The area has many universities so that the development of the printing business that supports the educational needs progress rapidly. Printing business competition is also getting tougher because the barrier to entry is the smaller businesses. Some printing companies are not able to survive because they cannot afford to efficiently operate. A respondent entitled to fill in a questionnaire is a general director or production manager.

Based on data from the Department of industry and commerce (*Dinasperindag*) Central Java and *Yogyakarta*, Indonesia, there are 1.950 scattered printing companies in *Semarang, Solo, Purwokerto* and *Yogyakarta*. Every printing company identity researched on the sustainability of the current business, operations, and media address of contact (telephone, letter or email). At first, the amount of sample is determined at 245 companies by considering the number representative of the population and the ability of the data to be processed by SEM AMOS. Respondents determined by purposive sampling method that considers several criteria, there are at least two divisions in the company (part of the production as one of the divisions of the company) and has been operating for three years.

The initial processing of the 245 respondents indicated their incompleteness and potential abnormalities questionnaire data. There are 15 questionnaires not completely replied, so such data had to be eliminated from subsequent processing. Test screening and trimming which identify inconsistencies and separate answers of 25 respondents is not processed at a later stage. Through early treatment with AMOS some data appear to have normally undistributed is represented by the value of c.r skewness and c.r. curtosis, at < -2.548 or > +2.548. Therefore, 23 respondents were eliminated gradually by taking into account the hierarchy of values mahanalobis.

The latest data in total 182 respondents rated, it meets normal distribution of data categorized as value univariate normality and multivariate normality at range required at value c.r. − 2.548 <normality <+ 2.548 (table 1). The value c.r skewness of these indicators is at intervals of -2.504 up to 1.104. While the value of cr kurtosis in these indicators on a range -0.983 up to 2.536. Even multivariate normality of the overall data showed that c.r 1.935

convincing. Some 182 respondents became the final data which can be analyzed with descriptive statistics and inductive statistics.

Table 1. Validity Test of Indicator

Indicators	Min	Max	Skewness	Cr skewness	Kurtosis	Cr kurtosis	Factor Loading	α-Cronbach
Integrated quality directing								0.784
• Quality commitment of all parts of organization	5	9	-0.076	-0.420	0.063	0.172	0.70	
• Information sharing of quality improvement	5	9	-0.122	-0.674	-0.318	-0.875	0.75	
• Relating the development of production process quality with the other parts of companies	5	9	-0.217	-1.193	-0.312	-0.859	0.71	
• Involving all parts of companies in enhancing production process quality	5	9	-0.014	-0.075	-0.357	-0.983	0.71	
Quality responsibility								0.774
• Understanding Product quality	4	10	0.142	0.784	0.921	2.536	0.89	
• Applying the culture of excellent production process quality	4	10	-0.169	-0.932	0.919	2.531	0.82	
• Training of enhancing production process quality	4	10	-0.060	-0.330	0.431	1.186	0.70

• Fulfilling of order quality in production part	4	9	-0.455	-2.504	0.428	1.178	0.84	
Multivariate normality					6.881	1.934		

2.   Construct validity

Determination of the indicators refers to variables on the basis of a strong theoretical and empirical arguments are irrefutable. Each indicator has been proven statistically that meet the loading factor above 0.7 and generates a cumulative great contribution to the variables that explain by α-Cronbach above 0.7. Factor loading value obtained by using SEM AMOS. While α-Cronbach in integrated quality directing has four indicators of quality commitment throughout the company, sharing information on the development of quality, linking the development of production quality and engagement with other sections throughout the company in improving production quality (Leonard & McAdam, 2004; Prabhu et al., 2000; D. Prajogo et al., 2012). The smallest factor loading value of the variable indicator quality integrated directing is 0.71 with α-Cronbach 0784.

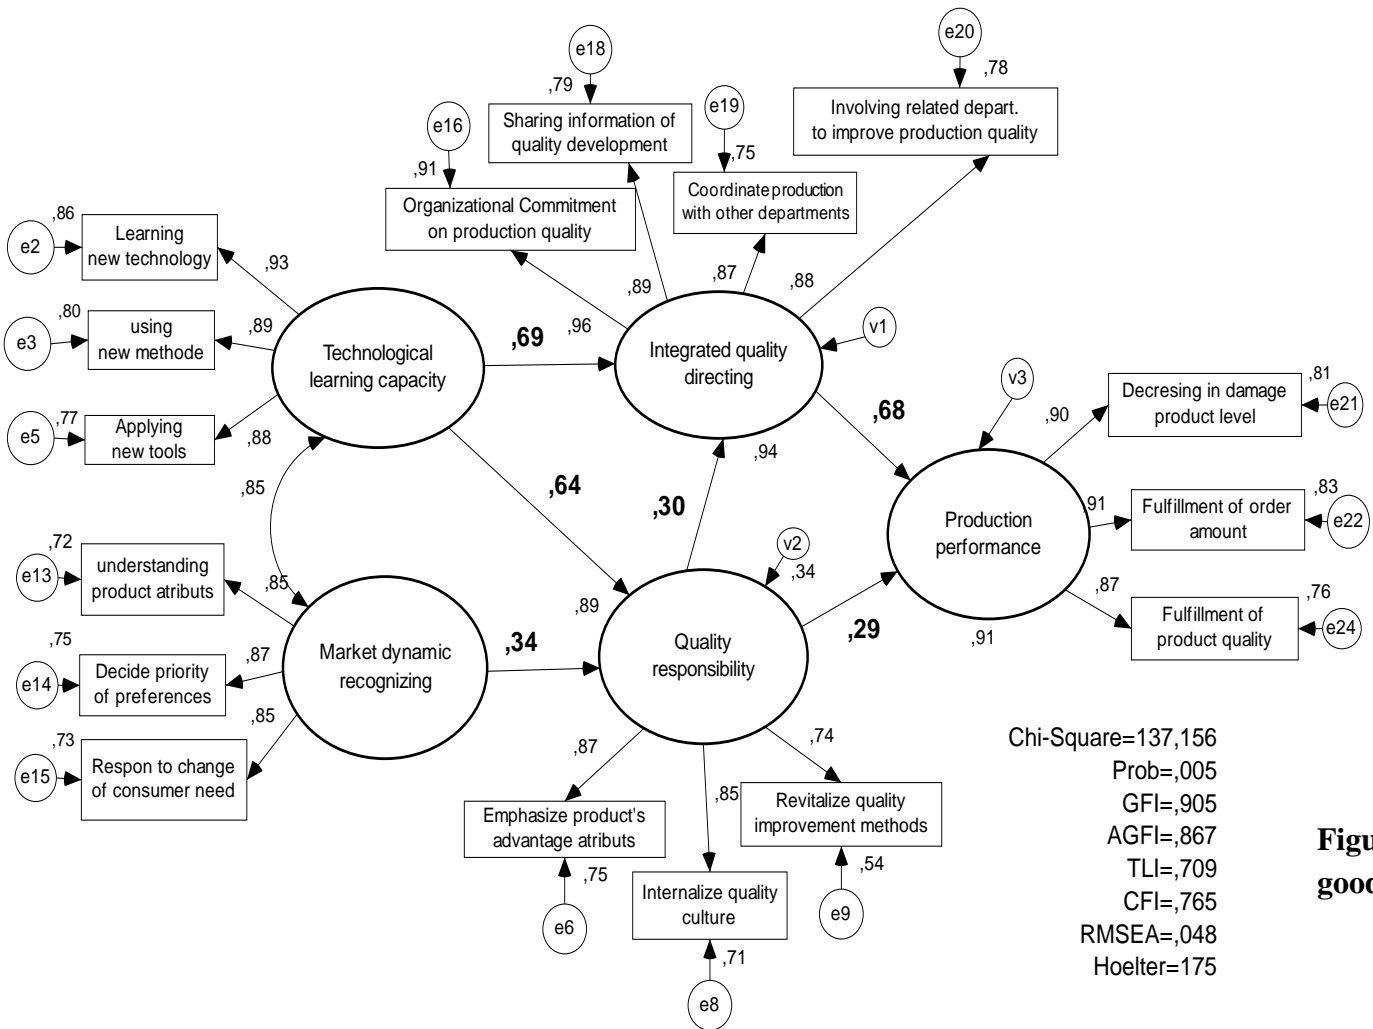
Quality responsibility has three valid indicators; there are the company's understanding of the superior attributes of the product, the implementation of a culture of quality in the production process, and product quality improvement process on an ongoing basis (Phan et al., 2011; Solis et al., 1998; Sun & Ni, 2012). Loading factor value of –indicators of quality responsibility ranged from 0.7 up to 0.8 which shows the ability of the indicator to explain quality responsibility variable. These conditions are supported by α-Cronbach value for the variable quality responsibility by 0.774.

Technological learning capability is characterized by three indicators: the ability to learn new technologies, using the new method and implement new tools (Perez-arostegui & Barrales-molina, 2015; Trentin et al., 2012). The smallest factor loading value of the indicator of technological learning capacity is 0.86, so that, all indicators have explanatory power with a value of α -Cronbach 0873. Market dynamic recognizing explained by the relevant indicator are the company's knowledge about product attributes that consumers want, prioritization expected product attribute preferences of consumers, and the level of the company's response to changes in consumer tastes (Narendra Wankhade & Dabade, 2007). Loading factor of indicators in market dynamic recognizing ranged from 0.7 to 0.8 which confirms the high validity. α-Cronbach value for a variable of market dynamic recognizing is 0792.

There are a number of indicators that mark the production performance, these are a decrease in the level of damage to the product, the suitability of the number of orders and fulfillment of product attributes (Pavlou, 2004; Yeung et al., 2005). Factor loading of production performance indicators is very high, ranging from 0.8 up to 0.9. α- Cronbach's value production performance variable is very convincing that is equal to 0.892.

Data Analysis

Parameters of goodness of fit shows that the model is able to describe the phenomenon of the behavior of companies in internalizing the values of quality (figure 2). There are parameters that convince models such as the chi-square value which was relatively low at 137.156, probability = 0.005, GFI = 0.905, AGFI = 0867 (marginal) and RMSEA = 0048. Nevertheless, there is a goodness of fit parameters that do not support such TLI = 0.708, CFI = 0.765 and Hoelter = 175. A perfect model requires TLI and CFI values above the figure of 0.9. While the value of the required Hoelter which should have a number above the number of respondents was 182. The model was accepted as the final model due to the requirement of five parameters of the 8 parameters of the goodness of fit specified are met.

