Fernando, A.A.J., University of Sri Jayawardenepura, Sri Lanka

Abstract

Intellectual capital [IC] is regarded as a strategic asset of firms, which is potential of creating value. However, the measurement of intellectual capital is extremely difficult and as a result mere disclosure of IC information in annual reports do not show the impact of value of IC in the financial position of a firm. Main objectives of this study are to develop an IC disclosure (ICD) index to measure the extent and quality of ICD and to examine determinants of ICD practices and their impact on ICD practices based on 50 companies listed on Colombo Stock Exchange (CSE) for the period from 2010 to 2014 by using a content analysis and questionnaire survey. Companies were selected in the order of market capitalization and the data was collected from annual reports. 20 disclosure items representing Internal Capital Disclosure (InCD), External Capital Disclosure (ECD) and Human Capital Disclosure (HCD) are included in the index. Data was analyzed using parametric tests, correlations and panel regression analysis based on pooled regression. Study finds that that there was a common increasing trend for disclosure of IC items and categories. Majority of listed companies disclose IC different forms such as text, sentences, pictures, tables and graphs in line with core discipline of Global Reporting Initiative [GRI] guidelines. ECD was mostly reported in the annual reports followed by HCD and InCD. Theoretical framework of the study takes into account agency theory, stakeholder theory, legitimacy theory and signaling theory. The study offers an insight to the corporate and business level managers, policy makers, potential investors and future researchers regarding ICD practices in terms of extent and quality.

Keywords: *Intellectual Capital Disclosures (ICD), Human Capital Disclosure, External Capital Disclosure, Annual Reports, Content Analysis*

Introduction

The world economy is transiting from an industrial economy to a knowledge based economy [KBE] in order to enhance the value creation. Hence, companies are more concerned about intellectual capital [IC] rather than financial capital in order to gain competitive advantages (Rashid et al. 2012). General source of IC information of companies is the annual report and therefore lots of research studies on Intellectual Capital Disclosure [ICD] have been carried out by using data given in annual reports. On the other hand, it is a legal right of shareholders to have decision useful information including IC in annual reports (Abhayawansa & Guthrie 2010 & 2014, Malwara Arachchi & Kehelwalatenna 2011, Abhayawansa & Azim 2015, Jayasooriya, Gunawardana and Weerakoon Banda, 2015).

Cost of human capital is either immediately expensed or amortized in the financial statement despite the fact that human resources create value at varies degrees. With the remarkable increase in the number of companies relying on ICD practices, it is worthwhile to carry out more in depth study on ICD practices and provide some guidelines for assessing value of IC in firms. Accordingly, it is possible to examine those aspects of ICD through a survey or structured

questionnaire (Bontis, Keow& Richardson 2000). Therefore, current study tries to examine ICD practices and ways of measuring the quality of ICD of listed companies in Sri Lanka.

Literature Review

There are numerous studies on ICD have been undertaken in different countries around the world such as: Canada, Australia, New Zealand, UK, Ireland, Hong Kong and India. In the context of Sri Lankan companies, in terms of ICD, there are limited numbers of research studies have been undertaken to date (Jayasooriya, Gunawardana&Weerakoon Banda 2015). Williams (2001) examined the ICD practices of 100 listed companies in UK over a period of five-years from 1996 to 2000. Major findings of this study revealed that there was a significant improvement for the quantity of ICD by companies during the investigated period. Oliveras and Kasperskaya (2004) examined the financial statements of 14 companies listed in Spain over the period of five-years from 1998 to 2002 based on content analysis. They found that the added value of the companies was decreasing. The general ICD was low but it was increasing year-to-year.

Dimitrios, Zeljko and Charalampos (2009) conducted a study to empirically examine the four basics of IC such as: human capital, customer capital, structural capital and innovation capital and their relationship with business performance in the Athens Stock Exchange. Findings of the study revealed that there was a positive association between human capital and customer capital in both service and non-service industries and structural capital had a positive relationship to business performance in both industry types and in non service industries. According to this study, it is noted that internal capital has a positively correlated to business performance.

Yi and Davey (2010) reported by using content analysis of the annual reports of 49 dual listed companies in mainland of China. Their findings revealed that most ICD elements were included in qualitative terms rather than quantitative terms in the annual reports. According to this study, the ICD quality was not considered as strong. The results of this study further found that the companies had a modest commitment in communicating their ICD in annual reports. Rashid (2010) explored a study to provide an overview of ICD practices of 136 listed companies with Dhaka Stock Exchange in Bangladesh by using the content analysis. Results found that company's disclosure on ICD were relatively low and there was an increasing trend over the years. Mostly reported disclosure item was HCD followed by InCD and HCD.

2. Objectives of The Study and Research Methodology

There are two objectives of this study. They are to to develop an ICD index to measure the extent and quality of ICD by companies and to examine the extent and quality of ICD and its practices in Sri Lanka.

Data was mainly obtained from annual reports for five years from 2010 to 2014 and a questionnaire given to eight corporate managers, four CFOs, four financial analysts, two Chartered Accountants and two lecturers in the field of accounting to identify the weightings of theses selected ICD items by using a five-point rating scale (1-5). An ICD index was developed by analyzing the ICD contents in annual reports. Sample consists of 50 companies in order of market capitalization as of 10 August 2015, out of 296 listed companies on CSE. These 50 companies account for more than 75% of market capitalization. ICD information in terms of words, sentences, pages, pictures, tables and graphs of the companies' annual reports from 2010 to 2014 were the unit of analysis of this study. The questionnaire used 5 point Likert scale from unimportant to extremely important options for ICD. 20 ICD items were identified as InCD (7),

ECD (6) and HCD (7) based on previous studies (Malawara Arachchi and Kehelwalatenna, 2011). Once the ICD index was developed, it was used to screen the annual reports of sample companies. Selected ICD items are presented in Table 1 below.

Table 1: Selected ICD items in the context of Sri Lankan companies

ICD	Proxies	Description
InCD	Company logos & trademarks	It comprises company logo and trademark.
	Philosophy	Evinced in company vision, mission, business values to reflect how leaders think about
	New products	Information of new products produced and new services offered by the companies.
	Management process	It covers specific processes companies use to alter their resource that is incorporated in their
	Organizational structure	Reporting of hierarchies that flow through the business.
	Systems	It includes information systems and network systems.
	Financial relations	Defined as favorable relationship with financial sources, such as: banks and other financial institutions.
ECD	Customers and their relationship	It includes customers, customer satisfaction and their relationship.
	Brands	Information about brand name and brand image.
	Corporate image	Information of company name and new stake holders.
	Supply chain management	Details of support of suppliers and distribution channels held.
	Company awards	Information relating to awards obtained by the company.
	Business collaborations	Information relating to group of companies (parent, subsidiary and joint venture), mergers and acquisitions, business partnering and licensing and franchising agreements. (continued)
HCD	Number of employees	It refers to number of staff employed.
	Employee equity issues	Information relating to gender (male and female) and age of employees.
	Employee related	Information relating to value added by employees.
	Training and development	It includes training programs, career development plans conducted to employees by companies.
	Employee relations	It refers to union activities, employees being thanked and employee involvement in the
	Entrepreneurial skills	It includes innovations of the employees.
	Employee welfare	It includes employee compensation plans and employee share option plans [ESOP].

To calculate the weighting for a particular IC item, the ratings assigned to the item by the survey respondents were summed and a mean score was calculated. There are few previous studies on ICD incorporating the element of ICD quality into their research (Schneider 2006, Yi 2012). These studies have employed quality criteria with differing scales to assess the quality of ICD in companies' annual reports. The quality criteria with a four-point scale were established for the construction of the ICD index in this study, as they were deemed to be comprehensive and more appropriate. Accordingly, following quality scores were assigned: The score '3' was assigned for both qualitative and quantitative disclosure of IC in the annual report. The score '2' was assigned for quantitative disclosure of IC in the annual report. The score '1' was assigned for qualitative disclosure of IC in the annual report. The score '0' was assigned for no any IC item is disclosed in the annual report (Nurunnabi, Hossain & Hossain, 2011). Once the ICD index was developed, it was used to code the companies' annual reports in order to examine the extent and quality of ICD of selected 50 companies. Words, sentences, pages, pictures, tables and graphs of the companies' annual reports from 2010 to 2014 were screened in terms of InCD, ECD and HCD.

3. Hypothesis of the Study

Hypotheses with regards to the extent of ICD were developed. The first hypothesis (H1a) assumes that an increasing trend of ICD can be seen whilst the second one (H1b) postulates a reduction in the extent of ICD. Accordingly, the hypotheses are expressed as follows.

H_{1a}:   The ICD of listed companies on CSE significantly increased over the five-years from 2010 to 2014.

H_{1b}:   The ICD of listed companies on CSE significantly decreased over the five-years from 2010 to 2014.

Data Analysis

20 aspects of ICDs measured for the purpose of developing an index for ICDs assessment were summarized based on the perception scores obtained. The summary of results is given in table 2 below. Accordingly all 20 aspects were recognized by the respondents either as extremely important or very important. However, the quality score given for each aspect varies from 1 to 3. The weights for each aspects ranged from a lowest of 3.5 to a maximum of 5 as per the preferences of respondents. Summary results given in the table 2 indicate that all the respondents have recognized the importance and relevance of ICDs aspects to be considered in determining its level of the quality of disclosures.

The descriptive statistics analysis such as mean, standard deviation, median, Skewness and Kurtosis were also used to analyze data. The summary is given in table 3. Table 3 shows that, the values of Skewness and Kurtosis for some of the variables, accounted beyond the threshold value. InCD ranged from 0.3452 to 0.9323 with a mean of 0.64 and standard deviation of 0.170. ECD ranged from 0.2634 to 1 with a mean of 0.65 and standard deviation of 0.186. HCD ranged from 0.1405 to 1 with a mean of 0.58 and standard deviation of 0.232 and ICD ranged from 0.2940 to 0.9549 with mean of 0.62 and standard deviation of 0.163. The extent and quality of ICD were assessed in terms of three categories, such as: InCD, ECD and HCD. Average scores were calculated with respect to 20 ICD items considered for developing ICD index. Statistics are given in table 4.

Table 2. ICD index

Disclosure of IC	Proxies	Weight as per questionnaire survey	Survey respondents' perceptions	Maximum quality score
InCD	Company logo and trademark	4.7	Extremely important	1
	Philosophy	3.7	Very important	1
	New products	3.5	Very important	1
	Management process	4.2	Very important	3
	Organizational structure	5.0	Extremely important	3
	Systems	3.8	Very important	2
	Financial relations	4.0	Very important	3
ECD	Customers and their relationship	4.2	Very important	3
	Brands	4.6	Extremely important	3
	Corporate image	4.6	Extremely important	3
	Supply chain management	4.5	Extremely important	3
	Company awards	5.0	Extremely important	2
	Business collaborations	4.6	Extremely important	2
HCD	Number of employees	5.0	Extremely important	2
	Employee equity issues	4.1	Very important	3
	Employee related measurements	4.7	Extremely important	3
	Training and development	4.6	Extremely important	3
	Employee relation	4.7	Extremely important	1
	Entrepreneurial skills	4.0	Very important	1
	Employee welfare	4.0	Very important	2

Source: Researchers constructed based on the content analysis.

Overall ICD in 2014 was quite good compared to other years with 11 out of 20 ICD items are achieving a score above 0.50. The five most reported items were organizational structure, brands, corporate image, market share and employee related measurements. Intellectual property, philosophy, new products, employee relation and entrepreneurial skills were the five least reported items.

1. Quality of Disclosure of IC Categories
As for the disclosure quality of ICD by categories, it can be seen from the following table that in 2014, ECD was the most highly reported category in quality with a mean disclosure score of 0.7022. InCD was the least reported category with a mean score of 0.4714. A summary result is given in table 5.

Table 5: ICD quality by categories

Variables	2010	2011	2012	2013	2014
InCD	0.3895	0.4009	0.3486	0.4219	0.4714
ECD	0.4733	0.5100	0.5611	0.6056	0.7022
HCD	0.3362	0.3810	0.4019	0.4343	0.4809
ICD	0.3997	0.4306	0.4372	0.4873	0.5515

Source: Researcher constructed.

As shown in the table 5, the average number of InCD items disclosed by a company was 0.7125. The minimum and maximum items disclosed by companies were 0.4095 and 0.9323 respectively, with regard to external ECD, the average items disclosed by a company was 0.7959. The minimum and maximum items disclosed by companies were 0.5720 and 1.0000 respectively. Average items of HCD made by a company was 0.6794. The minimum and maximum items disclosed by companies were 0.3288 and 1.0000 respectively. In regard to ICD, the average items disclosed per company was 0.7293. The minimum and maximum items disclosed by companies were 0.4578 and 0.9549 respectively.

Longitudinal comparison of frequencies of data values for InCD, ECD, HCD and ICD was carried out and the results are shown in table 6 below.

Table 6: A longitudinal comparison of the frequencies of InCD, ECD, HCD and ICD of the sample companies

	2010		2011		2012		2013		2014	
	Mean	Max	Mean	Max	Mean	Max	Mean	Max	Mean	Max
InCD	6.28	7	6.24	7	6.36	7	6.4	7	6.44	7
ECD	5.46	6	5.84	6	5.86	6	5.98	6	6	6
HCD	4.22	7	4.9	7	5.12	7	5.38	7	5.78	7
ICD	15.96	20	16.98	20	17.34	20	17.76	20	18.22	20

Source: Researchers constructed.

The mean values of InCD, ECD, HCD and ICD in five-years are exhibited in the above table 6. From the table, it can be observed that there was an upward trend for the extent of ICD over the five-year period. With reference to the quality of ICD, it can be observed that ECD was the highest scoring category, achieving an average disclosure score of 0.7959. The highest disclosure score for this category was 1 obtained by six companies. The lowest disclosure score for this category was 0.5720. The second highest scoring category was InCD which achieved a mean disclosure score of 0.7125. The highest disclosure score for this category was 0.9323. The lowest disclosure score for this category was 0.4095.The lowest scoring ICD category was HCD which obtained a mean disclosure score of 0.6794. John Keells Holdings PLC achieved the highest disclosure score of 1 for this category. The lowest disclosure score for this category was 0.3288. Overall average disclosure score for the total IC across all the firms was 0.7293. The highest score was 0.9549 achieved John Keells Holdings PLC. The lowest disclosure score was 0.4578 obtained by Distilleries Company of Sri Lanka PLC. A summary of statistics is given in table 7. Table 7 further shows that there is an increasing trend of InCD, ECD, HCD and ICD over the five-year period.

Table 7: A longitudinal comparison of ICD quality by sample companies from 2010 to 2014

	2010	2011	2012	2013	2014
InCD	0.5964	0.5978	0.6337	0.6574	0.7125
ECD	0.5437	0.5944	0.6456	0.6856	0.7959
HCD	0.4811	0.5374	0.5747	0.6116	0.6794
ICD	0.5404	0.5765	0.6180	0.6515	0.7293

Source: Researchers constructed.

2. ICD Practices

Most of the companies tend to qualitatively disclose the IC information where as some companies disclosed numerical values of some elements of ICDs. Item of trademarks and company logos considered to be extremely important by the survey respondents was under-disclosed. Philosophy, new products and financial relations were under disclosed but the survey respondents deemed them to be very important. Therefore, the disclosures of them do not satisfy the expectation of survey respondents. Approximately 20% of the items of InCD were under disclosed, 10% of the items were moderately disclosed and 5% of the item of InCD was highly disclosed by the sample companies. In terms of ECD, it can be observed that the disclosures of brand and corporate image were very consistent with the survey respondent perceptions. Supply chain management, company awards and business collaborations were moderately disclosed but the survey respondents rated them to be extremely important. The item of customers and their relationship moderately disclosed but the survey respondents rated them to be very important. Approximately 10% of the items were moderately disclosed and 20% of the items were highly disclosed by the sample companies. In terms of HCD, it can be observed that the disclosure of employee related measurement was very consistent with the survey respondent perceptions. Number of employees, training and development and employee relation were under disclosed but the survey respondents rated them to be extremely important. The item of employee equity issues was under disclosed but the survey respondents rated them to be very important. The item of entrepreneurial skills was under disclosed but the survey respondents rated them to be very important. The item of employee welfare was moderately disclosed but the survey respondents rated them to be very important. Approximately 25% of the items of HCD were under disclosed, 5% of the item was moderately disclosed and 5% of the item of HCD was highly disclosed by the sample companies.

It was acknowledged that there were some drawbacks for the sample companies in terms of IC. First of all, except Union Assurance PLC, other companies did not provide the IC report. Though, this should not be criticized because there is no generally accepted framework for ICD in Sri Lanka. Only few companies mentioned the term IC in their annual reports. These drawbacks point out that listed companies in Sri Lanka still have to improve their ICD practices. Sri Lanka is an industrialized economy and a developing country in Asia. Majority of the sectors in CSE have achieved a remarkable growth after the war in Sri Lanka. This very noticeably reveals that stock market growth and economic growth moving together (Dayaratne 2014).There are many driving forces, such as: globalization and increased use of information technology are motivated Sri Lanka towards KBE (John Keels Holdings PLC 2014).Most of the top companies in Sri Lanka have been preparing their annual reports in accordance with GRI guidelines since 2011.

3. Changes of ICD practices over the years 2010-2014

One way repeated measure ANOVA and Paired sample t-tests were conducted to determine the significance of the differences in InCD, ECD, HCD and ICD between the years concerned from 2010 to 2014. Output of Maluchly's test of sphericity is given in table 8 below.

Table 8: Maluchly's test of sphericity

Epsilon effect	Mauchly's W	Chi^2	Sig.	Greenhouse-Geisser	Huynh-Feldt	Lower-bound
Effect	0.346	50.272	0.000	0.656	0.697	0.250
ECD	0.312	55.182	0.000	0.708	0.755	0.250
HCD	0.529	30.228	0.000	0.765	0.822	0.250
ICD	0.530	30.066	0.000	0.792	0.853	0.250

Source: Researchers constructed.

4. Multivariate Tests

Wilks' Lambda – the $p < 0.05$, there is statistically significant effect for year from 2010 to 2014. There was a significant change in InCD, ECD, HCD and ICD across the 5 years. The values in partial eta^2 given in the multivariate analysis are InCD = 0.521, ECD = 0.778, HCD = 0.502 and ICD = 0.775. This suggests very large effect size. According to Cohen (1988 cited in Boduszek 2009) if partial eta^2 equals 0.01 then there will be a small effect, if partial eta^2 equals 0.06 then there will be a medium effect and if partial eta^2 equals 0.14 then there will be a large effect.

A one-way repeated measures analysis of variance was conducted in order to compare scores of InCD, ECD, HCD and ICD in 2010, 2011, 2012, 2013 and 2014. In terms of InCD, there was a significant effect for time, Wilks' Lambda = 0.000, $F (4, 46) = 12.503$, $p < 0.05$, multivariate partial squared = 0.521. The results suggest that InCD significantly increased over time. In terms of ECD, there was a significant effect for time, Wilks' Lambda = 0.000, $F (4, 46) = 40.374$, $p < 0.05$, multivariate partial squared = 0.778. The results suggest that ECD significantly increased over time. In terms of HCD, there was a significant effect for time, Wilks' Lambda = 0.000, $F (4, 46) = 11.601$, $p < 0.05$, multivariate partial squared = 0.502. The results suggest that HCD significantly increased over time. In terms of ICD, there was a significant effect for time, Wilks' Lambda = 0.000, $F (4, 46) = 39.682$, $p < 0.05$, multivariate partial squared = 0.775. The results suggest that ICD significantly increased over time.

5. Pairwise Comparisons

Pair wise comparisons compare each pairs of years and indicate whether the difference between them is significant. As shown in the Appendix XI, each of the difference is significant (less than 0.05). A one-way repeated measure ANOVA was performed to determine whether there was a change in ICD scores in the five-year period. The results in above table shows that there was an increase in the ICD of listed companies on CSE over the five-year period and the increase was statistically significant (p-value of 0.000). Hence, H1a that the ICD of listed companies on CSE increased significantly over the years 2010-2014 is fully supported. It leads us to reject H1b that the ICD of listed companies on CSE decreased significantly over the years 2010-2014. In terms of InCD, ECD and HCD, all these three disclosures increased significantly over the five-year period. Abeysekera (2008) observed a significant increase in the InCD category in Sri Lanka and attributed the increase to the amendment of intellectual property act in Sri Lanka.

6. **Discussion of the Extent of ICD Practices of the Sample Companies**

When it comes to compare with the previous Sri Lankan studies, it can be seen that the results of this study are greatly in line with them as those studies usually observed an increasing level disclosure of IC (Abeysekara & Guthrie 2005, Abeysekara 2007, 2008, 2011a & 2011b, Kehelwalatenna & Gunaratne 2010, Malwara Arachchi & Kehelwalatenna 2011,Jayasooriya, Gunawardanaand Weerakoon Banda 2015).Also, the results are consistent with majority of prior studies in the context of abroad that have shown ECD as the most reported category (Brennan 2001, April, Bosma & Deglon 2003, Oliveras & Kasperskaya 2004, Oliveras et al. 2008, Mention 2011, Singh and Kansal 2011). However, these findings were contradicted with those found the dominance of HCD (Branco et al. 2011) and InCD (Yau, Chun & Balarama 2009, Wagiciengo & Belal 2012).

It was found in this study that some companies were very reluctant to disclose some elements of IC in their annual reports, such as: trademark, number of employees, employee equity issues, training and development, employee relation and entrepreneurial skills. Firstly some companies might consider that the preparation of IC information would be a cost for them and consequently they would not like to disclose these elements of IC information. In addition, some disclosure items of IC such as: intellectual property, and the disclosure of them might be speedily imitated by competitors. This will impair the company's interests. Therefore it is not likely for some companies to disclose on such items (Abeysekara 2007 & 2011b, Yi & Davey 2010, Yi 2012). Moreover, the dominant role of the conventional financial reporting and the lack of a generally accepted ICD frameworks might be also factors discouraging some companies from disclosing the IC information in their annual reports (Abeysekara 2007, 2011a & 2011b, Malwara Arachchi & Kehelwalatenna 2011, Yi & Davey 2010).

Many types of corporate reporting have developed from the adoption of a stakeholder orientation. These include ICR (for example, the TBL reporting, CSR reporting, sustainability reporting, GRI index and IR that combines reporting on financial capital, IC and sustainability matters (IIRC 2011). Some companies have adopted these guidelines to disclosure the financial and non-financial information on IAs and IC in their annual reports. Only one company has presented the IC report in its annual report.

Conclusions

This study examined the ICD practices of the listed companies in CSE. A total of 250 annual reports for 50 top companies based on market capitalization were content analyzed longitudinally in a five-year period (2010-2014). Agency theory, stakeholder theory, legitimacy theory and signaling theory were used to explain the findings. The findings revealed that the ICD of the sample companies increased over time. In terms of the three categories, similar to most prior studies, the ECD was the most widely disclosed category in the five-year period. In terms of InCD, there was an increasing trend from 2010 to 2011 and from 2013 to 2014. In 2010 and 2011, firstly reported category was ECD followed by InCD and HCD. In 2012, 2013 and 2014, firstly reported category was ECD followed by HCD and InCD. The tendency of sample companies to disclose more in ECD could be due to corporate legitimating purposes to address the increased regulatory pressure and the then increased public attention toward the companies. In 2012, 2013 and 2014, firstly reported category was ECD followed by HCD and InCD as a way to influence the society's perception in areas of employment. In addition, changes in the ICD category (i.e. in 2012, 2013 and 2014, firstly reported category was ECD followed by HCD and InCD) could further be attributed to the absence of an ICD guideline.

ECONOMIC CONSEQUENCES OF IFRS ADOPTIONS AROUND THE ASEAN COUNTRIES: ROLE OF ANALYST FOLLOWING

Fitriany, Universitas Indonesia, Indonesia

Aria Farahmita, Universitas Indonesia, Indonesia
Viska Anggraita, Universitas Indonesia, Indonesia

Abstract

This paper examines the economic consequences of IFRS adoptions in the ASEAN countries. Economic consequences were measured with the amount of the asymmetry of information and cost of capital, while reporting incentives to adopt IFRS proxied by the number of analysts following. The study period is 2 years before and after the adoption of IFRS in each country.

The regression test using all data of ASEAN countries shows that the implementation of IFRS could not reduce levels of information asymmetry but could reduce cost of capital. Reporting incentives (measured by number of analyst following) could not able to reduce the level of information asymmetry and cost of capital. The negative impact of IFRS to the asymmetry of information will be greater with higher reporting incentives as measured by the number of analysts following. But this result only proved at few ASEAN countries. The results of this study indicate that regulators in ASEAN countries should encourage analyst to follow a listed company and listed companies should be more transparent in presenting its financial statements.

Keyword: *IFRS, Economic consequences, information asymmetry, bid ask spread, cost of capital, analyst following*

Background

Integration of world capital markets will have an impact on the growing need for high-quality and comparable financial information. Since the EU set 2005 as the year of adoption of IFRS in full for EU member states, many countries also begin to commit local convergence of accounting standards to IFRS, including ASEAN countries. The implementation of international accounting standards, such as IFRS, is expected to improve the quality and comparability of the financial statements in order to accelerate the realization of an integrated regional integration in global capital markets.

The adoption of IFRS is expected to facilitate the enterprises in ASEAN countries to carry out cross-border transactions, including mergers and acquisitions. However, empirical research on similar issues in developing economies in Asia is lacking due to late adoption of IFRS in the region. From the ASEAN countries, there are recent studies on Malaysia (Yeow and Mahzan, 2013), Vietnam (Phan and Mascitelli, 2014; Phan, 2014) and Indonesia (Wahyuni, 2013).

Convergence towards the adoption of IFRS has advantages and disadvantages (Jeanjean and Stolowy, 2008). These may impact differently on developed and developing countries. The IFRS Foundation has recognized the need to understand the impact of IFRS adoption in different parts of the world, especially in developing or emerging economies. To date little is known about this topic with respect to members of the Association of South East Asian Nations (ASEAN), which includes some of the world's fastest-growing economies. ASEAN was formed in 1967; it is a regional political and economic grouping made up of Brunei Darussalam, Indonesia, Malaysia, the Philippines, Singapore and Thailand, which are the

older members of ASEAN. Vietnam, Laos, Cambodia and Myanmar joined in the late 1990s. ASEAN countries had 600 million people, combined gross domestic product of US$1.5 trillion and total trade of US$1.7 trillion. Recent studies indicate that some ASEAN countries have already adopted IFRS to integrate with the world economy (Yapa et al., 2015). The development and global implementation of a single set of standards is a difficult goal.

Convergence of accounting standards is requiring a joint effort from national governments, stock market regulators, financial statement users, standard setters and the accounting profession (Street, 2002). Joshi et al. (2008) claim that nationalism might still present a hurdle to IFRS implementation, as do differences of language and culture (Schipper, 2005) as well as legal orientation in code-law countries like Spain (Navarro- García and Bastida, 2010). As IFRS commonly require the disclosure of more information than domestic GAAP (Wright and Hobbs, 2010), shifting to IFRS involves costs (Taylor, 2009). Rodrigues and Craig (2007) argued that it might be improper to enforce a single set of IFRS for all reporting entities regardless of their size or country of origin.

A study by Alali and Cao (2010) illustrates how public authorities in different countries had hindered the adoption of accounting standards in the European Union, the USA, the UK and China. Nurunnabi (2015) highlights that socio-cultural factors can play a very critical deterrent in the implementation of IFRS in developing countries: in Bangladesh the high levels of corruption and poor execution by the government were found to be discouraging for global policy makers. This is quite in line with research findings of another study by Herbert et al. (2013) on Nigerian accountants and academics. Despite IFRS being implemented in 2012 in Nigeria, the level of awareness was found very low and IFRS training curriculum implantation was considered the most important step for any future success of IFRS. For example, Pelucio-Grecco et al. (2014) find that a transition to complete implementation of IFRS has a "restrictive effect" on the earnings management of non-financial companies of Brazil whereas Zhang et al. (2013) from China find a positive effect of the same on the earnings management. Clearly, the response from within a nation or a region can be variable. So, examine the economic consequence of IFRS adoption in ASEAN country is very interesting.

In practice, implementing new standards is not easy. Many businesses have complained about difficulties in implementing the new standards in the company. Costs for investments in the field of technology and information to support the application of IFRS is high. Furthermore, the costs of IFRS training for employees are also high. In addition, the condition of the legislation that are not necessarily in sync with IFRS.

The impact of IFRS to the company vary depending on the type of industry, transaction, financial reporting elements owned and accounting policy's option. Some changes have to make significance changes to the operating system and the company's business, but the other changes related only to the accounting procedures. Banking companies, for example, are those that have the effect of changes quite a lot. The changes are not only done at the corporate level, but there should also be changes in the regulation of a country.

Implementation of IFRS-based accounting standards have been studied for most of the European countries, which already requires the implementation of IFRS since 2005. Previous research can be grouped into two categories: research that tests the quality of accounting after the implementation of IFRS and research that examine the economic consequences of the application of IFRS. Barth & Lang (2005) Verriest et al. (2010) and Beuselinck et al. (2010) found that quality improved after the implementation of IFRS. However, Hung & Subramanyam (2007), Beuselinck et al. (2008), Garcia-Osma and Pope (2010), Capcun et al. (2010), and Cascino & Gascen (2010) found that the quality of accounting did not increase after the implementation of IFRS. Research Daske et al. (2008), Beuselinck et al. (2010), Florou & Kosi (2010) found that IFRS bring positive economic consequences for the

company, but Clarkson et al. (2009) found the opposite, the adoption of IFRS did not improve the quality of financial reporting. IFRS adoptions that are part of a serious commitment to transparency are likely to reduce information asymmetry, uncertainty and estimation risk, and hence should be rewarded with a lower cost of capital and higher market liquidity (e.g., Leuz and Verrecchia, 2000; Lambert et al., 2007a).

In studying the economic consequences around IFRS adoptions, Daske et al (2013) using three proxies: *price impact, bid-ask spread and cost of capital. Price impact* is the ability of an investor to trade in a stock without moving its price, as the Amihud [2002] illiquidity measure (equal to the absolute stock return divided by the US$ trading volume). Higher values indicate more illiquid stocks. *Bid-ask spread* is a commonly used proxy for information asymmetry (e.g., Welker [1995], Leuz And Verrecchia [2000], Lang, Lins, And Maffett [2012]).

Companies that just implementing accounting standards IFRS with cosmetic purposes will have a low commitment to transparent financial statements. While the company that is sincerely applying IFRS accounting standards will have a strong commitment to transparent financial statements. Previous research has found higher transparency will reduce the estimation risk that will ultimately reduce the cost of capital (Daske et al., 2013 and Lambert et al., 2007). Daske et al. (2013) examined the economic consequences of the voluntary adoption of IFRS around the world and split the company into two: the label adopters (companies that not sincerely adopt IFRS) and serious adopters (companies that adopt IFRS in full). Daske et al. (2013) found that the impact of IFRS adoption on market liquidity and the cost of capital on a serious adopters significantly more powerful than the companies that belong to the "label adopters". This shows that if the adoption of IFRS is not done in earnest (just cosmetic), then it will not have a significant impact on the level of transparency and does not reduce the asymmetry of information, market liquidity and the cost of capital.

Daske et al. (2013) use three proxies to partition the firms into substantive and cosmetic Adopters: Reporting Incentive, Behavior Incentive, Environment Incentive. The underlying idea is that reporting incentives play a significant role for firms' reporting strategies as well as the choice to voluntarily adopt IAS. Based on this logic, Daske (2013) attempt to identify firms that experience substantial *increases* in their reporting incentives around IAS adoption. These firms are likely to make major improvements to their reporting strategy. In contrast, there could be firms that adopt IAS without material changes or even decreases in reporting incentives. For example, these firms could adopt IAS because managers perceive a general trend to IAS/IFRS and feel pressured to follow, but then are less likely to materially adjust their reporting. Similarly, they could adopt IAS for contracting reasons and hence not be concerned with transparency to equity investors.

This study continues prior research from Daske et al., (2013) in the context of ASEAN countries, but using only two proxy of economic consequence (information asymmetry-measure by value of bid-ask spread and cost of capital) and only one incentive variable (reporting incentive that is measured by number of analyst following). In Daske et al., (2013), company is divided into two groups: "serious adopter" who expect to achieve better financial transparency offered by IFRS, and "label adopter" who do not have the incentive of reporting as it gets little or no benefit at all from the adoption of IFRS. In Daske et al., (2013), *Serious Adopters* denotes a binary classification (1 and 0) that identifies firms with above-median changes in the reporting proxies around the adoption of IFRS. This research do not classified reporting incentive proxy (number of analyst following) to be 1 and 0, but using the real value of the variable. Sample of Daske et al., (2013) are 24 countries around 1998-2004, this research using 5 ASEAN countries.

1. **The objective of this research:**
   a) Are there any economic consequences of the IFRS adoption around the ASEAN countries?
   b) Whether Economic consequences around IFRS adoption in ASEAN Countries are increase by reporting incentive (number of analyst that follow a companies)?

The Convergence of IFRS in ASEAN
Five countries are considered to be representative of ASEAN conditions as it is 5 largest countries in the ASEAN. Accounting systems to the 5 countries is considered more advanced than the other member countries such as Brunei, Vietnam, Laos, Cambodia and Burma. Brunei, Laos, Cambodia and Burma have not even had a stock exchange. Five countries have something in common, namely the convergence of IFRS into local standards that previously have been reviewed by the local standard setters.

1. **Indonesia**
In 1994, the Financial Accounting Standards Board used IAS as a reference in setting accounting standards. Nevertheless, there are some standards self-made and also refer to US GAAP, although not many of them (www.adoptifrs.org). There are 28 IAS adopted at that time, 17 refers to US GAAP standards and 11 standards are self-made (Saudagaran and Diga, 2000; Saudagaran, 2004).
Starting in 2007, Indonesia has had a program to perform a gradual convergence of IFRS. The approach taken is to keep using local accounting standards, namely SFAS (Statement of Financial Accounting Standards) and make efforts to make the difference between IAS and IFRS is as few as possible.
In the period of 2007, Indonesia actively revised plenty of its accounting standards, and the peak is when Indonesia formally declare its accounting standards have been fully converged to IFRS and will be effective in 2012. IFRS that used as the base is IFRS that set on January 1, 2009. Only 2 standards which was not adopted, namely IAS 41 on agriculture and IFRS 1 on first-time adoption. Further convergence efforts continue to conduct annual improvement according to the latest revision of IFRS. Capital market authority in Indonesia requires all companies that listed on the capital market to prepare financial statements based on accounting standards.

2. **Malaysia**
Historical development of accounting standards in Malaysia is heavily influenced by the UK. After the establishment of the IASC in 1973, Malaysia is the first country in ASEAN that adopted the IAS to local standards in the mid-1970s (Saudagaran and Diga, 2000). In 1977, Malaysia began publishing local accounting standards based on IAS. There are several IAS that not adopted, for example, inventory accounting, depreciation, inflation, government grants, business combinations, special parties' disclosure, and accounting for financial institutions. Malaysia draw up its own standards for insurance and aquaculture. There is also some standard that refers to Australia, Canada, New Zealand, US and UK (Saudagaran, 2004).
IFRS Convergence conducted by the Malaysian Accounting Standards Board (MASB) through two stages. Starting January 1, 2005, the use of IFRS is permitted. Act was amended so that financial reporting of foreign companies that listed on the Malaysian stock market can apply Malaysian accounting standards issued by the MASB or international accounting standards approved by the MASB. The international accounting standards are the standards

issued by the IASB, USA, UK or Australia. However, this amendment has no impact at all as the company still uses its own standards that issued by MASB. (www.adoptifrs.org).

Furthermore, on August 1, 2008, MASB announced plans to convergence fully to IFRS that issued by the IASB at 1 January 2012. The revised standard is substantially conducted in the period 2009 to 2012. This standard is applicable to public companies and do not include private companies.

3.   Singapore

The same as Malaysia, the historical development of accounting standards in Singapore is heavily influenced by the UK. After the establishment of the IASC in 1973, Singapore is a country in ASEAN that first adopted the IAS to local standards in the mid-1970s (Saudagaran and Diga, 2000). In 1977, Singapore local accounting standards referring to IAS began to published. In development, there are several IAS that are not adopted as it was considered not appropriate.

IFRS Convergence done gradually. Since 2003, all companies are required to apply Singapore Financial Reporting Standard (Singapore FRS). Singapore FRS is substantially similar to IFRS. Then, since January 1, 2005, the SFRS are already equivalent to IFRS and since 2005 it resumed its full convergence to IFRS. The year 2012 is the final stage of the process of convergence of IFRS (PWC, 2012).

4.   Thailand

In 1997, the accounting standards in Thailand changed the base to IAS (www.adoptifrs.org) after initially referring to US GAAP. Furthermore, at that time there were 17 of 23 accounting standards in Thailand which refers to IAS (Saudagaran and Diga, 2000) and partly refers to US GAAP for the standards that are not regulated in the IAS (Saudagaran, 2004).

IFRS Convergence done gradually since 2006. According to the World Bank report (2006), Thailand is planning to adopt IFRS substantially by the end of 2006. There are 28 locally-based IFRS standards are scheduled to be published in 2007 (www.adoptifrs.org).

In 2011, Thailand announced it would adopt IFRS fully and apply to all companies listed on the capital market of Thailand (SET 50) and in 2013 for SET 100. IFRS adopted version was published in 2009 (Worldbank, 2008).

5.   Philippine

At the beginning of its development, accounting standards applicable in the Philippine sourced from US GAAP. Philippine begin drafting local standards in the 1980s where more referring to US GAAP. After the 1990, there are several standards that started to refer to IAS (Saudagaran and Diga, 2000). In 1997, Philippine decided to change the standard reference to IAS (www.adoptifrs.org).

In 2005, Philippine perform full adoption to IFRS that issued by the IASB and revise the previous version of the standard that refers to the IAS. At the beginning of its application, there are still some differences or exceptions, for example, there are some slower standards applicable to insurance companies and mining in 2006 (PWC, 2012).

Previous Study on the Impact of the Application of IFRS

The following section will review a number of relevant studies. Implementation of IFRS-based accounting standards have been studied for most countries in Europe, which already requires the implementation of IFRS since 2005. Previous study can be grouped into two categories: study to test the quality of accounting after the implementation of IFRS and study that examine the economic consequences of the application of IFRS.

Brüggemann (2013) empirical evidence on the economic consequences of mandatory adoption of International Financial Reporting Standards (IFRS) in the European Union (EU) and provides suggestions on how future research can add to our understanding of these effects. Empirical research on the intended consequences generally fails to document an increase in the comparability or transparency of financial statements. In contrast, there is rich and almost unanimous evidence of positive effects on capital markets and at the macroeconomic level. They conclude that both the intended and the unintended consequences deserve further scrutiny to assess the costs and benefits of mandatory IFRS adoption, which may help provide a basis for evaluating the effectiveness of the IAS Regulation.

Barth & Lang (2005) conducted a study of 21 countries that have adopted IFRS, and found that the quality of accounting after IFRS adoption increases in the lower level of earnings management and the recognition of losses is more timely. Verriest et al. (2010) examined the disclosure of financial statements to examine the quality of the disclosure after the adoption of IFRS and found that in the initial adoption of IFRS, financial statement disclosure quality is higher in companies that have strong corporate governance mechanism. Beuselinck et al. (2010) examined the content of the information (public and private) in the accuracy of earnings estimates by analysts at companies that adopt IFRS in Europe the period 2003 - 2007. The results show that the information content of both public and private information increased following the adoption of IFRS.

Research that found no benefit to the quality of the adoption of IFRS accounting done by Hung and Subramanyam (2007), that takes a sample of companies in Germany. Hung and Subramanyam (2007) found that higher variability in the book value and earnings are reported using IFRS compared using German accounting standards. In addition, Hung and Subramanyam (2007) also found lower earnings reported under IFRS is not persistent (transitory) than earnings reported by the German Accounting Standards. These results are consistent with the orientation of the IFRS fair value. On the other hand, Beuselinck et al. (2008) also showed the opposite, that in the first year of implementation of IFRS in the European Union, the changeover to IFRS did not increase the comparability of accounting earnings and accruals.

Garcia-Osma and Pope (2010) which only take a sample of companies in France, found that the accounting ratios was relatively stable during the past transition of IFRS accounting adoption. This result is due to the company utilizing accounting policy choice in the initial adoption of IFRS adjustments to eliminate the effects of the adoption of IFRS on the Balance Sheet. Even this study criticized the weaknesses in IFRS 1, concerning the implementation of the initial adoption of IFRS the company used to eliminate the effects of adjustments, lowering the quality of financial reporting information.

Capcun et al. (2010) examined the quality of financial reporting information that based on the size of accrual earnings management using a sample of companies in the EU on the adoption of IFRS transition period 2004 - 2005. The study found that ROA is significantly higher in the period that use IFRS. They found that the increase in ROA is higher in companies that have a low level in the period ROA in using local standards. These results indicate the occurrence of earnings management in the period after the adoption of IFRS occurs in all countries, especially countries that the rule of law (law enforcement) are weak and the high level of earnings management prior to the period of adoption.

Study on the economic consequences of the adoption of IFRS, among others, performed by Daske et al. (2008). Daske et al. (2008) found an increase in market liquidity (measured by the bid-ask spread and volume of sales) after the adoption of IFRS. This study took a sample of some of the countries in the European Union using monthly data. An important aspect in the study that this result was only found in countries that have a high reporting incentives and high levels of enforcement.

Furthermore, Daske et al. (2009) investigated the effects of the adoption of IFRS on estimating capital cost. The result is that the benefits of adoption of IFRS in lowering the cost of capital occurs only when there is a high incentive for financial reporting. Daske et al. (2009) distinguishes the country into two groups, namely "serious adopter" who expects achieve better financial transparency offered IFRS, and "label adopter" who do not have the incentive of reporting as it gets little or no benefit at all from the adoption of IFRS. Beuselinck et al. (2010) examined whether adoption of IFRS boost the stock price informativeness according to stock return synchronicity criteria, and found that the adoption of IFRS increases the ability of analysts in predicting stock prices and lower private information that is usually used by and benefited the institutional investors. Still on the cost of capital, Florou & Kosi (2010) found that the adoption of IFRS are associated with increased issuance of debt instruments to the public and lower the cost of debt.

Conflicting study results come from Clarkson et al. (2009) that investigated the impact of the adoption of IFRS in Europe and Australia based on the relevance of the book value and profits for equity valuation. The result is that the adoption of IFRS did not improve the quality of financial reporting. When the sample was divided by the structure of state law between common law and code law, it was found that the relevance has diminished value after the adoption of IFRS in common law countries, while the state law code was not found changes in the relevance of the book value and profits for equity valuation.

Inconsistency on improving the quality of financial reporting information after the adoption of IFRS is caused not only by the lack of expertise of the author and auditors, but also because of pseudo adoption as disclosed by Daske et al. (2009). Thus, accounting regulations are not always effective, as it depends on the reporting incentive and enforcement in each country. Reporting incentives could arise from the increase in the need for a standard due to lack of expertise in preparing the local accounting standards and the presence of multinational companies and international auditors. Besides, incentives can also arise from the need to produce high-quality financial reporting due to the potential growth companies and financing needs.

Hypothesis development

Firms' reporting incentives are different and the strength of enforcement differs considerably across countries (e.g., Ball et al., 2003; Leuz et al., 2003; Ball et al., 2005; Lang et al., 2006; Burgstahler et al., 2006). For these reasons, one frequently voiced concern is that some firms may adopt IFRS merely as a label without making material changes in their reporting policies (e.g., Ball, 2001, 2006).

Provided that market participants can differentiate between "label" and "serious" adopters, we should observe differential market reactions and economic consequences. IFRS adoptions that are part of a serious commitment to transparency are likely to reduce information asymmetry, uncertainty and estimation risk, and hence should be rewarded with a lower cost of capital and higher market liquidity (e.g., Leuz and Verrecchia, 2000; Lambert et al., 2007a).

The initial idea of this research is that the underlying motivation of manager to change accounting standards play an important role to look at the economic consequences around the adoption of IFRS. In the process of the adoption of IFRS, there are companies, which adopt IFRS only the name, without making any material change in reporting. But there are also companies that actually make changes because it has an incentive to increase transparency.

In studying the economic consequences around IFRS adoptions, Daske et al (2013) using three proxies: *price impact, bid-ask spread and cost of capital. This paper only examine economic consequences from the level of* information asymmetry and cost of capital.

Important antecedents for this paper are studies highlighting the role of firms' reporting incentives in explaining observed accounting properties and actual practices. In this paper, we

emphasize and test the role of *firm-level* incentives in the context of IFRS adoptions. IFRS, like any other set of accounting standards, afford management with substantial discretion as their application involves judgment and the underlying measurements are often based on private information. The way in which firms use this discretion likely depends on managers' reporting incentives, which are shaped by many factors, including countries' institutional frameworks, various market forces, and firm characteristics. Incentive variable that will be examine in this research are reporting incentive that is measured by number of analyst following. Based on these arguments, the proposed hypothesis are:

H1: Company with high analyst following will decrease the level of information asymmetry
H2: Company with high analyst following will decrease the cost of capital
H3: IFRS Adoption will decrease the Level of information asymmetry
H4: IFRS Adoption will decrease the Level of cost of capital
H5: Impact of IFRS Adoption to the information asymmetry will be higher for a company with high reporting incentive (analyst following)
H6: Impact of IFRS Adoption to the cost of capital will be higher for a company with high reporting incentive (analyst following)

Research Design and Data
Our research design relies on variation in the underlying motives for IFRS adoption.
We estimate the following model 1 to test hypothesis 1 and 3:
$BAS_{it} = \beta 0_{it} + \beta 1 IFRS_{it} + \beta 2 AF_{it} + \_\beta j\ Controls_{it} + \varepsilon.$ (1)

Model 2 is using to test hypothesis 2 and 4:
$COC_{it} = \beta 0_{it} + \beta 1 IFRS_{it} + \beta 2 AF_{it} + \_\beta j\ Controls_{it} + \varepsilon.$ (2)

Model 2 is using to test hyphotesis 5:
$BAS_{it} = \beta 0_{it} + \beta 1 IFRS_{it} + \beta 2\ AF_{it} + \beta 3\ IFRS_{it}*AF_{it} + \_\beta j\ Controls + \varepsilon.$ (3)

Model 2 is using to test hyphotesis 6:
$COC_{it} = \beta 0_{it} + \beta 1 IFRS_{it} + \beta 2\ AF_{it} + \beta 3\ IFRS_{it}*AF_{it} + \_\beta j\ Controls + \varepsilon.$ (4)

BAS   *is Information asymmetry, proxied by bid ask spread*
COC   *is Cost of Capital*
IFRS   is a binary variable coded as 1 for years after a country adopt IFRS, 0 others.
AF   is number of analyst following of a company

Control variables for model 1 and 3 are:
- *Market Value* is stock price times the number of shares outstanding (in US$ million).
- *Share Turnover* is annual US$ trading volume divided by market value of outstanding equity.
- *Return Variability* is the annual standard deviation of monthly stock returns.
- *Inflation* is inflation rate for every country, from Bloomberg

Factors such as unanticipated interest rate changes, productivity declines and excessive in inflationary pressures are likely to influence liquidity indirectly by inducing fund out ows, price declines and volatility increases for the stock market, as well as exacerbating inventory risks (Fujimoto, 2004). Control variables for model 2 and 4 are:

- TA (Total Aset)
- *STO (Share Turnover)* is annual US$ trading volume divided by market value of outstanding equity.
- *RVAR (Return Variability)* is the annual standard deviation of monthly stock returns.
- *INF (Inflation) is inflation rate for every country, from Bloomberg*

1.   Economic Consequences

Economic Consequences proxied by information asymmetry and Cost of capital. *Bid ask spread (BAS)* is a commonly used proxy for information asymmetry (e.g., welker [1995], Leuz And Verrecchia [2000], Lang, Lins, And Maffett [2012]). We use the yearly median of the daily quoted spreads, which we compute as the difference between the closing bid and ask prices divided by the midpoint. Cost capital measure by beta x country risk factors from Damodaran

2.   Reporting Environment (Reporting Incentive)

Lang and Lundholm [1996] show that analyst coverage (following) is related to more transparent reporting. Evidence in Lang, Lins,and Miller [2004] and Yu [2008] suggests a monitoring role of financial analysts, for instance, in curbing earnings management. Daske (2013) compute the *Reporting Environment* variable as the natural log of the number of analysts following the firm (plus one). A nice feature of this variable is that it does not rely on accounting information, and is free of mechanical accounting effects that likely occur around the switch to a new set of accounting standards. Higher values denote more external pressure.

3.   Sample and Data

This research uses companies that are listed on ASEAN countris. Data collected from the Thomson Reuters Eikon and Annual Report each company. Samples includes only listed companies and excludes financial companies (ie. banks, insurance and investments corporations) because those companies have special financial statements structure so that their earning quality measurement does not equal with the other industries.

The study period is 2 years before and after the adoption of IFRS. The early adopters is Singapore (2003), then the Philippines and Malaysia (2005), and Indonesia (2012) and last Thailand (2013).

Table 1. Period of Research

Countries	Before adoption of IFRS "0"	Adoption of IFRS Started	After adoption of IFRS "1"
Indonesia	2010,2011	2012	2012,2013
Malaysia	2003,2004	2005	2005,2006
Singapore	2001,2002	2003	2003,2004
Thailand	2011,2012	2013	2013,2014
Phipina	2003,2004	2005	2005,2006

Table 2. No of Sample

	MODEL 1 (BAS)	MODEL 2 (COC)
Indonesia	512	484
Malaysia	1548	1316
Philipines	516	372
Singapore	712	532
Thailand	872	800
Total	4160	3504

4.   Descriptive Statistic

The average bid ask spread for all samples is 0.039 with high variation, this is indicated that the standard deviation is greater than the average value. The average bid ask spread is the highest sample is Singapore and the average bid ask spread is the lowest average is Thailand. All countries have high variation of bid ask except Indonesia. The average of analyst following is small that has value smaller than 1, as most companies (over 50%) have no analyst following. Countries with highest number of average analyst following is Thailand and the lowest is Indonesia. For IFRS variable, the number of years the company prior to the application of IFRS and after IFRS implementation is balanced, respectively 50% before and 50% after the implementation of IFRS for all countries. For the average value of capitalization, the highest rate is the average of a sample of companies in Thailand and the lowest average of a sample of companies in Malaysia. While the average highest return volatility is a sample of the Indonesian company, and the lowest average is sample of Malaysian company.

Table 5 shows that on the whole sample of the ASEAN countries, with variable BAS as the dependent variable, the application of IFRS has not been able to reduce the level of information asymmetry. But, the test results with moderating variables showed that analysts

following reinforces the negative effects of the application of IFRS to the asymmetry of information.

This means, following analyst who monitors the company causing the company to apply IFRS, with earnest, thus reducing information asymmetry. Consistent with previous studies (Daske, 2013) which found that, reporting incentives such as the following analyst could reinforcing the negative effect of IFRSs on information asymmetry

Table 6. Regression Result All data - Model 2

Table 7 showed regression result for each ASEAN country with the BAS (bid ask spread) as the dependent variable. That table showed consistent results in Thailand and Malaysia where the company with a high reporting incentives (companies with many analysts), reinforcing the negative effect of IFRS on information asymmetry.

Table 8 shows the regression results per each ASEAN country with the COC as the dependent variable. The results show that in the countries of Malaysia, Indonesia and Singapore, analysts following could reduce cost of capital directly, but it does not moderate the effect of IFRS to the cost of capital. This means there is no difference in the impact of IFRS on the cost of capital in countries with low and high analysts following.

Conclusion

This paper examines the economic consequences of IFRS adoptions in the ASEAN countries. Economic consequences were measured with the amount of the asymmetry of information and cost of capital, while incentives to adopt IFRS proxiedby the number of analysts following. The more the analyst following number, the more external pressure to adopt IFRS. The study period is 2 years before and after the adoption of IFRS. The early adopters is Singapore (2003), the Philippines and Malaysia (2005), Indonesia (2012) and lastly Thailand (2013).

The regression test using all data of ASEAN countries showhs that the implementation of IFRS could not able to reduce levels of information asymmetry (bid ask spread). Reporting incentives (measured by the number of analyst following) have not been proven could to reduce the level of information asymmetry. But, the test results with moderating variables showed that analysts following reinforces the negative effects of the application of IFRS to the asymmetry of information. This means, analyst followinf who monitors the company causing the company to apply IFRS thus reducing information asymmetry. Consistent with previous studies (Daske, 2013) which found that, reporting incentives such as the following analyst could reinforcing the negative effect of IFRSs on information asymmetry. But regression for each country only proven at Thailand and malaysia.

Application of IFRS can lowering the cost of equity. The negative impact of the application of IFRS to the information asymmetry will be greater with higher incentive reporting, as measured by the number of analysts following. But regression result for each country only proven in Singapore.

In Thailand and Malaysia, company with high reporting incentives (companies with many analysts), could reinforce the negative effect of IFRS on information asymmetry. In Malaysia, Indonesia and Singapore, analysts following could reduce the cost of capital directly, but it does not moderate the effect of IFRS to information asymmetry. This means there is no difference in the impact of IFRS on the asymmetry of information in countries with low and high analysts following.

No difference in the impact of IFRS on the asymmetry of information of a company with the high or low reporting incentives.

The results of this study indicate that regulators in ASEAN countries should encourage analyst to follow listed company and listed companies should be more transparent in presenting its financial statements.

THE EFFECT OF AUDIT PROCEDURES AND AUDITORS' EXPERIENCES ON AUDITORS' RESPONSIBILITYIN DETECTING FRAUDS: JAVANESE CULTURE AS A MODERATING FACTOR

Ratna Siti Nuraisya, Universitas Diponegoro, Indonesia
Anis Chariri, Universitas Diponegoro, Indonesia

Abstract

This study examines the influence of audit procedures and auditors' experience on auditors' responsibility in detecting fraud, and to examine whether Javanese culture moderates such relationship. Using data of 35 auditors working at eight public accounting firms in Semarang, this study found that audit procedures and auditors' experience has significant influences on the auditors' responsibility in detecting fraud. In addition Javanese culture was found to moderate the influence of audit procedures and auditors' experience on the responsibilities of auditors in fraud detection.

Keywords: *Audit Procedure, Auditor Experience, Auditor Responsibility, Fraud Detection, Javanese Culture*.

Introduction

An auditor has main responsibility for planning and performing audits with practical reassurance of detecting material misstatements in financial reports. But through time, there have been conflicting opinions on the role of auditors with respect to their responsibility in detecting fraud. Though auditors have claimed that fraud detection is an audit objective, since the beginning, the auditor's role has not been well defined, which then resulted in the case of World-Com and Enron, as well as many other accounting scandals (Alleyne & Howard, 2005). Due to that, the auditing and the accounting professions have previously undergone major changes. Following the latest financial calamities, including the collapse of investment banks, the awareness of fraud had increased. Indeed, ACFE (2012) in their worldwide survey has reported that annual fraud costs to overall companies were estimated around 5% of their revenues, which is roughly US$3.5 trillion annually.

Occupational fraud had been defined by The ACFE (2012, p. 6) as "the use of one's occupation for personal enrichment through the deliberate misuse or misapplication of the employing organizations' resources or assets." The common types of fraud would include expense reimbursement schemes, payroll schemes, skimming, creating fictitious creditors, and bribery. In the study, it was stated that the median loss caused by occupational fraud was US$140,000 and the cases were reported with a median of 18 months before being detected (ACFE, 2012). Comprising of 87% of the cases reported, undoubtedly the most widespread type of occupational fraud was asset misappropriation schemes. Though financial statement fraud plots made up to just 8% of the cases, with US$1 million, it caused the utmost median loss. In Asia, the common type of fraud was corruption schemes with the percentage of 51%, whereas financial statement fraud only took up to 9%. Based on the Asia-Pacific Fraud Survey done by Ernst & Young (EY, 2013), in Indonesia, 79% of the survey participants believed that corruption and bribery is common with 36% saying that it is accustomed to use bribes to win long and short term business agreements. It was also noted that the study respondents suspected that when it comes to financial reporting, Indonesia has weak controls. The lack of regulation and allocated resources to fight corruption, bribery, and fraud nationally is mostly to blame.

An example of corruption case in Indonesia would be the massive corruption in the awarding of contracts to build the Hambalang Sports Center in Bogor at the beginning of the year 2013.

The project had a budget of Rp 2.5 trillion, but caused Rp 243 billion in state losses. The most recent case would be the fictious credits given by Syariah Mandiri Bank in Bogor totaling up to Rp 102 billion, that has a potential to cause Rp 59 billion in state loss.

The recent rise in fraud and the nature of corrupt decision making in organizations resulted in the increase of the public outcry for fraud prevention. In response to the massive frauds and public protest, the Sarbanes-Oxley act of 2002 had been acted out, which generated a focus on fraud prevention. Thus Statement on Auditing Standards (SAS) No. 82 *Consideration of Fraud in a Financial Statement* (Auditing Standards Board 1997), which had provided guidance on how auditors should perform an audit had been superseded by SAS No.99. *Consideration of Fraud in a Financial Statement,* the SAS No. 99 was put into practice to develop procedures in detecting fraud. It was argued by Ramos (2003) that SAS No.99 was considered to have the auditor's deliberation of fraud integrated wholly into the audit process from start to end. This new standard requires auditors to audit financial statements with professional skepticism.

Arens *et al*. (2003) have also stated that financial statements should be audited by experienced, independent individual and involves the collection and reviews of evidence to decide and report on the degree of connection between the information and certain established criteria. But it had been found by ACFE (2012, p. 14) on their survey that fraud which had been detected by external audit only fall up to 3.3%. Alleyne and Howard (2005) argued that due to today's technological age, it is becoming more difficult to detect fraud, particularly if it is conspirative in nature and that top managements were able to conceal it. Other than that, extensive fraud detection will result in higher cost and are not efficient. As a result, auditors have argued that it is not fully their responsibility in detecting fraud.

Due to the high cost, in the survey done by EY (2013), 31% of the Indonesian respondents said that complying anti-bribery/anti-corruption (ABAC) laws using technology, such as monitoring transactions or forensic data analysis are not being applied. Furthermore, when asked about the best way to proactively detect fraud, most of them believed that continuous transaction monitoring and whistle-blowing policy are much more effective than stronger internal audit team or using external auditor to assess fraud risk.

The users of financial statements and management perceptions on auditors' judgment and responsibility to detect fraud are gradually decreasing due to the wide expectation gap. Auditors still feel that it is management's responsibility to detect fraud and that companies have effective audit committees that are better equipped, sound internal controls, internal auditors to deal with prevention and detection (Alleyne and Howard, 2005). However, Moyes and Hasan (1996) had argued that the type of auditor was not reliant to the level of fraud detection, since both internal and external have equal capabilities to detect fraud. Watkins *et al*. (2004) concluded that individual auditor judgment produces the quality of an audit and it is also affected by auditor's individual competence.

An important environmental factor influences accounting practices is culture, whether it's their corporate culture or their cultural heritage. Patel *et al*. (2000, 2002) have argued that auditors' judgments are influenced by their collective and individual values, which are the product of country-specific culture in different countries. The relationship between attitudes towards fraud and cultural heritage has also been examined by Watson (2003). It was found that based on their cultural heritage; there is diversity in how people endorse fraud in general. For example, In Japan, the Japanese host was affronted by US businessmen because they turn down gifts, in fear of bribery. But it has been stated before that in Indonesia, bribery has become very common.

When discussing about culture in Indonesia, the Javanese culture has dominated the way of life of its citizens, including the culture of business, social and political activities (Magnis-Suseno 1997). Magnis has also stated that the foundation of Javanese culture is upholding

social harmony. Thus, reflecting the principles of respect and conflict avoidance. In the Javanese society, it is noted there is no room for individualism in a social relationship, they prefer much on collectivism (Chariri, 2009). They believed that individualism, diversity and conflict may threaten that social harmony (Mulder 1994). Therefore, by detecting fraud, auditors may cause conflicts and disrupt the social harmony or their auditor-client relationships. However, auditing is a profession that requires individualism and should remain independent.

Other than culture, the auditors' sense of responsibility in detecting fraud when performing audits is influenced by the audit procedure itself. Though detecting misstatements, errors, and fraud are already a part of the auditing procedure, according to Alleyne & Howard (2005) in Barbados, auditors obstinate that it was not their responsibility to search for illegal acts. Large businesses already have their own extensive internal controls and internal audits department. But then again the AICPA had stated that, "The SAS No.99 reminds auditors that they must approach every audit with professional skepticism and not assume that management is honest."

There are plenty of researches regarding the competence of auditors conducted worldwide. However, studies about the relationship of culture and accounting practices that were done in Asian countries especially Indonesia are limited. Indeed, studies that had examined the relationship of culture and accounting practices, especially in fraud detection and prevention, had been done in China (Chan *et al*. 2003; Lin *et al*. 2008; Hwang *et al*. 2008). Thus, this research attempts to examine the the relationship among audit procedures, auditors' experience and auditors responsibility in detecting fraud and how Javanese culture may moderated such relationship. This study at least contributes to the fact that local culture especially Javanes culture is important aspect that must be considered when studying auditor responsibility in detecting fraud.

Hypothesis Development

Attribution theory attempts to explain causes of behavior (Heider, 1958). The theory explains how individuals interpret events and how this narrates their judgment and performance. This theory is appropriate to the present study in seeking on how auditors perceive their responsibility in detecting fraud under the influence of culture. According to Heider, an individual has two attributes: (1) internal, with the assumption that a person behave in a specific way because of something about the individual, such as personality, attitude or character; (2) external, the presumption that a person behave in a particular way because of something about the condition that individual is in.

According to Kelley and Michela (1980), the theory analyses how causes are attributed when people interpret behavior. It explains the individual's own behavior ("I did X for reason Y") or provides a casual explanation of the behavior of others ("X happened to him because of Y") (Kaplan & Reckers, 1985; Lin *et al*., 2003). The link between attributions of responsibility and auditors has been investigated in prior studies (Arrington *et al*., 1985; Jennings *et al*., 1993; Anderson *et al*., 1998).

Jaffar *et al*. (2008) and Haron *et al*. (2011) have adopted the attribution theory to enlighten the effect of the external auditors' skill to assess fraud risk on the ability to sense the probability of fraud. The theory proposes that depending on certain causes to which prior success or failure of a task, the level of future performance of the same task will be expected.

1. Fraud Detection and Audit Procedure

Fraud takes place in a social setting and is an activity that as severe consequences for the individuals, corporations, and the economy. Hopwood *et al*. (2012) defined fraud as "the result of misleading, intentional actions or inaction (including making misleading statements

and omitting relevant information) to gain an advantage. According to the Auditing Standards (SAS) No. 82 and PSA (*Pernyataan Standar Auditing*) No. 70 (AU 316), fraud is identified into two categories: (1) fraudulent financial reporting, and (2) misappropriation of assets. Auditors need external information when analyzing a financial statement and the information are obtained through applying analytical procedures that are up to standards in their audit plans. Previous studies states that auditors' expectations in encountering fraud develop according to the information they have gathered (Knapp, 2001) and that lack of procedures in collecting quality information affects the analysis of financial statements (Akkerman et al, 2008). According to SAS 99 and ISA 120 audit procedures should include: skepticism, brainstorming, conduct risk assessment, identify and assess the risks of material misstatement due to fraud, respond to the assessed risks of material misstatement due to fraud, and obtain written representations. Consequently, we proposed hypothesis as follows

H1 : The audit procedures positively influence the auditors' responsibility in detecting fraud.

2. Auditors' Experience

A suggestion made by The Public Oversight Board (POB) Panel on Audit Effectiveness in finding the answer to why experienced auditors often fail to detect fraud, is that one factor might be that the auditors do not posses professional skepticism on an appropriate level (POB, 227 & 86). Accounting research have put forward that even more skeptical auditors still fail to detect fraud (Jamal, Johnson, and Berryman, 1995). Hoffman and Patton (1997) suggest that this is because the lack of knowledge that the auditors have that is needed to discover the related risk factors while in the process of carrying out an audit.

However, Carpenter et al. (2002) advocate that while knowledge and skepticism are significant factors in fraud, rather than their experience with auditing financial statements, it is an individual's experience (feedback and practice) with fraud detection that enables them to successfully detect fraud. But they also argued increased skepticism and knowledge acquisition are lead by experience with fraud detection, which then provides depth to professional judgments and increase the skill to detect fraud when it presents.

Experience is found to be a significant aspect of ability and knowledge. Earlier studies have found that the ability to detect fraud may significantly be affected by the auditor's experience (e.g. Benardi, 1994; Moyes and Hasan, 1996; Owusu-Ansah et al., 2002). According to Arens et al. (1999), it is expected that the auditors' knowledge about the level of fraud risk of a particular audit situation influence the external auditor's judgment concerning the existence of fraud in the financial statements of a client. In other words, if the external auditor evaluated the fraud risk as high, then more evidence will be collected and they will have to carry out more extensive audit procedures to make assurance that fraud or any material misstatements are detected. Whereas if the external auditor evaluated the fraud risk as low, their evidence gathering can be less extensive and may lead to less meticulous tests being carried out. Thus, external auditors will become more "relaxed" in their audit work and that there will be a lower possibility that they would be able to detect the probability of fraud than if they had appraised the level of fraud risk as high.

Experienced auditors usually take on more complex cognitive processing and have a more comprehensive knowledge base (Choo and Trotman 1991).

H2 : Auditors' experience and knowledge positively influences the auditors' responsibility in detecting fraud.

3. Javanese Culture

Hofstede (1980) defined culture as a way of living that influence ones' interaction with others, share beliefs and values. It is also defined as the mind's collective programming which differentiates the members of one organization from another."

The Javanese culture is a complex and diverse topic to discuss since it can refer to the performing arts, language, ethics, the way of life etc. However, this study focuses more on the way of life of the Indonesian society and how the Javanese culture have influence their perspectives and behavior. Based on the view of Magnis-Suseno, the social relations within the Javanese community are influenced by two principles; (1) conflict avoidance (*rukun*), and (2) respect. This is consistent with the study conducted by Geertz (1961), where it states that the Javanese social life is characterized by two principles that have a significant influence, with the first principle asserts that every Javanese should avoid open confrontations in every situation, and the second principle requires precaution when speaking, and that their behavior in the society should reflect respect.

In social interactions within a community, the Javanese values the maintenance of social harmony (*rukun*) and respect. Individuals should know their place and duty, respecting those of superior positions and responsible for their subordinates. *Rukun* is the obligation to suppress all forms of behavior which could lead to open conflict. Therefore, among the Javanese, in order to achieve *rukun*, any types of conflict in a community should be avoided and that it is characterized by cooperation, mutual acceptance, calmness and unity (Magnis-Suseno, 1997).

Magnis-Suseno (1997) insists that the Javanese tend to act in accordance with the *rukun* principle because each individual is frequently under pressure from his environment that demands from him to act in accordance with its expectations and penalizes individualist conduct. The commandments of *rukun* has been internalized in every Javanese that they both experience both guilt and shame when they offend the *rukun* principle.

Following Geertz, the second important principle in the Javanese society is respect, which is based on the belief that all social relationships are ordered in a hierarchical form. In order to maintain the social order, one should not try to develop ambition or compete against others and should be satisfied with their positions (Magnis-Suseno, 1997). In parallel with *rukun*, it concerns with the right forms of outward behavior and not with inner attitudes.

Due to conflict avoidance having an important role in keeping the social harmony and since it is widely known that the majority of the Javanese people rarely expressed their feelings, how the Javanese people express their disagreements are diverse. For example, they will try to avoid difficulties and keep their silence with one another which sometimes ends up with a formal third party mediator (Geertz, 1961). There is an assumption in the international literature concerning the audit process and culture, that an audit environment is impacted by culture, which then may influence the result of the audit process. Hofstede (2001) claims that auditors' decision making might be affected by the existence of cultural differences.

A lot of practices within an organization such as the internal control systems, accounting system, or employees' behavior can be influenced by culture. Chan et al. (2003) supported this idea when they say culture "is an important environmental factor influencing accounting practices and management control system." It also enlightens as to why the accounting standards are different in various countries (Wingate, 1997) and the diversities in views of accounting problems (Cohen et al, 1995; Arnold & Bernardi, 1997). All these past literatures suggest that implementations may vary even if the audit methodology and auditing standards are the same in different countries.

The Javanese culture is considered as collectivism culture based on their principle of *rukun* and respect. Hofstede (2001) stated that in a collective cultured dimension, employees are

believed to be a part of the "in group" and act in the importance of the group. There is high communal obligation and loyalty, and employment in these cultures may be alike to a family situation. In addition, people are less likely to form or express judgments individually when they are bought up in a collectivist culture.

H3 : The Javanese culture moderates the influence of audit procedures on auditors' responsibility in detecting fraud.

H4 : The Javanese culture moderates the influence of auditors' experience on their responsibility in detecting fraud.

Research Method

This study analyses one dependent variable, two independent variables, and a moderating variable: Auditors' responsibility in detecting faud (Y), Audit procedures (X1), Aditors' knowledge and experience (X2), and Javanese Cultue (X3). According to SAS No.122 AU-C sec 240, fraud is defined as: *"An intentional act by one or more individuals among management, those charged with governance, employees, or third parties, involving the use of deception that results in a misstatement in financial statements that are the subject of an audit."* It is also stated that an auditor conducting audit accordance with Generally Accepted Auditing Standards (GAAS) is responsible for obtaining rational assurance that the complete financial statements are free from material misstatements, whether caused by error or fraud. Martens and McEnroe (2001) strengthen the statement above by saying that the SAS was to clarify the auditors' responsibilities in the area of fraud detection. This variable is measured by a 4-point Likert scale with four items (Alleyne & Howard, 2005).

Auditors will go through a much comprehensive audit procedures to detect fraud when putting into practice SAS no. 99. The standard aims to have the auditors' deliberation of fraud impeccably merged into the audit process and is continually updated until its completion. SAS no. 99 provides aspects of a process in which the auditor (1) collects information required to notice the risks of material misstatement caused by fraud, (2) evaluates these risks after taking into account an assessment of the entity's controls and programs, and (3) act in response to the results. This variable is measured by a 4-point Likert scale with seven items (Alleyne & Howard, 2005).

According to Medin (1978), judgments are presumed to originate solely from accumulated exemplar information, which suggests that prior knowledge of a particular matter influence the judgment of an individual. Thus, knowledge regarding the level of fraud risk of an external auditor in a particular audit situation is expected to influence their judgment concerning the subsistence of fraud in the audit client's financial statements. The auditors will be asked with 6 statements regarding their experience with fraud and auditing (Moyes 2007; Moyes et. al. 2009). The statements that will be measured are; level of understandings regarding red flags (procedure for fraud detection), the ability to detect fraud by using red flags, how often red flags are used, number of attended course related to fraud in the past 3 years, have attended conferences related to detecting fraud by using red flags, the accounting firm has been offering in-house training related to red flags.

The essence on Javanese culture is the upholding of social harmony. The Java community has a very complicated code of ethics and level of respect. This is reflected in the Javanese language. However, efforts to maintain peace and harmony seem to be the main priority in the social relations in the Javanese society. The questionnaire that is developed the measure the Javanese culture is according to the views of Magnis Suseno, that the social relations in the Javanese society are influenced by two basic principles: (1) conflict avoidance and (2) respect. The Javanese culture is measured by a 4-point Likert scale with 14 statements and a pilot test has been carried out before being distributed to the respondents (Leiwakabessy, 2009).

The population and sample for this study are picked from 11 public accounting firms located in Semarang. This is because Semarang is the capital city of Central Java and it is where most of the economic activities take place and where the Javanese Culture is more prominent. The sampling technique that this study would use is purposive sampling because the information obtained should be from individuals that are related to the phenomenon, hence auditors who works at the accounting firms in Semarang. The data is analysed using multiple linier regression as follow:

$$Y_1 = \alpha + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 (X_1 X_3) + \beta_5 (X_2 X_3) + \varepsilon$$

Notes:
α = Constant
Y_1 = The perception of external auditors on their responsibility in detecting fraud.
X_1 = Audit Procedures.
X_2 = Auditors' Experience.
X_3 = Javanese Culture
β = Regression Coefficient.
ε = Error

Research Findings And Discussion

The numbers of respondents that are potential subjects related to this study were obtained from 8 public accounting firms among the 11 in Semarang. In the overall study, from the questionnaires sent to 40 auditors, a number of 35 have been received or with the return rate of 87.5%.

Table 1. Demography of Respondents

Culture Origin

Culture	Frequency	Percentage
Javanese	30	85.7%
Others	5	14.3%
Total	35	100%

Educational Level

Education	Frequency	Percentage
Diploma	6	17.1%
Bachelor	27	77.1%
Master's/PhD	2	5.7%
Certification	-	-
Total	35	100%

Position in Accounting Firm

Position	Frequency	Percentage
Junior/staff	6	17.1%
Senior	27	77.1%
Manager	2	5.7%
Partner	-	-
Total	35	100%

Professional Certificate Ownership

Certificate	Frequency	Percentage
CPA	2	5.7%

CIA	-	-
CMA	-	-
CFE	-	-
Others/Not Certified	33	94.3%
Total	35	100%

From the 35 respondents the majority are of Javanese origin with a percentage of 85.7%. The majority of the auditors' highest educations are Bachelor's Degree with the percentage of 77.1% followed by Diploma with the percentage of 17.1%. We can also see that the majority of the respondents do not own a professional accounting certificate having the percentage of 94.3%.

Table 2. Descriptive Statistics

Variable	Theoritical		Actual		
	Range	Mean	Range	Mean	SD
Responsibility detecting fraud	4 – 16	10.00	9 – 16	12.03	1.96
Audit Procedures	7 – 28	17.50	16 – 26	21.37	2.20
Auditors' Experience & Knowledge	10 – 40	25.00	14 – 28	24.60	5.20
Javanese Culture	14 – 56	35.00	35 – 50	43.49	5.19

Based on the comparisons between the theoretical and actual results it can be seen that there is a relatively high sense of responsibility in detecting fraud among the auditors, the audit firms are implementing relatively good audit procedures, and that the auditors still have a relatively little experience. The result also shows that the auditors' perception of the Javanese Culture is particularly high. The results of multiple linear regression analysis can be seen on Table 3, 4 and 5

Table 3. Results of Multiple Linear Regression Model I

a. Dependent Variable: Y

The results for the effect of audit procedures on the auditors' responsibility in detecting fraud are T-Value = 4.122 with 0.000 significance ($p < 0.05$). Seeing that the significance value is smaller than 0.05 and that it has a positive coefficient, then it can be said that audit procedures significantly and positively affect the auditors' responsibility in detecting fraud. This finding corroborates with the attribution theory that a person behave a specific way because of a factor about the state of affairs that the individual is in. The findings of this study upholds the idea of attribution theory stating that auditors' awareness of their responsibility in detecting fraud is attributed to the audit procedures their accounting firm practice. This finding is linear to the findings of Alleyne & Howard (2005) where the auditors in Barbados have a strong consensus to these procedures as well.

The results for the relation of auditors' experience and the auditors' responsibility in detecting fraud are T-Value = 2.537 with significance value of 0.016. With the significance value smaller than 0.05 and a positive coefficient, then it can be said that the auditors' experience has a significant positive effect on their responsibility in detecting fraud. The finding upholds the assumption of the attribution theory that an individual behaves a particular way because of a certain factor about the person. The findings of this study maintain the idea of attribution theory that auditors' awareness of their responsibility in detecting fraud is attributed to their knowledge and experience with fraud. This is linear to prior studies which state that auditors' experience significantly influences their aptitude in fraud detection (Moyes & Hasan, 1996; Owusu-Ansah et al., 2002) and that their judgment on the presence of fraud in a financial statement is influenced by knowledge relating to fraud risk in an audit situation (Arens et. al, 1999).

The test result of the Javanese Culture moderating the influence of audit procedure on the auditors' responsibility in detecting fraud which is obtained from the variable test of X1X3, shows that the T-Value = 2.713 and a significance value of 0.011 (p < 0.05). Seeing that the significance value is smaller than 0.05, therefore Javanese Culture moderates the effect of audit procedures on the auditors' responsibility in detecting fraud. This finding supports the assumption of the old institutional theory that normative pressures, sometimes arising from external social environment influence how an organization runs their tasks.

The test result of Javanese culture moderating the influence of auditors' experience on their responsibility in detecting fraud which is obtained from the variable test of X2X3, shows that the T-Value = 3.617 with 0.001 significance. Seeing that the significance value is lower than 0.05, hence Javanese culture moderates the effect of auditors' experience and knowledge on their responsibility in detecting fraud. This finding supports the old institutional theory assumption which states that beliefs or cultural systems provide a set of meanings that always mediate social actions which frequently have the effect of driving the attention away from task performance.

The auditors in Semarang have shown that they have a high perception and influence of the Javanese Culture. Therefore, despite the accounting firm have audit procedures that follow the standards of auditing, implementation and practice are still mediated by culture and the social environment as exposing fraud can cause conflict. This then prevents them from gaining more experience and knowledge in fraud detection which can lead to the decrease of awareness of their responsibility. This is in line with prior studies, that dynamics in personalized network of influence (the relationship individuals cultivate with other individuals), fear of retaliation and media coverage may discourage whistle-blowing (Hwang et. al., 2008). Hofstede (2001) also state that people that are brought up in collective culture have high commitment and allegiance, and that they are less likely to express or form judgments individually.

Conclusion

This study aims to investigatethe relationship of audit procedures, auditors' experience and auditors responsbility in detecting frauds and how Javanese culture may moderate such relationship. Based on the results, the study found that audit procedures significantly affectwd the auditors' responsibility in detecting fraud, indicating that the better the audit procedures that are applied, the better the auditors' responsibility in detecting fraud. In addition, the auditors' experience significantly influence their responsibility in detecting fraud, and indicates that the more experience that an auditor have the betterr their responsibility in detecting fraud. In regard to Javanese Culture, this study found that Javanese culture moderated the influence of audit procedure and auditors' experience on the auditors' responsibility in detecting fraud. This findings implies that we need to consider local culture in studying the behavior of auditor especially their role in detecting frauds.

Despite its contributions, this study suffered from weaknesses. The first one is that the questionnaires that were distributed directly to several accounting firms in Semarang were mostly filled by the junior accountants. The research scope to analyze the respondents' answers from senior auditors, and managers are a few in this study. The researcher also did not obtain much response from the firm partners; hence the results are less generalized. The second one is that the study has limitations inherent to the data obtained from the questionnaires, where there may be differences in perception between the researcher and the respondents because both could not clarify the questions. Although it has been attempted to be minimized, the limitations will remain on the research that uses primary data. Thus future research may considere auditors of larger public accounting firms. Finally, to deeply understand how culture influence auditors behavior, further studies may involve indepth interview.

AUDIT COMMITTEE CHARACTERISTICS AND INTERNAL AUDIT BUDGET: MALAYSIAN EVIDENCE

Redhwan Ahmed AL-Dhamari, Universiti Utara Malaysia, Malaysia
Almahdi Ali Mohamed Saleh Almagdoub, Universiti Utara Malaysia, Malaysia
Bakr Ali Al-Gamrh, Universiti Utara Malaysia, Malaysia

Abstract

An audit committee is viewed as an essential self-regulatory internal governance instrument that is expected to provide an overseeing role over the entire process of financial reporting. An internal audit is also one of the corporate governance cornerstones that is essential for the effective monitoring of the operating performance of internal control. To ensure its effectiveness, the audit committee monitors the resources available to the internal audit, and internal control functions should be directly reported to the audit committee. This study is set out to explore the effect of audit committee characteristics on internal audit budget in Malaysia, where data on internal audit budget is available and how well audit committee monitors the internal audit function is questionable. Our study also opens the door to an unanswered question, that is, whether an audit committee index is related to internal audit budget. Data of 96 companies listed on Bursa Malaysia for a three-year period, 2012-2014, was utilized to achieve this end. The regression result shows that audit committee meeting and index are significantly and positively associated with internal audit budget. They also indicate that audit committee tenure has a significant and negative impact on internal audit budget. On one extreme, the findings of the study support the recent policy initiatives in relation to audit committee and internal audit. On the other extreme, the result serves as a wake-up call to policy makers in requiring more committed, competent and skilled members on the audit committee.

Keywords: *Audit Committee Characteristics; Internal Audit Budget; Internal Audit Function; Bursa Malaysia*

Introduction

Following recent accounting scandals, deliberate manipulations and fraudulent activities of some corporations such as Enron, Worldcom and Satyam that lead to accounting failure, internal auditing has increasingly became relevant as an important corporate governance mechanism (Carcello, Hermanson and Raghunandan, 2005; Coram, Ferguson and Moroney, 2008; Sarens and Abdolmohammadi, 2011). In response to these accounting failures, the Congress of United States passed into law the Sarbanes Oxley Act of 2002 (SOX, 2002). This significantly changed several issues related to corporate governance and corporate financial reporting. Particularly, it pushed for more focus on internal controls and internal auditing. Hence, it is likely that a number of companies have shifted their concentration towards internal auditing during this period. In addition, the Public Accounting Oversight Board (PCAOB) asserts that an outstanding benefit of its standard on auditing an internal control is encouraging companies to invest in competent and objective internal audit function (PCAOB, 2004). Moreover, statistics show that internal audit budgets and number of internal audit staff grew by over 10 percent between 2001 and 2002 in the US (Carcello et al., 2005).

In a same token, internal auditing has become a very crucial component of global businesses. It is very important for companies as it offers services to the firm management such as monitoring compliance with government regulation and company policy, evaluating risk management, testing internal control as well as preventing fraud (Anderson, Christ, Johnstone

and Rittenberg, 2012). In a survey done by the Malaysian Institute of Corporate Governance (MICG), the Institute of Internal Auditors Malaysia (IIAM) and Ernst and Young, internal auditors are found to be in the best position to comprehend and articulate the business practices of the company and they serve as consultants to lessen risk. By evaluating governance, control and risk management, internal audit can help an organization to fulfil its goal to improve the firm performance (Carcello et al. 2005).

Owning to the severe financial crises of the year 2008, the need for sound governance system has been felt strongly (Bedard and Gendron, 2010). The agency theory suggests internal and external corporate governance mechanisms that alleviate the conflicts between managers and shareholders and reduce the agency costs (Jensen and Meckling, 1976). One of the corporate governance mechanisms is the audit committee. The audit committee is viewed as an essential self-regulatory internal governance instrument and is expected to provide an overseeing role over the entire process of financial reporting, particularly the working of the internal control system and the work of the auditors (Blue Ribbon Committee (BRC), 1999; Hermanson and Rittenberg, 2003). The Blue Robin Committee (1999) considers the following characteristics expected from members of audit committee to be more active and diligent in overseeing financial reporting process and internal control: independence, financially educate, and meet regularly (BRC, 1999).