Figure 2. Parameters of goodness of fit at the model


Chi-Square=137,156
Prob=,005
GFI=,905
AGFI=,867
TLI=,709
CFI=,765
RMSEA=,048
Hoelter=175

Regression coefficient between the integrated quality directing and production performance has a value of 0.679 with p = 0.000 which shows a significant relationship (table 2). This conclusion is in line with the results of previous research. Companies are able to actively involve some relevant company part in helping the production department produces better production performance (Prabhu et al., 2000). The manager is able to push the marketing and human resources to monitor the progress of customer orders achievement. The involvement of marketing in designing quality product can be the forwarding of information concerning the characteristics of competitor products that excel in the face of changing consumer tastes. In addition, resource section development can use the authority in its field in helping to resolve consumer orders such as the approval of the addition of employees, production skills training and additional incentives employee overtime production in pursuit of the delivery deadline. This fact supports the acceptance of hypothesis 1 that there is a close relationship between the integrated quality directing and production performance.

Table 2 Structural Model

No	Structural relationship		Regression weight	Cr	p
1	Integrated quality directing	→ Production performance	0.679	3.543	0.000
2	Quality responsibility	→ Integrated quality directing	0.298	2.057	0.040
3	Quality responsibility	→ Production performance	0.286	1.454	0.146
4	Technological learning capacity	→ Integrated quality directing	0.688	4.626	0.000
5	Technological learning capacity	→ Quality responsibility	0.641	5.246	0.000
6	Market dynamic recognizing	→ Quality responsibility	0.335	3.025	0.002

Regression coefficient between quality responsibility and the integrated quality responsibility shows a relatively small number that is equal to 0.335 but the significance value of 0.002, meets the requirements values (below 0.10). This value stresses that hypothesis 2 explaining that the intensity of the activities related to improving quality responsibility attempts to involve the important parts of the company to meet production completion. This is in line with the conclusions of several studies on the internalization of quality that highlights the importance of the leaders' level meeting to oversee the socialization of the implementation process quality (Lee & Peccei, 2008; Solis et al., 1998; Sarah J. Wu, 2015). Companies that have a higher structure in which there is a hierarchy of decision long needed more coordination efforts between departments.

Relationship between quality responsibility and production performance have the smallest value of regression coefficient that is equal to 0.286 at p = 0.146, the p-value is greater than the required (0.1). This value indicates no significant relationship between the two that the culture of

quality that has become a company's habit is not able to guarantee the fulfillment of the attributes of production (Solis et al., 1998; Zeng et al., 2015). These results differ from previous research that states automatically increase the awareness of the quality of production performance (Kaynak & Hartley, 2005; Prabhu et al., 2000). In the context of the printing industry that demands rapid rhythm of work to meet a number of orders, small and medium scale enterprises may face a difficult situation, such as material supply uncertainties and the limited skills of employees. If the company is not able to overcome these constraints, the work plan cannot be achieved. Therefore, the hypothesis 3 that suggested a link between the quality responsibility and production performance is unacceptable.

Regression coefficient value of technological learning capacity with integrated quality directing showed high at 0.688 significant at p = 0.000. This condition confirms that the company's ability to learn new technology encourages companies to manage the traffic information and coordination amongst the companies in helping to resolve schedule production orders (Bolívar-Ramos et al., 2012; Trentin et al., 2012). These results are also supported by previous research that companies are adaptive to new technologies are easier to assimilate the perception in the achievement of common objectives, including the fulfillment of the attributes of production excellence. This condition is more pronounced in industries that experienced the development of industrial technologies more quickly, such as the printing industry, from the industry were moderate in the face of technological demands. This condition leads to the conclusion that the hypothesis 4 which states a significant relationship between technological learning capacity and integrated quality directing is acceptable.

Significance relationship was also shown between technological learning capacity and quality responsibility, which both regression coefficient value of 0.641 with p = 0.000. These results are supported by previous studies which stated that the company is able to master the new technology is more aware of the importance of quality in the production process (McGuinness & Morgan, 2005). The term technology does not always refer to the complex hardware and costly but worth understanding technology in general as knowledge and skills. Companies, which acquire knowledge about the importance of the quality of working, implement activities that maintain the quality of the company's value (Perez-arostegui & Barrales-molina, 2015). It is also in line with the concept of a technological learning curve that the most intense the company to learn the technology, the greater the benefit of the company's capitalization to exploitation. Based on these facts, hypothesis 5, which believe the relationship between technological learning capacity and quality responsibility, can be accepted.

The relationship between the market dynamic recognizing and the quality responsibility to produce relatively high-value levels of significance with a regression coefficient of 0.335 at p = 0.002. Their relationship is already supported by the results of previous studies that companies that understand the changing tastes of consumers have the awareness to follow the attributes of preference (McGuinness & Morgan, 2005). Despite, following the trend of the market has the consequence that the need for preparedness weight skill of workers and the provision of appropriate production technology, but companies should be aware of the philosophy of change and adaptation (Narendra Wankhade & Dabade, 2007). The Company is able to withstand the competition if it perceives the change as part of the life cycle and adaptability as a consequence of readiness to accept change. This argument confirms the acceptance of hypothesis 6 that there is a close connection between recognizing dynamic market and quality responsibility.

Discussion

The research model has been able to describe the phenomenon of the implementation of quality processes in order-based companies. The application of quality management requires the company's internal capabilities in using technology and understanding of market trends. Companies should have the power to respond to the development of adaptive technology through improved stages of production and use of the latest means of production. Analysis of technologies that have long-term effects needs to be taken to choose the right technology and to encourage improvement of the quality of the production process. The production department should not only master the methods of production, but they need to follow the tastes of the consumer so that the attribute or attributes of products are made to follow the preferences of consumers. They can also discuss actively with marketing on consumer preferences. The spirit that should be emphasized in the production is the creation of product attributes that understand the dynamics of the market.

All proposed hypothesis, almost, in this study, may be accepted. Some 6 hypotheses used to build the model of this research there are five hypotheses are accepted while the last hypothesis was not accepted. Hypothesis 3 is not acceptable to explain the lack of relationship between quality and production responsibility performance. The production department, which is committed to producing goods orders in accordance with the expected quality consumers, is not able to increase the number of qualified goods. This can be understood as printing company studies who often work on orders totaling bulk and must be completed in a short time. Most of the customers of the printing industry are companies that typically have a tight schedule of the launch of specific products or services. They order printed material to support the promotion of products or services. Notwithstanding, production has awareness of the importance of quality printing products, they are not capable of achieving the production plan for the complexity of the issues surrounding the completion of printing goods orders.

Integrated quality directing as the novelty of this study possessed a significant role in triggering the role of quality responsibility. Quality responsibility does not have the power to affect production performance. Despite this position of quality responsibility is very pronounced if the companies enable integrated quality directing role that serves as a full mediation. Companies that seek to achieve production performance should be aware that the awareness of employees about the tasks of the production cannot guarantee to reach production performance. Companies need to coordinate the production with the other parts of the company so that the problems can be fully supported by the production company and production constraints that arise can be resolved quickly.

Integrated quality directing has a strong role in ferrying antecedent variables to achieve production performance. Based on the relationship between variables which is significant, production performance improvement efforts can take three paths. The first path is through technological learning capacity → integrated quality directing → production performance. The second path is technological learning capacity → quality responsibility → integrated quality directing → production performance. The third line is through market dynamic recognizing → quality responsibility → integrated quality directing → production performance. All of the lines must pass integrated quality directing as the only way towards the production performance. Therefore, the company's performance-oriented production should apply activities that represent integrated quality directing.

Managerial Implication and future research

Printing company can do various steps of suppression and improvement to improve production performance. Companies need to be more open to the presence of new printing technology through online media, printed media, or exhibition. Companies may discuss with technology experts to explain how far these new technologies can help improve the quality and productivity of production (Baker & Sinkula, 1999). Companies should equip the production part with knowledge of consumer behavior on an ongoing basis so that they are able to translate the wishes of consumers in the form of corresponding product attributes.

Responding to the rapid development of printing technology, companies need to intensify production skills enhancement through the involvement of employees involved in training or workshops. Companies should be aware that the development of the market, both with regard to suppliers, competitors, and customers, is very dynamic, so companies need to enrich their knowledge about the quality of the production process. Companies can internalize the quality of production through the awards giving to employees who excel. Companies can disseminate a culture of quality production through production quality achievement evaluation.

Companies need to regularly scheduled meetings between important parts of a company: division of marketing, finance, human resources, and of course, its own production division to discuss the development of production and provide troubleshooting to support production. Companies can create a cross-sector task force for the completion of certain orders if the project is very complex and has a critical time. Task force members, who are comprised of various fields, allow every member to communicate the necessary support to the head of both the head of marketing, finance, and resources.

Suggestions for further research can be grasped based on the weakness of the study. Subsequent research can maximize interview method to ensure the comprehensive questionnaires. Hoelter value by 175 is fewer than the number of respondents is 182 inform the limitations of the data. The total amount of data that can be collected at the beginning of the study is actually quite a lot, 245. After going through the stages of data filtering, 67 respondents should be eliminated because of incomplete questionnaires, inconsistent answers or answers that tend to be outliers. Amounts of eliminated data can be avoided if the method of interviews with respondents were done.

Various unexplored variable antecedents in this study can be used to develop a research model. Achievement of the goodness of fit from the model is not optimal because of many ineligible parameters. The next research can involve many other variables with regard theoretical foundation and logic of expertise. Other recommended variables such as production flexibility, information technology, and intra-organization communication.

Item questioner
(Options of question follow a Likert scale, 1-10)

Integrated quality directing
- Companies keep the commitment of all organizational parts in production process quality achievement
- Companies attempt to pursue information sharing on the development of production process quality
- Companies relate the development of production process quality with the other parts of companies
- Companies involve all parts of companies in enhancing production process quality

Technological learning capability
- Companies are able to learn new technology
- Companies are able to well utilize new method
- Companies are able to apply new means

Market dynamic recognizing
- Companies ascertain product attribute from customer
- Companies determine the priority of product attribute from customer
- Companies respond the changing of customer preferences

Quality responsibility
- Companies always accentuate the important of superior product attributes
- Companies apply the culture of excellent production process quality
- Companies employ any ways to improve production process quality

Production performance
- Declining level of broken product
- Suitability of order quantity in production part
- Fulfilling of order quality in production part

Abstract

The high incident rate reported on the issue of foodborne disease in Malaysia had alerted the society on the importance of food safety. As such, quality assurance (QA) practices or systems were implemented as an alternative in assuring the food product quality. The extensive review identified that there is a lack of investigating food quality assurance through an integrated approach. This study intended to fill the gap by identifying the level of quality assurance practices implemented by the small, medium and large food manufacturing companies in Malaysia. A survey questionnaire was constructed for data collection. Data was then analyzed using SPSS version 22.0 by first, tested with reliability analysis. T-test was conducted by based on the quality assurance practices components and the types of QA practices by comparing between small companies, medium companies, and large companies. Different levels of companies were discovered emphasized on the different quality assurance practices. Statistical differences were found between the small companies with medium companies and small companies with large companies. However, no statistical differences observed between medium companies with large companies. This study carried an important message to food industry where food manufacturers are able to realize the level of QA practices implemented and at the same time, facilitate in benchmarking purpose by further strengthen the quality assurance practices.
Keywords: *Quality assurance, Food industries, HACCP, TQM, GMP, GHP*.

Introduction

The Centres for Disease Control and Prevention (CDC, 2013) estimated that there were 48 million Americans suffered from the foodborne disease in the United States. The high incident rate of 56.25 reported in the Malaysia Health Facts 2012 indicated that the issue of foodborne disease is a challenging issue in Malaysia (Ministry of Health, 2012). The outbreak of this disease starts to draw public concern about the food safety properties. Nowadays, it is a norm that food safety was considered as the main attribute during food purchasing (Alvarez, 2010). Consequently, quality assurance practices or the quality assurance systems were adopted worldwide to assure for the food quality and food safety (Milios et al., 2013; Kafetzopoulos et al., 2013; Spadoni et al., 2013). Food quality assurance aims at ensuring the food safety and suitability for human consumption (Achilleas & Anastasios, 2008). In conjunction with this purpose, the scope of food quality assurance shall cover the whole food supply chain, starting from the raw materials, in process manufacturing and surfaces in contact with food (Alli, 2004; DSM, 2009a).

The quality assurance system refers to the systematic system implemented to assure, control and monitor the product quality (Manghani, 2011). It can be classified into the obligatory system and voluntary system (Sikora & Strada, 2006). The obligatory system such as Good Manufacturing

Practices (GMP), Good Hygiene Practices (GHP), and Hazard Analysis Critical Control Points (HACCP) emphasized on food safety. On the other hand, the voluntary system focused on food quality. An example of voluntary system is the ISO 9001 system.

Over the years, practitioners and academicians translated the term quality into different meaning (Ng, 2012). The term quality refers to the product features and characteristics, particularly in satisfying the intended requirements (DSM, 2009b). In the context of the food product, quality is categorized into two major categories: (i) the intrinsic quality attributes and (ii) the extrinsic quality attributes (Veale & Quester, 2009; Fandos & Flavian, 2006). The intrinsic attributes refer to the measurable product properties (Veale & Quester, 2009; Fandos & Flavian, 2006). It covers the product safety and reliability, the nutritional properties and wholesomeness, the sensory properties, shelf life and etc (Luning et al., 2002; Krissoff et al., 2002). In contrast, the extrinsic attributes refer to the alterable product properties (Veale & Quester, 2009; Fandos & Flavian, 2006). It is the image variables, the brand name, product price, certification, the country of origin and etc (Veale & Quester, 2009; Fandos & Flavian, 2006). Different quality attributes responsible for the different aspects of a food product. Food safety, as an intrinsic property responsible for the safety of a product. Failure in food safety shall result in the foodborne disease.

The extensive review over quality assurance identified that there are very limited studies in term of food related field and in Malaysia context. Study on quality management practices was conducted with regard to the small, and medium food manufacturing companies in Malaysia. This study was limited to TQM alone and the practices adopted by large companies were still unknown.

In the study demonstrated by Anuar and Yusuff (2011) on the best manufacturing practices of Malaysia small medium enterprises. The large companies were not included and the population was limited to the ISO 9000 certified companies only.

Abusa and Gibson (2013a) studied on the TQM implementation level of the small medium and large Libyan manufacturing companies with varies industrial groups. This included food, minerals, electronics, textiles and furniture and etc. This study, however, does not reveal the Malaysia situation and the implementation level in term of an individual industry were unknown.

Consequently, there is a lack of investigating quality assurance through an integrated approach. Further research is required by focusing on a more specialized sector, such as food manufacturing industry. This is further supported by the high incidence rate of 56.25 reported in the Malaysia Health Facts 2012 (Ministry of Health, 2012). In addition, the quality assurance practices implementation level of the Malaysia small, medium and large companies is still remained in the grey area. The objective of this study is therefore to identify the level of quality assurance practices implemented by the small, medium and large food manufacturing companies in Malaysia.

Materials and Method
1.   Population and Sample
This study covered all levels of companies ranging from small companies, medium companies, and large companies. These companies either with or without QA system certified were included where there shall have no significant difference in the end result. This was supported by Prajogo and Brown (2004) who discovered no significant difference between QA system certified companies and non-certified companies. There were 306 companies identified from the business directory of Small Medium Enterprise (SME) Corporation Malaysia and Federation of Malaysian

Manufacturers. The survey questionnaires were sent to 306 companies with targeted respondents to Managing Director, QA/ QC Manager, Operation Manager, and QA/QC Executive.

2.   Survey Questionnaire

A survey questionnaire was constructed via an extensive literature review. The commonly applied components and items of QA practices were adopted in this study. The questionnaire composed of (i) 11 questions on respondents' demographic information, and (ii) 72 items on the quality assurance practices components. Respondents were required to answer the questions by indicating the implementation level of QA practices based on a 5 points Likert Scale with scale 1 = very low and scale 5 = very high.

Table 1. Summarization of quality assurance practices (QAP) components from previous studies

Types of QAP	Components	Supported Studies
HACCP	Hazard analysis	Manning & Soon (2013a)
ISO 9001	Top management commitment	Jain & Singh Ahuja (2012); Prajogo et al. (2012); Sitki Ilkay & Aslan (2012); Anuar & Yusuff (2011)
	Customer management	Jain & Singh Ahuja (2012); Prajogo et al. (2012); Psomas et al. (2012); Sitki Ilkay & Aslan (2012); Anuar & Yusuff (2011)
	Employee management	Jain & Singh Ahuja (2012); Anuar & Yusuff (2011)
	Supplier management	Jain & Singh Ahuja (2012); Prajogo et al. (2012); Anuar & Yusuff (2011)
	Process management	Jain & Singh Ahuja (2012); Prajogo et al. (2012); Anuar & Yusuff (2011)
	Quality control	Jain & Singh Ahuja (2012); Anuar & Yusuff (2011)
	Continuous improvement	Jain & Singh Ahuja (2012); Psomas et al. (2012); Anuar & Yusuff (2011)
TQM	Leadership	Talib et al. (2014); Abusa & Gibson (2013b); Psomas & Fotopoulos (2010)
	Customer focus	Talib et al. (2014); Abusa & Gibson (2013b); Laohavichien et al. (2011); Psomas & Fotopoulos (2010)
	Human resource management	Talib et al. (2014); Abusa & Gibson (2013b); Laohavichien et al. (2011); Psomas & Fotopoulos (2010); Abdullah (2010)
	Supplier quality management	Talib et al. (2014); Abusa & Gibson (2013b); Laohavichien et al. (2011)
	Process management	Talib et al. (2014); Abusa & Gibson (2013b); Psomas & Fotopoulos (2010)
	Continuous improvement	Abusa & Gibson (2013b)

Results

 1.   **Reliability analysis**

Reliability analysis was conducted using Cronbach's Alpha. An overall alpha value of 0.842 was obtained with alpha coefficient ranged from 0.821 to 0.964, indicating for a high reliability.

Table 2. Reliability analysis

Variable	No. Of Item	No. of Item Deleted	Cronbach's Alpha
Leadership (LEA)	10	None	0.885
Customer focus (CUS)	8	None	0.837
Employee management (EMP)	10	None	0.938
Supplier management (SUP)	7	None	0.821
Process management (PRO)	14	None	0.964
Quality control (QC)	15	None	0.957
Continuous improvement (CON)	8	None	0.891
Overall reliability	*72*	*None*	*0.983*

 2.   **Demographic characteristics**

The respondents of this study comprised mainly from the manufacturing of bakery products (34.6%), other food ingredients (30.8%), and manufacturing of cocoa, chocolate and sugar confectionery (26.0%). The remaining composed of the manufacturing of dairy products (5.8%), grain mill products (1.9%), and vegetable and animal oils and fats (1.0%) respectively.

According to the definition guideline published by the SME Corporation Malaysia on the definition of micro, small and medium companies responded companies were categorized into small and medium respectively. For the purpose of this study, a company with a sales turnover of more than RM 50 million or with full-time employee more than 200 people was considered as a large companies as the definition guideline does not define the meaning of large company. This study therefore composed of small companies (41.3%), medium companies (28.8%) and large companies (29.8%).

 3.   **T-test analysis based on QA practice components**

Comparing between small companies and medium companies, the statistically significant difference observed in the leadership component ($p<0.001$) and process management component ($p<0.05$). Customer focus, quality assurance, and continuous improvement indicated significant difference at $p < 0.01$. There were no significant different discovered between employee management and supplier management.

Statistical comparison between small and large companies showing a significant difference in leadership component ($p<0.001$) where the large companies had a higher extent of implementation in leadership component. Customer focus, process management, and quality assurance components were significantly different between small and large companies at $p < 0.05$. However, there were no significant differences observed in the employee management, supplier management, and continuous improvement.

No significant different observed between medium and large companies in the implementation extent among all components of the quality assurance practices measured at any significant level.

Table 3. Independent T-test for QA practices components between small companies and medium companies (NSmall = 43; NMedium = 30)

Component of QAP	Company scale	Mean	Std. Dev.	t-value	Sig.

	Large	4.11	0.49		

Note: * significant at $p < 0.1$, ** significant at $p < 0.05$, *** significant at $p < 0.001$

4.   T-test analysis based on types of QA practice

Comparing between small and medium companies, the ISO 9001 was observed to have greater implementation level in the medium companies (mean = 4.24) compared to the small companies (mean = 3.97) at $p < 0.1$. The same thing is observed in the TQM practices, in which the medium companies (mean = 4.06) seem to be extensively implementing the TQM system compared to the small companies (mean = 3.84) at $p < 0.1$.