Based on agency theory and resources dependency theory, the presence of members who are independent in an audit committee improves the audit committee effectiveness in performing oversight duties. Independent audit committee directors are viewed by the market as professional members who are willing to facilitate advice and counsel (Sori, Ramadili, and Karbhari, 2009). Researchers argue that the independency of audit committee members increases the reliability and accuracy of financial reports of a firm (Abbott, Parker, and Peters, 2004; Dechow, Sloan, and Sweeney, 1995; McMullen and Raghunandan, 1996). Audit committee members with accounting background are more likely to understand accounting numbers and enhance the ability of audit committee in curbing management involvement in earnings management activities to cover self-interest behaviour (Chang and Sun, 2010). Furthermore, the BRC (1999) suggests an audit committee to meet frequently to effectively perform its oversight responsibilities. The number of meetings held by the audit committee is perceived to lead to transparent accounting information (Kent and Stewart, 2008). Finally, audit committee members with shorter tenure are more likely to perform oversight role effectively (Sharma and Iselin, 2006) as they are expected to challenge management decision (Barua, Rama, and Sharma, 2010; Boker and Goodstein, 1993).

In a move to guaranteeing the quality of financial reporting, the role of effective audit committee and internal audit system in enhancing the corporate governance and financial reporting outlook of the firm has been highlighted by academic researchers (e.g. Puri, Trehan, and Kakar, 2010; Soh and Martinov-Bennie, 2011; Zain and Subaramaniam, 2007). An effective internal audit system aids the audit committee with: assertions concerning control; independent assessment of accounting procedures and practices; risk and fraud analysis (Hermanson and Rittenberg, 2003). Internal auditing also serves as a prized asset for the audit committee to meet its financial reporting obligation (Bishop, Hermanson, Lapides, and Rittenberg, 2000). On the other hand, the audit committee is responsible for reviewing the internal audit plan and making sure the scope of the internal audit activity is adequate. (Zain, Subramaniam, and Stewart, 2006). Moreover, Carcello et al. (2005) argue that an audit committee must exact some sort of control over the internal audit function to ensure whether the internal audit system plays effective monitoring role and provides assistance to the audit committee. This may be done by exercising control over the organization's resources set aside for internal audit.

Therefore, the aim of our study is to explore the potential effect audit committee characteristics (e.g. independence, expertise, diligence, tenure and audit committee index) on internal audit budget [1]. From complementary-side perspective, we conjecture that an audit committee would effectively monitor the resources invested in internal audit department to make sure the department works towards enhancing financial reporting process. As such, a positive relationship between audit committee and internal audit budget is expected. Alternatively, form substitution-side perspective, the existence of effective audit committee within a firm may decrease the need for a detailed assurance service from internal auditors. This may lead to a negative association between audit committee and internal audit budget. Generally, our results are broadly in tandem with the view that firms with effective audit committee may invest more in internal auditing to boost the confidence of investors concerning the quality of accounting information. However, since the study's results are somewhat exploratory in nature, they should be interpreted with caution.

Malaysian setting is well-suited to investigate in details the relationship between audit characteristics and investment in internal audit because of several reasons. First, in Malaysia, there are rising incidents of company mismanagement and failures, which indicates that there is immediate need of effective internal auditing in both public and private sectors (Ali, Saidin, Sahden, Rasit, Rahim and Gloeck, 2012). Examples include Transmile group Berhad, Genting Malaysian Berhad, and Tai Kwong Yokohama. Nevertheless, Ali, Chen and Radhakrishnan (2007) highlight the serious deficiencies and shortcomings of internal auditing of Malaysian companies. They argue that public and private institutions lack efficient internal audit personnel, internal audit competence and that the Malaysian government fails to provide adequate support and assistance for internal audit functions. Second, most audit committee members in Malaysian companies are appointed by controlling managers who run the business (Abdullah, Yusof, and Nor, 2010; Sori et al., 2009). This places a lot of doubt on the ability of audit committee to challenge the management decision.

Additionally, academic researchers argue that many Malaysian audit committees only act as a 'rubber stamp' and are only formed to comply with the requirement of Bursa Malaysia, as the Bursa Malaysia makes it compulsory for all public listed companies to have an audit committee (Abdullah et al., 2010; Zulkarnain and Shamsher, 2007). Third, according to the Revised Malaysian Code on Corporate Governance (Revised MCCG 2007), Malaysian firms are compulsorily obliged to consist of audit committee members with a mix of 2/3 independent directors and at least one of this mix should be an active member of an accounting association or body. Moreover, Bursa Malaysia, to boost the effectiveness of board and audit committee, requires the tenure of independent directors of Malaysian public companies should not exceed a period of nine years (Revised MCCG 2012). Finally, in 2009, Malaysian firms are required to disclose information on internal audit budget. This would enable the researchers to collect secondary data on internal audit budget as well as audit committee variables after the new requirements to test the hypothesized relations in the study.

Prior studies have looked at the role of audit committee characteristics in relation to audit fees (e.g. Abbott, Parker , Peters and Raghunandan , 2003; Carcello, Hermanson, Neal, and Riley, 2002, Collier and Gregory, 1996), earnings management (Saleh, Iskandar and Rahman, 2007), audit report lag (Hashim and Rahman, 2011; Sultana, Singh, der Zahn and Mitchell 2015), audit risks (Bliss, Muniandy, and Majid, 2007; Muniandy, 2007) and timeliness of corporate financial reports (Abdullah, 2006). Our paper enriches the prior studies by exploring the influence of audit committee characteristics on internal audit budget. Moreover, a number of previous studies on internal audit have examined the relationship between audit committee characteristics and internal audit function characteristics other than resources available to internal audit department (Abbott, Parker, and Peters, 2010; Zain et al., 2006).

We contribute to the above studies by relating audit committee characteristics to internal audit budget. Finally, our research bears some similarities to the existing work of Barua et al. (2010) who link audit committee characteristics to internal audit budget. This study differs from theirs as it introduces a composite variable capturing several audit committee characteristics used by the researchers (i.e. independency, expertise, diligence, as well as tenure) in the form of an index and examines the index relationship with internal audit budget along with the other audit committee variables.

The other parts of the paper are structured as follows. The next section reviews prior literature and develops the hypotheses. Section 3 describes research methodology and Section 4 presents and discusses the main results. Additional analysis and sensitivity tests are summarized in Section 5, while the conclusion is presented in Section 6.

Literature Review and Hypothesis Development
1.   Audit Committee Independence and Investment in Internal Auditing

The independency of audit committee members is a crucial factor that influences the efficiency of the committee in overseeing the process of financial reporting. According to Sharma and Iselin (2006) and Al-Mamun, Yasser, Rahman, Wickramasinghe, and Nathan (2014), audit committee should be composed of multiple independent directors because they care about their reputation and prestige. Based on the MCCG (Revised Code, 2007), the audit committee has to be structured fully by non-executive directors, with most of them being truly independent. Moreover, Ye, Carson, and Simnett (2011) argue that independent audit committee members are keystone for financial reporting process as they enhance the quality of financial statements of the firm. A review of literature indicates that the independency of audit committee improves the financial information quality through mitigating earnings management activities (e.g. Amar, 2014; Bradbury, Mak, and Tan, 2006; Saleh et al., 2007; Salleh and Haat, 2014; Siagian and Tresnaningsih, 2011).

However, there are two competing views concerning the potential association between audit committee independence and internal audit budget. Proponents of complementary hypothesis argue that independent audit committee directors may demand greater assurance for financial reporting process as they are more concerned about their reputation and litigation risk (Barua et al., 2010). Therefore, a positive relationship between the independency of audit committee and internal audit budget is expected. Audit fees literature suggests firms with effect audit committees demand a higher audit quality to effectively monitor financial reporting process (e.g. Abbott et al. 2003; Carcello et al., 2002; Vafeas and Waegelein, 2007).

On the other hand, opponents of complementary hypothesis consider audit committee with independent directors as effective governance system that can monitor internal controls and financial reporting process. Therefore, there would be less demand for additional assurance from internal auditor (Sarens, Abdolmohammadi, and Lenz, 2012) and an adverse association between the independency of audit committee and internal audit is expected. Because of these two competing arguments, the following non-directional hypothesis is stated:

H1: There is relationship between Audit Committee Independence and investment in internal auditing.

2.   Audit Committee Expertise and Investment in Internal Auditing

In addition to audit committee independence, expertise is generally regarded as a critical characteristic for an audit committee's effective operation (Baxter and Cotter, 2009). Researchers argue that investors are attracted towards firms which comprise of higher number of financial and accounting experts in the audit committee. This is due to audit committee directors with such expertise have capability to analyze financial statements as well as to

recognize and understand the using of accepted standards of accounting (Carcello, Hermanson, and Ye, 2011). Schmidt and Wilkins (2012) posit that financial experts in audit committee provide significant value to customers by eliminating deceitful activities from the organization. The Sarbanes Oxely Act (2002) makes it mandatory for US listed companies to include at least one financial expert in audit committee. Moreover, the MCCG (2012) requires Malaysian companies to have an audit committee with at least one member who should be a member of Malaysian Institute of Accounting (MIA).

Persons (2009) asserts that independent members of an audit committee with financial or accounting expertise are more likely to detect any financial misstatements or improper business transactions because they would need to comply with their own professional codes of ethics to maintain their reputation. Extant literature document that audit committee financial expertise enhance earnings quality (e.g. Baxter and Cotter 2009; Dhaliwal, Naiker, and Navissi, 2006) and attenuate earning management activities (e.g. Badolato, Donelson, and Ege, 2014; Bédard, Chtourou, and Courteau, 2004; Salleh and Haat, 2014). These results are in tandem with the agency theory argument that the presence of an audit committee member with accounting expertise reduces the likelihood of agency-principal conflicts and enhance the quality of financial reports.

However, there are two competing arguments on how an audit committee with accounting and financial experts may influence the resources available to internal audit department. Proponents of complementary hypothesis argue that audit committees with accounting and financial experts, in order to protect their reputation, are more vigilant in safeguarding and keeping watch of financial reporting process (Persons, 2009). Since audit committee directors with accounting expertise are more likely to understand accounting figures and uncover management fraud, the presence of such members in the audit committee may result in more work for internal audit function (Barua et al., 2010). Extant studies provide evidence of firms which comprise of an audit committee with accounting expertise to demand   a higher audit quality and, thus, pay higher audit fees (Vafeas and Waegelein , 2007; Abbott et al., 2003; Goodwin-Stewart and Kent, 2006). Therefore, a positive association between audit committee expertise and internal audit budget is expected.

Advocators of substitution hypothesis argue that accounting expert members in an audit committee improves the effectiveness of internal control and financial reporting quality. Therefore, the presence of such members in the audit committee may minimize the need for more assurance provided by internal auditors. Zhang, Zhou and Zhou (2007) and Hoitash, Hoitash and bedard (2009) assert that situations where there exists members with expertise in accounting working in the audit committee, there is bound to be fewer cases of internal control problems, suggesting that investment in the internal audit function might not be necessary. Moreover, Barua et al. (2010) provide empirical evidence that internal audit budget decreases as the number of audit expertise directors in audit committee increases. Given these two competing viewpoints, our study states the following non-directional hypothesis:

H2: There is relationship between Audit committee expertise and investment in internal auditing.

3. Audit Committee Meeting and Investment in Internal Auditing

Theoretically, the agency theory posits that the agency conflicts between shareholders and managers can be addressed through increased activity by the audit committee (Kent and Stewart, 2008; Li, Mangena and Pike, 2012). The greater frequency of audit committee meeting allows for better communication between audit committee and external auditors, thereby making the audit committee to be more effective (BRC, 1999; Zaman, Hudaib, and Haniffa, 2011). Moreover, when the meetings are held frequently, more issues such as risk

management, internal accounting controls and financial reporting process can be discussed in detail (Abbott et al., 2003; Saleh et al., 2007). Prior studies found that such organisations with frequent audit committee meetings to indulge less in earnings management activities. They also pointed out that meeting frequently by the audit committee reduces the possibility of receiving a qualified audit opinion (e.g. Farinha and Viana 2009; Pucheta-Martinez and Fuentes, 2009; Xie, Davidson, and DaDalt, 2003).

However, there are two contradicting arguments on the association between audit committee meeting and the investment in internal audit function. Proponents of complementary hypothesis argue that a diligent audit committee (i.e the committee that meets frequently) is anticipated to support the internal audit activities as it is more focussed on the internal control procedures in place and the process of financial reporting (Barua et al., 2010; Raghunandan and Rama, 2007). Barua et al. (2010) and Anderson et al. (2012) suggest that an audit committee with frequent meetings will be able to control the tendency of financial misreporting and as such will demand more in internal audit budget. Moreover, Raghunandan, Read and Rama (2001) and Sarens (2009) argue that an active audit committee could consider the internal audit function as a necessary source of information to carry out its monitoring responsibilities, thus the audit committee may push for better staffed internal audit function. As such, audit committee meeting is projected to have a positive impact on internal audit budget.

On the other hand, advocators of substitution hypothesis allege that an audit committee that meets often is perceived to effectively cater for internal control problems and issues with financial report (Sarens et al., 2012). Therefore, the need for internal auditors to provide more assurance about financial reporting quality is minimized. Because of these competing arguments, the following non-directional hypothesis is stated:

H3: There is relationship between Audit committee meeting and investment in internal auditing.

4.   Audit Committee Tenure and Investment in Internal Auditing

There are two contradictory arguments with respect of the effect of audit committee tenure on investment in internal audit function. The first argument is that a longer tenure will enable audit committee members to accumulate more knowledge about the firm they work with which may facilitate the members ability to effectively manage the risks facing the company (Kor and Mahoney, 2000) and ensure voluntary ethics disclosure (Othman, Ishak, Arif, and Aris, 2014). A long-term relationship with client is crucial for the audit committee to understand specific knowledge about the client's accounting system, internal control, operations as well as the client's industry features (Boone, Khurana, and Raman, 2008). A review of literature indicates that firms with longer audit committee tenure are more likely to receive a clean audit report (e.g. Deis and Giroux, 1992; Copley and Doucet, 1993; Shaife, Hussin, Yusof, and Hussain, 2009) and report higher financial reporting quality (e.g. Dhaliwal, Naiker, and Navissi, 2010; Yang and Krishnan, 2005). Given that the presence of directors with longer tenure may enhance the monitoring duties of the audit committee, the need for internal auditing to attain effective internal controls and address financial reporting issues would be less likely. Chan, Liu, and Sun (2013) conclude that firms with audit committee members who have served for a elongated period have a lower need for audit effort and, therefore, pay lower audit fees. Moreover, Barua et al. (2010) provide evidence that there is an inverse relationship between average audit committee tenure and investment in internal audit.

A counter-argument is that too long a service on the audit committee may lead to audit committee members becoming less vigilant or more permissive of management self-interest

actions (Rickling, 2014). Sharma and Isselin (2012) document a significant positive association between the tenure of the independent audit committee members and financial misstatements suggesting that directors with longer tenure may not exercise independent judgment. Because of these contradictory arguments, our study states the following non-directional hypothesis:

H4: There is relationship between Audit committee tenure and investment in internal auditing.

5. Audit Committee Index and Investment in Internal Auditing

Academic scholars argue that traditional measures of audit committee effectiveness (e.g audit committee independence, expertise, meeting and tenure) do not guarantee an effective audit committee as these mechanisms complement each other and taking one variable and ignoring the other will render the audit committee ineffective (Connelly, Limpaphyom, and Nagarjan, 2012; Lara, Osma, and Penalva, 2007). An empirical study concludes that the independency of audit committee alone could not deter earnings management activities conducted by Malaysian firms, unless the audit committee meets frequently (Saleh et al., 2007). Moreover, a number of studies on audit fees have been motivated to use a composite index to assess the effectiveness of audit committee (Lisic, 2014; Zaman et al., 2011). The common conclusion from the studies is that the composite index can capture the effectiveness of audit committee to monitor financial reporting process and reduce audit fees.

This study adopts four characteristics (i.e independency, expertise, vigilance, and tenure) to represent the effectiveness of audit committee. An audit committee with such characteristics would be expected to provide more effective monitoring role over internal controls and financial reporting issues. This may lead to place a greater demand on internal auditing to mitigate control and financial risk that may encounter the firm. However, based on the substitution hypothesis, the presence of audit committee with independent, expert, vigilant and less tenure may reduce the need for assurance provided by internal auditors. Hence, given these two competing viewpoints, the following non-directional hypothesis is stated:

H5: There is relationship between audit committee index and investment in internal auditing.

Data Collection and Model Estimation

1. Data Collection

The initial sample of the study consists of top 100 companies listed on Bursa Malaysia based on the 2014 market capitalization. Our study observes the firms over a three-year period (i.e. from 2012 to 2014). These firms were selected because they are more likely to have complete internal audit and audit committee data. The reason for commencing with year 2012 was because it is considered as a recent year after Malaysian companies, in year 2009, are required to disclose information on internal audit function. Moreover, Malaysian Code of Corporate Governance has introduced new recommendations for audit committee in 2012. The reason for concluding with year 2014 is because it was the last year with available data as at time this research was conducted. Firms with missing financial and internal audit data for sample period are excluded. Table 1 summarizes the sample selection procedure. On one hand, data pertaining to audit committee and internal audit variables were hand collected from respective annual reports of sample firms. On the other hand, financial data were extracted from financial database "DataStream". We deliberately did not exclude financial data to avoid dealing with small sample size data. Moreover, prior academic works have included financial firms as they found the firms to have internal audit function (Carcello et al., 2005; Sarens et al., 2012). However, our study controls for financial companies to ensure the study results are

not driven by the companies. Table 2 presents the distribution of the sample firms according to Bursa Malaysia classification.

Table 1. Derivation of Sample

Criteria	No. of firms
Top100 companies based on market capitalization for 2014	100
Less:	
companies with incomplete data on firm size	(1)
Companies with incomplete data on internal audit function	(1)
companies with incomplete data on inventory	(2)
year * 3	3
Final Observations	288

Table 2. *Bursa Malaysia Sector Representation of the Sample Firms*

Industry	No. of firms	No. of firm-years	Percentage (%)
Consumer product	13	39	14
IPC	1	3	1
Construction	1	3	1

Hotels	1	3	1
Finical	13	39	14
Industrial products	10	30	10
Total	96	288	100

2.   **Model Estimation**

Our study models internal audit budget as a function of audit committee and a set of control variables as follows:

$IAFNV = \beta_0 + \beta_1 ACIND_{it} + \beta_2 ACEXP_{it} + \beta_3 ACMEET_{it} + \beta_4 ACTEN_{it} + \beta_5 ACINDX_{it} + \beta_6 ACSIZE_{it} + \beta_7 LEVG_{it} + \beta_8 INVT_{it} + \beta_9 OPCF_{it} + \beta_{10} FSIZE_{it} + \beta_{11} IAFSOU_{it} + \beta_{12} INDS_{it} + \beta_{13} YER_{it} + \varepsilon_{it}$

IAFNV equals the natural log of the const born by the Internal Audit Function (IAF). ACIND equals the proportion of independent audit committee members to the total number of audit committee members. ACEXP equals the proportion of audit committee members who have accounting or auditing qualification to the total number of audit committee members. ACMEET equals the natural log of the number of audit committee meetings. ACTEN equals the average tenure of audit committee members. We develop an audit committee index (ACINDX) through aggregating the scores of audit committee mechanisms tested in this paper. This is because we want to explore whether the index can better capture the ability of the audit committee mechanisms to control and monitor the fund assigned to internal audit function. Table 3 shows the incorporated mechanisms and scores attached to them. The index

ranges from zero to four. A higher index score indicates audit committee effectiveness, with an ACINDX of four being the highest.

Table 3. *Audit committee Index (ACINDX) components*

Items	Score
ACIND	1 for firms with above sample median ACIND for the year and 0 otherwise
ACMEET	1 for firms with above sample median ACMEETING for the year and 0 otherwise
ACEXP	1 for firms with above sample median ACEXP for the year and 0 otherwise
ACTEN	1 for firms with below sample median ACTEN for the year and 0 otherwise

We include a set of control variables that have been investigated in prior literature (Barua et al., 2010; Carcello et al., 2005). Following the literature, we include FSIZE in our regression models to control for firm size. Our study measures FSIZE by the log of a firm' total assets. Highly leveraged firms report financial information of low quality as managers of these firms manipulate earnings to hide the true performance of the firms (Sweeney, 1994). Academic literature provides evidence that an increased proportion of debt may lead to higher investment in internal audit function (Carcello et al., 2005). As such, we include LEVG (i.e. leverage measured by total debt to total assets) to control for information risk. Moreover, it has been argued that the need for better monitoring by an effective internal audit increases with a firm complexity (Ramamoorti, 2003). Therefore, we include INVT (i.e. inventory proxied by total inventory to total asset) to reflect complexity of firm operations. A higher level of operating cash flow may raise agency problem as managers of higher cash flow firms are expected to squander the cash in projects that only serve the managers' self-interest and secure their control over the firm resources (Jensen, 1986). As such, an audit committee of firm with higher cash flows is more likely to encourage and support the monitoring role of internal audit over the firm cash. Our study measures operating cash flow (OPCF) by cash from operations to total assets. Barr and Chang (1993) highlight the advantages of outside internal audit providers that include greater perceived independence, flexibility, cost savings and improved quality. Therefore, it is expected that firms with outsiders performing internal audit services to invest less in internal audit. We measure internal auditing source arrangement (IAFSOU) by the dummy variable, which takes the value of 1 if the IAF is outsourced and 0 otherwise. We finally include ACSIZE (i.e. audit committee size represented by the natural log of the number of audit committee members) to control for audit committee effectiveness.

We employ OLS estimations in our study. We use the Variance Inflation Factor (VIF) and correlation matrices to assess the multicollinearity problem [2]. Both tests indicate that the multicollinearity problem is not a major concern. We also utilize Cook-Weisberg and Wooldridge test to assess the potential of the existence of heteroscedasticity and autocorrelation problem respectively. Both tests indicate that the heteroscedasticity and autocorrelation problem are not a major concern of this study [3]. Finally, we winsorize ACEXP, ACTEN, LEV, INVEN and OCF at 5% and 95% to mitigate the potential normality problem that caused by outliers [4].

Empirical Evidence
   1.   **Descriptive Statistics**

Table 4 presents the descriptive statistics for all variables tested. The table shows the mean internal audit budget (IAFNV) is Ringgit Malaysian (RM) 3,985,917. The minimum (maximum) values of audit committee independence (ACIND) are 50% (100%) with an average value of 86%. The figures show that still some Malaysian firms are not following the Bursa Malaysia requirements of having an audit committee that should consist of at least 2/3 independent directors. While the average number of audit committee meetings (ACMET) is 6, the mean audit committee size (ACSIZE) of sample firms is 4. The mean value of audit committee expertise (ACEXP) is 33% with a minimum (maximum) of 0 (80%). The mean (median) tenure of audit committee directors (ACTEN) is 8.18 (7.67).

Notes: the upper diagonal of the matrix shows Spearman correlations and the lower diagonal demonstrates Person correlations. Bolds indicate significance at the 5 percent level or better. Please see Table 4 for variable definitions.

2. **Regression Results**

The results of the OLS regressions are presented in Table 6 below. Evidently, the adjusted R^2 are 65% and 64% in the model 1 and 2, respectively. The F ratio is significant ($P<0.00001$) across the two models. The results indicate that the independent and control variables could explain about 65% of changes in internal audit budget. From Model 1 of the table, on one hand, the finding shows that there is a positive and significant relationship between ACMEET and investment in internal auditing ($\beta = 2.07$, $P<0.05$). This finding suggests that firms with frequent audit committee meeting invest more in internal audit function. It also consistent with the argument that an effective audit committee (an audit committee that meets frequently) increases the demand for more assurance required from the internal audit. The result also is in conformity with Barua et al. (2010) who find that an effective audit committee may demand a higher internal audit budget. On the other hand, ACTEN is significantly and negatively related to investment in internal auditing ($\beta = -2.50$, $P<0.05$).

Table 6. *Results of Regression Analysis*

Adjusted R-squared		0.645				0.640		

Note: IAFNV: the natural log of cost born by internal audit department; ACMEET: the natural log of audit committee meetings; ACSIZE; the natural log of total number of audit committee directors, SIZE: the natural log of total assets, YEAR: is the year 2013 and 2014. Only five industry sectors are included into regression analysis. These sectors are consumer product, trading and services, finance, plantation and industrial product. The study excludes the remaining sectors reprehensive of the sample firms to avoid the dummy variable trap. Other variables are previously defined.

This result suggests that audit committee members with increased firm-specific knowledge reduce the need for having greater assurance from internal audit function. The finding is in line with Barua et al. (2010) who conclude that audit committee tenure is associated with lower internal audit budget. As appeared in Model 2 of the table, ACINDEX has a positive and significant impact on internal audit budget ($\beta = 2.51$, $P<0.05$). The result suggests that firms with effective audit committee invest more in internal audit. An effective audit

committee, to manage financial misreporting risk, may demand for obtaining greater assurance from internal audit budget.

However, other audit committee characteristics including ACIND and ACEXP do not appear to have a significant impact on internal audit budget. The results suggest that audit committee independence and expertise have no monitoring role over resources available to IAF, which is in contradiction to the authors' expectations. However, these findings are in line with Barua et al. (2010) who find that audit committee independence and accounting expertise are not significantly related to internal audit budget. A possible explanation for the insignificant association between audit committee independence and internal audit budget may be due to independent directors of audit committee are nominated and elected by the firm management. As such, the directors might not take deceive action against the management. Ismail, Dunstan, and Van Zijl (2009) argue that audit committee independence is not effective governance mechanisms in Malaysia because family members involvement in the appointment of audit committee directors. Moreover, Chen and Nowland (2010) assert that outside directors in Asian family-owned firms are not truly independent monitor because the involvement of family group in the selection of outside directors.

Another plausible reason of insignificant results may be due that most public firms in Malaysia tend to comply with Bursa Malaysia's requirements only with the intention to avoid any punishment by the regulators who favour independent members. Abdullah et al. (2010) argue that audit committees of Malaysian firms lack rigidity as the establishment of the audit committee is simply to comply with Bursa Malaysia's requirements. Therefore, an audit committee with such characteristics is less expected to effectively work together with internal audit department so as to provide assurance about internal controls and monitor financial reporting process.

As for audit committee expertise, the possible explanation for insignificant finding may be the dominance of audit committee members without accounting and audit qualification. In this paper, the majority of cases have only one or two audit committee member who is certified accountant or a member of a professional accounting body. This is evident by Table 4 which reports that only 33 percent of audit committee members have accounting and audit qualification. Audit committee members who do not understand financial reporting details may not be helpful in detecting financial misstatement and effectively communicating with external as well as internal auditors to enhance the quality of financial reports.

Evidently, most of control variables have a significant impact on internal audit budget across the two models with the expected sign. For example, ACSIZE is positively and significantly associated with internal audit budget. This result supports the argument that large audit committees have a better link with environment, more capabilities, more experience and expertise which may increase the effective of the committees (Anderson et al., 2012) .Such audit committees may demand greater assurance from internal audit. Furthermore, SIZE has a significant and positive effect on internal audit budget. The result suggests that large firm invest more in internal audit. IAFSOU is negatively and significantly related to internal audit budget. The result implies that firms with outside internal audit providers invest less in IAF. INVEN and OCF have a positive and significant relation to internal audit budget. The results suggest that firms with higher level of inventory and operating cash flow are considered complex and, thus, demand greater monitoring by internal audit. LEV is the only control variable that has no significant effect on internal audit budget, although it has the expected direction.

3.   Robustness Checks

Tow tests are conducted in this research to ensure the sensitivity and robustness of the main results reported earlier. The first test re-runs Models 1 and 2 using an alternative measurement

for audit committee independence, operationlized by the dummy variable taking the value of 1 if audit committee 100% independence and 0 otherwise. It also re-estimates the models with different measurement for audit committee expertise, represented by the dummy variable assigned the value of 1 if audit committee has at least one member of accounting or auditing expertise and 0 otherwise. Table 7 demonstrates the results of the re-estimated models.

Evidently, the results reported in the table lend further support to those shown in the main analysis. For example, ACTEN has a negative and significant influence on internal audit budget, whereas ACMEET and ACINDEX are positively and significantly related to internal audit budget. As for ACIND and ACEXP, the two variables still have no significant impact on internal audit budget, indicating that the study results are robust and not sensitive to using of the new measurement of ACIND and ACEXP.

Secondly, in the main analysis, the natural logarithm of audit committee meeting and size was utilized to mitigate the normality problem. As a test of sensitivity, Models 1 and 2 were re-estimated with winsorizing ACMEET as well as ACSIZE at 5% and 95% to ensure that the study's findings are not driven by the type of transformation. The results of the re-estimated models are reported on Table 8. The table shows findings that are approximately the same as those from using the natural logarithm of ACMEET and ACSIZE. The results presented in the table also are in line with the study conclusion that ACTEN and (ACINDEX) are negatively (positively) associated with internal audit budget. Other variables still have equivalent significant level as the one reported in the main analysis.

Summary and Conclusions

Extant research empirically documents that audit committee characteristics monitor resources available to internal audit department (Barua et al., 2010). Here, the study went one step further by exploring the association between audit committee index and the investment in internal auditing. It also extends prior literature that emphasizes solely audit committee characteristics in East Asian countries to an internal audit context. The findings of our study have some interesting practical implications. First, audit committee meeting and audit committee index were found to increase the internal audit budget. Second, resources available to internal audit department decrease as the average tenure of audit committee members increases. Third, audit committee expertise and independence have no significant impact on the investment in internal auditing. The results serve as alarm to regulators in Malaysia for requiring more independent and qualified audit committee members. Nevertheless, the overall results support the recent Malaysian requirements on internal audit and audit committee.

Like every other studies, this research has inevitable limitations. First, the study revolves around only the top 100 companies in Malaysia. As such, the results found in the study may not be generalized to small companies. Future research can include larger sample size to

allow for generalizable conclusions. Second, this study only emphasizes the role of audit committee over the resources available to internal audit function due to Malaysian companies are only required to disclose information pertaining to the cost of and sourcing arrangement of internal audit in their annual report. There are other factors that may affect the function of an internal audit which may, in turn, be linked to the effectiveness of audit committee. These factors that the audit committee can monitor include size of internal audit department, qualification of internal audit staff, availability of internal audit staff, internal audit organizational independence and internal audit department meetings. Perhaps, future studies may explore the possible relationship between audit committee characteristics tested in our paper and the factors using primary data. Third, this study only observes Malaysian companies due to data availability. It has been argued that relative to countries where establishing an internal audit function is not required by law, companies invest more extensive budgets for their internal audit function in countries where establishing internal audit function is required by the law (Sarens and Abdolmohammadi, 2011). As such, future studies may investigate the association between audit committee characteristics and internal audit budget in different settings, where (where not) internal audit function is required by the law.

Notes

1. The terminologies of internal audit budget and investment in internal audit are used interchangeably in our study as both of them refer to the resources available to internal audit department.

2. Multicollonearity is considered present when the VIF value is higher than 10.

3. The Cook-Weisberg test accepts the null hypothesis that the variance of the error terms is homogeneous and free of the heteroskedasticity problem (X=0.01, ρ-value= 0.936 in Model 1 and X=0.02, ρ-value= 0.887 in Model 2). Moreover, the Wooldridge test accepts the null hypothesis that the error terms are not correlated and free of autocorrelation problem (X=0.840, ρ-value= 0.362 in Model 1 and X=1.004, ρ-value= 0.319 in Model 2)

4. Our study also winsorizes the variables at 1% and 99% and we found the same results.

PERSISTENCE OF TAX AVOIDANCE AND ITS EFFECT ON PERSISTENCE OF EARNINGS

Achmad Hizazi, Universitas Indonesia, Indonesia

Abstract

This paper suggests new measure of one aspect of tax avoidance in time series perspective and investigates its effect to earning persistence as a measure of earning quality in same perspective. We argue that tax avoidance has persistence attribute and this attribute has negative slope, we also predict that positive relation with earning persistence. We derive an empirical measure for persistence of tax avoidance using present value revision (PVR) of coefficients from firm-specific auto regressive regressions of effective tax rate. Consistent with our conjecture, we documented that there is persistence of tax avoidance and this persistence has negative trend. Finally, we show that our measure of persistence of tax avoidance has positive relation with earnings persistence.

Keywords: **tax avoidance, persistence of tax avoidance, earning persistence**.

Data availability: data are available from commercial databases.

Introduction

This paper suggests new measure of one aspect of tax avoidance in time series perspective and investigates the effect of persistence of tax avoidance to persistence of earning in same perspective. For our suggested new measure, we investigates whether tax avoidance in certain period would affect tax avoidance in following periods. We extend our research by looking at the effect of persistence of tax avoidance to persistence of earning. Using data from five South-East Asian countries, we estimate persistence of tax avoidance period from 2001 to 2013, our final sample consist of 910 companies and reduced to 580 in extended investigation.

Motivational background for this research are coming from theoretical and practical background. Allingham and Sandmo (1979) who set tax avoidance theory for individual known as *taxpayer as gambler*, conclude that one is continuously avoiding tax as long as he isn't detected. Cowell et al. (2002) who pragmatically explain firm economical model for tax avoidance state that in term of tax avoidance behavior, firm and individual are identical. In the strand of long term tax avoidance research, first theoretical research of persistence of tax avoidance was conducted by Crocker and Slemrod (2005) which conclude the existency if persistence of tax avoidance. Dyreng et al (2008) and Lee and Swanson (2012) describe in long term span of research data that there are some companies who continuously doing effort in tax avoidance. But they are not specifically investigating tendency of companies in committing tax avoidance. We are the first to investigate persistence of tax avoidance in the long run time series. We extend our research to know the effect of persistence of tax avoidance to persistence of earning.

To provide evidence for our first hypothesis, we estimate each firm's effective tax rate (ETR) time series regression. Fortunately, e-views have feature that helping us simultaneously run in approximately a hundred firms in a time auto regressive OLS. We find that some companies

has persisten behavior in avoiding tax and this could be tracked up to 5 years back in common. After 5 years some firms'lag losing its significancies in its regression. We found that persistences have between 0 and 1 coefect and not around 1, which mean they have negative slopes.

Our contribution is new measure of tax avoidance which is Present Value Revision (PVR) of Effective Tax Rate which is calculated from each coefficient of persistence o tax avoidance from the model that we investigate to answer our first hypothesis. This PVR following same procedure in Kormendi and Lipe (1997) which measure PVR of earning.

Our second hypothesis concerning the relation between persistence of tax avoidance to persistence of earning. In this phase, we run regression of our PVR of ETR to PVR of earning and include control variables suggested by Lev (1983) and Ismail dan Choi (1996) in eastimating earning quality. This cross-sectional regression includes 524 firms which were reduced due to incomplete data and normality procedures.

We find the existency of persistence of tax avoidance in 25.27% of samples. They are distributed comparatively different in each countries and each industrial categories leaving us opportunities to seek answer why these persistence of tax avoidance has different level in each country and industrial category. We find that our research show range of coefficient spreads between 0 and 1 and not around 1, meaning persistences of tax avoidance are in negative slope. We found that our measure is robust supported by our sensitivity analysis in 3 and 4 lags (untabulated). Our further investigation shows that this persistence of tax avoidance has positive relation with persistence of earning persistence.

The paper proceeds as follows: Section 2 review extant literature and hypotheses developments, section 3 contains research methods including data and research samples, research models, variables measures and method of data analysis. Section 4 explores empirical test results, discussion, and final section concludes the paper.

Literature Review and Hypotheses Development

    1.   **Agency Theory**

Jensen and Meckling (1976) explain the agency theory which describes emerging conflicts between principals and agents when ownership and controlling functions are separated. Those conflicts occur when both principals and agents possess rational behavior attempting to maximize their personal interest. This is likely to happen because of information asymmetries in which managers as agents have more information that principals do not.

In relation to taxation, Slemrod (2004) says that shareholders will ask managers to act on their behalf in an attempt to reduce their tax liabilitites. Slemrod (2004) believes there is no agency conflict between agents and principals in tax avoidance since managers will also increase earnings through tax avoidance, which eventually leads to their increased prosperity. But there is still a good chance that managers will act opportunistically, due to confidential information the managers are aware of but the shareholders are not. Desai and Darmapala (2009) implement theoritical basics implying that managers will act according to shareholders' interest, in examining relations between firm's tax avoidance and firm's value. In firms which refer to ETR as a performance benchmark, placing a tax department as the center for earnings and determining compensation for managers' performance, managers will act in line with what shareholders want in terms of tax avoidance. Desai and Darmapala (2009) discover that the influence of tax avoidance on firm's values is one of corporate governance functions within the framework of agent-principal relationships in firm's tax avoidance. This means that the agency theory remains the basis of research on firm's tax avoidance.

2.   Tax Avoidance
  A.   Tax Avoidance Theory and Persistence of Tax Avoidance

Tax research has a long history of being conducted, but theoretical models of individual tax avoidance were formulated by Alingham and Sandmo (1972). Since then, the model they formulated which was widely known as Taxpayer as Gambler has become the basis of tax avoidance theory. Alingham and Sandmo (1972) who analyze individual decisions in making tax avoidance decisions say that someone will keep avoiding tax until he/she gets detected doing so.

Cowell et al. (2002) say that "Taxpayer as Gambler" model is based on four simple propositions, namely; i) if rate of return of tax avoidance is positive, then everybody will avoid tax; ii) individuals with high risk-aversion levels tend to evade tax avoidance; iii) individuals with higher earnings tend to do tax avoidance more often; and iv) the rise in parameter levels of tax enforcement (likely to get detected, penalty and tariff) will lower tax avoidance levels. Out of these four propositions, Cowell et al. (2002) say that two of them (1 and 3) have the potential to be criticized as they are less compatible with general logics (common sense) stating that every individual will avoid tax. These four propositions indicate that tax avoidance will always be done by taxpayers. Each of these propositions demonstates that tax avoidance will continue to exist, albeit in varied amount.

In addition to individual tax avoidance models, there are corporate tax avoidance models which, from public research perspective, are no different from individual tax avoidance models. Cowell et al. (2002) pragmatically explain that a differentiation carried out for corporate economic models is aimed at examining the influence of tax avoidance overall distortion. Behavior of corporate taxpayers is not significantly different from that of individual taxpayers. In corporate levels, a manager's decision will depend on the firm owner's desire. At the point of tax avoidance, managers will act according to firm owner's request (Slemrod 2004).

Cowell et al. (2002) mention three different features between corporate and individual tax avoidance models, which are i) the nature of taxpayers; ii) assumption of risk preferences[12]; and iii) determinants of responses to economic incentives. Firms are established based on economic incentives, which may change depending on economic conditions, including tax system and enforcement. On the other hand, from risk preferences, more researches assume that firms tend to be risk-neutral rather than risk-aversion. As for responses to incentives, there are four influential factors, namely i) nature of products, ii) firm's size and organizational structure, iii) reputation, and iv) industry concentration levels. Out of these three features, the second explains that corporate taxpayers are more inclined to tax avoidance than individual taxpayers are.

Furthermore, Slemrod (2004) investigates economic perspectives of corporate tax disobedience, stating that the risk-aversion assumption prevails among individual taxpayers when larger penalty than saving for tax avoidance will effectively restrict tax avoidance. This finding is only prevalent in small firms which are predominantly controlled (closely held) by the owners. In firms predominantly controlled by owners (closely held), the interest of firm's management is relatively similar to that of the owners. Because managements generally consist of people with great proximity to the owners, relatively identical tax avoidance decisions will be made. However, the situation will be different for firms with dispersed

---

[12] There are two types of taxpayer behavioral preferences over risks: *risk aversion* and *risk neutral. Risk aversion* is risk avoiders, in which case taxpayers will tend to evade tax avoidance due to penalties imposed, while *risk neutral* is taxpayers who tend to avoid tax although they face potential penalties if detected.

ownership, Slemrod (2004) says that firms must be assumed to be risk neutral even if the shareholders themselves are not neutral since the shareholders have a lot of portfolios which protect them against risks. As such, it is assumed that tax avoidance among corporate taxpayers in this research is risk neutral. This research assumes that firm's risk preference is risk-neutral.

Allingham and Sandmo (1972) explain that taxpayers tend to ignore morality aspects by being immoral, so that people choose to commit tax avoidance in an effort to maximize their personal profit. A 30-year theoretical research by Crocker and Slemrod (2005) indicates that tax avoidance is constantly done for as long as it remains unknown. This shows an indication of persistence of tax avoidance.

Tax avoidance is not only committed by individual taxpayers but by corporate taxpayers as well. Cowell et al. (2002) say that there is basically no difference between individual and corporate tax avoidance. Corporate tax avoidance decisions are still made by an individual or interactions among individuals in a firm. Yet corporate tax avoidance is committed in a more sophisticated way and using a method that requires a certain expertise. Research on tax avoidance has produced numerous literary works on corporate tax avoidance.

In various tax research literatures, a number of methods are found and such methods can be applied to identify corporate tax avoidance, one of which being the use of ETR (Stickney, 1979; Plesko, 2003; Hanlon and Heitzman, 2010). Stickney (1979) says that ETR trends can be analyzed through ETR of the previous period and can be used to better examine cash flows and future earnings. A research by Dyreng et al. (2008) provides evidence of persistence of tax avoidance indicating that annual cash ETR has different persistence of ETR when ETR cash samples are partitioned into High and Low ETR, with the research results showing that Low ETR is more persistent than High ETR. This goes on to show that firms with high tax avoidance levels tend to maintain their tax avoidance levels at a relatively equal level.

Lee and Swenson (2012) who investigate the influence of statutory tax rate and tax system on tax avoidance provide an explanation on relatively constant decline of ETR that took place worldwide during the period of 1990-2007 using a research sample that covers 86 countries. But the said research does not proceed with a further examination of this phenomenon.

The presence of immoral behavior apart from insatiable human behavior makes human being tend to strive to augment their personal satisfaction. Increased prosperity in this case is gained through tax avoidance which is measured by comparing achievements from previous periods. At first, someone/a firm might try to increase their prosperity via tax avoidance using a method in compliance with regulations, next, tax avoidance will tend to continue, although it goes against regulations as long as it goes undetected. That is why even though tax is set forth by rules and regulations, tax avoidance will still be done as long as opportunities are available (Allingham and Sandmo, 1972). The initial evidence of ETR decline in a research by Lee and Swanson (2012) indicates that tax avoidance is perpetually being done by corporate taxpayers in several countries. This explanation leads us to our first hypothesis as follows:

H_1:   there is persistence of tax avoidance.

B.   Tax Avoidance and Earning Quality

There are a variety of definitions of earnings quality, Dechow et al. (2010) mention that which definitions to use is contingent on contexts of decisions to make. Dechow et al. (2010) explain properties of earnings quality as follows: persistence, accruals, smoothness, punctuality, loss recognition, investor responses, and external indicators such as restatement, and release of SEC enforcement. Property of earnings quality by Dechow et al. (2010) as discussed in this paper is earnings persistence. Selection of earnings quality components is based on the nature of earnings persistence data which are most suitably used in the relations of persistence of tax avoidance and earnings quality.

Hanlon and Heitzman (2010) provide evidence that tax avoidance information indicated by Book-Tax Differences (BTD) contains earnings quality information. Phillips et al. (2003) say that tax avoidance as reflected in tentative Book-Tax Differences (BTD) reveals the presence of discretion in pre-tax earnings management. Book-Tax Differences arise because of differences in booking regulations and tax regulations. These differences may arise when what is acknowledged by accounting is not acknowledged by tax, or vice versa. For instance, cost of penalty or loss reserve that is acknowledged by accounting but not acknowledged by tax. Differences originating from accruals-based accounting records involve management discretion that lowers objectivity levels of determining firm earnings, so that tax avoidance leads to downward earnings quality.

Regarding the relationship between tax avoidance and earnings persistence, Hanlon (2005) and Blaylock et al. (2011) notice this connection by separating firm samples based on BTD compositions, i.e. firms with a large BTD will have a low persistence. Frank and Rego (2006) also provide evidence of a relation between tax avoidance and earnings management and use of loss reserve, consistent with Phillips et al. (2003). Corporate tax avoidance activities will affect earnings quality, either earnings persistence or accruals quality.

Hanlon (2005) and Blaylock et al. (2011) say that there is a relation between tax avoidance information and earnings persistence. Hanlon (2005) investigates the relation between tax avoidance using Book-Tax Differences (BTD) and earnings persistence, accruals levels, and cash flows in subsequent years. This investigation finds that firms with Large Book-Tax Differences/LBTD have less persistent earnings compared to firms with Small Book-Tax Differences. Hanlon (2005) shows that firms with LBTD experience a high rise in earnings and then a decline the following year. At the same time, LBTD also shows a high rise in accruals and a decline the following year.

Persistence of tax avoidance is a continued effort to increase tax avoidance or to decrease tax cost in subsequent periods, or to enlarge BTD in subsequent periods. Because tax avoiders with large BTD have less persistent earnings, persistence of tax avoidance which enlarges BTD will reduce earnings persistence even more. Therefore, persistence of tax avoidance will have a negative effect on earnings persistence. Atwood et al. (2010) who investigate the relationship between book tax conformity and earnings persistence find that higher conformity is linked to lower earnings persistence and vice versa.

H_2a : Persistence of corporate tax avoidance has a negative effect on persistence of earnings.

Research Method
1.   Data and Sample Selection

Data in this research collected from five south-east Asian countries: Indonesia, Philippine, Singapore, Thailand and Malaysia. Main consideration for selecting these countries is availability of the data which are publicly available from their capital market, where these capital markets are more advanced than other countries capital market in south-east Asian countries. These capital market are Indonesia stock Exchange, Singapore Exchange, Bursa Malaysia, Philippine Stock Exchange and Stock Exchange of Thailand. Methods of sample selection is purposive sampling with criteria of the companies are having complete data from 2001 to 2013 and having no extreme rate of effective ax rate. All industry groups will be used in the both stage, either in discussing the persistency level of tax avoidance and also in the investigation of the effect of persistence of tax avoidance to earning quality.

Table 1. Samples Selection

	Indo	Phill	Singa	Thai	Malay	Total
Listed companies	495	246	750	666	926	3083
Incomplete data 1	284	129	454	387	466	1720
	211	117	296	279	460	1363
Extreme ETR	70	31	81	119	152	439
Samples Phase 1	141	86	215	160	308	910
Incomplete data 2	46	66	51	99	68	330
Outliers						
Sample Phase 2	95	20	164	61	240	580

Indo   = Indonesia
Phill   = Phillipine
Singa   = Singapore
Thai   = Thailand
Malay   = Malaysia

2. Research Model

This study employs two main models consist of models of persistence of tax avoidance and the effects of persistence of tax avoidance on persistence of earning.

3. Model of Tax Avoidance Persistence

This model is the first to answer the problem formulation, as well as test the hypothesis H1, existence of persistence of tax avoidance. The model was built based on the persistence of tax avoidance autoregressive pattern. By using the ETR as a proxy of tax avoidance, this research model is as follows:

$$ETR_t/STR_t = \beta_0 + \beta_1 ETR_{t-1}/STR_{t-1} + \beta_2 ETR_{t-2}/STR_{t-2} + \ldots\ldots+$$
$$\beta_p ETR_{p-1}/STR_{p-1} + e_t \qquad (1)$$

ETR is the effective tax rate which is obtained by dividing the tax expenses on earning before interest and taxes. STR is the statutory tax rate, government regulated tax rates. ETR is scaled to STR to anticipate changes in tax rates in each country. The period of estimation is for 12 years from 2001 to 2013.

H1 can not be rejected if the coefficient $\beta 1$ significant positive value, so the expectation sign model coefficients (1) above is $0 < \beta 1 < 1$.

Measurement revision of persistence is using the present value of the expected future earnings (PVR) model (1) follows Kormendi and Lippe (1997). PVR is a revision of the present value of persistence models with two or more variable lag significant autoregressive models. PVR is a function of a time series of β from the model of persistence and the interest rate δ. In this study δ using the medium-term government bond yields, the risk free rate. With the level of risk free rate which may vary between countries, the estimated value of δ will use different in each country.

$$PVR\_TAPj = \frac{1}{(1-\delta)(1-\sum_{i=1}^{N}\delta^i\beta_i)} - 1 \qquad (2)$$

Where
PVR_TAPj   = measure of tax avoidance persistence
δ = *risk free rate*, which is the medium-term government bond yields.
β_i = beta coefficient with lag i in model (4.1.1).

4.   Model of Effect of Tax Avoidance Persistence to Earning Quality

The model is to answer the problem formulation as second hypothesis H2. This study using earning pesistence as measured of earning quality which is the best measure associated to persistence of tax avoidance.

Hanlon (2005) in view of the persistence of earnings, using autoregressive model with one lag following:

$$PTBI_{t+1} = \gamma_0 + \gamma_1 PTBI_t + \vartheta_t \qquad (3)$$

With the same application with the persistence of tax avoidance in model (1), lag variables that may affect more than one year, the basic model became the persistence of earnings:

$$PTBI_t = \gamma_0 + \gamma_1 PTBI_{t-1} + \gamma_2 PTBI_{t-2} + \dots \gamma_p PTBI_{p-1} + et \qquad (4)$$

Following the same procedure with the persistence of tax avoidance which follows Kormendi and Lipe (1987), the size of the persistence of earnings revisions are also using the present value of the expected future earnings (PVR), in this case of the model 4.2.3.2. With PVR result of calculation of a model of coherent waktuγ persistency and interest rate δ and this study also uses risk free rate δ, then the size of the persistence of earnings calculated using the following formula:

$$PVR\_Xj = \frac{1}{(1-\delta)(1-\sum_{i=1}^{N} \delta^i \gamma_i)} - 1 \qquad (5)$$

Where

PVR_Xj   = measure of the persistence of earnings

δ   = *risk free rate*, which is the government bond yield.

γ_i = beta coefficient with lag y model (4.2.3.2).

So that the model used to test the hypothesis H2 is:

$$PVR\_Xj = \beta_0 + \beta_1 PVR\_TAPj + \beta_2 Control + \vartheta_t \qquad (6)$$

Dimana :

PVR_X_j =   Earnings persistence, the proxy will be used, PVR of future profits expected from the model (4)

PVR_TAP_j =   The persistence of tax avoidance. With the proxy to be used, PVR of ETR expected future model (1).

Control   =   The control variables comprising:

$Size_j$ =   Log on average of total assets

$\sigma(Invlnt)_j$ =   The standard deviation of the ratio of inventories to total assets

$\sigma(Caplnt)_j$ =   The standard deviation of the ratio of depreciation to sales.

BTE_j =   *Barrier to entry*, log the average number of companies in the industry

Hypothesis in statistical format is as follows:

$H_3a: \beta_1 > 0$

While expectations for the control variable:

$B_2 >, \beta_3 < 0, \beta_4 < 0, dan \beta_3 > 0$

5.   Variable Measure

Tax avoidance in this study followed the general definition made by Hanlon and Heitzman (2010) which summarizes the range of tax avoidance from being compromised with the accounting rules to the offense. Then the most appropriate measure is ETR:

$$ETR = \frac{Tax\ Expense}{Pre\ Tax\ Book\ Income} \qquad (7)$$

To control the tax rate (Statutory Tax Rate) Different and tariff changes in a different year, estimation will be conducted with ETR scaled to the STR.

The persistence of tax avoidance (PVR_TAP) is using a revised present value (PVR) on ETR of the model (1) which is reflecting the persistence rate of tax on each company and persistence of earning (PVR_X) is using a revised present value (PVR) on earning of the model (4). PVR is computed using the formula Kormendi and Lippe (1987) follows:

$$PVR = \frac{1}{(1-\delta)(1-\sum_{i=1}^{N}\delta^i\beta_i)} - 1 \qquad (8)$$

Where β is the coefficient on the model (1), δ is the rate of interest, i is the number of years and N the number of years used.

Earnings persistence Variable is the coefficient $\beta 1$ model (3), which shows the relationship of the time series of earnings.

$$PTBI_{t+1} = \beta_0 + \beta_1 PTBI_t + \vartheta_t \qquad (3)$$

6. Control Variables

Lev (1983) and Ismail and Choi (1996) mentions the variables that influence the persistence of earnings is firm size (Size), the intensity of supplies (InvInt), capital intensity (PPE) and barriers to entry industry (BTE).

Size, company size measured by the Log Total Assets.

InvInt, Inventory Intensity is measured by the ratio of inventories to total assets lag

CapInt, capital intensity, measured by the ratio of PPE to lag gross total assets and

BTE, Barrier to Entry, barriers to entry the industry measured by the log of the number of companies in the industry. Where more number of companies means more easily and positively associated with persistence of earnings.

Data will be analyzed using ordinary least squares and autoregressive regression in first model and cross-sectional ordinary least square in the second model. Ordinary least squares and autoregressive regressions are made on testing the persistence of tax avoidances and persistence of earnings. While the cross-sctional ordinary regressions are conducted on the effect of persistence of tax avoidance to the persistence of earnings.

Classical assumptions OLS regression which is the condition will be met which include data normality, multicollinearity test, the data heteroscedasticity test and autocorrelation test. Except on auto regression both on the persistence of tax avoidance and persistence of earnings that do not require the classical assumption (Gujarati, 2009)

Normality of the data will be calculated using the Jarque-Berra residual test, and normal curve. Normalization of data will be done by removing the extreme values both positive and negative. Multicolinearity test data using Spearman correlation test. Test heteroscedasticity are using White-hetero. In testing the persistence of tax avoidance, time series analysis test will be done considering persistence is the relationship between time on the same variable.

Result

1. Persistence of tax avoidance

The result of the following regression equation is shown in Table 2.

$$ETR_t/STR_t = \beta_0 + \beta_1 ETR_{t-1}/STR_{t-1} + \beta_2 ETR_{t-2}/STR_{t-2} + \ldots\ldots+$$
$$\beta_p ETR_{p-1}/STR_{p-1} + e_t \qquad (1)$$

The estimation of the above equation is done with autoregressive ordinary least squares with the help of E-views, which can perform individual regression of each sample simultaneously. This is the estimation that can produce different β_n coefficient for each firm. The estimation is

performed for each company in each country. The regression results for each country can be found in appendix. The estimation result for each significant sample shows result as expected, with a value between 0 and 1 and is not close to 1. A persistence test which is significant generally happens up until lag-5; in the test for up until lag-6, there is a lag which no longer significantly affects its dependent variable. The following are the descriptive statistics of coefficients from the results of the above model for estimation with 1 lag.

Table 2. Result for Signifant estimations from model (1)

	All	Indonesia	Philippines	Singapore	Thailand	Malaysia
Significant at 1%	101	17	17	12	29	26
Significant at 5%	72	10	8	16	13	25
Significant at 10%	57	10	5	12	9	21
Total Significant Results	230	37	30	40	51	72
Persentage Significant at 1%	11.10%	12.06%	19.77%	5.58%	18.13%	8.44%
Persentage Significant at 5%	7.91%	7.09%	9.30%	7.44%	8.13%	8.12%
Persentage Significant at 10%	6.26%	7.09%	5.81%	5.58%	5.63%	6.82%
Persentage Total Significat Results	25.27%	26.24%	34.88%	18.60%	31.88%	23.38%

As seen from the above description table, 25.27 % of total sample shows significance on the estimated model of tax avoidance persistence with the details of 11.1% at 1% level; 7.91 % and 6.26% at 10% level. Comparing to the average of total sample, it can be seen that the results of Indonesia, Philippines and Thailand indicate more companies with significant persistence level of tax avoidance with persistence level of 26.24 %, 34.88 % and 31.88 %, respectively; while Singapore and Malaysia have lower-than-average persistence level of tax avoidance, with persistence level of 18.60 % and 23.38 %, respectively. The country with the highest persistence level is Philippines while the lowest one is Singapore.

Meanwhile, according to the industry, the significance distribution of companies persistently carrying out tax avoidance is described in Table 3. The industry categories used in this study are categories classified by Thomson Reuters. With the significance average of 25.27%, it can be seen that several industry categories have significance level that is far above average, i.e. Banks, Electricity, Food and Drug Retailing, Mining, Mobile Telecommunications as well as Oil and Gas Producers. Categories of companies with value which is far below average include Forestry and Paper Products, Gas, Water and Multi-utilities, Personal Goods, Software and Computer Services as well as Support Services. Meanwhile, other companies are circa the average.

Table 3. Number of significant estimations from model (1) in industries.

Industry	Populasi	Sampel	Sig.	Percent	Mark
Automobiles and Parts	49	19	4	21.05%

2.   The Effect of Tax Avoidance Persistence on Earnings Persistence

For the effect of tax avoidance persistence on earnings persistence, the estimation process is done with the following equation model:

$$PVR\_Xj = \beta_0 + \beta_1 PVR\_TAPj + \beta_2 Control + \vartheta_t \qquad (6)$$

The estimation is performed for each PVR with 2 lags until 4 lags, with control variables of the average log of total assets, inventory intensity, capital intensity and barrier to entry (BTE) in addition to dummy variable of country.

3.   Descriptive Statistics

The descriptive statistics for variables used in the estimation with 2 lags are described in TableX below. The average value of PVR_X is 0. 065493 with a minimum value of -0.004563 and a maximum value of 0.233856, while the average value of PVR_TAP is 0.051383 with a minimum value of -0.01524 and a maximum value of 0.0205429. After elimination, no value of PVR_X and PVR_TAP which are too extreme; likewise with the values of control variables, be it LogAvgTA, SD(Invlnt), SD(Caplnt) or BTE. The residual value shows the Jarque-Bera test score of 5.781489 with Prob score of 0.055535, which indicate the residual model has a normal curve and fulfill the requirement of data normality for OLS. The normal curve is presented in Figure 1.

Table 4. Descriptive Statistic

	Mean	Median	Max	Min	StdDev.	JarqBera	Prob.
PVR_X_j	0.065493	0.055964	0.233856	-0.004563	0.039258	562.1739	0
PVR_TAP_j	0.051383	0.044501	0.205429	-0.01524	0.030871	657.542	0
$LogAvgTA_j$	5.989891	5.733797	10.89943	0.477121	1.53002	130.8674	0

PVR_X_j	=	Persistences of earnings, which are PVR of coefficient from model (4)
PVR_TAP_j	=	Persistences of tax avoidances. which are PVR of coefficient from model (1).
$LogAvgTA_j$	=	Log on average of total assets
$SD(Invlnt)_j$	=	The standard deviation of the ratio of inventories to total assets
$SD(Caplnt)_j$	=	The standard deviation of the ratio of depreciation to sales.
BTE_j	=	*Barrier to entry*, log of number of companies in the industry

N = 524

4.   Correlations Analysis

The correlations among PVR_X, PVR_TAP, LOGAVGTA, SD(Invlnt), SD(Caplnt) and BTE are described in Table 5 below. The correlation table shows that in the individual relationship, PVR_TAP, LOGAVGTA, SD(Invlnt), and BTE indicate a significant relationship with PVR_X variable, with positive signs for both variables of PVR_TAP as well as LogAvgTA, and negative relationship with SD(Invlnt) variable, except for SD(Caplnt) which does not have a significant relationship with PVR_X. In the relationship among independent variables, PVR_TAP has a significant correlation with LogAvgTA and BTE, but still within the safe bound of multicollinearity with correlation of 0.50838 with LogAvgTA and -0.17392 with BTE.

Table 5. Correlation Matrix

5.   Regression Result

Hypothesis 2 is tested using model (6), whose result is shown in Table 6. PVR_Xj variable is the earnings persistence obtained from the revised Present Value of model (4), calculated using equation (5). PVR_TAPj variable is the tax avoidance persistence obtained from the present value reason? of model (1), calculated using equation (2); this method is similar with the calculation of PVR_Xj variable. The test is performed using model (1) and (4) with 2 Lags, 3 Lags dan 4 Lags. As the results are quite similar, discussion is focused on the equation with 2 lags, considering the model explanatory power weakens along with the addition of lag – which is shown by the value of Adjusted R Square that decreases in lag 3 and lag 4. The test results with 3 Lags and 4 Lags can be found in appendix.

The result demonstrates that PVR_TAP has a positive and significant relationship with PVR_X, denoting that hypothesis 2 is accepted, which means tax avoidance persistence positively affects earnings persistence. This result has been controlled by LogAvgTA, SD(Invlnt), SD(Caplnt) and BTE variables; whereby LogAvgTA indicates a positive and significant result as initially expected, SD(Caplnt) shows a negative and significant result as expected, while SD(Invlnt) shows an insignificant result with negative sign and BTE signifies an insignificant result with positive sign. In the second test with the addition of dummy variable of country, it can be observed that the results are consistent with the test without the control of country dummy variable, which indicates different country characteristics does not change the effect of tax avoidance persistence on earnings persistence. In this test, a better result is shown by a control variable of SD(Invlnt) which signifies a negative and significant result as expected.

Discussions and Implications

On a theoretical level, previous study on long-run persistence has been conducted by Crocker and Slemrod (2005). Dyreng et al (2008) examine long-run tax avoidance measure with Cash ETR but do not observe corporate tendency in tax avoidance. Another study that observes long-run tax avoidance is Lee and Swanson (2012), which descriptively sees an increasing tax avoidance behavior through presentation of data from the year 1990 up until 2007. It is the first study that shows the existence of tax avoidance persistence in the long-run and the relationship between tax avoidance persistence and earnings persistence.

The findings show the presence of tax avoidance persistence carried out by companies in South East Asia which are selected as a sample in this study. As expected, the estimation result of each company that shows a significant result circa between 0 and 1 and is not close to 1, which means tax avoidance persistence on a decreasing level.

The percentage of companies persistent in avoiding tax differs in each country. With the average of total companies of 25.27%, Indonesia, Philippines and Thailand stay above average while Singapore and Malaysia stay below average. This study has not gotten as far as providing the reason of the difference, which is an interesting topic that can be examined for further study.

Observing from the industry category, the persistence of tax avoidance also shows differing levels. Companies in industry category of Banks, Electricity, Food and Drug Retailing, Mining, Mobile Telecommunications as well as Oil and Gas Producers have a much more higher persistence level than other companies; while companies in the industry category of Forestry and Paper Products, Gas, Water and Multiline Utilities, Personal Goods, Software

and Computer Services as well as Support Services have a persistence level that is far below average. Some companies in other categories have a persistence level that is around the average. This study also has not observed the reason why there is a difference in the tax avoidance persistence level in different industries. This research opens up the opportunity for the next research to examine what are the factors that affect the persistence of tax avoidance, as well as to observe further whether this tax avoidance persistence can also be observed from the aggressiveness perspective of tax avoidance, such as if the tax avoidance persistence level and different industry category also determine the level of companies in carrying out a more aggressive tax avoidance.

This study also provides empirical evidence that tax avoidance attempts in the long run are also carried out in order to increase earnings quality. This is in line with the study of MgGill dan Outslay (2004), which find that some companies make tax as a source to increase profit. Although making tax avoidance persistence as a measurement for company performance has a different viewpoint between government and company, in practice, empirical evidence shows that tax avoidance persistence has a positive impact on earnings quality. It still needs to be examined further whether this tax avoidance persistence is more because of tax avoidance that comply with regulations or tax evasion that breach regulations.

Observing from government's point of view, the persistence of tax avoidance is not good for government revenue from tax sector. The tax avoidance persistence indicates a decrease in state revenue, even though sometimes officials do not realize it as the total revenue can still be the same or even greater – but individually, many companies continue attempting to avoid tax. Government or other policy makers need to continuously evaluate their tax regulations to suppress corporate tax avoidance.

Conclusion

This study manages to prove that some companies are persistent in carrying out tax avoidance. In such companies, it can be seen that in general, the persistence is on a declining trend. Each country in South East Asia shows a different level of persistence. Likewise, each industry category also shows different persistence level of corporate avoidance. These differences offer an opportunity for the next study to observe what cause the differing levels.

This study also proves the existence of a positive relationship between the persistence of tax avoidance and earnings persistence. This indicates there are companies that are consistent in carrying out tax avoidance behavior in order to maintain the level of earnings quality.

There are several limitations of this study. First, we only examine one aspect of earnings quality, which is earnings persistence. There are other measures of earnings quality, such as earnings management, earning smoothing, and earnings response coefficient. We already include country dummy variable to control differences between countries. However, there is a possibility that there are other country level factors that may affect our results.

TAX NON COMPLIANCE BEHAVIOUR AMONG HIGHER LEARNING EDUCATION INSTITUTION IN MALAYSIA

Saifulrizan Bin Norizan, Kolej Universiti Poly-Tech MARA, Malaysia

Abstract

This present study attempts to investigate the underlying reasons for non compliance behavior among higher learning education institutions in Malaysia. Tax non-compliance among individual taxpayers may have an impact on the collection of tax revenue to the government,The main purpose of this study was achieved by examining the relationship between tax non-compliance behavior as dependent variable while lack of tax knowledge, tax complexities, compliance cost and burden and ethic behavior as an independent variable. Data was gathered through survey with 271 respondents and analyzed using SSPS. The finding shows that there are two out four variables that have a significant relationship towards tax non-compliance. Therefore, the main purpose of the study is to identify the factors of tax non-compliance among higher learning education institutions. The results also show that there is a need for collaborative and collective effort from various parties such as individual taxpayers, tax practitioners and tax authority to shape and sustain a good environment of tax practices in Malaysia.

Keywords: *Tax Non-Compliance, Tax practitioners, Revenue*,

Introduction

Managing tax compliance is a complex issue for every country and Malaysia is no exception. Taxes are the one of the main sources of income because it can generate revenue for our country. According to Abbasi (1985), taxes and states are complementing each other. The main aspect for the development of a country's tax system is its effectiveness and efficiency in managing the taxation. Singh (1995) stated that Malaysian government used funds collected from the various taxpayers in order to provide facilities to the benefit of public as whole. The Ministry of Finance through Inland Revenue Board Malaysia (IRBM) is responsible to ensure that the tax collected are allocated and distributed properly to the various of economic sectors. This is because taxes collected by IRBM will then be used for operating and development expenditure. This is important to ensure the prosperity and sustainability of the state in achieving Vision 2020. There are two types of taxes that had been imposed by government to the public namely direct tax and indirect tax. Both taxes are also known as tax revenue or main source income to the Malaysian government. Examples of direct taxes are individual income tax, petroleum tax, corporate tax, real property gains tax and stamp duty. While, import duty, excise duty, good and service tax are example of indirect taxes. According to Ministry of Finance, in Budget 2014, the tax revenue collection is estimated at RM224.1 billion which is increase by RM4 billion compared the previous year which is it quite unexpectedly shows that the increasing of tax revenue can contribute to the national income for that year. In order to ensure the effectiveness and efficiency of tax collection, there are two government agencies that are responsible to manage the tax administration system in Malaysia namely Inland Revenue Board Malaysia (IRBM) that responsible in collecting direct tax while Royal Malaysian Custom Department (RMCD) is responsible in collecting indirect taxes. In order to determine the amount of revenue generated by the Malaysian government, the willingness of the taxpayers to comply with tax laws and regulations of the country is important. Indeed previous study done by Kirchler (2007) stated that non-compliance behaviour still exist if the individual taxpayer fails to comply to the tax rules and laws. Further, research done by Roth et al (1996) and Soos, (1991) found that tax non-

compliance behaviour exist because individual taxpayer do not declare actual income, fail to file tax return form and much more. It is important to ensure the tax is fairly distributable to the public. Tax compliance is the major factor that only affecting tax revenue collection to government. For example, when the level of tax non-compliance is high total government revenue collection was affected and government programs could not be implemented. Tax revenue collected by the IRBM in year 2011 (RM109.609 billion), in 2012 (RM124.88 billion) and 2013 (RM129 billion).The increase of tax collections for those years which was managed effectively and efficiency by the IRBM. Therefore, the aim of this research is to study on the tax non-compliance behaviour among higher learning education institutions with specific to identify the factors of tax non-compliance, to examine the relationship of the four independent variables that affects tax non-compliance and to recommend the possible ways in improvement of tax non-compliance among higher learning education institutions.

From this research, it is hoped that it will provide a clear understanding to IRBM about what are the factors that will affects tax non-compliance behaviour among taxpayers in Malaysia. Indirectly, it can assist IRBM in formulating new guidelines, requirements, procedures and policies to enhance the tax collection among the taxpayer in Malaysia. Results obtained from the objectives of this study will provide the benchmarking to IRBM to strengthen its strategies in improving tax non-compliance among salaried tax paying individuals. Also, the findings of this research will help the government to establish the necessary legislative and administrative measures to ensure that individual taxpayers will comply with tax requirements.

Literature Review and Hyphoteses Development

The growth of tax system in Malaysia has given many effects for various taxpayers such as sole proprietorship, partnerships, cooperatives and salaries workers. Kasipillai & Shanmugam (1997) reported that the tax system in Malaysia was first introduced by Malay rules in year 1910.

The factors that affect tax non-compliance behavior among higher learning education institutions will be analyzed in this research. The four relevant factors under this research are tax complexities, tax compliances cost and tax burden, ethics behaviours and lack of tax knowledge which it gives serious impact to revenue collection to the country. As mentioned by Oh Teik Hai and Lim Meng See (2011) there are 64 factors that affect tax non-compliance behaviour among taxpayer or company based on study done by Inland Revenue Services of USA such as gender, tax knowledge, income and many more. Tax non –compliance refers to those who do not obey with the tax rules and regulations set by the government which it affects the tax revenue collection to the country. Previous findings show no precise definition that related to tax non-compliance among taxpayers. Swingen (1991), Hasseldine and Li (1999) and Devos (2009) claimed that tax compliance can be define as filing all required tax return forms that are important in stipulated period of time and must report the correctly tax liability based on rules and regulation, tax code and court decision that establish by tax authority. Roth, Scholz, and Witte (1989) reported that according to Internal Revenue Service (IRS) tax compliance is a complex system which individual taxpayer must declare their income in voluntarily, calculate their chargeable income with correctly and must submit tax return form in a given period of time to tax authorities. Kirchler and Wahl (2010) stated that the intention of taxpayer to pay their income tax to tax authorities is important in determining the tax compliance behaviour. Section 113 (1) of Income Tax Act (1967) stated that one of the tax offences that derived from non-compliance behaviour is taxpayer fail to provide right information and return forms to tax authority.

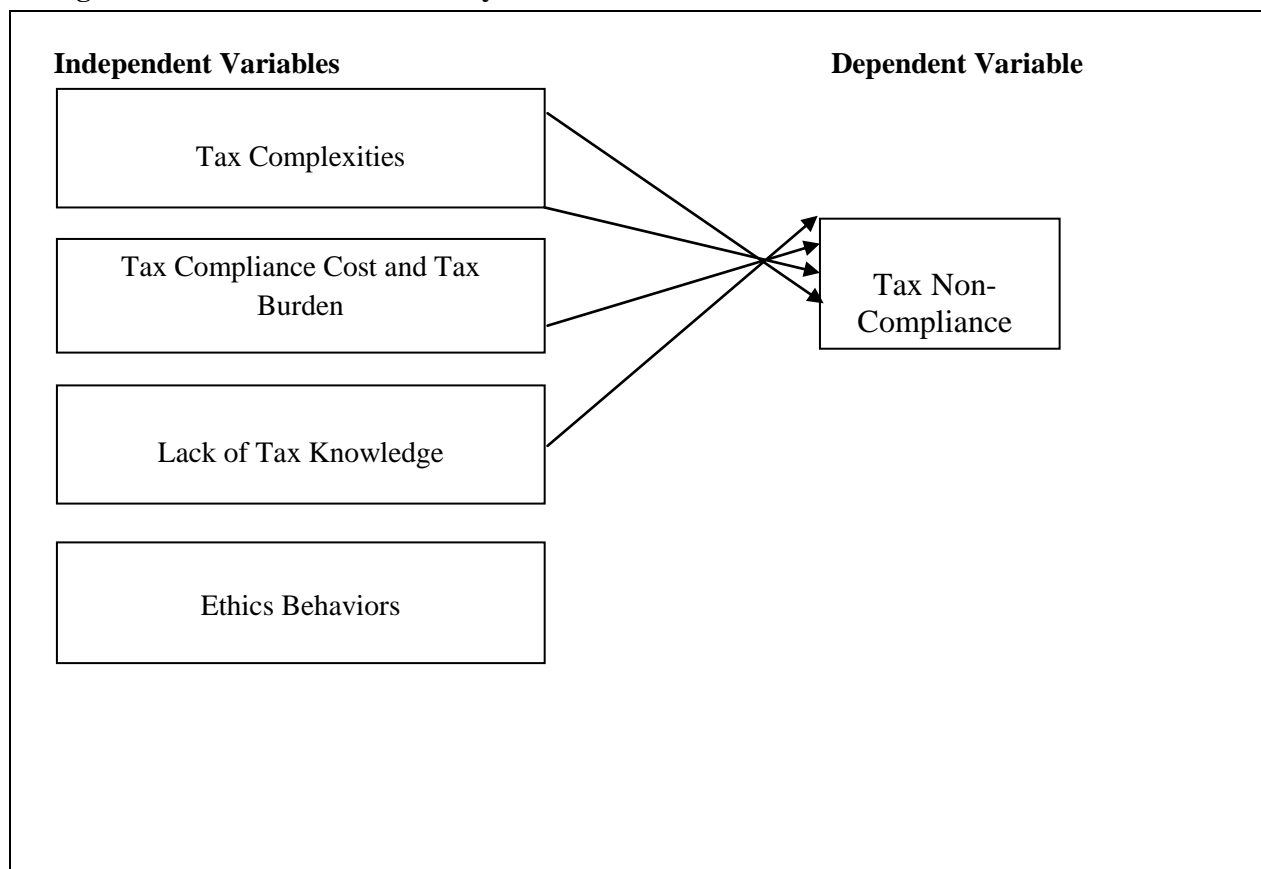
This following research framework consists of the four (4) factors of tax non-compliance 1) tax complexities, 2) tax compliance cost and tax burden, 3) lack of tax knowledge and 4)

ethics behaviours that represent the independent variables whereby the tax non-compliance represents the dependent variable.

Figure 2.1: Framework of the study

Independent Variables | Dependent Variable

- Tax Complexities
- Tax Compliance Cost and Tax Burden
- Lack of Tax Knowledge
- Ethics Behaviors

→ Tax Non-Compliance


Coskun and Savasan (2009) stated that, complexity can be defined as unwanted feature of a tax system as it enhances the opportunity by individual taxpayer to evade from paying the taxes.According to Natrah Saad (2014), there are four types the complexity of tax such as computational complexity, forms complexity, rule complexity and procedural complexity. Mohd Hanefah (1996) stated that the Malaysia tax is very complex, confusing and change regularly that will affect the tax non-compliance. The main obstacle of tax non-compliance among individual taxpayer is the tax law itself because of the tax law in a certain country is very complicated and difficult to understand by individual taxpayers and this may affect their payment of tax within the stipulated period of time. Thus, IRBM should think of an effective technique to make sure individual taxpayers fully understand the tax law that implement by the country. While Kasipillai al.(1999); Sheikh-Obid,(2004);Choong & Lai, (2008) reported that the complexity of tax law system in Malaysia will result in the growing high number of tax non-compliance which may be unintentional among individual taxpayers. But Pope and Abdul-Jabbar (2008) were arguing that the increasing level of tax compliance among individual taxpayers can be achieved by simplification of the Malaysia tax laws and regulations. Therefore it is hypothesized that:-

H1: **There is a significant relationship between tax complexities and the tax non-compliance among higher learning education institutions.**

Compliance cost can be defined all costs connected with the obeying the tax law and regulation. Tran Nam *et al* (2000) defined that tax compliance costs is the cost incurred by individual taxpayers in meeting tax requirement and therefore it is important that they pay

their tax within stipulated period of time to tax authorities. In Malaysia, taxpayers may get assistance and support from tax advisors which will increase their compliance cost (Sapiei, Abdullah 2008 Ern et al 2010). There are two types of compliance cost namely internal and external cost (Loh et al 1997 Sapiei and Abdullah 2008 Ern 2010). Tax compliance costs focused more on individual taxpayers because they incurred a lot of costs in order to comply with tax law and rules in paying their income tax to the tax authority. According to Abdul-Jabbar & Pope (2008a) & (2008b) there are three element of compliance costs that are related to non-compliance factors namely monetary cost, time cost and psychological cost. The costs of compliance are the cost incurred by individual taxpayer that derive from complying tax requirements such as the cost of hiring tax accountants, submission of tax return and many more. OECD (2003) noted that the higher the compliance cost, the higher the tendency to non-compliance behaviour. Compliance cost is higher because it involves cost to make sure tax computation correctly reflect the taxpayer's liability. There are three aspects of compliance costs in determining tax payable namely unpredictability, difficulty and manipulability Therefore, the second hypothesis is derived as follows:-

H2: There is a significant relationship between tax compliance cost and burden and the tax non-compliance among higher learning education institutions.

In computing the income tax payable to the tax authorities with correctly, tax knowledge is important aspect to every taxpayer. Khadizatul Asrin Bt Mazlan (2012) stated that in order for taxpayers to be more tax literate and knowledgeable on tax law system in Malaysia, they need to fully understand their responsibilities and duties to submit tax returns, taxability of income, penalty as well as learning how to use the E-Filing. Without sufficient and adequate information on tax knowledge, the taxpayer may misinterpret and misunderstand the rules in the tax law. On the issue of understanding of the tax law system in Malaysia, it shows that a greater number of individual taxpayer demonstrated poor understanding of the tax laws. This is because the tax law are written in a language that is not easy to understand and to apply.
Collins, Milliron and Toy (1992) believe that one of the main factors resulting in tax non-compliance among individual taxpayer from Southwestern and Northeastern United States is their low tax knowledge. In Malaysia, the level of tax knowledge among individual taxpayers is different, thus contributing to tax non-compliance. Loo et al (2009) reported that in order to ensure that the individual taxpayers voluntarily in paying their income tax to the tax authorities, they must have sufficient knowledge and understanding of tax laws and rules to avoid tax non-compliance. Bardai (1992) also stated that tax knowledge is important to individual taxpayers in order to pay their income tax with correctly. While Groenland and Veldhoven (1983) found that even taxpayer with good understanding and knowledge about tax laws and rules, the tendency to non-compliance among them was still high because paying tax has no benefit to them or in other words they do not fully understand the important of paying tax to the tax authority. In addition, Eriksen and Fallan, (1996) stated that in order to examine the taxpayers' behaviour to tax system in a country, the individual taxpayers should fully understand what is the country's tax laws and regulations applicable for its tax system and structure. Palil and Lymer (2009) concluded that after the implementation of self-assessment system (SAS) in Malaysia, tax knowledge become the primary factor in tax compliance behaviour. This research is supported with a study done by Loo (2006) and Loo et al., 2009) where tax knowledge can directly affect tax compliance behaviour after the development of SAS in tax system. Therefore, the third hypothesis is derived as follows:-

H3: There is a significant relationship between lack of tax knowledge and the tax non-compliance among higher learning education institutions.

Taxpayers' ethics and morals are believed to have positive effect on their behavioural intentions. In Malaysia, taxpayers realized that it is their legal and moral obligation and responsibility to submit tax returns and pay their taxes within stipulated period of time to the tax authorities (Ho et al, 2006 Ern et al, 2010). An individual taxpayer who fail to fulfil their responsibility or obligation to pay the tax is considered as unethical and immoral and should be penalize (Kasipillai et al ,2008). Ho and Wong (2008) stated that in order to evade the penalties, the ethical taxpayers need to obey the tax rule and regulation. In contrast, the individual taxpayers is said to be unethical if they do not comply with laws and regulation for tax compliance. Researchers also believe that there are a lot of factors influencing individual taxpayers to commit to an unethical behaviour such as attitude of individual taxpayer to risk; the expected benefits that may get from unethical behaviour and many more will contribute to non-compliance behaviour. Several studies have been carried out and it has been proven that taxpayers with high knowledge tend to have positive learning in their tax ethics compared to those with low knowledge (Singh,2003). Trivedi (2005) and Henderson & Kaplan (2005) reported that individual taxpayers' behavior is influenced by their ethics or morale. In other words their unethical behavior may lead individual taxpayer in Malaysia to perform non-compliance behavior. While Kohlberg (1981) stated that in order to enhance their relationship with others, the individual taxpayers must have higher ethic or moral reasoning so that they can comply in paying of their income tax in voluntarily. In Malaysia, ethics have a positive influence on compliance behaviour among individual taxpayers that translates into voluntarily payment of their income tax. Therefore, the fourth hypothesis is derived as follows:-

H4: There is a significant relationship between ethical behavior and tax non-compliance among among higher learning education institutions.

Research Methodology
The main focus of this research is on the individual taxpayers who derived income from employment in Malaysia. Therefore, data for this research is taken by distributing the questionnaire among 271 academic staff who worked in higher learning education institutions in Malaysia. A convenience sampling method was used rather than a random sampling because it was considered much more likely to produce a real number of responses from respondents The questionnaire used in this study consists of three parts. Part A contains eleventh questions regarding the demographic profile which gender, age, race, level of education, level of position (profession), length of services, mother tongue language, types of assessment, zakat, cash donation, paying Malaysia income tax or not could be used to analyze whether there is any relationship between demographic In Part B, respondents were asked about factors that contribute to tax non-compliance among higher learning education institutions in Malaysia such as lack of tax knowledge, tax complexities, tax compliance cost and burden and ethic behaviour. Likert Five-point Scale is taking place in this section where respondents are required to evaluate their behaviour on each of the items based on the scale : 1 = Strongly Disagree, 2 = Disagree, 3 = Not sure (Natural) , 4 = Agree, and 5 = Strongly Agree. In Part C, respondents were asked about academician's general opinion on taxation system in Malaysia. In order to ensure analysing process is easy and the respondents can answer the question with completely and honestly, the all questions are design into closed ended form of statement in order. For each question in all parts, respondent are required to choose only one answer. The area of sampling frame is focus on the higher learning education institutions in Malaysia where 800 respondents who are the academic staff will be tested. However, only 271 questionnaires (30%) managed to be collected. All information related to

the survey responses and the name of each respondent will be kept confidential for the purpose of this survey only.

Result and Discussion

The response rate was about 33.88% (271 respondents) of the 800 distributed questionnaires. The majority of the respondents were 99 % is Malay and 69% is female. Most of the respondents are between 65% is 26-34 years old and most of them have Masters Degree in various field. To ensure that the measurement of the attributes or variable is valid, test has been undertaken. The reliability test were undertaken to determine the consistency of the answer given by respondents in answering the questionnaires. Based on Chua (2013,p.147), the minimum requirement to determine the reliability is at alpha value of 0.65. Chua explained that if the alpha value is lower than 0.65, it means the internal correlation between the items of measurement is very weak and is not suitable to be used. On the other hand, George and Mallery (as cited in Gliem & Gliem,2003) regulated that if the alpha value is more than 0.90 is categorized as excellent; 0.80-0.89 is good; 0.70-0.79 is at acceptable range; 0.60-0.69 is questionable; 0.50-0.59 is at poor range and alpha less than 0.50 is totally unacceptable. Table 1 demonstrates that the Cronbach alpha for all variables.

Table 1: Reliability test

Items	Reliability output	Cronbach's Alpha
Tax Complexities	8 items	0.821
Tax Compliance Cost and Burden	10 items	0.695
Lack of Tax Knowledge	5 items	0.612
Ethic Behaviours	6 items	0.754

Note: Commonly accepted rule of thumb is an alpha of 6-7 which indicates acceptable reliability and 0.8 or higher which indicates good reliability (Cronbach,1951).