No significant difference observed in the implementation level of GMP and HACCP between the small companies and medium companies.

Table 6. Independent T-test for types of QA practices between small companies and medium companies (NSmall = 43; NMedium = 30)

Types of QA system	Company Scale	Mean	Std. Dev.	t-value	Sig.
GMP	Small	4.08	0.62	0.74	0.39
	Medium	4.37	0.54		
HACCP	Small	4.06	0.64	0.98	0.33
	Medium	4.43	0.54		
ISO 9001*	Small	3.97	0.57	3.47	0.07
	Medium	4.24	0.44		
TQM*	Small	3.84	0.60	3.73	0.06
	Medium	4.06	0.44		

Note: * significant at $p < 0.1$, ** significant at $p < 0.05$, *** significant at $p < 0.001$

A significant difference was shown at the implementation level in term of the ISO 9001 system and the TQM program. Large companies were observed to have higher implementation level in

both ISO 9001 (mean = 4.30) and TQM (mean = 4.10) compared to the small companies (mean for ISO = 3.97, mean for TQM = 3.84) at p < 0.05. On the other hand, no significant difference observed in term of the implementation level of the GMP and HACCP system.

Table 7. Independent T-test for types of QA practices between small companies and large companies (NSmall = 43; NLarge = 31)

Types of QA system	Company Scale	Mean	Std. Dev.	t-value	Sig.
GMP	Small	4.08	0.62	4.14	0.46
	Large	4.36	0.45		
HACCP	Small	4.06	0.64	2.76	0.10
	Large	4.45	0.47		
ISO 9001**	Small	3.97	0.57	8.52	0.005
	Large	4.30	0.35		
TQM**	Small	3.84	0.60	9.31	0.003
	Large	4.10	0.35		

Note: * significant at p <0.1, ** significant at p < 0.05, *** significant at p < 0.001

Medium companies and large companies showing no statistical difference in all types of quality assurance practices measured at all significant levels. It was observed that the large companies had a slightly greater level of quality assurance practices implementation in term of HACCP, ISO 9001 and TQM compared to the medium companies. An exception was discovered in the GMP practices whereby the medium companies were found to have slightly greater implementation level.

Table 8. Independent t-test for types of QA practices between medium and large companies (NMedium = 30; NLarge = 31)

Types of QA system	Company Scale	Mean	Std. Dev.	t-value	Sig.
GMP	Medium	4.38	0.54	1.24	0.30
	Large	4.37	0.45		
HACCP	Medium	4.43	0.54	0.40	0.53
	Large	4.45	0.47		
ISO 9001	Medium	4.24	0.44	0.80	0.38
	Large	4.30	0.35		
TQM	Medium	4.06	0.44	1.07	0.31
	Large	4.10	0.34		

Note: * significant at p <0.1, ** significant at p < 0.05, *** significant at p < 0.001

Discussions
Comparing among different sizes of company, large companies achieved an overall mean value which is highest among the medium and small companies. All sizes of companies were revealed the emphasis on different quality assurance practices components. The small companies found to be more focused (the top three highly implemented QA practices component) in the quality control, process management, and customer focus. The medium companies emphasized in

process management, leadership, and quality control; whereas the attention of the large companies was on the leadership components, process management, and quality control. This is supported by Talib and co-workers (2013) reported that SMEs emphasized more in the customer focus and quality assurance. The results were also in line with the study conducted by Islam & Karim (2011) who revealed that the SME companies emphasized more in the product quality compared to the large companies. This is further supported when the large companies were found to have a higher implementation level in the organization's quality policy (Islam & Karim, 2011). In this study, the company quality policy was placed under the leadership component; thus, suggested that large companies emphasized more in the leadership components.

Surprisingly, the implementation level was relatively low in the supplier management across all sizes of company. One item of the supplier management, namely 'Supplier are involved in product development and improvement' was marked low by respondents. The reason might be caused by lack of interest from food manufacturers in revealing the product development and improvement to third parties because of privacy and confidentiality. The same finding was observed in previous studies conducted by Anuar & Yusuff (2011).

In term of the level of implementation based on the types of quality assurance practices, large companies indicated an overall highest level in all types of quality assurance practices, followed by the medium companies. The small companies recorded with the lowest level of implementation. Both the medium and large companies focused more on the HACCP system and GMP practices. On the other hand, small companies emphasized more on the GMP practices.

Significant different was found in the implementation level of quality assurance practices components between the small companies with the medium companies, and the small companies with the large companies. However, no significant observed between the medium companies and large companies. Same findings observed while comparing the implementation level based on the types of quality assurance practices among the small companies, medium companies, and large companies. This suggests that the implementation level was found different in the small companies compared to the medium and large companies; no significant difference in the case of medium and large companies. This is in line with the study conducted by Abusa and Gibson (2013a) in identifying the level of TQM implementation in the Libyan manufacturing companies. They discovered that TQM implementation level showing no significant different between the medium and large companies. The reason might be explained by the experience of the companies involved in the operation. The majority of the respondents (more than 60%) had been in operation line for 20 years and above. Even if the company size is medium, the food quality assurance practices were already well established and implemented.

Conclusion

The implementation level of QA practices components and types of QA practices components were found highest in large companies, followed by medium companies and small companies.

As the focus of this study is in the food manufacturing industries, data collected might not representable to other manufacturing industries. This was because the quality assurance practices identified in this study refers to the quality standard of a food product; thus, might not suit the actual situation of other manufacturing industries.

Further research can be conducted by emphasized on a single specialized subsector. For example, the snack food manufacturing industry. Recommended industries for future research are to the rubber based industry or wood based industry which is of the main interest in the manufacturing sector in Malaysia.

TAX MANAGEMENT, COST OF DEBT, AND CORPORATE GOVERNANCE

Anies Lastiati, Universitas Indonesia, Indonesia
Sylvia Veronica Siregar, Universitas Indonesia, Indonesia
Vera Diyanti, Universitas Indonesia, Indonesia
Samingun, Universitas Indonesia, Indonesia

Abstract

This study examines the relationship between tax management and the cost of debt capital. More importantly, the paper probes managerial opportunistic theory on the relationship between the tax management and the cost of debt by evaluating the effects of corporate governance as an element that is expected to have a mitigating impact on the relationship.

This research employs financial and corporate governance data, including ownership structure, from companies in Indonesian Stock Exchange from the year 2008-2012. The result shows that tax management has a positive association with the cost of debt capital. This provide affirmation that tax management is perceived by lenders as having greater information asymmetry which leads to higher information risk, hence higher cost of debt capital. Moreover, this study find evidence that family ownership and corporate governance have a moderating role on the relation between tax management and cost of debt capital.

Keywords: *corporate governance, cost of debt, tax management, ownership structure*,

Introduction

Paying taxes as little as possible is an instinctive act of every taxpayer, be it individual or business entity. Nevertheless, a lot of studies find that tax management behavior, especially in companies, have impacts on the cost of capital that needs to be borne by the companies. Tax management can lower the cost of capital, or on the contrary can cause companies to bear a higher cost of capital (Dhaliwal et al., 2008; Graham & Tucker, 2006; Lim, 2011).

Companies that carry out tax management in the form of tax avoidance face an increasing information risk that must be borne by the shareholders, causing a higher rate of return that is expected of the company shareholders, which result in the higher cost of equity capital for the company (Dhaliwal et al., 2008). Tax management, according to Slemrod (2004) is an action that creatively attempted by companies in order to bear as little as possible tax expenses payable to the state. Such actions, in his opinion, would imply two things: hidden actions and hidden information, which means a lower level of transparency, and an increasing information asymmetry between managers and stakeholders.

On the other hand, tax management apparently can also affect the reduction of the cost of capital through the substitution effect on the use of debt (substitution on the utilization of interest expense as an income tax deduction) as a source of corporate funding, thus can lower the company cost of debt capital (Graham & Tucker, 2006 ; Lim, 2010; Lim, 2011).

Tax management, just like other management decisions, can be efficient for the company – for example the substitution effect on the use of debt through interest expense as an income tax deduction (Lim, 2011; Graham & Tucker, 2006); however, it can also be opportunistic, i.e. with the occurrence of rent diversion by the management. Rent diversion, according to Jensen and Meckling (1976) is a management behavior that seeks personal gain, and therefore need to be attended with caution so it will not interfere with the interests of shareholders and other

stakeholders. Tax management by the managers can incur separate problems, i.e. the decrease of corporate transparency (Desai &Dharmapala 2006; Desai et al., 2007; Desai &Dharmapala, 2009).

Supporting the above arguments of Desai & Dharmapala (2006), previous research has also find that companies committing tax evasion, which means they possess a low degree of corporate transparency, tend to carry out earnings management (Frank et al., 2009) and have low earnings quality (Tang & Firth, 2012). Whilst, earnings quality also has an impact on the degree of cost of debt capital borne by the companies (Francis et al., 2005). Earnings as a specific information for a company's condition can affect the information risk faced by investors and creditors, which have an impact on the degree of the cost of capital charged to the company (Francis et al., 2004; 2005).

The purpose of this study is to examine whether tax management increases the information asymmetry between a company and its loan capital providers, thus increasing the interest expense charged by the lenders to the company. Furthermore, this study aims to examine whether the effect of tax management towards the cost of debt capital occurs directly, or this effect occurs through the effect of tax management on the decrease in earnings quality, which is then responded by the lenders with the increase of the cost of debt capital charged to the company.

The research findings of Lim (2011) and Moore (2012) show that corporate governance has a contribution in controlling actions taken by the company management. Both studies found that institutional ownership structure has a monitoring role on the management, especially when the management decides to carry out tax management. In addition, Desai & Dharmapala (2006) found that a company's corporate governance (CG) plays a role in whether the company take decisions to perform rent diversion or tax management in the form of tax sheltering. CG also reduces the negative effect occurs between tax management and the company value (Wahab & Holland, 2012).

In developing countries, concentrated and pyramidal family ownership structures are more common (Fan & Wong, 2002; LaPorta et al., 1999; Diyanty, 2012); and thus controlling shareholders have exceptionally strong roles, with potentials of expropriation by the controlling shareholders against the non-controlling shareholders. Therefore, this study will also examine the role of the controlling shareholder, both owned by family and not, as well as the second largest controlling shareholder (Attig et al., 2008) in mitigating the effect between tax management and the cost of debt capital. The last purpose of this study is to test the role of corporate governance implementation in affecting the effect of tax management on the cost of debt capital.