Referring to Table 1, only three items in the measurements in this study were considered reliable as overall are at good and excellent range, where at 82 percent of confidence interval, the Cronbach's alpha for measurements of variable tax complexities, tax compliance cost and burden and ethics behaviour are higher than 0.70, at the good and acceptable range level; whilst, lack of tax knowledge is achieved 0.6 that considered questionable as well. Even though by deleting some of the items of measurement will increase the alpha, yet, due to high correlation between the items of measurement within the variable, the particular items were remained.

Table 2: KMO and Bartlett's Test

KMO and Bartlett's Test		
Kaiser- Meyer-Olkin Measure of Sampling Adequacy		0.600
Bartlett's Test of Sphericity	Approx. Chi- Square	600.655
	Df	10
	Sig.	0.000

Table 2 shows the validity test was conducted in order to test the accuracy of a measure or the extent to which a score truthfuly represent a concept. It was required to test the Kaiser Meyer Olkin (KMO) to measure of sampling adequacy (Zhang et al.,2003). Table 2 showed the value of KMO is 0.600. According to Field (2013,p.684), value more than 0.5 would be accepted as suggested by Kaiser (1974). Therefore the value of 0.600 was acceptable and would be confident that the sample sizes are adequate for validity test. Meanwhile, Barlett's test Sphericity tests the null hypotheses that the original correlation matrix is an identity matrix (Field,2013,p.695). The significant test is needed and the large number of sample sizes

used in this current study would certainly be significant which is <0.001.This test result was 600.655 (p<.001), which confirms the adequacy of using validity test.

Table 3: Correlation between Variables

	Tax Complexities	Tax Compliance Cost and Burden	Lack of Tax Knowledge	Ethics Behaviour	Tax Non-Compliance
Tax Complexities	1.000	0.441	0.171	0.904	0.327
Tax Compliance Cost and Burden		1.000	0.097	0.391	0.206
Lack of Tax Knowledge			1.000	0.037	0.175
Ethics Behaviour				1.000	0.363
Tax Non Compliance					1.000

The Pearson's Correlation Coefficient test was used to measure the strength between attributes or varaiblles as presented in Table 3. Pearson correlation is used to examine the correlation between two variables, and it helps in determining if there is a relationship between the construct in the study. Pearson correlation values of 0.3 to 0.4 indicate that the variables are moderately correlated , Pearson correlation values of more than 0.4 illustrate that the variables are largely correlated and correlation value of less than 0.3 indicate that that the variables has a weak and low positive correlated. In this study, Pearson correlation analysis is used to answer four (4) main research objectives. Table 3 above illustrates the relationship among the variables. Overall result as presented in Table 3 shows that the correlations between variables are low and moderately correlated to each other, meaning that there is no cases of multicollinearity problem exist. Thus, none of the variables are being rejected from this study.

Model 1:
The regressions equation is:
$$TNC = \beta_0 + \beta_1\ TC + \beta_2\ TCCB + \beta_3\ LOTK + \beta_4\ EB$$

Table 4.

Variables	Coefficient	t-statistics	P-value
Intercept	1.812	4.489	0.000*
Tax Complexities	0.162	1.263	0.208
Tax Compliance Cost and Burden	1.079	1.222	0.223
Lack of Tax Knowledge	2.295	3.047	0.003**
Ethics Behaviour	2.417	3.569	0.000*
R^2	16.60%		
Adj. R^2	15.30%		
F-statistics (P-value)	13.214 (0.000)**		

Note: **Significant at 0.01 level; *Significant at 0.05 level.

A multivariate analysis was performed on the tax non-compliance behaviour and its explanatory variables. Model 1 is develop to examine the relationship between tax complexities, tax compliance cost and burden, lack of tax knowledge and ethics behaviours with tax non-compliance among academicians' at KPTM. In order to determine how good the

model is, this research firstly looks into the analysis of variance (ANOVA) which represented by F-statistic and p-value in Table 4 above. The F-statistic presented in the table shows that a significant P value of 0.000 which is much more less than 0.005 of significant level. Further, the t-values and the absolute value is equal to 1.00 or less, thus the variables is said to be insignificant or not significant. Based on the result of Model 1 presented in Table 4, the overall explanatory factors of tax non-compliance are statistically significant at 1% significant level with adjusted R-squared of 16.6% (F-value = 13.21; p-value = 0.000). Hence, with this condition, it reveals that independent and control variable explains 16.6% of the variance in tax non-compliance. The low value of R^2 shows that most of the independent variables such as tax complexities, tax compliance cost and burden, lack of tax knowledge and ethic behaviour that selected are not able to demonstrate the magnitude and possibilities on the factors of tax non compliance. It means that only 16.6% of the variance in the tax non compliance rate can be explained by the chosen independent variables and the remaining variance 83.4% are unexplained. This is because may be the other variables such as the gender, income, tax rate, culture and many more that significant in influencing tax non-compliance but all these factors are outside the scope of this study.

Overall, the study revealed the significant relationship between all independent variables and dependent variable under study. The results have notified that lack of tax knowledge and ethical behaviour are the main factors that influence tax non-compliance among academicians. Even though the result reveals that there is no significant relationship between tax complexities and tax compliance cost and burden with tax non-compliance among the academician's staff, these two variables show a positive relationship. In conclusion, tax non-compliance behaviour among the academician's staff is positively influenced by lack of tax knowledge and ethical behaviour.

Conclusion and Recommendations

To be tax compliant, individual taxpayers need to possess some basic knowledge on personal taxation such as taxability of income, deductibility of expenses, entitlements, reliefs, rebates, donation and exemptions in order to compute tax liability correctly. One of the ways to increase voluntarily tax compliance in the future, IRB can increase the number of consciousness by giving a seminar or colloquium on tax education by using different strategies so that, taxpayers in Malaysia generally can be a good citizenship. There are a few limitation exits when research was being undertaken The first limitation is related to the selection of the respondents because this study was only distributed and answered by the respondents who work in higher learning academic institutions, which only covered certain area. Secondly, the distribution of the questionnaires to the respondents is not monitored properly by the researcher. This resulted to less response from respondents because some of the respondents is not fully understand and not clear enough the term and terminologies that has been used in the questionnaires which the tendency of respondent may simply answer the questions is high. This situation may lead to the wrong interpretation and conclusion made. . Lastly, the pilot test was not undertaken by researcher before actual questionnaires are distributed to respondents. Pilot test is important for researcher to determine the weaknesses in designation of questionnaires because it can help the researcher to identify and eliminate the complex and sensitive questions that give problem in answering the questionnaires by the respondents. In general, there are a lot of other areas and field that could be investigated by other researchers for future research. For example, the researcher can used a larger sample such as individual taxpayers who derived income from both employment and business in Malaysia so that, the result can be more conclusive.

Abstract

Hospital as a health care institution, are required to do service innovation in facing the increase number of hospitals in Indonesia that has made inter-hospital competition becomes tougher. This study was a descriptive and explanatory survey that using Confirmatory Factor Analysis (CFA) as method of statistical modeling in evaluating the causal relationship between dimensions of latent variables and shown in a measure of validity and reliability. This research was conducted at the. Outpatient Clinic, Gatot Soebroto Indonesia Army Hospital. The result of this study showed that the entire loading factor in all variables were above 0.70. Composite reliability (CR) generated was 0.913, which is greater than the minimum limit CR suggested, 0.70. The value obtained for average variance extracted (AVE) was 0.724, which is greater than recommended minimum value, 0.50. Development of new services was the most influencing factor to hospital innovation services.

Keywords: *service innovation, hospital, confirmatory factor analysis*
Paper Type: competitive paper

Introduction

Hospital as a health care institution, are required to do service innovation in facing the increase number of hospitals in Indonesia that has made inter-hospital competition becomes tougher. Innovation progression can be done in various ways; thus healthcare institution can have innovation on the service activity. Service innovation can be in a form of new services provided by the institution, new working methods applied by the institution, or the use of newest technology to meet consumer desires (Changkaew in Muslichati, 2015).

Patient is a major consumer of a hospital. According to Jamal and Naser (2002) in Delafrooz et al (2013) customer satisfaction is a key factor for consumers to make purchases in the future, satisfied customers who will recount their experiences in making a purchase to others. This means that patient satisfaction is essential in a hospital.

Therefore, each hospital is competing to innovate their services process and obtain patient satisfaction. Innovation can enterprise new products or services by combining or integrating previous separate products into a new and enhanced product (Gallouj and Weinstein, 1997). Innovative companies, have been leading the convergence trend for some product and revolutionized the product landscape. As the new product released, it becomes increasingly popular and replaces the previous products and thereby can affects the related industries. The purpose of this study was to analyze the factors that influence the services innovation, in outpatient clinic Gatot Soebroto Indonesia Army Hospital, Jakarta, Indonesia.

The remainder of the paper is structured as follows:

1. Service Innovation

Service: Service is described by Sampson and Froehle (2006) as an important role customers play in the service production process, with the key distinction being the customer providing the inputs, versus the customer themselves being the input to the service delivery process, as

cited in Agarwal (2010). Co-produced services view customers as an integral part of service delivery as they simply interact during the transaction, allowing the split of a front- and back-stage approach of a service at any point in the continuum, as written in Agarwal (2011). Services are treated as an application of competencies, making use of knowledge, skills and experience of all stakeholders, taking into consideration the notion of the supply chain and collaborators across both goods and services (Vargo and Lusch, 2008).

2.   Innovation

Innovation can be defined as a process and / or the development and use or mobilization of knowledge, skills, and experience to create or improve a product (goods and / or services), process, and the new system, which gives the value of meaningful or significant, relevant economic and social. Pearce II and Robinson (2009) stated that in the business world, innovation branches from the invention. If someone has already started producing, selling, and marketing goods such findings, then he is doing innovation. They mention that innovation is how the efforts twisted ideas into profit.

Innovation as an object also has a meaning as a new product or service that is available to applications, generally in a commercial context. The diversity of the level of novelty can be distinguished depending on the context. Meanwhile, the innovation as an activity is the creation of innovation is often identified with the commercialization of the invention. Innovation can also be regarded as a new change toward improvement, the other, or different from something that already exists, deliberate and planned or by chance.

According to Fontana (2011), innovation can make economically success by the introduction of new ways or new combinations of old ways in transforming inputs into outputs which resulted in significant changes or drastic in comparison between use-value perceived by the consumer on the benefits of a product (goods / services) and the price set by the manufacturer. Innovation in a broader context meaning means not only economic success, but also social success. Successful innovation is innovation that creates great value for consumers, communities, and the environment at the same time. Innovation is often associated with the development of products, processes, and technology. In fact, innovation can be applied to all parts of the company such as finance, business models, logistics, information technology, marketing, distribution, human resources, and so on.

Barras (1986) was one of the early contributors to a theory of innovation in services. According to Barras (1986), technological advances are the primary driving force behind service innovation. Later studies showed, however, that non-technological forms of innovation, so called service-oriented approaches, are also highly prevalent (Gallouj and Weinstein, 1997). Innovation in the service industry is distinctive due to a lack of standardization and formalization, greater decentralization of innovation activities within the firm and industry, and limited contributions by research and development departments (Ettlie and Rosenthal, 2012). However, service innovations can result in a competitive advantage because of the improvements in service novelty, quality, and customer satisfaction (Hertog et al., 2010; Lovelock and Wirtz, 2011).

3.   Service Innovation

According to Kotler (2012), the service is any action or activity that can be offered by one party to another. Basically, services are intangible and do not consequence in any ownership.

Act of the Republic of Indonesia Number 44/2009 on Hospital, explained that the duty of the hospital is carrying out the health care services in plenary with emphasis on healing and recovery efforts are carried out in harmony and integrated with efforts to improve and prevention as well as the implementation of the referral.

Health care can be included any organized effort in an organization to maintain and improve health, prevent and cure diseases, and restore the health of individuals, families, groups, and communities. Care in hospitals is given from the patient arrives until discharge from hospital (MOH, 2009). Innovation in services is possible in several dimensions through increased productivity, improvement in performance, and new service offerings (Johne and Storey, 1998; Menor et al., 2002; Van Der Aa and Elfring, 2002; Tidd et al., 2005; den Hertog, 2000; DTI, 2007; Kandampully, 2002). In particular, focusing on dimensions of service innovation, den Hertog (2000) developed a service innovation model centered on four key elements of any service innovation, including service concept, client interface, service delivery system, and technological options. Completely new service can be new features and attributes for a service offering. This changes the way employees work (delivery system), relate and interact with customers (client interface), and the way technology is used in business processes (technological options). As such, the concept of service innovation should include organisational forms of innovation as well. (Wernz, 2014; Agarwal, 2010)

Innovations are frequently categorized as radical or incremental. However, these do not capture the full scope and mechanisms of innovations in the service industry (Henderson and Clark, 1990). Gallouj and Weinstein (1997) differentiate between radical, improvement, incremental, ad hoc, re-combinative, and formalism innovations. The integration of medical services by a hospital can be classified as a re-combinative innovation. Re-combinative innovations generate a new service product by combining the characteristics of two or more existing service products, for instance medical services are enhanced by combining them with hospitality services as cited in Wernz (2014). Health care innovation means a process change or reform efforts undertaken by the service provider facility in disease prevention, health maintenance and improvement, as well as the recovery and treatment of individuals and groups who come for treatment to health facilities.

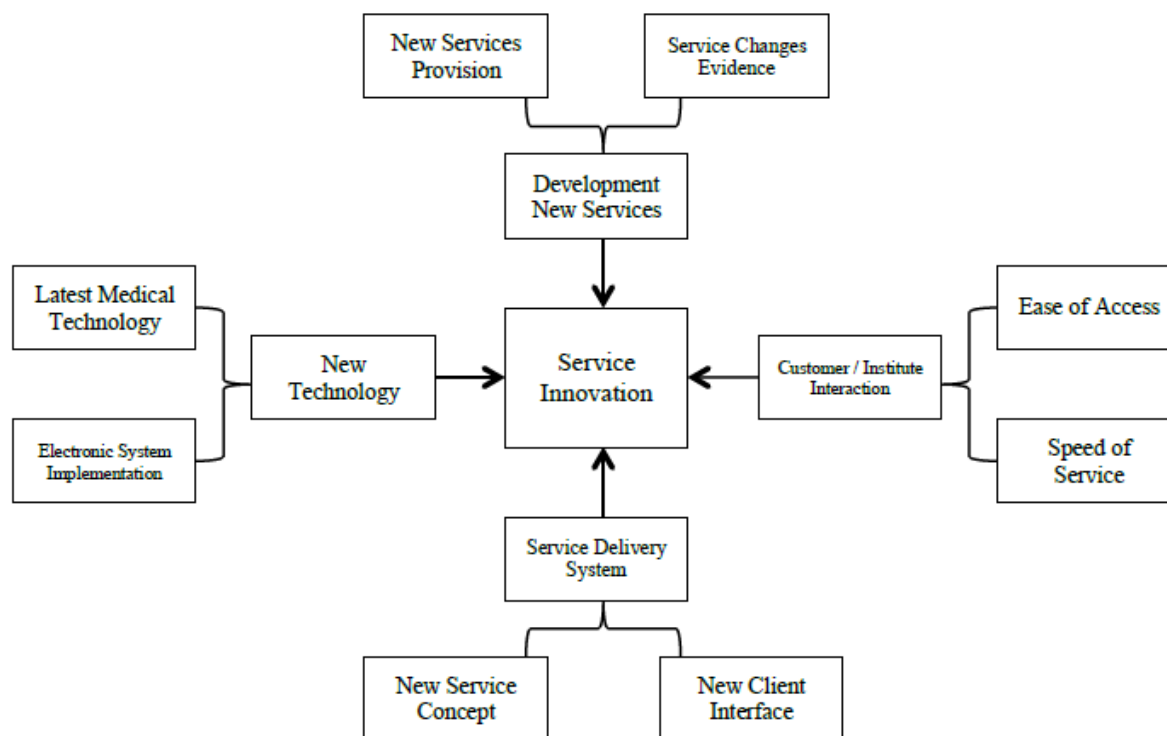
Measurement service innovation can be done through (Delafrooz et al, 2013): Firstly, development of new services. Development of new services is a new service that is applied which is different from the previous services, or improvements to the service process. Forms new service will affect the performance of marketing for the development of services that successfully implemented will increase the company's marketing performance. Vice versa, if the development of such services does not work in practice, the performance marketing companies will decline. Secondly, new technologies. The use of tools that is in accordance to recent technology will facilitate the company in the process of service that will accelerate the company to provide services. The use of technology will enhance consumer privacy, confidentiality, and the effect on communication between companies and consumers so it will able to ease companies in evaluating the service process. Furthermore, service delivery system. The company's service delivery system can be measured by how well the product or service delivered to customers. This includes rapidity, precision, and attention during the delivery process. Finally, customer / institution interaction. Close interaction between the consumer and the company so can make an institution easily know the wants and needs of consumers. Additionally, interaction with customers will enable the company to make repairs in customer complaint.


Figure 1. Service Innovation Model

In conclusion, the study proposes a hypothesis as follows: Hypotheses Testing and Analysis Method

H1: Development of new services is contributed to hospital service innovation
H2: New technologies is contributed to hospital service innovation
H3: Service delivery system is contributed to hospital service innovation
H4: Customer / institute interaction is contributed to hospital service innovation

The model of hospital service innovation is a fit model, as pictured on Figure 2.

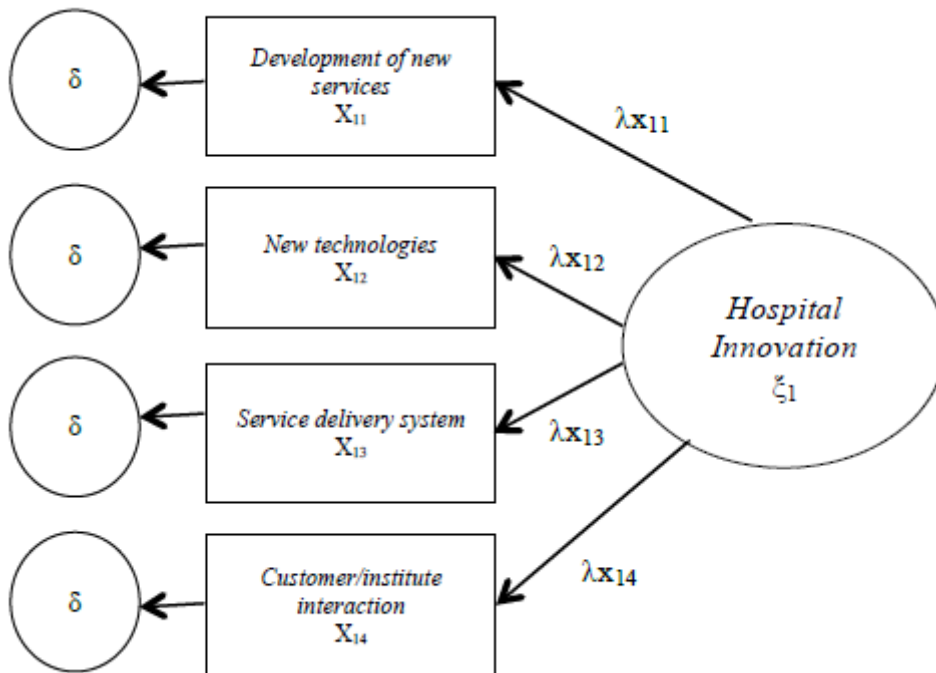
Methodology
The study method used was descriptive survey and explanatory survey. This study describes the causal relationship by testing hypotheses that have been formulated in advance between the variables development of new services, new technologies, service delivery systems and customer/institution interaction to service innovation. This information is collected directly from the field to know the opinion of the respondents to the object being studied.


Figure 2. Structured Model of Hypotheses

Table 1. Operational Variables

Dimension	Indicator	
Development of new services	1.	Provision of new services
	2.	Evidence of the service changes
	3.	Innovative Services
New technologies	1.	Provision of tools and the latest medical technology
	2.	Implementation of an electronic queuing system
	3.	The adoption of new technologies
Service delivery system	1.	Ease of procedure in service
	2.	Provision of online services and digital
	3.	Provision of special services for specific consumer
Customer / institute interaction	1.	Ease of access via electronic media
	2.	Ease of access through the customer service staff
	3.	Speed of service complaints

This study used a technique nonprobability sampling with purposive sampling type. Nonprobability sampling is a sampling technique that does not provide opportunities or equal opportunity for each element or member of the population to be selected into the sample (Sugiyono, 2012). While the sampling is purposive sampling technique with a certain consideration according to the research conducted (Sugiyono, 2012). Determination of the sample size based on the Hair et al (2010) which states that the number of samples taken is at least five times the number of parameters used in the study. The parameters used in this study are 40 parameters so that the number of samples taken is 5x40 = 200 respondents. The

research sample consisted of patients who visit the outpatient clinic in Gatot Soebroto Indonesia Army Hospital during July 2016. The inclusion criteria were including individuals who seek treatment Kartika Pavilion in Gatot Soebroto Indonesia Army Hospital, and individuals who are willing to fill out a questionnaire. Exclusion criteria were including individuals who were unable to read and understand the purpose of the questionnaire and who do not fill out a questionnaire completely.

Data collection methods used in this study is a questionnaire method. A list of written questions needed to be filled by the respondents regarding service innovations. Methods of measurement on the questionnaire were using modified Likert scale. By using Likert scale, measurement of variables was translated into indicator variables. In each item Likert scale instrument has gradation.

1. Reliability and validity

Prior to data collection, content validity was supported by previous literature, interviews, and initial tests. After the data collection, analysis was performed to test the validity and reliability of the constructs.

Validity test used to measure whether questionnaires valid or invalid (Ghozali, 2011). A questionnaire considered valid if the questions in the questionnaire were able to express something that is measured by the questionnaire. Validity indicates the extent to which the precision and accuracy of a measuring instrument in doing measuring function.

Validity testing must be performed on each of the questions on the questionnaire as a measuring tool as a whole. According to Aaker et al., Validity testing was done by using product moment correlation or correlation coefficient. In this study, the correlation coefficient obtained from the corrected item-total correlation that can be done with SPSS for Windows version 23.

Decision making validity based on r result. If r result is positive and r results> r table, then the construct was valid and if r result is negative and r result <r table, then the construct was not valid. R coefficient table αis= obtained0.05%. from the value table product moment by

The total item questionnaire in this study consisted of 40 items of questions. The results of the validity of the test showed that all items proposed questionnaire is valid as shown in Table 2, as follows:

Table 2. Validity Test Result

Variable	Questions Item	Correlation Coefficient (r)
	X1.1	0.786
	X1.2	0.824
	X1.3	0.723
	X1.4	0.723
	X1.5	0.687
	X1.6	0.597
Service Innovation	X1.7	0.824
	X1.8	0.549
	X1.9	0.764
	X1.10	0.821
	X1.11	0.719
	X1.12	0.793

According Ghozali (2011), reliability testing is a tool to measure a questionnaire which is an indicator of variables or constructs. A questionnaire said to be reliable if anyone answers to the above statement is consistent stable over time. Reliability indicates the consistency and stability of the score (scale of measurement). Reliability different validity because the first one focusing on consistency issues, while the second is more concerned with accuracy.

Nunmally in Ghozali (2011) stated reliability test measurement can be done by means of Cronbach's Alpha statistical test with SPSS for Windows version 23. A variable is said to be reliable (reliable) if it has a Cronbach's Alpha> 0.70.

Table 3. Reliability Test Result

Variable	Reliability (*Cronbach Alpha*)
Service Innovation	0.915

Description: All variables reliable due to have a Cronbach Alpha value of more than 0.7

The results of calculation of the value of reliability for all items reliable because all variables Cronbach alpha values greater than 0.7. This indicates that the research data obtained using instruments used are consistent when the instrument is used repeatedly. With the results of validity and reliability that meets the minimum requirements, the research instrument can be used for a study of the main sample.

2.   Descriptive Analysis

Descriptive analysis techniques used to disclose formulation on how is the innovation of service in outpatient clinic, Gatot Subroto Hospital. Steps of the analysis started by describing the frequency and percentage obtained in the form in order to obtain a conclusion. Likert scale used in the study can be used in the descriptive analysis by summing the scores obtained and the calculated percentage of the score to see the proportion of respondents. Processing of the data used in this study is the use of percentage calculations derived from the total score of respondents compared with a total score ideal. Data are presented in tabular form frequency by using a simple percentage to see the size of central tendency.

3.   Verification analysis

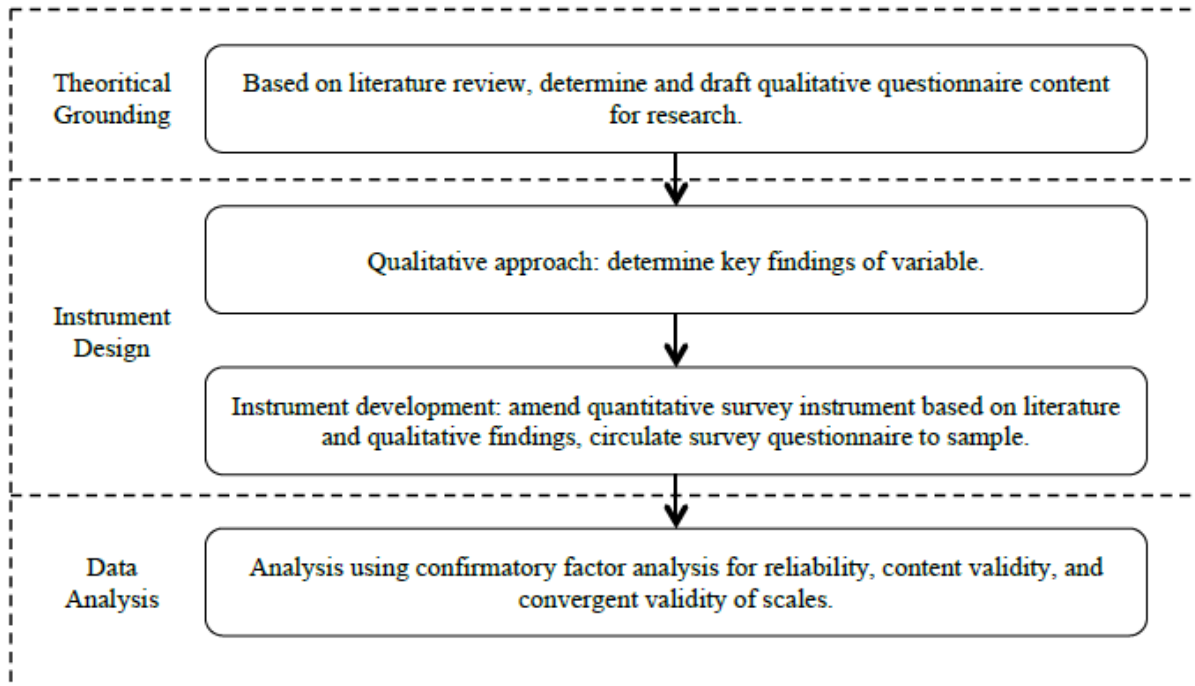
This study used analysis techniques namely Confirmatory Factor Analysis. Confirmatory factor analysis was used to confirm the factors most dominant in one group of variables.


Figure 3. Steps of the Research

Result

Table 4 shows demographic characteristics of the respondents. From the table it is known that the majority of respondents were women as many as 103 people (51.50%) and the rest are men that as many as 97 people (48.50%). However, basically the percentage of men and women do not differ much. This hospital is a public hospital, is not reserved for men or women only, so the comparison is obtained almost balanced between male and female respondents.

From the table it is known that the majority of respondents aged between 18 years to 64 years old with 185 people (92.50%) and the respondents whose age is below 18 years old were the least with 7 people (3.50%).

The majority of education level respondents were high school / equivalent as many as 107 people (53.50%) and the majority of respondents were private employees. From the table it is known that the majority of respondents are respondents whose income is between 2,600,000.00 IDR to 6,000,000.00 IDR as many as 99 people (49.50%). Most of the respondents were respondents who previously never went to the hospital as many as 162 people (81.00%) before.

Table 4. Demographic characteristics of the respondents surveyed

Gender	Frequency	Percentage
Male	97	48.50%
Female	103	51.50%
Age		
< 18 years old	7	3.50%
18 - 64 years old	185	92.50%
> 64 years old	8	4.00%
Education Level		
None	0	0.00%
Primary school/equivalent	2	1.00%

Junior high school/equivalent	6	3.00%
Senior high school/equivalent	107	53.50%
Diploma	25	12.50%
Bachelor Degree	50	25.00%
Master Degree	9	4.50%
Doctoral Degree	1	0.50%
Occupation		
Army/Police/Government Worker	12	6.00%
Private Sector	81	40.50%
Business	35	17.50%
Housewife	54	27.00%
Student	8	4.00%
Other	10	5.00%
Income		
< 2,600,000.00 IDR	68	34.00%
2,600,000.00 IDR – 6,000,000.00	99	49.50%
> 6,000,000.00 IDR	33	16.50%
History of previous visit		
No	38	19.00%
Yes	162	81.00%

Table 5 illustrates the responses of respondents regarding service innovation at Gatot Soebroto Hospital. Based on the processing results presented in the table, it can be seen that most of the patients in the hospital chose answers in service innovation on the answer strongly agree. Thus innovation in the service of the hospital has been well conducted. This shows that services innovation hospital has been felt by patients who seek treatment. Development of new services, new technologies, service delivery systems, and the interaction of the hospital with the patient to make this hospital as an innovative hospitals in the patient's perspective.

Table 5. Recapitulation of Service Innovation Descriptive Analysis

Dimension	Likert Scale			
	Strongly Agree	Agree	Disagree	Strongly Disagree
Development of New Services	81.00%	17.67%	0.67%	0.67%
New Technologies	71.50%	25.00%	2.50%	1.00%
Service Delivery System	67.33%	29.00%	3.00%	0.67%
Customer / Institute Interaction	50.67%	43.17%	5.00%	1.17%
Service Innovation	67.63%	28.71%	2.79%	0.88%

Table 6. Loading Factor Construct Service Innovation

	λ_i	λ^2_i	ε_i
X1.1 <--- X1	0.925	0.856	0.144
X1.2 <--- X1	0.881	0.776	0.224
X1.3 <--- X1	0.862	0.743	0.257
X1.4 <--- X1	0.723	0.523	0.477
Total	3.391	2.898	1.102

Based on exceeding table, CR and AVE was calculated as follows:

$$CR = \frac{\left(\sum_{i=1}^{n} \lambda_i\right)^2}{\left(\sum_{i=1}^{n} \lambda_i\right)^2 + \sum_{i=1}^{n} \varepsilon_i} = \frac{(3.391)^2}{(3.391)^2 + 1.102} = 0.913$$

$$AVE = \frac{\sum_{i=1}^{n} \lambda^2_i}{n} = \frac{2.898}{4} = 0.724$$

Based on table 6, all loading factor values that is measured, were above 0.7. Thus it is known that the dimensions are valid in measuring variables. CR generated at 0.913 greater than the minimum limit CR suggested that 0.70, and the value obtained for 0.724 AVE is greater than the value of the recommended minimum is 0.50 or 0.724> 0.50, so use the size of CR and construct AVE indicate that reliability is good.

Discussion and Conclusion

Evaluation of the measurement model or Confirmatory Factor Analysis (CFA) is the earliest stage performed prior to the process of testing the structural model or influence between the latent variables in a study. CFA process used to evaluate the causal relationship between the dimensions of latent variables are shown in a measure of validity and reliability.

Validity relates to whether a variable measure what should be measured, while reliability is the consistency of a measurement. The high reliability demonstrated that these dimensions have a high consistency in measuring latent constructs. Evaluate the validity of each indicator refers to the value of the loading $\geq$ factor0.7, while (LF) which there liability sworth evaluation invalid if visits of construct reliability (CR) $\geq$ and variance extracted (VE). CR reliable value is > 0.70 and VE 0.50 (Vitello, 2008). Rated (λ) loading generated factor will (be used to calculate the composite reliability coefficient or CR and AVE with the formula below.

Table 3 shows that development of new services have contributed most to the formation of innovation services. This is due to the success of the Gatot Soebroto Indonesia Army Hospital provision of new services, changes in long service into new services, and innovate better compared to other hospitals.

Based on the analysis and calculation using the CFA, it can be concluded that the factors related service innovations such as the development of new services, the use of new technologies, system service delivery, and interaction between the hospital with the patient,

can be used to assess the innovation of services performed in a hospital. The factors that best represents innovation assessment services, namely the development of new services.

Limitation

Lastly, this study only focused on innovation in the military hospital, which is owned by the government. In fact, Indonesia's private hospitals are competing in innovation services to enhance patient visits to get a bigger profit. Therefore, the combination of samples taken in future studies need to be included a combination type of hospitals in order to do get better result.

Although the validity and reliability of the results showed a strong relationship between the variables construct the latent variables, the analysis on other constructs variables needed in future studies to look for other more variable constructs have a strong relationship to explain the latent variables.

THE RELATIONSHIP BETWEEN INNOVATION AND PERFORMANCE – IMPLEMENTATION IN A STATE-OWNED ENTERPRISE

Laura Gultom, Universitas Indonesia, Indonesia
Aryana Satrya, Universitas Indonesia, Indonesia

Abstract

The main objective of this study was to determine the implementation of innovation practices in the government organizations. How is the innovation implemented in the state-owned enterprise in Indonesia? Does the employees who are engaged the innovation, have a positive correlation with their individual performance? Innovation has been defined in various forms by previous researchers. According to Schumpeter (1934), innovation is development or adoption of new concepts or ideas, and/ or the new or adopted ideas themselves as well as the successful exploitation of new ideas. By innovation, an organization or enterprise will be able to maintain its competitive advantage against its competitors, and earn profits in accordance with the objectives of the organization or enterprise in general. As known, that government organization is a non-profit organization runs public service obligation for social welfare escalation. Due to the lack of clarity about the owner of the enterprise, then there is a doubt whether the State-Owned Enterprise (SOE) in Indonesia is implementing innovation management to improve its internal capabilities. Based on the said understanding, researcher wanted to describe innovation practice that is in one of the SOE in Indonesia, which is engage in natural gas.

Introduction

In order to deal with the dynamic environment, then the organization must constantly adapting to maintain or escalate their competitive advantage against other organizations. Literature of innovation shows that any firm needs innovation to succeed and survive (Jimenez & Sanz-Valle, 2011; Bell, 2005; Cho & Pucik, 2005; Gopalakrishnan & Damanpour, 1997; Damanpour, 1996; Fiol, 1996; Wolfe, 1994) and gain sustainable competitive advantage (Standing & Kiniti, 2011; Bartel & Garud, 2009; Johannessen, 2008; Mumford & Licuanan, 2004). Therefore, an organization should continually improving their organization's internal capabilities. The conditions that may affect an organization's main capabilities and competencies are uncertainty, complexity, and inter-organizational conflicts (Hitt, Ireland and Hoskisson, 2013). Based on the effects of these conditions, to improve its internal capabilities, then an organization should implementing the innovation on products as well as operational activities in the organization (Hitt, Ireland and Hoskisson, 2013). This must be done to create distinctive value for its customers.

"Innovation is the implementation of new knowledge that transform organizational processes or create new features of products and services" (Dess, G.G., Lumpkin, G.T., Eisner, A.B., McNamara, G. 2014). "Innovation is mainly defined as a change by human creativity, resulting in the adoption of new ideas, new products or services, systems or processes" (Zaltman, Duncan & Holbek, 1973; Daft, 1982; West & Farr, 1989). Innovation is intangible resources in an organization that is difficult to be duplicated by competitors that may support improving the organization's internal capabilities (Hitt, Ireland and Hoskisson, 2013). Innovation is intangible resources in an organization that is difficult to be duplicated by competitors that may support improving the organization's internal capabilities (Hitt, Ireland and Hoskisson, 2013). Innovation resources within an organization may be new ideas, scientific capabilities, and capacity to innovate (Hall, 1992). Associated with these innovation resources, it means the enterprise has human resources that oriented to the creation of

innovations in their duties, they must be able to provide added value for the business progress. This is possible because the workers who focusing on innovation would make every endeavor to find new ways or methods in resolving their duties, so it will be found a simpler method or product development than the current services. Thus, the enterprise will be more effective and efficient, which in turn will impact on the value offered to corporate customers.

Several studies said that innovation tends to be done by a business/profit-oriented organization or private sector (Lin and Su, 2013; Bank and Raza, 2014; Vitezic, 2015). In this case, the profit/ business-oriented organization is always driven to improving their competitive advantage, in order that the business is able to survive on an ongoing basis. The process of decision-making of profit-oriented organizations are also usually more tactical and fast, not like in bureaucratic organization. The process of innovation resources utilization becomes more optimal because of the decision-making process is shorter which is done by the owner or shareholder. That is different with the government organizations which is a non-profit organization, is known as an organization that has a long bureaucratic chain, so the decision-making was quite slow. Particularly in Indonesia, that one of the government organizations, which is state-owned enterprise (SOE), an organization mandated with the task that is in addition to seeking profits may also providing services to the community, as the embodiment of the government to perform public service obligation (PSO). Based on the above explanation, the purpose of this study was to ensure whether the SOE in Indonesia, particularly the SOE of natural gas transportation, has implemented the innovation practices in their daily operations. How is the innovation conducted by the SOE to create value for its stakeholders? Do the employees who are engaged the innovation, have a positive correlation with their individual performance?

Literature Review

Innovation is related to a creation, but it is not an invention. That is, actually in the process of innovation, there's almost no really new products or services (Dess, G.G., Lumpkin, G.T., Eisner, A.B., McNamara, G. 2014). According to Dess, G. G., Lumpkin, G. T., Eisner, A. B. , McNamara, G. 2014, based on the type of innovation, it may be divided into:

   a. Product innovation is the efforts to create product designs and applications of technology to develop new products for end users
   b. Process innovation is the efforts to improve the efficiency of organizational processes, especially manufacturing systems and operations

Whereas based on the rate of speed in implementation, innovation may be divided into:

   a. Radical innovation is an innovation that fundamentally changes existing practices
   b. Incremental innovation is an innovation that enhances existing practices or makes small improvements in products and processes

Based on the above explanation, it may be said that innovation is a series of processes that start from problems identification in the organization till the product/ services process or implementation will be more effective and efficient than the previous one. According to Van de Ven, Polley, Garud, and Venkataraman (1999), the innovation journey is a nonlinear of divergent and convergent activities that may repeat over time and at different organizational levels if resources are obtained to renew the cycle. Based on this, then there is common elements in the innovation process, which are: (1) The initiation period; (2) The development period; and (3) The implementation/termination period.

Innovation is needed for the organization to improve its internal capabilities, how man is always thinking that the organizations should improving the effectiveness of existing processes or activities in the working environment. A group of individuals who always want innovating will make a competitive and efficient work culture. That in the end, the working performance of these workers will make added value to the enterprise's customers. This

innovation is commenced from new ideas relating to products or existing work processes. The Management who encourages in making creative ideas will create a conducive working atmosphere for their workers to believe that they are getting involved in every process in an organization. According to Bank and Raza (2014), there are three major inhibitors of innovation:

1. Growing size

The growing size of an organization usually it will cause no organization internal communication strategy down to the rank and file workers. Organizations that have a growing business will make the organization busy with the preparation of business strategies in the high-level to boost the company's revenue on an ongoing basis. However, in general, the business strategy is quite difficult to be translated into operational strategies nor to be understood by the workers. The implementation of the business strategy that is extremely difficult or even failed to be performed. In many cases, the major reason identified is not the dearth of skill to execute the high-level strategy but a lack of communication initiatives to drive and manage the core message to all employees to help them work towards the organization's goals that have been already set. This led to the innovation process of the organization is not running well, especially if the organization actually discouraging the innovation program through the establishment of a working unit that is responsible for generating innovation for the companies. It is usually not involve a major resources in the innovation process, which is the front-end employees, who serve as the connection points between organization and its customers.

2. Operational silos

The continuity development of the company will lead to the increasing of the amount or type of business managed and the increasing of the number of functions or working units within the organization. This causes each of working units tends to focus on the achievement of performance (key performance indicator) only and be not paying attention to the input and output of its work force. Because each division is so busy competing and is focused on completing their given tasks, "tunnel vision" may begin to inhibit innovation. By means of the operational silos in an organization's environmental will cause innovating towards a common goal becomes challenging.

3. Lack of employee motivation

Another concerning that may hinder the innovation process is the lack of motivation of employees to contribute, innovate or provide creative ideas to encourage innovation. Employees work only to the job description or key performance indicators set by their superiors. Employees are not quite engage with the work he / she did nor the company where he/ she works. The long process of innovation and needs on the consistency required employees enthusiasm to live, which is in turn may provide a distinctive value to the customer company to support corporate sustainability.

To support the innovation implementation in order to become a culture in the organization, then the organization needs to do a variety of ways to improve the workers awareness who will eventually be culture internalized of innovation in the organization working environment. Organizations supports may be a role model of the leaders, whereas they focus on ideas or feedbacks from their employees and even willing to be a mentor in the innovation process which is undertaken by workers. So here the workers will feel listened to and involved in efforts to improve the company's internal capabilities on an ongoing basis. Parker et al. (2010) recognized that situational variables (e.g. leadership, climate) also indirectly contribute to individual innovativeness. Higher levels of support for innovation climate motivate team members to initiate and persist in innovative behaviors and coordinate their innovative efforts

with others (West, 1990). According to Gong et al., 2012; Pirola-Merlo & Mann, 2004; Taggar, 2002, average individual team members' creative performance positively relates to team creative performance, so that with having creative and innovative workers will enhance the performance of organization.

The stages of innovation according to Van de Ven, Polley, Garud, and Venkataraman (1999), the innovation journey starts from the insight, which the employees must understand the theory, procedures or regulations related to the their activities. After that, they get a clearer understanding by comparing the prevailing procedures with the reality. Second, the problem is found in the taken activities, which may be caused by the difference between the procedures to reality or are known as a continuous improvement or reengineering of the existing processes. Thirdly, after determining the problem, then the employee will look for alternative solutions to improve the effectiveness or efficiency of the working process (process innovation) or create a product development (product innovation) that provide added value for the customers. Furthermore, the solution is determined in a business model that will be run by the organization in order to improve corporates sustainability There are some writers who study on the innovations, one of which is The Ten Types of Innovation (Keeley, Pikkel, Quinn & Walters, 2013). This Ten Types Framework (Figure 1) is a simple shape, whereas this framework is a tool that may be used to diagnose and improve the sharpness of the innovation that is being done.

This Ten Types of Innovation is divided into three main parts:

a. Configuration: the types of innovation which are focused on the innermost workings of an enterprise and its business system
b. Offering: the types of innovation which are focused on an enterprise's core product or service
c. Experience: the types of innovation which are focused on more customer-facing elements of an enterprise and its business system

Figure 1. The Ten Types of Innovation

By the needs of the organization to build its capabilities in order to maintain its competitive advantage through improving the existed innovation resources in the internal organization, it is necessary to study further whether the government organization implement the innovation practices? How is the innovation implemented in the state-owned enterprise in Indonesia? Does the employees who are engaged the innovation, have a positive relationship with the individual performance?

Method

The respondents of this research are employees in SOEs transportation who were innovation award finalists in 2014 and 2015. The age of respondents ranged from 23 to 39 years old, their position from rank & file to managerial level. Education of the respondents were from highschool to post-graduates.

This research was conducted by using secondary data related to the implemented innovation practices, which is participated in innovation award program in 2014 and 2015. In this study, the data of innovation is the employees' participation, not the total result of award criteria. Then, secondary data of performance appraisal of the participant of innovation award is taken from the employee database. The data of performance appraisal is data in 2014 and 2015. The research was conducted to prove whether the innovators has a correlation with their performance in their unit concerned.

Analysis and Result

SOE of natural gas transportation is the company that runs the business of transmission and natural gas distribution, which the company became a liaison between the natural gas sources and the customers who need energy in carrying out its activities. The existing customers are divided into three categories: housing, commercial and industrial. SOE has a goal to provide clean energy for the community associated with the mandate that carried public service obligation, in addition to generating revenue or profit.

SOE of natural gas transportation implemented the performance evaluation in order to measure the performance results of its workers. As for the performance evaluation starts from the stage of the company's business strategy cascading into the unit's and individual performance's targets, the company who expects alignment between organizational KPIs and individual KPI. By the alignment, success or failure may be measured more objectively so as to minimize the suspicion among workers and between the working units impact on work motivation of individuals within the organization. Performance evaluation is done on a yearly basis, which is divided into two parts: a review of the mid-year and year-end assessment. Mid-year review was done to analyze to the employee who has reached or not reached the target, and discuss on the things that must be done to renew or improve the performance, or if it should be done considering the target change current conditions. The final assessment was carried out as a cover of all activities and assessing the achievement of employee's performance evaluation in accordance with the goals or targets set.

In carrying out its vision and mission, SOE has a corporate culture as the driving force for their employees' behavior. This culture of SOE is ProCISE, which stands for Professionalism, Continuous Improvement, Integrity, Safety, and Excellent Service. As each element of the corporate culture has a major behavior that the main behavior associated with Continuous Improvement is creative, innovative, and adaptive to change. To raise workers awareness for the corporate culture, particularly the human form to employees who are creative and innovative company, the company devised a program, which is innovation awards program.

This program has been implemented since 2012, and has been followed by the workers in all existed working units. In this program, workers were asked to explain their innovation in three ways, which are: product / new service, working processes improvements or products / services that already exist, or adopt and develop the innovations that have successfully implemented elsewhere. From the innovations that have been submitted by the innovation award program participants, we conducted a selection process with the assessment criteria:

Table 1. Criteria for Innovation Award

No	Criteria	Weight
1.	Background	5%
2.	Creativity	25%
3.	Implementation	30%
4.	Impact/value creation	35%
5.	Originality	5%
	TOTAL	100%

Before following the judging process, workers equipped with an understanding of innovation, by explaining the Ten Types of Innovation as in Figure 1. Through the above debriefing program, workers gain the insight that innovation may take many forms and sources of endless ideas. As for some of the innovations that qualify for the finalists round is as follows:

Table 2. The Innovation in Year 2014 - 2015

No.	The Innovation	Type of Innovation	Benefits
1.	Smart Meter Reading Integration	Structure	- Prudent operation to reduce the customer's complaint; - The more effectiveness in supervising the performance of meter reader; - Operational budget savings; - Increase the corporate's image.
2.	POPAY	Process	- Increase the effectiveness and efficiency; - Operational budget savings (paperless); - Online monitoring of administrator's performance; - Increase the customers' satisfaction.
3.	gasPOL	Service	- Increase corporate's competitive advantage; - Reduce the opportunity loss (risk mitigation); - Increase efficiency.

Employees are encouraged to innovate and give creative ideas in the completion of their works, encourage workers to always contribute to the advancement of companies that could ultimately improve the sustainability of a company's competitive advantage. As has been explained that the employee's contribution may be shown through workers performance results. The results of such performance were made once per year through the performance evaluation process. Aspects of performance assessment consists of:

Table 3. Criteria for Performance Appraisal

No	Criteria	Weight
1.	Performance results (productivity targets)	70%
2.	Work attitudes	10%
3.	Working cultures	10%
4.	Additional tasks	10%
	TOTAL	100%

Performance appraisals are conducted to assess working results and behavioral aspects. Each employee is required to be able to complete the work target that has been set with behavior which suits to company values. Performance evaluation is done through the online system that every employee may do a recording on the progress of the work which is being done for achieving these targets to be properly managed. Besides, an online performance appraisal system is also to facilitate the executives to provide feedback at any time, by looking at the employees track record in the working unit. The online system also may reduce the using of paper in the work and physical assessment documents storage.

The performance appraisal which is conducted by the immediate supervisor will be calibrated by a higher superior to obtain the grade of cumulative rate index (IPK), in which the IPK is the individual performance rate divided by the group performance rate multiplied by 100%. By such result, we may set the rank of each employee as follows:

Table 4. Performance Rating and IPK

No	Performance Rating	IPK
1.	Outstanding	>125%
2.	Very Good	111% - 125%
3.	Good Plus	101% - 110%
4.	Good	86% - 100%
5.	Reasonable	65% - 85%
6.	Unsatisfactory	< 65%

Regarding to that explanation, below is a comparison of the performance appraisal of the innovation award finalists from 2014 to 2015:
Figure 2. Performance Appraisal Result in Year 2014 and 2015

As illustrated in Figure 2, it shows that the performance appraisal result of the innovation award finalists on average had a good performance. This may be explained by the results of performance appraisal, the employee who is innovation award finalist, is being rated Good, Good Plus and Very Good on average. In 2014 there were 13 employees with Good rating, 29 employees with Good Plus rating, and 4 employees with Very Good one. While in 2015 there were 17 employees with Good rating, 23 employees with Good Plus rating, and 6 employees with Very Good one. The rating may be compared with the overall rankings in Table 4.
Figure 3. Changes in Performance Appraisal Result between Year 2014 and 2015

As in Figure 3, it described the changes in the innovators performance between 2014 and 2015, with 12 employees who have improved performance, 21 employees who have the same performance, and 13 employees who have decreased performance. Based on these data, it may be concluded that in general the employees who make innovations actively have a positive correlation with their performance results.

Discussion

This study illustrates that the government organizations are practicing innovation in their workplace, particularly in the SOE of natural gas transportation. This is illustrated by the support of the corporate culture in the SOE of natural gas transportation, the company has held innovation awards program since 2012. The Company believes that innovation is the intangible resources (Hitt, Ireland and Hoskisson, 2013) that may support improving the company capability to deal with competition or changes in the dynamic business environment. By innovation, the company strives to provide its best to the customers, thereby improving the customer satisfaction. Moreover, by doing innovation, the company is always looking for a more effective and efficient way in the work process that could ultimately affect the overall business chain (Dess, G.G., Lumpkin, G.T., Eisner, A.B., McNamara, G. 2014). The SOE of natural gas transportation has the goal of keeping the company's products could meet the needs of natural gas to its customers, for domestic, commercial and industrial. Not merely for profit profusely, but also doing its role as a public service obligation. This is demonstrated through the provision of services to domestic customers, that this customer segment is expected to meet the energy needs at reasonable prices and friendly environmental. The innovation made in the SOE of natural gas transportation, as shown in Table 2 ultimately perceived by customers, so that customer satisfaction could be improved. By improving the customer satisfaction, it will benefit the company and the company could improve its long-term competitive advantage, so that the company could maintain its sustainability.

As discussed earlier, that the SOE of natural gas transportation has implemented innovations in their daily activities. One of the organizational culture is Continuous Improvement encourages the employees to always be creative and innovative in performing their duties (Parker et al., 2010). This is also illustrated by the aspects of performance appraisal in the performance evaluation process (Table 3), that the assessed aspect is not only the results aspect but also the behavioral one. The Company is expecting its employees to do innovating then they will have a mental readiness to adapt to changes in a dynamic business environment. Not only through the performance evaluation, the company also held a program to internalize the creative and innovative aspects for their employees, which is an innovation award program. In this innovation award program, the employees are equipped with knowledge about innovation, which is The Ten Types of Innovation (Keely, Pikkel, Quinn & Walters, 2013). The employees are also being given a briefing to run this program starting from the idea to the implementation stage systematically (Van de Ven, Polley, Garud, and Venkataraman, 1999). This is explained by the appraisal aspect in the innovation award program as in Table 1. This innovation award program has been implemented since 2012 to the present, in which the innovations that have been implemented have contributed an added value to the company as described in Table 2. Companies are benefiting where such innovation may decrease the operating costs, improve the work process effectiveness within the company, and may ultimately increase the company's revenue and even improve its image.

In a state-owned enterprise that service-oriented, they also should implement innovation in its operational activities. Particularly in the SOE of natural gas transportation, innovation programs become into one of the programs that may drives the employees to be consistent in creative and innovative mind. By innovating, the company will optimize the utilization of its internal capabilities (Hitt, Ireland and Hoskisson, 2013) to always creating products/ services or their working processes. As has been explained that the innovation award program has been implemented since 2012, which is it needs to be done so that all employees in each business unit are being motivated to do the work practices more effectively and efficiently. Also with creative and innovative mind, it may encouraging a collaboration among the existing human resources, so that the silo operational could be minimized (Bank and Raza, 2014). By collaboration, each working unit would trying to understand the working process of input-process-output, in which the output from each working unit would be the input for the others. If the working unit solely focused on its KPI, then this will impede the achievement of corporate objectives that will ultimately slow the company business so it will lose the opportunity to maintain its competitive advantage sustainability (Standing & Kiniti, 2011; Bartel & Garud, 2009; Johannessen, 2008; Mumford & Licuanan, 2004). Besides, by implementing the innovation, the process of continuous improvement will be maintained in the company environment, that it will help the existed process of change when the company's business is growing (Bank and Raza, 2014). Because of that innovation needs to be consistently implemented within an organization, especially in the SOE of natural gas transportation in Indonesia.

A company that encourages its employees to innovate in their duties, may creating a competitive working atmosphere (Parker et al., 2010). Employees will give their best efforts at work when companies give attractive rewards to motivate them. In this case it may be said that the company's innovation award program is an attractive rewards for their employees, where they feel valued at their ideas and works (innovation) by the company. Employees were given the freedom to provide ideas and innovation that may support the objectives of the company, will give their best performance for the organization, as demonstrated in the individual performance results. In Table 3 above is explained that the aspects measured in the individual performance evaluation in the SOE of natural gas transportation is result and

behavior aspects, wherein the behavioral aspects, it assessed the implementation of the corporate culture which is the Continuous Improvement that major behavioral indicators are creative and innovative. As described in Figure 2, that the employees who are actively involved in innovation award program, obtain performance rank with a rating of Good, Good Plus and Very Good, where the results of the performance evaluation is an appraisal in 2014 and 2015. Although in Figure 3 is illustrated that there is an improvement, same or dropped from the performance appraisal of 2014 to 2015, but the distribution of the individual performance results remain in the rating of Good, Good Plus and Very Good. It may be concluded that the employees who make innovations, will have a positive correlation with their individual performance results.

Conclusion

The results of this study has implications, both in terms of study or practical. That is, the government organizations, especially the SOE of natural gas transportation, also implementing the practice of innovation to deliver an unique value to its customers. It is necessary to support the SEO tasks, one of which is the public service obligation. The applied innovation in SOE is through one of the indicators of the performance appraisal to support the corporate culture in order to equip its employees to always think out of the box, creatively to adapt to ever-changing business environment. Lastly, the company who is able to facilitate its working conditions that respect their employees who provide creative ideas and innovation in its work, will affect individual performance positively. This is possible because the employees feel being involved by contributing for the development of the company's business.

For further research, may doing a quantitative analysis of the innovation correlation related to individual performance, which complements the qualitative analysis performed in this study. Thus, the existing research may provide a new perspective to the company related to the innovation practices to encourage individual performance and ultimately improve corporate performance in order to maintain the sustainability of corporate's competitive advantage.

INFLUENCE OF MARKET-SCANNING CAPABILITY AND TECHNOLOGY-SCANNING CAPABILITY ON FIRMS' PRODUCT INNOVATION PERFORMANCE

M. Shahedul Alam, North South University, Dhaka, Bangladesh
Paul D. Guild, University of Waterloo, Canada
Douglas Sparkes, University of Waterloo, Canada

Abstract

Using sense-and-respond framework and resource-based view of firms as theoretical base, this article examines the effect of market-scanning (MktScan) capability and technology-scanning (TechScan) capability of firms on their product innovation performance (PIP). In the context of fast changing business environment and increasing practice of open innovation, environmental scanning capability is increasingly more relevant and using MktScan and TechScan lens to look at environmental scanning activities is helpful to managers. The findings suggest that both of these capabilities have positive influence on product innovation performance. TechScan capability mediates the MktScan-PIP relationship in case of market-pull firms, while MktScan capability mediates the TechScan-PIP relationship for technology-push firms.

Introduction

Haeckel (1999) suggests that the success of enterprises operating in dynamic environments can be explained by 'sense-and-respond' framework. This framework emphasizes firms' need to understand the changes occurring in their business environment and provides a guideline for these firms to remain viable in spite of the evolving environment. Particularly, this framework suggests firms to invest in early detection of 'weak signals' (Ansoff 1975) to broaden their 'peripheral vision' (Haeckel 2004). Also, the resource-based view (RBV) of the firm (Wernerfelt 1984; Barney 1986; Barney 1991; Conner 1991; Peteraf 1993; Teece and Pisano 1994; Wernerfelt 1995; Eisenhardt and Martin 2000; Barney 2001) is an important anchor for the study. Having its roots in Penrose (1959), this theory looks at resources at the firm level as opposed to product-based analysis at the industry level. The theory explains why some firms achieve superior and sustainable competitive advantage compared to their peers in the industry. The theory holds that some firms achieve sustainability in competitive advantage by differentiating resource endowments that they create (Wernerfelt 1984; Barney 1986; Barney 1991).

In a dynamic business environment, the existing opportunities may disappear and the firm's static resources may no longer be enough to maintain an advantage once it had over its rivals. Hence, when the business environment is changing, sustaining competitive advantage of the firm is difficult. Wiggins and Ruefli (2002; 2005), drawing on the works of Schumpeter (1939; 1942) and D'Aveni (1994), explained how hyper-competition diminishes competitive advantage. Due to accelerated changes in the business environment, firms are finding it increasingly difficult to retain for a longer time their strategic advantage over their competitors. Rather, sustained advantage is increasingly becoming dependent on the firms' ability to create a series of competitive advantages over time (Wiggins and Ruefli 2005). In other words, firms operating in high 'clock-speed' (Fine 1998) business environments need to create a series of temporary advantages to achieve sustained competitive advantage over a duration of time (D'Aveni 1994; Brown and Eisenhardt 1998). In pursuit of identifying opportunities to create advantages on a continuous basis, firms have to develop information collecting and processing capabilities that focus on both market and technological domains – enabling them to sense the changing trends in business environment and to find tangible ways

to respond to those changes.

In this context, to create sustained competitive advantage, a firm needs: a capability to sense the changing nature of its business environment (e.g., MktScan capability) and a capability to find out the techniques and technologies that it could use to create or change its products and services (e.g., TechScan capability) and thereby monetize the expected changes in the business environment. Together these two capabilities to perform market-scanning and technology-scanning does the firm sustain its competitive advantage even when it faces a dynamic business environment.

Literature Review

A sense-and-respond mindset helps firms to identify weak signals (Ansoff 1975) what may first appear to be random[13]. According to sense and respond framework (Haeckel 1999), firms are to 'imagine' these random signals into a sense-making pattern and respond to the changes occurring in their business environment. These weak signals may be related to changes either in the market domain or technology domain. If a weak signal is picked up in the market domain, it may represent a new customer need or a new type of offering from a competitor. The management in the focal firm may respond to that by looking for ways to fulfill the new customer need or to compete with the new offering from competitor. These responses may involve using the technological know-how that already exists within the firm and the knowledge would be exploited to implement the current business goals. However, if the knowledge needed doesn't currently exist within the firm, it will look for potential new technologies that others might be working on. A weak signal could also be picked up in the technology domain first and it may represent new knowledge that could affect either product development or process development. The management in the focal firm would then respond to that weak signal coming from technology domain by looking for relevant information in the market domain that would support or negate the use of technology under consideration.

Generally, a firm may sense weak signals in both technology domain and market domain (as in 'push-pull' theory, e.g., Zmud 1984). Some firms may be inclined to sense more signals in technology domain than in market domain, while some other firms will sense more signals in market domain than in technology domain. This preference will more likely be influenced by the firms' overall culture of 'technology push' or 'demand pull' thinking (Langrish et al. 1972; Myers and Marquis 1969; Gibbons and Johnston 1974; Rothwell et al. 1974; Mowery and Rosenberg 1979; van den Ende and Dolfsma 2005) and by their unique industry context. We anticipate that firms need to have well-developed scanning processes in place to acquire information about the business environment in both market and technology domains.

As several authors claim, the capabilities of firms to understand the direction of changes in market and technology domains are preconditions to success when operating in a dynamic environment (e.g., Capon and Glazer 1987; Bond and Houston 2003). These capabilities assist firms reduce uncertainty from two important sources: (1) uncertainty about the amount and type of demand for the firms' products and services, and (2) uncertainty about developing technologies. These two sources of uncertainties are important since firms have to sense the nature of their customers' changing needs and wants (i.e., 'what' needs to be done), and then find out what technologies can be used effectively to create the desired products or services (i.e., 'how' what needs to done will be done). In addition, and more importantly, firms need to use both of these capabilities simultaneously given the dynamic nature of the business environment.

A market-oriented firm performs better than its less market-oriented counterparts (Narver and Slater 1990; Ruekert 1992; Deshpande et al. 1993; Jaworski and Kohli 1993; Slater and

---

[13] Of course, by weak signal we mean an early and emergent cue, not a feeble or vulnerable indicator.

Narver 1994; Atuahene-Gima 1995; Pelham and Wilson 1996; Pitt et al. 1996). A firm with a high degree of market-scanning activities has improved capability to process information relating to the changes in its customers' choices; i.e., the firm has a better idea about 'what needs to be done'. This capability enables the firm to significantly reduce the demand uncertainty for its products and services. While many scholars agree that market orientation is an important and necessary characteristic of better-performing firms, they also indicate that this capability is not sufficient to enable firms for continuous innovation and thereby, to achieve competitive advantage (Day and Nedungadi 1994; Slater and Narver 1995; Baker and Sinkula 2002). This is more applicable to manufacturing firms than to service firms (Cano et al. 2004). Firms explore ideas for new products and services to meet identified and unexpressed customer needs (e.g., 'lead users' in von Hippel, 1988). Firms then find ways to develop these new and improved products and services. In order to find an appropriate way to develop these products and services, firms gather and process information about available technological options. Firms use market information to guide the purposeful search for technologies to address customers' need. This way is akin to the pull model of new product development (Langrish et al. 1972; Myers and Marquis 1969; Gibbons and Johnston 1974; Rothwell et al. 1974; Mowery and Rosenberg 1979; van den Ende and Dolfsma 2005).

Technology-oriented firms place emphasis on using technological knowledge to solve their customers' problems (Gatignon and Xuereb 1997). These firms are proactive in acquiring new technologies and use them while developing new products (Cooper 1984; Cooper 1994). Atuahene-Gima and Evangelista (2000) asserted that technology-oriented firms are more likely to promote technology in their new products at the expense of customer needs; these firms are pre-disposed to push a certain technology into the market. Such firms have a pro-technology culture, according to Workman (1993; 1998), and these firms are likely to depend more on R&D insights than marketing insights. Firms with high degree of technology orientation have improved capability to process technical information and they are better at reducing uncertainty in developing technologies; i.e., these firms have a better idea about how things should be done. Hence, when firms effectively use their technology knowledge to find applications in products and services that are popular, firms achieve higher performance. This model is akin to push model of new product development (Langrish et al. 1972; Myers and Marquis 1969; Gibbons and Johnston 1974; Rothwell et al. 1974; Mowery and Rosenberg 1979; van den Ende and Dolfsma 2005).

A high level of scanning capability in both market and technology domains may be more necessary for firms in dynamic industries; since firms often experience high intensity change in either of these domains (Cetron and Davies 2001; Day and Schoemaker 2004) and uncertainties are often very high in both dimensions. These fast changing trends in development techniques and technology, customer preference and other environmental factors can deprive a firm of its current leading market position, allowing other firms, which place priority on innovation, to take the lead. One such example is Wang Computer, which "led the word processing industry in the early 1980s before Apple and IBM introduced PCs with word processing software. …Wang could not see how PCs offered customer value. As a result, Wang's sales dropped and it went bankrupt" (Cohan and Unger 2006, p. 11). To avoid such outcomes, firms need to search and use the latest information to apply management practices effectively when innovating toward new products and services, a tactic that would eventually enable firms to achieve sustainable competitive advantage (Han et al. 1998).

Model Development and Hypotheses

This article examines how information processing capabilities of a firm may help achieve competitive advantage – firms may do so by developing market-scanning capability (Alam et al. 2013a) and technology-scanning capability (Alam et al. 2013b). Market-scanning

capability enables firms to effectively recognize customers' changing needs and to decide on how to satisfy those needs either by implementing new products and services or by making changes to current products and services. Technology-scanning capability helps managers to make informed decisions on the use of technological options to implement those new products and services or to make changes to current products and services. In a broad sense, both market-scanning capability and technology-scanning capability are viewed as two resources that enable firms to identify the opportunities and threats in the business environment. In the parlance of resource-based view, when firms successfully create differentiating resource configurations, they better satisfy their customers' needs, they produce more efficiently, and eventually, they achieve superior performance leading to competitive advantage (Barney 1991; Peteraf 1993).

The underlying assumption of this study is that when firms have increased product innovation performance, they can convert their better-matched products and services into overall business performance, leading them eventually to gain sustainable competitive advantage. It is also acknowledged that product innovation performance is neither automatic nor sufficient; rather it is a necessary condition for sustainability of competitive advantage. Bacharach's (1989) framework is used to operationalize the theory for the study. The framework provides three different guidelines: for operationalizing independent variables, that is, technology-scanning capability and market-scanning capability; for operationalizing dependent variable, that is, product innovation performance; and for operationalizing relationships between independent and dependent variables. Two independent latent variables in this study represent two intangible resources reflecting firms' market-scanning capability and technology-scanning capability.

Studies anchored in the resource-based view face challenges in defining sustainability in terms of duration or degree, hence the attention in this regard in empirical studies are limited (Armstrong and Shimizu 2007). Based on the choice about how to ascertain sustainability of competitive advantage, research design might either be cross-sectional or longitudinal. For the current study that is cross-sectional in nature, product innovation performance is used as the outcome or dependent variable that is influenced by both market-scanning capability and technology-scanning capability. It is reasoned that with the higher level of these capabilities, firms attain product innovation performance that, in turn, help them achieve above average overall business performance that is sustainable. The inherent advantage of being innovative helps firms maintain their advantage once it is achieved.

RBV theory conveys the implication that both market-scanning capability and technology-scanning capability would positively influence the dependent variable of product innovation performance. These two capabilities enable firms to detect 'weak signals' (Ansoff 1975) that are early indications of future changes either in market or technology domain. Based on these early indications, firms can respond in a timely manner (Haeckel 1999; Haeckel 2000). These two capabilities of firms are demonstrated in the richness of sources of information and the ability of the firms to process the collected information to generate insights and to act on those insights. Firms identify the signals what may first appear to be random noise to an untrained eye and interpret those signals into a sense-making pattern and make decisions. Firms act as a pool of capabilities that are dynamically combined and recombined to sense the changing needs of individual customers and customers often do not have a clear idea about their own future needs (Haeckel 2000). Following resource-based theory of the firm, the effects of both market-scanning capability and technology-scanning capability on product innovation performance are expected to be positive.

H_1: Firms with higher level of market-scanning capability will exhibit a higher level of product innovation performance.

H_2: Firms with higher level of technology-scanning capability will have a higher level of product innovation performance.

The sense-and-respond framework (Haeckel 1999) helps to understand how information age firms successfully operate in a fast-changing business environment. This framework however does not provide a clear indication about where firms might source their signals first and where they might then get their information to respond to those weak signals. The sense-and-respond cycle might initiate either in market domain or in technology domain; it might depend on the firm culture or, on the unique industry context, or it could be a random sequence. Firms that are traditionally driven by market domain knowledge are known as market-pull firms (Langrish et al. 1972; Myers and Marquis 1969; Gibbons and Johnston 1974; Rothwell et al. 1974; Mowery and Rosenberg 1979; van den Ende and Dolfsma 2005); these firms are assumed to have relatively stronger marketing-scanning capability than technology-scanning capability. Market-pull firms would be inclined to use their market-scanning capability more often to identify (i.e., sense) a potential new customer need. Once firms identify a new customer need by using market-scanning capability, they will need to leverage their technology-scanning capability to find a tangible way to solve (i.e., respond) that customer problem. The sequence of sense-and-respond cycle would start in the market domain for firms that are culturally inclined to market-pull characteristics. These firms would exhibit stronger level of market-scanning capability that might translate into product innovation performance mediated by technology-scanning capability. This led to hypothesis H_3.

H_3:   In case of market-pull firms, technology-scanning capability will strongly mediate the relationship between market-scanning capability and product innovation performance.

Firms that are traditionally driven by technology domain knowledge are known as technology-push firms (Langrish et al. 1972; Myers and Marquis 1969; Gibbons and Johnston 1974; Rothwell et al. 1974; Mowery and Rosenberg 1979; van den Ende and Dolfsma 2005). Technology-push firms would be inclined to use their technology-scanning capability more often to identify (i.e., sense) a new technological opportunity – either in the form of a new technology or in the form of re-using an existing technology. Once firms identify a new technology or an opportunity to reuse an existing technology by using technology-scanning capability, then they will need to leverage their market-scanning capability to find a suitable customer problem (i.e., respond) where the technology opportunity can be utilized. The sequence of sense-and-respond cycle would start in the technology domain for firms that are culturally inclined to technology-push characteristics. These firms would exhibit stronger level of technology-scanning capability that would translate into product innovation performance mediated by market-scanning capability. This led to hypothesis H_4:

H_4:   In case of technology-push firms, market-scanning capability will strongly mediate the relationship between technology-scanning capability and product innovation performance.

Research Methodology and Data Collection
Given the findings of the literature review and developed hypotheses, the overall research model is tested using empirical data collected through a Canadian national survey that was conducted as part of a broader research. The survey instrument was delivered through the web to a national sample of managers of different manufacturing firms. A web-based survey was selected as a methodological option because of the benefits of speed, reasonable cost, and easy accessibility, and because of the geographic dispersion of the target participants (Ilieva et

al. 2002; Deutskens et al. 2004; Cole 2005; Evans and Mathur 2005; Deutskens et al. 2006). When the contact email information of C-level officers (e.g., CEO, CTO) was not available, preference was given to recruit someone from General Management, R&D or Marketing.

The Industry Canada database of Canadian Company Capabilities (CCC 2008) was used to find contact information of Canadian companies who were engaged primarily in manufacturing. A total of 17,272 usable contacts (i.e., email addresses) of firms who listed their primary business activity as 'Manufacturer / Processor / Producer' were available at the time in the database. These firms were invited through email to participate in a web-based survey. Effort was made to increase the response rate by development of a user-friendly interface, by careful design of the questionnaire so that the questions were unambiguous, by use of reminders, and by timing of the survey. There were 467 participants who provided useful information for further analysis. The contact rate for the survey was 77.3%, while the cooperation rate was 3.1% with effective response rate of 2.7%.

Measurement Scales for Latent Variables
The above four hypotheses illustrate interactions among three main latent variables under consideration. These three latent constructs are market-scanning capability, technology-scanning capability, and product innovation performance. MktScan (Alam et al. 2013a) is a second-order reflective construct with four first-order components. The four sub-constructs of MktScan capability are identified as: collection of information about customers (CustInfo), information regarding competitiveness (CmpInfo), responsiveness to collected market-related information (MktResp) and coordination among different business units of the firm (Coord). Table 1 shows the details of the scale used.

Table 1: Items and Factors of MktScan Scale

Factor Names	Items
CustInfo	We help our customers anticipate developments in their markets.
	We continuously try to discover additional needs of our customers of which they are unaware.
	We brainstorm on how customers use our products and services.
	We search for opportunities in areas where customers have a difficult time expressing their needs.
	We work closely with lead users who try to recognize customer needs months or even years before the majority of the market may recognize them.
	We extrapolate key trends to gain insight into what users in a current market will need in the future.
CmpInfo	We constantly monitor our level of commitment and orientation to serving customer needs.
	Our strategy for competitive advantage is based on our understanding of customers' needs.
	We are more customer-focused than our competitors.
MktResp	We respond rapidly to the competitive actions of our rivals.
	Top managers from each of our business units regularly visit customers.
	Business functions within our organization are integrated to serve the target market needs.
Coord	We freely communicate information about our successful and unsuccessful customer experiences across all business functions.

Factor Names	Items
	Our salespeople share information with each other about competitors.
	Top management regularly discusses competitors' strengths and weaknesses.
	We share resources among business units.

TechScan (Alam et al. 2013b) is a second-order reflective construct that includes its four first-order components. The four sub-constructs of TechScan capability are identified as: technological information gathering (TechInfo), technology alignment (TechAlign), responsiveness to collected technology-related information (TechRespond) and exploitation of existing technology portfolio (TechExploit). The details of the scale used are shown in Table 2.

Cooper and Kleinschmidt (1995) used a scale to measure the new product performance of firms when they reported their findings in benchmarking the firms' critical success factors in new product development. More recently, Alegre et al. (2006) reported a measurement scale of product innovation performance where they modeled it as a two-dimensional construct. The 'efficacy' component of their scale was similar to the assessment tool provided in Oslo Manual (OECD-EUROSTAT 1997) for economic innovation efficacy that reflected the degree of success of an innovation. The other component in their scale, called 'efficiency', reflected the effort carried out to achieve the degree of success captured by the efficacy component – it captured the cost and time required for the innovation. Wheelwright and Clark (1992) supported the use of these two as a measure of product innovation efficiency. Several other studies (Griffin 1993; Griffin and Page 1993; Pisano 1994; Griffin 1997; Hoopes and Postrel 1999; Zhang and Doll 2001; McEvily and Chakravarthy 2002; Valle and Avella 2003) had also considered cost and development time for their work in innovation efficiency, both as an objective measure and as a subjective measure. Items in the Alegre et al. (2006) scale were used during survey administration. These items were used for further exploratory analysis before using it in the overall research model. Table 3 shows the details of the scale as it is used for the current study.

Table 2: Items and Factors of TechScan Scale

Factor Names	Items
	The market drives our search for new technological solutions.
	Technology plays an important role in our approach to tackling an issue, when appropriate.
	Encourages employees to explore new technological ideas voluntarily.
	Policies, processes and tools to enable employees to explore new technologies.
TechInfo	Uses the information available within the organization.
	Gathers information from global sources when searching for new technological solutions.
TechAlign	Attempt to co-develop future development plans about its technology with other players in business network.
	Looks for synergy of product offerings with existing technological trends in the market.
	Seeks to ensure compatibility with existing technologies, resources and

Factor Names	Items
	competencies.
TechRespond	Responds well to any technology information that has a strategic implication.
	Responds well to any technology information that has an operational implication.
TechExploit	Seeks to exploit new international markets through acquisition and sale of intellectual property.
	Engages in both types of innovation, namely, incremental and breakthrough innovation.

Table 3: Items and Factors of Product Innovation Performance Scale

Factor Names	Items
	Our company successfully replaces the products that are being phased out.
	Our company extends its core product offering through technologically new products.
	Our company extends its core product offering through technologically improved products.
PrdEfficacy	Our company often extends its product range outside the core product offering.
Efficiency	Our company takes less time to develop a new product or a new component in comparison with our major competitors.
	Average cost to develop a new product or a new component is less for our company in comparison with our major competitors.
	Overall satisfaction of top management with the efficiency of new product development is very high.
MktEfficacy	Our company develops environment-friendly products.
	Market share of our products is improving.
	Our company often breaks into new overseas market.
	Our company often captures new domestic market segments.

1. Reliability and Validity of The Construct

The core of the research model consisted of three firm-level constructs – technology-scanning capability, market-scanning capability and product innovation performance. All three constructs were modeled as second-order reflective constructs. According to Nunnally (1978), in order for factors to be considered as having convergent validity and reliability, both of Cronbach's Alpha and Construct (Composite) Reliability scores have to be 0.7 or greater. Fornell and Larcker (1981) further provided guidelines by specifying the measure of Average Variance Extracted (AVE) value of greater than 0.5 in order for the measurement error associated with the construct to be outweighed by the variance extracted through its indicators. The corresponding factor loading, AVE, Cronbach's Alpha and Composite Reliability value are shown in Table 4.

Table 4: Details of the Constructs' Internal Consistency, Convergent Validity

Constructs and their factors, if the construct is second order	Order of the Construct and Alpha of the first order components	AVE	Composite Reliability
TechScan	2nd Order (0.866)	0.597	0.855
TechInfo	1st Order (0.809)	0.516	0.861
TechAlign	1st Order (0.708)	0.642	0.842
TechRespond	1st Order (0.854)	0.865	0.928
TechExploit	1st Order (0.586)	0.688	0.813
MktScan	2nd Order (0.875)	0.608	0.861
CustInfo	1st Order (0.843)	0.553	0.881
CmpInfo	1st Order (0.739)	0.651	0.848
MktResp	1st Order (0.676)	0.616	0.828
Coord	1st Order (0.708)	0.534	0.821
Product Innovation Performance	2nd Order (0.775)	0.562	0.793
PrdEfficacy	1st Order (0.716)	0.568	0.836
Efficiency	1st Order (0.759)	0.664	0.855
MktEfficacy	1st Order (0.593)	0.465	0.773

Gefen et al. (2000) provided guidelines for examining the discriminant validity at the construct-level and indicator-level. The square root of AVE was compared with cross-correlation of the constructs. If all of the cross-correlations of the constructs were less than the square root value of the AVE, then the condition for construct-level discriminant validity would be fulfilled. Further, in order for the items and the components to be internally reliable and to have discriminant validity, component-level and item-level cross-loadings for each item should load more highly on its assigned construct than on the other constructs. Tables 5 and 6 show the results, which were satisfactory.

Table 5: Discriminant Validity of Constructs

	MktScan	PIP	TechScan
MktScan	0.779*		
PIP	0.609	0.749	
TechScan	0.664	0.629	0.773

* Square Root of AVE where AVE is generated by aggregating first-order factors.

2. Influence of Techscan and Mktscan On Performance

The influences of market-scanning capability (MktScan) and technology-scanning capability (TechScan) of a firm on its product innovation performance (PIP) were examined. Product innovation performance was used to examine the direct influence of MktScan and TechScan. In order to explore the influence of MktScan and TechScan capabilities on PIP as it was manifested in the current set of data, Pearson correlations between MktScan-PIP and TechScan-PIP was derived. Both of these coefficients, as shown in Table 7, were found to be statistically significant - thereby supporting the hypotheses H_1 and H_2.

Table 6: Indicator Cross Loadings Showing Reliability and Discriminant Validity

First Order Components	Second Order Constructs		
	MktScan	PIP	TechScan
CmpInfo	0.776	0.443	0.471
Coord	0.734	0.416	0.450
CustInfo	0.819	0.546	0.589
MktResp	0.782	0.455	0.520
Efficiency	0.398	0.710	0.392
MktEfficacy	0.451	0.729	0.427
PrdEfficacy	0.517	0.817	0.577
TechAlign	0.549	0.473	0.767
TechExploit	0.414	0.549	0.662
TechInfo	0.576	0.501	0.891
TechRespond	0.517	0.514	**0.775**

Table 7: Pearson Coefficients to Test Hypotheses H_1 and H_2

Hypotheses			PIP
H_1	TechScan	Pearson Correlation	0.645
		Sig. (2-tailed)	0.000*
		N	409
H_2	MktScan	Pearson Correlation	0.571
		Sig. (2-tailed)	0.000*
		N	393

*Correlation is significant at the 0.01 level (2-tailed).

3. Mediation Effect of TechScan (in market-pull firms)

In Hypothesis H_3, it was examined whether TechScan capability has stronger mediation effect on the relationship between MktScan and PIP in case of market-pull firms. Mediation effect of TechScan capability on MktScan-PIP relationship is examined – on the full set of firms, on the firms having relatively stronger MktScan capability and lastly, on the firms having relatively weaker MktScan capability. Firms with a market-scanning capability higher than their technology-scanning capability have been treated as market-pull firms. Mediation effect of TechScan is found to be stronger in firms with market-pull characteristics. Table 8 shows the relevant measures of the tests for Hypothesis H_3. A measure of the ratio of Indirect to Total Standardized Coefficients between MktScan and PIP showed that the mediation effect was higher for market-pull (i.e., MktScan > TechScan) firms with the ratio 0.503.

4. Mediation Effect of MktScan (in technology-push firms)

It was also examined whether MktScan capability had stronger mediation effect on the TechScan - PIP relationship in case of technology-push firms. This was captured in Hypothesis H_4. Mediation effect of MktScan capability on TechScan-PIP relationship is examined - on the full set of firms, on the firms having relatively stronger TechScan capability and lastly, on the firms having relatively weaker TechScan capability. Firms with a technology-scanning capability higher than their market-scanning capability have been treated as technology-push firms. Table 9 shows the relevant measures of the tests for Hypothesis H_4 and the hypothesis is empirically supported. A measure of the ratio of Indirect to Total Standardized Coefficients between TechScan and PIP showed that the mediation effect was higher in technology-push (i.e., TechScan > MktScan) firms with the ratio 0.607.

Table 8: Mediation Effect of TechScan (Hypothesis H_3)*

	Full Dataset (N = 467)	MktScan > TechScan (N = 257)	MktScan < TechScan (N = 123)
Hypothesis	H_3	H_3	H_3
Independent Variable	MktScan	MktScan	MktScan
Outcome Variable	PIP	PIP	PIP
Mediating Variable	TechScan	TechScan	TechScan
Standardized Coefficient between MktScan and PIP (Total)	0.571	0.535	0.765
Standardized Coefficient between MktScan and PIP (Direct)	0.291	0.266	0.495
Standardized Coefficient between MktScan and PIP (Indirect)	0.280	0.269	0.270
Type of Mediation	Partial	Partial	Partial
Ratio of Indirect and Total Standardized Coefficients Between MktScan and PIP	0.490	0.503**	0.353

* Mediation analysis performed using MedGraph (Jose 2003).

** Mediation effect of TechScan was higher when MktScan > TechScan.

Table 9: Mediation Effect of MktScan (Hypothesis H_4)*

	Full Dataset (N = 467)	TechScan > MktScan (N= 123)	TechScan < MktScan (N = 257)
Hypothesis	H_4	H_4	H_4
Independent Variable	TechScan	TechScan	TechScan
Outcome Variable	PIP	PIP	PIP
Mediating Variable	MktScan	MktScan	MktScan
Standardized Coefficient between TechScan and PIP (Total)	0.645	0.749	0.565
Standardized Coefficient between TechScan and PIP (Direct)	0.454	0.294	0.373
Standardized Coefficient between TechScan and PIP (Indirect)	0.191	0.455	0.192
Type of Mediation	Partial	Partial	Partial
Ratio of Indirect and Total Standardized Coefficients Between MktScan and PIP	0.296	0.607**	0.339

* Mediation analysis performed using MedGraph (Jose 2003).

** Mediation effect of MktScan was higher when TechScan > MktScan.

5. Limitations of The Research and Future Directions

When collecting data, firms that were primarily in the business of manufacturing products were selected although no such constraint was imposed while developing the hypotheses. Such a focus during data collection provided a moderate choice as opposed to the two other extreme choices for selecting a sample population to test the research model. A more general

population of firms could have been selected for the national-level survey. While that choice might have caused the result to be more widely supported, it entailed the risk of being too broad for an exploratory type of study. Another option was to collect data from a more selective group of firms focused on a specific type of customer or a specific industry. Since new products in a single industry are more homogenous with respect to market, technology and their economic effects, analysis of data focused on a single industrial sector often was more useful (Santarelli and Piergiovanni 1996). At the cost of being too narrow, it might have enabled a deeper understanding of the chosen industry or chosen customer segment, in addition to the prospect for a more relevant and stronger result. It may be interesting to compare outputs among a few focal industries and examine whether a certain industry makes more use of either technology-scanning capability or market-scanning capability. It may also be worthwhile to explore the underlying causes (e.g., competitive pressure) that might be responsible for increased use of either MktScan or TechScan capability – if that is found to be the case - in an industrial sector at a given time.

6. Theoretical and Practical Implications and Conclusion

The findings of this study provide important insights for practitioners as well as researchers. Since firms need to know about external activities in market and technology domains as a result of the increasing popularity of open innovation practices (Chesbrough et al. 2006), market-scanning capability and technology-scanning capability are increasingly important. Indeed, Chesbrough (2003) stated that the job of R&D managers involved not only managing within the company but also looking beyond the firm's boundaries and managing the network relations to take advantage of other firms' technological efforts. Similarly, chief innovation officers or CEOs are interested to know about market dynamics to find the external opportunities that may exist. Alliances, mergers and acquisitions are frequently used as tactical tools to practice open innovation. An improved level of technology-scanning capability and market-scanning capability of firms would be helpful to execute these tactics to implement open innovation strategies of firms.

Technology-scanning capability was found to mediate the relationship between market-scanning capability and product innovation performance. Similarly, market-scanning capability mediated the technology-scanning capability and product innovation performance relationship. Results also implied that technology-push firms would benefit more from a stronger market-scanning capability. Firms operating in technologically volatile environments will need to improve their TechScan capability to maintain their product innovation performance. Overall, the study connected sense-and-respond framework and resource-based view of firms to put together a theoretical foundation for creating adaptive enterprises. On a more detailed level, the study illustrated how two intangible resources (i.e., capabilities) of firms interacted with each other to create product innovation performance.

HOW INNOVATION AFECTS PERFORMANCE MANAGEMENT AND CONTROL SYSTEMS IN BUSINESS ORGANIZATIONS ACROSS ECONOMIC AND CULTURAL ECOSYSTEMS

Lavanya Rastogi, University of Salford, United Kingdom

Introduction

Innovation is one of the most important ingredients for maintaining the competitive advantage and gain leadership when it comes to growth and survival for large business organizations on the global stage with various cultural and economic challenges affecting them in domestic and international markets.

Businesses have always known that to sustain their success they must evolve and adapt to the changes in their operating environments and the ecosystems. Over the past decade or so the pace of change in the economic environment has been unprecedented, forcing businesses to evolve at a faster pace than ever before. The forces of this change have been multi-dimensional and somewhat omnipresent in the operating business environment for decades but have seen a significant acceleration in the last decade as most constituent variables have gone through a point of inflexion (Funk, 2013).

 The new operating systems involved in innovation management consistently influence firms and industries, and they can have reactions with much better velocity, agility and creativity than the existing systems. The innovative system acts as a complementary entity rather than loads in the traditional hierarchy. Consequently, this sort of system is actually making firms more facile to operate, run and accelerate the strategic moves and changes (Sharp, Bergh, & Li, 2013).

Most of management thinking of the past few decades from Porter, who studied on "waking-up call that organizations need to consider strategy much more frequently and explicitly", to Christensen's perception on how poorly traditionally organized companies have been handling the technological discontinuities in-built in such a very fast developing world, to the latest work done by Laureate and Kahneman (2013) about the role of innovations in transforming the contemporary firms on the global stage.

Innovation stimulus is initiated with establishing a "sense of urgency, emerging a revelation change , interacting the idea for buy-in, , generating short-term wins, creating a guiding coalition , never allowing and combining changes into the culture, empowering broad-based action" are the ways which can be implemented by large business firms (Anderson et al., 2014).

Through the 1970s and 1980s the organizations needed to compete along the axis of productivity, pricing and access. However, recent decades have seen the tremendous acceleration in the technology adoption and also the market place becoming truly globalized with the advent of the internet and social media which led toward significant innovations in the success of organizations (Gressgård et. al., 2014).

Roberts (as cited in Schilling, 2015) argued that the rise of the internet concurred with quick innovations in related networking facilities and software, and quick drops in prices of IT products such as telecommunications and technological equipment. For enforcing the consequences of technology in development and advancement of organisms, some scholars found numerous challenges affecting product development, comprising more swift product merchandising, bringing up the global competition, and augmenting the uncertainty connected with technological and market restrictions. Technology convergence and market fragmentation have been the hallmarks of such innovation processes across large business firms (Song & Weiss 2001; Raisch et al., 2008; Cardinal, Turner, Fern, & Burton, 2011).

While Johnson and Kaplan (1987) claimed that the significance of management accounting and control systems should be reclaimed by capitalizing on substantial growths in information technology, which allow a growth of organizational technology innovation in gathering and processing information.

Today's contemporary consumer across the world has more choices as different sources of information available in real time and on demand and often come from a social context of their existing trusted relationships. In the line with Eccles, Ioannou, and Serafeim (2014) findings, this has required organizations to be become much more adaptable, agile and responsive to the ever-shifting needs and preferences of the customers augmented by innovative technologies.

As large business firms have redesigned themselves to adapt to this new reality of the omnipresent hyper competitions, they are increasingly relying on disruptive business models as the source of sustaining their competitive advantage. Even established businesses are having to innovate in not only in all the marketing dimensions, but across the entire product and organizational development including though not limited to supply chain, sourcing, talent development, access to the capital and access to market etc. (Hannan & Freeman, 1984; Tripsas & Gavetti, 2000).

With some examples being that of UBER, the global transportation company that is now valued at over $50 Billion and does not own a single car or employ any driver or one of the largest telecom company in the world, Skype – it does not even own/operate any traditional telecom infrastructure, but help millions of people to connect and communicate or AIRBNB that has the largest availability of rooms worldwide but does not own or operate a single hotel, while still being worth upwards of $20 Billion. The induction effect of this unicorn type of businesses are that even established organizations are experimenting both with their business models and offerings, often by leveraging best of innovation and technologies, in a bid to become more innovative and competitive, McKesson, a fortune 500 in health care, space is taking on Amazon to protect its turf in the drugs distributing business or GE Engines redefining Analytics and Telemetry as the growth driver for its aircraft engines business or Insurance companies preparing to respond to Driverless Cars.

So while innovation has clearly made its case as arguably the greatest value creator or driver for the new global economy and there is a significant body of research (Ichniowski, & Shaw, 1999) fostering and managing innovation, there is one more area where organizations are beginning to feel the "stress" in the area of designing their "Control and Performance Management Systems" to adopt to these new expectations of a highly responsive customer facing organization, shorter decision cycles, shorter product release cycles, quick learning – assimilation goals, more quick research to monetization goals, cross functional product teams (Elenkov, 2005).

A formal process for innovation will assume that the competencies that are needed at different stages of innovation have been to a certain degree matured within the organization and have an effective engagement with the larger performance and control systems – it is therefore to understand the correlation between the relative formality and maturity of innovation systems with financial performance (Yuan & Woodman, 2010). Especially given that new economy businesses often referred to as amongst the most innovative like Zappos and Netflix have credited "boundless" innovation or innovation without boundaries.

Baer and Fresem (2002) examined the importance of understanding and exploring innovation in an industry context as presumably the dynamics of B2B innovation in the business model between GE and United, innovation in the business model between UBER and a self-employed driver are likely to follow different paths with different measurement of outcomes and different control systems implications.

This study aims to investigate how innovation will affect the control system and management

performance and how it will affect the business organization across different ecosystems as there are a number of variables that affects and impact organizations, particularly larger ones and how innovation plays an important role in it. As for the majority of the competitive organizations, innovation is established as a crucial facet of their business strategy. The capability to produce profits through the sale of innovative products that is taken account as the sustainable basis in global markets (Barney, 1985).

Discontinuity of being innovative in technology management influences the capability of an organization in obtaining or maintaining the positive organization performance. Chan and Huang (2012) mentioned that technological innovations affect organizational performance.

The challenges occur when individuals and their organizations focus their attention on routine tasks. As a result, they do not invest time and resources in generating new ideas (Van de Ven, 1986). While innovation is often achieved through shaping ideas and make them concrete and valuable to organizations, in large and successful organizations, it is more difficult to encourage employees to innovate (Ibid). Innovation involves the reflection and resources between alteration and extension of current capabilities and investigation substitutes (March, 1991).

Successful large business firms encounter numerous challenges in inspiring peoples (employees, suppliers and consumers) to come up with new ideas for innovative processes and systems (Damanpour, 1991; Amabile, 1988, Bisbe & Otley, 2004; Jørgensen & Messner, 2009, Pavie, Carthy, 2013; Owen, Bessant, Heintz, 2013, Von Schomberg, 2013; Owen, 2009; Owen, Macnaghten, Stilgoe, 2012).

Literature Review
1.   Performance Management:
Performance management is a strategy that contributes to organizations' sustained success by developing and improving the potential of the human resource in the organization (Reynolds & Ablett, 1998). This type of management centrally focuses on performance improvement as a means to achieve individual, team, and ultimately organizational effectiveness (Armstrong, 2004). Perceiving people, not capital, as the key factor that provides organizations with a competitive advantage, performance management thus emphasizes transforming people's capabilities into effective performance by diminishing barriers and motivating the human resource (Kandula, 2006; Reynolds & Ablett, 1998). Performance management system provides a complete and skill management process for organizations to evaluate the performance consequences of organizations and employees. Worker performance might be expected, assessed and inspired. Macky and Johnson (2000) illustrated that the significance of the performance management system is endlessly rising organizational performance, and this is often achieved by improving individual worker performance.

2.   Organizational Culture:
A well-established culture is the key to satisfying performance. Therefore, organizational culture plays a more active and direct role in performance management (Kandula, 2006). As Ogbonna and Harris (2000) examined that the organizations which have a strong and positive culture can encourage an average employee to perform tasks and achieve the goals of company. On the other hand, organizations with an undesirable culture may make an outstanding employee underperform and thus end up with no accomplishment. (Magee, 2002; Murphy & Cleveland, 1995) investigated organizational culture as it directly affects how employees perform. Furthermore, innovation has a great impact on generating revenue for organizations and help to sustain it on a competitive environment (Yuan & Woodman, 2010).
Innovation:
Innovation has a profound impact on the business formation of an organization which leads

on unceasing innovation and productivity as vital tools for fostering competition (Gök, 2014). Innovation is not always considered as a new invention, in many cases it is a new solutions or ideas that come from a different country or an organization. Although it may not be the original solution, but it can significantly impact the market (Roberts & King, 1996). Innovation agencies around the world are more concerned on opportunities available for investment in technological industries driven by innovation but at the same time they consider contests through investment policies. The socioeconomic encounter involve technical, social and universal modifications to help improve industries and adopt to the changes (Foray et al. 2012) Innovation through technology has helped organizations of all kinds, particularly public organization such as the US Department of Defense which supported and finance Arpanet (the origin source of the internet) which accredited internal organizational subtleties and cultivated research and education (Abbate 1999; Block 2008). Furthermore, Innovation policy study has proven the impact of innovation on industries' economic improvement (Fagerberg, Srholec, and Verspagen 2010). Today innovation policy affects both short term and long term sustainable progression of organizations and because of its important innovation policy now researched by scholars and researchers across the world (Christensen and Fagerberg 2016).

3.   Organizational Performance:

Cainelli et al. (2006) observed the affiliation between innovation and performance in details and determines that there is a two-way relationship, innovative corporations win over non-innovative ones, furthermore the most creative innovator corporations, are more intended to innovate and distribute possessions to innovation.

There is a positive relationship between innovation and performance particularly to improve efficiency and development. Consumers have positive impact on innovation and innovation positively affects performance (Leiponen, 2005; Tether, 2005).

4.   Management Control System:

Management control systems develop over time. Traditional management accounting measures had lost their significance to management planning and control as management accounting failed to keep pace with business environment and organizations landscape and were frequently not suitable and up to date to be appropriate for planning, decision making and control" It needs to keep up with the changing information and process and control needs of an organization (Johnson & Kaplan, 1987). Management control system has to be designed explicitly to facilitate organizational strategies to achieve competitive advantage and desirable performance (Langfield-Smith, 1997). When an organization's environment, strategies, and internal structures and systems go hand in hand, high organizational performance will yield dividends (Govindarajan, 1988).

5.   Environmental Factors:

There are many frameworks which demonstrate the reaction of companies when competitive environment change (Peljhan et al., 2008). Miles and Snow (1978) argued that corporations respond to a shifting environment, they acknowledge common strategies and they identified them in four categories labelled defender, prospector, analyzer and reactor which defender and prospector are considered to be in the end of continuum. They also claimed that defender accentuate cost control, tendency, observing and competence rather than scanning the environment for new opportunities. In divergent, prospectors use inclusive development and measure performance more instinctively.

Research Model/Framework
1.   Research Objectives

Driven by my research questions and hypotheses, this research has following objectives:

- To identify the effects of cultural and economic factors in innovations.
- To investigate the impact of performance management and control systems on the business firm's organizational performance.
- To examine the challenges encountered by the business control system and management performance.
- To gain a better understanding of the relationships and interface between innovations, control systems and their individual and combined impact in performance management.
- To analyze the determinants, factors and variables that influence the efficiency of business firm's performance.

2.   Research Questions

The following research questions have been framed for the pursuance of this study:

- To what extent control systems facilitate Innovation
- To what extent Formal Process for Innovation will facilitate financial returns
- Are there any difference in causality of different balance score card dimensions in the innovation?
- What factors contribute to the responsiveness in organizations within innovative industries?

Hypotheses

H1: There is a positive relationship between innovation and control system.

H2: There is a positive relationship between the innovation and performance management.

H3: There is a positive relationship between Innovation and business organization performance.

H4: There is a positive relationship between control system and business organization performance.

H5: There is a positive relationship between performance management and business organization performance.

H6: There is a positive relationship between cultural factor and innovation.

H7: There is a positive relationship between economic factors and innovation.

Research Methodology
Scholar will employ both quantitative and qualitative methods to collect primary data for the pursuance of this study. Questionnaire as well as structured interviews will be used to examine and inspect the relationships between dependent, independent, mediating and moderating variables and to examine their individual and combined affects on a business firm's organizational performance.

1.   Population (Sample)
Participants (subjects) will be senior leaders, and managers (individuals with more than 10 years of experience) affiliated with different large firms of different industries headquartered in different geographical regions of the world.
Only firms with annual revenues of more than 500 million dollars and having global operations would be selected for this study.

2.   Questionnaire Construction:
Constructs for the questionnaire would be retrieved from similar scholarly studies conducted in the past, and new constructs would be identified and gleaned from interviewed conducted with some of the top players in different industries on the global stage. Such firms and their respective leaders and managers would hail from different cultural and economic systems such as North America, European Union, Asia Pacific and Middle East regions.

3.   **Expected Research Contribution**
This study is expected to make a globally profound contribution (both in terms of theoretical and practical dimensions) by developing a scholarly model for estimating and measuring innovations and their impact on the   global entrepreneurship, consumer satisfaction, profitability, control systems, management performance, and thereby overall organizational performance across economic and cultural ecosystems.

Abstract

This study investigates the competitiveness and performance of organizations based on their ability to adopt incremental innovation or continuous improvements (CI) and create creative climate in their efforts to be adaptable to change. We are able to confirm the influence of CI, and creative internal climate on the competitiveness and performance of Saudi Arabian organizations. We find some positive effect of CI and competitiveness on the performance of the organizations. Some implications of the findings to practice are also given.
Keywords: *Continuous improvement, Incremental innovation, Creative internal climate, Competitiveness, Organizational performance, Saudi Arabia*

Introduction

An organization's ability to generate innovation continuously in the present era of globalization and highly competitive business environment is crucial for it to attain a sustainable competitive advantage (Montes *et al*., 2004; Brennan and Dooley, 2005; Bowen and Schneider, 2014). Competition among firms resulting from changing business environment makes it necessary for firms to be more innovative (Deng *et al.*, 2012). Incremental innovations or continuous improvements (CI) are of strategic importance for organizations in their effort to achieve and sustain their competitive advantage (Bessant, Caffyn, & Gallagher, 2001; Lin, Su, & Higgins, 2006). Through CI organizations can generate long-lasting growth spurts (Durmusoglu *et al*., 2013). Organizations that implemented various types of innovations including CI have been found to be more innovative and competitive than those that did not (see Narayanan *et al*., 2008; Zain, 1995a, 1995b; Zain & Rickards, 1996). In some developed and developing countries of Asia, there have been many initiatives or policies carried out by their government or institutions aimed at making their organizations more technologically capable and innovative (see Baark, 2007; Debroux, 2008; Intarakumnerd and Chaminade, 2011; Rasiah and Shan, 2016). Nevertheless, in another example, Dekkers (2009) reported that Chinese companies have not yet adopted or developed adequate practices for innovation.

Innovation is the successful implementation of novel and useful creative ideas offered by employees when their creativity is required at work (Amabile, 2004). Innovation in an organization does not happen by accident but by conscious efforts made by certain individuals in certain situations inside the organization (Amabile, 1997). In order for innovation to happen the working climate or the climate inside the organization must be creative. Creativity is a relevant input or a prerequisite for innovation in organizations (Amabile 1998). It is commonly believed to emerge from an interaction of the person and the situation (Hunter *et al*., 2007). In the current study, we are examining the linkage between CI adopted and implemented by Saudi Arabian organizations, where their internal climate is conducive to such adoption and implementation, with their competitiveness and performance. In other words, we investigate the competitiveness and performance of the organizations based on their ability to adopt CI and to create a creative internal climate in their organization in their efforts to be adaptable to change in a turbulent environment.

Theoretical Background and Hypotheses
1.   Continuous improvements (CI)

Organizations need to establish innovation routines in the form of CI in order to sustain their organizational capability (Bessant, Caffyn, and Gallagher, 2001). Tavassoli and Karlsson (2015) found that firms that chose to implement more than one strategy of CI were able improve their future productivity as opposed to those that chose to implement only one strategy. They also stressed the need for organizations to have an appropriate mix of both technological and non-technological innovations. Certain types of firms' collaborative structures as well as inter-firm collaborative efforts have been found to result in more innovative activities or innovation among firms (Opper and Nee (2015; Zhang and Cantwell, 2011). In the United Arab Emirates, Mohamed (2002) found that various incremental changes implemented throughout organizations in the country were important predictors of group innovation, which could influence the competitive position of the organizations. Furthermore, large organizations that frequently introduced incremental technological improvements were found to be more effective competitors in their markets (McKendrick & Wade, 2009). Thus far, the literature has provided very limited guidelines as to what is the right innovation strategy that can help improve the performance of a firm (Le Bas and Poussing, 2013; Tavassoli and Karlsson, 2015). In the past, there have been more research focus given to technological innovations as compared to non-technological innovation even though Schumpeter (1934) has long suggested the need for both. Thus, it is not adequate for organizations to rely just on science and technology-based radical innovations, but they also need to carry out CI in order to remain competitive. In other words, in addition to occasionally carrying out few big or drastic changes, organizations also need to be involved with managerial and organizational improvements in all their functional areas on a continual basis (Zain, 1995a; Hobday, 1996; Hallgren et. al, 2010) as earlier identified by Schumpeter (1934).

In order to develop and sustain competitive advantage an organizations need to be able to innovate in many ways (Tidd *et al.,* 2001). Organizations not only need to introduce radical innovations but they also need to introduce small changes and to do new and better things on a continual basis (Slater and Narver, 1995). They also need to always manage their innovation process (Brown, 1997; Humphreys et al., 2005). Hence, our first hypothesis:

>   H1: CI implemented by an organization influences its competitiveness.

2.   Creative Internal Climate and Competitiveness

Innovation in an organization is contingent upon a series of creative efforts in various functional areas and across different fields of specialization (Udwadia, 1990). Organizational internal climate is "a conglomerate of the attitudes, feelings and behaviour which characterize life in an organisation" (Ekvall *et. al*, 1983, p. 3). An organization needs to have a creative internal organizational climate or work environment in order to foster the right atmosphere for creativity and innovation to flourish (Ekvall and Ryhamnar, 1999; Kattara and El-Said, 2013; Yusuf, 2009). Past research has defined creativity as an outcome, concentrating on the production of new and useful ideas pertaining to products, processes, procedures, and services (e.g., Amabile, 1988; Ford, 1996; Oldham & Cummings, 1996; Shalley, 1991; Zhou, 1998). Thus, an organization needs to develop an internal climate that can promote creativity (Ahmed, 1998), and that can give a strong external focus on its many stakeholders (Cagliano *et al*., 2001). Creative work environment has been found to influence creative outcome and organizational competitiveness (Dul and Ceylan, 2010). At the individual level, creativity in the organization is generally considered essential for fostering organizational innovation, an important ingredient for long-term organizational growth and survival (Amabile, 1988;

Kanter, 1983; Tushman & O'Reilly, 1997). Many researchers have suggested that a person can find creative insights or ideas by questioning his or her assumptions (e.g., Adam, 1982; Runco, 2011). By doing so, one can shift perspectives on a problem, which can result in a creative insight or idea (Runco, 2015). Creativity of employees in organizations has been found to be more effective if it is supported by organizational interventions that focus on training of supervisors and work-group members to support creativity than broader and less focused interventions (Diliello *et al*., 2011). In one study conducted by Mayfield and Mayfield (2010) on garden variety creativity in the US, they found that in order to maximize workers' creative outputs, managers need to improve all aspects of their organizations' creative environment. Interestingly, research has found that in a climate of strong organizational innovation, time pressure hinders creative outcomes whereas in a climate of weak innovation, time pressure enhances the outcomes (Hsu and Fan, 2010). Type and role of leadership have also been found to influence creativity differently (Shalley and Gilson, 2004; Si and Wei, 2012). For example, Si and Wei (2012) found transactional leadership as opposed to transactional leader to be more effective in employees' creative performance. Researchers have suggested some ways in which climate can be developed in Asia and elsewhere (see Bowen and Schneider, 2014; Hoang *et al*., 2015).

In Malaysia, Ismail (2005) found a significant relationship between creative climate and innovation implementation by organizations. Suliman and Al-Shaikh (2006) found that when quite a bit of conflicts are present among employees within an organization it tended to reduce the employees' readiness to create and innovate. Aleksic *et al*., (2015) found that a preference for creativity among employees in an organization has resulted in higher creative outcomes. Conversely, a lack of creativity among employees would stifle new ideas and innovations (Amabile, 1988; Eyton, 1996; Goldsmith, 1996). A more recent study in Spain found that the relationship between creative climate and innovation is not a linear but an inverted "u-shaped" relation, which indicates that beyond a certain point the benefits from creativity decreases (del-Corte-Lora *et al*., 2015). In measuring organizational creative climate of an organization, Ekvall *et*. al (1983) constructed and validated an instrument called the Creative Climate Questionnaire (CCQ). The CCQ, which is used to assess the creative climate of Saudi Arabian organizations in this study contains 50 questions that are categorized into ten indices: challenge/motivation, conflict, debates, freedom, idea support, idea time, liveliness/dynamism, playfulness/humor, trust/openness, and risk taking.

Yepes et al. (2016) pointed out that organizations must modify their attitudes towards innovation in order to sustain their competitiveness. In giving a holistic definition of competitiveness, Feurer and Chaharbaghi (1994, p. 58) say:

"Competitiveness is relative and not absolute. It depends on shareholder and customer values, financial strength which determines the ability to act and react within the competitive environment, and the potential of people and technology in implementing the necessary strategic changes. Competitiveness can only be sustained if an appropriate balance is maintained between these factors which can be of a conflicting nature."

Thus, there remains to be seen whether there is a link between creative climate and competitiveness in organizations. In the UAE, Politis (2005) found that providing a right stimulating work environment resulted in both creativity and productivity in an organization, which could enhance its ability to compete in the market place. Hence, the next hypothesis:

H2: Creative internal climate of an organization influences its competitiveness.

3.   Performance

Creativity and innovation in any organization are vital to its successful performance (Anderson *et al*., 2014). Creative organizational climate has been associated with several

positive organizational outcomes, such as increased organizational success and higher job satisfaction, as well as overall organizational performance (Koles and Kondath, 2015). Also, management of innovation is crucial to the performance of organizations. Several factors that are important for the success of innovation management were provided by Zairi (1995). Chen and Huang (2010) found that an increase of creative workforce density of an organization resulted in an increase in its innovation performance. Past studies have also shown that a country's innovation policies and enhanced capabilities have resulted in increased organizational performance (Giroud *et al.,* 2012; Yuan *et al.,* 2016). Furthermore, Fores and Camison (2016) found that knowledge accumulation of an organization and its size positively affect its incremental innovation performance. Thus, knowledge management is very important for an organization in its effort to improve performance (Leipone, 2006). In addition, Hine and Ryan (1999) found that more innovative organizations are of greater potential value to their industry than less innovative ones. A recent study found that organization performance is mediated by innovative organizational culture (Park *et al*., 2016). Thus, a culture that stresses on CI is of paramount important to an organization. Hence, our final set of hypotheses for this research:

> H3a: CI carried out by an organization positively influences its performance.
> H3b: Creative climate of an organization positively influence its performance
> H3c: Competitiveness of an organization positively influences its performance.

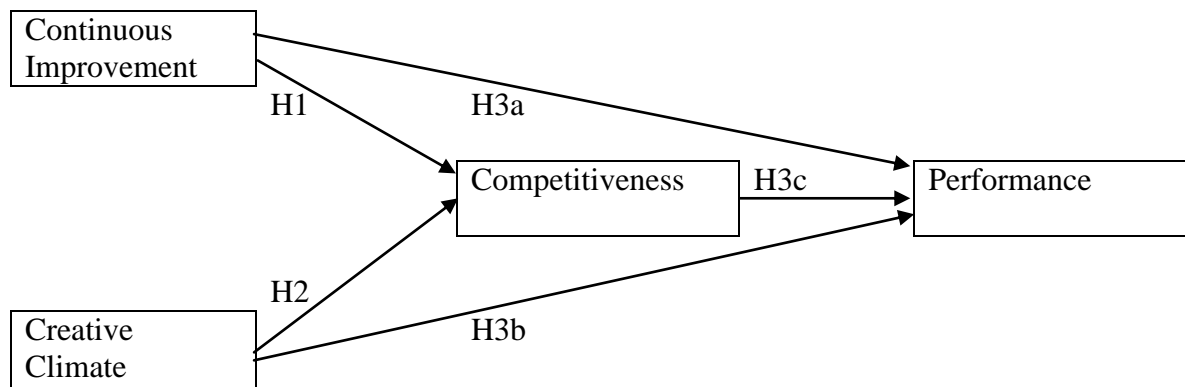
Figure 1 shows the research framework and the various hypotheses of this research.


Figure 1: The Research Framework

Methods
We carried out descriptive analyses using the SPSS and structural equation modeling (SEM) software to establish the reliability and validity of the instrument used in this study as well as the causal relationships between the constructs. We used the AMOS software for SEM, which includes covariance structural causal data analysis method because it can simultaneously test the relationships under study (Bollen, 1989; Bollen and Long. 1993). These methods include both a measurement and a structural model, and are capable of evaluating latent variables and the overall model fit. The overall goodness-of-fit statistics are also more comprehensive as compared to other traditional methods (Ramanathan, 1989).
When using SEM, some broad guidelines about absolute sample sizes need to be followed: small sample size is less than 100, medium sample size is between 100 and 200, and large sample size is more than 200 (Hair *et al*. 2010; Hulland *et al*., 1996; Kline, 1998). Normally, models with many parameters require a larger sample than more parsimonious models (Hulland *et al*., 1996; Kline, 1998) even though there are no clear guidelines as to what

constitutes an 'adequate' sample size (Baumgartner and Homburg, 1996). The sample size of 135 respondents used in this research is appropriate for the complexity of the research model shown in Figure 1.

The questionnaire used in this research has five sections: (1) 18 statements that assess the CI initiatives carried out by the organizations within the last five years from the time of the survey; (2) 50 statements, adapted from Ekvall's *et al* (1983), that assess the creative climate of the organizations; (3) 10 statements that assess the competitiveness of the organizations; (4) 4 statements that assess the performance of the organizations; and (5) a section that gathers the respondent's demographics. The questionnaire used 6-point Likert-type scale that ranges from 1 (Strongly Disagree) to 6 (Strongly Agree). We used the even-numbered scale in order to discourage the respondents from choosing a mid-point scale in order to appear more socially acceptable in giving their answers (Garland, 1991). We carried out back-to-back translation procedure of the questionnaire recommended by Brislin (1970) in order to ensure the correct meanings of the items in both English and Arabic languages.

We employed a self-administered questionnaire method for the survey. The questionnaires were conveniently distributed to 145 Executive MBA students from two campuses (in Jeddah and Qassim) of a public university in Saudi Arabia in 2012. The questionnaires were distributed to the students during their class hours and they were asked to return the completed questionnaire within two weeks. Out of this exercise, 135 returned questionnaires were usable. Majority of the respondents were from service industry (67.4 percent) and holding either middle or lower level management position (50.4 percent). Most of the organizations were limited liability companies (39.4%), followed by private corporations (28.4%), sole proprietorships (14.6%) and partnerships (13.5%).

Results

Based on our preliminary data analysis, we found that all the estimated correlations of the constructs (CI, creative climate, competitiveness, and performance) ranged from 0.41 to 0.80 and were statistically significant ($p<0.01$). Our assessment of the creative climate of the organization based on Ekvall's CCQ turned out that, with the exceptions of challenge/motivation, freedom, and conflict, all the organizations were found to be reasonably innovative (Table 1).

Based on our statistical analysis using SEM we found that the model's key statistics to be good (Table 2) and thus, we could safely conclude that the model is valid and we could thus continue to test the hypotheses.

Table 1. Creative Climate Based on Ekvall's CCQ Indices[1]

	Variables	Means	"S"	"I"
1	Challenge (CCM)	1.8	1.8	2.3
2	Freedom (CFR)	1.7	1.5	2.1
3	Idea support (CIS)	1.8	1.1	2.1
	Liveliness (CLD)	1.8	1.3	2.2
5	Humor (CPH)	1.8	1.3	2.3
6	Debates (CDB)	1.8	1.1	1.5
7	Trust (CTO)	1.7	1.2	1.7
8	Conflicts (CCF)*	1.8	1.5	0.7
9	Risk taking (CRT)	1.8	0.6	1.8
	Idea time (CTM)	1.7	0.9	1.5

Note: Means based on Ekvall's results:
S = Standard Companies; I = Innovative Companies
* Reverse score

[1]The original 6-point scale was converted to a 3-point scale in order for it to be consistent with the scale used by Ekvall *et at* (1983).

Table 2. Goodness of fit indices for structural model based on Hair *et al.* (2010)

Fit indices	Recommended value	Structural model
χ^2/df (180.09/112)	> 3.00	1.61
P_{value}	Significant, $P > 0.0001$	0.00
CFI	> 0.95 or better	0.97
RMSEA	< 0.08 with CFI = 0.95 or higher	0.05

As shown in Table 2, we represented the strength of the relationships among the constructs using the respective standardized path coefficient based on Cohen's (1988) recommended standardized path coefficient (β): $\beta < 0.10$ indicates a "small" effect; $\beta = 0.30$ indicates a "medium" effect; and $\beta = 0.50$ or more indicates a "large" effect.

The results of the hypotheses testing are shown in Table 3. From this table we can see that, as expected, CI has significantly effects on both organization competitiveness (H1: $\beta = 0.21$; $t_{value} = 2.16$; $P = 0.03$) and performance (H3a: $\beta = 0.16$; $t_{value} = 1.98$; $P = 0.05$). We also found that creative organizational climate has a significant medium effect on competitiveness (H2: $\beta = 0.36$; $t_{value} = 3.37$; $P = 0.00$). Thus, H1, H2, and H3a are confirmed. However, there was no significant relationship between organizational climate and performance (H3b: $\beta = 0.04$; $t_{value} = 0.51$; $P = 0.61$), and thus, H3b is not supported. Finally, the findings indicate that the path between organization's competitiveness and performance is statistically significant. We found that the organizations' competitiveness tended to have a large and significant positive effect on organizations' performance (H3c: $\beta = 0.77$; $t_{value} = 6.40$; $P = 0.00$), thus confirming H3c.

Discussion

Some interesting results have emerged from this study on organizations in the developing country environment of Saudi Arabia. Firstly, the study has shown the importance of CI to be adopted and implemented by organizations in the country. By adopting and implementing this type of innovation, it would have a direct influence on the competitiveness as well as on the performance of the organizations. Thus, this study has confirmed in the developing of Saudi Arabia what other researchers have found elsewhere (for e.g. Slater and Narver, 1995; Brown, 1997, Terzvioski, 2002; Humphreys *et al*, 2005), i.e., the positive relationship between CI and competitiveness and performance of an organization. Secondly, this research has also found the significant contribution of an organization's creative internal or working climate on its competitiveness. Of seven of the ten creative climate variables or indices (the exception being challenge, freedom, and conflicts), the Saudi Arabian organizations are rated either as more than "standard companies" or as "innovative companies". In other words, in terms of idea support, liveliness, humor, debates, and trust, the scores obtained by the organizations are above the "standard" rating while in terms of risk taking, and idea time, the scores obtained by the organizations are rated as "innovative" companies. Thus, from this study we have found three specific areas the Saudi Arabian organizations need to work on in order to improve their creative climate: challenge/motivation, freedom, and conflict. In other words, in term of challenge/motivation, based on what was defined by Ekvall *et al.* (1983), Saudi

Arabian organizations need to encourage more emotional involvement of their employees in the operations and goals of their organization (Zain and Rickards, 1996). Similarly, in term of freedom, Saudi Arabian organizations need to allow more independence in the behavior practiced by the employees of their organizations. As for conflict, there is a need for Saudi Arabian organizations to lessen the occurrence of personal and emotional tensions among their employees.

Table 3. Results of the hypotheses testing

Path			Standardized path coefficients	t-value	p-value	Results	
Competitiveness	←	CI	0.21	2.16	0.03	H1:	Accepted
Competitiveness	←	Creative Climate	0.36	3.37	0.00	H2:	Accepted
Performance	←	CI	0.16	1.98	0.05*	H3a:	Accepted
Performance	←	Creative Climate	0.04	0.51	ns	H3b:	Rejected
Performance	←	Competitiveness	0.77	6.40	0.00	H3c:	Accepted

Note: Significant level at $p < 0.01$ and $p < 0.05$* (two-tailed); CI = Continuous improvements

Finally, as expected we found a positive influence of organizational competitiveness on the organizations' performance. Many previous researchers (for e.g., see Zain and Rickards, 1996; Lin and Chen, 2007; Santa *et al.,* 2010) found that innovative organizations performed better than the non-innovative ones. Thus, this research confirmed such a finding in the Middle Eastern developing country environment of Saudi Arabia. Nevertheless, implementing continuous improvement is not necessarily an easy thing to do since there are some barriers which an organization needs to overcome (Audretsch *et al.,* 2011).

Implications and Conclusion

Through this research we are able to confirm as well as disconfirm the effect of CI, and creative internal or working climate on the competitiveness and performance of Saudi Arabian organizations. First, we are also able to confirm the positive influence of CI and creative internal climate on the competitiveness of the organizations. Second, we found positive effects of CI and competitiveness on the performance of the organizations. Third, we found a positive relationship between competitiveness and performance of the organizations. Thus, from these findings, a number of practical implications could be derived. First, it is important for Saudi Arabian managers to adopt and implement CI in their organization, in addition to implementing other types of innovation, such as technological or radical innovations (Tidd *et al.*, 2001; Coccia; 2015). Having a culture of CI is one of the ten commandments of quality in an organization (Antony, 2014). In carrying out CI, Quesada-Pineda and Madriga (2013) suggest five factors that affect the long-term sustainability of the CI process: change management, strategic planning, knowledge management, performance management, and sustainability of the CI process. Secondly, as demonstrated in other parts of the world, Saudi Arabian managers need to create an internal environment or working climate where creativity can be nurtured among their employees, as indicated by the ten creative climate measures or indices shown in Table 1. Creating an internal climate that is creative would help make their organizations to be more competitive vis-à-vis their rivals. This, in turn, would help improve the performance of their organizations. Previous researches in other parts of the world have suggested some frameworks for enhancing organizational creativity

and sustainable organizational innovation and organizational performance (see Brennan and Dooley, 2005; Hannevik *et al*., 2014; Rezaei et al, 2015). In term of climate, we have also found three specific areas in which Saudi Arabian managers need to work on in order to improve the creative climate of their organization: to provide more challenge/motivation, to provide more freedom, and to reduce conflicts among their employees. Finally, we have demonstrated the usefulness of the Ekvall's CCQ in assessing the creative climate of organizations in a developing Gulf Cooperation Council (GCC) country environment.

Just like most other studies, this study is not without its limitations. The main limitation is that the sample is rather small and the respondents were confined to only executive MBA students from two cities in Saudi Arabia. Also, the use of convenience sampling method in itself has its own limitations. In order to strengthen or to further confirm the findings of this study, future studies need to collect data from bigger and wider spectrum of the Saudi Arabian population across the country.

BEHAVIOURAL COMPLEXITY SHAPING AMBIDEXTROUS BEHAVIOURS AMONG SMES IN MALAYSIA

Poon Wai Chuen, Multimedia University, Malaysia
Osman Muhamad, Multimedia University, Malaysia
T. Ramayah, Multimedia University, Malaysia

Abstract

Although research on ambidextrous behaviour has surfaced over the recent years and were found to positively influence business performance, antecedents of individual ambidexterity are still largely unknown. This study focuses on the effect of behavioural complexity on exploitative and explorative behaviours ultimately leading to the development of individual level ambidexterity. Structured questionnaires have been collected from 183 managers of SMEs in mainly Selangor and Kuala Lumpur. Using partial least square, our result demonstrates that collaborate, compete and control behavioural roles positively predicts exploitative behaviour while collaborate, control and create behavioural roles positively predicts explorative behaviours. In addition, both exploitative and explorative behaviours were found to significant for ambidextrous behaviours.

Keywords: *Ambidextrous behaviour, behavioural complexity, exploitative behaviour, explorative behaviour, small and medium enterprises (SMEs)*

Introduction

Studies has shown that the possession of dynamic capability is empirically critical in both sustaining the performance of the business. Wilden et al., (2016) argue that dynamic capabilities exist on multiple level within an organisation (i.e. individual, teams, business unit and corporate level) which in turn influence on organisational outcome (such as innovation, performance and competitive advantage). Tushman and O'Reilly (1996; 2013) argue that in order for firms to develop dynamic capabilities, firms should develop ambidexterity in addressing both short and long term needs Dynamic capability is related to ambidexterity, which in short can be explained as firm simultaneously pursue both exploitation and exploration capability for short-term and long-term survival. Ambidexterity was presented as a possible solution to increasing innovative effort in an organisation. Junni et al., (2013) analysis showed that ambidexterity were found to be consistently contributing in the improvement of firm performance. The purpose of this paper is to extend the understanding of antecedents in the development of ambidexterity that have underscored the importance of ambidextrous behaviour in an organisation

Literature Review on Behavioural Complexity and Ambidextrous Behaviour

The concept of behavioural complexity may best explained with the concept of cognitive complexity (Denison et al., 1995; Rosing et al., 2011; Lawrence et al., 2009) due to the series of paradox and contradiction (Denison et al., 1995) that entails on the individual. According to Lawrence et al., (2009), the frameworks consist of flexible versus stable structure and internal versus external focus and with these four structure, together it forms four quadrant which consist of compete (rational goal criteria), control (internal process criteria), collaborate (human resource criteria) and create (open systems criteria). Compete behavioural roles refers to planning, goal setting and productivity, collaborate behavioural roles refers to cohesion,

morale and training, while control behavioural roles refers to information management, stability and control, and finally create behavioural roles refers to adaptation and growth (Lawrence et al., 2009).

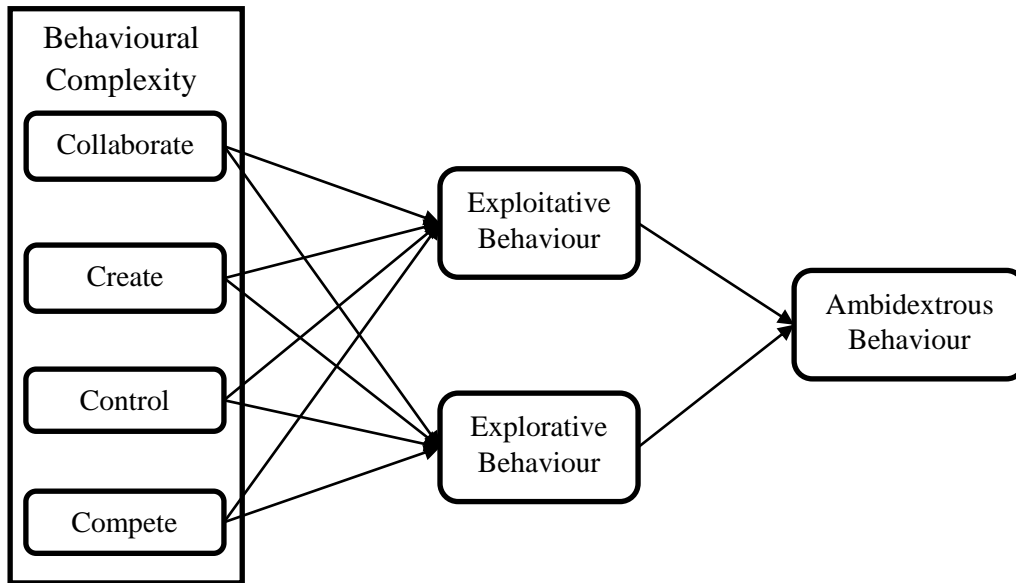
Behavioural complexity demand individuals to be both loose and strict, creative and routine and formal and informal at the same time. The logic underlying behavioural complexity traces back to the competing values framework (See Lawrence et al., 2009). In an attempt to define behavioural complexity, Denison et at., (1995) explains it as someone who has the ability to "perform the multiple roles and behaviours that circumscribe the requisite variety implied by an organisational or environmental context.

Raisch et al. (2009) remarked that ambidextrous individuals must manage contradictions and conflicting goals, engage in paradoxical thinking and fulfil multiple roles. Very often individuals are required to play a crucial role in finding the right balance between exploration and exploitation is important to encourage ambidexterity in preventing obsolescence. Exploitation behaviours refers toward the refinement and extension of existing assets, competencies, knowledge, efficiency, selection, implementation and implementation, while exploration behaviours refers to gaining broader knowledge, advance new or alternative opportunities, searching, risk taking, experimentation and flexibility (March, 1991; Benner and Tushman, 2003; Gupta et al., 2006; Jansen et al., 2008; O'Reilly and Tushman, 2013). At individual level, explorative increases the breadth of knowledge, thus creating prospects for radical changes, while exploitative increases the depth of knowledge, which typically leads to incremental development and enhanced reliability (Benner and Tushman, 2003).

Achieving ambidexterity on an individual level is the most difficult to attain, due to the contradicting demand faced by the individual (Gupta et al., 2006; Kauppila and Tempelaar, 2016). Individual resources such as time and knowledge are limited (March, 1991) which restrict and individual in developing both capability (i.e. exploitation and exploration) adequately (Ambos et al., 2008; Gupta et al., 2006). Raisch et al., (2009) suggested that performing both explorative and exploitative action are heavily influenced by individual characteristics.

While studies done by Kauppila and Templaar (2016) found that individual general self-efficacy positively influence learning orientation which then motivates employees to engage in ambidextrous behaviours. This indicates that individual level behaviours are influence by past knowledge and individual characteristics. Building upon past studies, it is expected that employees perform ambidextrous behaviours, however the mechanism in shaping ambidextrous behaviours remains unclear (See Lawrence et al., 2009). Thus, the main focus of this this study is to improve the understanding of complex and contradicting task perform by individual in cultivating both explorative and explorative behaviours.

It is important to note that, due to the nature of how SMEs operates, work roles are often shared among the entrepreneurs and its motivated employees (Carmeli and Halevi, 2009). The presents a particular challenge, where individuals of all levels in the organisation are now required to oscillate between the four behavioural roles as a response to different situation in order to achieve both exploitative and explorative behaviours. Finally, our conceptual model acknowledges that behavioural complexity plays a central role for individual in their effort of sensing, seizing and reconfiguring daily work roles (See Figure 1)

Figure 1: Conceptual Model


Hence, in this study we propose the following hypotheses:
H1: Collaborate behavioural roles positively influence exploitative behaviour
H2: Collaborate behavioural roles positively influence explorative behaviour
H3: Create behavioural roles positively influence exploitative behaviour
H4: Create behavioural roles positively influence explorative behaviour
H5: Control behavioural roles positively influence exploitative behaviour
H6: Control behavioural roles positively influence explorative behaviour
H7: Compete behavioural roles positively influence exploitative behaviour
H8: Compete behavioural roles positively influence explorative behaviour
H9: Exploitative behaviour positively influence ambidextrous behaviour
H10: Explorative behaviour positively influence ambidextrous behaviour

Methodology
This study is quantitative in nature targeting managers in SME companies were approached around Kuala Lumpur and Selangor, Malaysia. In determining the sample size, Hair et al., (2011; 2013) suggested a rule of thumb 10 times the largest number of structural path directed at a particular construct in the structural model. Furthermore, Kline (2005) also recommended another way to estimate the minimum samples size which is power analysis by using G*Power 3.1 program (Faul, et al., 2009) Using this software, the estimate sample size would be 98 respondents with the power at 95%, the alpha at 0.05 with the medium effect size of 0.15. In short, questionnaire were distributed through email and 183 useable responses were collected.
Behavioural Complexity were captured using the scales developed and validated by Lawrence et al., (2009). The scale consist of 36 measuring four different behavioural roles (i.e. create, compete, collaborate and control). As for explorative and exploitative behaviour, fourteen items from Mom et al., (2009) scale to capture individual explorative and exploitative behaviours. Similar to Mom et al., (2009), both explorative and exploitative behaviours of an individual by asking the extent to which they pursue a particular activities in the last year. Finally, in capturing ambidextrous behaviour, twelve items from Lubatkin et al., (2006), that

8 items were originally adapted from He and Wong (2004) scale to capture the extent of ambidextrous behaviour. Similarly for exploitative behaviour, explorative behaviour and ambidextrous behaviour as proposed by Lubatkin et al., (2009), an additive model were used to conceptualise the measurement.

Data Analysis

In testing the hypothesis, Partial Least Square (PLS) a second generation multivariate technique (Ringle et al., 2012) which evaluate both measurement and structural model to minimise error variance (Hair et al., 2013). Smart PLS 3 (Ringle et al., 2015) were used to analyse the data. Through our analysis, we observed that the results returned a 14 factor with a total variance explained of 71.87% and the first factor only explained 28.09% which indicated that there is no serious common method bias in this research (Podsakoff et al., 2003).

Table 1. Items, Loadings, AVE and CR for First and Second Order Construct

First Order Construct	Second Order Construct	Items	Loadings	AVE	CR
Exploitative Behaviour		AB_Exploit	SIC	SIC	SIC
Explorative Behaviour		AB_Explore	SIC	SIC	SIC
Ambidextrous Behaviour		ADD	SIC	SIC	SIC
	Collaborate	Encouraging Participation	0.84	0.72	0.89
		Developing People	0.89		
		Acknowledging People's Needs	0.82		
	Create	Anticipating Customer's Needs	0.74	0.65	0.85
		Initiating Significant Change	0.79		
		Inspiring People to Exceeds Expectations	0.87		
	Control	Clarifying Policies	0.82	0.67	0.86
		Expecting Accurate Work	0.84		
		Controlling Projects	0.79		
	Compete	Focussing on Competition	0.70	0.62	0.83
		Showing a Hard Work Ethic	0.82		
		Emphasizing Speed	0.84		

Note. SIC = Single Item Construct, AVE = Average Variance Extracted, CR = Composite Reliability

1. Assessment of Measurement (Outer) Model

As explorative behaviour, exploitative behaviour and ambidextrous behaviour was modelled as a single item measure, validity and reliability assessment were not required to be conducted. As for the second order construct behavioural complexity, firstly we assessed the

first order construct, all items met the minimum cut off value of 0.5 as proposed by Hair et al., (2014) where the outer loadings for all items were ranged from 0.67 to 0.91. In assessing convergent validity, each first order construct were assessed and achieve a composite reliability ranged from 0.83 to 0.89 exceeds the recommended value of 0.7 by Hair et al., (2014) and the value of average variance extracted (AVE) as recommended by Henseler et al., (2009) of above 0.5, as for the construct they were ranged from 0.62 to 0.72 (See Table 1). Subsequently, the discriminant validity was assessed. It was observed that all constructs fulfill Fornell-Larker criterion, where discriminant validity is established if a latent variable accounts for more variance in its associated indicator variables than it shares with other constructs in the same model (Fornell and Larker, 1981) (See Table 2).

Table 2. Fornell-Larcker Criterion

	1	2	3	4	5	6	7
1. Ambidextrous Behaviour	1.00						
2. Collaborate	0.42	0.74					
3. Compete	0.41	0.46	0.67				
4. Control	0.31	0.47	0.64	0.69			
5. Create	0.49	0.63	0.61	0.55	0.68		
6. Exploitative Behaviour	0.41	0.41	0.47	0.53	0.37	1.00	
7. Explorative Behaviour	0.50	0.61	0.38	0.28	0.64	0.42	1.00

2. Assessment of Structural (Inner) Model

Following suggestion by prominent researchers, bootstrapping method of 5000 re-sampling procedure was used to estimate for standard errors and significant of parameter estimates (Hair et al., 2014b, Henseler et al., 2009) for hypothesis testing. From the analysis, it was found that collaborate ($\beta = 0.19$, $p<0.05$), compete ($\beta = 0.19$, $p<0.05$) and control ($\beta = 0.35$, $p<0.05$) was positively related to exploitative behaviour, while collaborate ($\beta = 0.38$, $p<0.01$), control ($\beta = -0.18$, $p<0.05$) and create ($\beta = 0.49$, $p<0.01$) was positively related to explorative behaviour. Next, both exploitative behaviour ($\beta = 0.24$, $p<0.01$) and explorative behaviour ($\beta = 0.41$, $p<0.01$) was found to be positively related to ambidextrous behaviour. In evaluate the structural model, the path analysis was conducted to test the ten hypotheses outline in this study. We calculate R^2, which indicates the amount of variance explained by the exogenous variable. Based on guideline by Cohen (1988) regarding the effect size which states that f^2 is small (0.02 – 0.14), medium (0.15 – 0.34) and large (more than 0.35) reflects the effect on the endogenous variable. The findings were summarised in Table 3. The R^2 for explorative behaviour was 0.504 which indicates that 50.4% of the variance is explained by behavioural complexity, while as for exploitative behaviour, the R^2 value was 0.33 which indicates 33%. As for ambidextrous behaviour, the R^2 value was 0.30 which indicates 30% variance explained by explorative and exploitative behaviour.

As for the predictive relevance (Q^2), which is assessed through blindfolding procedure. This method procedure is relevant for endogenous model with reflective items and single item construct, which intend to examine the capabilities of the exogenous variable in predictive relevance of the endogenous variable (Hair et al., 2014). The findings indicates that the predictive validity for all exogenous were ranged between 0.26 to 0.46 with all exogenous variable predictive value greater than zero, then the model is considered to have predictive validity (Hair et al., 2014).

Table 3. Std. Beta, Std. Error, T-Value, Effect Size, Variance Explained and Predictive Relevance

	β	Std Error	T-Value	Decisions	f^2	Effect	R^2	Q^2
Collaborate -> Exploitative Behaviour	0.19	0.09	2.04*	H1 Supported	0.03	Small	0.33	0.26
Collaborate -> Explorative Behaviour	0.38	0.06	5.85**	H2 Supported	0.17	Medium	0.51	0.46
Compete -> Exploitative Behaviour	0.19	0.11	1.66*	H3 Supported	0.03	Small		
Compete -> Explorative Behaviour	0.02	0.08	0.21	H4 Not Supported	-	-		
Control -> Exploitative Behaviour	0.35	0.12	3.06*	H5 Supported	0.10	Small		
Control -> Explorative Behaviour	-0.18	0.07	2.53*	H6 Supported	0.04	Small		
Create -> Exploitative Behaviour	-0.06	0.12	0.49	H7 Not Supported	-	-		
Create -> Explorative Behaviour	0.49	0.08	5.97**	H8 Supported	0.23	Medium		
Exploitative Behaviour -> Ambidextrous Behaviour	0.24	0.07	3.65**	H9 Supported	0.07	Small	0.30	0.28
Explorative Behaviour -> Ambidextrous Behaviour	0.41	0.07	5.93**	H10 Supported	0.20	Medium		

*p<0.05, **p<0.01, f^2 = Effect Size, R^2 = Variance Explained, Q^2 = Stone-Geisser Predictive Relevance (Bootstrapping = 5000, Omission Distance, D = 7)

Discussion

Kauppila and Tempelaar (2016) argued that individual's ambidextrous behaviours are mainly influence by factors and it's vital to better understand and determine individual predictors of ambidextrous behaviour. The study focus on the central question of what influences the development of ambidextrous behaviours?

Member of the organisation demonstrate contradicting behaviours which positively influence both exploitative and explorative behaviours which in turn leads to the development of ambidextrous behaviours. This study also demonstrates that for individuals that perform collaborate, compete and control behavioural roles significantly influence exploitative behaviour while behavioural roles such as collaborate, control and create significantly

influence explorative behaviours. Create behavioural roles is an external focus in a flexible structure is not significantly affecting exploitative behaviours, on the other hand, data shows that it significantly influence explorative behaviour instead. As firm perform exploitative behaviours, organisation's routine and processes would have been establishing for maximum efficiency thus, create behavioural roles seems unnecessary to be carried out in achieving exploitative behaviour. In contrast, compete behavioural roles were found to be not significantly affecting explorative behaviours. Compete behavioural role encourages individuals to focus on competition, showing a hard work ethic and emphasising on speed, which isn't concurrent with explorative activities which might years for an organisation to explore and develop new opportunities domestically or abroad. Thus, performing a range of behavioural roles are vital in cultivating individual exploitative and explorative behaviours.

Di Stefano et al., (2014) highlights the importance of internal processes specifically on the roles of individuals in creating, implementing and renewing dynamic capabilities (p.332). Through this research, the study provides an insight to individual level of reconfiguration of existing skill and behaviours in achieving new forms of competitive advantages (i.e. exploitative and explorative behaviours). This research concurs with recent discussion on dynamic capability on an individual level (Di Stefano et al., 2014; Kurtmollaiev, 2015; Wilden et al., 2016). As a results, individuals performing exploitive and explorative behaviours leads to the cultivation of ambidextrous behaviours at an individual level.

Following Raisch et al. (2009), which suggested that employees' ambidexterity is heavily influenced by individual characteristics, the results from this study extended the understanding of individual behavioural complexity on individual exploitative and explorative behaviours. Unlike firm or team level ambidexterity which could be achieve due to numerous factors, individuals behaviours are much more precarious. As the environment among SMEs are hardly constant, the interaction between multiple behavioural roles promotes exploit and explorative behaviour, which motivate members in the organisation to deal with opposing tensions is likely results in greater adaptability and capacity (Weick, 2003). As individual who is able to balance and comparably skilled in all behavioural roles are likely to have a high level of behavioural complexity (Dennison et al., 1995; Hooijberg, 1996; Hooijberg and Quinn, 1992; Lawrence et al., 2009). Members of SMEs have a high level of behavioural complexity, where all four behavioural roles (i.e. create, compete, collaborate and control) are demonstrated.

Conclusion

SMEs are constantly challenged with limited resources coupled with a hostile dynamic environment. These challenges further emphasise and motivate firms to establish dynamic capability with minimal impact of firm's resources. Based on the study, behavioural complexity has significant impact on exploitative and explorative behaviours, which leads to the establishment of ambidextrous behaviours. Hence it is importance for the entire firm, as a whole in formulating and cultivating different behavioural roles as a method of establishing ambidexterity that increase the chances for long term survival among SMEs.

PROPOSED BUSINESS STRATEGY OF GARUDA INDONESIA SUB-BRAND *EXPLORE* IN KOMODO ROUTE

Arinta Hendri Wijaya, Institut Teknologi Bandung
Satya Aditya Wibowo, Institut Teknologi Bandung

Abstract

The growth of tourism and business activities in East Nusa Tenggara province has increase the demand of air transportation between the cities in this province, known as Komodo route. PT. Garuda Indonesia (Persero) Tbk. introduced a sub-brand called Explore to expand and strengthening its market in Komodo-type route. Although it look promising, but currently Explore faced strategic problems such as (i) low passenger load factor due to intense competition and limited market capacity (ii) price competition against low cost airlines and (iii) lack of internal capability in this type of market, which resulted in two-straight years financial loss. Therefore, Explore needs to implement a new strategy in the institutional and operational levels as a tool to create a sustainable competitive advantage. The business environment analysis adopts external and internal situation approach, combine with the extended service marketing (7Ps) model. Key success factors for creating value to Explore customers are seamless operation, and focusing on customer experience. The research recommended that strategic option for Explore is differentiation which focusing on superior service and network connectivity for business travellers and high-end leisure market. Crucial elements to meet these factors are the ability to improve operation reliability and efficiency, experiential marketing strategy, and human capital improvement. At the end, the implementation process will divide into quick wins and long term initiatives to ensure the effectivity of strategy implementation.

Keywords*: business strategy, extended service marketing (7Ps), experiential marketing, Garuda Indonesia Explore, Komodo route.*

Introduction

The increasing number of air transportation passengers in Indonesia has opened an opportunity for Garuda Indonesia to expand their market and network by introducing a sub-brand called **"*Explore"*.** It is specialized for market between remote area and small cities, such as Komodo route which connected Denpasar - Labuan Bajo – Ende – Kupang in East Nusa Tenggara province. *Explore* planned to use the combination of excellent operation, service quality, and the power of Garuda Indonesia's brand to accelerate customer awareness, and translate into successful business in Komodo route. Although the situation looks promising, but in reality *Explore's* performance in Komodo route is below the target, and experiencing two years consecutive loss in 2014 and 2015.

PT Garuda Indonesia (Persero) Tbk. is one of the leading company in Indonesia's airline industry. The history started shortly after the independence of Indonesia, when the people of Aceh donated their belongings to buy a DC-3 Dakota aircraft in 1948. Then the aircraft conduct its inaugural flight in the same year from Calcutta to Rangoon on 26 January 1949 using the name of Indonesia Airways, and since that time Garuda Indonesia has expanded their operation by operate 38 aircrafts and start to conduct international flight (PT Garuda Indonesia (Persero) Tbk., 2016). In the next two decades Garuda Indonesia has started to do revitalization and restructuring process to become more competitive in airline industry. The new management team formulate a new plan called *Quantum Leap*, consists of comprehensive re-evaluation and restructuring of the company to improve operational effectiveness, financial stability, service quality, and revitalize the spirit of them.

Garuda Indonesia has a vision to be a strong distinguished airline through providing quality services to serve people and goods around the world. This vision means Garuda Indonesia always try to implement appropriate strategies to record profit that is higher than competitor in this industry, and always maintain quality of safety and give comfortable feel for. In order to achieve its vision, Garuda Indonesia have define mission as the flag carrier of Indonesia that promotes Indonesia to the world, supporting national economic development by delivering professional air travel services.

As of 2015 they have seven subsidiaries which focus on supporting Garuda Indonesia's core business, which are: PT Garuda Maintenance Facility AeroAsia, focusing on aircraft maintenance, engineering, material services, and engine repair business. PT Aerowisata which develop business related to tourism and hospitality industry. PT Abacus Distribution Systems Indonesia to engage in *Global Distribution System* (GDS) by providing reservation system services for travel agents. PT Aero System Indonesia, with the core business in the field of consulting services and engineering of information technology. PT Citilink Indonesia, to perform business in low-cost air transportation under. Garuda Indonesia Holiday (GIH) France S.A.S which runs business activities in aircraft rental service. Lastly, PT Gapura Angkasa which built to meet the growing needs of professional ground handling services for domestic and international airlines operating in all airports in Indonesia.

Figure 1. Garuda Indonesia Explore brand (PT Garuda Indonesia (Persero) Tbk., 2016)

As a part of Garuda Indonesia effort to expand and strengthening its network in domestic market, they introduced a new sub-brand called *Explore*. The unique characteristic of its operation are using brand new Aerospatiale ATR 72-600 aircraft which capable of take-off and landing from limited airport infrastructure (short runway, limited parking stand, and terminal building), suitable for small market with capacity of 70 passenger, and powered by turboprop engine to ensure efficient fuel usage. Some of the destinations operate by *Explore* are Denpasar, Labuan Bajo, Ende, Kupang, Medan, Gunung Sitoli, Pontianak, Ketapang, Jember, and Banyuwangi.

The decision of Garuda Indonesia to enter the market in Komodo route through sub-brand *Explore* can be seen as a strategic plan to expand the market and increase revenue. But this is not an easy process, several challenges appeared during their operation:

a) Deciding which segment to focus. The actual passenger data of Explore flight in 2015 has shown that the market in Komodo route divided into two major segments, leisure traveller to Labuan Bajo and business traveller from Ende to Kupang. This situation has create a problem for *Explore* because it must create an optimum service concept, operational, and marketing approach for both segment in a single journey will result in leveraging or deleveraging value

obtained by passengers.

Table 1. The passenger data of Explore in Komodo route year 2015 (Internal data)

Route	No of Pax	% of Total Pax
Denpasar - Labuan Bajo	14,764	33.4%
Denpasar - Ende	5,153	11.6%
Denpasar - Kupang	123	0.3%
Labuan Bajo - Ende	3,124	7.1%
Labuan Bajo - Kupang	6,600	14.9%
Ende - Kupang	14,486	32.7%

b) Intense competition with limited capacity. There are several airlines who conduct scheduled flight in Komodo route, and the limited number of passenger has make the competition become tougher.

Table 2. Capacity offered in Komodo route (CAPA, 2016)

Route	Airline Operator	Weekly Capacity (Seats)	Monthly Capacity (Seats)
DPS - LBJ	Garuda Indonesia, Lion Air, Kalstar Aviation	3276	13104
LBJ - ENE	Garuda Indonesia, Lion Air	994	3976
ENE - KOE	Garuda Indonesia, Lion Air, Kalstar Aviation, Transnusa	1799	7196

c) Beating the price competition. The competitors in Komodo route can be considered as *Low Cost Carrier* (LCC), and mostly sold the ticket with very low price. *Explore* cannot use the same concept because it is a *Full Service Carrier* (FSC), and has higher *Cost per Available Seat Kilometres* (CASK), which translated into higher ticket price, compare to LCC.

d) Building internal capability. Another challenges that appeared in is internal capabilities to handle the dynamic condition of the market and operation, because Garuda Indonesia did not have any experience in most routes fly by *Explore*. Secondly, they must dealing with limited airport infrastructure in this area, which could increase the possibility of irregularities in the flight.

The poor performance of *Explore* in Komodo route mostly happened due to its inability to overcome those challenges which resulted in low number of passenger and cargo. This kind of situation happened because *Explore* use the same business strategy with its main brand, Garuda Indonesia, although the market situation between both of them is very different. This research will try to fix the problem by defining a new business strategy for Explore in order to create sustainable competitive advantage over the competitor. In order to make the implementation become easier, then the strategy will be explained into tactical strategy in operation, marketing, and human capital aspect.
Figure 2 Average cost per seat per airline in Asia Pacific (CAPA, 2016)

Business Issue Exploration
In order to develop a new strategy for *Explore*, a conceptual framework need to define to assist the process of finding root cause of the problem, analysing significant factors affecting the business, and using the result of the process as the foundation of strategic formulation process. The first part will elaborate the real business issues faced by *Explore* in Komodo, followed by scanning process of its business environment. The result of this analysis will be elaborate using SWOT concept, and combine with qualitative research through in-depth interview process. Lastly, the implementation part will be focusing on how *Explore* put the formulated strategy into implementation process (Appendix 1).

1. External Environment
The aim of this analysis is understand the industry in which the firm operates, and competitive forces that affected the firm from outside (Rothaermel, 2015). The tool that will be used to understand the
current situation in the industry is PESTEL. On the other hand to analyse the competition and profit potential in airline industry, Porter's Five Forces concept will be used.

Table 3. Summary of PESTLE analysis for Explore

Political	Economic	Sociocultural	Technological	Ecological	Legal
Government's budget efficiency program	Lower growth rates	Increase of middle class	Improvement in aircraft technology	Community concern of climate change	Highly regulated in airline operation
Implementation of Open Sky Policy	High interest rates	Intrapersonal approach for business passenger	Limited airport infrastructure	Carbon trading mechanism	Government limitation in ticket price
Tax reduction for aircraft parts	Low fuel price		Rise of Internet in Indonesia		
Wonderful Indonesia campaign			Improvement in communication		

A. PESTLE Analysis
The PESTLE analysis of *Explore* divide the forces in general environment into six factors: *Political/Legal, Economic, Sociocultural, Technological, and Ecological*.

a) Political: (i) The government policy of reduce business trip for efficiency program. (ii) Implementation of open sky policy increase competition between airlines. (ii) The decision to reduce tax for aircraft spare parts has reduce maintenance cost. (iv) The *Wonderful Indonesia* campaign which encourage local government to improve air transportation.

b) Economic: (i) The Indonesia has lower growth rates in 2015, and significantly impact air travel demand. (ii) The exchange rates of US Dollar to Rupiah has increase 7.5% annually, which directly impact airline's cost structure. (iii) The fall of fuel price reduce fuel cost component around 10% but has negative impact in economic condition of Indonesia.

c) Sociocultural: (i) The rise of middle class has increase air travel demand, especially in middle-to-low market. (ii) The preference of business passenger in Komodo route mostly based on personal relation instead of advertising.

d) Technological: (i) The improvement in aircraft technology has increase efficiency. (ii) Limited airport infrastructure become an obstacle to maximize *Explore* performance. (iii) The rise of internet and online travel agent has increase customer preferences. (iv) The Improvement in communication has a potent to reduce traveling activities.

e) Ecological: (i) The concerns about global warming and climate change has impact the operation of an airline. (ii) Government plan to implement carbon trading initiatives can increase airline's cost.

f) Legal Factor: (i) airline industry is highly regulated in term of safety, so there is only small margin of error available. (ii) Government create a regulation to limit the highest and lowest price to keep the fair competition, and reduce the possibility of price war.

B. Porter Five Forces

The aim of this analysis for Explore is reveals the roots of industry's profitability and characteristics while providing a framework for anticipating and influencing competition over time (Porter, 2005).

a) Threat of New Entrants (LOW): This threat can be considered low, due to several possible barriers to enter airline industry. (i) High resources needed with very low profit margin, and high cost during operation for buy or lease aircraft, maintenance, and promotional activities. (ii) Highly regulated industry. (iii) Incumbent has better economic of scale.

b) Bargaining Power Buyer (HIGH): the profitability of a firm in airline industry is strongly affected by the power of their customer. (i) A company traded a loyalty to airline for significant ticket price discount. (ii) The switching cost is low. (iii) The characteristics of Komodo route is price-sensitive.

c) Bargaining Power Supplier (HIGH): Airline industry is an example of industry which is totally dependent on limited supplier, which resulted in low power against suppliers. Some of the reasons are (i) Limited number of supplier due to high capital needed. (ii) The monopoly policy for certain components in Indonesia, such as fuel, and air traffic provider.

d) Threat of Substitute (MID): The possible substitute for airline in Komodo route are other transportation modes, and communication technology. (i) Comparing with sea and land transportation, airline has better competitive advantage against them. (ii) Whereas communication technology improvement will make frequent business travellers will travel less.

e) Rivalry among Competitors (HIGH): The competition between airlines in Komodo route is very tough due to limited capacity, similar marketing activities and the growth of each airline groups in Indonesia.

2. Internal Environment

In order to become market leader *Explore* also need to analyse their resources, capabilities

and core competencies to understand the strength and weakness owned by them. Then, types of resources and capabilities needed to create a sustainable competitive advantage.

A. Value Chain Analysis

The value chain analysis is develop by Michael Porter to describe the activities the organization performs and links them to its competitive position based on primary and supporting activities. It also explain the sequential value-creating activities from the resource owned by *Explore*, in order to increase buyers' intention to pay their products (Dess, et al., 2014).

a. Primary Activities

First of all, inbound logistics is related to activities to manage inputs for operation process such as aircraft and flight crews. In order to do the process smoothly, Garuda Indonesia has created an integrated scheduling process which consists of monthly duty schedule for flight crews, assigning suitable pilots with their licensed aircraft, and optimization schedule process to reduce cost of operation. Secondly, in operations aspect Garuda Indonesia has a concept to bring Indonesian hospitality to each flight, and safety management system in each operational aspects. The element of outbound logistics related to Garuda Indonesia's capability to give better service quality and punctuality of each flight. The fourth element is marketing and sales, in which Garuda Indonesia has resource to do above and below the line marketing concept, and special event such as *Garuda Indonesia Travel Fair* (GATF) to promote their products. The last element related to capability to give best service to its customer to maintain their loyalty through dedicated key account officer and strong customer service support.

b. Supporting Activities

In term of creating competitive advantage from the element of firm infrastructure, Garuda Indonesia built a dedicated aircraft base in Bali for *Explore* to make the operation become more effective. Then, they also focusing on human resource aspect by implementing *Performance Management System* (PMS) concept as a backbone to evaluate employee's capability. Garuda Indonesia also improving their technology to support the operation by implementing technology to report its aircraft position and integrated passenger service system to manage their reservation process, check in procedure, loading process, and baggage monitoring. Lastly, Garuda Indonesia have built its capability in procurement by centralized the process for general goods or services needed not only by Garuda Indonesia, but also their subsidiary, in order to reduce the price and lowering cost.

3. Extended Marketing Mix

It is well known that service industry is very different with manufacture industry and it has unique challenges such as: cannot be inventoried, and intangible elements mostly dominate value creation process. As the implication, the conventional marketing mix concept (4Ps) are not adequate with challenges in service industry. Therefore there is a need to extend the marketing mix from into 7Ps, with additional components are Process, Physical environment, and People (Lovelock & Wirtz, 2011).

The first components of *Extended Marketing Mix* for *Explore* is **Product**, which defined as a set of elements (both physical and intangible) that create value for customer (Lovelock & Wirtz, 2011). 6

Explore's product is specialized to broaden and strengthen Garuda Indonesia's networks in Indonesia. All of its flights are short-haul with less than 90 minutes duration to develop tourism and business through Indonesian archipelago, and capture market in an area with limited airport infrastructure. As a differentiator with other airlines, *Explore* implement the same service standard with its main brand.

In order to make sure the product offered by *Explore* can easily reach the target market, a strong distribution channel (**Place**) must be built to connect customer and product. Some distribution channels for *Explore* are: Sales office in city centre and mall, travel agents, travel fair, and online distribution channel. Related to **pricing** strategy, Garuda Indonesia use *Revenue Management System*, which will optimize financial returns by setting the number of seats they sell, and the price for each class to maximize the profit. According to Lovelock, the element of **promotion** and education play significant roles in service industry, which are providing needed information and advice, persuading target customers, and encouraging them to take action. One of the strategy done by Garuda Indonesia in Komodo route is showcase the beauty of tourism activity with strong call to action to convert customer consideration into purchase using above the line campaign such as TV commercial, digital banner, and adlibs.

In addition to 4Ps elements, which has explained above, the 3 other elements of extended marketing mix also has implemented by *Explore*. The element of **process** is defined as the way a firm delivering its product or service into customer. In order to give strong performance well-designed service process must be built lead to fast response, flexible activities, and timely manage. In current situation Garuda Indonesia has create a standard business process for service delivery and operational activities, although it is still less flexible during the implementation. Organization which focusing on service industry have come to recognize that the **physical environment** is an important component of their service's marketing mix and overall value proposition (Lovelock & Wirtz, 2011). In term of Garuda Indonesia, they provide the concept of *Garuda Indonesia Experience* through the convenience of cabin seat, cabin equipment, ambience, restroom, inflight entertainment, and cabin services in each flight. Then in order to maximize the delivery process, Garuda Indonesia have maintain the quality of the people by having a human resource program which focused on three main pillars: talent management, corporate culture, and people manager development.

The Komodo route also impacted by the intense competition among airlines in Indonesia, currently there are five airlines which operate daily scheduled flight in this route. As a result, passengers have more power to choose between them, and transform the market into price-sensitive. This kind of situation has hurt *Explore*, due to its nature of business is full service which is most suitable for non-price sensitive market. In order to find out the actual competition, then this research also construct a competitive analysis using extended service marketing criteria as shown in *Appendix 3*. According to this analysis, the position of Explore compare to other airlines in Komodo route are:

Advantage: *Explore* is the only full service airline in Komodo route, so it must become the first choice for non-price sensitive passengers. In term of marketing mix, *Explore* also considerably superior than competitors in term of safety aspect, distribution channel, and in-flight service quality.

Disadvantage: The price level is higher than competitors, so it is hard to compete in leisure market. Otherwise, the operation aspects also become a weakness for them due to lack of flight connectivity and its multi-leg concepts increase the possibility of irregular flight, and bottlenecking passenger.

4. SWOT Analysis

The SWOT (Strength, Weakness, Opportunity, and Threat) is one of the tools to combine external analysis and internal analysis of a company to become the foundation for the strategy formulation for Garuda Indonesia *Explore* in order to win the competition in Komodo route. The strength and weakness refer to internal conditions of the firm, then opportunity and threat mostly related to external factors.

Strength	Weakness
1. Safety culture 2. Integrated group business 3. Strong brand 4. Service concept 5. Corporate culture	1. High unit cost per passenger 2. Unintegrated IT support 3. Lack of innovation in marketing & sales
Opportunity	**Threat**
1. Low fuel volatility 2. Traveling & culinary lifestyle 3. Government regulation 4. Skyteam Alliance 5. Corporate account	1. Intense competition 2. Airport infrastructure 3. Economic downturn 4. Open Sky policy 5. Communication technology

Figure 3 The result of SWOT analysis for Explore

Business Solution

The business environment analysis has provide relevant information about the actual situation of *Explore* operation in Komodo route. In order to define the best business strategy for Explore, then this research only focus on several critical problems faced by it.

1. The Critical Problem

a) The current business strategy has lack of capability to compete with LCC airlines in Komodo route in term of price, operational cost, and services.

b) The problem in airport infrastructure and technology has made the operation become less efficient.

c) The product is not strong enough to obtain leisure passenger due to lack of network connectivity between Komodo route and other flight sector.

d) Lack of capability to compete in price-sensitive market, the plan to compensate it with excellent service concept does not draw much attention because mostly the flights are short haul.

e) The problem in marketing innovations and educating customer for market like Komodo route due to it has two market segmentations (business, and leisure traveller).

f) The business process related to Explore is very complicated and bureaucratic, which reduce its flexibility to compete against competitors in Komodo route.

g) Inability to encourage their staff to do more than standard procedure when it is related to customer' satisfaction, due to weak leadership and lack of training.

2. Key Success Factors

Garuda Indonesia *Explore* must transform their current strategy, and conduct a thorough analysis to position themselves against competitors by focusing on these key success factors.

a) **Business Strategy:** Redefining strategy to explore its competitive advantage, by combining the concept of seamless operation, service, and experiential marketing.

b) **Operation:** Creating efficient and reliable operation in order to reduce cost without sacrificing safety.

c) **Product:** A proper route scheduling & connectivity for passenger, and integrated services during pre-flight and post-flight.

d) **Price:** Incorporating the concept of flexible price, and capability to convince the customer regarding the value of *Explore's* flight.

e) **Process:** Improvement in business process by making it more flexible, and open opportunity for individual to innovate when needed. 8

f) **Promotion:** Improve the customer education element in promotion to change the mind set of customer regarding *Explore* flight.

g) **People:** Build strong leadership and customer centricity value to people in Garuda Indonesia**.**

3. New Business Strategy

The analysis has shown that *Explore* has a strength in strong brand awareness in Garuda Indonesia's name, service concept, and integrated group business. Whereas they can seek opportunity from corporate account, improvement in traveling & culinary lifestyle, and *Skyteam* alliance. It means, from Porter's generic strategy point of view, *Explore's* designed to serve non-price sensitive customer and using differentiation strategy instead of cost leadership. What *Explore* must do is adding unique features to increase the value of their service to make the customers are willing to pay higher price. But, they also must pay attention to "keeping cost at the same or similar level" by conducting some cost efficiency program.

The decision to focus on differentiation strategy must be followed by an iterative process to achieve a robust, reinforced consistency among the elements of the strategy itself (Hambrick & Fredrickson, 2005). The new business strategy for *Explore* use the strategy diamond concept which integrate all five elements of strategy to achieve the objectives of become market leader and contribute to profit of organization. Here are the five strategy elements for Explore in Komodo route:

a) **Arenas:** (i) Superior service by giving more attention not only in-flight experience, but also pre-flight and post-flight. (ii) Increase its network connectivity to increase passenger flexibility. (ii) Focusing on business travellers & high-end leisure market which less sensitive to the price.

b) **Vehicle:** (i) Strategic agreement with corporate and travel agent by adding more value in tour and traveling package. (ii) Maximizing the potency of *Skyteam* alliance to grab high-end leisure market. (iii) Focusing on Garuda Group integration to be more powerful in the market.

c) **Differentiators:** (i) Expanding the Garuda Indonesia *Experience* service concept to improve passenger experience before and after the flight. (ii) Creating a seamless strategy to make sure the operation running smoothly. (iii) One stop shopping experience, not only give passenger the Explore' service but also all member of Garuda Group.

d) **Staging:** (i) Education process to give understanding to the customer related to correlation between price and service. (ii) In-ground service improvement to expand the customer experience in *Explore*. (iii) Intensive promotion through price discount, advertising, and local campaign

e) **Economic Logic:** (iii) Offering difficult to match product to customers in order to obtain premium price. (ii) Bundling travel package for the tourist which come to Bali. (ii) Maximizing group collaboration to reduce operational cost through.

f) The next step for *Explore* in order to ensure the strategy will be positively affect their performance is creating tactical strategy based on those five elements. It will covered operation side, marketing, and human capital strategy improvement.

4. Operation Strategy

The first part of tactical strategy development for *Explore* is related to operational activities, which focusing on (i) Ensuring effective and efficient operation to reduce operational cost, related to capability of *Explore* to reduce or keeping similar level of cost although it positioned as full service airline, and (ii) Reliability and flexibility of operation to support its differentiators in business travellers market which is very sensitive to punctuality, and reliability of the flight.

First of all, limited airport infrastructure has significantly impact the operation of *Explore* in Komodo route. Combine with limited aircraft technology has made the operation become sensitive some elements such as weather, and payload limitation. So, improvement in aircraft navigation technology is a must in order to allow *Explore's* aircraft to fly using instrument flying procedure instead of visual.

The second issue is related to *Explore's* cockpit crew home base which currently positioned in Jakarta. As a result, the operation become costly because *Explore* needs to pay their hotels, and traveling allowance. In order to solve the problem Explore must create a dedicated cockpit crew home base for *Explore* operation in Denpasar. When a crew has shift their base, then there will be a significant cost reduction in operation.

The third issue is route scheduling of Komodo route which is not favourable for passenger due to limited connectivity with domestic and international flight and bottleneck problem due to multi-leg operation. According to those situation, the proposed strategy for *Explore's* is re-designing its route structure in Komodo route, by re-timing the schedule, and split the route into shorter one as explained in (Appendix 4).

5. Marketing Strategy

Implementing the best and suitable marketing strategy is very important to create profitable operation for *Explore* in Komodo route. In order to achieve those target, the strategy in the research will integrate some key important factors in service industry to improve *Explore's* STP and Marketing Mix using experiential marketing concept.

a. STP Improvement

The building block of new business strategy for *Explore* in Komodo route has also impact the current STP. The biggest reason was the decision to focus only on business and high-end leisure travellers has shift the product itself, as the result, the new STP shown in table below.

Table. 4 The new STP for Explore

Market Segmentation	Origin of traveler	• Indonesia resident, mostly from Jakarta, Makassar, Bali, East Nusa Tenggara • Foreign citizen, mostly from China, Japan, South Korea
	Demographic	• Age between 31 - 65 years old • Male become a focus for business, whereas female for leisure • Occupation are: civil servant, corporate employee, businessmann, retired citizen
	Psychographic	• Middle class to upper level class
	Behavioral	• Commuting passenger between cities in Komodo route • Passenger focusing on punctuality of flight
Targeting	Concentrated Marketing	• Focusing on business traveler and high-end leisure traveler • Corporate and government institution • Tour group passenger • Traveler who is looking for integrated services
Positioning	Differentiated Full Service Airline	• Superior in-flight service compare to other airlines • Focusing on passenger services during pre-flight and post-flight • High level of safety and on-time performance • Flexible payment process and broaden network connectivity

b. Extended Marketing Mix Improvement

In order to fix the problem in Explore operation, the elements of extended marketing mix (7Ps) needs to inject by the value of key important factors in service industry as mentioned above, combine with the concept of experiential marketing. According to Schmitt, the experiential marketing concept is focusing on five elements: First, the element of *Sense* which focusing on creating experiences through the five senses owned by people. Secondly, the element of *Feel* focusing on creating affective experiences related to inner feelings and emotions. Thirdly, the element of *Think*, which has objective to engage customers creatively through problem-solving experiences. The next one is *Act*, related to enhance customer's physical experiences, and give more alternatives of doing things. Lastly, the element of *Relate* which expands the value of product to individual experiences and become the part of customer life.

Figure 4 Extended marketing mix improvement for Explore

6. Human Capital Strategy

In order to create a brand new integrated business strategy, this chapter will focusing on creating Human Capital (HC) strategy to support *Explore* in Komodo route, which divided into recruiting process, and improving current employee. The recruitment activity become an important factor because it will define the quality of output for the company. Garuda Indonesia must investing in selecting employee process, by creating a custom criteria to get the best one, based on customer's data and current employee feedback. On the other hand improving the current employee in order to adapt with new strategy also very important. The strategy are redefining the concept of corporate university and training centre in order to give more knowledge and benefit for employee, then focusing on knowledge management process to improve the service to customers.

Conclusion and Implementation Plan

As explained in this research, *Explore* facing problem related to its financial performance due to several factors.

a. **Lack of consistency in implementation *of differentiation* strategy.** The aim of this strategy is delivering higher service quality in-ground and during the flight compare to competitors, by keeping costs at the same or similar level. Unfortunately, it cannot be achieved due to limited capability of the aircraft and inefficiency during flight operation and delivering service.

b. **Inability to compete with other airlines in Komodo route.** *Explore's* competitor mostly low cost carrier which offer cheaper price. As a result, the passengers tend to choose other airlines than *Explore* which resulted in lower revenue for it. The marketing strategy for this route is also cannot show the *Explore* excellence, and promote its capability to the market.

c. **The gap between plan and implementation in human capital aspect.** The implementation gap between plan and actual in human capital strategy is still wide, as a result the company still experiencing lack of service leadership which impacted customer satisfaction.