Literature Review and Hypothesis Development
1.   Tax Management Definition

Tax management is defined by Santoso & Rahayu (2013) as an extensive effort continuously made by a taxpayer so that everything related to taxation affairs can be managed well, economically (tax administration task is obtained with a relatively cheap price), effectively (able to maintain the minimum tax payment when the tax liabilities are checked by the tax authorities) and efficiently (efficiently manage to implement a saving strategy without incurring problems and expenses in the future) by the taxpayer.

In this definition, tax management does not distinguish whether the actions taken by the company are still within the legal bounds allowed by the tax regulations (tax avoidance), or actions that lead to tax crimes and are illegal (tax evasion). Gunadi (1997), as cited in Santoso & Rahayu (2013), suggests that the above-mentioned legal bounds in tax management are actually a

juridical concept whose legality will only be known for certain by the presence of a decision of a judicial authority.

 2.   **Tax Management and the Cost of Debt Capital: Previous Studies**
One source of corporate funding is debt financing. Elements of tax cause the debt financing to be preferred by companies as compared to equity financing, as this source of funding can reduce the company's tax debts (through interest expense) and hence maximize the company value. Interest expense borne by the company as a consequence of the debt capital is recognized by tax charges, while dividends on equity capital are not included in the income tax deductions.

Many studies that had been conducted to examine the relationship between BTD as a proxy of various forms of tax management – be it tax avoidance, tax evasion or tax sheltering – and the cost of debt (COD) found a substitution effect between the use of debt as sources of funding and savings from tax (Graham & Tucker, 2006; Lim, 2010). Graham and Tucker (2006) found that companies that carry out tax sheltering appear to have lower borrowing costs in comparison to companies that do not perform tax sheltering. Meanwhile, Lim (2010) generalized such findings by mentioning the presence of substitution effect between tax avoidance measures and the use of debt as a source of corporate funding. The research mentioned that companies that take advantage of tax avoidance as a substitution of debt will experience the benefits of the increased quality of corporate debts, the decreased inherent risk, which thus in general lower the degree of company COD.

On the other hand, tax management will reduce corporate transparency and increase information asymmetry; thus increasing the information risk borne by the lenders. The lenders, who perceive that companies receiving loans are quite risky to return their capital, will charge a high cost of capital in the form of interest. Therefore, the lenders' perception of risks they will have to bear for the capital they lend to the company will determine the amount of the cost of loan capital (COD) which must be borne by the company. Bhojraj & Sengupta (2003) mention that information asymmetry and interest rates are the main factors that affect the level of the interest rate. From the above arguments, the first hypothesis is as follows:

H_1: Tax management positively affects the company cost of debt capital.

 3.   **The Effect of Tax Management on the Cost of Debt Capital through Earnings Quality**
Earnings quality is an important concept in the world of accounting and finance (Dichev et al., 2013). Earnings, according to Dechow et al. (2010) is considered to be of quality if it can provide information about the company financial performance which is relevant to certain decision-making by certain decision-makers.

Earnings quality, according to Dechow et al. (2010) can be categorized into:
1. Income properties, which include earnings persistence measurement, discretionary accruals with its various methods of measurements and quality of accruals.
2. Market perspective, i.e. the ability of reported earnings to reflect the company's true earnings. One of the measures included in this category is value relevance, be it measured by time series or cross sectional.

Previous studies indicate that the difference between accounting profit and taxable profit not only implies the presence of tax management – both those still within legal bounds (tax avoidance) or the ones that are illegal (such as tax evasion) – but also the potential of earnings management behavior (Frank et al., 2009; Tang & Firth, 2011). Frank et al. (2009) find that companies that

were aggressive in their tax affairs apparently also reported their financial position aggressively. Companies that carried out tax management, apparently also carried out earnings management. Additionally, another study find that companies with a high difference between their accounting profit and taxable profit (especially those that are abnormal – i.e. caused by things other than the difference between the accounting and the tax regulations) also showed a low level of earnings persistence (which means earnings quality) (Tang & Firth, 2012; Blaylock et al., 2010). Investors can therefore assess a company's earnings quality through the difference between its accounting profit and taxable profit (Blaylock et al., 2010).

Earnings quality is further related to the cost of loan capital (Francis et al., 2004; Francis et al., 2005). Low earnings quality causes information risk, i.e. when investors do not have enough information in their decision making process. A study of Francis et al. (2005) found that with the increase of information risk, lenders will experience a lack of certainty on their cash flows in the future. This increase in information risk will raise the cost of capital, including the cost of debt capital (by the lenders).

Previous studies have shown that adequate information, both quantitative and qualitative, could reduce the cost of equity capital (Botosan, 1997) as well as the cost of loan capital (Sengupta, 1998). Good earnings quality will fulfill the lenders' needs of earnings information provided by the company in the financial statements. From these explanations, the second and third hypothesis are as folllows:

H_2: *Tax management negatively affects company earnings quality.*
H_3: *Earnings quality negatively affects the cost of debt capital.*

4. Corporate Governance, the Cost of Debt Capital and Tax Management

In general, ownership structures in countries with developing economies and in most developed countries are still focused on several controlling shareholders, which primarily are families. Only in the United States and the United Kingdom alone, which possess very advanced capital markets, have widespread ownership structures (LaPorta et al., 1999).

LaPorta et al. (1999) mention that the concentrated ownership found in many countries is a consequence of the lack of legal protection to minority shareholders in countries with concentrated ownership structures. The said study discovered that in average, the concentrated ownership are mostly found to be held by family or government.

Concentrated ownership may also signify a concentrated control by the company's ultimate owner (UO). In this kind of structure, the agency problem often occurs between the controlling shareholders (UO) and non-controlling shareholders (LaPorta et al., 1999; Attig et al., 2008).

This form of ownership can induce the occurrence of the entrenchment effect, i.e. the ability of the controlling shareholder that holds more control rights than cash flow rights to control the company opportunistically, which thus can harm the minority shareholders' interests (Fan & Wong, 2002). The entrenchment problems against the minority shareholders include expropriation of interests of the minority shareholders rights through related party transactions (Diyanty, 2012), or through the achievements of the objectives that benefit the UO but not the minority shareholders (Fan & Wong, 2002).

With the above potential of entrenchment, concentrated ownership held by controlling shareholder allegedly can encourage a higher degree of information asymmetry that causes a greater positive effect of tax management on the cost of debt capital. Therefore, the next hypothesis is as follows:

H_{4a}: A higher ratio of control rights to cash flow rights held by the company ultimate owner will further strengthen the positive effect of tax management on the cost of debt capital.

Many studies had been conducted to observe the impact of family ownership on company performance. Companies with family ownership are deemed to have higher financial profitability as compared to other companies, especially if the family owners are actively involved in the company management (Maury, 2006). This is because the owners want to perpetuate the company's glory so it can be inherited to other family members.

Nevertheless, family ownership which is usually accompanied by the pyramidal ownership structure (Claessens & Yutroglu, 2002) can also carry expropriation risk to minority shareholders for the sake of the company controlling shareholder's personal gains. Pyramidal ownership structure can cause a (group of) controlling shareholder(s) to have a greater power control than the number of shares owned, thus allowing the UO to determine the company's financial and operating policies. In Indonesia, ownership structure is also centralized and dominated by family ownership, making it possible for the UO to take part in determining management policies, such as through related party transactions (Diyanty, 2012).

In connection with tax payment, Chen et al. (2010) indicate that family companies in the United States market apparently tend to not be tax aggressive. This trend, in their opinion, is a result of those companies' efforts to avoid the high capital costs they need to bear as a result of the relationship between the family controlling shareholders and other shareholders. In addition, family firms tend to maintain the reputation and relationship with the authorities in order to ensure the survival of the family business in the long term.

The above arguments form the below hypothesis 1b:

H_{4b}: The positive effects of tax management on the cost of debt capital will be different in family-owned companies in comparison with non-family-owned companies.

Attig et al. (2008) found the role of the second largest shareholder aside from the ultimate owner (SLS) is reducing agency conflicts and information asymmetry between UO and minority shareholders. This monitoring role of SLS in the study of Attig et al. (2008) was significantly found in companies in developing countries as compared to companies in developed countries. This is due to the weak institutional environment (protection of shareholders and law enforcement) in developing countries (Attig et al., 2008).

Although SLS can weaken the agency conflicts between UO and minority shareholders, the presence of SLS may also have an opposite effect. This may happen if the SLS appears to have interests that are in line with the interests of the management (and UO), which are different from the common interests of minority shareholders (Kim et al., 2007); or if the SLS appears to have an agenda of his/her own, apart from the objective to increase shareholder value (Thomsen et al., 2006).

Hypothesis that test the role of SLS in affecting the positive effect of tax management on the cost of debt capital is a two-tailed hypothesis as follows:

H_{5c}: The positive effect of tax management on the cost of debt capital will be different with the presence of the second largest shareholder.

CG mechanism is deemed as one of the most capable ways of suppressing agency problems, be it the ones occur between management and shareholders, or the expropriation of minority shareholders by controlling shareholders.

Previous studies show that companies with good CG will be able to suppress the management tendency to do rent diversion and tax evasion measures (Desai & Dharmapala, 2006); as well as can also moderate the relationship between the tax planning and the company value (Desai & Dharmapala, 2009). Based on the arguments above, hypothesis 1d was made as follows:

H$_{5d}$: Stronger CG mechanism in a company will weaken the positive effect of tax management on the cost of debt capital

Research Methods
 1.   Sample Selection
The population of this study is all companies listed on the Indonesia Stock Exchange from 2008 up until 2012. From that population, samples were then selected using purposive sampling method with criteria as follows:

1.   Have complete data to meet all the components required to be a regression variable of this study.
2.   During the observation period, the company did not have negative equity, as companies with negative equity are usually companies facing financial distress.
3.   During the observation period, was not involved in any corporate activities such as mergers, acquisitions and divestitures, in order to segregate the company financial data as the pure results of operations and not due to other corporate actions as mentioned above.
4.   Companies that are not specifically regulated in the tax regulations:
    - Companies that are not final income taxpayers (Wajib Pajak PPh Final), as regulated in Article 4 Clause (2) of Undang - Undang No. 36 of 2008 (Income Tax Act), i.e. construction service business, real estate and land and/or buildings rental.
    - Companies that are not included in the groups of companies which in the tax provisions are allowed to form and nurture a reserve fund as regulated in Article 9 Clause (1) Letter C of Undang – Undang No. 36 of 2008 (Income Tax Act).