In order to solve the problem, then it is recommended to redefine its business strategy through the using five diamond strategy concept and cascade it into operation efficiency, experiential marketing, and human capital strategy.

Furthermore, to implement the strategy a plan must be built which divided into quick wins and long term plan. The initiatives categorized as quick wins mostly can be quickly implemented and has biggest impact for the business, with the timeframe of this activities are six months. Some of the initiatives are creating task force, route restructuring, and service improvement. On the other hand, the long term plan is used to create a sustainable competitive advantage for Explore, and has one to five years horizon of implementation. Some of these initiatives are operation improvement, group synergy, human capital actions, and further service improvement. The detail implementation plan can be seen in (Appendix 5).

Appendix 4 Route Structuring Scenario for *Explore*

A.   The first action is re-timing process by swapping the flight schedule with GA-7036 which currently operate DPS-LBJ vv and scheduled to fly daily at 11.00 WITA. This strategy benefits for *Explore* are:

  i.   It will open a connection with flight coming from Jakarta, Bandung, and Makassar.
 ii.   The proposed schedule will be at 09:45 WITA instead 11.00 WITA as scheduled for GA-7036 before. This time is choose because it is the best available window time in route scheduling due last flight to Komodo route is conducted at 08.00 WITA by Lion Air, but it is also still before the schedule of Kalstar Airlines in 10.00 WITA.
iii.   Currently there are two shuttle flights to Labuan Bajo from Denpasar conducted daily by Garuda Indonesia with these schedule:
   - Denpasar – Labuan Bajo vv / Flight Number GA-7036 / Departure Time 10:45 WITA
   - Denpasar – Labuan Bajo vv / Flight Number GA-7028 / Departure Time 14:30 WITA

	Departure Time	Connected Flight
Previous Schedule	07:30 WITA	-
Proposed Schedule	09:45 WITA	GA-400/Jakarta-Denpasar
		GA-334/Bandung-Denpasar
		GA-675/Makassar-Denpasar

Figure 7 Proposed schedule for Explore in Komodo route

The idea for *Explore* in Komodo route is swapping the schedule with GA-7036 and retiming into 09:45 as explained in point (b) above. The airport slot availability will not become a problem because it is only swap the schedule within same airline, instead of publish a new schedule. This process also given many benefits for the financial performance because Garuda Indonesia will not lost the revenue from Labuan Bajo's flight in the. Whereas the new schedule for the flight of Komodo route will increase its load factor, by absorbing the current passenger load factor of GA-7036 which is around 62%, and added more passengers which will go to Ende and Kupang.

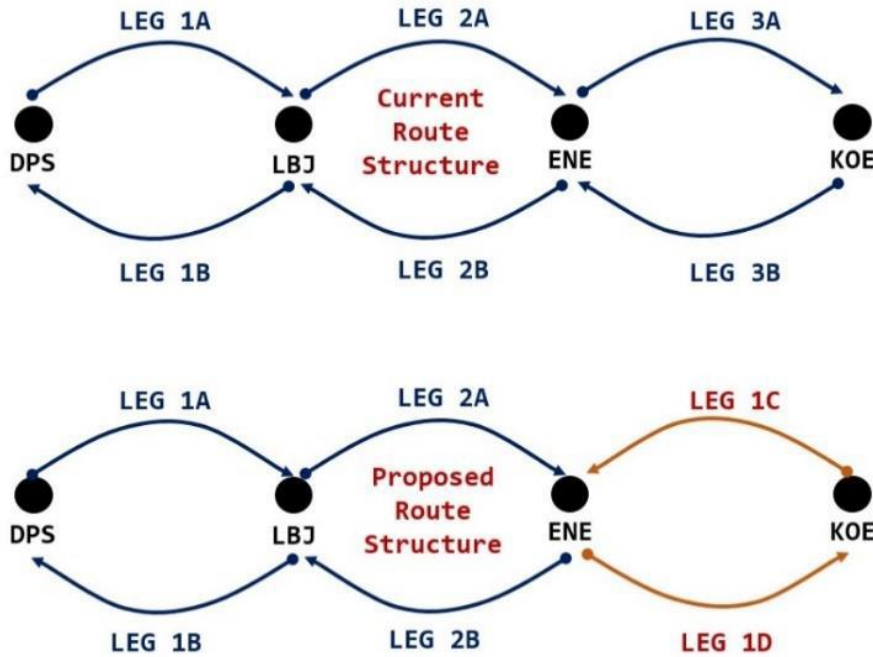
B.   The second solution is splitting the route into two shorter legs which are DPS-LBJ-ENE vv, and ENE-KOE vv instead of DPS-LBJ-ENE-KOE in order to give more flexibility to passenger, limiting operational risk due to airport operating hours, and reduce continuing delay due to a problem in one location. The proposed route can be seen in picture below.


Figure 8 Proposed route structure of Explore in Komodo route

The advantages of proposed route compare to current one are:
i. The availability of Leg 1C and 1D in proposed route is intended to grab business traveler (especially civil servant) who travel between the capital city of Nusa Tenggara Timur, Kupang, to Ende and vice versa in the morning.
ii. The proposed route structure also reduce the cost impact of irregular flight. For example with the current route, when an aircraft is having technical problem in Ende after doing Leg 2A, and cannot continue their flight to Kupang. Implementing the proposed route structure will solve the problem because whenever the problem happened, the aircraft which conduct Leg 1C can continue their flight to Leg 2B, and Leg 1B, without resulting in delays.
iii. The last benefit of proposed new route is giving better flexibility to the passenger compare to current route.

Figure 10 Long Term Plan for Explore

GLOBAL CULTURAL CLUSTERS AND DETERMINANTS OF MARKET POTENTIALITY RELATIONS AND INFLUENCES IN A LONGITUDINAL STUDY

Jorge Mongay, ESIC Business and Marketing School

Abstract
This papers explores the relationships between cultural clusters and the determinants that drive market potentiality. The research shows differences in variances using a longitudinal one way ANOVA method. Conclusions show three revealing issues: 1) Generally clusters don't differ from each other when a longitudinal analysis is applied supporting H^0. 2) The Latin American cluster differs more than other clusters when relates its Commercial Infrastructure (CI) and its Market Consumption Capacity (MCC), and 3). There is a high longitudinal correlation between the ease of doing business and the levels of corruption perceived in all a countries.
Keywords: *Market potentiality, clusters, culture, doing business, corruption.*

Literature review
1. GLOBE, clusters and culture
National culture is widely analyzed in the literature and its references to international business are quite relevant and regular. Rational and sociopolitical power in strategic decision-making is explored and country clusters appear to moderate the power relationships (Hoffman, 1987). Also, a combined role language, religion, and geography generates cluster formation and these forces play a prominent yet complex role (Ronen & Shenkar, 2013). Cultural and religious differences are incrementally related to perceived corruption in countries, even after controlling for other economic and political factors (Mensah, 2014). Cultural effects, the internationalization process and national culture are based on established International Business theory (Chabowski, Hult, Kiyak and Mena, 2010). Clusters of countries are analyzed suggesting correlations with national wealth, as well as with dimensions of national culture (Hofstede, Van Deusen, Mueller & Charles, 2002). Cultural country clusters identified by Ronen and Shenkar (1985) and Shenkar (2001), as Oesterle and Fisch (2000) have observed in diferent research projects, representing the 'soft' side of globalization. By classifying the geographical distribution of FDI is possible to take into account cultural and institutional diversity as a locational determining variable (Sullivan, 1994; Ietto-Gillies, 1998). Six clusters are considered in other research performed, an Anglo cluster, a Germanic-Nordic cluster, a Latin American cluster, a Latin European cluster, a Far Eastern cluster, and an 'Other' or 'Mixed' cluster, which includes all other countries (supporting the findings of Rugman and Verbeke). This explanation for the regional concentration of FDI and MNE activity reflects that of the gross domestic product (GDP) and trade of the countries concerned (Dunning & Fujita, 2007).
While geographic clusters may develop as a result of historic factors and co-location advantages (Mudambi & Swift, 2012; Zucker, Darby, & Armstrong, 1998), the functionality of clusters may be conditioned by different types of connectivity, such as personal relationships, pipelines, or a mix of both (Lorenzen & Mudambi, 2013), and networks of alliances (Markusen, 1999). Research suggests that firms can reduce the liability of foreignness by expanding to geographically proximate countries (Hymer, 1960) and co-locating with other home-country firms (Zaheer & Mosakowski, 1997). The clustering phenomenon has also been used to show a positive relationship between spatial proximity and knowledge spillovers (Cantwell & Piscitello, 2005) and the impact of proximity with collaborators and competitors on firm performance (Chang & Xu, 2008). Country clusters in

Vietnam and its FDI have been studies showing distinct clusters of foreign investors from a wide range of industries and countries of origin. (Tan & Meyer, 2011). Country and industry effects matters substantially in explaining the variation in the value of growth options of firms based in different countries (Tong, Alessandri, Reuer & Chintakananda, 2008). National culture influences as well the effectiveness of legal settings and regulations on ethical behaviors (Zengin Karaibrahimoglu & Guneri Cangarli, 2015).

National cultures differences influence to MNC's experience with foreign direct investments (FDI) and subsidiary mortality. (Zeng, Shenkar, Lee & Song, 2013). Other findings indicate the importance of 'fit' between cultural relational values and individual attachment orientations in shaping interpersonal justice perceptions (Game & Crawshaw, 2015). The effect of culture on corporate governance is analyzed using a single institutional framework, language, and religion as proxies for culture with results suggesting that a company board composition is significantly driven by language, although in contrast, ownership and equity structure are not significantly related to culture. (Volonte, 2015). Nation's culture affects the quality of information (Gnanlet & Yayla Kullu, 2014).

Some studies conducted by (Yim & Gray, 2009) assess the relative merits of alternative cultural frameworks as the basis to construct indices of cultural distance using the one introduced by Kogut and Singh (1988). Not only Hofstede (1980, 1991) but also Schwartz (1994, 2003) and GLOBE (2004) frameworks. These results support not only the robustness of Kogut and Singh's method to construct an index of cultural distance but also the consistency of the alternative indices of cultural distance used to explain ownership mode decisions by MNEs.

Some studies that have been using the GLOBE approach In particular, stating that some national cultures are more conducive to the implementation of quality management than others. The analysis of the data done by the authors endorses the idea that through an accumulation of scientific knowledge relevant to the applicability of quality management across national settings, managers can better understand how to transfer best quality management practices from one country to another, suggesting that the creation and transferability of knowledge and quality at an international level is relates to culture. (Vecchi & Brennan, 2011). The GLOBE project received criticisms from a marketing perspective, supporting others like Brewer and Venaik's. It is stated the fact that the implausibility of deterministic claims about the multi-level power of national culture is described and discussed by drawing on a wide range of disciplines (including anthropology, geography, and sociology). Findings related to "Descriptions of the characteristics and origins of subnational level behavior based on a priori depictions of national culture values look invalid and misleading. Research conducted highlights the unsoundness of descriptions of the subnational (individuals, consumer segments, organizations, and so forth) which are derived from national-level depictions of culture and the dangers of ignoring the independent causal influence of non-national culture and non-cultural factors. (McSweeney, 2013). Researchers should be cautious in using the Hofstede or GLOBE national culture dimension scores for analysis at the level of individuals (Venaik & Brewer, 2013).

Other models developed state that is possible to cluster European countries by market attractiveness. The authors encourage international marketing and business scholars to make use of Inglehart's framework. (Gaston-Breton & Martin, 2011). (Ronen & Shenkar) synthesized cultural clustering of countries based on similarity and dissimilarity in work-related attitudes. Their map uses an updated dataset, and expands coverage to world areas that were non-accessible at the time. Cluster boundaries are drawn empirically rather than intuitively, and the plot obtained is triple nested, indicating three levels of similarity across given country pairs. Also delineated are cluster adjacency and cluster cohesiveness, which vary from the highly cohesive Arab and Anglo clusters to the least cohesive Confucian and

Far Eastern clusters. Exploring predictors of cluster formation, it is drawn on the ecocultural perspective and other inputs, and examine the combined role of language, religion, and geography in generating cluster formation. Findings state that forces play a prominent yet complex role. (Stephan & Uhlaner, 2010) develop a cross-national study testing a framework relating cultural descriptive norms to entrepreneurship in a sample of 40 nations. Based on data from the GLOBE project, they identify two higher-order dimensions of culture as socially supportive culture (SSC) and performance-based culture (PBC) and relate them to entrepreneurship rates and associated supply-side and demand-side variables available from the Global Entrepreneurship Monitor.

Findings provide strong support for a social capital/SSC and supply-side variable explanation of entrepreneurship rate. PBC predicts demand-side variables, such as opportunity existence and the quality of formal institutions to support entrepreneurship.

Understanding the influence of culture on business operations has been one of the most enduring components of international business and international management theorizing and empirical investigation. While several critiques and debates questioned the significant progress made in this domain, authors tend to demonstrate that further advancement on how we conceptualize and measure culture is not only needed, but also possible. (Caprar, Devineey, Kirkman & Caligiuri, 2015). Also, (Dow, Bunyaratavej & Hahn, 2009) explores how within-country diversity of both language and religion influences the ownership structure of foreign acquisitions. They propose that diversity plays two distinct roles. Diversity within the home country may increase the cognitive complexity of the decision makers, moderating the firm response to the distance and diversity of the host country. The social dynamics which precede international exchange are considered and the hypothesis stated is that knowledge of foreign market opportunities is commonly acquired via existing inter-personal links rather than collected systematically via market research. (Ellis, 2000). Others as (Gomez-Mejia & Palich, 1997) test the hypothesis that culturally related international diversification will have a positive impact on firm performance and that the opposite will be true for culturally unrelated globalization.

2. Geography and strategic implications.

Making reference to clusters, culture, societies and their potentiality as market, the importance of geographical location has been analyzed in as well. Findings of research suggest that the political and legal related risks associated with enterprises' activities pose a threat to the majority of executives and the vulnerability to these risks are not related to any enterprise's-specific characteristics (Khattab, Aldehayyat, Alrawad, Al-Yatama, Al, Khattab 2012). Research on Home Regional Orientation (HRO) suggests that there is an emerging consensus that most multinational companies are regional and performance significantly reduces Home Regional Orientation although this factor does not show a significant effect on performance. (Banalieva & Dhanaraj, 2013). Geographic location may be one reason why some ventures are able to acquire the resources needed to internationalize while others cannot. Location influences new venture internationalization, and firm characteristics impact the nature of the relationship (Fernhaber, Gilbert & McDougall, 2008) and international business has much to contribute to intranational business in helping develop a theory of the business enterprise in space (Ghemawat, 2015).

Regional institutional complexity is both a challenge and an opportunity for Multinational companies, (Arregle, Miller, Hitt & Beamish, 2016). Also it is highlighted in the literature the nature and importance of international segmentation (Wind & Douglas 1972). The relationship of country-specific corporate social responsibility (CSR) to international organizational strategy shows that institutional pressures, rather than strategic analysis of social issues and stakeholders, are guiding decision-making with respect to Corporate Social

Responsibility. (Husted & Allen 2006). National trust affects the governance structure used to organize alliances between partners. Research argues that this effect of national trust is moderated by improved information on the partner firm. (Kwon, Haleblian & Hagedorn, 2016). Also and despite failure rates of around 30%, international joint ventures (IJVs) continue to grow. IJVs provide a platform for organizational learning, which contributes to the facilitation of organizational performance, suggesting that larger gains in performance are achieved by firms who have low initial levels of market orientation. (Farell, Oczkowski & Kharabsheh, 2008). Research has also being conducted on strategy related beliefs in organizations with substantial foreign participation finding that one of the strongest determinants of similarity of beliefs was being a member of the functional area favored by the strategic change. It looks that the effect of being in the favored area was greater than the effect of all other individual characteristics, including nationality. (Markoczy, 2000). Related to Emerging Markets (EM), also it has been demonstrated that Multinational Corporations (MNC) play a pivotal role in the development of the markets. (Meyer 2004).

3. The role or risk, corruption and doing business.

The perception of the legal risk is an important a consideration in dealing effectively with the threats exposed by international companies. It has been explored the relation between individualism and horizons and types of corporate investment, based on individualism and implications for risk taking. Research findings related to the idea that firms in individualistic countries invest more in long-term (risky) than in short-term (safe) assets. Also it Is shown that that individualistic firms tend to employ excess cash to increase R&D rather than increase dividends, and R&D decisions are less reliant on internal financing but more responsive to growth opportunities in individualistic countries. (Shao, Kwok & Zhang, 2013). Some authors provide space for the consideration of alternatives to the dominant conceptions of corruption and its measurement being quite critical with the application of the Corruption Perceptions Index (CPI) and other indexes of Transparency International in the way of measurement of African corruption. It is argued that some indices could be manipulated to serve Western economic interests. Conclusions reached related that the most popular measure of corruption, Transparency International's (TIs) corruption perception index (CPI), is a flawed instrument, capable only of calculating vague proxies of corruption. The index is oblivious to cultural variance and is business centric in style and philosophy. Corruption cannot be comprehended outside the experience, nor can it submit to empirical investigation. (Bill de Maria 2008). Supranational laws against bribery abroad are designed to reduce the supply of bribes by foreign investors by increasing the costs of bribing abroad. Such increase in costs will make foreign investors more sensitive to corruption, and induce them to reduce their investments in corrupt countries. However, research done argues that these laws need to be implemented and coordinated in multiple countries to become effective. Empirical analysis shows that investors from countries that implemented the OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions of 1997 reduced their investments in corrupt countries. Investors from the US, which were bound by the Foreign Corrupt Practices Act of 1977, also reduced investments in corrupt countries, but only after the OECD Anti-Bribery Convention was in place. (Cuervo Cazurra 2008).

Corruption occurs in multiple forms such as bribery, entertainment, extortion, facilitating payments, favors, gifts, gratuities, and travel. International anticorruption accords now constitute a formal global norm against bribery and extortion in commercial or governmental transactions. Economic and political costs of corruption are high and an active enforcement is gradually increasing. Corporate policies should not relate to the payment of bribes, large or small, in any form for any reason. Such policy will in future extend to prohibit even minor

facilitating payments. Businesses should define and enforce broadly applied anticorruption norms. (Duane 2013). Corruption and its implications in international business trading and investments represent an increasing interest for academicians. It is extremely important to understand how corruption affects economic growth directly, by shifting the allocation of public funds, and, indirectly, by changing the incentives, prices, and opportunities faced by entrepreneurs (Jain, 2002). Corruption refers to behavior that violates the trust placed in public officials and serves to destabilize the basis on which generalized interpersonal trust relies and increases the risks faced by the entrepreneur (Anokhin & Schulze, 2009), showing positive correlation with the ease of doing business (Mongay & Filipescu, 2012). Also, the greater the access to information, the lower the corruption levels although bridging the digital disparity across countries can also serve to lessen national corruption levels. (Di Rienzo, Das, Cort, & Burbridge, 2007).

Some authors assess the extent to which institutional convergence has taken place in the new European Union (EU) countries. It does so by contrasting arguments that are inspired by transaction-cost economics within the mainstream international business literature and contentions within the comparative-capitalisms perspective. Some arguments within the former is that those countries that have less transparent ways of doing business will post poorer economic growth records than those with more predictable and less costly regulations. (Matthew and Maria 2013). This shows certain degree of relationships between economic growth and the ease of doing business.

4. Market potentiality and attractiveness.

The imperatives for sustainability marketing (SM) adoption in the emerging markets (EMs) have been evaluated due to their importance in today's international business context. (Anayo, 2011). Using Rugman and Verbeke's diamond network model, (Asmussen, Pedersen & Dhanaraj, 2009) its possible to hypothesize upon the contingencies influencing the links between host-country environments and subsidiary competence configuration. Results provide new insights into how multinational enterprises can overcome unbalanced national diamonds by acquiring complementary capabilities across borders. Companies seeking to expand abroad are faced with the complex task of screening and evaluating foreign markets. How managers define, characterize, and express foreign market opportunities, what makes a good market or an attractive industry environment? Markets differ in terms of market attractiveness, due to variations in the economic and commercial environment, growth rates, political stability, consumption capacity, receptiveness to foreign products, and other factors. Research proposes the use of two complementary approaches to preliminary foreign market assessment and selection: country clustering and country ranking. These two methods, in combination, can be extremely useful to managerial decision makers in the early stages of foreign market selection (Cavusgil, Kiyak & Yeniyurt, 2004). It is also encouraged to business and international marketing scholars the use of Inglehart's framework. (Gaston-Breton & Martin 2011).

Market potentiality and attractiveness is not always easy to measure and compare. When comparing the BRIC countries with Germany as a representative mature market to put into perspective the short to medium-term market potential of BRIC markets, the majority of the companies examined focused their strategic investment priorities on emerging markets. The short-to mid-term revenue potential of the BRIC countries are expected to be lower in absolute terms than those for mature markets such as Germany. This holds true on several levels of granularity, such as GPD per capita, size and growth of high-income market segments. (Heinz & Tomenendal 2012). (Erhman & Hamburg 1986) report the development and testing of a normative model for determining how firms should select the countries to be used in the information search for foreign direct investment.

International business research has long acknowledged the importance of supranational regional factors in building models to explain phenomena such as where multinational corporations (MNCs) choose to locate. It is documented and supported in comparative analyses of regional schemes used to explain where US-based MNCs locate operations around the world. Geography, culture, trade and investment-based schemes with better structural coherence exhibit better initial fit with MNC location models and less change in fit after modest scheme refinement using a simulated annealing optimization algorithm. (Flores, Aguilera, Mahdian & Vaaler, 2013) while (Hashai 2011) theorizes and empirically demonstrates that born global firms stick to a dominant internationalization path over subsequent periods.

A robust understanding of international retailer's market selection process has been conducted and the results obtained highlight the importance of host market characteristics and the importance of understanding host market selections in the context of home market retail structural development and, by implication, the relative lack of importance of secondary managerial input factors. (Alexander, Rhodes & Myers, 2011). Although there are numerous techniques which are used in determining market potentials, when the data are scarce one of these becomes more readily useful than others. A relevant technique used is the multiple factor analysis. Research attempts to determine the market potential of East Europe by using this particular technique. This approach converts the unknown East European market conditions into the known U.S. market conditions by using a series of criteria as common denominators. (Samli, 1977).

Also, the importance of proximity in the supply chain has been analyzed on the field of the European automotive industry in order to simultaneously evaluate the relative importance of three dimensions: geographical, cultural, and relational proximity. Using a rich and novel data set, the authors find that carmakers value some aspects of each dimension independently in their sourcing strategy. The estimates indicate which proximity measures provide the largest (independent) benefits, but also that the positive effects the literature has attributed to some measures tend to reflect past relationships rather than predict new ones. In particular, co-location and a low cultural distance should be interpreted as outcomes of a sourcing strategy, not as predictors for sourcing success. (Schmitt & Van Biesebroeck, 2013).

Traditional market selection analysis relies on purely macroeconomic and political factors and fails to account for an emerging market's dynamism and future potential (Sakarya, Eckman & Hyllegard, 2007). A theoretical model of managerial decisions involving international market entry has been analyzed by (Malhotra & Sivakumar, 2011). The authors find that cultural distance and market potential have curvilinear and interaction effects on the level of equity participation. (Rahman, 2003) states that the importance and need for systematically evaluating and selecting potential foreign markets has been stressed by many researchers. The conclusions drawn by the author related to the fact that international businesses follow a stepwise; the first stage of this two-stage process is based on the evaluation of market size attractiveness which takes into consideration some macro and microeconomic variables along with some other macro level and firm related variables; and the second stage is based on the evaluation of a markets structural attractiveness which takes into consideration some cost, structural compatibility, government policy variables, along with some firm related variables.

Determining factors in the rate of franchising among emerging nations has been researched as well (Baena, 2012). Yet despite all this, little is known about the factors influencing country selection for expansion into these markets. In an attempt to enhance the knowledge that managers and scholars have on franchising expansion, a study examines how market conditions may constrain diffusion of franchising into emerging markets. They are: geographical distance; cultural distance; uncertainty avoidance; individualism; political

stability, and corruption. The author also controlled for gross domestic product, the efficiency of contract enforcement, and nascent. (Sahoo & Acharya, 2012) state that it exists a positive significant correlation between foreign direct investment (FDI) and Macroeconomic performance (MEP) indicates that a State's overall macroeconomic policy performance does matter to attract FDI.

Methodology, research and Hypothesis.

This research project will try to determine if the fact of being a member of a certain cultural cluster has something to do with the variables that determine the market potentiality index, in line with prior research of variables identification (Cavusgil, 1997). A normality test is applied to verify the datasets and make sure that the correct statistical contrast is used. A one-way ANOVA will evaluate the significance between the groups including a Post Hoc analysis (if applies) in order to verify the significance between groups. Finally a generic correlation analysis will be executed including all the collected data of variables determinants of the Market Potentiality Index.

The research includes also the Ease of Doing Business and Corruption measures in its Distance To Frontier (DTF) mode. The literature states that some kind of relationships between Ease of Doing Business and FDI attraction exists, examining the effect that a country's business regulatory environment has on the amount of foreign direct investment it attracts. The Doing Business rank is highly significant when included in a standard empirical foreign direct investment (FDI) model (Corcoran & Gillanders, 2015) supporting as well the longitudinal approach of the research.

Using the GLOBE project as a framework for analysis looks coherent with the literature review e.g. (Dorfman % House, 2004), (Peterson & Castro, 2006) on measurements of the GLOBE, (Javidan, Dastalmachian, 2009) on managerial implications in Asia, (Den Hartog, Koopman, Thierry, Wilderom, Maczynski & Jarmuz, 1997) comparative research, or (Kabasakal, Dastmalchian, Karacay & Bayraktar, 2012).

This research starts collecting data of 10 different global clusters. Notice that African cluster is excluded in its MPI index analytics due to the lack of data (although not excluded in the CPI and DTF analysis). The clusters analyzed are as follows according to GLOBE classification: 1.Anglo, 2.Germanic, 3.Latin European, 4. African, 5. Eastern European, 6. Middle Eastern, 7. Confucian, 8. South East Asian. 9. Latin American and 10. Nordic. Each group of countries are considered our independent variable or factor in the study.

Collected longitudinal information on the dependent variables relate to the ease of doing business in its Distance to Frontier (DTF) calculations (World Bank, 2016) years 2010-2016 included, Corruption measures through the utilization of the most widely indicator as the Corruption Perception Index (CPI) years 2012-2015 and absolute values of the Market Potentiality Index (MPI) (Cavusgil, 1997) and its determinants which construct the MPI. The determinants are as follows: 1) Market size (MS), 2) Market growth (MG), 3) Market intensity (MI), 4) Market Consumption Capacity (MCC), 5) Commercial Infrastructure (CI), 6) Economic Freedom (EF), 7) Market Receptivity (MR) and 8) Risk. Longitudinal data collected refers to years 2014, 2015 and 2016 leading to an N=2204.

The cultural clusters are based on values and beliefs and abstract ideas influenced by lifestyle, religion or other human variables. The elements which compose the Market Potentiality Index (Cavusgil, 1997) depend on weighted factors.

Peculiarities of the sample:

- The US does not appear in the study of the MPI variables due to the fact that the MPI index explores a total of 87 nations identifying the levels of attractiveness or potentiality for US companies. So, consequently all possible nations are analyzed but the US.

- The country Switzerland is included in the cluster Germanic.
- The country South Africa is included in the cluster Anglo (due that most business and economic drivers are still under this cluster and not the African one).
- Absence of data in the MPI determinants in the African cluster (but still data is collected and analyzed in CPI and DTF).

Hypothesis formulation

H^0 = Due to the natural asymmetry of the type of countries and in line with the complexity of the variables already stated by (Stephan & Uhlaner, 2010), there is no reason to believe that groups differ from each other regularly in a longitudinal way.

H^1= some groups of countries might differ more than others in a regular and longitudinal way.

Results of the research related to the normality tests.

1. Test of normality related to the DTF dataset ease of doing business in its values Distance to Frontier DTF). The results of the test are satisfactory in all groups with a sig > 0.05 under the Shapiro-Wilk measure with the regular exception of group 10 which is Nordic countries. Only 3 countries are part of this group, Finland, Sweden and Denmark. In some particular cases other groups show lack of normality although this applies only to particular years of the longitudinal analysis. E.g. Latin European 2015, 2016 and South East Asia 2016. (*See Appendix 1, Table 1).* Also, it has been applied to the dataset a non-parametric normality test (K-S) Kolmogorov-Smirnov being >0.05 in all the cases. *(See Appendix 1, Table 2)*

2. Test of normality section 2. Dataset of corruption using the Corruption Perceptions Index (CPI). All values are satisfactory stating that it is a normal distribution according to Shapiro-Wilk tests with the regular exception of the Nordic countries again and Latin American countries in year 2015 with a value of .009. *(See Appendix 1, Table 3)* After the normality test is applied a non-parametric K-S test reflects normality appears in all cases. *(See Appendix 1, Table 4).*

3. Test of normality section 3. It applies to all eight (8) variables and to the overall MPI index. In this case all variables show normality in their distributions (See Appendix 1, Tables 5-10). Still in the MPI determinant Risk, Six (6) countries out of ten (10) present distributions non-normal so it is decided to eliminate this section from the ANOVA test.

Results related to One-way ANOVA analysis.

1. Results ANOVA related to the Ease of Doing Business and its Distance to frontier (DTF) measure show significance p <.005 all years analyzed (.000 years 2010 to 2012 and .001 for years 2013 and 2014 and .002 (2015) and .004 year 2016.

As we can see there is significance (<0.05) in all years. The test of homogeneity of variances (Levene), reveals homogeneity in the results of the variances stating that is it appropriate to apply Post-Hoc studies to verify significance between groups. The most relevant results of the Post Hoc Studies show that there is no significance between groups (clusters) when performing DTF analysis. Still some groups show certain significance. The binomials of groups which represent bigger variability and differences in their results are in most cases "*Anglo-Latin American*" and "*Anglo-South East Asia*". Also the group "*Nordic-Latin American*" shows significance although less. The location of countries in these groups or clusters state influence in the results versus some other clusters.

2. ANOVA results related to the corruption indexes, CPI. Years 2015-2012

There is a significance (<0.05) in all years. The test of homogeneity of variances (Levene), reveals homogeneity in the results of the variances stating that is it appropriate to apply Post-Hoc studies to verify significance between groups. Taking into account the significance of ANOVA and the similarities in the variances it is applied a Tukey contrast to validate significant differences between the groups or clusters. Consequently these are the significant differences according to CPI dataset. The most appearing clusters showing differences applied normally to all years are the ones between the better scores in the 3 groups Germanic, Anglo and Nordic and their opposite clusters which are in this case SOUTH East Asia (SEA) and Latin American (LATAM).

3. ANOVA results for the Determinant. "Market Growth". 2016-2014.

This determinant variable shows significance <0.05 in all 3 years analyzed, 2016, 2015 and 2014, showing values .000 in all cases with a F = 5.049 (2016), F=4.824 (2015) AND F= 6.637 (2014). Levene's test shows significance <0.05 the year 2016 with a value of .039. In the first dataset related to year 2016 has been applied Tukey while in years 2015 and 2014 T2-Tamhane has been applied leading to the following Post Hoc results: In year 2016 Latino America (LATAM) cluster shows significance with Germanic and Nordic groups (.011 and .025 respectively). Years 2015 and 2014 show preponderance of a varied number of groups in a fragmented series.

4. ANOVA results for the determinants "Market Size" (MS) and "Market intensity" for years 2014, 2015 and 2016 do not show significance at the level <0.05 at all.

5. ANOVA results for Market Consumption Capacity (MCC). 2014, 2015 and 2016. Market Consumption capacity (MCC)

determinant shows significance in 2 years (2016 and 2015), with levels <0.05 as .003(2016) and .032 (2015). Levene's test show significance all 3 years 2016, 2015 and 2014 with levels of .013, .041 and .014 respectively. The post hoc analysis shows a great significance and presence of the cluster LATAM with levels of significance of <0.05 in its pair with the Germanic cluster in the years 2016 and 2015 and with the Eastern European (EE) cluster in all 3 years.

6. ANOVA results for Commercial Infrastructure.

(CI). 2014, 2015 and 2016. In this case the analysis shows a great significance in the levels of Commercial Infrastructure appear very significant showing levels of F=12.943 (2016), F= 6.537 (2015) and F= 9.252 (2014), being significance at the .000 level in all years. The Levene's test of homogeneity of variances shows levels <0.05 in the years 2015 with a value of .013) and 2014 with a value of .047. Post Hoc analysis applies under Tukey and T2-Tamhane reflecting a very fragmented series of binomials in year 2016 and a quite important presence of the LATAM cluster in the years 2015 and 2014.

   c. ANOVA results for Economic Freedom. 2014, 2015 and 2016. Significance appears here again in this determinant. The results show an F= 4.156 and a sig= .001 (Year 2016), F=2.891 and sig = .013 (2015) and F= 4.257 and sig = .001 (2014). In the test of homogeneity of variances (Levene), shows significance the years 2016 and 2014 (.036 and .028) respectively while not in the year 2015 with a value of .062. After applying Tukey corrector no significance appear for any group during the year 2015. On the other side and using T2, se see again a predominance of LATAM cluster combined with a fragmented series of clusters.

   d. ANOVA results for Market Receptivity (MR). 2014, 2015 and 2016. There is

significance in all groups and years, Year 2016, p=.001, Year 2015, p = .006, Year 2014, p = .010. Levene's test express significance in the differences in the variances as well with a Sig., p= .000 in all 3 years. Post hoc applied under T2-Tamhane is performed showing no significant differences at all between binomials.

7. ANOVA results for the overall Market Potential Index (MPI). 2014, 2015 and 2016. There is significance in all groups and years, (.000 in all years). Levene's test express significance in the differences in the variances as well (.009, .007 and .008) , so post hoc analysis under T2-Tamhane is performed showing significance only in the pair Latin America-Germanic with a value of sig=0.049. Next you can see the table showing the ANOVA results with significance in the study:

(Table 1 goes here)

After the Post Hoc test are applied to the relevant groups and significance appears, not all groups show differences and when differences appear not always shows a longitudinal consistency. Only D1, D2, D6 and D7 show this significance supporting H1.

(Table 2 goes here)

Specifically, the analysis of the Ease of Doing Business in its Distance to frontier (DTF) test shows regular significance in all periods in the Anglo-Latin America and in 5 periods Anglo with South East Asia. Clearly the Anglo cluster differs in providing better frameworks for doing business that the other clusters.

(Table 3 goes here)

According to Corruption measures, (CPI) suggest that there is significant differences in results between the Anglo group and Latin America and South East Asia. Also Germanic group differs with the same groups (Latin America and South East Asia). Finally the next cluster showing very different behaviors is Eastern European cluster against Anglo and Nordic.
According to Market Consumption Capacity (MCC) we see that Latin America cluster differ from others all the 3 years, with Germanic in 2 years and with EE and Nordic. No doubt that the behavior of the Market Consumption Capacity in Latin America tends to differ from other groups analyzed.

(Table 4 goes here)

According with Commercial Infrastructure (CI), we see again that the clusters Latin

American is the one that differs more from other groups consistently during the 3 years.

(Table 5 goes here)

(Table 6 goes here)

(Table 7 goes here)

Limitations and future research.
This research refers to the collected information providing 6 years in the analysis of the DTF (2010 to 2016), 4 years in the analysis of the CPI (2012 to 2015) and only has been possible to collect 3 years of the analysis of the determinants (2014 to 2016) due that the MPI index is still relatively young. The research uses the GLOBE classification which in some cases has been criticized (mainly from a marketing perspective), although I believe that it provides a generic robust framework very useful to understand mechanisms related to market potentials and culture. Another limitation of the research is the fact that the determinants of the market potentiality used are the ones made by (Cavusgil, 1997) and they are made from a US point of view in order to evaluate the market potentiality versus the US. Obviously the US is excluded from the Anglo cluster in its analysis of determinants, but still, future recommended research would go in line of the elaboration of the Market Potentiality Index of countries versus other countries instead of countries versus the US only.

Conclusions
The clusters do not show significant differences according to the MPI determinants with the exception of Latin American cluster:
Latin American cluster in its Market Consumption Capacity (MCC) factor differs more than other clusters (mainly with the Anglo, Germanic and Nordic clusters). It is important to state that the MCC is a mix of other sub-factors as Consumer Expenditure, Income Share of Middle-Class, or Household Annual Disposable Income of Middle-Class. The behavior of the MCC, is not in line with other groups and in the same cluster but here there is a much more heterogeneous approach. Possible explanations to be explored might related to the facts that the distribution of the consumer expenditure or income behaves radically different than in Anglo or Nordic parameters.
Latin American clusters differ from others in its Commercial Infrastructure (CI). This determinant is made by a fragmented collection of sub-factors which increase its complexity. These factors are Cellular Mobile Subscribers, Households with Internet Access, International Internet Bandwidth, Number of PC's, Paved Road Density, Population per Retail Outlet, Available Airline Seats and Logistics Performance Index. The evolution of the commercial infrastructure in Latin America might differ from other countries because of political reasons, political economy decisions or vulnerability to economic crisis or periods of expansion. Also, the degree of economic and financial volatility might influence as well.
Also, it is found high correlation between the levels of corruption perceived (CPI) and the ease of doing business (DTF). The paper states that this variables might impact indirectly in a market potentiality, mainly with the connection existing between Economic Freedom and Doing Business. The correlation appears all the time between 0.8 and 0.89 stating that all countries data navigates in parallel.

EXPLORING THE MARKET POTENTIAL OF TRADITIONAL FOOD AND RESTAURANT IN CENTRAL JAVA

Djoko Purwanto, Sebelas Maret University, Indonesia
Budhi Haryanto, Sebelas Maret University, Indonesia
Amina Sukma Dewi, Sebelas Maret University, Indonesia

Abstract

This research aims to analysis the correlation of prices, qualities, and obtainable merchandise on positive behavior and purchasing intent. It was started with consumers' opinion analysis on snack products and restaurant foods.

The samples of this research were 970 respondents and the data were collected using convenient methods in Central Java Province. This research used descriptive statistics and factor analysis.

The result of this research shows that public opinion on diversities products tends to indicate snacks as healthy foods, acceptable price, delicious flavor and tasteful, non-perishable, obtainable, attractive color, and sufficient products. Respondents also tend to choose restaurant foods that acceptable price, many flavors, healthy foods, non-perishable and effective, sufficient products, high quality, and invigorate products. Respondents tend to find the indicators of products above that strengthened through the increase of public opinion, public feeling and public marketing.

Keywords: *acceptable price, high quality, local brands, diversities products, positive thinking, purchasing intent*

Introduction

Technology advancement and complex competition are two important things that must be considered by marketers to sell their products, particularly the one associated with local or traditional brands. Marketer s should be able to create a strategy that can direct consumers to do purchasing process on the products they sell.

Purchasing process of a product begins with the process of thinking, behaving, and acting (Dodds *et al.,* 1991; Engel *et al.,* 2001). What an individual thinks is the one that marketers try to catch, then this person will start to like it, after that, the intention to purchase will bring up (see Haryanto, 2014; Setiawan & Haryanto, 2014), and so is the purchasing process of local and traditional brands. Some cases encountered by the marketers of local brands are the lack of knowledge about what the person thinks, their market share, which ultimately decreases the marketing performance. Therefore, it becomes a phenomenon for local brand marketers due to the unlimited influx of foreign brands; so many consumers prefer purchasing foreign brands to domestic ones. The object which is interesting to observe in this study is consumers' behavior in choosing the product types of local or foreign brands.

This research focuses on the question of how the purchasing process of a consumer that prefers the local brands by considering the product types, which is expected to provide insights into traditional or local brand marketers to determine the more effective strategy in attracting consumers toward the traditional brands.

Literature Literature Review and Hypothesis Development
This research focuses on individual behavioral process toward local brands, and it discloses a process of formatting attitude and product purchase intention.

1. Positive Attitude and Purchasing Intention of Local Brands

Positive attitude and purchasing intention are variables which are used to predict real purchasing from a consumer. Purchasing intention is an action that has not been expressing in the real terms and still in the level of individual's thought. In the consumer's behavior it is often called purchase intention. Dodds *et al*., (1991), define purchase intention as individual's desire to buy a product. Because of that, in the behavioral study, the desire is shown by individual's tendency, individual's possibility, and individual's decision to buy a product (Howard & Shay, 1988).

The literature review has explained that intention is a good predictor for individual in making a purchase (Kim & Chung, 2001; Munger & Grewal, 200; Kwek, 2010; Delafrooz & Paim, 2011; Harcar *et al.,* 2012; Beneke *et al.,* 2013). As a predictor, intention is an important variable to decide the amount of market share which indicates a potential demand on a product and service. Marketer is very concerned about purchase intention, because from the purchase intention, the marketer can determine the success rate of marketing performance. Therefore, high effort is required to explain the variable which is considered important by individual to decide the purchase intention of a product.

In the behavioral process, the positive attitude of a brand and purchase intention on it is conceptualized as positive relationships (See Mitchell & Olson, 1981; Simonin & Ruth, 1998; Haryanto, 2014). It means that the higher positive attitude on a product, the higher purchase intention on it is. Thus, a hypothesis can be formulated to explain the behavioral process on local brands.

Hypothesis 1: ***The higher positive attitude on a product, the higher purchase intention on it is.***

2. Product Price

Product price is defined as individual's perception on a value that must be paid by the buyer to get a product or a service which has use and service values. In behavioral, price is described as the result of individual perception on some money that is sacrificed of a product or brand. (De-Matos *et al*., 2007). This concept explains that price is a quality indicator. If the price of a brand is high, the quality of that brand is high as well.

In this research, the price in question is a price in accordance with quality that is accepted from a product or also called price fairness or honest price (see Ayres & Nalebuff, 2003). This concept is also called price-quality inference (Dodds *et al.,* 1991). In the behavioral process, price has a positive relationship with purchasing decision (See Campbell, 1999; Vaidyanathan & Aggarwal, 2003, Xia *et al*., 2004). In accordance with positive attitude, it is conceptualized that the higher the price fairness, the higher the positive attitude on local brands is (See Delafrooz and Paim, 2011; Harcar *et al*. 2012; Beneke *et al.* 2013).

*Hypothesis 2: **The higher the price fairness, the higher the positive attitude on local brands is.***

Then, in relation to the purchasing intention of local brands, it is conceived that the price fairness has a positive relationship with purchasing intention (See Delafrooz dan Paim, 2011; Harcar *et al*. 2012; Beneke *et al.* 2013). It means that the higher the price fairness, the higher

the positive attitude of brands is. Thus, the hypothesis 3 formulated in the local brands context is as follows.

Hypothesis 3: The higher the price fairness, the higher the purchasing intention on local brands is.

3. Product Quality

Several different concepts associated with product quality were employed by previous researchers. First, they claimed that the quality of a product, apart from the shape of good or service, is value opportunity for a company to achieve the greater profit margin (Selnes, 1993). Secondly, they explained that the product quality from marketer's perspective is always associated with the specification, feature, functionality or performance of a product (Van-Trijp *et al*., 1996). Thirdly, they stated that quality is defined as superiority or advantage on a product when it is compared with the alternative product from market perspective (Mittal *et al*., 1998). In the context of culinary product, food quality is shown by the color, presentation, portion, shape, temperature, freshness, texture, aroma, mellowness and flavor.
In behavioral, it is conceived that product quality has a positive relationship with the purchasing decision (Weiss, 2003) and in purchasing intention, the higher the product quality, the higher the positive attitude on a product is, and the high quality will bring up the purchasing intention (See Munger & Grewal, 2001; Beneke *et al*, 2013; dan Kordnaeji *et al*, 2013).

Hypothesis 4: The higher the product quality, the higher the positive attitude on local brand iss.

Besides the positive attitude, the product quality has a relationship with the purchasing intention (See Munger & Grewal, 2001; Beneke *et al*, 2013; and Kordnaeji *et al*, 2013). It explains that the higher the product quality, the higher the purchasing intention on a product. Below is the fifth hypothesis:

Hypothesis 5: The higher the product quality, the higher the purchasing intention on local brands is.

4. Ease of Getting the Products

Ease of getting the products is taken from convenience term, and based on the result of literature review; convenience has variety of understanding based on the application. First, convenience is defined as individual capacity in using all owned source efficiently to get a product (Nickols & Fox, 1983; Gofton& Ness, 1991; Scholderer, J., & Grunert, K.G., 2005). It means that convenience has a meaning of easiness for obtaining goods or shopping a product. Second, convenience is defined as the easiness for using a product (Verlegh & Candel, 1999; Scholderer, J., & Grunert, K.G., 2005). It means that an individual needs some efforts to use a product.
In the context of observed product, which is traditional cuisine, convenience is ease of product acquisition (See Thom, 2007; Delafrooz & Paim, 2011; Harcar *et al*, 2012). It is based on an observation that in the modern society, especially in Indonesia, transportation is relatively expensive in terms of time, psychic, and psychological that is sacrificed to achieve a product that is relatively long. This consideration becomes an important determinant in buying a product, so that if the sacrificed effort to get the product is higher, the positive attitude and purchasing intention on a product is lower. Thus, it can be conceived that the higher the ease of product acquisition, the higher the positive attitude on the product is (See

Thom, 2007; Delafrooz & Paim, 2011; Harcar *et al*, 2012). Therefore, the hypothesis is:

Hypothesis 6: The higher the ease of product acquisition, the higher the positive attitude on the local brands is.

Likewise, the purchasing intention is conceptualized as follows: the higher the ease of a product acquisition, the higher the purchasing intention on it is (Thom, 2007; Kwek, 2010; Delafrooz & Paim, 2011; Harcar *et al*, 2012). Thus, the hypothesis is formulated as follows:

Hypothesis 7: The higher the ease of local brands acquisition, the higher the purchasing intention on it is.

5. Type of Product

Type of product is a behavioral external variable that allegedly moderates the behavioral process (see Dmitrovic & Vida, 2010, Bearden & Etzel, 2001). As a moderating variable, type of product has a role to distinguish behavioral process in buying a product. Thus, the phenomenon is the process of forming positive attitude and purchasing intention on local brands is differentiated by the product types, namely: snack and restaurant food products. Here is the hypothesis for the phenomenon.

Hypothesis 8: The process of forming positive attitude and purchasing intention on local brands is moderated by product types

Methodology

This research was focused on the determination of market share of consumers who knew about snack and restaurant food products. Of 1000 questionnaires spread, 970 were returned. 485 respondents knew the former and 485 knew the latter.

The samples of research were determined by using the convenience sampling technique through survey, without any consideration but being based on ease. Factor analysis was employed to explain the public opinions of the snack products and restaurant food products.

1. Public Opinions of Snack products

In Table 1, the rotated factor indicated that OPI4, OPI5, OPI9, OPI10, OPI13, OPI14, OPI17, and OPI20 were members of Factor 1. The consumers' main opinions were those related to health, namely: the snack products were fresh, fresh-made, healthy, hygienic, preservative-free, and nutritious so that Factor 1 was health dimension. Factor 2 consisted of OPI22, OPI23, OPI24, OPI25, and OPI26, meaning that the consumers desired appropriate, reasonable, acceptable, and proportional prices so that Factor 2 was price reasonableness dimension. Factor 3 consisted of OPI1, OPI2, OPI3, and OPI8, meaning that the consumers required snack products which were tasty, delicious, scrumptious, and suitable in terms of flavor so that Factor 3 was flavor dimension. Factor 4 consisted of OPI8, OPI11, OPI12, meaning that the snack products were durable, attractive, and long-lasting so that Factor 4 was durability dimension. Factor 5 consisted of OPI19 and OPI21 indicating that the snack products were easily available and practical so that Factor 5 was ease of getting dimension. Factor 6 consisted of OPI6 and OPI7, meaning that the snack products were bright and attractive so that Factor 6 was color and attractiveness dimensions. Factor 7 consisted of OPI15 and OPI16, meaning that the snack products were plentiful and filling so that Factor 7 was product quantity dimension.

Thus, public opinions of snack products could be categorized into seven dimensions: the snack products were connoted as healthy snack products (Factor 1), reasonable price snack

products (Factor 2), appropriate flavor snack products which (Factor 3), long-lasting snack products (Factor 4), ease-of-getting snack products (Factor 5), attractive color snack products (Factor 6), and plentiful quantity snack products (Factor 7).

Rotation Method: Varimax with Kaiser Normalization.
a. Rotation converged in 9 iterations.

2. Public Opinions of Restaurant Food Products

In Table 2, the rotated factor indicates that OPIM22, OPIM23, OPIM24, OPIM25, and OPIM26 were members of Factor 1. The consumers' main opinion was related to prices. The consumers required reasonable, appropriate, and proportional prices so that Factor 1 was price reasonableness dimension. Factor 2 consisted of OPIM1, OPIM2, and OPIM3, meaning that the consumers wanted the tasty, delicious, scrumptious restaurant food products so that Factor 2 was flavor dimension. Factor 3 consisted of OPIM9, OPIM10, OPIM11, and OPIM17, meaning that the consumers required healthy, clean, attractive and nutritious restaurant food products so that Factor 3 was health dimension. Factor 4 consisted of OPIM7, OPIM8, OPIM12, and OPIM21, meaning that the consumers required attractive, durable, long-lasting, and practical restaurant food products so that Factor 4 was durability and practicality dimensions. Factor 5 consisted of OPIM13, OPIM14, and OPIM15, meaning that the consumers required preservative-free, natural, and plentiful restaurant food products so that

Factor 5 was no-preservative and plentiful quantity dimensions. Factor 6 consisted of OPIM16 and OPIM20, meaning that the consumers wished filling and quality restaurant food products so that Factor 6 was food quality dimension. Factor 7 consisted of OPIM4, OPIM5, and OPIM6, meaning that the consumers required fresh, fresh-cooked and bright restaurant food products so that Factor 7 was food freshness dimension.

Thus, the public opinions of restaurant food products could be classified into seven dimensions: reasonable price food products (Factor 1), varied-flavor food products (Factor 2), healthy food products (Factor 3), durable and practical food products (Factor 4), preservative-free and plentiful food products (Factor 5), quality food products (Factor 6), and refreshing food products (Factor 7).

3.   Market Share of Snack Products and Restaurant Food Products

There were three market shares of snack products and restaurant food products, namely: (1) mind share to explain the average level of brands in the individuals' mind; (2) hear share to explain the average level of brands in the individuals' heart; and (3) market share to explain the average level of individuals' desire to buy a brand.

4.   Market Share of Snack products

Table 3 shows that the mean score of public opinions of snack products was 3.38. The score indicates that the public opinions of snack products were moderate (neutral). The public was aware that the snack products were mediocre and nothing special. The mean score of mind share of snack products was 4.22. Snack products were relatively good to occupy the mind of individuals, meaning that the public regarded that the snack products were perceived as good products. The mean score of heart share of snack products was 4.42. The public valued the products positively, which was expressed through their pleased and excited feelings by the presence of the brands. The markets share of snack products was 4.32, indicating that the snack products received relatively good reactions from the public, which was expressed through their intention to purchase the products in the future.

Maximum		5.00	7.00	7.00	7.00

5. Market Share of Restaurant Food Products

Table 4 shows that the mean score of public opinions of restaurant food products was 3.86. The score indicates that the public opinions of them were relatively good, meaning that the public was aware that the products were good.

Table 4 above shows that the mean score of mind share of restaurant food products was 4.98. The score indicates that the public had relatively good perception of the food products in their mind. The mean score of heart share was 5.33. The score indicates that the public loved the restaurant food products, which was expressed through their pleased and excited feelings toward the restaurant food products. The mean score of market share of restaurant food products was 5.24. The score indicates that the restaurant food products received relatively good reactions from the public, which was shown by their intention to purchase the restaurant food products in the future.

Table 4.
Market Share of Restaurant Food Products

		Opinion	Mind Share	Heart Share	Rerata Share

Minimum		2.23	1.00	1.00	1.60
Maximum		5.00	7.00	7.00	7.00

a. Multiple modes exist. The smallest value is shown

Conclusion

Public opinions of snack products show that the snack products were healthy, reasonable-priced, easy to obtain, attractive, and plentiful. Meanwhile, the restaurant food products were connoted as reasonable price, plentiful flavor and taste, healthy, durable, practical, plentiful, fresh, and quality food products.

In term of market share, snack products have neutral public opinions meaning that the

products are mediocre good products, and the public intend to buy them in the future. Meanwhile, the restaurant food products have relatively good public opinions, and the public like and intend to purchase such products in the future.

CRITICAL ECALUATION OF CIRCUITRY MARKETING ENVISAGING THE GLOBALIZED ECONOMIC EPOCH

Bhavannarayana Kandala, India
Reddy Krishna Cys. Y. S., School of Management Studies, Jpnce, India
A. Xavier Raj, LIBA, India

Abstract
In the digital era stride ahead at the speed of thought, everything is in its dynamic state of flux. The explosions in the Circuitry Marketing (CM) are an infrequently explored vicinity in doing research to compare the distributor's insight on strategies from two selective companies of our scholarly research presentation. Such a comprehensive study ultimately relieves marketing strides after developing tools and techniques for generating knowledge by throwing light to new vistas to collaborate with multiple science-based fields such as computer science, biotechnology, and neuroscience as well as with other knowledge fields such as cultural anthropology, philosophy, and the arts in coordination with viable models of research. The study significantly focuses on the importance of taking appropriate corrective measures to attend major classes like demographics, customer-loyalty and satisfaction. Even though precautions are taken to include all sections to represent the Telangana state, it is more effective to conduct such studies geo-stratified to be more accurate. It is intended that outcomes will help customers, distributors, and companies' executives to respond to the ever-changing needs of end-users in Indian marketing through increasing flexibility via (Network Marketing) NM. Few studies that have been explored till recently focus on comparison of MLM in Indian and hence add more value in understanding customer's buying behavior. The findings hypothetically reveal relevant facades. The presentation will discuss various critical aspects of CM foreseeing the universal economic era.

Keywords: *Circuitry Marketing, Distributor, Globalization, Entrepreneurship Development Micro-Business.*

Introduction

The concept of Circuitry *Marketing* has been transforming the way companies are doing business and is gaining a steady momentum. Many companies across the world have perceived the potential of this concept to reach prospective customers in the nook and corners of the world. The traditional distribution structure in most of the marketing companies for a long time depended on tried and tested physical distribution system of "Manufacturer – Wholesaler – Retailer - Consumer". It is like lessening the scale of networking of sales persons in selling products to the end-users through 'Referral' and 'Word of Mouth' (WOM) publicity.

Circutary Marketing is an opportunity through which people can protect themselves from the unemployment or insufficient salary of paid jobs. In foreseeable future significant number of goods and services sold in the world will be through *Circutary Marketing* companies.

Most of the *Circutary Marketing* companies feel that there is a bright future because of plethora of reasons like 'diffusion of brands' through powerful 'word of mouth', 'referral', 'product quality', 'Low Investment-cum-High Returns' and 'Royalty Income' etc. While *Circutary Marketing* has been fast growing as per organizational spectrum, it has sizable unorganized sector.

The World Federation of Direct Selling Association (WFDSA) encourages various member

country associations, such as Indian Direct Selling Association (IDSA)[14] in India and other country Regulatory Bodies (or Associations), for organizing and promoting *Circutary Marketing*. The *Circutary Marketing* has been in vogue in many of the countries.

There has been a surge in *Circutary Marketing* in India to improve standard of living of Indians by converting unproductive time of housewives, unemployed, physically challenged, retired people and students into productive time on either part-time or on full-time basis.

Globally direct selling has gained prominence, primarily in product categories such as *Cosmetics-cum-Personal care products* has maximum share of 30%, followed by *Wellness* products 28% and *Household goods and durables* 21% as per *WFDSA*[15] (2011).

1. **Direct Selling in India:** Direct selling market in India is about 1.2 billion US Dollars. It is expected to increase to 10 billion 2025, engaging over 18 million consumers. In a recent report on direct selling market in India by FICCI and KPMG the direct selling industry will have a positive impact on industry. Direct selling industry impact positively by creating additional income opportunities for large number of people (micro-entrepreneurship – 18 million), women empowerment (self-employment – 11 million), development of SME sector (transfer of know-how, process and technology), employment generation (manufacturing, packaging, processing and now retail stores: 2.5 million people), CSR activities (health, education, etc.: INR 0.5 billion) and contribution to exchequer (INR 90 billion). Recognizing the potential of direct selling market, Government of India has come up with a guidelines that shall voluntarily regulate direct selling and protect consumers.

The need to protect consumers from pyramid or Ponzi schemes that emulate MLM to dupe consumers, most at the base of the pyramid, is real. Same applies to genuine MLM companies that are operating in India resulting in arbitrary legal actions. The country head of well know global MLM company in India and his associates were arrested twice in the last five years. The need for a supportive legal framework has become necessary, specifically considering social and economic benefits of MLM in India, its potential growth and its popularity among consumers. The recent guidelines, which is likely to eventually become an act, regulating *Circutary Marketing* in India is an important step in this direction.

Recently, some of the MLM brands, for example Amway, are setting up pick centers and experience stores. It is expected that with increasing awareness, increasing purchasing power, convenience of buying and possibility of earning commission by selling to others will continue to expand MLM market. Foray in online sales and selling through e-commerce sites are on the rise. Social media network are likely to contribute to the scale, thereby expanding the scope of Circutary Marketing as well as willingness to consider a market mix by MLM companies, which is becoming imperative in 21st century, specifically in the content of digital and social networking.

2. **Relevance:** In this context, a micro-level study of circutary marketing in India is timely. This study provides certain useful insights that may be of relevance to policy makers, CMOs, investors, academicians and general public at large. Specific insights on consumer segment and its characteristics, consumer touch points, profile of distributors, drivers for distributors, service quality improvement requirements, and emerging role of social media. The objectives of the studies were firmed through a systematic literature review (salient points presented below) identifying certain persisting gaps, specifically in the context of marketing landscape in India.

---

[14]. www.idsa.co.in (Accessed on 10th May, 2013)
[15]. www.wfdsa.org (Accessed on 15th July, 2013)

The gaps identified, based on literature review, are:
Gap
1. The researcher felt the need to identify the problem and prospects of *Circutary Marketing* in the Indian context as this dimension was not included in the earlier studies.
2. Detailed comparative study of two or more companies in the field of *Circutary Marketing* was not comprehensively covered.
3. The researcher did not come across the attempt to explain and analyze the role of distributors in *Circutary Marketing*.
4. The researcher did not come across analysis of impact of 'demographics characteristics' on 'factors influence business orientation'.
5. 'Sources of Information' about *Circutary   Marketing*, which was not covered comprehensively in the Indian context. Hence the researcher wanted to ascertain this aspect.

3. Objectives of the study:

1. To identify the factors that motivate distributors to join Circuitry marketing companies?
2. To study the factors influencing distributors to deal with circuitry marketing companies?
3. To find out/develop the factors influencing level of satisfaction of distributors belong to Circuitry marketing companies and to establish their association?

4. Research Questions

The Research Questions are derived from the review of literature, after identification of literature gaps.
RQ1: What are the factors that motivate distributors to 'join' *Circutary   Marketing* Compan*ies*?
RQ2: What are the factors influencing distributors to 'deal' with *Circutary   Marketing* Compan*ies*?
RQ3: What are the factors influencing 'Level of Satisfaction' of distributors belongs to *Circutary Marketing Companies* and what is their nature of association?

The study pivot focus importance of taking appropriate corrective measures to attend major classes like demographics, customer loyalty and satisfaction. Even though precautions are taken to include all sections to represent the Telangana state, it is more effective to conduct such studies geo-stratified to be more accurate. It is intended that outcomes of this study will help customers, distributors, and companies' executives to respond to the ever changing needs of end users in Indian marketing through increasing flexibility via NM. The studies which focus on comparison of MLM in Indian context are very few and hence add more value in understanding customer's buying behavior in these areas.
The findings of the survey of *Circuitry Marketing* distributors *Hindustan Unilever Network* and *Amway India* includes distributors' demographic profiles, experiences, sources of information related to *Circuitry Marketing*, motivational factors, their opinion towards *Circuitry Marketing*, problems as expressed by the distributors and also suggestions. Attributes of *Circuitry Marketing* like distributor satisfaction on Network Products, Proprietary Products, 'Word of Mouth' Publicity, Prestige, Quality Perception, Service Perception and 'Reputation of Company' are included in the study.

5. Originality It is part of Ph.d thesis of corresponding author.

6. The limitations of the study are as follows:

1. This study is limited to two major Circuitry Marketing Companies (CMCs). Even though these two Circuitry Marketing Companies capture the essence of Circutary Marketing, there are more number of players in the market. A detailed study of the entire spectrum of Circuitry Marketing will reveal nitty-gritty's of this business model.
2. Only MLM was considered for the study whereas the formats like Single Level Marketing, Home Party Plan, with different compensation plans can be taken for consideration.
3. The study does not cover actors, layers, verticals in Circutary Marketing business.

7. **Sampling technique:** Gathered data using 'Snowball' sampling technique from 300 *HUN* and 300 *AIE* customers through structured questionnaire in Telangana joint state capital Hyderabad.

Data Analysis
The analysis of data and to reveal the results of the survey. The results were obtained by using 'Descriptive' as well as 'Inferential' statistics on the basis of responses collected from the distributors of selected *Circutary Marketing* companies through questionnaire survey method. 'Inferential' statistical tools like Reliability Test (Cronbach's Alpha Co-efficient), Factor Analysis, Testing of hypotheses, Chi Square (χ^2), Phi Cramer's V Test and ANOVA (Analysis of Variance) were applied for testing of the hypotheses and to answer the research questions (mentioned in the review of literature), research objectives, Regression (Multiple Linear) and Henry Garret Rank Technique.

The data was analyzed through descriptive and inferential statistics. Descriptive Statistics tools like mean, standard deviation, and cross tabulations were applied to distributor's demographic variables, which were mentioned in the Part-A of the questionnaire. These were followed by *Circutary Marketing* behavior, Motivational factors, and opinion covered in Part-B of the questionnaire. Subsequently analysis of practitioner's approach to *Circutary Marketing* was conducted in Part-C of the questionnaire.

Originality It is part of Ph.d thesis of corresponding author.

The limitations of the study are as follows:
1. This study is limited to two major Circuitry Marketing Companies (CMCs). Even though these two Circuitry Marketing Companies capture the essence of Circutary Marketing, there are more number of players in the market. A detailed study of the entire spectrum of Circuitry Marketing will reveal nitty-gritty's of this business model.
2. Only MLM was considered for the study whereas the formats like Single Level Marketing, Home Party Plan, with different compensation plans can be taken for consideration.
3. The study does not cover actors, layers, verticals in Circutary Marketing business.

Review of Literature
Circutary Marketing is an extension of direct selling and its basis is positive 'Word of Mouth' publicity. It can do anything and everything for the rapid spread of what it intends to spread. According to news item published in *India Today*[16] many liters of milk isappeared into the tiny Ganesha's idol in Mumbai and other parts of India and also other countries of the

---

[16]. "Ganesh Idol Drinking Milk?!", India Today, English Edition, 26th May, 1995, www.milkmiracle.com.

world. The example of Lord Ganesha's idol drinking milk is globally quite evident and popular among all circles. It is quite clear that the piece of news about Ganesh idol's drinking milk has been spread globally in a rapid manner. This is what 'Word of Mouth' publicity can do.

Even though *Circutary Marketing* is quite a new territory for most Indian marketing *pundits*, some of the interested scholars and researchers have furnished many valuable opinions concerning what constitutes a *Circutary Marketing*. It is always good and useful to explore what research scholars and eminent writers in the field of *Circutary Marketing* have done so far. That will give us an idea of the area covered so far and what yet remains to be addressed. Also, it will save a researcher from repeating what has been done before.

1. **Joining Business Groups** Richard C. Bartlett[17] (1992) made a survey on "*A Profile of Direct Salespeople*" and it presents information on the demographic characteristics and direct-selling experience of direct salespeople. More specifically, the report covers personal characteristics of direct salespeople, including gender, age, ethnicity, education, marital status, and household income. Direct-selling employment experience is measured by average weekly hours in direct selling, direct-selling income, expenses and other items. The article also provides key salespeople and characteristics of the salesperson. In addition, the report provides foundation for future research.

Bloch Brain[18] (1996) stated that *Multilevel Marketing* is the relationship between the would-be seller and his prospective 'Down line'. He opines that truly determined sellers may well make money but most will not, yielding rather in the face of rejection ranging from uninterestedness to serious disapproval and resentment of the matter having been raised at all. He further described that if you get your friends to join up, you get a commission not only from the cosmetics, magazines or whatever your friends purchase, but from the sales they make to their friends too. Theoretically, you can make a fortune as this process expands in a sort of multi-layered network which, when drawn on paper, fans out into a pyramid-like structure.

Richard Berry[19] (1997) articulates that in essence, *Circutary Marketing* [NM] is a way of organizing sales operations of a direct selling organization. It is a non-store approach to relating and distribution of goods and services, directly to the customers. *Circutary Marketing* embodies the essence of free enterprise by providing an opportunity for the interested individuals or independent contractors to run a home based business. Richard Berry[20] (1997) also indicates that, instead of a supply organization constructing a large administrative and sales force comprising of employees, self-employed independent contractors can be encouraged to build a sales organization of persons, like themselves, by using a unique coaching and training system called 'sponsoring'. In this system of sponsoring the distributor (sometimes referred to as an 'independent contractor' or 'a direct salesperson') shares knowledge and expertise with new entrants leaving the business for the first time. In turn, for this commitment, the sponsor earns commission based on a percentage of the sales from those recruited, subject to the structure of the organization plan.

[20]. Ibid-3

Patralekha B. and M.Krishna Kumar[21] (2000) exemplified the fact of attracting many-a-distributor which was proved in the *Nu Skin* annual convention held in March, 1998 attracted 13,000 distributors out of which more than 8,000 came from Japan, Taiwan, Hong Kong, Korea, Thailand, and Philippines. *Rexall* hosted series of conventions in 1998, each of which was attended by about 2,000 distributors. Five thousand distributors from USA, Canada, Australia, New Zealand attended USANA's Health Science 1998 convention. Nearly 15,000 attended America's 1998 convention.

Even more astonishing than the phenomenal growth of Circutary Marketing Organizations (NMO) is the controversies these organizations seem to attract critics which have complained that the average Circutary Marketing Organization distributor earns very little. Every NMO has its share of distributors but most NMO distributors make negligible debate of their propensity to mould into close knit (and often very exclusive) social groups and revolve primarily around parties, meeting, rallies, convention and other occasions organized under the NMOs banner.

The chapters are supported by local directors who receive a 250-page manual and hours of training before managing an area. Directors are offered training twice a year in three-day conferences on strategies that give them a *distinct competitive advantage* in their markets. Business Networking International (BNI) emphasizes the following benefits to join: increased business through referrals, participation in business tradeshows, free networking workshops and the knowledge that everyone in a group has been screened for competency and ethics.

Findings of the Study
1. Demographics Description
Demographic characteristics include Age, Gender, Marital Status, Education, Occupation and Monthly Income.

---

[21]. Patralekha B. and M.Krishna Kumar, "Socialization in Circutary Marketing organizations: is it cult behavior?" July 2000, The Journal of Socio-Economics Vol 29, Iss 4, pp 361-374.

Table 1. Sample Composition – Overall (N=600)

Demographic Characteristics	Description	No of respondents	Perctg %	Mean	S.D

	Above 20,001	221	*37*		

'*' Indicates Standard Deviation for Age & '**' indicates Standard Deviation for Income
Source: Primary Data

Table 1 shows the profiles of 600 respondents. The respondents are the distributors of sample companies. 46% of respondents are between 18-30 years of age, 30% are between 31-40 years age group. Respondents above 41 years constitute 24% of the sample. Women dominated constituting 66% of the sample. 61% of the respondents are married. 50% of the respondents are graduates. SSC constituted 24% of the sample. Housewives constituted the segment 41% of the sample. 37% of respondents have monthly Income above Rs.20,001, 29% have income in the range of Rs.10,001-Rs.20,000 and 34% have income of less than Rs.10,001. Thus the sample represents heterogenic demographic categories.

Cronbaachs' Alpha

Table 4.2: Reliability Table

Reliability Statistics

Cronbach's Alpha	No of Items
.712	18

Cronbach's Alpha Reliability statistics shows .712 for 18 Items, it is more than .600 which is close to .6. In social sciences, it is adequate Malhotra[22] hence proceeded with further study.

Scale Statistics

Mean	Variance	SD	No of Items
43.45	24.201	4.919	18

The eighteen statements are condensed to eight factors. Factor analysis was used to test the construct validity as shown in Figure No 4.1 Scatter Scree Plot.

Key findings

1. **Findings** reveal that the majority of *HUN r*espondents are business people, whereas housewives are more prevalent in *AIE*. 'Word of Mouth' (WOM) through 'Reference group' plays a leading role. 'Distribution Flexibility' is mostly by Network management support and acquaintances. 'Support' is low in *AIE* when compared to *HUN*. 'International quality' is comparatively high in *AIE* than *HUN*. Prices are perceived to be higher in *AIE than HUN* customers.

2. **Suggestions**

Based on the findings present suggestions were given.

   a) Organization intending to adopt Circuitry Marketing has to offer a product range/mix, which is acceptable to various age groups. People in the age groups of 18-40 years are purchasing less regularly compared to above 40 years, hence this segment need more attention in the aspects of product salability and Price.

   b) As distributors of all age groups are equally interested to use as well as sell entire product mix, organizations involved in Circuitry Marketing need to focus on the needs of all the age groups, while giving priority age group of 18-40 years.

   c) Employees appear to use more CM products, when compared to Agriculturists, Businessmen, Professional and others. This may be because of fixed salaried persons may show more interest to increase their income through CM as part time occupation. A full time businessman may find it more advantages to focusing on his own business than diverting his attention on CM. It may pay well to focus on Agriculturists and Professionals, who may find time during slack period.

   d) Overall the regular customer contact is less across all occupations. However employees are having less 'Regular contact with customer' than Non-employees. Promotional plans may be worked out to ensure 'regular contact with customers' by all the segments with focus on employees. Frequent customer meet should be arranged necessary support to the distributor by CM Company need to be given by the company.

   e) Distributors above 41 years of Age group, Men and Agriculturist 'Keeping in touch more with distributors of other NM companies'. To ascertain the reasons for being touch with other NM companies and take remedial actions to cultivate these segment to retain them.

---

[22] Value above 0.6 is considered sufficient as per statistician and famous author Malhotra

f) The practice of 'Guiding down line' across all the age groups' is not satisfactory across all demographics. Married distributor are 'guiding down line' more than the unmarried distributors. Employee are guiding down line better than Businessman, Professionals and Agriculturists and others. Motivating Non-Employee segment is important.

g) To highlight the role of service in Circutary Marketing and communicates its importance to the distributors suitable. Tangible measures of service quality can be measured and monitored. Kaizen (Small improvement on continuous basis across the organization) needs to be adopted for continuous improvement of services.

h) Since the reasons like 'Retail Margins' and 'Be own boss' are preferred by the distributors. These have to be highlighted in the sales pitch, while showing the plan to prospects.

i) International Quality, benefits from the products and Prompt service and WOM publicity are the top four reasons which influence the purchase of products from NM.

j) Service, self-employment, monetary gains, Feature Advantage Benefit are top four reasons for recommend others to join. As the distributor based is increasing year after year, maintain the quality of service is challenging. Focus on service quality should be given top priority.

k) 'Friends', 'Relatives', Media and Internet are figuring top source of information. Attempt should to made to use social Network Media such as Facebook, Twitter etc. to be used to established between the customers and customer contact with the company. To cultivate groups, chat rooms, blogs etc. to facilitate customers meet and chat online.

Definitions

IDSA defines Circutary Marketing as the act of marketing of consumer goods and services through personal contact, away from a fixed location or a shop. Direct selling involves the marketing of products and services directly to consumers in a face-to-face manner, away from permanent retail locations. Circutary Marketing and Direct Selling are used inter-changeably. The WFDSA defines direct selling as 'a dynamic, vibrant, rapidly expanding channel of distribution for the marketing of products and services directly to the consumers'.

Federation of European Direct Selling Association (FEDSA) which was founded in 1978 defines Circutary Marketing as "the marketing of goods and services directly to consumers principally in a face-to-face manner, generally in their homes or the homes of others, at their workplace and other places away from permanent retail locations. Direct selling typically occurs through explanation or demonstration of the products by salespersons, referred to as direct sellers".[23]

A form of selling without retail outlets, distributors, wholesalers or any type of middlemen. Traditional UK methods of direct selling to the consumer include the milkman and the creamboy. This form of selling is also used by various publishing houses especially to sell encyclopedias. More sophisticated versions of direct selling are used by companies such as Avon Cosmetics and Tupperware who organize in-home demonstrations of their goods.

BAKER (1984)	A form of selling without retail outlets, distributors, wholesalers or any type of middlemen.

[23]. Peterson R.A., and T.R.Wotruba."What Is Direct Selling? Definition, Perspectives, and Research Agenda", Journal of Personal Selling and Sales Management, 1996, Vol XVL. p.2.

BERNSTEIN (1984)	Direct Selling is the technique of approaching a customer on a person-to-person basis, either with a group approach (as in in-home party plan) or individually, one-on-one, to offer products conveniently with a personal service emphasis.
BENNET (1988)	A marketing approach that involves direct sales of goods and services to consumers through personal explanation and demonstrations primarily in their homes.
OSTROW & SMITH (1988)	Direct Selling commonly refers to such activities as telephone sales, door-to-door selling, or in-home parties.
ARON, DAVIES & SWINDLEY (1991)	The establishment of an immediate exchange relationship with a customer in which the usual intermediaries in the distribution chain are omitted.
CLEMENTE (1992)	A sales approach characterized by personal product explanations and demonstrations, often in the consumer's home or retailer's establishment.
HART & STAPLELON (1992)	Selling without the use of a retail outlet, distributor, broker or wholesaler or any other form of middleperson.

Circutary Marketing Concept Circutary Marketing Companies (NMCs) produce and supply the products to distributors on wholesale price (i.e. Distribution Acquisition Price) and provide the necessary promotional and sales materials, (i.e. product and literature kit) which are chargeable; handle the data processing, accounting and even impart training. NMCs initially appoint founder members who are by default satisfied customers, and also empowered as distributors and further they recruit new 'down line' distributors. These motivational groups (i.e. Britt Worldwide, Quest Corporation, Network 21, Dester Yager group and Winners International etc in case of *Amway*) of people then introduce the products and business opportunities to others, who in turn, introduce it to even more people. Thus, it continues with the base of consumers and independent contractors from time to time.

WHY DO SATISFIED CUSTOMERS WANT TO SWITCH?

Damar Sumeru, Sebelas Maret University Indonesia
Haryanto, Sebelas Maret University Indonesia

Abstract

The purpose of this study is to find the causes of why satisfied customers is not a guarantee to remain in the same restaurant? Based on previous researches, some variables are examined in this study including service quality, food quality, atmosphere, price, satisfaction, intention to stay and the influence of variety-seeking moderate the relation of customer satisfaction and intention to stay in traditional family restaurant setting.

Respondents of this study are 320 customers of that restaurant who have high satisfaction rates, but has intention to switch. To fulfill the objective of this study, Partial Least Square (PLS) was used to calculate data. The result indicates that all independent variables (service quality, food quality, atmosphere, and price) effects to satisfaction except price variable. Furthermore, satisfaction influences intention to stay and variety-seeking negatively moderate the relationship between customer satisfaction and intention to stay.

This research faces limitations and the laxities of this study are discussed at the end of this article.

Keywords: *service quality, food quality, store atmosphere, price, customer satisfaction, intention to stay, variety-seeking*

Introduction

Pre-research on this study has been conducted on 26 February 2016 in Restaurant Omah Lawas, Solo City. The collected data of this study are 40 respondents consisting of 19 respondents aged 17-25 years and 21 respondents aged above 25 years. Respondents of this study are citizens of Solo City and students, the results obtained from pre-research was 95% of respondents have intention to move from the restaurant, although the level of satisfaction (customer satisfaction) was high, in this case we can say that Intention to Stay on consumers is low. While 5% of respondents over 25 years do not feel like to switch to other restaurants, in other words the Intention to stay is high. Based on the result of the pre-research that has been done, researcher interested to make a research on a restaurant that have traditional concept that is Wedangan Omah Lawas in Solo City.

When customer get the satisfaction they will usually buy again and more but it looks different in culinary case as exposed in pre-research of this study. It is suspected that variety seeking variable influences the satisfaction variable. Kan et al, (1995) describes that variety seeking is customer's tendency to replace the product had been purchased or to find another product or service. Jung & Yoon (2012) has same perspective about variety seeking, but their emphasis on experience to meet the customer's emotional needs. Some researchers said clearly that satisfaction is a good predictor to repurchase intention, but this pre-research shows a bit different. Thus, study of relationship among satisfaction and repurchase intention is interesting to be conducted. This aim of this research is to find the causes of why satisfied customers is not a guarantee to remain in the same restaurant.

Background Review

1. Service Quality

According to Parasuraman et al., (1985) in Liza and Carolina (2011) Service Quality is a whole variety of features and characteristics of a product or service in terms of ability to meet the various needs that have been determined or latent. Good quality is not based on the

viewpoint of the company, but based on the customer's viewpoint (Jimmy and Sugiono, 2013). Service Quality items based on consumer ratings of the entirety of the various features and characteristics of a service restaurants in terms of ability to meet the various needs that have been determined or latent. According to Zeithaml et al., (2009) there are five dimensions for service quality there are tangibles, reliability, assurance, responsiveness, and emphaty.

2. Food Quality

Food is a product for a service provider especially for a restaurant. A good product is a product that can satisfy a desire or need (Kotler, 2002). According to Knight and Kotschever (2000) the quality of the food is a consistency of quality levels in the menu that achieved with standard setting products. According Essinger and Wylie (2003) indicators used to measure the quality of the food are flavor of food, food portions, and Various types of food, the specificity of the taste of food, Food Hygiene, and Food Innovations.

3. Store Atmosphere

Store atmosphere is everything related to the store environment, such factors exterior, factors interiors, store displays, scent, color and music to create an impression that is convenient to attract customers, a good store atmosphere is designed for the purpose of consumer convenience (William, 2013). In the relation in this study Store Atmosphere means Restaurant Atmosphere, because the object of this study was the restaurant. The operational definition for this variable is consumers' assessment of the environmental quality of the restaurant. There are four dimensions to measure the atmosphere of the store, according to Hadi (1995) in (Stefan, 2014), the dimensions are exterior factors, interior factors, design and layout, and display.

4. Price

High or low prices could affect customer perception, thus it will affect the purchases. According Basu Swasta (2000) price is the amount of money needed to add a number of combinations of items and their ministry. High prices describe the good quality of a product, whereas a low price will benefit for customers (Kirmani and Rao, 2000). The operational definition of the price is a form of consumer ratings on the amount of money needed, to add a number of combinations of goods along with services commensurate with a product that will take consumers to the restaurant. The indicator used to measure prices by Zeithaml and Bitner (2006) in Jimmy and Sugiono (2013) are Affordable prices, Conformity with the price of the food portions, Conformity with the price of the food display, and Competitive price.

5. Customer Satisfaction

According to Kotler (2001), customer satisfaction is a sense of happiness or disappointed from someone to a product after customers compare the performance of these products with their expectations. Meanwhile, according to Zethamal et al., (2009) customer satisfaction is customers' ratings for products or services in terms of assessing whether products or services meet the needs and expectations of customers. Costumer satisfaction increases when consumers have good experience during a visit to a restaurant. Perceived by consumers experience it is a combination of food, service, atmosphere of restaurant, as well as the price offered. Operational definitions on this variable is consumers' assessment of the restaurant when consumers make a visit, whether the product or service has met the needs and expectations of the customers or not. The following parameters are used by Jung and Yoon (2012), among others: compatible with expectation, Happiness, Enjoy, and a pleasant experience.

6. Intention to Stay

Intention to stay is defined as intentions contained on consumers to conduct repeated or re-purchase the specific product or service (Gerpott et al., 2001). Consumers choose to stay or keep doing the activity because the products or services has a good quality. In this study the intention to stay is meant consumer intentions to remain in a restaurant. Operational definitions on this variable is consumers' assessment of whether they had the intention to conduct to re-purchase or to keep doing the activity in the restaurant.

7. Variety-seeking

Variety-seeking according to Ratneshwar and Mick (2005) in (Jun and Yoon, 2012) is a reduced possibility of purchasing specific products in the future from the same products. Consumer-oriented look for variations defined as customers who are always looking for variation in a visit for restaurants (Holbrook and Hirscham, 1982, in Jun and Yoong, 2012). The consumer will not visit the same place in a row because they are always looking for something new and different to meet their emotional needs. According Szmigin and Carrigan (2001), teenagers tend to look for things or new products and make the shift that could reduce consumer intention to stay. Indicators in this variable is a form of consumers' ratings about the possibility of making a purchase of products decreased in the future. So the variety-seeking votes by Jung Yoon (2012) operationalized using five measurement items include: customers like to try new places, customers want to try new places, customers dare to take risks, customers like the familiar food (R), customer like to make a re-visit (R), customers aware with new restaurants
(R).

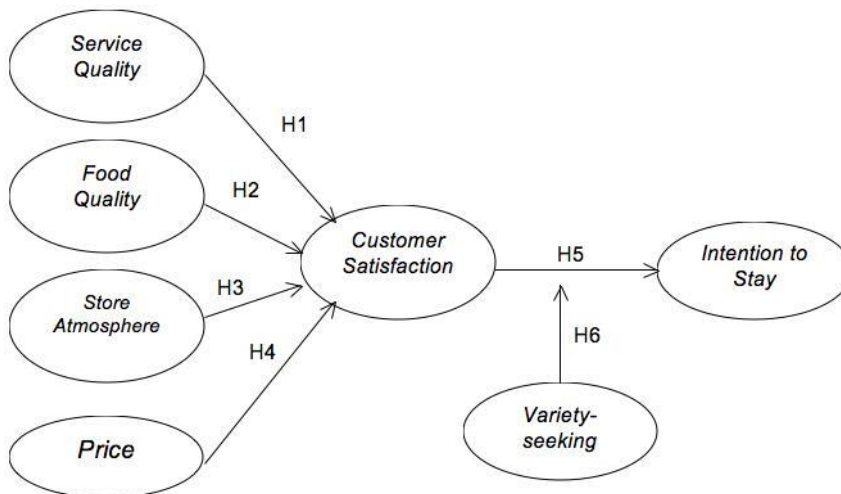
Model and Hypothesis Research


Figure 1: Research Model

This study was a construction from previous research (Park and Jang, 2014; Yoon Jung, 2012; Sugianto and Sugiharto, 2013). The framework above described that service quality significantly affect customer satisfaction (Park & Jang, 2014; Sugianto & Sugiharto, 2013). Food quality significantly affect customer satisfaction (Park & Jang, 2014; Sugianto & Sugiharto, 2013). Store atmosphere significantly influence customer satisfaction (Park & Jang, 2014). Price significantly affect customer satisfaction (Sugianto & Sugiharto, 2013). Customer satisfaction adversely affect the switching intention (Park & Jang, 2014; Jung &

Yoon, 2012). Variety-seeking moderate the relationship between Customer satisfaction and switching intention (Jung & Yoon, 2012).