Table 1 outline the sample selection process. The data is obtained from sources such as: Data OSIRIS, Data Stream, Indonesia Capital Market Directory, Lembar Berita Negara and Bloomberg database.

Table 1: Sample Selection Process

	2008	**2009**	**2010**	**2011**	**2012**	**Total**
Firms listed in the Indonesia Stock Exchange	399	400	422	442	466	2129
Less: firms subjected to specific regulation as per in point 4 above:	101	86	114	104	129	534
Less firms which have no complete data, or have negative equity, or in the process of mergers acquisition or diverstature	146	157	152	162	162	779
Less firms which accounting periods do not end at the 31st of December	1	1	1	1	1	5

Final Sample						
	151	156	155	175	174	811

2. Variable Definition
a. The Cost of Debt

Cost of debt (COD) is calculated with reference to Lim (2011), which is obtained by dividing the company's interest expense by the average corporate debt (short-term debt and long-term debt) for a year. Following Sengupta (1998), COD used in this study is the COD for the year $t + 1$.

b. Earnings Quality

In this study, the earnings quality is measured by two proxies, i.e. the value of Discretionary Accrual (DA) and the relevance of earnings figures in the market by using Earnings Transparency (ET) figure. Discretionary Accruals (DA) is used as a proxy for earnings quality as it can catch on earnings management carried out by the company (Scott, 2015). The model of determining the DA value of the companies used in this study is the Modified Jones model (Dechow et al., 1995). This model was chosen because it is considered the most suitable for measuring earnings management in companies that carry out tax management (Lim, 2011; Desai & Dharmapala, 2006). The DA figure is obtained from the residual value of following model run separately for each industry in each year.

$$\text{Accruals}_{it}/\text{Assets}_{it-1} = a_{it} (1/\text{Assets}_{it-1}) + \beta_{1it} ((\Delta REV_{it} - \Delta AR_{it})/\text{Assets}_{it-1}) + \beta_{2it}(PPE_{it}/\text{Assets}_{it-1}) + \varepsilon i_t$$

Accruals : total accruals of firm i in industry j in year t, calculated as income minus the cas flow from operation; Assets: total asset; ΔREV: change in revenue; ΔAR: change in the account receivables; PPE: gross property, plant, and equipment.

Earnings Transparency (ET) is defined as how vary the stock returns change as a result of changes in the earnings figures (Barth et al. 2013). ET is operationalized by the measurements based on the explanatory power (adjusted r-squared) of the relationship between yields and cross-sectional earnings as follows (Barth et al., 2013):

$$TRANS_{i,t} \equiv TRANSI_{j,t} + TRANSIN_{p,t}$$

$TRANS_{i,t}$ is the total of R^2 for company i in year t derived from the sum of R^2 from the regression results of yields and company earnings in industry j (TRANSI) with R^2 from the regression results of yields and company earnings in portfolio p (TRANSIN).

The TRANS value of a company i in year t comprised of two R^2 value. According to Barth et al. (2013), the first R^2 is used to represent regression of sample companies from the same industry to show similar characteristics of earnings-yields relationship in one industry. The second value of R^2 represents a regression of sample companies without considering the industry, to show the earnings-yields relationship without being influenced by the type of industry (industy-neutral commonalities). Both values of R^2 are derived as follows:

- $TRANSI$: is the value of R^2 obtained from the estimation equation below:

$$RET_{i,j,t} = \alpha_0^1 + \alpha_1^1 E_{1,j,t}/P_{1,j,t-1} + \alpha_2^1 \Delta E_{1,j,t}/P_{1,j,t-1} + \varepsilon_{i,j,t}$$

- TRANSIN: is the value of R^2 obtained from the estimation equation below:

$$RET_{i,p,t} = \alpha_0^{IN} + \alpha_1^{IN} E_{1,p,t}/P_{1,p,t-1} + \alpha_2^{IN} \Delta E_{1,p,t}/P_{1,p,t-1} + \varepsilon_{i,p,t}$$

RET : anual return measured ending three months after the firm's fiscal year end; E/P: earnings before extraordinary items and discontinued operation deflated by beginning of the year pric; ΔE: change in earnings from year t-1 to year t.

The regression of this model was run for each year of observation and year of industry. With five years of observation and six industries in this study, six groups with the same R^2 for all years of the sample companies as a TRANSI variable will be obtained.

Following Barth et al. (2013), observation samples were then grouped based on each industry-year regression into four portfolios. The portfolio is made based on the magnitude of the yearly regression residuals for the relevant industry. Meanwhile, the clustering of samples based on the portfolio will be done based on the magnitude of the residual value.

From the above two measurements of earnings quality, the confirmatory factor analysis (CFA) is then conducted to determine whether these two measures truly represent the earnings quality variable (Hair et al., 2010), and further can form a new measurement construct of earnings quality variable. By combining both of these measurements, i.e. DA which is the earnings quality based on the accounting data, as well as ET which is the market reflection on company reported earnings, a new construct is then expected to be able to represent both points of view of earnings quality (accounting data and market perception) altogether in one measurement. The new construct is expected to be more suitable to the purpose of this study, one of which is to observe how lenders react (through the cost of capital) towards company earnings quality. In fact, the lenders usually look at company's overall earnings quality, both if there is a presence of earnings management (DA) as well as how well the market is responding to the reported earnings (ET).

Both measurements form a new construct of earnings quality: earnings quality - EQ, i.e. DA and ET, although they are representing the same variable, they have different nature. The higher the DA value, the worse the earnings quality. Conversely, the higher the ET value, the better the company earnings quality. In order to have the same direction for both of the above measurements (DA and ET), the DA value of each company is multiplied by -1. Hence, higher DA and ET value will have the same meaning, i.e. a higher earnings quality, and vice versa.

4. Tax Management

Tax management (TM) is measured with the following measurements, following Tang & Firth (2011)'s abnormal Book-Tax Differences (ABTD). First, BTD was calculated as a whole, by using a tax effect approach instead of an income effect, as follows:

BTD = (BIit X STRt) – CTEit

BIit: Pre-tax book income; CTEit: current tax expense; STRt: statutory tax rate.

ABTD was measured from the regression equation residual value of the forming factors of BTD which are considered normal (which occur as a normal consequence of differences between tax regulations and accounting principles applied by the company). The residual value of the regression model is abnormal BTD (ABTD).

BTDit = a0 + a1ΔINVit + a2ΔREVit + a3NOLit + a4TLCit + a5BTDit-1 + εit

BTDit: book-tax differences; ΔINVit: the change in investment in gross property, plant and equipment; ΔREVit: the change in revenue; NOLit: net operating loss; TLCit: tax losses carried-forward; εit: error (ABTD)

5.   Ultimate Owners

The ratio of the degree of CR to CFR UO*(Cash-Flow Leverage -CFL):* Claessens et al. (2002) found that the greater this ratio, the higher the influence the UO has on the corporate decision-making. Such condition will open up the possibility of expropriation by UO against minority shareholders.

Family shareholders: is the firm's UO which is individual, or a group of individuals who constitute a family. Following the study of Diyanty (2012), the identity of UO is determined whether it is an individual or a group of individuals who are still in family ties. UO is dummy varable where 1 if the ultimate controlling shareholder is an individual name within a family or group of families and 0 if otherwise.

In situations where the UO is a firm but has been identified as a SPV (special purposed vehicle) of another company, then the company ownership will be identified as one family with the UO family of the parent company.

6.   **The second largest shareholder (SLS)**: taking into account the presence of another large group of shareholders, other than the ultimate owner, as a group who has the ability and power to oversee the UO (Laeven & Levine, 2006). The SLS's role will be measured using a dummy value, 1 if the company has a SLS, and 0 if the company does not have a SLS.

7.   Corporate Governance (CG)

Represents the degree of CG implementation in a company. In this study, a CG index score is calculated with reference to the study of Hermawan (2009) and the ASEAN CG Scorecard (www.theacmf.org/ACMF/upload/asean_cg_scorecard.pdf, accessed on 15 November 2015). These scores measure the effectiveness of a company's Board of Commissioners and Audit Committee (Klein, 2002).

8.   Control Variables

- Leverage: The higher the outstanding debt of a company, the higher the risk possessed by the company, resulting in the higher the cost of capital need to be borne by the company. Meanwhile, Dechow et al. (1996) found that firms with high leverage tend to manipulate in order to meet debt covenants; thus affecting the quality of reported earnings. Therefore, leverage will tend to be negatively associated with the earnings quality.
- GROWTH: the company's growth rate, which is measured using the company's growth i in year t as compared to sales in year t-1. Companies with a high growth rate are expected to have high discretionary accruals, which are associated with the performance and not with the purpose of manipulation (Siregar, 2005). Hence, the higher the company's growth rate, the higher the discretionary accruals value.
- MTBV: represents the company value at this moment. Companies with high MTBV indicate that the market rates the companies to be higher than the value of the companies itself. The higher rates demonstrates the confidence of the market, which indicate lower degree of company information asymmetry, which means higher earnings

quality presented by these companies as compared to the companies with lower MTBV (Nelson et al., 2002).

- SIZE: measured using the natural logarithm of assets. Larger companies have the chance and opportunity to perform maneuvers in order to look better, including in its financial reporting, and therefore are expected to have a positive relation with earnings management (Nelson et al., 2002).

- Age: calculated from the number of years the company has been listed on the stock exchange. Companies that have been incorporated for long and listed on the Stock Exchange already have a good reputation in the market and thus tend to be positively associated with earnings quality observed from the market. Reputation is also something that will be maintained by older companies, hence they will avoid poor presentation of earnings quality.

- ROA: indicates the profitability of the company. Obtained by dividing the net profit of company i in year t by its total assets. A high ROA value indicates that the company is profitable. The more profitable a company, the less likely it manipulates its financial data.

The high ROA also gains the company a higher confidence of lenders and investors, hence the association between this variable and the cost of debt capital is negative.

- CFO: Cash Flow from operations. Used as a control variable for the profitability of the company. Companies that have high profitability, with a high cash flow from operations, is expected to have a low COD. This is because such companies are more capable to attend to the needs of cash from its own operations, and less in need of loan assistance (Petersen & Rajan, 1994).

- Intcov: interest coverage, a measure which can represent how much power a company's earnings can cover the needs of the company in paying the interest expenses of its loans. The higher the value, the higher the degree of trust the lenders has on the company, so the intcov value is expected to be negatively associated with the company's cost of debt capital (Francis et al., 2004).