1. The relationship between Service Quality on Customer Satisfaction

There are some empirical studies that support the theory of relationship between service quality and customer satisfaction. Research conducted by Atmawati and Wahyuddin (2005) explained that to obtain high customer satisfaction, the company requires a good quality of service as well. This is supported by other research that has been done by Jimmy and Sugiono (2013), service quality has a significant impact on consumer satisfaction restaurants. Other literature also supports that service quality affect satisfaction (Fullerton and Taylor, 2002, Caruana, 2002, Namkung and Jang, 2008). It can be concluded that when service quality of the restaurant is high, it will increased customer satisfaction. and established the following hypothesis:

H1: Service Quality significantly affect Customer Satisfaction

2. The relationship between Food Quality to Customer Satisfaction

Product quality is an important aspect for a company. In this study, the product is food itself, which is the main product of the restaurant.

In the study by Jimmy and Sugiono (2013) food quality significantly affect customer satisfaction. Namkung and Jang (2007) in their research at American restaurants, stating that the quality of the food affect customer satisfaction and behavioral intentions. This is supported by Ha (2009) on his research in ethnic restaurants, Korean cuisine in the United States, the results mention that the food quality had positive effect on customer satisfaction. Ryu and Han (2010) states the quality of food, service, as well as the physical environment are the determining factors of customer satisfaction. Ivyanno (2014) also supports that the Dining Experience Attributes (Food Quality, Service Quality, and Physical Environment) had positive effect on customer satisfaction.

Therefore, if the elements contained in food quality in restaurants are improved then it would help improve customer satisfaction and established the following hypothesis:

H2: Food Quality significantly affect Customer Satisfaction

3. The relationship between Store Atmosphere on Customer Satisfaction

Ryu and Han (2010) on their research explains that the quality of the physical environment has a positive influence on customer satisfaction. Other literatures also supports that the physical environment can significantly affect the perception of the overall service at the restaurant, and then will have an impact on customer satisfaction in the restaurant industry (Brady and Cronin, 2001; Ryu and Jang, 2007). Research conducted by Bitner (1990) mentions that the physical environment can significantly affect customer satisfaction. In Ivyanno study (2014) on restaurants in Jakarta also said that the physical environment had positive effect on customer satisfaction. Based on the translation described the physical environment had positive effect on customer satisfaction the hypothesis is:

H3: Store Atmosphere significantly affect Customer Satisfaction

4. The relationship between Price on Customer Satisfaction

Price is an important element for the company from the customer's perspective. From previous research, it said that the price on the restaurant affects customer satisfaction. Therefore, if the price of the restaurants is more affordable and in accordance with customer expectations, then the customer satisfaction will increase (Jimmy and Sugiono, 2013). In consumer behavior research states that the price perception has a positive influence on consumer satisfaction (Bowman and Narayandas, 2001). Other literatures also supports that

the price positively affects customer satisfaction (Huffman and Cain 2001; Cao et al., 2003; Ordonez et al., 2000).

If the price is considered very high, customers usually expect a high quality, and the actual perception of customers will be affected by these expectations. If the price is too high, the company will considered as a company that doesn't care about their customers, or considered committing fraud. Conversely, if the price is too low, then the customer may doubt the reliability of the company. Based on the description, the hypothesis obtained as follows:
H4: Price significant influence on Customer Satisfaction

5.   Relationship between Customer Satisfaction on Intention to Stay

Customer satisfaction has an important role in measuring customer ratings on the company. Customer satisfaction also has a considerable influence on the intention to stay on the consumer because as it is known that consumers who have a high level of satisfaction will be less likely to make the shift. Conversely a low level of satisfaction of customers will make the transaction no longer happen. It will lead them to the behavior to move to another place (Homburg et al., 2005).

Results of research conducted by Ari (2008) explains that the factors that cause consumers want to remain in a product or service are the quality of service and customer satisfaction. The higher the level of satisfaction, the higher the satisfaction of Intention to stay on the consumer. Therefore if restaurants wants to maintain consumers it is necessary to increase consumer satisfaction with the quality of services offered. According to Hartline et al. (2003) quality of service in service companies significantly affect the intention to stay.
H5: Customer Satisfaction significantly affect Intention to stay

6.   The relationship between Variety-seeking moderate the relationship between Customer Satisfaction on Intention to Stay

Variety-seeking means that the consumer is looking for a variety of restaurants that will be visited by consumers. In the model developed by Hoyer and Ridgway (1984) in (Uturestantix et al. 2012), the need for variety is the most influential factor in the study of customer switching intentions. Nevertheless, this behavior is not always caused by a low level of customer satisfaction, but it is because the customer wants to explore new things (Raju, 1980, in Uturestantix et al. 2012). According Szmigin and Carrigan (2001), teenagers tend to look for new things or new products and make the shift that could affect consumer intention to stay out of it.

The previous study explains that consumers making transactions in certain restaurants in the future will likely to have same transaction on previous restaurant (Ratneshwar and Mick, 2005). Consumers who are looking for a variation will be the cause of the change in the level of either revisit of the consumers. Research conducted by Bansal et al., (2005) mentions that the high level of satisfaction would be meaningless when consumers have a high level of variety-seeking. It is then also supported by Homburg and Giering (2001), which explains that consumers who satisfied does not guarantee them to stay. Thus the hypotheses is:
H6: Variety-seeking moderate the relationship between Customer Satisfaction on Intention to Stay

Research Methodology
1.   Instrument Development
The survey instrument for this study was composed of 2 parts. The first part pertained to service quality, food quality, store atmosphere, price, customer satisfaction, intention to stay on customer, and customer variety-seeking orientation includes a five point scale: "How much do you agree or disagree with these statements?" (1: strongly disagree to 5: strongly agree).

The measurement items for the study constructs are presented in Appendix A. Second Part contained questions about participant demographic information (e.g., age, gender, education level, and income per month).

2. Sample and Data Collection

Table 1: Profile Respondents

Respondent Characteristic		Total	Category	Frequent	Percentage
Gender		320	1. Male	141	44,1%
			2. Female	179	55,9%
Age		320	1. 17 – 24 years	144	45%
			2. 25 – 30 years	69	21,5%
			3. 31 – 40 years	55	17,2%
			4. 41 – 50 years	29	9,1%
			5. above 50 years	23	7,2%
Education	(On	320	1. High School	5	1,6%
			2. Diploma	21	6,6%
			3. Bachelor Student	77	24,1%
			4. Postgrad Student	42	13,1%
			5. Doctoral Student	3	0,9%
			6. Non-student	172	53,8%
Last Education		320	1. Middle School	5	1,6%
			2. High School	92	28,7%
			3. Diploma	43	13,4%
			4. Bachelor Degree	140	43,8%
			5. Master Degree	39	12,2%
			6. Doctoral Degree	1	0,3%
Income	per	320	1. < Rp 500.000	21	7,5%
month			2. Rp 500.000 – Rp 2.500.000	138	43,1%
			3. Rp 2.500.001 – Rp 5.000.000	111	34,7%
			4. Rp 5.000.001 – Rp 10.000.000	40	12,5%
			5. > Rp 10.000.000	10	3,1%
Occupation		320	Employee	114	35,6%
			Entrepreneur	15	4,7%
			Student	132	41,3%
			Professional	38	11,9%
			Un-employee	21	6,6%

The samples of this study is the customers of Restaurant Omah Lawas that has the intention to switch to others restaurants. While according Sekaran (2006), the sample consisted differences number of members chosen from the population. According to Hair (1998) the amount of ideal and representative sample is an amount of parameter used in the study

multiplied by 5 until 10. Thus the minimum amount of sample taken in this study are 60 x 5 = 300. In order to prevent damaged samples, researcher took a sample a number of 320 samples. Data Source used in this research is primary data. Primary data is the data collected and processed by an organization or an individual from the object with spesific purposes (Sekaran, 2006). Data Source in this study used a direct answer from the respondents in order to answer the questions in questionnaire.

Based on data, the percentage of female visitors who visit Omah Lawas were higher than males. The percentage of women was 55.9% with the number of 179 visitors, while for males are slightly lower at 44.1% with the number of 141 visitors. This percentage indicates that women prefer a visit to the restaurant than men.

On age category, visitors who are 17-24 years are the highest percentage at 45%. While the fewest percentage of this category, visitors who above 50 years, the percentage is only 7.2%. This indicates that the most frequent visitors to Restaurant Omah Lawas are young men aged 17-24 years.

While from educational background, the number of respondents indicated that most of them are educated. The data shows that S1/ Bachelor degree is the highest percentage with the number 77 people with a percentage of 24.1%. This indicates that consumers of Omah Lawas is consumers who have a good educational background.

Meanwhile, based on the amount of income, Omah Lawas visitors who earn Rp 500,000 – Rp 2,500,000 per month as many as 138 people with a percentage of 43.1%. These rates are followed by visitors with an income of Rp 2,500,001 – Rp 5,000,000 per month, as many as 111 people with a percentage of 34.7%. These results indicate that the majority of respondents who visited Omah Lawas is an upper middle class community.

Based on profession of the customers of Omah Lawas, the majority of visitors of Omah Lawas is about 132 students with a percentage of 41.3%. This indicates that students are the most often visited Omah Lawas.

3. Partial Least Square

Partial Least Square (PLS) is a method of family-based regression introduced by Herman O.A Wold (1982) for the creation and development of models and methods for the social sciences with a prediction-oriented approach. PLS had free research data distribution assumption, it means the research does not follow on specific distribution (eg normal distribution). PLS is an alternative method of (SEM) which can be used to solve the complex relationships between variables but the data sample size is small (30 to 100), considering that SEM has a data sample size of at least 100 (Hair et al., 2010).

PLS is used to determine the complexity of the relationship between constructs, as well as the relationship of a construct and their indicators. PLS is defined by two equations, namely inner model and outer model. Inner models determine the specifications relationship between the construct and the indicators, while the outer defining the specification models the relationship between a construct and their indicators. PLS method has its own advantages such as: data does not have a multivariate normal distribution (with a scale indicator categories, ordinal, interval until the ratio can be used on the same model) and the sample size should not be large (Gahazali, 2006).

Hypothesis testing on PLS is done with Bootstrap resampling method developed by Geisser & Stone. The statistic test used in PLS is a statistic T or t test. Application of resampling methods, enabling the enactment of distributed data freely and does not require the assumption of a normal distribution, and does not require a large sample (minimum of 30 samples). Tests conducted by T- statistics , if obtained values > 1.96.

Table 2: Output of PLS

	Original Sample (O)	*Sample Mean (M)*	*Standard Deviation (STDEV)*	*Standard Error (STERR)*	*T Statistics (|O/STERR|)*
AT -> CS	0,5031	0,5079	0,0752	0,0752	6,6880
AT -> DL	0,2356	0,2299	0,1042	0,1042	2,2610

Analysis and Discussion

The result showed that the service quality in the restaurant Omah Lawas has a positive effect on customer satisfaction. This happens because the service quality in the restaurant can make consumers satisfied. The results supported by previous research carried out by Park and Jang (2014), which shows that the quality of service can make consumers feel happy and comfortable so that consumers will be satisfied. Service Quality is formed by five dimensions that exist at the restaurant Omah Lawas, there are Tangibles, Reliability, Assurance, Responsiveness and Empathy. From the five dimensions, the highest significance level is Assurance. It shows that the guarantee (assurance) is the most positive and has significant impact on Service Quality in Omah Lawas.

The results of the second hypothesis states that food quality affects customer satisfaction. This indicates that the food quality provided by Omah Lawas is have a good rates, and this increase satisfaction on consumers. The results support previous research that carried out by Park and Jang (2014), and research conducted by Jimmy and Sugiono (2013) which states that the quality of food can make consumers feel happy and comfortable so that consumers will be satisfied. In the third hypothesis testing results, found that price affects customer satisfaction. The result of this third hypothesis is contrary to the previous research conducted by Jimmy and Sugiono (2013) in one of the restaurants in Surabaya, which states that the price significantly affect customer satisfaction, but it is different in this study. Based on data, it can be seen that the majority of survey respondents have a burgeoning middle segment, that is make them not really concern about the price in Omah Lawas. thus making this hypothesis is unsupported.

The result from the fourth hypothesis states that the atmosphere in the restaurant affects customer satisfaction. Based on the data the atmosphere in the restaurant affects positively towards customer satisfaction. Additionally atmosphere at the restaurant is the variable that

the most influence on customer satisfaction, and the most responsible dimension of atmosphere in Omah Lawas is Interior Factor.

The fourth hypothesis testing shows that the atmosphere of the restaurant is in Omah Lawas influence on consumer satisfaction. Hypothesis test results also support previous research that says that if the atmosphere is low, the quality will make customer satisfaction decreases, otherwise if a high quality atmosphere it will create increased customer satisfaction (Park and Jang, 2014). It can be concluded that the atmosphere of the restaurant in Omah Lawas greatly affect the level of consumer satisfaction.

The Results from the fifth hypothesis states that customer satisfaction affects the intention to stay. Based on data shows that consumer satisfaction at Omah Lawas influence on the decision to stay in the restaurant. Results support the hypothesis testing research conducted by Bansal et al., (2004) which states that the commitments made by the customers affected by the satisfaction and trust. This hypothesis also supports research Huang and Chiang (2014) which states that there are positive relationship between customer satisfaction and intention to stay.

Based on the latest and the major result of hypothesis testing in this study it was found that variety-seeking negatively moderate the relationship between customer satisfaction and intention to stay. The results support the hypothesis of previous research conducted by Jung Yoon (2012), which states that consumers who satisfied it shall still have intention to switch, this caused by the level of variety-seeking is high. Research Park and Jang (2014) which states that consumers who have a high satisfaction score still have the intention to move. It is also supported by the results of this hypothesis.While the study Le Chi Cong et al., (2013), mentions the variety-seeking makes consumers think to look for new places to have diner and leave the previous place that alraeday been visited although consumers are satisfied with the place before.

Conclusion

Overall the conclusions of this study is the customers of the restaurant who have a high level of satisfaction still having intention to switch to other restaurants, because the variety-seeking of the customers is high, thus undermining the intention to stay or to remain in Restaurant Omah Lawas in Solo City.

While for specifics on the terms of hypothesis testing is done, this research also has the following conclusion:

1. Service Quality proven has positive effect on the Customer Satisfaction. The guarantee on service makes Omah Lawas increased consumer satisfaction.
2. Food Quality proven positive effect on the Customer Satisfaction. Diverse variety of foods to make customer satisfaction levels in Omah Lawas increased.
3. Store Atmosphere proven positive effect on Customer Satisfaction. Interior Factor contribute most to the atmosphere in Omah Lawas.
4. Price is not proven effect on Customer Satisfaction. Omah Lawas market segment which is the middle class and above, making the price variable was not considered important.
5. Customer Satisfaction proven positive effect on Intention to stay. High customer satisfaction is influenced by the quality of service, quality of food, price, and atmosphere of the restaurant makes consumers think to survive in the restaurant Omah Lawas.
6. Variety-seeking proven to moderate the relationship Customer satisfaction and intention to stay. Pleasure seeking a new variation on the consumer Omah Lawas weaken consumer intentions are to survive in the restaurant.

Limitations and future research

The author realizes that this study would not be separated from the limitations and shortcomings. Several limitations of this study include the object of research is a restaurant with traditional concept that can not describe the phenomenon that occurs in restaurants in general. Secondly, the location of Omah Lawas is located in a small town that is Solo City, thus the respondents are less able to describe the characteristics of respondents from big cities in Indonesia and abroad, if in further research, researcher would like to do research in the larger city than Solo City.

Based on the results obtained, the advice for further resrach include, profile of respondents in this study are only limited to the customers' of restaurants Omah Lawas in Solo City, therefore the impact on the results of this study is limited. For further research is expected to involve more respondents from different backgrounds so the results will be maximized. Further research is also expected to look for more literatures related to the variables studied so that the research would be more accurate. Researchers also hope that in the future studies to add variable "Intention to WOM" as mediation between customer satisfaction and intention to stay in order to get the results that consumers will still remain in restuarant, as has been done by Le Chi Cong et al., (2013). Lastly further research is also expected to have a wider object for research, because it will be easier for readers, practitioners, and academics to understand the content of future studies.

CITY MARKETING SCALE ON MALUKU PROVINCE INDONESIA

Aisah Asnawi, Universitas Padjadjaran, Bandung, Indonesia
Popy Rufaidah, Universitas Padjadjaran, Bandung, Indonesia

Abstract

City marketing (CM) is not a new phenomenon in the world of marketing. Basically, this phenomenon is used to introduce the uniqueness of a city compared to other cities as well as how a city to use any ideas, concepts and tools in marketing to market a city / region. This policy was first used by the Dutch (Braun: 2008). According to Rufaidah (2007), city marketing (CM) consists of three dimensions namely visitability, investability and livability. This paper is aimed at measuring the scale used to calculate the dimensions of CM in Maluku province. There are 100 respondents participate in this study. Confirmatory Factor Analysis is employed to analise the data.

Results: All indicators used to measure the three-dimensional of CM have a positive influence. Visitability, investability and livalibility have positive relationship with magnitude of 0.894, 0.896 and 0.889 respectively.

Keyword: *City marketing, city marketing scale, visitability, investability, livability*

Introduction

During the year of 1993 to 2015, city marketing (CM) is constantly changing and evolving reflecting the glabal changes and economic growth. CM has been discussed by academics coming from different field of scientific backgrounds. Some of them are experts in the field of management (Kotler, Kavaratzis, Rufaidah, Ograjensek), Geography (Paddison, Boisen), Urban Planning (Asworth & Voogd, Smyth, Braun, Hospers), and even communication (Gelders) and Engineering & Design (Jiyoung Yoon). Various background leads to various definitions of CM. However, inspite of differences, there are some similar understanding between city marketing and place marketing.

CM is one way to introduce a city or region. CM is not a new phenomenon in the world of marketing. This concept has been practiced for decades. In 1960 Kevin Lynch published a book entitled "The Image Of The City". CM phenomenon is the way a city to use ideas, concepts and tools in marketing to market a city/region. In the mid-1980s in several cities in the Netherlands claimed to have a policy in CM. Since then, a number of cities reported to have a very good development. (Braun: 2008)

A broad definition of CM makes the dimensions of this concept is also diverse. However, this paper discusses more about the CM scale as adopted by some previous researchers (Kotler, 2003; Geyonggi 2007; Rufaidah, 2007; Braun, 2008; AMA 2008; Hospers, 2011; and Balencourt, 2012). According to them, there are three-dimensional in the CM; population or community, visitors and investors/ entrepreneurs.

Since the enactment of Law No. 32/2004 on regional autonomy, many regions in Indonesia are trying to increase the Regional Revenue Budget through the tourism sector. This sector is considered more profitable than any other capital-intensive sector. Besides, it is also supported by the amazingly beautiful natural potential of Indonesia. As other Maluku province in Indonesia are also being aggressively increaae revenue from the tourism sector. National Statistical Bereau report for the year of 2014-2015, the revenue from the tourism sector has not yet reached the expected target. It is the underlying research to measure the scale of the CM in accordance with the indicators that have been built.

Furthermore, this paper will examine the validity of the indicators as adopted from Rufaidah model (2007), using the criteria liveability representing community / host cities, visitability

representing visitors, and investability representing businesses. Liveability, visitability and investability dimensions consists of eight, ten amd six items of questions respectively. So a total of 24 questions are used to measure the CM scale. To get the expected results, the 100 respondents are employed in this research. To analise the data, Confirmatory Factor Analysis with SEM-PLS approach is employed.

Literature Review

According to Van Den Berg et al. (1990) when the CM terminology extends in some urban literature in the year of 1980 in Europe, it has actually much longer begun in the US. In contrast to Berg, Braun (2008) states that theterminology of CM begins as "Dutch Invention". In 2005, the city of Amsterdam launch a new marketing policy labeled 'Amsterdam'. Efforts to market the city of Amsterdam and the strapline 'Amsterdam' appear to be popular in the media. In 2006 Rotterdam appoint Chief Marketing Officer to market the city.

The problem arises when there are differences of understanding in CM. In America, the city marketing practitioners connected to the development of the local economy, the promotion places and between public and private partnerships to achieve regeneration (Paddison, 1993: 340). While most academics understand the CM as a long-term process that requires an organized capacity to fulfill the needs of a different target area - they see it as a strategic activity, synthetic and integrated (Hospers, 2010).

The big cities using CM expect to create differentiation from other cities that can attract new investment. (Hospers,2010). The purpose of CM is to achieve long-term sustainability of the community and create satisfaction (Ograjensek, 2015)

CM can be divided according to the expert background who have different understanding on the concept. Some experts claim the city as a product and CM as the marketing process. Experts who have such opinion are Burges (1982), Paddison (1993), Gelders (2012), and Smyth (2005). But inspite of having such idea, the researchers still urgue that marketing a city is different from marketing a product. Meanwhile, according to some experts such as; Rufaidah, Boisen, and Lombarts state that CM is a process, directed and scalable to be able to achieve long-term or sustainable.

In the period of 1980 to 2000, discussion and defining CM is limited to the characteristics of each academic field (economics, geography and planning). This debate has led to the understanding of the traditional concept of CM, problems and solutions, and application of marketing in a city. Therefore, experts have used more conventional marketing methods such as increasing promotion in order to improve the image of the city that leads to increased social economy. At this time, CM put more emphasis on a method or strategy of attracting tourists and selling potential of the city. Whereas in the 2000s until today, the definition of CM are widespread and contain functions in marketing management more scalable and clear and consider the interests of all stakeholders (residents, investors and visitors) in which not just talking about the image of a city but more emphasis as a competitive strategy between one city to another city, highlighting the uniqueness of a city and the positive things that lifted the value of city. Even the definition of CM in this period has dimension of the economic sustainability broader and long-term (Rufaidah, 2007).

1. Definition of City Marketing

Some experts agree that CM is a marketing activity in the form of promotions and sell the image of a city, the researchers are Burges (1982) which states that: "city marketing is a strategy to do better than other Cities in competition, and all activities that productise and sell a city space factors with a positive image of a city so it can develop attractive points of interest ".Paddison (1993: 339) also defines marketing the city as a "city marketing is more than the promotion of place, being used in some Cities to rebuild and redefine Reviews their image, allied to the which has been a strategy of targeting specific types of activity roomates both reflect and bolster the image "(Paddison, 1993: 339).

Authors who agree with this concept is also expressed by Gelders (2012) also agree with the previous opinions. He defines "city branding or city marketing as the whole of activities by a city Aimed to initiate, promote, Facilitate, foster and execute transactions as far as Reviews These activities fit into the city's strategy and as long as they are coordinated by the city's authorities. In 2005, Smyth defines city marketing as "as promotion of a city (or a district within a city) with the aim of drawing attention to the which pre selected activities take place there". It is used to change the external perception of the city which sometimes the goal is not necessarily suitable, such as relocation of businesses; to attract in-migration; and to encourage the development of tourism. JiyoungYoon (2010) assert that "city marketing is a strategy to do better than other cities in competition, and all activities that productise and sell a city space with positive image factors of a city so it can develop attractive points of interest".

In addition to the above opinion, there are some opinions stating the CM as a method that lead to three aspects or dimensions of the residents, visitors and investors. This opinion is suggested by Kotler (2003) urguing that "city marketing concept by Realizing specific locations as a product and through cooperation with various concerned parties, facilitates the regional economy and raises the value of the city for the investors, residents and visitors through the development of it environment, image and various Infrastructures ". This was confirmed by Geyonggi (2007) which defines the CM as "city marketing is a commercial marketing activity that sells and exchanges spaces for the capital city, and seeks to Attract both visitors and residents. In other words, city marketing is a strategy to deal with residents, enterprises and visitors as the target market and Attract Them through promotion combined with values of sales and a city environment. ". Whereas the same definition is supported by Rufaidah (2007) stating "City marketing as a process of creating, communicating, and delivering values towards the stakeholders of the city or region to create economic, social and environmental sustainability.

Braun (2008) also agreed with Rufaidah (2014) by referring to the definition of the AMA, "City marketing is the coordinated use of marketing tools supported by a shared customer-oriented philosophy, for creating, communicating, delivering, and exchanging urban offerings that have value for the city's customers and the city's community at large ".Balencourt (2012) more clearly define the city marketing as "promotion of a city, or a district within it, with the aim of encouraging Certain activities to take place there. It is used to alter the external perceptions of a city in order to encourage tourism, Attract inward migration of residents, or enable business relocation. A significant feature of city marketing is the development of new landmarks, or flagship, buildings and structures ".

2. Scale Of Development

Noviana & Rufaidah (2012) in their study which adopted the Rufaidah study (2007), there are three dimensions to measure CM. The first dimension is visitability that leads to comfort of s city or places to visit. It is associated with domestic and foreign travelers who visit for the first time and recurrent. To achieve visitability cities, local governments must accentuate the friendliness of the people, sites, artifacts, and various attractions viable and attractive to visit.

This study adopts the studies that have been conducted by Rufaidah stating that to measure the CM there are three dimensions. The first dimension is visitability. Visitability is the term for measuring the comfort of a place worth visiting. It is very important for tourists visiting the first time so it could be a repeat visit. To achieve visitability in the city, the government should be able to provide the elements of such a spirit, the friendliness of the local people, artifacts, and a variety of attractions and activities that are viable and interesting place to visit. In this dimension, the number of the item in question amounted to eight and represent all the indicators set. The second dimension is investability. Investability is the management of a number of investment into an area and the number of workers involved, the number of SMEs that grow and develop, the level of business confidence, and the number of immigrants seeking work. In order investability increase, the government is expected to have the ability to identify and optimize the competitiveness of the city. One of the steps that need to be owned by the city government is the competition index as an indicator to see the competitiveness of a country or region. The number of the item in question from this second dimension of ten questions. While the last dimension is livability. Livability is managing the number of permanent residents and immigrants who settled in the city by level of education, profession and social activities, the amount of household waste that is processed by the cleanliness department, the amount of consumption, and the availability of water and air qualify. To achieve livability, a city must have the ability to provide an opportunity for individuals to optimize their potential to become more prosperous. Indicator used to measure the dimension between six and represent items livability. Thus, the total of the item in question amounted to twenty-four. By looking at Rufaidah studies, this research also uses the same dimensions as the dimensions of the CM.

Methodology

To explain the City Marketing Scale of Maluku province in this study the authors use Confirmatory Factor Analysis approach to Component / variance Based Structural Equation Modeling. SEM-based component or variance is known as Partial Least Square (PLS). SEM-PLS models used have a reflexive measurement model. To perform data processing they use SmartPLS 3.Rate reflexive measurement model using Internal consistency (composite reliability), Indicator reliability, Convergent validity (average variance extracted) and Discriminant validity. For structural models rated berdasarkkan Coefficients of determination (R2), Size and significance of the path coefficients. (Hair et al, 2014).

Results

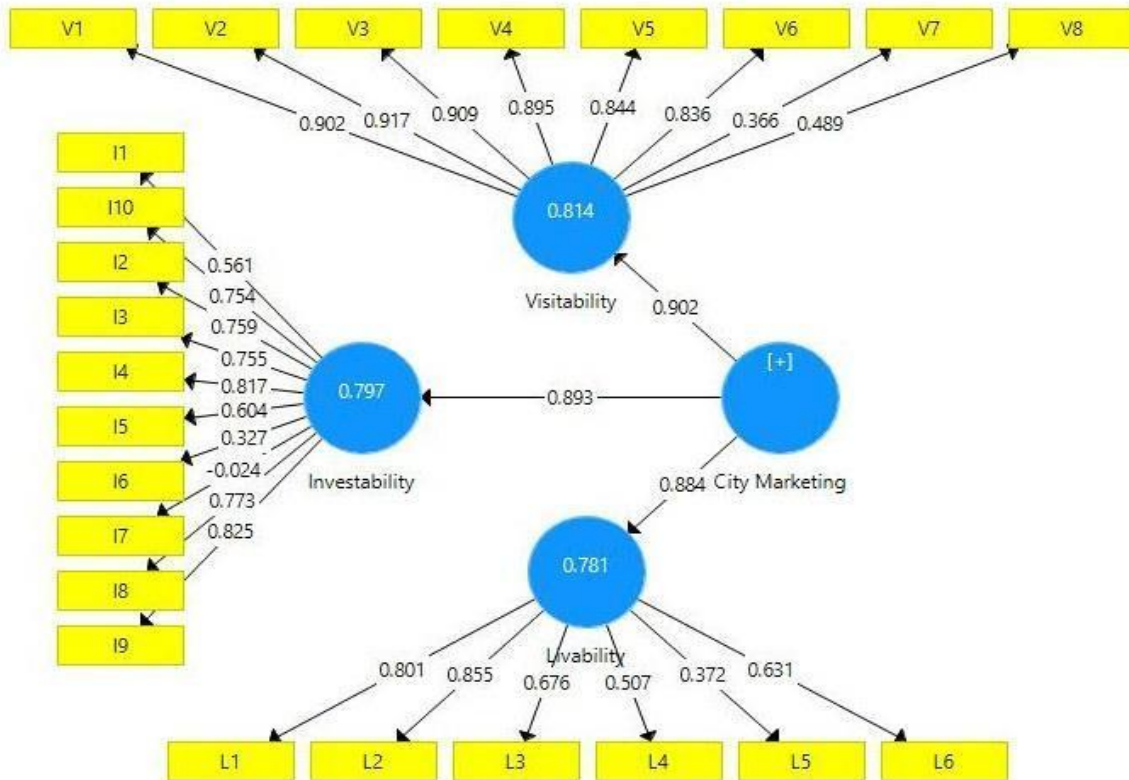
CM-scale used in this study consist of 3 dimensions indicated by by 24 elements as manifest variables (observed variables). Variable scale consists of CM latent variables, Visitability with 8 indicators as manifest variables (observed variables), latent variables Investability with 10 indicators as manifest variables (observed variables) and latent variables of livability with 6 indicator as manifest variables (observed variables). CFA-Structural Equation Modeling (SEM) used as a model approach to the Second Order. The calculation result can be seen in the figure below.


Figure 1. *Confirmatory Factor Analysis of* **CM**

1. Outer Model Measurement

Outer Assessment Model is measured by made by testing the reliability and validity of observed variables. Outer models describe the relationship among latent variable indicators. The criteria used in assessing the outer 'model are convergent validity, composite discriminant validity and reliability.

Convergent validity of the measurement is based on the correlation between the estimate item score / component score (Loading Factor Value). The size is said to be high if it is correlated with the construct being measured is more than 0.70. However, according to Chin, 1998 (in Ghozali, 2008; 24) to study the early stages of development measurement scale loading value of 0.5 to 0.6 is considered adequate. In this study loading factor of 0.50 will be used limit criterion validity can also be seen from discriminan validity based on the average variance extracted (AVE). If it has a good construct AVE is above 0.50. Composite reliability is a measure of internal consistency.

2. Validity

For each variable model parameter estimation obtained variable measurement or weighting factor, to reflect rhe variable. The results are displayed in Table 1 below.

Table 1. Estimation of Parameter Model

Indicator	Outer Loading	Note.	T Value	p-value	Ket	Outer Loading	Note.	T Hitung	p-value	Ket

The result of the calculation shows the outer loading of the first stage for eight manifest variables (indicators) of the latent variable with visitability ranging from 0.366 to 0.917. There are two outer loading indicators with values less than 0.5. Outer loading for 10 manifest variables (indicators) of the latent variable investability ranging from 0.024 to 0.825. There are two outer loading indicators with values less than 0.5. Outer loading to 6 manifest variables (indicators) of the latent variable livability ranged from 0.372 to 0.855. There is one indicator of the value of outer loading of less than 0.5. Because the outer loading of less than 0.5 is declared invalid then there are five manifest variables (indicators) of the three latent variables which are eliminated from the calculation model.

Results of outer loading after elimination can be seen in Table 2 of Outer Loading Phase II in which all manifest variables (indicators) are valid and the value of t-test showed significant indicators (because t value is more than 1.96 at 5% significance level) in the latent variable of Visitability, Investability, and the latent variables Livability.

Table 2. *Convergent Validity* **dan R***eliability Analysis*

Latent variable	Indicators	Loadings	Indicator reliability	Composite reliability	AVE
Visitability	V1	0,921	0,848	0,960	0,800
	V2	0,930	0,865		
	V3	0,923	0,852		
	V4	0,899	0,808		
	V5	0,848	0,719		
	V6	0,840	0,706		
Investability	I1	0,554	0,307	0,904	0,500
	I2	0,753	0,567		
	I3	0,754	0,569		
	I4	0,820	0,672		
	I5	0,601	0,361		
	I8	0,781	0,610		
	I9	0,824	0,679		
	I10	0,762	0,581		
Livability	L1	0,811	0,658	0,828	0,543
	L2	0,864	0,746		
	L3	0,698	0,487		
	L4	0,507	0,257		
	L6	0,591	0,349		

Tabel 3. *Latent Variable and Discriminant validity*

Construct	*Visitability*	*Investability*	*Livability*
Visitability	**0,894**		
Investability	0,637	**0,737**	
Livability	0,708	0,765	**0,707**

Note : The bold number shows the root square of AVE

Table 2 shows the Value of composite reliability (CR) which was obtained for Visitability (0960), Investability (0904), and Livability (0828). Since they are all above 0.70, it can be conscluded that all constructs have high internal consistency reliability.The results in Table 4 show Factor loadings of each construct cross loadings greater than with the other constructs.

Table 4. Factor loadings dan Cross loadings

	L3	0.507	0.582	**0.698**
	L4	0.332	0.282	**0.507**
	L6	0.384	0.294	**0.591**

3. R^2 Analysis

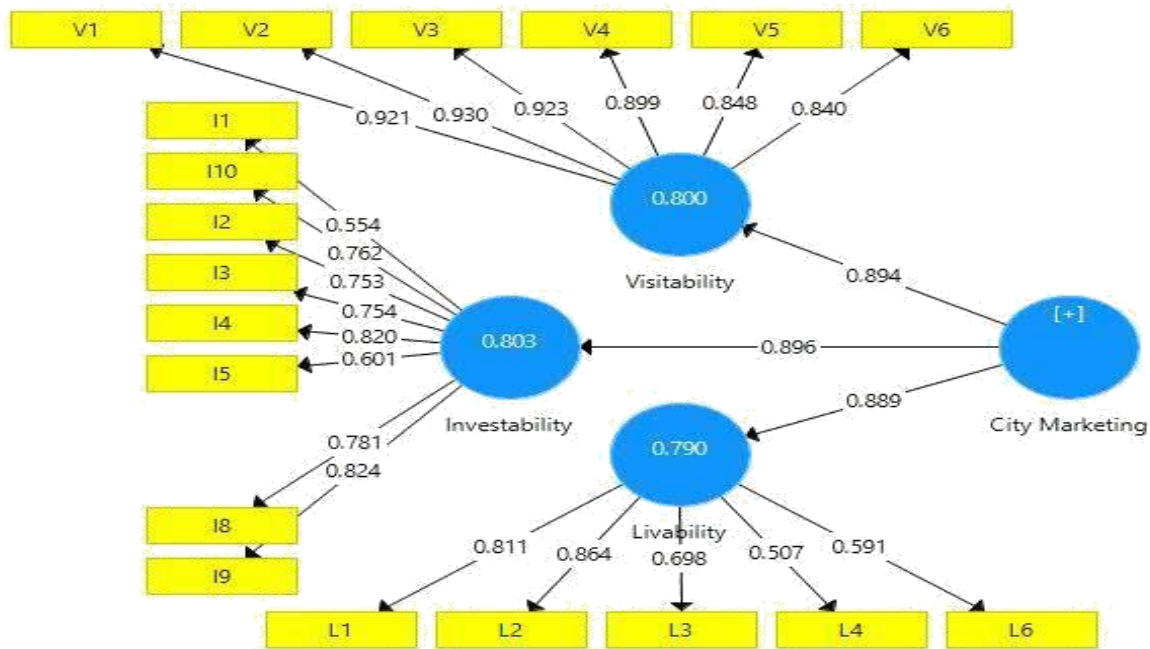
To find out the effect of each variable on CM, it can be seen from the value of R2. The R2 shows the prediction of the model accuracy. (Hair, 2014). R2 value equal to 0:25 means a weak effect while 0.5 and 0.75 have a substantial effect (Chin, 2010). In figure 3 it can be seen that the value of R2 of Visitability on CM is 0,800. So the research model in establishing Visitability-CM accuracy of 0,800 or enter into a substantial category. To Investability viewable R2 value obtained for 0.803. So the research model accuracy of Investabilityon City Marketing is 0.803 (a substantial category). For Livability it can be seen on the R2 value of 0.790. So the research model in establishing Livability-CM accuracy of 0.790 (a substantial category).


Figure 2
SEM-PLS – CFA Structural Model

4. Hypothesis testing

Hypothesis testing is conducted to see the significant value. This significant value can be obtained by boostrapping procedure. The significance of the hypothesis is determined by looking at the value of the coefficient parameter and the value of statistical significance at the T-algorithm boostrapping report. To find out whether it is significant or not, the T-table at alpha 0.05 (5%) = 1.96, then the T-table compared by T-test (T-statistic) The results in Table 5 and Figure 3 show the impact of Visitability, Investability, and the latent variables to the CM are significant.

Table 5
Impact of *Visitability*, *Investability*, dan variabel laten *Livability* on CM

No.	Hypothesis	Path coefficient	Standard error	t-value	p-value	Conclusion
1	*City Marketing -> Visitability*	0,894	0,028	31,412	0,000**	Significant
2	*City Marketing -> Investability*	0,896	0,035	25,827	0,000**	Significant
3	*City Marketing -> Livability*	0,889	0,023	39,399	0,000**	Significant

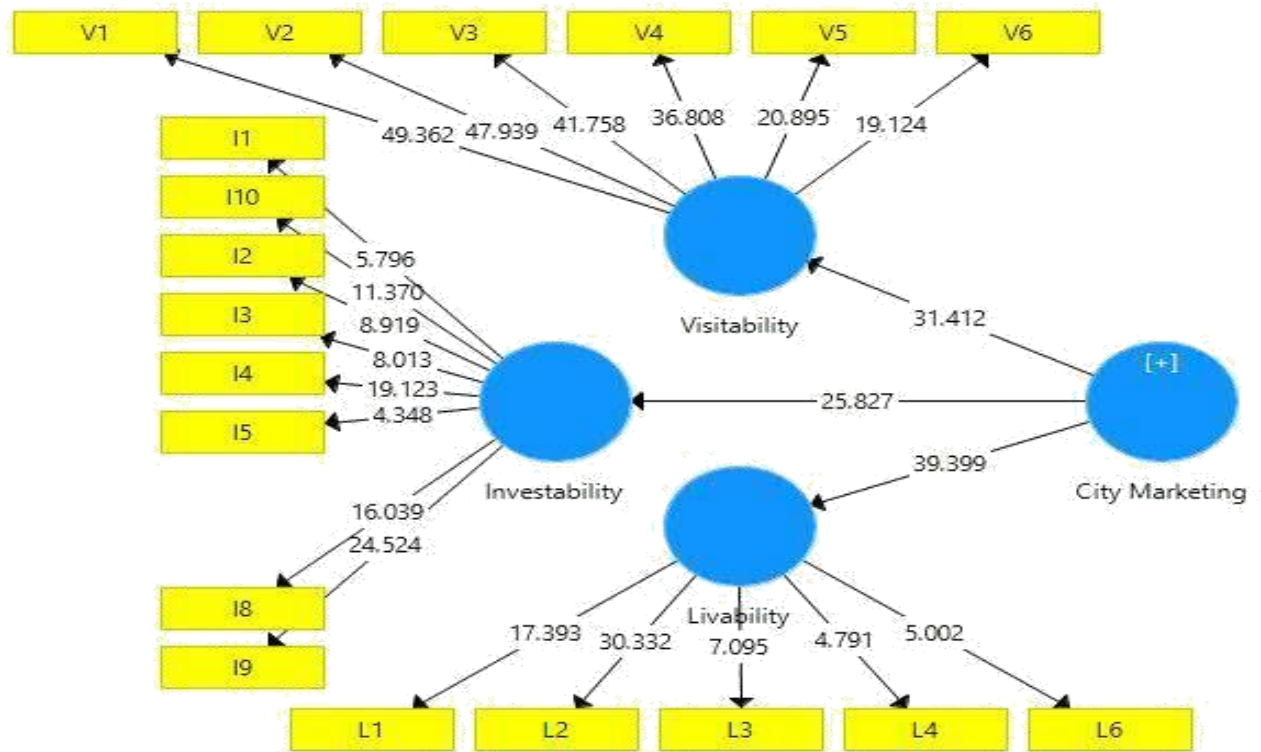
Note : ** shows significant level of p < 0.01


Figure 3. Bootstrapping Result Stuctural Model

Hypothesis Testing 1: Visitability effect on CM

The result of Statistical hypothesis testing is as follows:

H0: λ 1 = 0 Visitability has no effect on CM

H1: λ 1 ≠ 0 Visitability has an effect on CM

Table 5 shows that the coefficient value of Visitability and CM is 0.894 with a t value of 31,412. Scores t-statistic is greater than t critical (1,960) and a P-value = 0.000 <0.005, and is therefore null hypothesis is rejected. It can be concluded Visitability affect the City Marketing. Its influence is positive with magnitude of 0.894 relationships.

Hypothesis Testing 2: Investability effect on CM Statistical hypothesis testing is as follows:

H0: λ 2 = 0 Investability no effect on CM

H1: λ 2 ≠ 0 Investability effect on CM

Table 5 shows that the relationship between Investability and CM is indicated by coefficient of 0.896 with a t value of 25.827. T-statistic score is greater than t critical (1,960) and a P-value = 0.000 <0.005, and is therefore null hypothesis is rejected. It can be concluded that investability affect CM. Its influence is positive with magnitude 0.896 relationships.

Hypothesis Testing 3: Livability effect on CM.

Statistical hypothesis testing is as follows:

H0: λ3 = 0 Livability no effect on CM

H1: λ 3 ≠ 0 Livability effect on CM

Table 5 shows that the relationship between Livability and CM is indicated by coefficient of 0.889 with a t value of 39.399. T-statistic score is greater than t critical (1,960) and a P-value = 0.000 <0.005, and is therefore null hypothesis is rejected. It can be concluded Livability affect the CM. Its influence is positive with magnitude 0.889 relationships.

Conlussion

The study of the measurement scale model of the all indicators are valid in measuring the sub-variables (visitability, investability and livability) and the sub-variables are valid in measuring the research variable (CM). The calculation shows the outer loading of the first stage for eight manifest variables (indicators) of the latent variable with visitability ranging from 0.366 to 0.917. There are two outer loading indicators with values less than 0.5. Outer loading for 10 manifest variables (indicators) of the latent variable investability ranging from 0.024 to 0.825. There are two outer loading indicators with values less than 0.5. Outer loading to 6 manifest variables (indicators) of the latent variable livability ranged from 0.372 to 0.855. There is one indicator of the value of outer loading of less than 0.5. Because the outer loading of less than 0.5 is declared invalid then there are five manifest variables (indicators) of the three latent variables which are eliminated from the calculation model. Results of outer loading after elimination indocators V7, V8, I6, I7, and L5 (Table 1) and can be seen in Table 2 of outer loading phase II in which all manifest variables (indicators) are valid.

The study has proven that this scale is an established measurement for examining the city marketing of Maluku Province. The results from the study indicate that using confirmatory factor analysis approach to test the model validity that is conducted through variance structure model approach (PLS-PM) is an essential way for this study.

Thus, the paper contributes to design management and marketing theories about the component of CM. It also contributes to Maluku Province Government and other local government or cities for building and marketing the city more competitiveness.

2.	Having the first visit to Maluku, I feel happy
3.	Visiting Maluku is somethings that I want
4.	Visiting Maluku is something that I plan to go back
5.	Natural resources of Maluku is a wonderful thing
6.	The nearest beach from the center like the Pintu Kota beach, Natsepa beach and Liang beach in
	my opinion is one of the sites to be visited
7.	Visiting the events held by the local government is the boring one.
8.	The events held on Maluku in my opinion is not interesting
II	*Dimensions of Investability*
9.	Business / product business fishing / marine in Maluku now, according to me is growing rapidly
10.	Opening the business / product business fishing / marine in Maluku I think is very interesting because it is profitable
11.	By opening a business / product business fishing / marine, it will recruit the labor in Maluku
12.	The more events held local government will increase business opportunities
13.	More and more businesses are coming from outside of Maluku as a sign of business opportunities in the Moluccas, the better
14.	The population of Maluku which have had a job in my opinion is more than the unemployed
15.	Business in the field of food processing of fishery products / marine in Maluku, to me it does not follow trends.
16.	I think other than in the field of fisheries products / marine, open a business in the field of culinary is interesting to invest.
17.	If opening a business in Maluku, I believe my business will flourish
18.	Beside growing, I think opening in Maluku can attract investors who want to work together.
III	*Dimensions of Livability*
19.	Ambon as the capital city of Maluku has a nickname as "Ambon Manise" I consider it very precisely.
20.	Some of the best tourism destinations are located in Maluku
21.	To optimize the individual in Maluku, I think opportunities like jobs are still limited
22.	With the high number of people who work moved to Maluku, then jobs in Maluku wanewill be decreasing
23.	For me, living in Maluku is desirable.
24.	Spending more time in Maluku according to my is delighting

THE MEDIATING ROLE OF INTER-ORGANIZATIONAL TRUST BETWEEN EXTERNAL GROWTH STRATEGIES AND ORGANIZATIONAL PERFORMANCE OF MALAYSIAN COMPANIES

Saad Alaarj, University Sains Islam Malaysia, Malaysia
Zainal Abidin-Mohamed, University Sains Islam Malaysia, Malaysia
Ummi Salwa Ahmad Bustamam, University Sains Islam Malaysia, Malaysia

Abstract

Inter-organizational trust has a vital role in any external trade relationship. But studies relating growth strategies and inter-organizational trust are few. The purpose of this paper is to identify and compare the effect of external growth strategies on organizational performance of companies and to examine the mediating role of inter-organizational trust between the variables. Data was collected from 240 senior managers from public listed companies in Malaysia and was analyzed using AMOS. The findings indicate that growth strategies has significant effect on organizational performance. Strategic alliance and acquisition, have significant effects on organizational performance. Inter-organizational trust fully mediates the effect of growth strategies on organizational performance. Its relationship component has no mediating effect while task component partially mediates the effect. Building inter-organizational trust among companies and relying on strategic alliance rather than merger and acquisition will sharpen their competitiveness and enable them to survive and thrive.

Keywords: *External growth strategies, Inter-organizational trust, Strategic alliance, Merger, acquisition, Public listed companies*

Introduction

A continuous review of growth potential and change is critical to a company's competitiveness. This particularly proves to be critical considering the ever-increasing levels of change and uncertainty in the business environment, and the emerging shifts in principles of competition in markets (Hilman & Zainal A.M., 2011; Zainal A.M. et al. 2009). Against this new competitive background, selecting the direction and focus of the growth strategy will be a critical decision that entails a degree of risk, and consequently the company's competitive position (Nath et al., 2010; Chang & Thomas, 1989; Abdullah et al., 2009). Companies assume growth as their central strategic paradigm (Gümüs and Apak, 2011). Survival occurs when a company utilizes its ability to create new resources, build on its capabilities platform, and make the capabilities more inimitable to achieve competitive advantage (Prahalad & Hamel, 1990). Growth can be achieved either by internal or external strategies (Ortiz-de-Urbina-Criado et al., 2014). The internal one is slow while the external is more preferable because it leads to faster results (Isoraite, 2009). External growth usually achieved by involving in merger and acquisition (M&A), or strategic alliance (Ömür et al., 2012).

External growth strategies foster the growth of businesses and enhance their accesses of technology, knowledge, financial capital, and market capabilities (Cassia & Minola, 2012; Lechner & Dowling, 2003). Evidences from the literature refer to the growing importance of external growth strategies and companies are benefiting greatly from alliance and M&A for reducing the costs and increasing the efficiency of distribution networks (Qiu, 2010). Previous studies indicate that researchers either focus on the effect of M&A (e.g. Shanmugam & Nair,

2004; Aik et al., 2015) or on strategic alliance (Sambasivan et al., 2011: 2013; Hilman & Zainal A. M. 2011). In addition, the majority of the previous studies are qualitative in nature while the quantitative studies related to external growth are few (Furlan et al., 2014).

In Malaysia, according to the Malaysian Merger and Acquisition Association (MMAA), the value of M&A increased from $16 billion in 2010 to $30 billion in 2014 (MMAA, 2015). This value will continue to increase due to the competition in the country and region as well as due to the involvement in partnership such as the launching of the Trans-Pacific-Partnership (TPP). The recent report of Merger & Acquisition produced by Global Legal Insight (GLI) in 2012 indicates that the volume and value of mergers and acquisitions in Malaysia stem mainly from government initiatives that encourage economic growth in certain sectors. Mainly, the initiatives include (a) The Economic Transformation Programme (ETP) which is the catalyst for the transformation needed by Malaysia to achieve the status of a developed nation by 2020 as targeted under the Malaysian New Economic Model; and (b) The cooperation and understanding amongst the Association of Southeast Asian Nations (ASEAN) which encourages the member countries to synergize (GLI, 2012). The Star newspaper indicated that most of the merger and acquisition were conducted by insurance companies (The Star, 2014). In addition, banks and other financial institutions are increasingly involved in strategic alliance. For example, in 2015, four banks had established strategic alliances to develop a multi-bank platform (Bank Islam, 2015).

It can be seen that the trend for merger and acquisition as well as for strategic alliance is increasing among companies in Malaysia. This paper investigates only the external trust (inter-organizational) as it being part of the external growth strategies. Researchers have divided trust into relationship side and task side (Zainal A.M. et al, 2014), or goodwill trust and competence trust (Jiang et al. 2013). In this study, the trust components of the former is adopted. The motive of this study is to contribute to the literature related to trust and growth strategies. Consequently, the purpose of this paper is to investigate and compare the effect of growth strategies on the organizational performance of companies in Malaysia. It aims also to test the mediating role of inter-organizational trust between the growth strategy and organizational performance.

Literature review and hypotheses development

This section will cover specifically on three topics namely organizational performance, external growth and inter organizational trust as well as the related proposed hypotheses.

a. Organizational Performance

Organizational performance is one of the highly researched dependent variables in the literature (e.g. Abdullah et al., 2009; Zainal A.M. et al., 2009; Sambasivan et al., 2011). It is defined as a set of financial and non-financial indicators which offer information on the degree of achievement of objectives and results (Lebans & Euske, 2007). It is difficult to measure the organizational performance without including the external relationship and intangible values such as knowledge, competencies, and partnerships (Cotora, 2007). Gyula (2013) comments that there are strong limitations on measuring organizational performance with only financial indicators (Gyula, 2013). Using only financial indictors is not sufficient to measure the real performance of organizations and likewise in case of using only non-financial ones. Therefore, this study is measuring performance using financial and non-financial indicators. These measurements have been used by many researchers (e.g. Alaarj et al., 2016; Holsapple & Wu, 2011; Tseng 2014).

b. External Growth Strategy

Strategy has been one of the major topics that received attention from researchers. It is defined as a concern with integrating company activities and allocating resources, so that the

present objective can be met (Zainal A.M., 2010). Businesses adjust their strategies in order to survive and grow in rapidly changing environments. Company growth can be divided into internal growth and external growth. Internal growth is a strategy to grow through accumulating profits by management rationalization such as expanding investment, increasing production, and improving sales while external growth is a strategy to grow by acquiring some or all of the assets of another company. M&A and strategic alliance are major approaches to external growth (Ömür et al., 2012; Yoo el al., 2013).

This paper focuses on external growth strategies because they foster the growth of businesses and enhance accesses of technology, knowledge, financial capital, and market capabilities (Cassia & Minola, 2012; Lechner & Dowling, 2003). Evidence from the literature refers to the growing importance of external growth strategies. Chang and Wang (2007) investigated the effect of product diversification strategies on the relationship between international diversification and firm performance. The findings indicated that the number of M&A and strategic alliances are positively related to the performance. Similarly, Qiu (2010) found that a large number of cross-border strategic alliances are marketing and distribution alliances that reduce distribution costs for the allied companies. Cross-border mergers and acquisitions are often found to be motivated by taking advantages of each other's distribution networks. Ortiz-de-Urbina-Criado et al. (2014) found that external growth has strong effect on organizational performance when the involved parties seek to diversify their businesses. Thus, the first hypothesis of this study is:

H1: External growth strategies has a significant effect on organizational performance

Supporters of Resource-based View Theory pointed out that organizations can use its own resources and capabilities to achieve competitive advantage and superior performance (Barney, 1991). Building inter-organizational relationship is a strategic capability that companies can use to establish networks with partners in the form of M&A or strategic alliance. Strategic alliance are important sources for companies to achieve sustainable competitive advantages (Sambasivan et al. 2013). Previous studies tested the effect of strategic alliance and found that it has positive implications on the organizational performance of involved parties (Das et al., 1998; Schreiner et al., 2009). Jiang and Li (2008) commented that having strategic alliance can improve the organzational learning and performance. Similarly, Khalid and Larimo (2012) found a signficant effect of alliance entrepreunership on the performance. Accordingly, it is expected that:

H1a: strategic alliance has a significant effect on organzational perofrmance.

M&A have become a global phenomenon and a popular strategic choice for companies pursing growth and expansion (Buckley and Ghauri, 2002; Shimizu et al., 2004). The literature shows that M&A are ~~is~~ investigated heavily by researchers from different disciplines but the majority focused on banks' M&A (e.g. Kuriakose and Paul, 2016; Aik et al., 2015). M&A are effective tools in the hands of the management to achieve greater efficiency by exploiting synergies and growth opportunities (Ghosh & Dutta, 2014). They are important vehicles for companies' business, product, and geographic strategies. M&A has become major strategic tools for multinational corporations' growth (Hitt et al., 2001).

M&A have significant impact on companies' performance (Laamanen and Keil, 2008), and hold long-term consequences for the company (Capron & Pistre, 2002). Rani et al. (2015) found that M&A in India had resulted in significant improvement in the profitability of acquiring companies. Aik et al. (2015) found that mergers are driven by managerial self-

interest to create market power and those non-merging rival organizations in Malaysia have significantly higher productivity. At the same token, Kuriakose and Paul (2016) suggested that the dissimilarity between the merging partners has led to weak and adverse impact on performance. In this paper, it is expected that M&A have significant effect on ~~the~~ organizational performance. Thus, it is hypothesized that:

H1b: Acquisition has a significant effect on organizational performance.
H1c: Merger has a significant effect on organizational performance.

c.   Inter-organizational Trust

Trust has emerged as an important factor that can affect entirely the performance of the parties that are involved in inter-relationships. Trust is defined "the degree to which parties are willing to act on the words, actions, and decisions of others (McAllister, 1995). Jiang et al. (2013) investigated the effect of trust and contract on knowledge leakage in strategic alliance. Trust was divided into goodwill trust and competence trust. The findings indicate that competence trust is the most effective safeguard against knowledge leakage, whereas formal contracts are not an effective mechanism. Seppänen et al. (2007) suggest further empirical studies on inter-organizational trust in order to derive the benefits of both empirical and theoretical generalizations in this emerging field. Zainal A.M., (2014) pointed out that the need for trust has arose due to expanding strategies of companies when they look for growth opportunities with partners, outsourcing from new suppliers, or having to deal with different culture. Sambasivan et al. (2011) emphasized on the importance of including trust as a major component in relationship capital and strategic alliance.

Pesämaa, et al (2013) investigated the role of inter-organizational trust on commitment. The finding reveals that trust and reciprocity are related to inter-organizational commitment. Similarly, a study conducted by Lusch et al. (2003) to investigate the inter-organizational trust between suppliers and retailers before and after conducting strategic changes. The findings show that higher levels of trust in the pre-change organization by the retailer results in higher support for the change. They conclude that trust from business partners is important for initiating a collective action to gain support for a strategically changed organization.

It can be seen that inter-organizational trust is an important factor to enhance the relationship and the effectiveness of business partners. Previous studies found that trust could play a mediating role between knowledge management processes and organizational performance (Alaarj et al., 2016). Lui et al. (2006) found that inter-organizational trust played a full mediating role between the relationships of firm similarity and partner reputation with coercive strategy. Perrone et al. (2003) found also that inter-organizational trust mediates the relationship between an individual's firm's clan culture and the trust placed in that individual by other boundary spanners. In this paper, it is expected that:

H2: Inter-organizational trust mediates the effect of external growth strategies on organizational performance.
Zainal A.M. et al. (2014) divided external trust to complementary components namely relationship and task. This is because relationship alone is not enough and must be supported by tasks, actions, and competence (McAllister, 1995; Jiang et al, 2013). According to Zainal A.M. et al (2014), the relationship side of trust is dealt with by the staff involved in inter-relationships who interact and create the relationship. The relationship increases the communication level and that helps in solving problems. Wong et al. (2005) emphasized on the relationship side of trust. They pointed out that in all forms of strategic alliance, members from the organizations need to collaborate and work together. Theory of relationship states

that commitment will develop as a result of direct and mediating variables of trust and only then will commitment influence successful relational exchanges (Morgan & Hunt, 1994). Accordingly, the following is hypothesized:

H2a: Relationship side mediates the effect of strategic alliance on organizational performance.
H2b: Relationship side mediates the effect of M&A on organizational performance.

For the task side of trust, Zainal A. M. et al. (2014), deliberated that the staffs who are involved in relationship side must be consistent and competent in performing their work. In addition, a team with task side must have integrity, competence, reliability, and accountability. The study of Jiang et al (2013) identified the competence of trust as the most effective safeguard against knowledge leakage between partners. In this study, the task side is expected to influence positively the performance of public listed companies in Malaysia. Based on above, the following is hypothesized:

H2c: Task side mediates the effect of strategic alliance on the organizational performance.
H2d: Task side mediates the effect of M&A on the organizational performance.

Research methodology
A quantitative approach of analysis was selected to look into these issues. A survey method was applied and thus a questionnaire need to be applied.
a. Population and Sampling
The population of this study were the public listed companies in Malaysia. A purposive sampling technique was deployed because they have to be those who have the information related to the organizational strategies. The sample thus includes senior managers who were chosen because of their awareness of the growth strategies and the relationship with business partners.
b. Validity and Reliability
Hair et al. (2006) suggested that validity and reliability tests need to be done in all researches as they are necessary to ensure that the instruments used are not questionable. In this study, two professors in strategic management were invited to validate the measurement. The comments and feedbacks were addressed accordingly. Next, the instrument was checked for reliability. A total of 31 Ph.D. students participated in a pilot study. All the Cronbach's Alpha were greater than 0.70.
c. Instrument of the Study
The instrument of this study is an online questionnaire. It consists of invitation letter to the respondents that shows the purpose of data collection as well as the consent form, followed by the background information of the respondents along with questions related to the variables of the study. The measurement of strategic alliance (7 items), acquisition (7 items), and merger (5 items) are self-developed. Measurement of inter-organizational trust (relationship (4 items) and task (4 items) are adapted and adjusted from Zainal A. M., et al. (2014). Financial and non-financial performance measures are adapted and adjusted from Tseng (2014). A ten point Likert scale was used to assess the questions. The scale ranges from (1) strongly disagree to (10) strongly agree.
d. Data Collection
A total of 813 questionnaires were mailed to respondents using social media website and network referral as well as websites of the companies. A total of 251 complete questionnaires were returned. Data was examined for univariate and multivariate outliers. As a result, 11 responses were removed. This makes the final complete and usable responses to

be 240, a response rate of about 40.8%. Kline (2011) considered 200 as a typical and acceptable sample size for Structural Equation Modeling (SEM). Thus, AMOS will be used.

e. Cleansing and Improving the Data

After removing the outliers, the normality of the data was checked. The values of Kurtosis and skewness are within the recommended range of less than absolute two. Thus, the assumption of normality was achieved. Multicollinearity was also checked and it was found that the variance inflation factors (VIF) is less than 5.3 and the value of tolerance is less than 0.19 thus confirming its non-existence (Hair et al., 2006). Exploratory factor analysis was also conducted. Some items were deleted due to weak factor loading. Seven components were identified based on the Eigenvalue (>1) and the Kaiser-Meyer-Olkin (KMO) is 0.921 with 496 degree of freedom (df) and Sig value of <.05.

Data analysis

A brief descriptive analysis of the profile of the 240 respondents noted that their age ranges between 28 and 54 with a mean of 38.04 years. The majority were males (60%) with bachelor degree (59.2%) and working experience ranging from 3-29 years with a mean of 11.67 years.

a. Measurement Model

CFA was employed to estimate the subscales of the growth strategies, organizational performance, and inter-organizational trust. Maximum likelihood estimation was used as estimation methods for the analysis with indices such as RMSEA, GFI, CFI, IFI, and Chi sq used to assess the model fit. These indices are considered sufficient (Hair et al., 2006; Awang, 2012). Variables with factor loading of less than 0.60 were removed. All the indices were achieved. CFA for growth strategies showed that the construct has three components; strategic alliance, acquisition, and merger. For other two constructs, the CFA indicated that organizational performance has two components (financial and non-financial performance) and inter-organizational trust has two components (relationship and task side).

The measurement model was performed with all constructs included. Factor loading of items and components of the construct were all greater than 0.60 and the model fit indices were achieved (RMSEA=0.065, IFI=0.94, CFI=0.94, GFI=0.83, and Chi sq=2.008). These indicate that all the indices were achieved except GFI. However, Hair et al. (2006) recommended that analysis can continue further when at least three of the indices meet the threshold requirement.

b. Convergent and Discriminant Validity

The convergent validity of the model is assessed using the output of the measurement model and it is achieved when the composite reliability (CR) > 0.70 (Hair et al. 2006) and the Average Variance Extracted (AVE) >0.50. In addition, the Cronbach's Alpha (CA) is >0.70 (Hair et al. 2006). On the other hand, the discriminant validity is achieved when the root square of AVE is greater than the cross loading (Hair et al., 2006). Based on these criteria, all the indices can be accepted.

. Table 1: Convergent and Discriminant Validity

	CR >.70	AVE>0.50	CA>0.70	TS	SA	AQ	MR	NFP	FP	RS
TS	0.925	0.754	0.923	0.868						
SA	0.944	0.770	0.942	0.496	0.878					

AQ	0.914	0.681	0.912	0.413	0.645	0.825				
MR	0.962	0.864	0.961	0.534	0.722	0.524	0.930			
NFP	0.875	0.541	0.871	0.416	0.406	0.408	0.312	0.736		
FP	0.919	0.740	0.911	0.457	0.464	0.354	0.409	0.448	0.860	
RS	0.871	0.772	0.871	0.692	0.604	0.505	0.575	0.510	0.364	0.879

Note: TS: Task Side, SA: Strategic Alliance, AQ: Acquisition, MR: Merger, NFP: Non-Financial Performance, FP: Financial Performance, RS: Relationship Side.

c. Hypotheses Testing

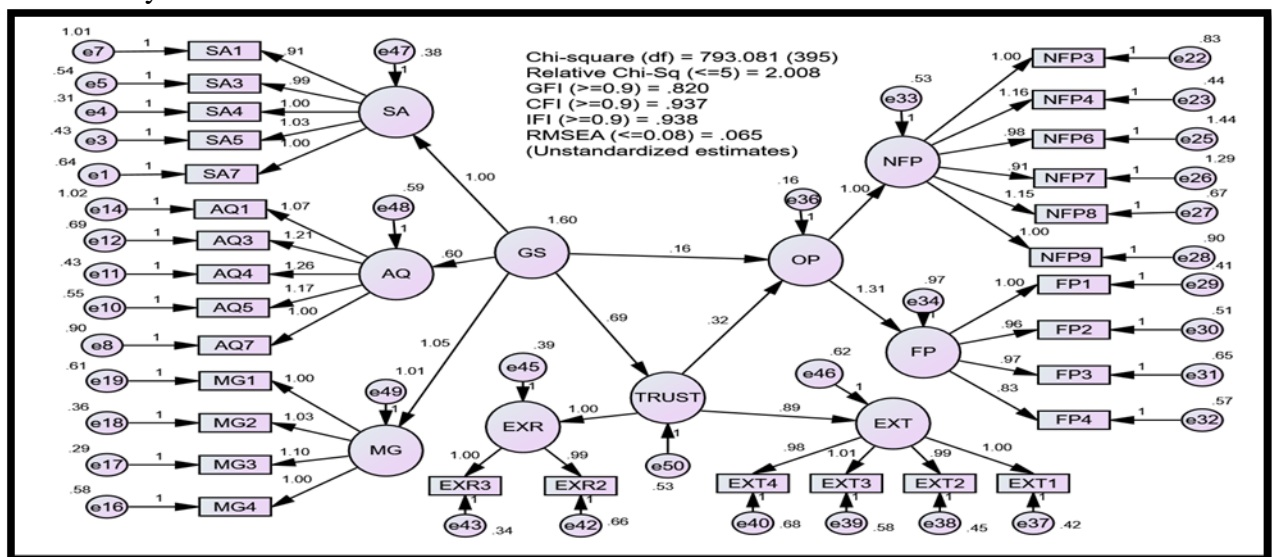
This study has developed direct and indirect hypotheses. Figure 1 shows the structural model of this study.


Figure 1: Research Structural Model

1) Direct Effect

The direct effect of growth strategies on the organizational performance was tested using the structural model. Result of the analysis is given in Table 2.

Table 2: Result of Direct Effect

H*				Estimate	S.E.	C.R.	P	Label
H1	Organizational performance	<---	Growth strategies	.336	.058	5.801	.001	Sig**
H1a	Organizational Performance	<---	Strategic alliance	.184	.061	2.999	.003	Sig**
H1b	Organizational performance	<---	Acquisition	.133	.063	2.123	.034	Sig**
H1c	Organizational performance	<---	Merger	.048	.043	1.115	.265	Not sig

H*: Hypothesis, sig**: significant, P<0.05, N=240.

As shown in Table 2, H1 is accepted. The direct effect of growth strategies is significant. H1a and H1b are also accepted. Strategic alliance and acquisition have significant effects on organizational performance. While merger has insignificant effect on organizational performance. Thus, H1c is rejected.

2) Indirect Effect

Table 3 presents the results of testing inter-organizational trust and its dimensions as a mediator between external growth strategies and organizational performance. Since the direct effect of merger is not significant, no test of mediation will be conducted and the related hypotheses are removed.

Table 3: Result of Mediating Testing

			Estimate	S.E.	C.R.	P	Label
Inter-organizational Trust	<---	Growth strategies	.688	.074	9.324	.001	Sig
Organizational performance	<---	Growth strategies	.158	.082	1.923	.054	Not Sig
Organizational performance	<---	Trust	.324	.100	3.229	.001	Sig
Relationship side	<---	Acquisition	.251	.071	3.518	.001	Sig
Task side		Acquisition	.205	.073	2.795	.005	Sig
Task side	<---	Strategic alliance	.371	.058	6.421	.001	Sig
Relationship side		Strategic alliance	.444	.058	7.677	.001	Sig
Organizational performance	<---	Acquisition	.106	.049	2.162	.031	Sig
Organizational performance	<---	Strategic alliance	.126	.047	2.668	.008	Sig
Organizational performance	<---	Relationship side	.099	.054	1.833	.067	Not sig
Organizational performance	<---	Task side	.172	.049	3.533	.001	Sig

In comparison between Table 2 and Table 3, it can be seen that the direct effect of growth strategies on organizational performance is reduced from 0.336 (before entering the mediator) to 0.158 (after entering the mediator). This shows that the mediation occurs. However, the direct effect has insignificant effect which indicates that the mediation is full. This leads to the acceptance of H2. For H2a and H2b, the effect of relationship side on organizational performance is not significant thus, relationship side does not play a mediator role. Accordingly, H2a, and H2b are rejected. For H2c and H2d, the effect of strategic alliance and acquisition on organizational performance decreased after entering task side as a mediator. However, the effect is still significant. Thus, it is concluded that task side is a partial mediator between the variables. Accordingly, H2c and H2d are accepted.

Discussion

The finding of this study showed that inter-organizational trust is essential for growth strategies and organizational performance. Trust could reduce the transaction cost and the cost

of writing to tighten the contracts. It also promotes knowledge sharing among partners. Strategic alliance is vital for the organizational performance and it has the highest effect followed by acquisition. Merger on the other hand has no effect on organizational performance. Previous findings are in agreement with the outcome of this study. Researchers agreed that external growth can foster the development and performance of organization (Anderson et al., 2010). Strategic alliance has strong effect in reducing cost (Qiu, 2010). Similarly, acquisition is important for achieving advantage in the distribution network. In contrast, this study found that the effect of merger on organizational performance is insignificant. Most of the literature found that merger has a significant effect on organizational performance. However, in agreement with the finding of this study, Aik et al. (2015) and Kuriakose and Paul (2016) related the weak performance of companies after merger to managerial self-internet and dissimilarity between merged partners.

Inter-organizational trust is essential for the external growth strategies. The existence of trust reduces the anxiety and promote more opportunity for future deals between partners. The inter-organizational trust is an essential variable and it played a full mediating role. This finding is in accordance with the literature (e.g. Lui et al., 2006; Perrone et al., 2003). The task side and the relationship side confirmed to work as complementary components of inter-organizational trust. The task side mediated partially the effect of strategic alliance and acquisition on organizational performance while the relationship side has no mediating role. A possible explanation derived from an interview with respondents who pointed out that in the case of small and medium enterprises (SMEs) or family-owned businesses, the relationship side and the task side could mediate the effect of growth strategies on organizational performance. This is because the size of the company is small and the number of alliance is limited. However, in the case of public listed companies where each company might have several acquisitions and alliances on different level (local, regional, and international), it is difficult to focus on the relationship side and only will be matter, is the action or the task side i.e. each party has to perform its role and contribute to the inter-relationship as agreed upon the binding contracts.

Conclusion and future work

This study was conducted to examine the effect of growth strategies on organizational performance of Malaysian public listed companies. The study also sought to test the mediating role of inter-organizational trust between the variables. A total of 240 senior managers have participated in this study. The finding indicated that growth strategies has a significant effect on organizational performance. More importantly, strategic alliance is comparatively the best strategic growth option among the surveyed companies. The finding also showed that inter-organizational trust fully mediated the effect of growth strategies on organizational performance. Task side confirmed to have a partial mediating role between strategic alliance and acquisition, and organizational performance.

This study has contributed to the literature in the area of trust and growth strategies. However, the studies that are related to the variables in emerging economies are still in their infancy. It is recommended for future work to investigate more the effect of organizational and inter-organizational trust under environmental uncertainty. In addition, the majority of literature is related to banks. There is a need for more studies on different types of industry such manufacturing or services. Lastly, the relationship side of trust was insignificant as a mediator. It is recommended for future work to replicate this study using different sample such as social enterprises, small and medium enterprise (SMEs), or family-owned business.

THE INFLUENCE OF GREEN MARKETING MIX ON CONSUMER SATISFACTION AND LOYALTY (CASE STUDY: CARGILLS (CEYLON) PLC, COLOMBO DISTRICT, SRI LANKA)

Upul Piyavi Wijewardene, Management and Science University, Malaysia
Chameera Pathinayake, University of Colombo, Sri Lanka

Abstract

The purpose of this research study is to evaluate the influence of green marketing mix on satisfaction and loyalty of the customers and consumers of Cargills (Ceylon) plc, Colombo District, Sri Lanka. For this purpose, all customers and consumers (total of 5000) of the company in Colombo District were taken as the statistical population and two forms of questionnaires were distributed among them as the sample population. The customers are taken as those who sell the Cargills Company's products in the district and consumers are the people in the district who consume the company's products. After analysis it was concluded that green marketing mix has significant effect on consumer satisfaction. It was also concluded that consumers' satisfaction has significant effect on their loyalty. By considering the effect of green marketing mix upon consumers' and customers' satisfaction and the effect of such satisfaction upon their loyalty, it can be assumed that companies can create competitive advantage in their organization through taking steps in making the green marketing part of their overall marketing strategy.
Keywords: *Green Marketing, Consumer Satisfaction, Loyalty*

Introduction

Green marketing has been viewed as one of the most important academic research subjects since its conception (Ottoman, J., 1994). The issue gained more emphasis in the late 1970s; when the American Marketing Association held its first seminar on Ecological Marketing in 1975, which led to the publication of a book entitled Environmental Marketing (Henion, K.E. and T.C. Kinnear, 1976). The first definition of green marketing was according to Henion (1976); "the implementation of marketing programs directed at the environmentally conscious market segment" (Banerjee, S.B., 2001). Despite the early development, it was only in the late 1980s that the idea of green marketing actually made an appearance because of the consumers' growing interest in green products, increased awareness and willingness to pay for green features (Peattie, K., 1995). Henion's definition of green marketing has evolved and many more definitions for green marketing have arisen throughout the years. Consumers have started to show more interest in green products and the tendency to spend on products with green features has increased. Since then, research programs have been conducted to study the interest of people towards the environment and green products.

With respect to the existing data, research results, growing public awareness and also responsibilities, ever increasing attention to environment, increasing attention of companies to customer satisfaction and loyalty and also tendency of organizations to acquire international certificates such as ISO (e. g. ISO 4001) and also the fact that green marketing has brought about a competitive advantage for the companies, the significance of green marketing has been greatly highlighted.

Research problem

Tremendous increase in use of natural recourses and inconsiderateness towards environment, human health risks and irreversible severe ecosystem damages make human being more cautious about environment and related health problems. Since companies look for competitive advantage to increase their customer satisfaction and loyalty, they are being forced to consider environmental issues in producing their products. So far, a lot of research has been done on the management of customer communications, satisfaction and loyalty (Greenberg, P., 2000) and also on the subject of green planning management in compiling company strategies (Olsson, P., C. Folke and T. Hahn, 2004), however, very little research has been done on green marketing and its relationship with customer satisfaction and loyalty.

literature review

Review of the related literature shows that there is not so much research, nor a unique definition about green marketing approach due to its youngness, however, what is a common fact among proposed definitions, is fulfilling the company's goals with the least damage to living environment and human beings. Following is a number of definitions being floated on the subject:

- Green marketing is a managerial process to identify, foresee and meet society's and customer needs via a sustainable and profitable procedure (Peattie, K., 1995).
- Green marketing or ecological marketing focuses on all designed activities to meet human's needs and wants with the least impact on natural environment (Polonsky, M.J., 1994).
- According to the American Marketing Association (1976), green marketing is the study of positive and negative aspects of marketing on pollution and reducing consumption of energy and other scarce resources.
- Green marketing or environmental marketing includes all activities that are designed to facilitate the transactions in order to meet human wants and needs in a way with the least adverse effects on living environment (Polonsky, M.J., 1994).

Primary studies on green marketing and about customer interest for green products was first done by Vandermerwe and Oliff in 1990. In 1989, a study in the United States of America indicated that 49 percent of responders have made changed in their purchase habits for the sake of environment. According to another research by Callan and Thomas in 1992, 93 percent of participants stated that environmental consequences have had a role in their purchasing habits (Callan, S. and J.M. Thomas, 1992). The results of another research which was done in developing countries by Peattie in the same year showed that 75 percent of participants somehow involved environmental criteria in their purchasing (Peattie, K., 1995).

In a study in 1994, Dietz and Stern proved that 42 percent of the British consumers paid attention to environmental consequences in their purchases and 27 percent of them had the will to pay 25 percent more than the normal market prices for environment-friendly products. According to the studies done by Levinson J.C. and S. Horowitz, 2010, 83 percent of customers claimed that they chose environment-friendly brands and 80 percent concerned the company reputation regarding environmental protection issues.

Customer Satisfaction

During recent four decades, customer satisfaction has been viewed as an important theoretical and practical issue for most of the marketers and researchers. Kotler (2000) defines it as a feeling in individuals after comparing product and service performances with their expectations (Kotler, P., 2000). Hawkins (1995) states that such factors as friendly, polite, knowledgeable and useful employees, clear and accurate bills, competitive prices and quick services, can affect customer satisfaction. Satisfaction also refers to pleasant or unpleasant

feeling caused with comparison between imaginative function and expectations (Hawkins, D.I., R.J. Best and K.A. Kony, 1995). If a good's performance is better than expectations, customer will be pleased (Kotler, P., G., Armstrong, V. Wong and J. Saunders, 2008).

Satisfaction is directed to consumer's judgment to the extent to which a product's or service's feature can create joy and pleasantness at the time of consumption (Oliver, R.L., 2006). According to experiences and customer comments, satisfaction works as complementing the consumption purposes of the customer (Oliver, R.L., 2006).

Previous studies have indicated two different conceptualizations from customer satisfaction: Particular purchase and Cumulative purchase. The former refers to evaluated judgment after purchase for a particular occasion, while the latter is based upon general experience with goods and services of a particular company during a period of time. A common agreement on all the definitions proposed is on the necessity of purpose by which the customer looks for.

All companies face an increasing pressure towards creating greener products. Jamal and Nasser define customer satisfaction as the customer's attitude towards a product or post-usage services (Divandary, A. and J. Delkhah, 2003). Satisfaction is also referred to as customer reactions to use or consume a product (Westbrook, R.A., 1987). A comprehensive definition of customer satisfaction would be as follows: "customer satisfaction is a result received through the comparison of expected performance before purchase with the real perceived performance and paid expense" (Farris, P.W., T.B. Neil, E. Phillip and J.D. Rubinstein, 2010).

Customer Loyalty

Customer loyalty refers to the customer's behavior in keeping in touch with institution after buying products and obtaining after sale services (Bhara, *et al,* 2002 and Singh, J., 1990). Loyalty is having and keeping a deep commitment to re-purchase of an offered product. In other words, loyalty can be considered as ensuring future behavior for buying a product or a service, or getting in touch with a factory in all situations even if there are other alternatives for purchasing (Oliver, R.L., 2006). Therefore, customer loyalty requires a positive attitude towards the company's products and services. It is reached through desired behavior which results in buying goods and services and recommending to others (Backman, S.J., 1991). Customer loyalty is also a sustainable source of income for companies that, as an informal communication channel, introduce the products or services to families and friends (Martensen, *et al*, 2000*)*

Interrelationship between Customer Satisfaction and Loyalty

Much research has been done on the interrelationship between customer satisfaction and loyalty which is the direct result of customer satisfaction (Haskett *et al,* (1994)). Andersen and Fornell (1994) have mentioned that customer satisfaction depends upon his/her overall satisfaction. All customers do not become loyal due to receiving a satisfying service, but due to the fact that a group of them do not want to bother to transfer to another provider.

Background of Study Done Abroad

In their research paper "Green product quality, green corporate image, green customer satisfaction and green customer loyalty", Nai-Jen Chang and Chen-Min Fong (2010) studied the effects of these variables with the use of a questionnaire survey. Consumers who had experienced purchasing green products were identified as the subjects of this study. The results showed that (1) the green product quality is positively associated with green customer satisfaction and green customer loyalty; (2) green corporate image is positively associated with green customer satisfaction and green customer loyalty; and (3) green customer satisfaction is positively associated with green customer loyalty. The results also indicate that green product quality could bring about green customer satisfaction and green customer

loyalty

In their study " Strategic green marketing: a comparative study of how green Marketing affects corporate strategy within business to business", Oscar Baverstam and Maria Larsson (2009) examined how strategic green marketing can be developed and what incentives there are for companies to do so. To fulfill the objectives of this study, four research questions were formed and a qualitative case study was conducted of three business to business companies from different industries. Interviews helped gain insight as to how companies develop their green marketing strategies and for what reasons. The results indicated that most companies were not segmenting their target markets based on consumer's environmental attitude. Findings also indicated that green market strategies differed for each company and might be derived from a company's individual circumstances including its objectives, resources and competitive advantages. Furthermore, the findings showed that most companies can implement green changes in their marketing mix but that these should be actively promoted when a product's green attributes constitute a key selling point. Finally, the findings indicated that financial benefits and the possibility of gaining a competitive advantage were the foremost incentives for implementing green measures.

In another research study entitled "A study on the relationship among green marketing, consumer satisfaction, consumer loyalty and the degree of consumer involvement in environmental protection: examples from chain stores in the middle section of Taiwan", Hung-Ta (2009) argued that in recent years, due to the global rise of environmental awareness, enterprises are indirectly let to begin affording more social responsibilities and implementing concepts of social marketing (Hung-Ta W., 2009). Thus, it has prevalence on the concept of green marketing and a number of small and medium-sized and even large enterprises are taking part in this trend. Of course, Taiwan is not exception, for example, the convenience chain stores use shopping bags of green environmental protection and the Environmental Protection Administration policies limit use of plastic ba So in this study, it takes examples from the four major convenience chain stores consumers in the middle section of Taiwan and use survey method questionnaire to explore the relationship with convenience stores' green marketing, consumer satisfaction and consumer loyalty.

Finally, results show that the convenience stores' green marketing will have positive influence on consumer satisfaction and loyalty and the consumer satisfaction will have positive influence on consumer loyalty and finally consumer satisfaction plays an intermediary role between the convenience stores' green marketing and consumer loyalty. Then, the different degrees of consumer involvement in environmental protection will interfere in the relationship between consumer satisfaction and his/her loyalty.

In their research study "Cosmetics green marketing in Thailand", Johari and Sahasakmontri (1998) surveyed green marketing strategies and consumer attitude towards green products in two competitor companies namely Body Shop and Oriental Princess using a sample of 120 customers. The results showed that from the view of Body Shop's customers, natural materials, shop atmosphere, skin protection, brand logo and lack of animal tests were important factors in their decision to purchase. Questionnaire analysis indicated that Oriental Princess's customers considered such factors as skin protection, product function, ingredient materials, product fragrance and fee, in their decision to purchase (Chan, J.K.L. and T. Baum, 2007).

In another exploratory research study "Determination of satisfaction and dissatisfaction using Herzberg's motivator and hygiene factor theory", Chan and Baum (2007), using 29 informed customers in Sukau, Sabah, Malaysia, explored underlying satisfaction dimensions adopting Herzberg's Motivator and Hygiene Factor Theory. The study suggests that consumer satisfaction can be measured by proposing a paradigm that adopts a behavioral and experiential perspective as an alternative to the

confirmation/disconfirmation paradigm, rather than the expectancy disconfirmation paradigm that is predominantly employed in measuring consumer satisfaction. Building on Herzberg, underlying satisfaction and dissatisfaction dimensions are linked to job satisfaction in a way that is a function of two types of condition, known as hygiene factors (dissatisfiers), leading to the condition of dissatisfaction (prevention) and motivators (satisfiers), leading to a condition of satisfaction (Chan, J.K.L. and T. Baum, 2007).

In a research study entitled "An empirical study on the influence of environmental labels on consumers" by D'Souza *et al.,* (2006), the data were collected on an Australian sample using a structured questionnaire administered on the phone. A total of 155 questionnaires were completed and used for analysis. The data were analyzed using both descriptive measures and correlations between variables. There appears to be a proportion of consumers that find product labels hard to understand. The research found that there are consumers who will buy green products even if they are lower in quality in comparison to alternative products, but would look for environmental information on labels. With respect to price sensitive green consumers, there appears to be a relationship between price sensitivity and 'always' reading labels as well as indicating that there is 'sufficient' information on product labels to make informed purchase decisions (D'Souza, C., *et al,* 2006).