9.   Research Model

To test Hypothesis H1 and H3, we use following research model:

$$COD_{it+1} = \gamma 0 + \gamma 1 ABTD_{it} + \gamma 2 EQ_{it} + \gamma 3 Growth_{it} + \gamma 4 Age_{it} + \gamma 5 Lev_{it} + \gamma 6 CFO_{it} + \gamma 7 Size_{it} + \gamma 8 Intcov_{it} + \gamma 9 ROA_{it} + \varepsilon_{it} \quad (1)$$

Whereas hypotheses H1a, H1b, H1c, and H1d are tested using following research model:

$$COD_{it+1} = c0 + c1 ABTD_{it} + c2 EQ_{it} + c3 Growth_{it} + c4 Age_{it} + c5 Lev_{it} + c6 CFO_{it} + c7 Size_{it} + c8 intcov_{it} + c9 ROA_{it} + c10 Fam_{it} + c11 Fam*ABTD_{it} + c12 CFL_{it} + c13 CFL*ABTD_{it} + c14 OWN2_{it} + c15 OWN2_{it}*ABTD_{it} + c16 CG_{it} + c17 CG*ABTD_{it} + \varepsilon_{it} \quad (1A)$$

COD_{it+1}: cost of debt; ABTDit: abnormal book-tax difference; EQ_{it}: earnings quality; $Growth_{it}$: sales growth rate; Age_{it}: number of years firm has been listed on the stock exchange; Lev_{it}: total debt to total equity; CFO_{it}: cash flow from operation; $Size_{it}$: natural logarithm of total assets; $Intcov_{it}$: ratio of operating income to interest expense; ROA_{it}: return on asset: FAM_{it}: 1 if the firm's UO is an individu or group of individu is family and 0 if otherwise; CFL_{it}: the ratio of UO's CR to CFR; $OWN2_{it}$: 1 if the firm has a SLS, and 1 if otherwise; CG_{it}: CG score.

To test hypotheses H2, we use following research model:

EQ_{it} $= \alpha0_{it} + \alpha1ABTD_{it} + \alpha2Lev_{it} + \alpha3Growth_{it} + \alpha4MTBV_{it} + \alpha5Size_{it} + \alpha6Age_{it}$

$+ \alpha7ROA_{it} + \epsilon it$ (2)

EQ_{it}: earnings quality; ABTDit: abnormal book-tax difference; Lev_{it}: total debt to total equity; $GROWTH_{it}$: sales growth; MTBV: ratio of market-to book value of the equity: $SIZE_{it}$: natural logarithm of total assets; AGE_{it}: number of years firm has been listed on the stock exchange; ROA_{it}: return on assets

Results and Analysis

Table 2 shows the descriptive statistics of all variables used in this study. Moderating variables in this study consist of the ownership variables and company corporate governance that are divided into three major sections:

1.   The largest controlling shareholder, comprising of:

    a.   Family ownership (FAM) is a dummy variable. The average of this variable is 0.7, while the median is 1. These numbers indicate that companies included in the study sample are more of family-owned companies than non-family-owned.

    b.   The power of the controlling shareholder (CFL – *cash flow leverage*). The minimum value (maximum) CFL 1 (2.03) shows that there is no company in the sample that has a lower degree of cash flow rights as compared to the control rights. At least, control rights of the companies in the sample are on the same degree with their cash flow rights.

2.   The second largest controlling shareholder:

The dummy variable that indicates the presence or absence of the second largest controlling shareholder in the sample companies (OWN2). The average value of 0.7 and the median of 1 indicate that there are more companies in the sample that have the second largest controlling shareholder as compared to those who do not.

1.   The Effect of Tax Management on the Cost of Debt Capital
Table 3 Panel A and Panel B show the results of the univariate analysis of variables used in this study. Table 3 Panel A presents the correlation between the variables used in the model 1 analysis. Tax management variable positively and significantly correlated with the cost of debt capital variable (COD). This correlation is an early indication that there is a positive effect of tax management on the cost of debt capital.

In Table 3 Panel B, the correlation between the moderating variables and the cost of debt capital variable is presented. All interacting variables between the moderating variables and the tax management variable show a positive correlation with the cost of debt capital variable. The only moderating and interacting variable that does not show a correlation with the cost of debt capital is the family ownership variable. Again, this is an early indication of the existence of correlation between the moderating variables and the cost of debt capital.

The next analysis is a multivariate analysis. In the multivariate analysis, this study used the estimation model of random effect model (Gujarati & Porter, 2009; Nachrowi & Usman, 2006) in order to accommodate the possibility of characteristics differences among the individuals in the sample companies. This estimation model also takes into account that the error can be correlated over time (time series) and cross-sectionally.

The regression results using model 1 and model 1A can be observed in details in Table 4. The following are the analyses for each regression results of both models.

2.   The Effect of Tax Management on the Cost of Debt Capital without Moderation

Hypothesis H1 stated that tax management positively affects the company cost of debt capital. The test result with model 1 supports the said hypothesis. Tax management has a positive association with the cost of debt capital. The tax management can lower the corporate transparency, which can result in the occurrence of the opportunistic management behavior as well as diversion of rents (Desai & Dharmapala, 2006; Desai et al., 2007; Wilson, 2009). Tax management can cause agency problems between the management and lenders in the form of information asymmetry and other problems related to moral hazard (Lim, 2011). Therefore, lenders will tend to protect themselves from such risks by charging a high cost of debt to the company.

A significant positive value found in ABTD variable in Table 4 (*no moderation*) indicates that the sample companies undertaking tax management need to incur a higher cost of debt as compared to other companies. This result supports hypothesis 1.

3.   The Effect of Tax Management on the Cost of Debt Capital with Moderating Variables

In this section, four factors which allegedly have a role in strengthening or weakening the positive effect of tax management on the cost of debt capital were tested. The four factors, together with the results of the analysis are discussed below:

a)   *The role of the ultimat owners (UO)*

Hypothesis H1a tested in this section is that UO with control rights which are relatively greater than the cash flow rights, or whose CFL – *cash flow leverage* is greater, will tend to have a stronger positive influence between tax management and the cost of debt capital as compared to other companies. The test result in Table 4 shows the result that is inconsistent with the said hypothesis. CFL*ABTD variable, which is an interacting variable between CFL variable and tax management variable shows an insignificant value.

UO with greater control rights than its cash flow rights actually has an incentive to commit expropriation, i.e. by using its control power to maximize personal gains (Claessens et al., 1999). An insignificant effect on this moderating variable shows that companies with UO that possesses greater control rights turn out to have an indifferent effect of tax management on the cost of debt capital as compared to other companies.

b)   **The role of family ownership**

Family ownership is expected to have an influence, be it positive or negative, on the relationship between tax management and the cost of debt capital (hypothesis H1b). Family that plays a major

role in a company's ownership is expected to have an entrenchment effect on the decisions taken by the company; i.e. the decisions taken by the management will be influenced by the largest controlling shareholder for personal or the family interests alone.

On the other hand, family ownership is also alleged to have a negative influence on the positive relationship between tax management and the cost of debt capital. Chen et al. (2010) mention that family-owned companies will be more cautious and tend to avoid tax managemenet in order to protect their reputation. For family-owned companies, reputation and the company's survival in the long term are very important (Maury, 2006).

The test result in Table 4 shows that family-owned companies undertaking tax management tend to have a lower cost of debt capital as compared to other companies which also carry out tax management (FAM*ABTD variable, i.e interacting variable between family ownership variable and tax management variable with significant negative value). Lenders regard the reputation held and maintained by the family-owned companies can ensure the fulfillment of the company debt covenants, even if the companies carry out tax management.

If this test result of hypothesis 1b is combined with the test result of hypothesis 1a, they indicate that ultimate owner in the sample companies do not have any influence on the positive effect of tax management on the cost of debt capital, unless the ownership is held by family. Lenders are only affected by the identity of the ultimate owner, whether it is a family or not. The family's reputation in protecting the company's survival can convince the lenders of the fulfillment of the debt covenants, which means a lower risk faced by the lenders. Meanwhile, the degree of control rights possessed by the ultimate owner is not taken into consideration by the lenders.

This is possibly because the lenders do not have any information regarding the ultimate owner and his degree of control rights.

c)   The role of the second largest controlling shareholder (SLS)

The test result on the role of SLS shows an insignificant value. The coefficient of OWN2*ABTD variable, which is an interacting variable between SLS variable and tax management variable is insignificant. This result shows that the presence of SLS does not have any impact on the positive effect of tax management undertaken by companies on their cost of debt capital. In other words, companies undertaking tax management with SLS turn out to bear the cost of debt capital which is indifferent with the companies without SLS.

This does not support hypothesis 1c and is inconsistent with the research findings of Attig et al. (2008) which state that SLS can have a monitoring role on the management and the UO, which can be seen from more efficient tax management measures taken by companies (by a lower cost of debt capital borne by the company). Nevertheless, this finding is actually consistent with the test result of hypothesis 1a on UO, which also does not have an impact on the cost of debt capital borne by the company as a result of tax management. If lenders consider a company's UO to not have an impact on the magnitude of tax management and the motivation to carry out tax management, then the monitoring role of SLS will not have any influence on the lenders' assessment.

Again, this is probably because the lenders do not have information on the ultimate owner structure of the company. Information possessed by investors and lenders is limited to the company ownership structure based on the number of shares owned by each investor (shareholder cash flow rights) and not shareholder control rights.