Background of Study Done in Iran

In their research study "measuring the relationship between customer loyalty and relevant factors e-banking in Tehran", S. Javadin et al, (2009) assessed the relations of key customer loyalty factors among Tehran bank customers. Attributing the concepts of satisfaction, perceived quality, change costs and accuracy to loyalty and using data analysis of research hypotheses about direct variable effects on each other, they concluded that such factors had positive effects on loyalty (Sayyid Javadin, S.R. and S. Yazdani, 2005).

In their research study "designing a model for customer loyalty in banking industry of Iran", Tabatabaie Nasab (2009) explored the model for customer loyalty in banking industry (Tabatabaei Nasab, S.M., 2009). In this study, first loyalty affecting factors were identified and then interactions between dependent and independent variables were tested within the model framework. At the first level, variables of "trust" and "commitment" as the key medium variables in establishing long-term relations in B2B environment and relational marketing were identified and their effects on loyalty were confirmed. At the second level, different variables of affective and cognitive processes involved in evolving different levels of trust and commitment were analyzed and their relationship in the final loyalty model was clarified. Final model declared that in line with customer satisfaction, customer's relational commitment and trust had important role in reaching loyal customers and consumers.

Methodology

By considering the importance of products of the Cargills Ceylon Company and the tendency of the company's management team for green management, the present research is aimed to study the effect of green management on customer's satisfaction and loyalty and the effect of green marketing mix on the customer mental image and value, his satisfaction and loyalty and in practice, to facilitate the way for establishing green management.

Research Hypotheses

Main Hypothesis:
Green marketing mix has effect on customer and consumer satisfaction and loyalty.

Minor Hypotheses:
Green marketing mix has effect on customer and consumer satisfaction.
Green marketing mix has effect on customer and consumer loyalty

Sampling and Determining Sample Size

To determine sample size, a preliminary study was carried out by distributing a questionnaire among 30 customers and consumers. Through variance analysis of primary sample at the confidence level of 95%, sample size for the customers and consumers was calculated to be 375.

Data Collection Procedures

Required data was collected via two procedures of library studies and field studies. In the library study section relevant sources including scientific books and articles, magazines, brochures and journals are used. In field study section, questionnaire is used to collect data. Regarding the research subject, which focuses on the effect of variables among customers (sales agents) and consumers, two questionnaires with distinct questions were designed and distributed among customers and consumers.

Questionnaires included two types of questions: general questions containing age and sex of the responders and technical questions. In design technical questions, different parameters were used. To determine green marketing mix-related parameters and other parameters were determined from reviewing previous research. In this research, Lickert's ranking scale is used for evaluation. The scale includes options of "very much=5" to "very little=1".

Data Analysis Procedure

Data processing for the research is done at two levels: 1. descriptive statistics and 2. Multi-purpose analysis. In this section, mean (m), standard deviation (SD), maximum, minimum, range of variations, skewness and kurtosis of the variables are calculated to establish a general map of the population. In the second section, multi-purpose analysis, multi-factor, variance analysis is used to measuring the general validity of the research model.

Questionnaire Validity and Reliability

Questionnaire validity was measured and confirmed using expertise comments. Questionnaire reliability is one of the technical features of measurement, which indicates the extent to which measurement tools devised for measuring particular trait and variable produce the same results under similar conditions. A method of estimating reliability is using Cronbach's alpha. To estimate Cronbach's alpha coefficient in this research, a preliminary study was done by distributing 30 questionnaires among customers and 30 questionnaires among consumers. After that, Cronbach's alpha was calculated with SPSS software. Its value was 0.85.

Frequency Distribution of Gender

Out of the samples under study, 55 percent of the consumers were male and 45 percent were female. 92.9 percent of customers were male and 7.1 percent are female.

Table 1: Depicting frequency distribution of responders' gender

Group	Gender	Frequency	Percent (%)
Consumers	Male	176	55.0
	Female	144	45.0
	Total	320	100
Customers	Male	288	92.9
	Female	22	7.1
	Total	310	100

Frequency Distribution of Education

Out of the samples under study, 4.7 percent is uneducated (U), 9.4 percent is at reading and writing level (RW), 12.5 is at Ordinary Level (OL), 11.6 percent is at Advanced level (AL), 31.2 percent is with diploma (D), 25 percent is with bachelor's degree (BS) and 5.6 percent is with master's degree (MS) and higher. 3.8 percent of customers is uneducated (U), 6.4 is at reading and writing level (RW)12.9 percent is at Ordinary Level (OL), 26.4 is at Advanced Level (AL), 12.9 percent is diploma, 27.7 percent is with bachelor's degree (BS) and 9.7 percent is with master's degree (MS) and higher.

Table 2: Depicting frequency distribution of education of responders

Group	Education	Frequency	Percent
Consumers	U	15	4.7
	RW	30	9.4
	OL	40	12.5
	AL	37	11.6
	D	100	31.2
	BS	80	25
	MS	18	5.6
	Total	320	100
Customers	U	12	3.8
	RW	20	6.4
	OL	40	12.9
	AL	82	26.4
	D	40	12.9
	BS	86	27.7
	MS	30	9.7
	Total	310	100

Age Description

For age variable, the number of sample, mean, median, standard deviation, minimum and maximum, are calculated and their histogram is drawn, separately for consumers and customers. The mean of age for consumers and customers are 38.57 and 37.94 years, respectively.

Table 3: Depicting age description of responders

Consumers	Number	320
	Mean	38.57

	Median	38.00
	Standard Deviation	8.876
	Minimum	22
	Maximum	60
Customers	Number	310
	Mean	37.94
	Median	37.00
	Standard Deviation	8.183
	Minimum	22
	Maximum	60

Description of the Effect of Green Marketing on Satisfaction

For the effect of the variable of green marketing on satisfaction, the number of sample, mean, median, standard deviation, minimum and maximum, are calculated and their histogram is drawn separately for consumers and customers. The range of grades is 1-5. The mean of the variable for consumers and customers are 3.72 and 3.65, respectively.

Table 4: Depicting description of the effect of green marketing on satisfaction

Consumers	Number	320
	Mean	3.7165
	Median	3.7500
	standard deviation	0.62617
	Minimum	2.17
	Maximum	5.00
Customers	Number	310
	Mean	3.6511
	Median	3.6667
	standard deviation	0.62351
	Minimum	1.80
	Maximum	5.00

Description of the Effect of Satisfaction on Loyalty

For the effect of satisfaction on loyalty, number of sample, mean, median, standard deviation, minimum and maximum, are calculated and their histogram is drawn, separately for consumers and customers. The range of grades is 1-5. The mean of the variable for consumers and customers are 3.71 and 3.79, respectively.

Table 5: Depicting description of the effect of satisfaction on loyalty Variable

Consumers	Number	320
	Mean	3.7051
	Median	3.6667
	standard deviation	0.80855
	Minimum	1.67

	Maximum	5.00
Customers	Number	310
	Mean	3.7911
	Median	3.6667
	standard deviation	0.76920
	Minimum	1.67
	Maximum	5.00

Checking for Normal Distribution of the Grades of the Variables

To test normality of the distribution, Kolmogorov-Smirnov test (K-S test) is used. Null hypothesis in this test is that variable distribution is normal. If significance level of the test is less than 0.05, null hypothesis will be rejected and it will be concluded that the given variable distribution is not normal. The result of significance level shows that the variable of green marketing effect on perceived image of both consumers and customers have normal distribution (significance level more than 0.05), while, other variables do not display normal distribution, neither in consumers nor in customers (significance level less than 0.05). However, due to numerousness of samples and lack of irrelevant data, data distribution is supposed to be normal. Finally, parametric and non-parametric tests are both used.

Hypothesis 1: Green marketing mix has effect on customer and consumer satisfaction.

Table 6: Depicting results of K-S test for normality of the variable grades distribution

Variable	Group	Number	Kolmogorov-Smirnov statistic	Significance level
Green marketing effect on satisfaction	Consumers	320	1.979	0.001
	Customers	310	1.501	0.022
Satisfaction effect on loyalty	Consumers	320	1.835	0.002
	Customers	310	2.178	0.000

With every question in the questionnaire, we directly asked for the amount of effect from the responders. So, there is only one variable. The distribution of this variable was not normal. In regard with large sample size and lack of irrelevant data, to test this hypothesis, single-sample t-test is used. To obtain results confidence, non-parametric binomial test is used. Grades fall in the range of 1 to 5. So, the test size is 3 which is average variable is presumed. The variable mean more than 3 indicates higher effect and variable mean less than 3 shows lower effect.

- Null hypothesis = amount of green marketing mix effect on customer and consumer satisfaction is average (3).
- Alternative hypothesis = amount of green marketing mix effect on customer and consumer satisfaction is not average (3).

Among consumers, variable mean is 3.72 and significance level of the test is 0.000. Since the mean is more than 3 and significance level is less than 0.05, null hypothesis is rejected. As a result, green marketing mix has a significant effect on consumer satisfaction. Among customers, variable mean is 3.65 and significance level of the test is 0.000. Since the mean is more than 3 and significance level is less than 0.05, null hypothesis is rejected. As a result, green marketing mix has a significant effect on customers ' satisfaction.

The hypothesis was retested with non-parametric binomial test, which produced no difference.

Table 7: Depicting results of single-sample t-test for testing the green marketing effect on satisfaction

Test size = 3								
Variable	Group	Number	Mean	SD	t	D.O.F	Significance level	Mean of variable difference with test size
Effect of green marketing on satisfaction	Consumers	320	3.717	0.626	20.212	311	0.000	0.717
	Customers	310	3.651	0.624	18.086	299	0.000	0.651

Table 8: Depicting results of binomial test for testing the green marketing effect on satisfaction

Variable		Group	Size	No.	Observed probability	Probability test	Significance level
Effect of green marketing on satisfaction	Consumer	Group 1	<= 3	60	.17	.50	.000
		Group 2	> 3	260	.83		
	Customer	Group 1	<= 3	60	.17	.50	.000
		Group 2	> 3	250	.83	.50	

Table 9: Depicting results of single-sample t-test for testing the satisfaction effect on loyalty

Test size = 3								
Variable	Group	Number	Mean	SD	t	D.O.F	Significance level	Mean of variable difference with test size
Effect of green marketing on satisfaction	Consumers	320	3.705	0.809	15.404	311	0.000	0.705
	Customers	310	3.791	0.769	17.814	299	0.000	0.791

Table 10: Depicting results of binomial test

Results of Testing the Hypotheses

On the basis of the data analysis, the following results about the hypotheses are obtained: Considering the fact that the data was not normal, to test this hypothesis, one-sample t-test is used. To obtain results confidence, non-parametric binomial test is used. Among consumers, the variable mean is 3.72 and significance level of the test is 0.000. Since the mean is more than 3 and significance level is less than 0.05, it is concluded that green marketing mix has a significant effect on consumer satisfaction. Among customers, variable mean is 3.65 and significance level of the test is 0.000. Since the mean is more than 3 and significance level is less than 0.05, it is concluded that green marketing mix has a significant effect on customers ' satisfaction. The hypothesis was tested with non-parametric binomial test, which produced no difference in results. As to the second hypothesis, considering the fact that the data was not normal, in the same way, to test this hypothesis, one-sample t-test is used. To obtain results confidence, non-parametric binomial test is used. Among consumers, the variable mean is 3.70 and significance level of the test is 0.000. Since the mean is more than 3 and significance level is less than 0.05, it is concluded that consumer satisfaction has a significant effect on their loyalty. Among customers, the variable mean is 3.79 and significance level of the test is 0.000. Since the mean is more than 3 and significance level is less than 0.05, it is concluded that customer satisfaction has a significant effect on their loyalty. The hypothesis was retested with non-parametric binomial test, which produced no

Variable		Group	Size	No.	Observed probability	Probability test	Significance level
Effect of green marketing on satisfaction	Consumer	Group 1	<= 3	90	0.27	0.50	0.000
		Group 2	> 3	230	0.73		
	Customer	Group 1	<= 3	68	0.19	0.50	0.000
		Group 2	> 3	242	0.81		

difference in results. As a result, the research hypotheses were verified.

DEVELOPMENT OF NEW PRODUCT FOR ON HARD DISK DRIVES COMPETITIVE ADVANTAGE

Adisak Suebthamma, King Mongkut's Institute of Technology Ladkrabang (KMITL), Thailand
Thepparat Pimonsatian, King Mongkut's Institute of Technology Ladkrabang (KMITL), Thailand
Wanno Fongsuwan, King Mongkut's Institute of Technology Ladkrabang (KMITL), Thailand

Abstract

Thailand's electronics and hard-disk drive component industries are on the precipice of swift and radical change with technologies such as much faster solid state drives which use solid-state memory chips accelerate in sales. Replacing the older and slower hard-disk drives of the past, these new drives are used in products such as tablets, ultra-thin laptops and the newest smartphones. It is critical that Thailand's electronics industry, which was worth nearly US$60 billion in 2014 and employed 600,000 people, embrace this change to stay competitive. This study therefore presents a conceptual framework about the structure of the factors including supply chain management and new product development that affect the competitive advantage of electronics components and hard-disk drive component industries. Quantitative data is being obtained from a proposed sample of 200 production control and operations mangers, including executive directors, managers and department heads that have had a minimum of five years of experience. Qualitative research is being conducted with 10 executives by the use of purposive sampling. Analysis will be conducted using Partial Least Square (PLS-Graph) software to apply Structural Equation Modeling (SEM).

Keywords: *HDD, Competitive Advantage, structural equation model*

Introduction

Thailand has been one of the world's foremost manufacturing bases for hard-disk drives (HDD), with a 2014 trade record showing a 30.1 percent market share on 180.9 million HDDs exported, second only to China whose exports totaled 35.2 percent of the global total (Kasikorn Bank Research, 2015). Also, Thailand's electronics industry is a core element of the Thai manufacturing sector and in 2014, Thailand's overall trade in the electronics industry was worth nearly US$60 billion, with export revenues accounting for over US$32 billion (BOI, 2015).

In 2014, Thailand's main electronics exports were computer components and integrated circuits (IC), which accounted for approximately 56% and 24% of total electronics exports respectively. Having two of the global data storage manufacturers, Western Digital and Seagate, has also helped make Thailand the second largest data storage product producer and exporter in the world. At the same time, Thailand holds an equally renowned reputation in the IC and semiconductor sectors due to Thailand being one of the main manufacturing bases for these products in the ASEAN (Association of Southeast Asian Nation) region with exports reaching US$32 billion in 2014 (BOI, 2015). The AEC (ASEAN Economic Community) is presently a $2.5 trillion economy with over 625 million people growing at an annual rate of 6 percent (Menon, 2016).

At the moment however, HDD exports are falling as they are primarily used in personal computers which are being displaced by the much faster solid state drives (SSDs) which use solid-state memory chips and are used in products such as tablets and ultra-thin laptops. SSDs are light in weight and have swifter data access speeds and are fast becoming a popular choice with many projecting skyrocketing annual growth of over 34 percent for them through 2017 (Kasikorn Bank Research, 2015).

Additionally, the evolution of cloud computing and the general 'Internet of Things' trend has augmented demand for enterprise data storage, consumer electronics as well as other electronic equipment for daily use. With such demand, especially for business and retail consumers, growth potential should still be evident for the HDD industry. Also, to ensure a sustainable path, innovations must not be limited to large companies. Encouraging innovations among our SMEs is crucial to uplift the growth potential (Amornvivat, 2014), As Thailand surges up the ladder of economic development, the country naturally has moved away from an over-reliance upon labor-intensive industries to a more tech-savvy, knowledge-based economy. To further support this move towards a high value-added economy, the government has prioritized the development and promotion of science, research and development, technology and innovation and has stated its intention to increase R&D expenditures to 1% of total GDP (TIR, 2015).

Within this highly complex environment discussed above, supply chain leaders struggle to align corporate and supply chain strategy and drive improved performance. This difficult balancing act involves the process of balancing growth, profitability, cycle and complexity within a company's supply chain operations (Mayer, 2014). Semiconductor and hard disk drive manufacturers have been successful in a challenging downstream position while cost pressures from OEMS has not (as of yet) cut into margin with growth levels remaining strong during the move to mobile.

Product innovation is a major driver of growth and is the lifeblood of the semiconductor and hard disk drive industries. Strong planning processes enabled adaptation in the face of extreme supply and demand volatility. Manufacturers in these industries are also disadvantaged as well because of their downstream position in the supply chain. However, rising complexity and outsourcing bring new supply chain challenges but the good news is that the supply chain capabilities within this industry are strong and ready to meet the challenge (Mayer, 2014). According to Intarakumnerda, Chairatanab, and Chaiyanajitb (2016), although Thailand's electronics industry has been considered as one of strategic sectors, the evidence shows that it is dominated by midstream and downstream activities with the multi-national corporations (MNCs) dominating the assembly activity with an extensive control over supply chain of parts and components. The case studies show that firms in Thailand must acquire and develop technological capabilities to stimulate the industry's transformation from low to high value added activities.

In the above overview of Thailand's electronics and hard-disk drive (HDD) manufacturing sector, experts are becoming stronger in their analysis about the need for competitive change so Thailand can maintain its once unchallenged competitive advantage. Those days are now over and with entry into the AEC, some speculate that competition will become even more fierce. With the tighter integration of the AEC at the end of 2015, many regulations, laws, tariffs and the ability for the movement of workers changed. As yet, this change is small as bureaucracies move slowly. Companies however must be quick to change or their very survival might be at stake. According to Maleval (2013) and Shilov (2015), of the 218 companies worldwide that have taken a stab at HDD assembly production - not

including components -, now only three remain (Seagate, Toshiba and WD). The other ones didn't survive or were acquired. The researchers therefore have decided to undertake a study how competitive advantage is affected by new product development and Supply Chain Management.

Literature review

Supply Chain Management

Supply Chain Management is the management of a network of interconnected businesses involved in the ultimate provision of product and service packages required by end customers (Harland, 1996). Supply Chain Management spans all movement and storage of raw materials, work-in-process inventory, and finished goods from point of origin to point of consumption (supply chain). A big piece of SCM planning is developing a set of metrics to monitor the supply chain so that it is efficient, costs less and delivers high quality and value to customers. This is consistent with Hsu, Tan, Kannam, & Leong, (2009) which state that supply chain management stresses the seamless integration of value-creating activities across organizational boundaries. It enables firms in a supply chain to eliminate waste, leverage synergies and compete more effectively in an intensely competitive global market.

Abdallah, Obeidat, & Aqqad (2014) tested the impact of supply chain management practices on supply chain performance in terms of supply chain efficiency and supply chain effectiveness on 104 Jordanian manufacturing companies. The results indicated that three supply chain management practices, internal integration, information sharing, and postponement significantly and positively affect supply chain efficiency performance. The results also showed that three supply chain management practices, internal integration, customer integration, and postponement significantly and positively affect supply chain effectiveness performance. This is supported by Feng and Wang (2013) which stated that the success of new products relies on supply chain involvement. Time to market and development cost are also effected by supply chain coordination and new product development.

Lai, Chen, & Yang (2012) examined the effects of supply chain and third party involvement on product innovation performance on 208 Taiwanese firms. The concept of supply chain network was studied as the type of external member collaboration for firm new product development. The results indicated that external member involvement had a positive impact on product innovation performance. According to the study's research and examination of the literature, it was determined that there were 4 key manifest variants or observable variables related to *Competitive Advantage*. Scholars have studied these manifest variants or observable variables effects on *Supply Chain Management* from which the researchers have synthesized the research to include *customer involvement, internal involvement*, and *supplier involvement* in this study (Hsu, Tan, Kannam, & Leong, 2009; Abdallah, Obeidat, & Aqqad, 2014; Lai, C-S., Chen, C-S., & Yang, C-F., 2012; Feng & Wang, 201).

New Product Development

Success depends on the ability of organizations to develop new products and constantly and consistently bring these products to market. A case in point are P&G's leaders recognizing the need for this as the kind of growth the company was after couldn't come from simply doing more of the same. It needed to come up with more breakthrough innovations—ones that could create completely new markets (Brown & Anthony, 2011). Brown and Anthony (2011) further discussed P&G's success in innovation in new product development

with something the leaders called a "new-growth factory," which strengthened both its core businesses and its ability to capture innovative new-growth opportunities. Innovation has long been the backbone of P&G's growth with the company spending nearly $2 billion annually on R&D—roughly 50% more than its closest competitor and more than most other competitors combined, teaching its senior management and project team members the mind-sets and behaviors that foster **'disruptive growth'.**

Trainor, Krush, & Agnihotri (2013) examined how a firm's behavioral tendencies, along with its existing business resources, contribute to the formation of new product development (NPD) capability. Findings also suggested that a firm's competency in marketing intelligence and itstendency to engage in partner-style relationships have both direct and interactive effects on NPD capability. This capability is further shown to positively relate to organizational performance, and this relationship is moderated by technological uncertainty.

This is consistent with Feng and Wang (2013) which found that internal involvement is important in improving NPD speed, while customer and supplier involvement have significant effects on NPD cost and NPD speed. A customer needs to standardize the technology and manufacturing industries. Ability to develop products in shorter times can improve the timeliness of products and increase market share. Developing new products faster than the competition can increase customer satisfaction and customer loyalty, which results in cross-selling and increased sales.

Other studies have demonstrated a relationship between management of the supply chain and new product design and development (NPDD). McGinnis and Vallopra (1999) proposed that purchasing and supplier involvement in NPDD is a source of competitive advantage Ettlie and Sethuraman (2002) showed that NPDD intensity and the resulting percentage of revenue generated are directly related to levels of global sourcing. Ragatz, Handfield, and Petersen (2002) demonstrated that early supplier involvement in NPDD leads to significant improvements in cost, quality, and cycle time across the supply chain when customers have clear goals and specifications.

According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *Competitive Advantage*. Scholars have studied these manifest variants or observable variables effects on *New Product Development* from which the researchers have synthesized the research to include *time to market, engineering change request*, and *development cost* in this study (Trainor, Krush, & Agnihotri, 2013; Feng & Wang, 2013; Brown & Anthony, 2011; McGinnis & Vallopra, 1999; Ettlie & Sethuraman, 2002; Ragatz, Handfield, & Petersen, 2002).

Competitive Advantage

Hayes and Wheelwright (1984) suggested that companies compete in the marketplace by virtue of one or more of the following competitive priorities including quality, lead-time, cost, and flexibility. This is consistent with Li, Ragu-Nathan, Ragu-Nathan, and Rao (2006) which stated that with supply chain management (SCM) the empirical literature has been quite consistent in identifying price/cost, quality, delivery, and flexibility as important. Additionally, study results indicate that higher levels of SCM practice can lead to enhanced competitive advantage and improved organizational performance. Also, competitive advantage can have a direct, positive impact on organizational performance.

Wang, Lin, and Chu (2011) discussed internal sources of competitive advantage and identified technology and innovation, human resources and organizational structure as crucial key elements and further states that most innovative firms engage in a continual search for better products, services, and ways of doing things. They try to continuously upgrade their

internal capabilities and other resources. This is consistent with Awwad, Al Khattab, and Anchor (2013) which stated that competitive priorities included quality, cost, flexibility and delivery. Furthermore, competitive priorities and competitive advantage need to be recognized and nurtured as this relationship provides the master key for a firm to survive in a turbulent environment.

Leonidou, Leonidou, Fotiadis, and Zeriti (2013) stated that creating a long-term strategy that makes a difference uses low costs in order to generate revenue and profits. The organization should benefit from increased customer satisfaction and the building of customer retention. This also includes the use of innovative processes and products to take advantage of the cost and the difference in the market (Wong, 2012). According to the study's research and examination of the literature, it was determined that there were 4 key manifest variants or observable variables related to *competitive advantage*. Scholars have studied these manifest variants or observable variables effects on *competitive advantage* from which the researchers have synthesized the research to include *cost, quality, delivery*, and *flexibility* in this study (Hayes & Wheelwright, 1984; Li, Ragu-Nathan, Ragu-Nathan, & Rao, 2006; Wang, Lin, & Chu, 2011, Awwad, Al Khattab, & Anchor , 2013; Leonidou, Leonidou, Fotiadis, & Zeriti, 2013; Wong, 2012).

Proposed research hypotheses

H :1*Supply Chain Management* has a direct influence on *Competitive Advantage*
H :2*Supply Chain Management* has a direct influence on *New Product Development*
H :3*New Product Development* has a direct influence on *Competitive Advantage*

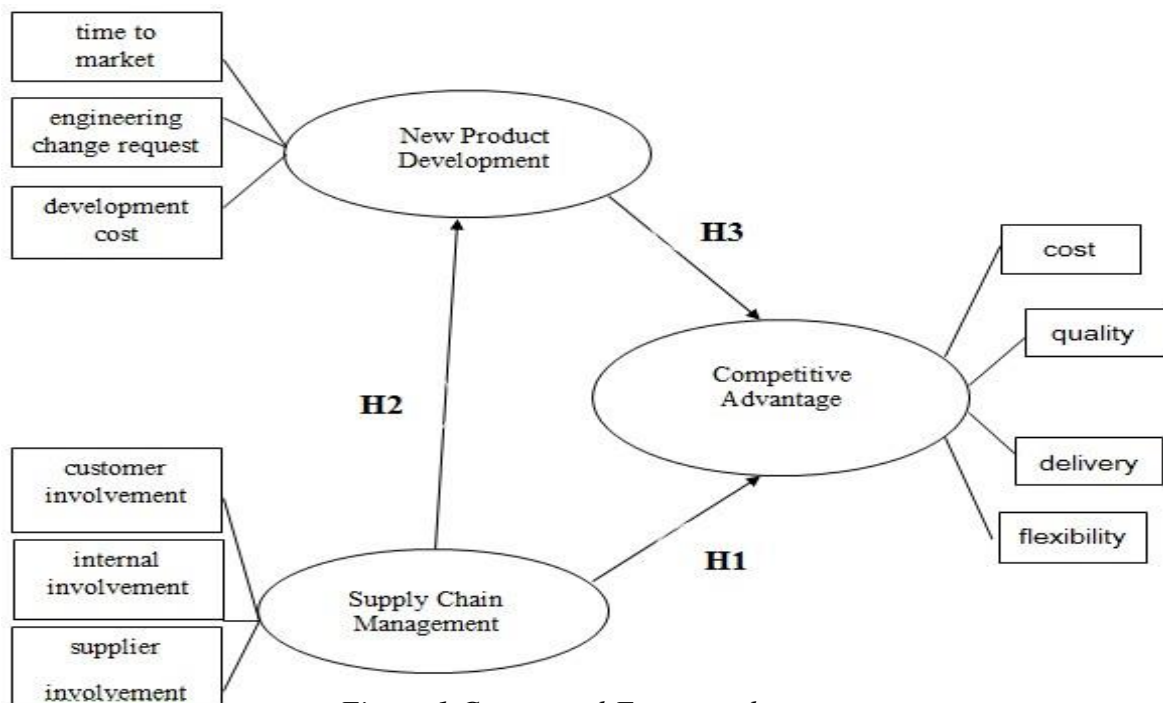
Proposed conceptual framework


Figure 1 Conceptual Framework

Methodology

This research aims to study the structure of the factors influence the competitive advantage of enterprises in Thailand's electronics and hard-disk components industry. Therefore, researchers have determined the following detailed steps of how to carry out the proposed research.

For this study the researchers used both quantitative and qualitative research from both primary and secondary data. The researchers thus determined the following steps for this study: The researchers are reviewing the literature related to the electronics and hard-disk drive (HDD) components industry. Thus far, research has been comprised of published research, textbooks, internet materials, media reports, and data which have been synthesized from the secondary data to develop a conceptual model for the variables that influence the competitive advantage of Thailand's electronics and hard-disk drive (HDD) components industry.

Quantitative Research Methods

Quantitative research will be performed using the primary data by collecting a questionnaire from the target sample. The questionnaire to be used to collect data is structured and written in a realistic, easy-to-understand format which is deemed to be reliable and reasonable. Further measurement and reliability validation will be undertaken as follows:

1. Questionnaire review will be conducted by academic scholars to validate the investigation questions and the use of rhetoric and the simplicity and comprehension of the questions.

2. During the questionnaire trial stage, questions and responses will be monitored so better clarity can be achieved. Questions will be updated as needed.

3. Perform data collection and statistical analysis

Qualitative Research Methods

Qualitative research will involve confirming the model of the quantitative research. It is a collection of interviews with individuals who have been involved in the electronics and hard-disk drive components industry, including executive directors, managers and department heads that have had a minimum of five years of experience.

Population and sample

The sample used in this study was executive directors, managers and department heads with at least five years' experience in the electronics and hard-disk components industry.

The sample size

Schumacker and Lomax (2010) stated that Structural Equation Modeling (SEM) uses a variety of models to show the relationships between observed variables with the same basic goal of providing a quantitative test of a theoretical model hypothesized by a researcher with Meldrum (2010) further stating that a sample size smaller than 100 should not be used in SEM as it is unreliable. Therefore, using a factor of 20 for each of the 10 variables from the research survey, it is anticipated that a total of 200 samples are adequate to assure a reliable sample size (Schumacker & Lomax, 2010). To confirm the model of quantitative research, 10 in-depth interviews with those involved in innovation, production control and operations, including executive directors, managers and department heads that have had a minimum of five years of experience to confirm the quantitative research.

Tools used in the research

For this research, the measurement instrument or questionnaires utilized was prepared from the literature. A self-administered questionnaire (SAQ) is being used as it is exploratory in nature and serves as a starting point for other methodologies (Mahdi, 2012).

Research quality inspection tools

Researchers will continue to monitor the quality of the instruments used in the research to be used as a measurement of quality. The entire content validity and reliability is divided into two stages.

1. The questionnaire will be created by the research team, and be peer-reviewed and tested by use of the content validity of item objective congruence index (IOC) by five experts in their respective fields. The index of Item-Objective Congruence (IOC) developed by Rovinelli and Hambleton (1977) being employed to carry out the screening of questions is a procedure used in test development for evaluating content validity at the item development stage. This measure is limited to the assessment of unidimensional items or items that measure specified composites of skills. The method prescribed by Rovinelli and Hambleton (1977) results in indices of item congruence in which experts rate the match between an item and several constructs assuming that the item taps only one of the constructs which is unbeknownst to the experts. The study will then proceed to select items that have an IOC index higher than 0.5 which will be considered acceptable foe the research.The IOC for each item is the summation of scores given by the experts divided by the number of experts. This ensures the quality of the questionnaire with any IOC score less than 0.05 being eliminated.
2. Checked by five experts in their fields including:
   Management Engineer   1 individual
   Production and Cost Control Management   2 individuals
   Academic Management Scholars   2 individuals

Data collection

Primary data is a collection of factors that influence Thailand's electronics and hard-disk drive (HDD) components industry firms. Secondary Data consists of studying the theories related to the research from various sources; including books, manuals, tutorials, articles, research papers, etc., which will be used to define the concepts and theories used in the study.

Analysis of data and statistical methods used

Quantitative data analysis research will be conducted using statistical analysis as follows: Descriptive statistics including frequency, percentage, mean, and standard deviations will be used to represent the data. Both univariate and multivariate logistic regression analysis will be performed to examine the association between dependent variables and independent variables. Descriptive statistics is also used to demonstrate the profiles as well as rating scores and response rate. An analysis will be conducted using structural equation modeling (SEM) to determine the relationship of the factors influencing the competitive advantage of Thailand's electronics and hard-disk drive (HDD) components industry enterprises.

Qualitative data analysis

To confirm the results of the quantitative analysis are credible and the findings reliable, the researchers will conduct interviews with those involved in product innovation

such as executive directors, managers and department heads in manufacturing or operations that have had a minimum of five years of experience.

Afterwards, the researchers will proceed to interpret qualitative information, including classified information. According to Hancock, Windridge, and Ockleford (2007) data collection and analysis should proceed concurrently: in theory, data analysis should occur at the same time as data collection to allow researchers to refine the research question and data collection procedures in the light of new findings, but in reality, this is hard to achieve (e.g. because transcribing recorded interviews takes time, and analysis takes even more time). However it is important to review transcripts as they are transcribed and to undertake informal modification of prompt guides.

The idea that qualitative data is mainly 'unstructured' is useful, if this is taken not as a definition but rather as an imperative for analysis. Although unstructured data may not be classified, it can be classified and indeed one of the main aims of qualitative analysis is often to do just that (Dey, 1993). *Qualitative* data deals with characteristics and descriptors that can't be easily measured, but can be observed subjectively (Martz, 2014).

Conclusion

After a preliminary review of the literature in the development of the study's hypotheses on *Supply Chain Management and New Product Development effects on Thai Electronics/Hard Disk Drives Competitive Advantage*, it was established that Thai HDD assemblers need to concentrate on enterprise and consumer electronics HDDs which would allow Thai factories to respond better to global HDD demand. Additionally, there is a steady and growing trend towards SSD in HDD key markets, internet-connected devices and smartphones. Furthermore, it has been suggested that Thailand needs to adjust its current HDD-focused manufacturing strategy to incorporate production of various types of storage devices which will allow the industry to rise to current challenges amid changes in global demand, lowering the risk from HDD market saturation as used by businesses and in consumer electronics in the past.

Flash memory technology is exceptionally important to Thailand's long-term competitiveness and as a result, getting into flash memory production supply chains would help ready Thailand for SDD manufacturing later on. To achieve this, the industry we will need good planning, effective skills development policies, plus private technology research and development, with an emphasis placed on technical skill-based training.

Economists say that Thailand is not as nimble as other low-cost economies to adapt to newer types of technology, and its innovation ranking in the World Economic Forum's Global Competitiveness Index fell to 67 in 2014 from 33 in 2007 (Reuters. 2015).. As the old children's song goes, "Jack be nimble, Jack be quick!" According to Sathirathai (a senior economist of Credit Suisse in Singapore); "When you look at the context of the continuous decline, you see there is a structural competitiveness problem that has been eroding Thailand" (Reuters, 2015). This is consistent with SCB (Siam Commercial Bank) Economic Intelligence Center analyst Amornvivat (2014), who stated that "the inconvenient truth is that Thailand has reached the tail end of growth in several of Thailand's major tech-related exports; e.g., computer hard disk drives". At present, Thai companies rank low in R&D investment levels with spending on R&D at just 0.3% of GDP, much lower than those in China and Malaysia (Amornvivat, 2014). Maybe it's time for competitive change?

Abstract

In 2014 Thailand's overall trade in the electronics industry was worth approximately US$59.5 billion currently, employing over 600,000 people in the sector. At the end of 2015, Thailand joined a 10-nation economic community with 625 million people and a $2.5 trillion economy with a projected growth of six percent per year over the next decade which opens many doors for sales, but competition as well. This study therefore presents a conceptual framework about the structure of the factors including technology capability and new product development that affect the competitive advantage of manufacturing enterprises in the electronics components and hard disk drive industries. Quantitative data is being obtained from a proposed sample of 220 production control and operations mangers, including executive directors, managers and department heads that have had a minimum of five years of experience. Qualitative research is being conducted with 10 executives by the use of purposive sampling. Analysis will be conducted using Partial Least Square (PLS-Graph) software to apply Structural Equation Modeling (SEM).

Keywords: *ASEAN, HDD, new product development, SEM*

Introduction

According to Thailand's Board of Investment (BOI, 2015), Thailand's electronics industry is a core element of the Thai manufacturing sector's success and in 2014, Thailand's overall trade in the electronics industry was worth approximately US$59.5 billion, with export revenues accounting for over US$32 billion. The electrical and electronics industry has not merely played an important role in Thailand's economy as a main growth driver, but has also made Thailand Southeast Asia's electrical and electronics manufacturing hub.

In 2014, Thailand's main electronics exports (Figure 1) were computer components and integrated circuits (IC), which accounted for approximately 56% and 24% of total electronics exports respectively. Having two of the global data storage manufacturers, Western Digital and Seagate, has made Thailand the second largest data storage product producer and exporter in the world. At the same time, Thailand holds an equally renowned reputation in the IC and semiconductor sectors due to Thailand being one of the main manufacturing bases for these products in the ASEAN (Association of Southeast Asian Nation) region with exports reaching US$32 billion in 2014 (BOI, 2015).

Having long been a cornerstone for an automatic data processing (ADP) machine industry, Thailand is one of the largest global producers and exporters of automatic data

processing machines. In 2014, Thailand's exports totaled US$12 billion and grew by 7% from 2011. The competitiveness of Thailand's HDD industry is based on its world class industrial clusters containing supporting industries that manufacture most of the components utilized in the assembly of HDDs. Technological innovations in the consumer and enterprise sectors have produced next generation of HDD and newer data storage techniques such as Solid State Drives (SSD) and Solid State Hybrid Drives (SSHD).

Source: Thai Electrical and Electronics Institute
Figure 1 Thailand's Electronics Exports and Imports, 2010-2014

HDD production in Thailand began in 1983 after Seagate Technology shifted its head-stack assembly (HSA), the most labor-intensive segment in the HDD production process, out of Singapore (TIR, 2015). It was relatively low-wage labor as well as a favorable investment climate in the Kingdom that enticed HDD makers. Back then, the imported content of HSA exports was close to 80%. Despite the presence of high tariffs, HDD manufacturers were eligible for exemption schemes as their products were principally for export.

In 2013, Thailand's main electronics exports were still hard disk drives (HDD) and integrated circuits (IC), which accounted for approximately US$11.79 billion and US$7.42 billion worth of total electronics exports, respectively (TIR, 2015). Major HDD producers – Western Digital, Seagate, Hitachi and Toshiba – have production facilities in Thailand. Similarly, the country is recognized as a leader in the IC and semiconductor industries, and boasts one of the largest concentrations of assembly plants in Southeast Asia for these products. The primary markets for these exports were the USA (19.5%), Hong Kong (19.3%), ASEAN (14.3%), China (10.8%) and Japan (7%). Increasing demand for electronics saw imports rise to US$27 billion with mainly printed circuits and IC being imported to supply Thailand's increasingly advanced electronics manufacturing ecosystem.

Furthermore, Techanuvat and Tantisunthorn (2015) reported that Thai exports of electronic circuits expanded significantly by 20% YOY in April, 2015 after a 10% drop the previous month. The growth was propelled by exports to Hong Kong and the U.S. that grew by 37.7% YOY and 24.4% YOY. In addition, exports of electronic circuits to China rose by 60% YOY in April. Auto and parts exports grew by 9% YOY in April after a 5% rise in March. Particularly, auto exports to Australia, one of Thailand's key markets, leaped by 71.8% YOY. Similarly, auto exports to markets such as CLMV and EU maintained the high growth levels of 30.6% YOY and 74.1% YOY in the first four months of 2015.

Currently, over 600,000 people are employed in Thailand's electrical and electronics sector and with entry into the AEC (ASEAN Economic Community) at the end of 2015; Thailand entered a 625 million, $2.5 trillion economic community projected to grow 6

percent per annum over the next decade (Menon, 2016). The AEC will expand export opportunities for electrical & electronics manufacturers located in Thailand with manufacturers benefiting from manufacturing clusters, government research programs, and incentives devoted to the electrical & electronics industry. Thailand's government, recognizing the crucial role the electrical and electronics industry will continue to play in Thailand's economic development, offers attractive investment incentives to attract major global players in the electrical and electronics industry. Some unfortunately do not see such a rosy picture as others might suggest.

According to the SCB (Siam Commercial Bank) Economic Intelligence Center analyst Amornvivat (2014), the inconvenient truth is that Thailand has reached the tail end of growth in several of Thailand's major tech-related exports; e.g., computer hard disk drives. Foreign direct investment is only a short-term solution, notwithstanding. Thai businesses indeed must invest more in research and development for a more sustainable growth path. At present, Thai companies rank low in R&D investment levels with spending on R&D at just 0.3% of GDP, much lower than those in China and Malaysia (Amornvivat, 2014).

Also, to ensure a sustainable path, innovations must not be limited to large companies. Encouraging innovations among our SMEs is crucial to uplift the growth potential. The government has to equip them with knowledge and access. One way to facilitate this is to establish testing facilities for SMEs to improve their products. Domestic testing center that is up to par with international standard will reduce test time sending sample products overseas for testing, facilitating innovation and increasing our value added (Amornvivat, 2014),

As Thailand surges up the ladder of economic development, the country naturally has moved away from an over-reliance upon labor-intensive industries to a more tech-savvy, knowledge-based economy. To further support this move towards a high value-added economy, the government has prioritized the development and promotion of science, research and development, technology and innovation and has stated its intention to increase R&D expenditures to 1% of total GDP (TIR, 2015).

The commercial production and marketing of electronic and industrial components and hard disk drives is causing dramatic changes to the competitive environment of the industry. A case in point is Seagate Technologies which opened its operations in Thailand in 1983 having to date invested more than US$2.5 billion in capital now having two manufacturing facilities with over 16,000 employees (TIR, 2015). It is the largest hard drive facility in the world and produces slider, head gimbal assembly (HGA), head stack assembly (HSA), and drive assembly and conducts R&D.

According to Seagate Technology, data storage will continue to expand at 26% per year through 2020, when the data storage market is expected to be three or four times its current size and about 60% of it will be in the cloud (TIR, 2015). More big data is to come as demand keeps increasing from governments and the private sector, especially manufacturing, retail, media, banking, real estate and science with Asia being the largest revenue source for the industry.

In the above short discussion of Thailand's electronics and hard disk drive manufacturing sector we have seen an industry to soar to new highs which momentarily seems to be on the precipice of change. From all directions we hear government leaders and corporate CEOs bang the drum for the development of R&D and testing facilities that are up to international stamdards along with higher investment in innovation to increase Thailand's competitive advantage. With the tighter integration of the AEC at the end of 2015, many regulations, laws, tariffs and the ability for the movement of workers changed. As yet, this change is small as bureaucracies move slowly. Companies however must be quick to change or their very survival often times becomes critical. Production, trade, marketing and

investment are also other components in the equation of having a competitive advantage. The researchers therefore have decided to undertake a study how *competitive advantage* is affected by new *product development* and *technology capability.*

Literature review
Technology Capability

There are many interpretations of what technology capabilities consist of but according to the German Development Institute (GDI, 1994) it is stated that adequately developed technological capability that is essential is the knowledge of the technologies available, the ability to evaluate and select such technologies, to utilize, adapt, improve, and, finally, to further develop them.

This is consistent with Meyer-Stamer (GDI, 1994) which describes the *Four Pillars of Technological Capability* (embraced by the GDI) as the capacity to gain an overview of the technological components on the market, assess their value, select which specific technology is needed, use it, adapt and improve it and finally develop technologies oneself. Technological capabilities can also vary between sectors (Eckaus, 1991; Zahlan , 1990). In the industrial sector, the elements of technology capability - production engineering, manufacture of capital goods, and research and development, etc. - are different from those essential for the services sector.

Huang (2011) investigated technology competencies and stated it plays a significant role in firm innovation and competitiveness. Research from Taiwan's information and communication technology (ICT) industry suggested that capabilities of exploring or exploiting technological opportunities, core technology capability, and autonomy of R&D decisions are particularly important to firm innovation in a highly competitive environment.

Rasiah (2004) discusses the importance of foreign firms in technological capability building and economic performance in developing countries. Research reveals that although foreign firms tend to enjoy higher human resource and process technology capabilities in the most underdeveloped economies, in the more advanced nations this comparative advantage is significantly eroded. Institutional and systemic strength of a country can help to explain the level of participation of foreign firms in R&D activities. Also, domestic and regional markets, infrastructure, incentives, natural resources and human capital are important factors in stimulating significant R&D investment by foreign firms.

According to the study's research and examination of the literature, it was determined that there were 4 key manifest variants or observable variables related to *competitive advantage*. Scholars have studied these manifest variants or observable variables effects on *technology capability* from which the researchers have synthesized the research to include *automation production, production technology*, *design technology* and *technology development* in this study (GDI, 1994; Eckaus, 1991; Zahlan, 1990; Huang, 2011; Rasiah, 2004).

New Product Development

Feng and Wang (2013) investigated the impacts of three types of supply chain involvement (SCI) on three types of new product development (NPD) performance from 214 Chinese manufacturing companies. It was discovered that internal involvement is positively associated with customer and supplier involvement. It was also found that three types of SCI influence three types of NPD performance differently. Specifically, internal involvement is important in improving NPD speed, while customer and supplier involvement have significant effects on NPD cost and NPD speed. Moreover, internal and customer

involvement enhance market performance indirectly, whereas supplier involvement improves market performance both directly and indirectly.

Trainor, Krush, & Agnihotri (2013) examined how a firm's behavioral tendencies, along with its existing business resources, contribute to the formation of new product development (NPD) capability using survey data from more than 150 US-based firms. Findings suggested that a firm's competency in marketing intelligence and its tendency to engage in partner-style relationships have both direct and interactive effects on NPD capability. This capability is further shown to positively relate to organizational performance, and this relationship is moderated by technological uncertainty. Tan (2001) analyzed the effects of supplier assessment, Just-In-Time, and quality management strategies on new product design and development from a survey of senior managers who are members of the American Production and Inventory Control Society in the United States. Results showed that supplier assessment and Just-In-Time strategies were correlated and affected the quality management strategy used, which in turn influenced the new product design and development strategy. The data also showed that the Just-In-Time strategy directly influenced the new product design and development strategy. Mikkola (2006) discussed the implications of platform management for new product development and sourcing strategies using a Danish hearing aid manufacturer as a case study. Analysis revealed the risk of single sourcing and raised the question, how buyers without leverage can become an interesting customer for large suppliers?

Lai, Chen, & Yang (2012) examined the effects of supply chain and third party involvement on product innovation performance on 208 Taiwanese firms. The concept of supply chain network was studied as the type of external member collaboration for firm new product development. The results indicated that external member involvement had a positive impact on product innovation performance.

According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *competitive advantage*. Scholars have studied these manifest variants or observable variables effects on *New Product Development* from which the researchers have synthesized the research to include *time to market, engineering change request*, and *development cost* in this study (Trainor, Krush, & Agnihotri, 2013; Feng & Wang, 2013; Lai, C-S., Chen, C-S., & Yang, C-F., 2012; Tan, 2001; Mikkola, 2006; Mikkola & Skjøtt-Larsen, 2006).

Competitive Advantage

Porter (2001) identified two basic types of competitive advantages consisting of cost advantage and differentiation advantage. A competitive advantage exists when the firm is able to deliver the same benefits as competitors but at a lower cost (cost advantage) or deliver benefits that exceed those of competing products (differentiation advantage). Thus, a competitive advantage enables the firm to create superior value for its customers and superior profits for itself.

Awwad, Al Khattab, and Anchor (2013) stated that competitive priorities included quality, cost, flexibility and delivery. In the research, the results of the data analysis indicated a significant relationship between competitive priorities and competitive advantage and suggested that recognizing and nurturing this relationship provides the master key for a firm to survive in a turbulent environment. Therefore, operational and marketing strategies should place emphasis on competitive priorities such as quality, cost, flexibility and delivery to achieve, develop and maintain competitive advantage.

Chang (2011), focused research on the rrelationships between corporate environmental ethics and competitive advantage, and concluded that companies should invest more resources

to enhance their environmental ethics. By so doing, this will help to improve their competitive advantage as well as driving green innovations.

This is consistent with Chen (2008) which showed that three types of green intellectual capital – green human capital, green structural capital, and green relational capital – had positive effects on competitive advantages of firms. Moreover, this study found that green relational capital was the most common among these three types of green intellectual capital, and the three types of green intellectual capital of Medium & Small Enterprises (SMEs) were all significantly less than those of large enterprises in the information and electronics industry in Taiwan. In sum, companies investing many resources and efforts in green intellectual capital could not only meet the trends of strict international environmental regulations and popular environmental consciousness of consumers, but also eventually obtain corporate competitive advantages.

Peng, Schroeder, & Shah (2011) examined the strategic contingency of plant improvement capability and innovation capability from 238 manufacturing plants and found that improvement capability and innovation capability are associated with different competitive priorities and also have varying impact on different operational performance dimensions. Ong, Ismail, Guan, & Goh, 2010 collected 356 survey results from Malaysian SMEs (small and medium-sized enterprises). Analysis suggested that flexibility in operations and adaptability to changes afford SMEs with a greater possibility to gain from unexpected changes and accidental discoveries. Furthermore, both entrepreneurship and luck play a significant role in influencing the competitive advantage of SMEs. Therefore, SMEs are encouraged to cultivate a flexible and adaptive organizational structure in order for it to benefit from both endogenous and exogenous luck.

According to the study's research and examination of the literature, it was determined that there were 4 key manifest variants or observable variables related to *competitive advantage*. Scholars have studied these manifest variants or observable variables effects on *competitive advantage* from which the researchers have synthesized the research to include *cost, quality, delivery*, and *flexibility* in this study (Porter, 2001Awwad, Al Khattab, & Anchor, 2013; Chang, 2011; Peng, Schroeder, & Rachna, 2011; Chen, 2008; Ong, Ismail, Guan, & Goh, 2010).

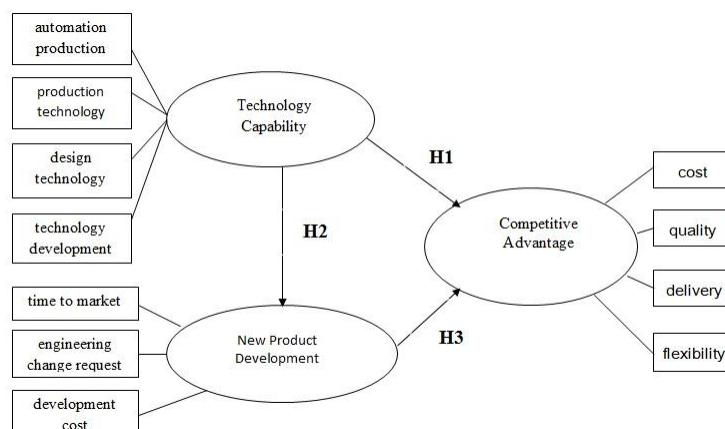
Proposed conceptual framework
Proposed Research Hypotheses
H :1Technology Capability has a direct influence on Competitive Advantage
H :2Technology Capability has a direct influence New Product Development
H :3New Product Development has a direct influence Competitive Advantage


Figure 2 Conceptual Framework

Methodology

This research aims to study the structure of the factors influence the competitive advantage of enterprises in Thailand's electronics and hard-disk components industry. Therefore, researchers have determined following detailed steps of how to carry out the proposed research.

The approach used in the study

For this study the researchers used both quantitative and qualitative research from both primary and secondary data. The researchers thus determined the following steps for this study:

Study of Secondary Data

The researchers are reviewing the literature related to the electronics and hard-disk components industry. Thus far, research has been comprised of published research, textbooks, internet materials, media reports, and data which have been synthesized from the secondary data to develop a conceptual model for the variables that influence the competitive advantage of Thailand's electronics and hard disk drive components industry

Quantitative Research Methods

Quantitative research will be performed using the primary data by collecting a questionnaire from the target sample. The questionnaire to be used to collect data is structured and written in a realistic, easy-to-understand format which is deemed to be reliable and reasonable. Further measurement and reliability validation will be undertaken as follows:
1. Questionnaire review will be conducted by academic scholars to validate the investigation questions and the use of rhetoric and the simplicity and comprehension of the questions.
2. During the questionnaire trial stage, questions and responses will be monitored so better clarity can be achieved. Questions will be updated as needed.
3. Perform data collection and statistical analysis

Qualitative Research Methods

Qualitative research will involve confirming the model of the quantitative research. It is a collection of interviews with individuals who have been involved in the electronics and hard disk components industry, including executive directors, managers and department heads that have had a minimum of five years of experience.

Sample

The sample used in this study was CEOs, executive directors, and managers responsible for the performance of their respective manufacturing enterprises in the electronics and hard-disk components industry in Thailand.

The sample size

Schumacker and Lomax (2010) stated that Structural Equation Modeling (SEM) uses a variety of models to show the relationships between observed variables with the same basic goal of providing a quantitative test of a theoretical model hypothesized by a researcher with Meldrum (2010) further stating that a sample size smaller than 100 should not be used in SEM as it is unreliable. Therefore, using a factor of 20 for each of the 11 variables from the

research survey, it is anticipated that a total of 220 samples are adequate to assure a reliable sample size (Schumacker & Lomax, 2010).

To confirm the model of quantitative research, 10 in-depth interviews with those involved in innovation, production control and operations, including executive directors, managers and department heads that have had a minimum of five years of experience to confirm the quantitative research.

Tools used in the research

For this research, the measurement instrument or questionnaires utilized was prepared from the literature. A self-administered questionnaire (SAQ) is being used as it is exploratory in nature and serves as a starting point for other methodologies.

Quality inspection tools used in the research

Researchers will continue to monitor the quality of the instruments used in the research to be used as a measurement of quality. The entire content validity and reliability is divided into two stages.

1. The questionnaire will be created by the research team, and be peer-reviewed and tested by use of the content validity of item objective congruence index (IOC) by five experts in their respective fields. The IOC for each item is the summation of scores given by the experts divided by the number of experts. This ensures the quality of the questionnaire with any IOC score less than 0.05 being eliminated.
2. Checked by five experts in their fields including:
   Management Engineering   1 individual
   Production and Cost Control Management   2 individuals
   Academic Management Scholars   2 individuals

Data Collection

Primary data is a collection of factors that influence Thailand's electronics and hard-disk components industry enterprises.

Secondary data

Secondary Data consists of studying the theories related to the research from various sources; including books, manuals, tutorials, articles, research papers, etc., which will be used to define the concepts and theories used in the study.

Data analysis and statistics used

Quantitative data analysis research will be conducted using statistical analysis as follows:
1. Descriptive statistics including frequency, percentages, means, and standard deviations will be used to demonstrate the profiles as well as rating scores and response rate.
An analysis will be conducted using structural equation modeling (SEM) to determine the relationship of the factors influencing the competitive advantage of Thailand's electronics and hard-disk components industry enterprises.

Qualitative data analysis

To confirm the results of the quantitative analysis are credible and the findings reliable, the researchers will conduct interviews with those involved in product innovation such as executive directors, managers and department heads in manufacturing or operations that have had a minimum of five years of experience.

Afterwards, the researchers will proceed to interpret qualitative information, including classified information. According to Hancock, Windridge, and Ockleford (2007) data collection and analysis should proceed concurrently: in theory, data analysis should occur at the same time as data collection to allow researchers to refine the research question and data collection procedures in the light of new findings, but in reality, this is hard to achieve (e.g. because transcribing recorded interviews takes time, and analysis takes even more time). However it is important to review transcripts as they are transcribed and to undertake informal modification of prompt guides.

The idea that qualitative data is mainly 'unstructured' is useful, if this is taken not as a definition but rather as an imperative for analysis. Although unstructured data may not be classified, it can be classified and indeed one of the main aims of qualitative analysis is often to do just that (Dey, 1993).

Conclusion

From a review of the literature, it was established that if engineering changes are underestimated, the impact on the project budget or time-to-market can be severe with even a relatively modest time delay greatly compromising the profit margins for large projects as well as a firm's competitive advantage (Eger, Eckert, & Clarkson, 2007).

As was seen in the discussion on Seagate Technology's investment in Thailand and its subsequent global leadership, competitive advantages for multinational firms comes from not relying only on wage levels and land resources but instead incentives from the country in which it is based, with the key to achieving this being the forming of industrial clusters (Amano, 2005).

Electronic components and hard disk drives manufacturers can achieve a competitive advantage by developing new products focusing on their time to market, engineering changes and development costs. Additionally, new product development results from strategic development, management efficiency and competitiveness which can lead to a competitive advantage. Technological capabilities consist of automated production, manufacturing technology, and design and technology development. These factors are the most immediate causes to competitiveness and contribute to the development of new products, which are intermediate variables that affect competitiveness as well.

BUSINESS STRATEGY FORMULATION FOR INCREASING APPAREL INDSTRY COMPETITIVENESS IN BANDUNG

Aditya Darmawan, Institut Teknologi Bandung, Indonesia

Abstract

Apparel is a part of TPT industry. With gross domestic product (GDP) esteemed at Rp.172.4 billion (US$14.4 billion) in 2013. Textile and textile products (TPT) industry is one of the significant sectors in Indonesia.The textile and clothing (TPT) industry in Indonesia currently facing pressure from both domestic and foreign market, which in turn lowering its growth. This research is aimed to increasing apparel industry competeveness in Bandung. The competitivenesss is going to be analyzing using general analysis (pest analysis), porter 5 force, analysis of competitors, time series analysis and growth index to asses internal capability sector share analysis, value chain analysis, value added analysis, asset mapping, skills audit and stakeholder analysis is conducted. The result shows that Bandung have strength such as image as creative and fashionable city , abundant of natural and human resource and the presence of supporting industry. The weaknesses are the lack of innovation and data. On the external side, the greatest opportunity is the collaboration from all shareholder and the growth of e commerce. The threat comes from invasion of foreign goods especially from china. From four alternative strategy, two strategy is chosen. First strategy is make fashion tourism in Bandung and long tail business model. In addition, the second strategy is create agile supply chain. Two strategy is chosen because each strategy using different approach which is resource driven and offer driven. Business canvas model is used to explain about the business model for each strategy.

Keywords: *Indonesia - Tasikmalaya, Real Estate Development, Feasibility Study, Risk Management*

Introduction

With gross domestic product (GDP) esteemed at Rp 172.4 billion (US$14.4 billion) in 2013. Textile and textile products (TPT) industry is one of the significant sectors in Indonesia This sector also absorb quite significant labor with 2.9 million people, or 21.7 percent of the total labor absorption of non-oil and gas manufacturing industries according to Central Statistics Agency (BPS) data

The growth of the TPT industry in this year is decline with negative growth of 0.98% over the same period last year. It was below the growth of the manufacturing industry, which is 3.87%, and then the growth of Indonesia's total GDP of 4.71%.
Figure 8 Comparison between Manufacturing, TPT and Indonesia GDP

Export sales accounting for about 63% of the total revenue from Indonesia's TPT Industry. Looking at this fact, global economic condition will affecting the performance of the TPT industry, especially US and Europe economy as the largest market for TPT export US economy is expected to improve in 2015. However, TPT exports is not expected to felt in any significant improvement because of this. Furthermore, there are still problem facing Indonesian TPT exports in domestic constraint that needed to be addressed such as, the dwelling time at ports and the lack of free trade agreement with other countries. Additionally, 60% of the TPT exports comes from garment products. These products have the Harmonized System (HS) codes of chapter 61 (articles of apparel, accessories, knitted or crochet), 62 (articles of apparel, accessories, not knitted or crochet), and 63 (other made textile articles, sets, worn clothing). Looking at the exports by country of destination, United States is the largest market for Indonesian TPT exports with (31.08%), followed by the EU (16.02%), Japan (9.60%), Turkey (5.10%), and ASEAN (6.90%).
Figure 9 Indonesia TPT Industry Export destination

The majority of Indonesian TPT exports to US in 2014 are HS codes 61 and 62, which accounted for 47.07 % and 46.65% respectively of the total. It is similar to EU export, with the codes reversed, in which the HS codes 62 and 61 accounted for 41.67% and 31.84% respectively of the total.

Facing pressure from both domestic and foreign market, growth in textile and clothing (TPT) industry in Indonesia is slowing. The slowing economic growth in the world, lead to decreasing demand in local and foreign market. To make matter worse, the declining demand is combine with increased production costs such as increased labor cost, the rising energy

prices such as, fuel and electricity. Price instabilities due to Rupiah devaluation and dependent to imported raw material. Moreover, imported products overflowing the market, mainly import comes from China and Korea. There also a problem facing Indonesian TPT exports in domestic constraint such as, the dwelling time at ports and the lack of free trade agreement with other countries. Besides that, Indonesia need to face competition with global player especially Vietnam, to fight for US and European markets. Production costs in Vietnam is lower than Indonesia, because Vietnam labor cost is cheaper. This situation is different compare with Indonesia at this time. The combination of the increased cost of raw materials, expensive fuel cost, the ever-growing cost of labor plus the weakening of the Rupiah, causing many companies face difficult time to compete. The increased production costs have caused industries, especially the textile industry, to lay off their employees.

For example, textile industry centers in four districts in the Regency of Bandung retrenched 6,000 textile factory workers during the period from January to May 2015. If the situation is not handled immediately, it will cause even worse effects and chain reaction. As much as tens of thousands or even hundreds of thousands of workers would lose their jobs if such layoffs were to take place across the island of Java. The ability of a region to innovate is a very important factor for a region to face the increasing pressure of global competition. The development of competitiveness must be based on the potential in the regions so that the theme of the development of an area should be based on the potential of the area. Determination of the innovation must be tailored to the strategic issues of the city, which will be the basis of city development direction to form an innovation system that is appropriate to the potential of the region.

1. Research Methodology

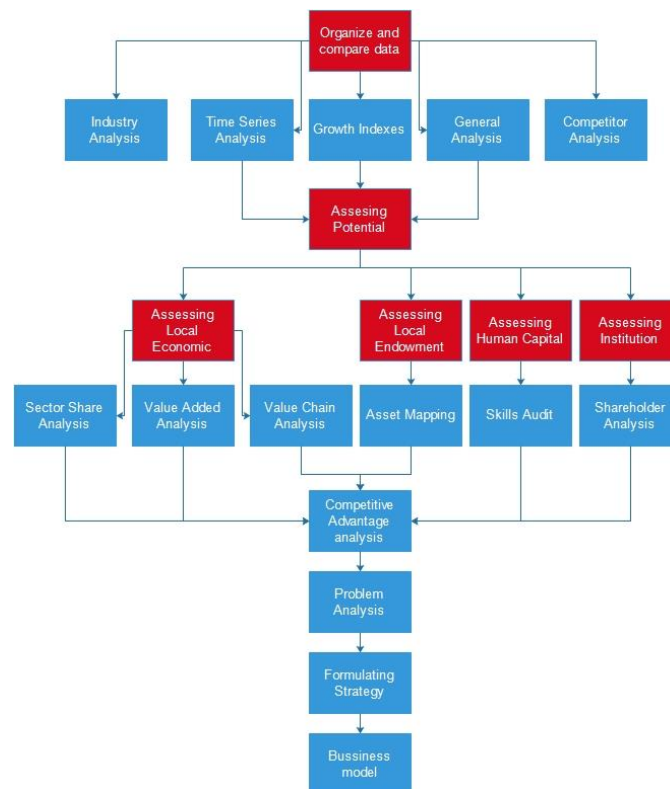
To analyze Bandung competiveness in Apparel Industry describe as follow:


Figure 10 Conceptual Framework

Author uses outside in perspective to create the conceptual framework. Outside in perspective is used so that we can see the bigger picture before assessing the local economy. This framework is based on recommendation of journal in City alliance about local economic development. The competitiveness exploration is started by organizing and comparing data using General Environment Analysis, Industry Analysis, Competitor Analysis, Time Series Analysis, and Growth Index. Then author assesses the potential of Bandung in four themes, which is the Local Economy, Local Endowment, Human Capital and Institution. The choice of the theme is based on the competitive source of city, which is, Local endowments, Human resource, Local economic and Institution. After done assessing the potential of the city, Competitive Advantage Analysis is conducted to assess the local economy based on its potential to see advantage and challenge, and then use the output for SWOT and TOWS analysis. After that problem, analysis is conducted to identify core problem to be addressed in the strategic planning process.

The formulation strategy begins from creating strategy alternative using SWOT and TOWS analysis. From several alternative strategy, author choose the most suitable strategy to be implemented.Bussiness canvas model is used to explain the business model of proposed strategy.

2.   Business Issue Exploration
The idea is to makes apparel industry in Bandung is able to compete in global stage. To confirm that this idea is a right and attractive project, we need to first assess the current condition, choose the right business strategy, set correct targets, and understand the strength and weaknesses of Bandung apparel industry

3.1 External Analysis

3.1.1 Industry analysis

Using the Porter 5 Forces, (Hitt I. H., 2011) this step analyses the five aspects of the Textile and Clothing Industry (TPT) industry in Bandung. Those aspects are Threat of Substitutes, Threat of New Entrants, Bargaining Power from Suppliers, Bargaining power of Buyer and Industry Rival.

Threat of Substitutes   In Apparel Industry, the substitutes for apparel is branded label from Europe or cheap product from china. Because there is no real substitute for apparel/Clothing. Branded label from Europe and cheap product from Chinese is attractive in buyer perspective. The easiness to buy clothing online also increased their threat all of the substitutes have low switching cost. Therefore, the threat of substitute is high

Threat of new entrants or barrier to entry for new entrant need to overcome few factor. Economic of scale on apparel Industry could give benefit especially if they have modern and integrated supply chain. The strongest differentiation for apparel industry is the trademark design and their brand value in customer's eyes. The more integrated supply chain the more capital requirement will be needed. Apparel industry have low switching cost to switch to rival or newcomer. Apparel industry relies heavily on logistic. The incumbent may have a cost advantage that is hard to replicate by a newcomer Newcomers to apparel industry will have a significant barrier to entry if they join the high-tier market. Nevertheless, have a low barrier to entry to join low tier market.

Industry Rivalry Industry rivalry means the concentration of opposition among the competitors in the industry. Industry rivalry often occurs in the form of competing for the position by using several tactics (for example, price competition, advertising, and product introductions). The intensity of this rivalry tends to increase when companies either suffer competitive pressure or discover an opportunity to improve their position.

Bargaining power of suppliers, the existence of influential suppliers reduces potential profit in the industry. Because of inexpensive shipping costs and product nature, suppliers are sourced from around the world Apparel industry suppliers are the raw material provider, apparel manufacturers, design firm, distributor. Many players in this sector weaken their power. In addition, many firms employ strategy to have more than one supplier in order to decrease the suppliers' power even more

Bargaining power of Buyers the existence of powerful buyers decreasing the profit potential in an industry. Buyers increase competition within an industry by forcing down prices, bargaining for improved quality or more services, and playing competitors against each other. Buyers in this market vary in size from the international player to the individual retail customer. The majority of sales will be from a big player such as large fashion company etc. The big player can also easily switch without losing much cost. The individual retail customer has very little
are one of the strong competitor in textile sector. Since Vietnam has joined the Trans-Pacific Partnership (TPP). The competition become fiercer because Vietnam already undergo negotiation for free trade agreement/FTA with the EU. This will make Vietnam get the access to the European market, a larger market than US. Led by US the TPP member is predicted will control 40 percent of the world market. financial power compared to any branded apparel player. However, individual customers can easily switch due to the many undifferentiated products offered by players and low costs involved/or it is difficult to maintain brand loyalty. Therefore, these two different buyer types – large firm and individual retail customers-experience similar levels of buying power. They have significant power.

3.1.2 Competitor Analysis

In average Indonesia is ranked in the middle for most factor Figure 4. The data is obtained in USAID report. Vietnam almost scores highest in all aspect indicating that Vietnam is seen as Indonesia's greatest competition. China is the runner upVietnam

3.1.3 PEST Analysis

PEST Analysis is used to describe the four aspects of external environment. Those aspects can directly or indirectly affect apparel industry.

1. Political condition is important for business, in the past decade; a lot has change in the global supply chain of the Apparel Industry. There are 3 trigger that bought the changes:
   - the end of the Multi-Fiber Arrangement (MFA) in January 2005;
   - Consumer wants a new fashion with shorter cycle time; and
   - Increasing overall quality from consumers, multinational brands, and retailers

2. According to Global Competitive Report Indonesia is in efficiency driven phase .And Corruption, access to financing and inflation is the most problematic factor in Indonesia.

3. Indonesia was in a transition period of the structured productive population. In the period 2020- 2030, a decrease in the index (ratio) dependency Indonesia (which has been ongoing since 1970) will reach the lowest number. An important implication of this is the growing importance of employment in order to take maximum advantage of the productive population. More importantly, if the level of education is generally assumed to continue to improve, the actual productivity of the country's economy is in premium condition, where it would be very useful for acceleration and expansion of economic development.

4. Technological advancement especially Internet is what makes business landscape changed a lot. E commerce become a potential market place, Indonesia interternet user reached 82 million people or 30% of Indonesian use Internet, But according to mc Kinsey only 7% of Internet user that already experience online shopping. So there still a large potential market.

5. As the world's largest archipelago nation, Indonesia has a region with a length of 5,200 km and 1,870 km wide reach. Its geographical location is also very strategic (have direct access to the largest market in the world) because Indonesia is passed by the Sea Lane of Communication (SLOC), the Strait of Malacca, where the line was ranked first in the global container shipping line. Based on data from the United Nations Environmental Programme (UNEP, 2009) there were 64 territorial waters of the Large Marine Ecosystem (LME) worldwide are compiled based on the level of fertility, productivity, and the effect of climate change on each LME. Indonesia has direct access to the 6 (six) LME region that have the potential of marine and fisheries sizeable, namely: LME 34-Bay of Bengal; LME 36-South China Sea; LME 37-Sulu-Celebes; LME 38-Indonesia seas; LME 39-Arafura-Gulf of Carpentaria; LME 45-North Australian Sea. Thus, an opportunity for Indonesia to develop as the trade hub is huge.

3.2 Internal Analysis

The internal analysis explores the resources, capabilities and core competencies of Textile and Clothing (TPT) Industry in Indonesia. Resources and capabilities are not inherently valuable, but they create value when the firm can use them to perform certain activities resulting in competitive advantage. Resources are bundled to create organizational capabilities. In turn, capabilities are the source of a firm's core competencies, which are the basis of competitive advantages

After conducting porter diamond analysis, Indonesia have certain advantage and challenge, which is:

Element	Advantage	Challenge
Factor Condition	o Good human resources, o Have many sources of technology o Have capital resources, o Good infrastructure.	o Misfit labor force o dependent into imported raw material
Demand Condition	o Healthy demand growth	o Foreign Brand

Context for Strategy and Rivalry	○ Have resource to make integrated value chain	○ Fierce Competition
Related and Supporting Industries	○ Many supporting and related industries	○ Need to increase integration from each industry to increased competitiveness

3.3 SWOT analysis

SWOT analysis is the overall evaluation of a company's strengths, weaknesses, opportunities, and threats. SWOT analysis can identify not only an organization's distinctive competencies from particular capabilities and resources possessed by the organization but also the superior way to identify the opportunities that an organization is not currently able to take advantage due to lack of appropriate resources.

ASPEK	SWOT	
EKSTERNAL	*OPPORTUNITY*	*THREAT*
General Analysis (Economy, politics, law, sociocultural, demographic, global (tourism, AEC), physical (infrastructure)	• Collaboration between each shareholder • There is a law of the country quota restrictions • E-commerce growth • Bandung as a tourist destination	• Human resource leaving to other cities • Law and Politics: The existence of regulations that became inhibitors, particularly related to the licensing and port efficiency
Competitor Analysis		• Invasion of foreign goods, especially from China
INTERNAL	*STRENGTH*	*WEAKNESS*
Resources analysis: *Tangible (financial, organization, technology, physical (infrastructure)* *Intangible* (SDM, innovation, reputation)	Image as a city of fashion in Indonesia "Paris Van Java"	Lack of Innovation and data sharing
	Image as a creative city	Downstream problem: lack of marketing and branding initiative for local product
	Natural resources of Bandung and supporting Industries)	Miss match skill because of lack of institution and miss match curriculum
	Have good source of human resource and have a lot of universities	Lack of domestic and foreign investment for research and infrastructure

ASPEK	SWOT	
	Creative culture, community and local unique arts (Sundanese)	Downstream problem: lack of Advance Labor Skill (Especially in Design)
Value chain activity-industry dominant (primary, support),	There is already a cooperation between actor in quadruple helix	Lack of Government Support to facilities' a shopping district
	There are many industries related to fashion industrial center such as (Footwear in Cibaduyut, shirt in Cigondewah, Knitting Industry, jeans etc.).	Upstream problem: Dependence to Import of Raw Material
	Tourism as core competence	

Result and Discussion

By looking at the previous analysis, we can see the opportunity , threat, weakness and strength.Knowing this, the research has compile numerous strategy, those are:

1. Create creative fashion cluster and implemented long tail business model

2. Create agile supply chain to increase competitiveness

3. Create fashion tourism in Bandung with Sundanese as unique sales point

4. Deregulation

Below is the explanation for each proposed strategy:

Create creative fashion cluster and implemented long tail business model. Looking   at   the exponential growth of e-commerce and Bandung image as fashionable and creative city. Bandung can use this opportunity and strength to build creative fashion cluster. Sundanese as a famous culture also can be uniqueness and added value. Also looking at the presence of variation regional competitive product. Bandung can create its own platform to sell its own product along with long tail business model. Long tail business models are about selling many variations of the item at a same time: They focus on offering a large number of niche products, each of which sells relatively infrequently. Long Tail business models require low inventory costs and strong platforms to make niche content readily available to interested buyers. The idea is to collect all SME in Bandung into one place/ platform. With collaboration of the quadruple helix, and technology advancement. SME will reach a broader market. Using a curated fashion based on Bandung creativity will be a value added. It will encourage overcame data sharing the problem and stimulate investment.

Create agile supply chain to increase competitiveness

There has been an increasing interest in the design and implementation of agile supply chain strategies (Christoper, 2000) Fashion is one of the fast move goods in the world, so timing is an important factor. The focus in agile supply chain is responsiveness. The conservative supply chains not responsive enough to face fast moving nature of apparel/fashion Industry. The agile supply chain are faster and more responsive. Other differentiation between conservative and agile is, whereas conservative are forecast-driven and inventory-based. Agile supply chains are more information-based. However, the problem is, fashion market are unstable and hard to predict. It has been suggested (Harrison, Christopher, & van Hoek, 1999) that an agile supply chain should have certain characteristic, Such as:

- market sensitive – it have close connection to end –user
- virtual – depend on information from all supply chain partner
- network-based – its adaptive and use the strengths of specialist players
- process aligned– have many connection to all network member

Looking at Bandung strength such as Bandung natural resource, supporting industry, good human resource, collaboration in a quadruple helix with the support of many industry related presence. Bandung can make integrated supply chain, from upstream to downstream. From design, procurement of raw material, garment, logistic, and branding. Bandung has all necessary resource to build integrated supply chain. However, there are several challenge from the upstream problem: dependence to import raw material, and mismatch labor skill. But if Bandung can overcome such challenge it can counter-invasion of foreign goods and compete in Global level. Sritex in Solo is one of success story in Indonesia that success implemented integrated supply chain and become a global player.

Create fashion tourism in Bandung with Sundanese as unique sales point

Bandung is one of favorite tourist destination in Indonesia. With increasing visitor trend each year, isn't a surprise that tourism is one of core competence. Bandung can use this opportunity to create fashion tourism. Fashion tourism is a tourism that involve at least three major sector: Cultural tourism, Creative Tourism, and Shopping Tourism. There is no need for city to make new activity, its only need to diversify their economy and many city adopted this approach. Large city like New York conduct an event so that public will be interested to come to their city, e.g.; London fashion week. Bandung have creative culture, Sundanese culture and many shopping areas to make Bandung as one of fashion tourism destination in Indonesia. With many variety fashion item in Bandung, it's an interesting strategy to attract tourist and increase public awareness to the local brand at the same time. But there will be a certain challenge to overcame such as basic infrastructure, mismatch skill, lack of fashion district for SME. But if it was successfully implemented it will become new tourism activity and city point of difference and be Bandung driving force.

Deregulation

With fast-paced nature, speed is important. Even with integrated supply chain, it will not be optimal if port efficiency is still low. But Bandung don't have the power to change this other than ask help from Indonesia. Hence, Bandung cannot do much with this proposed strategy

Author choose 3 strategies to be implemented and combine 2 strategies. And then the proposed strategy is:

- Create creative fashion tourism and implementation of long tail business model.
- Create agile supply chain to create competitiveness

Fashion tourism and Long tail strategy

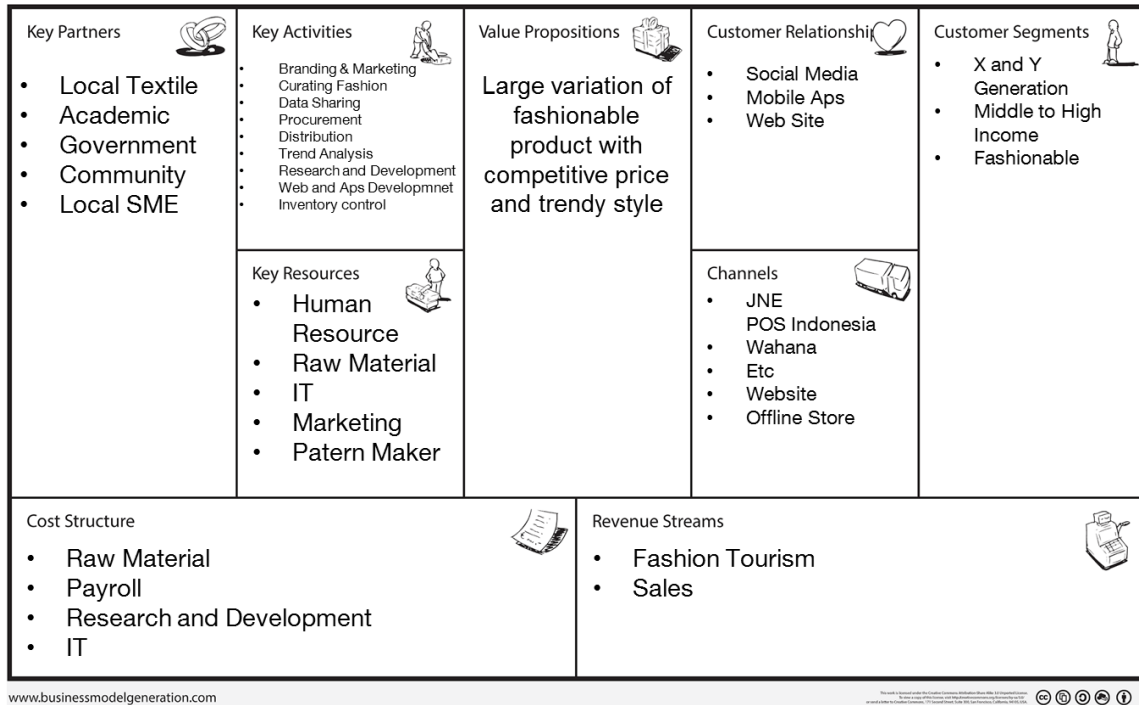
The core of this strategy is create a fashion tourism and collect all goods from SME in Bandung and makes ecommerce platform to sell it, also use a curated fashion so that it will have added value and unique value proposition.


Figure 11 Fashion Tourism with long tail strategy Business Canvas Model

Agile Supply Chain

The core of this strategy is creating a holistic supply chain using the potential of integration of all related industry in Bandung. Many large apparel buyer using outsource to create their product, especially in cheap labor country such as China, Vietnam, and Cambodia. However, Indonesia is regarded as a high-quality producer high end and basic product, but Indonesia longer cycle time compare to china sometime become the important factor that prevent buyer to make it in Indonesia , if Indonesia can tackle this problem, Indonesia will get benefit From it. Most high-end buyers and large retailers will create their design in-house, the Indonesian apparel industry should be able to adapting designs, but at the same time should develop its own unique design. Also developing a new kind of clothing material.

Figure 12 Agile Supply Chain Business Canvas model

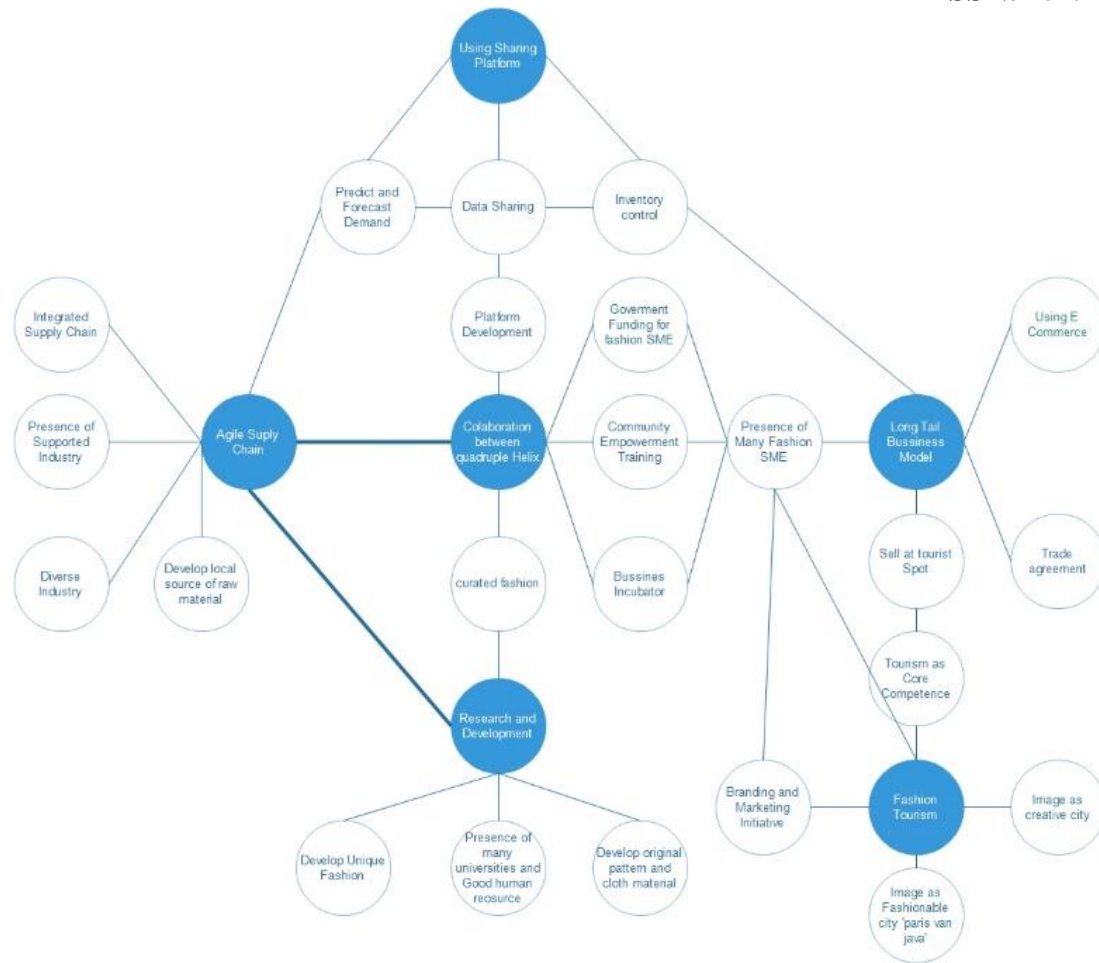
A firm must choose to perform different activities or performs activities differently to reposition itself differently from competitors. Firms create an activity map to show how they integrate the activities they perform. This strategy integrated activities is the source of is the foundation for the integrated cost leadership/differentiation strategy. The tight integration among each activities will be the key source of the competitiveness. As shown in Figure 10, this strategy have 6 fundamental activities that support this strategy such as—Using shared Platform, Agile Supply Chain, Collaboration between Quadruple Helix, Long Tail Business Model, Research and Development and Fashion Tourism.