Table 4. The Effect of Tax Management on The Cost of Debt

Model 1: $COD_{it+1} = \gamma_0 it + \gamma_1 ABTD_{it} + \gamma_2 EQ_{it} + \gamma_3 Growth_{it} + \gamma_4 Age_{it} + \gamma_5 Lev_{it} + \gamma_6 CFO_{it} + \gamma_7 Size_{it} + \gamma_8 intcov_{it} + \gamma_9 ROA_{it} + \varepsilon_{it}$

Model 1A: $COD_{it+1} = c_0 + c_1 ABTD_{it} + c_2 EQ_{it} + c_3 Growth_{it} + c_4 Age_{it} + c_5 Lev_{it} + c_6 CFO_{it} + c_7 Size_{it} + c_8 intcov_{it} + c_9 ROA_{it} + c_{10}Fam_{it} + c_{11}Fam\_ABTD_{it} + c_{12}CFL_{it} + c_{13}CFL\_ABTD_{it} + c_{14}OWN2_{it} + c_{15}OWN2\_ABTD_{it} + c_{16}CG_{it} + c_{17}CG\_ABTD_{it} + \varepsilon_{it}$

H_1: *Tax management positively affects the company cost of debt capital.*

H_{1a}: *A higher ratio of control rights to cash flow rights held by the company ultimate owner will further strengthen the positive effect of tax management on the cost of debt capital.*

H_{1b}: *The positive effects of tax management on the cost of debt capital will be different in family-owned companies in comparison with non-family-owned companies.*

H_{1c}: *The positive effect of tax management on the cost of debt capital will be different with the presence of the second largest shareholder.*

H_{1d}: *Stronger CG mechanism in a company will weaken the positive effect of tax management on the cost of debt capital*

H_3: *Earnings quality negatively affects the cost of debt capital.*

CR to CFR; OWN2: 1 if the firm has a SLS and 0 if otherwise; CG: CG score.

d)   The role of CG

Hypothesis H1d stated that CG has a negative role in the effect of tax management on the cost of debt capital. The result in table 4 shows that this hypothesis is supported. Coefficient of CG*ABTD variable which is an interacting variable between CG variable and tax management shows a significant negative value. This means that the sample companies undertaking tax management with a better CG score apparently have a lower cost of debt capital as compared to other companies carrying out tax management. The finding support the assertion that the CG score mitigate the positive effect of tax management on the cost of debt capital.

This finding is also consistent with the findings of previous studies. Desai & Dharmapala (2006), for instance suggest that companies that implement a good systematic governance can suppress the occurrence of rent diversion by management when the companies carry out tax management. Companies undertaking tax management with good CG implementation were also found to have better company value as compared to companies with weaker CG scores (Desai & Dharmapala, 2009). CG implementation is considered to represent monitoring mechanism on the management; thus can reduce the occurrence of entrenchment (Lim, 2011).

4.   The Effect of Tax Management on Earnings Quality

Tax management is hypothesized to have a negative effect on earnings quality. The greater the tax management behavior, the lower the earnings quality. Prior to the multivariate analysis, univariate analysis was conducted on the variables used in the model 2 equation. The result of this univariate analysis using the Spearman correlation can be seen in Table 5 below:

Table 5. Correlation - Model 2

	EQ	ABTD	LEV	GROWTH	MTBV	SIZE	ROA	AGE

From Table 5, it can be seen that ABTD variable has a negative correlation with earnings quality variable (ET). This univariate analysis becomes an early signal of the presence of negative and significant relationship between tax management and earnings quality, in accordance with the hypothesis which will be tested further with the multivariate analysis.

5. The Effect of Tax Management on Earnings Quality

This test is intended to test hypothesis H2 which mentions that tax management will negatively affect company earnings quality. The presence of a difference between taxable profit and accounting profit, which is a characteristic of tax management, implies a potential that companies do not report their actual earnings, which could be interpreted as a poor quality of company's reported earnings.

The test result of the effect of tax management on earnings quality as reported in details in Table 6 shows that tax management has a significantly negative effect on earnings quality. Tax management in sample companies is apparently lower the companies' earnings quality. The higher the difference between accounting profit and the profit used as a base for outstanding tax calculation, the lower the company earnings quality, which corresponds with hypothesis 2.

This result is consistent with the research findings of Frank et al. (2009) which found that companies that attempt to manipulate tax (tax aggressive) tend to also carry out earnings management which result in low earnings quality. This study actually extends the findings of Frank et al. (2009) which limited the observation on companies that conducted tax manipulation alone. This study includes all elements of company actions that aim on tax management. Companies that perform tax management apparently also tend to perform earnings management, and as a result lower the company's earnings quality.

Furthermore, Desai & Dharmapala (2006) state that tax management can increase the information asymmetry between managers and shareholders. This condition will cause the occurrence of rent diversion risk perception, that is, managers can do anything according to their interests, which can harm other shareholders. Meanwhile, Barth et al. (2013) found that companies with high degree of information asymmetry usually have a low degree of earnings transparency. The results of this study support the findings of Barth et al. (2013) by adding proof of another source of information asymmetry, which is the tax management carried out by companies, and its relationship with the earnings transparency.

6.   The Effect of Earnings Quality on the Cost of Debt Capital

The last section of this study analysis is the analysis or the test result of the effect of earnings quality on the cost of debt capital. This effect is included in equation model 1, and the result is reported in details in Table 4 above. The test result in Table 4 does not support the Hypothesis H3. Instead, earnings quality has a positive effect on the cost of debt capital. It appears that the higher the earnings quality, the higher the cost of debt capital needs to be borne by the company. pEQ variable (which is a fitted value of the earnings quality of the equation 2 result) in Table 4 shows a positive and significant value.

Although this result is not consistent with the Hypothesis H3, it supports the findings of Li & Richie (2016). In their study, it was discovered that a high discretionary accruals is actually an indication for the lenders that a company has extra cash, which can be used to pay company loans. The discretionary accruals carried out by companies during the income smoothing allows the investors to predict future earnings more easily. Income smoothing is also useful as an effective tool in disclosing company information. For the lenders, income smoothing will ease the assessment of company's default risk, and in the end lower the cost of debt needs to be borne by the company (Trueman and Titman; 1988). Therefore, according to the above study, the presence of income smoothing (through a high discretionary accruals) will reduce the cost of debt. Trueman & Tritman (1998) further state that income resulting from income smoothing will increase investors' confidence that debt covenants will be met throughout the lending period.

Sensitivity Analysis

1.   The use of DTAX measurement as a proxy of tax management

The other tax management measurement is to follow the measurement carried out in the study of Frank et al. (2009). This measurement is used an element of permanent difference of BTD as a base for tax management measurement calculation:

$$PERMDIFF_{it} = [BI_{it} - (CTE_{it}/STR_{it})] - (DTE_{it}/STR_{it})$$

BI_{it}: Pre-tax book income; CTE_{it} : current tax expense; DTE_{it}: deferred tax expense; STR_t: statutory tax rate

The next step is regressing the value of PERMDIFF towars variables alleged to be the normal permanent difference sources with the following estimation:

$$PERMDIFF_{it} = a_0 + a_1UNCON_{it} + a_2MI_{it} + a_3CSTE_{it} + a_4\Delta NOL_{it} + a_5LAGPERM_{it} + \varepsilon_{it}$$

$UNCON_{it}$: income (loss) reported under equity method; MI_{it}: income (loss) attributable to minority interest; $CSTE_{it}$: current state income tax expense; ΔNOL_{it}: change in net operating loss carry-forwards; $LAGPERM_{it}$: one-year lagged PERMDIFF.

The residual value (ε) of the regression is a part of permanent difference which resulted from managerial discretion.

The test result of this measurement (untabulated) also find that tax management negatively affects earnings quality and positively affects the cost of debt capital. Moreover, earning quality from the predictive value result of tax management that used this measurement also indicates a positive and significant effect on the cost of debt capital, consistent with the findings of the main testing.

2.   Alternative Measurement for The Second Largest Controlling Shareholder (SLS)

Following Attig et al. (2008), the role of SLS was also measured using two other measurements: the degree of control rights held by SLS and the ratio of the SLS's control rights to UO's control rights. The test using the two measurements pprovide quite consistent result with the main analysis on the role of SLS (untabulated).

3.   The use of DA and ET measurement as an individual proxy of earnings quality

If in the main analysis the earnings quality was measured using one measurement, as a result of confirmatory factor analysis of two measurements of Discretionary Accruals (DA) and Earnings Transparency (ET), in this section, a test against each earnings quality measurement was done separately. The results show that tax management will decrease earnings quality, be it measured using discretionary accruals, or observed from the viewpoint of earnings transparency reported by the company (untabulated).

Conclusion

The purpose of this study is to examine the effect of tax management carried out by a company on the cost of capital it must bear. The initial hypothesis of this study is that tax management, which is performed by many companies as it is deemed to encourage tax savings, has a positive effect on the cost of debt capital needs to be borne by the company due to the lower corporate transparency.

The findings show that tax management apparently have an effect in increasing the cost of debt capital borne by a company through the information asymmetry incurred by the tax management behavior. Furthermore, the study also examined whether the increase of the cost of debt capital due to the tax management occurs directly as a result of the tax management behavior, or through the decrease in earnings quality. The findings indeed show that tax management reduces earnings quality. The earnings quality measured in this study is the discretionary accruals and earnings transparency value. Therefore, companies undertaking tax management indeed have a higher value of discretionary accruals, and/or decrease their reported earnings transparency. Nonetheless, this decrease in the earnings quality is attended by the lenders in a different way from the initial hypothesis of this study.

For lenders, a lower earnings quality induces a totally different reaction. Lenders, who usually have a greater financial knowledge (banks and institutional investors) as compared to shareholders, understand the low earnings quality is the result of the increase in discretionary accruals; which means the debt payment and the fulfillment of debt covenants are potentially more guaranteed due to the availability of the company's operational cash flows. Lenders apparently view the companies with low earnings quality to be more reliable and thus charge a lower cost of debt capital.

This study also examine the roles of ownership variables (family, the ultimate owner and the second largest shareholder) as well as CG in impacting the positive effect of tax management on the cost of debt capital. The results on the roles of the four variables are as follows. Of all ownership variables, only the family ownership shows a role in mitigating the effect of tax management. The earnings quality of companies with family ownership undertaking tax management is not as low as other companies. In addition, family-owned companies are performing tax management bear a lower cost of debt capital. Family-owned companies are deemed to carry out tax management not with manipulating purpose or other purposes that will harm lenders. Family-owned companies are reckoned to always maintain their reputation and the company's survival. Other ownership variables (cash flow leverage held by the ultimate owner and the second largest shareholder) do not have any impact on the effects of tax management, both on earnings quality and on the company cost of debt capital. This is probably because the financiers do not have adequate information on the controlling shareholders and the degree of control rights possessed by these shareholder groups.

The test result on the role of CG variable on tax management behavior apparently is capable of changing the lenders' view of the tax management performed by the company. Lenders consider tax management of companies with a good CG system to have less tendency to carry out rent diversion as compared to other companies.

There are several limitations of this study. We have not examined all alternatives measurement for tax management as in Hanlon and Heitzman (2010). We use CG score to measure corporate governance implementation. Future studies may want to focus on specific corporate governance mechanisms that may have more direct effect on tax avoidance, such as audit committee effectiveness.