Figure 13 Activity Map

Conclusion

Here is the conclusion that can be drawn from this research:

1.   Based on looking at Bandung potential. Fashion cluster have the most potential to develop into regional competitive product. This subsector consists of a combination of convection and clothing sub-sector as well as handbags, leather & footwear. Looking at the strength of Bandung which is the cooperation between actor in quadruple helix Image as a city of fashion in Indonesia "Paris Van Java "and creative city. Abundant natural resources of Bandung, supporting Industries, good source of human resource, variety of fashion industrial center, creative culture, diverse community and tourism as core competence. Bandung can be a center of fashion in Indonesia. And with presence of strong textile and other supporting Industry. Bandung can be one stop solution for apparel manufacturing

2.   To make use of Bandung potential at maximum effect, first Bandung must overcome some challenge. Textile supply chains compete on low cost, high quality, accurate delivery, and flexibility in variety and volume. And to become Fashion center of Indonesia, focused and consistent brand and image building should be performed. Some challenge face Bandung are Economic of scale, shortage of correct human resource, efficient and effective supply chain, lack of innovation and technology, need to increase collaboration between the quadruple actor, and need to develop the right platform to enable e commerce and integrated supply chain

INDIA'S ASPIRATIONS TO BECOME GLOBAL ENTREPRENEURSHIP ECONOMY

Neelam Sharma, Bharti Vidyapeeth University, India
Pankaj Saini, Bharti Vidyapeeth University, India

Abstract

This study investigate the factors which boost the spirit of entrepreneurship in Indian economy, The rate of growth of new businesses formation with its probability to run profitable is critical to India's aspirations to become global entrepreneurship economy. The success of entrepreneurship in any country has been the driver of GDP growth and employment generation. India has committed changes in policy making and supportive eco systems which encourages entrepreneurship and in line with this mission, Govt. of India has begun Make in India,, Digital India and Start up India campaign. There has been an attempt to find out the factors which boost entrepreneurship in the economy .Govt. should make policy formulation accordingly and create a eco system which encourages these factors of entrepreneurship. This is a review paper in which descriptive research has been used to find out the factors contributing boost to spirit and eco system for entrepreneurship. Secondary data has been used for literature review. The main factors which boost the spirit and eco-system for entrepreneurship has been classified in three factors a- Personal factors (ambition , Passion, family background, etc) b- Business environment and c- Education .Government should keep these points in mind while making any policies to boost the spirit of entrepreneurship in economy. Findings are based on opinions of entrepreneurs based in North India and literature which is freely available ,Scope is limited to entrepreneurship and general management of business only ,No use of statistical tools , Research has been done by only two individuals not by a big team due to lack of resources.

Keywords: *Personal factors, entrepreneurship, education, eco system etc*

Introduction

The term "Entrepreneur" is often used interchangeably with entrepreneurship. Entrepreneur is a creator whereas entrepreneurship is the creation. According to Zimmerer and Scarborough, entrepreneur is one who creates a new business in the face of risk and uncertainty for the purpose of achieving profit and growth by identifying significant opportunities and assembling the necessary resources to capitalize on them , whereas entrepreneurship is the tendency of a person to organize his own business and run it profitably, exploiting qualities of leadership ,decision-making and managerial caliber. According to John K. Howard Stevenson Entrepreneurship is the attempt to create value through recognition of business opportunity, the management of risk-taking appropriate to the opportunity, and through the communicative and management skills to mobilize human ,financial and material resources. The rate of entrepreneurship, a multidimensional concept including both the percentage of existing business owners in the labour force as well as the

start-up rate of new enterprises, varies substantially across countries and over periods of time.(Wennekers , Uhlaner, & Thurik, 2002)
Growth of entrepreneurship in India can be studies in three parts:

1.1-BEFORE 1850
This period of entrepreneurship has been characterized by following developments and progress. This time also called Vedic period when metal handicrafts were produced. People were organized into an economic & social system, the unit of which was the agricultural village i.e. village community (farmers, artisans ,Brahmins, weavers, carpenters goldsmiths etc).Some entrepreneurship existed among artisans in cities on banks of rivers, because rivers provided transportation facility. At this time there was weak communication and transportation facilities .There was a competition from highly developed European industry .Dupatta and dhotis of Ahemdabad, Silk-bordered clothes of Nagpur, shawls of Kashmir etc were famous products produced in country. Major commercial and economic development in India centered on the growth of the British private enterprise in Banking, insurance steamships, plantations and coal mines.

1.2-1850-INDEPENDENCE
This period has witnessed   progress in railways, railways were introduced in India in1953 which successfully transformed Indian economy. The 'Swadeshi' campaign which began in 1905 emphasized the use of indigenous goods. The Indian mercantile class, along with Europeans, took advantage of the rapidly expanding trade and got engaged in highly lucrative trading. Up to 1915, Textile industry progressed by Parisis. After World War-1,Government of India (GOI) agreed to provide discriminating protection to certain industries, even requiring that companies receiving its benefits be registered in India with rupee capital and have a proportion of their directors as Indians. These measures helped in establishing and expanding the factory system in India in the 20th century. East India Company's arrival in India was the hidden consequence of manufacturing entrepreneurship.

1.3-POST-INDEPENDENCE
This period of entrepreneurship has witnessed momentum of growth in following order. First industrial policy in1948 came into existence. Mixed economic system, distribution of economic powers in public and private sectors has been initiated by Govt. Basics industries were formulated in First &Second Five-year plans i.e electrical & heavy machines tools industries, cement, paper ,jute, cotton, industries etc. New industrial townships and industrial regions came up. One thousands small factories were set up. Third year plan focused on Automobiles, BHEL were established,17000 small industries were set up .Fourth and fifth year plan witnessed growth in Steel, aluminum, fertilizers, petro products, engineering goods, etc. Sixth and Seven year plan witnessed focus and progress on computers, energy, electronics, exports of handicrafts, man made fiber. The eight and ninth Plan highlighted small scale industries and these industries were freed from regulations and 821 items were reserved for small scale industries. Tenth plan focused on science and technology, Increased flow of credit. The eleventh plan highlighted on MSMI sector. In 1991 when Liberalization, Privatization and Globalization were the buzz words and this LPG marked the presence in form og economic reforms in Indian economy. In true sense the significant progress on Indian economy has been started after 1991 .The Indian Government has now taken several steps to boost the spirit of entrepreneurship like Make in India,, Digital India and Start up India campaign.

Literature review

After studying last 50 year literature on entrepreneurship many factors have been identified and grouped into three main factors which are responsible for boost in the entrepreneurship spirit in country . The factors are a- Personal factors (ambition ,passion, family background, Occurrence of events in one's life) b- Business environment and c- Education

2.1-PERSONAL FACTORS

Following personal factors have been identified by literature which are responsible for an individual to become entrepreneur.

2.1.1- AMBITION

The individual's ambitions play a significant role in deciding whether one will opt for doing business or job. The individual who are ambitious is more likely to go for entrepreneurship. Entrepreneurs need to have plenty of self-confidence and be passionate about their projects – not just when starting up their own businesses but also when innovating within large corporations. The biggest difference which has been found between managers and entrepreneurs is that managers analyze a lot and entrepreneurs act a lot. Management executives spend a lot of time analyzing data and research before crafting a decision, "entrepreneurship is the opposite. People need to have the confidence to act and then learn from the outcomes." (Santos, Filipe)

2.1.2-PASSION

The individual's passion play a significant role in deciding whether one will opt for doing business or job. Without passion, there would be no entrepreneurs. But without a vision, there would be no passion. At the very core of the entrepreneurial spirit is the vision that drives you to produce the highest quality products and services. (Kristy, 2016).

2.1.3- FAMILY BACKGROUND

The family background has been found one of critical factor which works as a catalyst for entrepreneurship .The individual who belongs to business family is more likely to opt doing business .Family background and culture plays a significant role in one's life and career. In India , the people who belongs to business family learn business from family and more likely to opt for business as their career.

2.1.4-OCCURRENCE OF EVENTS IN ONE'S LIFE

Sometimes situations force one individual to go for entrepreneurship. Most of people opt to do business if the bred earner of their family dies or loses the earning capacity which serves as the pull factor for entrepreneurship. Many people come into businesses because of these reasons. One go through many situations and get experiences by different events of his or her life and end up getting into business.

Business environment

Following factors of business environment have been identified by literature which is responsible for creating an eco system conducive for entrepreneurship in country where individuals willingly opt to become entrepreneur.

3.1 –POLITICAL & LEGAL ENVIRONMENT

Government's initiative in form of ease of doing business plays a significant contributor to boost entrepreneurship spirit of in the economy. The kind of infrastructure both digital and physical , liberalization in policy making for new start up businesses , incentives to entrepreneurs, ease in winding up of business   are the key factors which contribute in enhancing the spirit of entrepreneurship. Latest campaign of Make in India, Star up India and Digital India run by Govt. on India is working as a catalyst for making a eco system which encourages entrepreneurship.

The most important obstacles faced by entrepreneurs include unfair competition, changes in taxation procedures, lack of financial resources and problems related to public order. Bureaucracy and corruption do not appear to represent significant barriers to entrepreneurship. Bitzenis & Nito (2005). Government should liberalize business policies and ease of doing business should be encouraged which has been done in India by current Government .The fruits of these initiatives will be reap in coming future.

3.2-SOCIO-CULTURAL ENVIRONMENT

The kind of culture , traditions , custom , demographic variables also play a critical role in the economy with regard to entrepreneurship spirit among citizen. India is a young country where more than 50 % population is between age 25-40, this is serving a boost to spirit of entrepreneurship in the economy. Many young start ups are coming in to business. There are some communities which are into business from generations to generations and it can be concluded socio cultural environment also decides entrepreneurship in the country.

Education

The kind of education, quality, and focus has been found key determinant which encourages entrepreneurship in any country .In India, majority of pass out students do not possess minimum employability skills. Education institutions can assist in breaking down the barriers which discourages the entrepreneurship spirit in economy. Business education has been found key factor which transform service to entrepreneurship   economy. (Robertson, Collins, Medeira, & Slater, 2003) Management training is constantly seen as an effective way of providing small-medium size enterprises with the management expertise they require in order to develop and grow. According to Ibrahim & Soufani (2002) management training is constantly seen as an effective way of providing small-medium size enterprises with the management expertise they require in order to develop and grow. They found business sector suffers from a considerably high failure rate that is largely attributed to the lack of management skills and planning, which can potentially be improved by providing training and education in different business areas. According to Garavan & O′Cinneide (2006) a number of problems associated with entrepreneurship education and training programmes. The major problem relates to balance: too much of an emphasis on knowledge and not enough on competence; too much emphasis on information transfer learning methods and not enough on individual small group learning methods such as project teams, peer exchange, individual counseling and workshops. There is very little evaluation of the effectiveness of such programmes. There is a lack of evidence on how learning strategies influence the development of entrepreneurial competences and how these competences transfer into new venture formation. In India there is not a single University which only focus on entrepreneurship and provides eco system for it. Practical education in form of projects , internship should be encouraged and emphasis should be more on practical aspects instead of making the teaching & learning process theoretical, which is a case in India.

Conclusion

The factors which encourages of Entrepreneurship has been classified into three categories1-personal factors (Ambition, Passion, Family background, Events occurring in one's life),2- Business environment(Political & legal environment , Socio-cultural environment) and 3-Education .Government should make such a eco system in the country which encourages such factors of entrepreneurship except personal factors.

CLEARING THE CONCEPTUAL AND MEASUREMENT CONFUSION BETWEEN ENDURING PRODUCT INVOLVEMENT AND PRODUCT IMPORTANCE: A CRITICAL REVIEW AND EMPIRICAL EVIDENCE

Ahmad Khaldi, Australian College of Kuwait, Kuwait

Abstract

Consumers' arousal and concern in the product is a reflection of its perceived self expressive and hedonic values, which are the main components of enduring product involvement. Many previous studies have confirmed the existence of these two components of enduring involvement and explained that most of the other components that were mentioned in past studies were either confused with involvement antecedents and behavioural outcomes, or were implied and included in the hedonic and self expressive dimensions of enduring involvement. Other misconceptions of the components of enduring involvement included the consideration of some situational and purchase decision factors as components of enduring involvement, as well as the adoption of the product importance concept as an equivalent or a component of enduring product involvement. The present study provides the theoretical and empirical evidences to prove that product importance is an outcome, rather than a component, of enduring product involvement.

Keywords: *Enduring Involvement, Product Importance, Discriminant Validity, Measurement Scale, Consumer Behavior, Hedonic Consumption, Self Expression.*

Introduction

The concept of involvement refers to the perception of personal relevance for an object, activity, or event, to the individual in terms of her/his basic values, goals, and self-concept (Bloch & Richins 1983, Blackwell, et al. 2001). Enduring product involvement is regarded as a dynamic construct that emerged due to socialization and symbolic influences endemic to the product class (Bloch, et al. 2009). Another common definition of enduring involvement refers to consumer's enduring perceptions of the importance of the product category based on the consumer's inherent needs, values, and interests (Mittal, 1995; Zaichkowsky, 1985). The primary problem in defining the involvement construct, according to Laaksonen (1994) was that numerous antecedents and consequences of involvement have been confused with involvement itself.

Researchers' understanding of the involvement construct was complicated by many theoretical and operational problems. For example, an early review by Costley (1988) indicated that previous research results have differed according to the definition of involvement used by researchers. The comparison of involvement effect sizes (among previous studies), on the dependent variables that were investigated, indicated that the effect of involvement was not consistent across the studies. Costley (1988) explained that this result was not surprising given the variety of conceptualizations of the involvement construct. Some of these conceptualizations of the previous involvement constructs were also reviewed by Higie & Feick (1989), who noticed that product interest and product importance along with several behavioural outcomes of involvement, were frequently referred to as "measuring dimensions" of involvement scales in some previous studies. Higie & Feick (1989) argued that using behavioural outcomes to measure enduring involvement is largely questionable.

Andrews et al (1990) also criticized the confusion about measuring the involvement construct in the literature and questioned the uni-dimensionality of some general product involvement measures (as used by Zaichkowsky 1985, 1987), and noticed that some involvement antecedents (e.g., risk) or consequences (e.g., consumption behaviour) were measured as product involvement constructs. In line with Higie & Feick (1989) earlier view, Andrews et al (1990) further confirmed the inappropriateness of inferring the level of involvement by measuring involvement antecedents or consequences. Rather, they stressed that measures taping the state of involvement should be used. This opinion was later confirmed by O'Cass (1996) who also noticed that most of the involvement researchers inferred the concept of involvement from its proposed antecedents or consequences with no direct measure of the construct of involvement itself.

Behavioural Consequences of Product Involvement

Tigert, et al (1976) and Bloch (1981) assumed that people with enduring product involvement engage in ongoing product-related information search and transmission because of their ongoing interest and concern for the product or activity. Turnbull & Meenaghan (1980) suggested that opinion and advice giving occur when the continuous involvement with the product is put into the service of self-affirmation by the consumer, to reassure herself in front of significant others and to confirm her assessment of the product or service.

Goldsmith (1996) explained that when consumers are aroused by a product category in which they are interested, they pay more attention to information about that category, process the information more deeply, and have better memory of the information. Therefore, he agreed with Laaksonen (1994) that the "responses" in the response-based involvement approach, are the consequences of involvement rather than involvement itself. In Dholakia's (1998) study, enduring involvement caused higher levels of information seeking and opinion-leadership, and higher probability of continuous product-related information reception and acquisition. The results also indicated that the information-seeking behaviour of situationally involved consumers who are not enduringly involved is likely to temporarily imitate enduringly involved consumers. This later finding, in particular, came in line with an earlier explanation by Richins & Bloch (1986) that enduring and situational involvement could be distinguished only by the temporal duration because their behavioural outcomes are the same. However, Dholakia's (1998) results also indicated that while the level of information-search for such situationally involved consumers is high, the reasons underlying the search might be different. Situationally involved consumers may use information-search as a risk-reduction strategy while enduringly- involved consumers may obtain information for hedonic or recreational purposes or to develop expertise.

The Components of Product Involvement

Lastovicka & Gardner (1979) identified familiarity, commitment, and importance as the three factors of involvement. The self-expressive component of involvement was supported by Bloch's (1982) research which concluded that the magnitude of enduring involvement is positively related to the extent to which an individual perceives such involvement as a vehicle for self-expression or enhancement. Bloch (1982) argued that, consumers use enduring involvement as a vehicle for self-expression. He emphasized that being highly involved with a product that carries a symbolic meaning provides a way to project and enhance parts of one's self-image.

Park & Young (1983) identified two primary components underlying the involvement construct; the utilitarian component (functional attributes) and the value expressive component (aesthetics and expression of self-image). Zaichkowsky (1985) developed the personal involvement inventory (PII) scale, which was based on the uni-dimensional

conceptualization that involvement is an index of product/product importance that reflects its personal relevance. Contrary to the previous view, the empirical identification of the hedonic component and the symbolic (or the self-expressive) component of enduring product involvement was one of the major contributions of Mittal & Lee (1989) research which was in line with Higie & Feick (1989) view that emphasized the existence of both the self-expressive and hedonic components of enduring involvement.

Higie & Feick (1989) also discussed McQuarrie & Munson (1987) Revised Personal Involvement Inventory (RPII). Higie & Feick (1989) argued that the factor analysis reported by McQuarrie & Munson, which resulted in a three-factor solution (where the pleasure and self-expressive items loaded on one single factor) re-emphasizes the importance of distinguishing enduring involvement as a unique construct that is conceptually different from product importance and situational risk factors. Building on this view, Higie & Feick (1989) criticised Bloch, et al (1986) earlier study which measured enduring involvement using "product interest," "time spent thinking about product" and "average importance of the product to the performance of social and career roles".

Higie & Feick (1989) argued that product interest is related to the hedonic component of enduring involvement, whereas the importance of the product performance in social and career role is related to the self-image component of enduring involvement. Time spent thinking about the product, however, is a behavioural outcome, and the appropriateness of using behavioural outcomes to measure enduring involvement is questionable according to Higie & Feick (1989), who explained that behaviours such as time spent thinking or searching for information, can occur for reasons other than enduring involvement, like individual concerns with a pending or previous purchase. In sum, Higie & Feick (1989) concluded that previous studies of the enduring involvement construct fell short of adequately measuring its original motivating factors; the self-expressive and the hedonic components which are the only two components of enduring involvement.

Enduring Product Involvement and Product Importance

Bloch & Richins (1983) were the first to notice the confusion between product importance and product involvement, when they emphasized that perceived product importance and involvement refer to conceptually distinct phenomena, because importance is a perceptual judgment, and involvement is a feeling. Antil (1984) used the term product importance in a non-functional meaning to refer to enduring product involvement when he argued that the degree of involvement is equal to the level of perceived personal importance, which is determined by the psychological satisfaction the consumer gains from interacting with the product. Such perspective of product importance is obviously not related to product functionality or performance; alternatively, it refers exactly to the concept of enduring product involvement. Therefore, there is no need to use the term product importance in the first place.

In Zaichkowsky's (1987) study, the FCB model for product classification was used as a framework for testing the use of the PII (Zaichkowsky, 1985). The consistent misclassification, according to Zaichkowsky (1987), was in the product category of personal computers. Personal computers were perceived as high involvement products, and while they were expected to have a great thinking or cognitive component, they apparently were seen to have a great emotional or affective component by respondents. As a possible explanation Zaichkowsky (1987) suggested that the average student respondent viewed personal computers as an exciting, fascinating product category. However, Zaichkowsky (1987) did not provide an explanation why they might do so. The only viable explanation for Zaichkowsky (1987) finding might be reached through the application of Higie & Feick (1989) conception of involvement, instead of Zaichkowsky's (1987) product importance perception of involvement. Personal computers have high hedonic and self expressive value

and that is why they were perceived as high involvement products with a great affective component due to their self expressive and hedonic values which are purely emotional. The consistency of such misclassification, as reported by Zaichkowsky (1987), supports this explanation. Consumers see the product to be important because they are involved in it and not vice versa. Therefore, product importance is an outcome of product involvement and not an antecedent or even a component of it. Zaichkowsky's (1987) usage of product importance as an index of involvement led her to overpass the emotional component of personal computers involvement, and therefore consider such finding as misclassification with no convincing explanation.

In line with this opinion, Higie & Feick (1989) explained that product importance cannot be used in a measure of enduring involvement since it confounds the importance concept which is based on functional necessity. Higie & Feick (1989) argued that product interest is related to the hedonic component of enduring involvement, and that the importance of product performance in social and career role is related to the self-image component of enduring involvement. Indeed, if McQuire & Munson's (1992) interest component items (exciting/unexciting, dull/neat, boring/interesting, fun/not fun, appealing/unappealing) were compared with Higie & Feick's (1989) hedonic component items (interesting, fun, fascinating, exciting, and appealing), the conclusion would be clear that the interest component is already included in the hedonic component of product involvement.

Higie & Feick (1989) discussed the Personal Involvement Inventory (PII) generated by Zaichkowsky (1985), which taps attitude toward the product, product importance, and a hedonic component. They argued that because of the inclusion of the first two factors and the exclusion of the self-expression factor the PII should not be used to measure enduring involvement, but the hedonic items in PII, however, are useful in measuring one component of enduring involvement. Higie & Feick (1989) re-emphasized the need to develop and refine a reliable scale to measure the enduring involvement construct which is distinct from the product importance and risk factors.

Divine & Page (1994) argued that enduring involvement reflects an intrinsic interest in a product which motivates people to perform product related tasks because such activities are self-rewarding. Building on this logic, Divine, & Page (1994) emphasized that product importance is not at all consistent with enduring product involvement since there are many products that consumers consider important but not intrinsically interesting. Furthermore, the importance construct does not address the affective evaluative aspects typically associated with the enduring involvement construct.

In line with Antil's (1984) earlier work, Goldsmith (1996) explained that consumers describe products as important because they perceive them to be instrumental in achieving desired goals. Many products are thus important to consumers, but not all important products are also involving simply because they do not elicit excitement or interest in consumers. They explained that although enduringly involved consumers are motivated by their emotions, similar emotional responses might be triggered by other causes which operate in addition to involvement, but they should not be confused with involvement itself.

Dholakia (1998) further supported Antil's (1984) opinion, when he viewed enduring product involvement as a stable perception of importance resulting from the product's relatedness to the self-concept and identity. Dholakia (1998) explained that a product is perceived as causing enduring involvement when importance perceptions are based on the product's ability to intrinsically satisfy consumers' enduring needs, rather than on specific purchase or usage goals.

In sum, product importance was viewed from three different approaches. The first approach viewed product importance as a component of enduring product involvement (Zaichkowsky 1985, 1987; McQuarrie & Munson 1992). The second approach viewed

product importance as an equivalent to the level of personal relevance of products in the enduring product involvement construct (Antil 1984; Goldsmith 1996; Dholakia 1998). However, according to this view there is no real distinction between both constructs because they refer to the same phenomenon therefore, there is no practical need to use the term product importance to refer to an existing concept anyway. The third approach viewed product importance as a completely distinct and different concept from enduring product importance (Bloch & Richins 1983; Higie & Feick 1989; Divine & Page 1994). According to this view product importance is not consistent with the enduring product involvement construct and it does not address the affective component of enduring product involvement therefore, product importance is not a component of, nor an equivalent to, the enduring product involvement construct. In fact, according to this approach, product importance is seen as an outcome of enduring product involvement. Therefore, the current study is adopting the following hypotheses:

H1: Consumer's product importance is not a component of her/his enduring product involvement.
H2: Consumer's enduring product involvement has a positive direct effect on her/his product importance construct.

In order to investigate Higie & Feick's (1989) proposition that product importance is related to both hedonic and self-image components of enduring involvement, the current study aims to test the following hypothesis:

H3: The hedonic and self expressive components of consumer's enduring product involvement have a single and a simultaneous positive direct effect on her/his product importance construct.

Research methodology

This study has chosen cars as a general product category to investigate. In line with Bloch's (1982) product selection recommendations for involvement research, cars were chosen because consumers typically are very familiar with them and because it is assumed that respondents would exhibit a relatively wide range of enduring involvement levels with respect to this product.

The sampling frame for this study consisted of university students in a private university in Kuwait. A convenient sample of 650 was drawn and a total of 516 usable questionnaires were retrieved in data collection which is considered to be an appropriate sample size according to Hair et al (1998) recommendations of 100 observations or larger and a minimum of 20 cases for each variable to factor analyze a sample.

The Enduring Product Involvement Scale

This study defines enduring product involvement as consumer's perceived level of continues self relevance of the product which is reflected by the product's hedonic and self expressive perceived value to the consumer. Higie and Feick (1989) developed the adopted scale of the study which included ten items or questions. The first five items constituted the hedonic factor, while the second five items constituted the self-expressive factor, of the enduring involvement scale. Higie and Feick (1989) have demonstrated the discriminant and predictive validity of their enduring involvement scale and its components. They have also reported a reliability Cronbach's alpha index of 0.89 for their enduring involvement scale items. This scale was later considered to be the most reflective of the enduring ivement construct according to Jain and Srinivasan (1990) who assessed all previous involvement

scales by replicating them and concluded that Higie and Feick's (1989) enduring involvement scale accounted for the largest explained variance (77%) among all previous measuring scales. The first five items (the hedonic factor) of the enduring product involvement scale which was adopted from Higie & Feick (1989) is a semantic differential 5 point scale. Respondents were instructed to circle the corresponding number for each item that best describes their opinion about cars (for example; if they think that cars are … Extremely interesting = ⑤ or Not at all interesting = ①) as shown in Table 1.

Table 1

I think that **cars** *are…*	*Extremely………………………………………………………Not at all*				
1. Interesting	5	4	3	2	1
2. Fun	5	4	3	2	1
3. Fascinating	5	4	3	2	1
4. Exciting	5	4	3	2	1
5. Appealing	5	4	3	2	1
Table 1 The hedonic factor items of the enduring product involvement scale.					

The second five items (the self expressive factor) of the enduring product involvement scale which was adopted from Higie & Feick (1989) is an interval Likert type 5 point scale. Respondents were instructed to indicate their opinion about each statements by marking (X or ✓) in the choice that corresponds to their level of agreement, or disagreement, with each of the statements shown in Table 2.

Table 2

I think that my car...	*Strongly agree*	*Agree*	*Neither agree nor disagree*	*Disagree*	*Strongly disagree*
1. Portrays an image of me to others.	[ ]	[ ]	[ ]	[ ]	[ ]
2. Is part of my self-image.	[ ]	[ ]	[ ]	[ ]	[ ]
3. Tells others about me.	[ ]	[ ]	[ ]	[ ]	[ ]
4. Helps others to judge me.	[ ]	[ ]	[ ]	[ ]	[ ]
5. Tells me about a person.	[ ]	[ ]	[ ]	[ ]	[ ]
Table 2 The self expressive factor items of the enduring product involvement scale					

The Product Importance Scale

The present study defines product importance as the level to which the product is perceived to be important to the consumer. The adopted scale of the study included five items or questions that were derived from McQuarrie & Munson's (1992) revised product involvement inventory (RPII) measure. The two sub-scales of product importance and product interest measures constituted the (RPII) scale. The individual reliability index of the product importance sub-scale was not reported by the researchers. However, the overall Alpha indexes that were computed over the nine products included in their study ranged from 0.80 to 0.95 and the dimensionality of the importance sub-scale items were confirmed through exploratory factor analyses with varimax rotation. Discriminant validity of the importance sub-scale were demonstrated through significant correlation with the attitude measure (R = 0.74). Criterion

validity for the (RPII) as a whole, was demonstrated through the prediction of ten outcomes of involvement.

The product importance measure which was adopted from McQuarrie & Munson (1992) included five items in a semantic differential 5 point scale. Respondents were instructed to circle the corresponding number for each item that best describes their opinion about cars (For example; if they think that **cars** are certainly important = ⑤…or certainly unimportant = ①) as shown in Table 3.

I think that cars…
➤ *Are Important……………………………………………………………………Unimportant*
5   4   3   2   1
➤ *Are Relevant……………………………………………………………………Irrelevant*
5   4   3   2   1
➤ *Mean a lot to me………………………………………………………….Mean nothing to me*
5   4   3   2   1
➤ *Matter to me…………………………………………………………………Don't matter to me*
5   4   3   2   1
➤ *Of concern to me……………………………………………………….Of no concern to me*
5   4   3   2   1
Table 3 The product importance scale items.

Data analysis

The first hypothesis of this research states that consumer's product importance is not a component of her/his enduring product involvement. In order to prove this hypothesis, discriminant validity between both constructs should be established to confirm that product importance and enduring product involvement are completely distinct and different constructs. Discriminant validity between the two constructs is established in two different ways. Firstly, the ten items of enduring product involvement scale and the five items of product importance scale are submitted all together to varimax rotated factor analysis. Exploratory factor analysis produced a three factor solution explaining 75.8% of the variances, as Table 4 indicates.

Table 4: Factor analysis of the enduring product involvement and product importance items

Items	1	2	3
HED1			.832
HED2			.843
HED3			.725
HED4			.787
HED5			.722
SELF1		.764	
SELF2		.762	
SELF3		.835	
SELF4		.852	
SELF5		.790	
IMPRT1	.761		
IMPRT2	.728		
IMPRT3	.821		
IMPRT4	.841		

IMPRT5	.819

The results confirmed the difference between product importance and enduring product involvement constructs. All the items related to the self-expressive component of enduring product involvement highly loaded on the second factor and all the items related to the hedonic component of enduring product involvement highly loaded on the third factor, while all product importance items highly loaded on the first factor. Therefore, it is concluded that none of the components of enduring product involvement is included in, or can be measured by, any of the constituents of the product importance construct, and vice versa.

A second and stronger test of discriminant validity between the product importance and enduring product involvement constructs, as suggested by Fornell and Larcker (1981) and Chaudhuri (2000) is that the average variance extracted for each construct should be higher than the squared correlation between both constructs. The results indicate that the variance of the product importance construct is .777 and the variance for the enduring product involvement construct is .586 and the squared correlation between both constructs is .487 which proves that both constructs are theoretically and empirically different and distinct from each other. Therefore, H_1 which states that consumer's product importance is not a component of her/his enduring product involvement is accepted.

The second hypothesis of this research states that consumer's enduring product involvement has a positive effect on her/his product importance construct. Regression analysis revealed that enduring product involvement had a positive effect on product importance, with positive coefficients (β = .698 and b = 0.803 P = .000) explaining about 49% (adjusted R^2 = .487) of the product importance variance. The pure contribution of enduring product involvement to predict product importance was assessed through the partial correlation coefficient which was significant (R_P = .384 P = .000) and indicated a positive pure direct effect of enduring product involvement on product importance. Therefore, H_2 which states that consumer's enduring product involvement has a positive effect on her/his product importance construct is accepted.

The third hypothesis of this study states that both the hedonic and self expressive components of consumer's enduring product involvement have a single and a simultaneous positive direct effect on her/his product importance construct. Regression analysis revealed that the self expressive dimension of enduring product involvement, when entered alone into a simple regression equation, had a positive effect on product importance, with positive coefficients (β = .622 and b = .659, P = .000) explaining about 39% (adjusted R^2 = .387) of the product importance variance.

Similarly, when the hedonic dimension of enduring product involvement, was entered alone into a simple regression equation, it had a positive effect on product importance, with positive coefficients (β = .614 and b = .609, P = .000) explaining about 38% (adjusted R^2 = .377) of the product importance variance. Multiple regression analysis revealed the simultaneous positive effect of both dimensions of enduring product involvement on product importance. Together, both independent variables explained about 49% (adjusted R^2 = .488) of the product importance variance, as table 5 indicates.

Table 5

Dependent Variable	Independent Variable	Unstandardized Coefficient	Standardized Coefficient	Sig.

		s B	s Beta	
IMPORT NC	SELF	.428	.404	.000
	HED	.382	.385	.000

Table 5 Regression analysis for the effects of enduring product involvement components on product importance.

Multicollinearity between the independent variables was assessed through tolerance and VIF values. Tolerance value equalled 0.678 and VIF value equalled 1.474 which confirmed the non-existence of multicollinearity between the independent variables. The pure contribution of each independent variable to predict product importance was assessed through partial correlation. The partial correlation coefficient between the self expressive dimension of enduring product involvement and product importance was positive and significant (R_P = .242 P = .000), and it was also positive and significant (R_P = .281 P = .000) between the hedonic dimension of enduring product involvement and product importance. The results of data analysis confirm that both dimensions of enduring product involvement have pure direct (single and simultaneous) effect on product importance. Therefore, the third hypothesis is acceptable.

Research conclusion

The present study has critically reviewed previous research papers on enduring involvement and identified many previous studies that confused involvement components with its behavioural outcomes. The outcomes of involvement that were considered by some researchers as components included; importance (Rothschild & Ray 1974; Lastovicka & Gardner 1979; Parameswaran & Spinelli 1984; Zaichkowsky 1985; Jensen, et al 1989; and Jain & Srinivasan 1990), commitment (Rothschild & Ray 1974; Lastovicka & Gardner 1979; and Jensen, et al 1989), innovativeness (Tigert, et al 1976), interpersonal communications (Tigert, et al 1976; Bloch 1981), knowledgeability and familiarity (Tigert, et al 1976; Lastovicka & Gardner 1979; Parameswaran & Spinelli 1984; and Jensen, et al 1989), awareness (Tigert, et al 1976), reaction to change (Tigert, et al 1976), attachment (Bloch 1981), product preference (Jensen, et al 1989) and attitude (O'Cass 1996).

The current study provided theoretical explanation that is supported by empirical evidences to explain the relationship between enduring product involvement and product importance and to clear the measurement and conceptual confusion that existed between them in previous research. The present study has proved that product importance and product enduring involvement are two distinct and different concepts; therefore, product importance is not a component of enduring product involvement. This conclusion is in line with Bloch & Richins (1983) opinion that perceived product importance and involvement refer to conceptually distinct phenomena, and it is also in line with Higie and Feick (1989) statement that importance cannot be used as a measure of enduring involvement since it confounds the importance concept which is based on functional necessity. The results also support, Divine & Page (1994) point of view that importance construct does not address the affective evaluative aspects typically associated with the enduring involvement construct.

Such conclusions, however, does not support other researchers' (Rothschild & Ray 1974; Lastovicka & Gardner 1979; Parameswaran & Spinelli 1984; and Jensen, et al 1989) argument that the importance construct is a component of involvement. The present study also proved that product importance is an outcome of enduring product involvement which supports Goldsmith (1996) explanation that all product categories that consumers find

involving, are important to these consumers precisely because they find these product categories interesting and exciting. The results of this study also refute Zaichkowsky's (1985) uni-dimensional conceptualization of involvement as an index of importance. Data analysis also revealed that both components of enduring product involvement, the hedonic and self-expressive, have simultaneous positive direct effects on product importance which supports Higie & Feick's (1989) opinion that both dimensions of enduring involvement produce product importance because of consumers' feelings of product interest and the social and career roles related to the product.

DIGITAL MUSIC PURCHASING INTENTION BY GENERATION-Y THAIS: A CONCEPTUAL PERSPECTIVE

Pannawit Sanitnarathorn, King Mongkut's Institute of Technology Latkrabang (KMITL), Thailand
Wanno Fongsuwan, King Mongkut's Institute of Technology Latkrabang (KMITL), Thailand

Abstract

The global recording industry is passing through a new transition in the fast-evolving digital market place with music streaming a key component of this growth. Artists and entrepreneurs must embrace new ideas, business models and channels to accommodate the change. Globally in 2014 the digital music industry reached US$6.85 billion in revenues but ownership and piracy issues are always stumbling blocks to the industry's sustainable growth. Entrepreneurs therefore need to adapt to changing consumption habits as digital music consumer habits are changing fast and digital music labels need to rethink their strategies to keep pace with new technology. In Thailand, those born between 1981 and 2000 are known as Generation-Y which is the largest consumer segment in the country with a lifetime spending potential of over USD $5 trillion. Additionally, these Generation-Y digital music consumers are also the largest owners of smartphones within the population and some of the most connected individuals on earth. This study therefore aims to identify factors and methods that affect this huge markets' decision to purchase and download digital music.

Keywords: *attitude, idolatry, subjective norms, perceived behavioural control, SEM*

Introduction

Music is one of the most potent forces shaping culture, entertainment and technology today with the worldwide digital music industry in 2014 reaching US$6.85 billion. For the first time in history digital revenues equaled physical sales at 46% each (IFPI, 2015) with an estimated 41 million people worldwide now paying for a music subscription service, up from 28 million in 2013. The global recording industry is passing through a new transition in the fast-evolving digital market place with music streaming a key component of this growth. Music subscription services are a major driver of digital growth, sustaining a sharp upward trend in recent years. For the first half of 2015 in the US, strong growth in revenues from streaming services offset declines in digital downloads and overall wholesale revenues increased 0.8% to $2.3 billion on a year-over-year basis while with retail sales, the overall value decreased 0.5% to $3.2 billion (RIAA, 2015).

Music markets are moving at different speeds with diverse trends in different countries. Asia saw revenues fall by 3.6 per cent in 2014 overall but there was strong growth in South Korea (+19.2%) and some smaller markets such as China (+5.6%), Indonesia (+16.3%), and Singapore (+4.7%). Japan saw digital revenues increase by 4.9 per cent, driven by strong subscription revenues, but the total music market declined by 5.5 per cent overall. India continues to underperform, with a market decline of 10.1 per cent (IFPI, 2015).

In Thailand, studies show that Thais to be some of the most connected consumers on earth. For countless generations Thai people have embraced music as a fundamental part of everyday life with today's music consumer enjoying a wide variety of different styles, devices and services to access it. INTAGE described the new digital lifestyle in Thailand as

the '5th element' of Thai daily life (INTAGE, 2014). In Thailand, INTAGE (2014) research also reveals that neither multi-screen usage behaviour nor the number of devices one owns is determined by age or generation, but rather by *lifestyle*, *values*, and *behaviour*.

Another study titled 'Generation Y' Leads the Way on Smartphones' stated that the Generation-Y users (born between 1981 and 2000) are the most likely age group to own smartphones (eMarketer, 2013). According to the Siam Commercial Bank Economic Intelligence Center (2015), this same Generation-Y is the largest consumer segment in the country and are the biggest generation ever (unlikely to ever be surpassed) with a spending potential rivalling that of Generation-X in 2015 having a lifetime spending potential of THB 160 trillion (USD $5 trillion).

In all this excitement about young consumers that are technologically savvy with large expendable incomes, it would seem that the digital music industry has a bright and profitable future ahead of it. Unfortunately, there are some that would disagree as historically aberrant consumer behaviour costs firms millions of pounds a year, and the Internet has provided young techno-literate consumers with a new medium to exploit businesses (Freestone & Mitchell, 2004).

Past industry observers have also attributed the decline in music sales to several factors including a lack of "blockbuster" releases, competition from other media such as computer games for younger consumers, and the availability of free music on the Internet. By 2001, an estimated 30 million American adults—29 percent of all adults—had downloaded music files over the Internet (Graziano & Rainie, 2001).

Today research by Steele (2015) states in the title of a report *If You Think Piracy Is Decreasing, You Haven't Looked at the data…* that **file-sharing in North America has grown 44% from 2008 to 2014.** The report data also shows that globally in 2015 that 6, 090 petabytes (PB) of file sharing took place each month. One PB is equivalent to 1 million gigabytes or 1.6 million CDs which represent 117 billion CDs a year, which is an amazing statistic if true.

The data from the reporting however might be held suspect as the researcher is in the business of protecting artists' rights on the internet and collecting payments from people who are file-sharing music and movies without permission. There is also the assumption in the data reporting that file-sharing and piracy are the same but there is a debate raging as to the validity of this assumption. The report however is filled with extremely detailed and interesting data and by itself could be the topic of many more studies.

The U.S. Copyright Office (2015) also put out a report in February 2015 titled, *Copyright and the Music Marketplace* where regarding piracy, the editor stated, "Unlike in the Napster era, stakeholders now seem resigned to this marketplace condition and the perhaps irreversible impact it has had on the industry." It was also stated that piracy is a continuing challenge that depresses revenues for both legal music providers and rightsholders. RIAA—which abandoned its lawsuits against individual file-sharers several years ago—observed that piracy "certainly is in the background when you talk about whether digital music services are earning enough money or paying enough money, as competing against free remains a problem."

Steele (2015) summarizes the dilemma as "First, I think those that care about distribution of media without compensation on the internet have progressed from outrage to fatigue, then to resignation, and ultimately to acceptance and its cousin, denial." Ultimately however (quoting from the American science fiction drama show 'The X-Files') "the truth is out there", and thus a reason for the proposed research.

Literature review

Idolatry

Godin (2009) argues the Internet has ended mass marketing and revived a human social unit from the distant past: tribes. Founded on shared ideas and values, tribes give ordinary people the power to lead and make big change. Godin, who as an American marketer exited from the traditional use of the word 'tribe' to describe it as "a group of people connected to one another, connected to a leader, and connected to an idea" and went on to discuss how a fan base and a special interest group have a unified interest in something or someone (Godin, 2008). A fan base has one particular common factor that draws people to that group. It could be a person (or group of persons), an event, or a product such as digital music.

Worshipping

Hyatt (2014) went on to discuss the hierarchy of fandom which was listed as 1) Superfans; 2) Engaged fans' and 3) Ambient fans. Superfans are the fans who are primarily **live audience as** they attend the artists' shows regularly and buy many things being offered (not just music, such as t-shirts). They have street teams and evangelize strongly on the artists' behalf. **Engaged Fans** are the **active online audience who** are newsletter subscribers, blog readers, video watchers, RSS subscribers, active social media engagers who frequently comment and engage with the artists on Facebook, Twitter, and other sites. **Ambient Fans** are the **passive online audience which use** social media such as Twitter, Facebook, MySpace, Last.fm, etc. but don't actively communicate with the artist and may not have even listened to the artists' music yet.

Giles (2000) explained the prevalence of celebrity idolization in modern societies as direct products of mass media and communications while adolescents often revering celebrities such as pop singers and sports figures (Greene & Adams-Price, 1990). This is consistent with Chiou, Huang & Lee (2005) which stated that 'idols' can take on the form of an athlete, actor, writer, singer or music artist and Raviv, Bar-Tal, Raviv, & Ben-Horin (1996) which studied the phenomenon of adolescents' idolization of pop singers. In the study by Raviv et al. (1996) it was discovered that in the three age groups of male and females between the ages of 10-17, the intensity of idolization and its behavioral manifestations decreases with age. It was also found that girls idolize singers more than boys and are more influenced by their idols.

Further research by Chiou et al. (2005) and Wang, Chen, Yang & Farn (2009) found that Idolatry affects the attitude of the fans and their willingness to support the artists by not downloading illegal or buying pirated goods. Wang et al. (2009) further stated that with regards to idolatry, analyses revealed that idolatry moderates the relationship between the intention to illegally download music and the intention to buy music. For teenagers with high idolatry, a higher music downloading intention results in a lower buying intention. One possible explanation is the price of music CDs.

Modelling

Idolization of pop singers is based mostly on two important components: worship and modeling (Raviv et al., 1996). Modeling refers to the desire to be like an idol, which may involve imitation of idolized figures by copying their dress, hairstyle, speech, activities, etc. Adoration of musical personalities, which has for many years been actively fostered by

recording companies as a marketing tool, creates an atmosphere of idolatry: feelings of religious worship directed at ordinary humans (Riversong, 2008). According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *idolatry*. Many scholars have studied these manifest variants or observable variables effects on *purchasing intention* from which the researchers have synthesized the research to include *identification, worshipping* and *modelling* in this study (Godin, 2009; Greene & Adams-Price, 1990; Hyatt, 2014; Giles, 2000; Chiou et al., 2005; Raviv et al., 1996' Wang et al., 2009; Riversong, 2008)

Subjective norms

Social Pressure

The theory of planned behaviour (TPB) by Ajzen (1985) stated that human behavior is caused by systemic cues which was based on an earlier theory of reasoned action (TRA) by Ajzen and Fishbein (1975), which was a model for the prediction of behavioral intention, spanning predictions of attitude and predictions of behavior. According to TRA (Ajzen & Fishbein, 1975) and TPB, subjective norms and attitude are independent variables with a significant causal relationship to intention and according to research by Liao, Liu, Lu and To (2008), attitude and subjective norms were confirmed as having a very significant influence on consumers' intention of purchasing digital products. This is consistent with additional studies by Chang (1998), Shepherd and O'Keefe (1984), and Al-Rafee and Cronan (2006) which also found that subjective norms influence attitudes to purchase digital music files.

Strength of referents

Wong (2008) studied the social referents that group members turn to for judgments about knowledge importance, and the extent to which the relative influence of each referent depends on the group-level social network structure. The findings indicated that group members are more likely to have shared judgments with their cohesive and structurally equivalent referents within their advice network, and the strength of social influence from their cohesive and structurally equivalent referents is likely to depend on the advice network density at the group-level. However, there was no significant association in judgment similarity between group members and their central referents within the advice network. Overall, this study suggests that while social influence (in its most straightforward form) occurs between pairs of individuals, the strength of influence of a social referent is dependent on how social cues are distributed within the group's network structure.

Personal relevance refers to how significant the attitude is for the person and relates to self-interest, social identification and value. If an attitude has a high self-interest for a person (i.e. it is held by a group the person is a member of or would like to be a member of, and is related to a person's values), it is going to be extremely important (McLeod, 2014). As a consequence, the attitude will have a very strong influence upon a person's behavior. By contrast, an attitude will not be important to a person if it does not relate in any way to their life.

Motivation to comply

When examining software piracy, Eining and Christensen (1991) reported that consequences were a significant influence on an individual's behavioral intention. This is consistent with Kreie and Cronan (1999) which proposed an end-user computing model for an ethical dilemma which determined that consequences influence ethical decision-making.

Their model studied the influence of societal environment, belief system, personal values, personal environment, professional environment, legal environment, business environment, moral obligation, and awareness of consequences on an individual's decision as to the behavior, in each case, being acceptable (ethical) or unacceptable (unethical). Ultimately, the study showed that influencing factors differ by case (i.e. situation).

According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *subjective norms*. Many scholars have studied these manifest variants or observable variables effects on *purchasing intention* from which the researchers have synthesized the research to include *social pressure, strength of referents*, and *motivation to comply* in this study (Ajzen, 1985; Ajzen & Fishbein, 1975; Liao et al., 2008; Chang, 1998; Shepherd & O'Keefe, 1984; Al-Rafee & Cronan, 2006; Wong, 2008; McLeod, 2014; Eining & Christensen, 1991; Kreie & Cronan, 1999)

Attitude

An attitude is "a relatively enduring organization of beliefs, feelings, and behavioral tendencies towards socially significant objects, groups, events or symbols" (Hogg, & Vaughan, 2005). Every attitude has three components that are represented in what is called the ABC model of attitudes: A for affective, B for behavioral and C for cognitive (Ostrom, 1969), which involves a person's belief / knowledge about an attitude object. For example: "I believe snakes are evil".

Cognitive and Affective

To demonstrate that people might say one thing and do another, LaPiere (1934) accompanied a young Chinese couple in their travels across the United States and recorded whether they received service in restaurants and overnight accommodation in motels, hotels, and inns. From this very early study on attitudes, it was concluded that attitudes do not always predict behavior (Ajzen & Fishbein, 2005).

Cognitive and affective components of attitudes are not necessarily expressed in behavior. There is evidence that the cognitive and affective components of behavior do not always match with behavior (McLeod, 2014). Trafimow and Finlay (1996) stated that *intentions to perform most behaviors are more controlled by attitudes than by subjective norms.* A broad definition of perceived or subjective norm is the perceived social pressure to perform or not to perform the behavior in question (Ajzen, 1991). *Yet subjective norms typically account for a significant, albeit small, proportion of unique variance in intentions and those individual differences are associated with the strength of the collective self. Thus possible reasons for the attitude to download illegal, pirated music.*

Behaviour

Attitude has been found to significantly affect an individual's intention to behave ethically or unethically (Fishbein & Ajzen, 1975; Ajzen & Fishbein, 1969, 1980; Ajzen, 1989, 1991; Leonard & Cronan, 2001). Therefore, understanding the dimensions of attitude will lead to the further understanding of the influences on ethical behavior intention (Leonard & Cronan, 2005) with many research studies having found a person's gender to play a role in explaining ethical behavioral attitude and intention. Attitude therefore is considered by many to be a crucial factor in the loss or generation of revenues for the music industry. When people question someone's attitude, they refer to beliefs and feelings related to a person or event and the resulting behavior. Taken together, favorable or unfavorable evaluative reactions—whether exhibited in beliefs, feelings, or inclinations to act—define a person's attitude toward something (Olson & Zanna, 1993). Ajzen and Fishbein (1975) has a view that

attitude is a reflection of that behavior. It also processes and measures the impact of attitude. The second is the implicit like or dislike, either positive or negative. This attitude is a key factor for the determination of behavior under any theory of reasoned action.

This research has several leading theories which applies to the music business, including factors that influence attitudes and purchase intention through online channels (Cheah, Phau, Chong, & Shimul, 2015). According to the study's research and examination of the literature, it was determined that there were 3 key manifest variants or observable variables related to *attitude*. Many scholars have studied these manifest variants or observable variables effects on *purchasing intention* from which the researchers have synthesized the research to include *cognitive, affective*, and *behaviour* in this study (Hogg & Vaughan, 2005; Ostrom, 1969; LaPiere, 1934; Ajzen & Fishbein, 1969, 1975, 1980, 2005; McLeod, 2014; Trafimow & Finlay, 1996; Ajzen, 1991; Fishbein & Ajzen, 1975; Ajzen, 1989, 1991; Leonard & Cronan, 2001, 2005; Olson & Zanna, 1993; Cheah et al., 2015).

Perceived behavioural control

Controllability

The theory of planned behavior is an extension of the theory of reasoned action (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975) made necessary by the original model's limitations in dealing with behaviors over which people have incomplete volitional control. In the discussion about perceived behavioral control, Ajzen (1991) went on to state that the importance of actual behavioral control is self-evident: The resources and opportunities available to a person must to some extent dictate the likelihood of behavioral achievement. Of greater psychological interest than actual control, however, is the perception of behavioral control and is impact on intentions and actions. Perceived behavioral control plays an important part in the theory of planned behavior. In fact, the theory of planned behavior differs from the theory of reasoned action in its addition of perceived behavioral control.

Chiou (1998) investigated whether the relative influences of attitude, subjective norm, and perceived behavioral control on consumers' purchase intentions would be different when consumers possess different levels of product knowledge (subjective and objective) and attention to social comparison information (ATSCI). The results showed that the relative importance of attitude, subjective norm, and perceived behavioral control in the prediction of intention varies when consumers possess different subjective product knowledge or social information comparison disposition. As proposed by the theory of planned behavior, consumers' purchase intentions are affected not only by their attitudes, but also by their group's influences and their own perceived control. The relative strength of effects of these three factors on consumers' purchase intentions is expected to vary across behaviors and situations.

Self-Efficacy

According to Ajzen (1991), the present view of perceived behavioral control is most compatible with Bandura's concept of perceived self-efficacy which "is concerned with judgments of how well one can execute courses of action required to deal with prospective situations" (Bandura, 1982). These investigations have shown that people's behavior is strongly influenced by their confidence in their ability to perform it (i.e., by perceived behavioral control). Self-efficacy beliefs can influence choice of activities, preparation for an activity, effort expended during performance, as well as thought patterns and emotional reactions. The theory of planned behavior places the construct of self-efficacy belief or perceived behavioral control within a more general framework of the relations among beliefs, attitudes, intentions, and behavior (Ajzen, 1991).

According to the study's research and examination of the literature, it was determined that there were 2 key manifest variants or observable variables related to *perceived behavioural control*. Many scholars have studied these manifest variants or observable variables effects on *purchasing intention* from which the researchers have synthesized the research to include *controllability* and *self-efficacy* in this study (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975; Chiou, 1998; Bandura, 1982; Ajzen, 1991).

Purchasing intention

Likelihood of purchase

According to the 2015 Digital Music Report (IFP1, 2015) the global recording industry is passing through a new transition in the fast-evolving digital marketplace. The key features of this evolution, driven by consumers, are the rapid growth of music streaming; a marked diversity of revenue streams and trends from one country to another and a continued evolution from traditional models of music ownership to the new fast-growing model of music access. From the study, key findings showed:

- The industry's digital revenues in 2014 increased 6.9% to $6.85 billion
- In 2014, or the first time, the industry derived the same proportion of revenues from digital channels (46%) as physical format sales (46%).
- Revenues from music subscription revenues now make up 23% of digital revenues globally, up from only 18% in 2013.
- An estimated 41 million people worldwide now pay for a music subscription service, up from 28 million in 2013.

In research by Giletti (2012) on streaming, downloading and digital music consumption, it was stated that the rise in popularity of online download stores such as iTunes and streaming services has been a major factor in this music segment's growth. At the same time, rights holders have attempted to re-commodify a product that has been de-commodified through copyright infringement. Drawing from the theory of planned behavior, the study placed emphasis on the role of norms and attitudes in the formation of intentions to either purchase music or download it for free with the results indicating that a large portion of consumers are willing to pay for digital music but they are not encouraged by the threat of legal repercussions. The youngest consumers hold favorable attitudes towards illegal downloading which is grounded in a norm of copyright infringement and belief in the Internet as free. Finally, it was found that affinity for the recording artist serves to moderate intentions to download illegally.

Recommendation

This is consistent with Ostrom and Lacobucci (1995) which stated that consumer satisfaction and repeated purchase intention have different structures. There are two dimensions in consumer satisfaction, cognitive and affective while repeated purchase intention has the additional dimension of behavior. Normally, consumers will make a repeat purchase when the purchased product or service works well or has the required qualities. Price is also an influential as it must be reasonable and consistent with the provided service and quality (Barsky & Labagh, 1992).

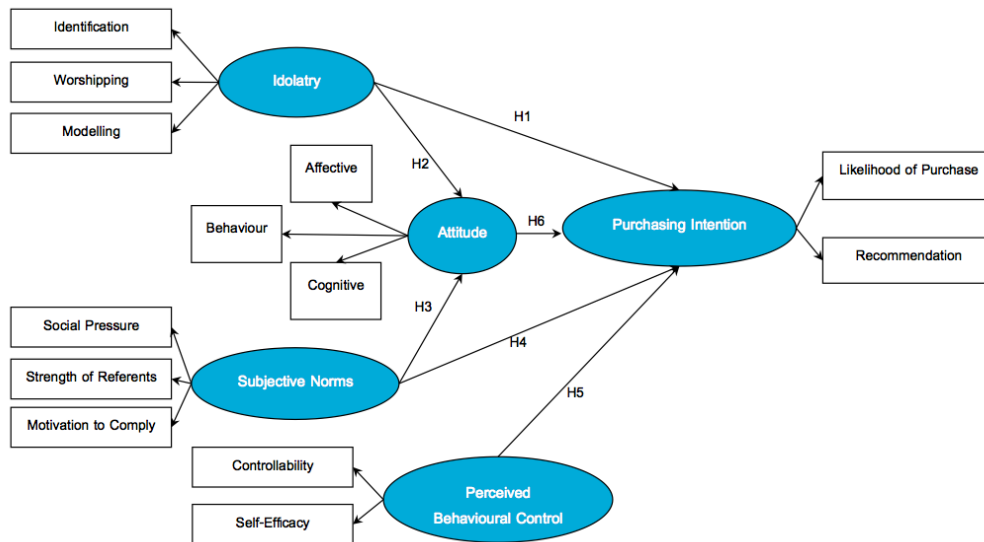
According to the study's research and examination of the literature, it was determined that there were 2 key manifest variants or observable variables related to *purchasing intention*. Many scholars have studied these manifest variants or observable variables effects on *purchasing intention* from which the researchers have synthesized the research to include

likelihood of purchase and *recommendation* in this study (IFP1, 2015; Giletti, 2012; Ostrom & Lacobucci, 1995; Barsky & Labagh, 1992).

From the above conceptual review and development, the researchers have developed the following six hypotheses for the study:

PROPOSED RESEARCH HYPOTHESES MODEL

H1: *Idolatry* has a direct influence on *Purchasing Intention*
H2: *Idolatry* has a direct influence on *Attitude*
H3: *Subjective Norms* has a direct influence on *Attitude*
H4: *Subjective Norms* has a direct influence on *Purchasing Intention*
H5 :*Perceived Behavioural Control* has a direct influence on *Purchasing Intention*
H6 :*Attitude* has a direct influence on *Purchasing Intention*

PROPOSED CONCEPTUAL MODEL


Methodology

This research aims to model the structure of the factors that influence the willingness of 'Y-Generation' Thais to buy music in digital form. The researchers have therefore set out to determine the details and procedures of the methods as follows:

Data Collection and Analysis

For this research the researchers will use both quantitative and qualitative research from both primary and secondary data. The researchers will use the following steps for the study:

Study of Secondary Data

Secondary data will be comprised of published research, internet materials, media reports, and data which will be synthesized and analyzed. This secondary data will also be used for the development of the 13 variables and the structural equation model in understanding the variables that effect purchasing intention by Y-Generation digital music users.

The Quantitative Research

Quantitative research will be performed from the primary data by collecting a questionnaire from the target sample of Thai 'Y' generation digital music users. The questionnaire used to collect the data will be structured and written in a realistic, easy-to-understand format which is deemed to be reliable and reasonable. The measurement instrument or questionnaires will utilize a 5-Point Likert Scale (Likert, 1972) as a tool for research. Further reliability validation will be undertaken as follows:

1. The review of the questionnaire will be conducted by 5 experts in their fields to validate the investigation questions and the use of rhetoric and the simplicity and comprehension of the questions.
2. During the question trial period, the questions will undergo a continual rigorous review and inspection for their clarity and ability to the meet the objectives of the research.
3. Improvement of the questions for clarity and comprehension will be undertaken when there are any problems during the trial period.
4. Data collection and statistical analysis will be performed.

The Qualitative Research

Qualitative research involves confirming the model of the quantitative research and for this research will be a collection of interviews with industry professionals involved in the music industry including 1 music industry executive, 1 label executive, 1 digital music download manager and 2 music industry scholars.

The Sample Size

Schumaker and Lomax (2010) stated that structural equation modeling (SEM) uses a variety of models to show the relationships between observed variables with the goal being of providing a quantitative test of a theoretical model. The models developed using SEM can be tested to show how sets of variables define concepts and how they are related. The goal of SEM is to determine the extent to which the model is supported by the data that is gathered during research (Schumaker & Lomax, 2010) and since SEM is capable of statistically modeling and testing complex phenomena, it has therefore become the preferred method for confirming (or not) theoretical models, quantitatively.

Another very important consideration is the intended sample size with most authors recommending a sample size of at least 100 for good results generation (Schumaker & Lomax, 2010; Cunningham, 2008; Weston & Gore, 2006; Worthington & Whittaker, 2006). Meldrum (2010) further stated that a sample size smaller than 100 should not be used in SEM as it is unreliable. Therefore, based on the 13 variables of the model and with the use of a 20:1 ratio which is deemed to be highly reliable, a minimum of 260 Thai 'Y' generation digital music users are anticipated for the survey.

Research Tools

Quality and content will be monitored with tools used in the research and as a measurement of quality. Both content validity and reliability will be assured by the 5 listed experts above in their respective fields with an evaluation index consistent with the content and the purpose of the research. Additionally, the index of Item-Objective Congruence (IOC) developed by Rovinelli and Hambleton (1977) will be employed to carry out the screening of questions to a group of 10 initially in the pilot study.

The IOC is a procedure used in test development for evaluating content validity at the item development stage. This measure is limited to the assessment of unidimensional items or items that measure specified composites of skills. The method prescribed by Rovinelli and Hambleton (1977) results in indices of item congruence in which experts rate the match between an item and several constructs assuming that the item taps only one of the constructs which is unbeknownst to the experts. The research will then proceed to select items that have an IOC index higher than 0.5, which will be considered acceptable.

Data Analysis

Descriptive statistics are used to describe the basic features of the data in a study which provides simple summaries about the sample and the measures and form the basis of virtually every quantitative analysis of data (Subong, 2005). For the proposed structural equation modeling, an analysis will be conducted on the frequency, percentage, mean and standard deviation as appropriate to determine the relationship of the factors that influence the purchasing intention of digital music by Thai Y-Generation consumers.

Qualitative Data Analysis

To confirm the results of the quantitative analysis, the researchers will conduct interviews with those involved with innovation and business management in the digital music industry and then to proceed to interpret the qualitative information.

Conclusion

From the literature review, it has been established that the intent to purchase digital music occurs because of consumers' idolatry and modeling of their music idols. Furthermore, due to subjective norms factors which influence others such as friends and family, the intent to purchase is also enforced. These two variables are speculated to have a direct and positive influence on the intent to purchase digital music by Generation-Y Thais. It should also affect the attitude, the intermediate variable that affects their willingness to purchase digital music.

CUSTOMERS' PERCEPTION OF TECHNOLOGY-ENABLED BANKING SERVICES IN INDIA

Liaqat Ali, Punjabi University, India
Simran Jit Kaur,l Punjabi University, India

Abstract

Technology has the potential to provide the financial services at affordable cost to ensure the inclusive growth of the nation. It connects the unbanked section with the mainstream banking system. However, various studies in the past have focused on the factors that affect the acceptance of internet banking among customers. But very limited numbers of studies trace out the customers' perspective of technology-enabled banking services on an overall basis. The present study makes an effort to develop our understanding of the customers' inclination towards technology-enabled banking services. The main aspiration of the study is to come up with a first view of consumers' incisiveness of modern financial services delivery channels. The findings highlight the significant influence of age, occupation, income, education, availability of computer and internet facility on their usage of technology-enabled banking services. The research sheds light on different factors that encourage or discourage the respondents' use of technology-enabled services. For this purpose the data from a sample of 337 Indian bank customers was collected through a self-administered questionnaire. The results establish that perceived ease of use, convenience and accessibility, prior experience of customers with technology are the factors that influence the customers' perception regarding acceptability of modern financial services delivery channels.

Keywords: *Banking technology, Internet, Banking services, Customers' perception.*

Introduction

Since the last decade, the Indian banking industry has been demonstrating massive transformation owing to rapid technological advancements. These technological advancements have removed all the barriers in the way of introducing new products and services. Technology enabled financial services have potential to bank the unbanked masses at least possible cost. The financial institutions and banks are taking these advancements as a tool to outreach the underserved section of the society. Traditional financial services delivery channels are accompanied with these new technology- enabled services like ATM, mobile banking, internet banking, telephone banking, and electronic fund transfer (EFT) etc. to make a gradual change in the whole scenario. The cost of each transaction is reduced approximately to $0.27 from $1.07 (Nath et al., 2001). Technology-enabled distribution channels are not only significant in reducing the cost of transaction but also in retaining the existing customers (Ramayah et al., 2003).

According to the Global Findex database 2014, the bank account penetration is increased from 35% to 53% during last four years in India but at the same time the dormancy rate is also very high with 43%. This figure brings light to the fact that most of the account holders are holding an account just for the sake of formality. On practical ground they are disconnected from the mainstream banking system. At this point of time there is a dire need to

sketch out the customer's opinion towards technology-enabled banking services delivery channels. The present study is an attempt to ascertain the factors influencing the customers' attitude and perception towards technology-enabled banking services through extensive literature review and self-administered questionnaire. In developing economies, due to the presence of various resistant factors the acceptance rate is really low. There is a dire need for the collaboration among bank managers and IT managers to ensure the successful framing and implementation of IT strategies in developing countries (Aladwani 2001; Mahdi and Dowson, 2007). Customers hesitate to adopt these new products and services either due to the limited resources or lack of knowledge. The perception of consumers from developing countries towards new financial services delivery channels deserves special attention of researchers, academicians and policy makers. This paper explores the customers' perception by shedding light on the overall incisiveness measured on the basis of extensive literature review and questionnaire designed. Literature review helped in framing questionnaire covering the factors that encourage and discourage the consumers' adoption of innovative services and identifying the variables measuring demographic and attitudinal attributes of users and nonusers.

With a brief discussion about the role of banking technology in accessing the unbanked, the paper moves to the literature review section. The various core research papers were analysed to determine the factors influencing the customer's attitude and perception towards technological advancements in the banking sector. With the purpose to gain a deeper insight into the matter, literature measuring the banker's opinion regarding technology-enabled banking services is also explored. Next section of the paper presents research objective and research methodology followed by ananalysis of the findings. Finally, the results are presented and paper concludes with details of major findings.

Literature review

Banking has undergone tremendous changes due to the technological interventions in the industry. In banking sector technology is considered as a key driver of internal changes (Jayawardhena and Foley, 2000). Over the next decade, technology is expected to have a great impact on banking sector (Bednar et. al., 1995). The new financial services delivery channels are gaining attention of researchers, academicians and policy makers these days. Technology is playing a pivotal role in banking the unbanked. It becomes possible to provide banking services at the bottom of the pyramid through technology. An extensive literature is available on technological interventions in banking sector. On the basis of review, the recent literature is classified into three sections namely: changes influenced by IT in banking sector, customers' attributes and technology-enabled services, bankers' approach to technology-enabled banking services.

Changes influenced by IT in banking sector

Traditional banking model was concerned with providing banking services to the consumers at bank branches only. Traditional banking model which was based on relationship establishment is facing a change in competition structure by offering internet based products and services. New financial services delivery channels have made it possible for community banks to expand the area of operations and markets (Acharya et al. 2006). Structural changes in retail banking industry are the result of growth of technological knowledge in the system. Changing regulatory framework and technological interventions have resulted into more competitive retail banking market (Consoli, 2005). Bank customer relationship has taken a new definition in lieu of personal contact with the customers. Put succinctly, Technology-enabled services have developed 'virtual relationship' between bank and customers (Harden, 2002).

Financial institutions are able to provide better services through technology-enabled delivery channels at lesser cost. An extensive research undertaken on the preferences of customers for financial services distribution channels have reported that modern technology enabled channels can provide the improved services at lesser cost. Howcroft et al. (2002) conducted a study on UK customers and reported that a mix of delivery channels is more preferable to the consumers than depending upon a single channel. Modern financial services delivery channels have significantly reduced the cost of transactions. Nath et al. (2001) observed with the introduction of new channel like ATM the transaction cost is reduced to $0.27 from $1.07. Jayawardhena and Foley (2000) reported the benefits of technology-enabled banking services to the banks as development of non-core businesses, reduced cost, increased customer base.

Customers' attributes and Technology- enabled services

Literature suggests that the attitude and perception towards a particular product or service are expected to develop over time and gets affected by various factors. Initially, researchers (Filotto et al., 1997; Davies et al., 1996; Rugimbana, 1995; Moutinho and Smith, 2000) focused on consumers' adoption of automated teller machines (ATM). Later on, the concern of researchers was shifted to exploring the potential of telephone banking (Howcroft et al., 2002) and PC banking (Mols, 1998; Hitt and Frei, 2002). Recent studies concentrates on investigating the consumers' adoption of internet banking and other technology-enabled banking services (e.g., Jo Black et al., 2001; Karjaluoto et al., 2002; Ramayah et al., 2003; Ibrahim et al., 2006; Singh and Kaur, 2013; Murari and Tater, 2014; Harris et al., 2016). Using 12 attitudinal attributes of consumers related to electronic banking Akinci et al. (2004) defined three groups of consumers namely: "speed seekers", "cautious users" and "exposed users". In the same line McPhail and Fogarty (2004) identified three groups of mature Australian consumers, on the basis of their frequency of using self-service technologies like ATMs, telephone banking, internet banking, and electronic fund transfer. These were "Users", "Med-High users" and "Non-users". Barczak et al. (1997) conducted a study in USA and shed light on the motives of consumers for using technology based banking services. They asserted that four motivational groups could be formed on the basis of attitude and behaviours of consumers towards banking innovations namely: "Security conscious", "Maximisers", "Instant gratification".

In UK Howcroft et al. (2002) found that lower fees and improved level of services are the most significant factors affecting the consumer attitude towards internet banking. However, recommendations by family, friends or newspaper are least important factors. Karjaluoto et al. (2002) added that consumers' demographics, prior experience of computer and technology, personal banking experience, reference group influence affect the consumer adoption of on-line banking and technology enabled services. Lee (2009) conducted a study on UK consumers, and reported that perceived risk which constitutes performance risk, social risk, financial risk, time risk and physical risk was the most resistant factor to adopt online banking.

He further argued that perceived benefit and usefulness were considerable factors positively affecting consumers' intention to use online banking. The parallel findings were reported by Ramayah et al. (2003) who conducted a study on receptiveness of internet banking by Malaysian customers and concluded that perceived ease of use and perceived usefulness are the significant variables explaining the consumers' intention to use technology-enabled banking services. Similarly, Wentzel et al. (2013) highlighted lack of education and knowledge about products & services, people's trust in technology enabled services as the resistant factors in adopting technology-enabled services in South Africa.In case of India,

Kaushik&Rehman (2015) asserted that perceived risk factor owing to the lack of knowledge about the availability& usefulness of self service banking technologies restrain customers to adopt technology-enabled services.Using the case of USA, Harris et al. (2016) emphasised the impact of age factor on consumer technology acceptance in banking sector. They asserted that young consumers prefer technology based services whereas older consumers show high value preposition for physical based banking. They further added that not only cognitive declines but cohortdifferences also have a significant impact on technology usage.

In another study in UK, Moutinho& Smith (2000) found that ease of banking and convenience were the predominant expectations of established bank customers. Laukkanen (2007) who compared the customers' value perception for internet and mobile banking and asserted that worth mentioning differences between the customer value perception for internet and mobile banking are concerned with location free service and display of device. Usability of devices and services is predominant for customers to make use of technology enabled services. Saythe (1999) inferred that in Australia, consumer intention to adopt internet banking is affected by variables like: ease of use, awareness of service, availability of infrastructure, resistance to change and system's insecurity. Lichtenstein et al., (2006) found that perception of convenience is important quality attribute rather than fear of security issue among Australian consumers. Apart from that the study observed the need for interactive and immediate support by banks to the consumers for making them familiar with technology enabled banking services. Singh and Kaur (2013) added that when it comes to talk about the customers' satisfaction towards e-banking services the predominant factors are: ease of use, reliability, convenient accessibility, security, low transaction cost and the time consumption.

Bankers' approach to technology-enabled banking services

Extensive research has already been done to investigate the customers' attitude and perception towards internet banking or innovative delivery channels. But there is paucity of studies determining the banks and bank managers' view on internet banking, EFTPOS(Electronic Fund Transfer Point of Sale), ATM etc. Using the case of US, Nath et al. (2001) asserted that internet banking was in its initial stage and a significant number of banks believed that their survival relies on offering internet base innovative services to the customers. In the same line Harden (2002) concluded that high street banks in UK were forced to introduce modern financial services delivery channels in order to face the competition. He further propounded that technology had redefined the nature of relationship between bank and customers and had become diluted. In another study, Malhotra and Singh (2007) conducted a study on commercial sector banks in India to investigate the determinants of internet banking adoption by banks. They argued that banks with low branch intensity, higher deposits, and private ownership were highly inclined towards adoption of new delivery channels to enhance their market share.

Based on the experience of USA, Acharya et al. (2006) claimed that traditional community banks were facing competition from large national banks due to the introduction of internet based banking services. The community banks were compelled to offer internet based products and services to take the competitive edge. Aladwani (2001) shed light on the drivers, expectations and development challenges of adopting online banking in Kuwait. He asserted that lack of internet specialists, change in internet technologies and top management support were the main issues to the development of online banking in Kuwait. In another study, Jayawardhena and Foley (2000) found that banks realised the immediate need to offer innovative products and services to consumers in order to satisfy the need of the consumers, get a competitive edge and to address the demands placed upon supply chains. Similarly, factor like perceived ease of use, social pressure, and national culture was considered as predominant factor to motivate bankers to use microcomputers in Nigeria (Anandarajan,

2000). Parallel to this, in a recent study Murari and Tater (2014) looked at the advantages of information technology for banks. These were: increased customer satisfaction, improved operational efficiency, reduced transaction time, and facilitating competitive edge in reducing the running cost by quick responses in delivery of services.

Table1: Summary of literature

Theme	Author/Year	Type of study	Source of data	Country	Focus area
Changes influenced by information technology in banking sector	• Morisi (1996)	Theoretical	-----	USA	The author suggested that computer technology is essential to reduce the cost and take a competitive edge in the market. Technology has allowed the banks to provide more services with lesser employees.
	• Jayawardhena and Foley (2000)	Theoretical	Banks' website	UK	The author opined that banking sector is subject to various internal and external forces in UK. Internet in particular is the key driver of internal changes that are taking place e.g. changes in delivery strategies of banks.
	• Consoli (2005)	Theoretical	-----	UK	Research indicates that growth of technological knowledge in

					the system contribute to the structural changes in the banking industry in UK.
	• Acharya, Kagan, Sobol&Kodepaka (2006)	Empirical	Bank managers	USA	Technological interventions in banking industry have resulted into substantial increase in level of competition. At the same time, the use of internet has opened up new options for community banks in terms of products offered.
Customers' attributes & Technology-enabled services	• Barczak et al.(1997)	Empirical	Bank customers	USA	Defines three groups of consumers on the basis of the motives of consumers about technology-enabled banking services namely: "Security Conscious", "Maximisers", and "Instant Gratification".
	• Saythe (1999)	Empirical	Bank customers	Australia	Security concern and lack of awareness were defined as major hurdles in the

				way of adopting internet banking. Facilitating financial services over internet is suggested to be the part of customer service and distribution strategy.
• Moutinho and Smith(2000)	Empirical	Bank customers	UK	The study emphasised the importance of customers' perceptual outcomes while analysing the customers' satisfaction towards human and technology based financial services delivery channels. Ease of banking and convenience were reported as major expectation of customers.
• Howcroft et al.(2002)	Empirical	Bank customers	UK	The author inferred that financial service consumers are not homogeneous in terms of their attitude towards online banking. Their attitude differs

				as per the demographic and socio-economic profile. Lower fees and improved service quality are most influencing factors affecting the attitude of customers positively.
• Karjaluoto et al.(2002)	Empirical	Bank customers	Finland	The study provides evidence that online banking provides cheap, fast and easy services to the customers. It emphasise that prior experience with computer, technology and personal banking has an impact on customer's attitude towards internet based banking.
• Ramayaha et al.(2003)	Empirical	Bank customers	Malaysia	Prior experience and external pressure were reported as external pressures influencing the consumers' intension. Perceived

				usefulness was considered to be the better driver of intention to use internet banking instead of perceived ease of use.
• Akinci (2004)	Empirical	Bank customers	Turkey	The study brings light on the factors affecting the customers' adoption of internet banking. Three groups of customers are defined on the basis of their perception namely speed seekers, caution users, exposed users.
• McPhail and Fogarty (2004)	Empirical	University staff	Australia	The study explored the three segments of mature consumers' namely non users, low users and medium to high users. The non-users show innovation resistance which can be addressed by putting efforts and time. Users have tendency of discontinuance from one to

				another innovative technology enabled service.
• Linchtenstein at al. (2006)	Empirical	Bank customers	Australia	The study propound that convenience in terms of time saving is the main dominating factor influencing the customers attitude towards internet based banking services. The risk acceptance of the customers in Australia has gradually increased and they prefer convenience over risk and security issues.
• Laukkanen (2007)	Empirical	Bank customers	Finland	The study explored the various components of customer value perception for mobile banking and internet banking. It found that the customer don't prefer to rely upon single delivery channels but a mix of these channels.

• Lee (2008)	Empirical	Bank customers	Taiwan	The paper highlighted that demographic and socio-economic factors have a significant impact on willingness of customers to adopt technology enabled services. Perceived benefit, perceived usefulness and attitude have positive impact on intention to adopt technology.
• Wentzel et al.(2013)	Empirical	Bank customers	South Africa	Author proposed an extended TAM model consisting of additional constructs: social factors, self- efficacy, fun, trust and task. Attitude was reported as the most important factor in the model followed by perceived ease of use on the flip side social factors and self-efficacy were least important factors.

• Harris et al. (2016)	Empirical	Bank customers	USA	The study sheds light on the impact of age factor on technology acceptance in banking sector. The paper concludes that young consumers are more comfortable with technology based services whereas older consumers show high value preposition for physical based banking.

Objectives of the study

The main aim of the study is to come up with the first view of customers' incisiveness of modern financial services delivery channels. The study makes an effort to develop an understanding of the customers' inclination towards technology enabled banking services. In particular, present study concentrates on:

- Identifying the factors that encourage and discourage the respondent's use of technology enabled banking services.
- Understanding the impact of the demographic profile on customers' perception regarding whether technology has made it easy for customers to access banking services or complicates it further.

Research methodology

The present study is based on primary data. A well-structured questionnaire was used to understand the perception of consumers towards technology enabled banking services and their preferences for different service delivery channels. The questionnaire was designed after an extensive review of the related literature (e.g., Ramayah et al., 2003; Poon, 2007; Nyangosi et al., 2009; among others). The data was collected through paper-based questionnaire as well as online survey questionnaire. For pilot testing, the questionnaire was forwarded to a group of 20 respondents through 'Google forms' and adequate changes were incorporated. Ambiguous statements were eliminated and some new variables were introduced after conducting reliability analysis. The questionnaire was administered to 380 consumers from the states of Punjab, Haryana and U.T. Chandigarh (India) during June-August 2016. 337

usable questionnaires were received (response rate of 88.68%), out of which 103 were collected through the online survey (Google forms) and 234 through paper-based questionnaire. Convenience- judgement sampling was used to select the respondents. The sample units were asked to mark their opinion regarding various statements on a five-point Likert scale ranging from 5-strongly agree to 1- strongly disagree. Negatively worded statements were reversely coded (Malhotra, 2004). To analyse the data statistical packages for social sciences (SPSS) 16.0 version was used.

Sample profile

The sample for the study comprises the respondents (aged 18 years & above), who were using the technology enabled financial services. As the Table 2 depicts, majority of the respondents were male (60.5%). It is worth mentioning that predominant age group in the sample belong to 21-30 years (48%) and 31-40 years (24%), collectively comprises 72% of the total sample, as young people are more open to technological advancements and are more tech-savvy. Apart from that Table 2 shows that 53.4% customers were service class with moderate annual income (44%). Proportionally large chunk of respondents (76.8%) were highly educated with graduation degree or above.

Table 2: Demographics of the sample

Demographic characteristics	Respondent frequency	% frequency
Gender Male Female Total	 204 133 337	 60.5% 39.5% 100%
Age 18-20 Years 21-30 Years 31-40 Years 41-50 Years >50 Years Total	 20 162 81 47 27 337	 5.9% 48% 24% 13.9% 8% 100%
Occupation Business/consultant/self-employed Service Student Home maker Agriculturalist Total	 41 180 86 19 11 337	 12.2% 53.4% 25.5% 5.6% 3.3% 100%
Annual Income <2 lakh 2-5 lakhs 5-8 lakhs >8 lakhs Total	 108 150 62 17 337	 32% 44% 18.4% 5% 100%
Education Metric & above Senior secondary	 18 60	 5.3% 17.8%

Graduate	112	33.2%	
Post graduate	110	32.6%	
Doctorate and above	37	11%	
Total	337	100%	
Ownership of IT products			
Computer/Laptop	266	78.9%	
Internet	261	77.4%	
Mobile phone	307	91.1%	

Analysis of findings

To analyse the impact of the demographic profile of the respondents on their perception regarding ability to utilize the technology-enabled banking services, one-way analysis of variance (ANOVA) technique is employed. The findings are presented in the table 3 below. The table clearly depicts that age, occupation, income level, education, availability of computer/laptop and internet is having a significant impact on the adoption rate. As young people are tech savvy and they are open to adapt new technologies. Consumers with high-income level are more likely to have the positive attitude towards technology enabled banking services (Howcroft et al., 2003; Lassar et al., 2005, Worthington, 2007). The educated people perceive it easier to use modern financial services delivery channels rather than the traditional banking system. With the availability of computer and internet, the likelihood of understanding and adopting the technology enabled services tends to increase. The parallel findings were reported by Zeffane and Cheek (1993), Poon (2008). On the flip side, gender and availability of mobile phones are insignificant factors; it means that gender and access to mobile phones does not make much difference in the opinion of the customers regarding technology acceptance.

Table 3: Relationship of demographic profile and perception

Items	F-value	Significance
Gender	2.308	0.130
Age	22.37	0.000*
Occupation	11.46	0.000*
Income	5.099	0.002*
Education	16.584	0.000*
Mobile phone availability	1.410	0.236
Computer/laptop availability	12.083	0.001*
Internet availability	17.642	0.000*

Note: * denotes significance at $p < 0.05$

Factor analysis

To analyse the perception of the consumers that whether the technology has made it easy to access and operate the bank account or complicates it further, factor analysis technique of data reduction is used to come up with a significant factors. The respondents were asked to mark their opinion regarding the nine statements on a five-point Likert scale ranging from strongly agree (5) to strongly disagree (1).

Reliability and validity of scale

Before applying the factor analysis on the set of data reliability of the whole scale is measured with the widely used measure of internal consistency i.e. Cronbach's alpha. The acceptable level of internal consistency is >0.70 (Malhotra, 2004). The overall Cronbach's alpha of the 9 statements came out to be 0.731, which indicates the adequate internal consistency. The questionnaire was designed after an extensive review of related literature which certifies the content validity of the scale.

KMO test is used to measure the sample adequacy, the value greater than 0.50 is highly desirable. As the Table 4depicts, the value of KMO came out to be 0.799 which shows that the sample is sufficiently enough for factor analysis. Bartlett's test is significant (P<0.05), which implies that there is a significant correlation between the variables.

Table 4: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.799
Bartlett's Test of Sphericity	Approx. Chi-Square	797.921
	Df	36
	Sig.	.000

Rotation of the factors was done with Varimax rotation method. The rotated component matrix makes the analysis and interpretation of the results much easier. The table reflects the values greater than 0.50 as the set criteria. The total variance explained by the three extracted factors was 61.72%. The three factors and their factor loading are displayed in Table 5 below.

Table 5: Extracted factors and the related variables

Factor	Statement	Factor loading
Ease of use	I feel confident of using electronic banking method for accessing my account.	0.880
	It is easy to understand and operate.	0.870
	I understand the functioning of computer, internet and mobile phone.	0.857
	Through technology it becomes possible to get complete control of account.	0.589
Convenience and	It is highly convenient to	0.830

accessibility	access banking services from anywhere.	
	Internet, computers and mobile phones are easily availability all the time.	0.610
	Technology enabled services are faster than traditional banking services.	0.578
Prior experience of technology	Due to limited knowledge ** about technology the chances of occurring an error are so high.	0.933

Note: ** statement negatively worded so reverse coding was done

In order to analyse the effectiveness of different financial services delivery channels, Friedman test was employed. The respondents were asked to rank six financial service delivery channels in such a way that the most preferred channel is to be assigned 1 and least preferred as 6. After using Friedman test on the set of data, the value of χ^2 came out to be 733.68 (p= 0.000). The result shows that respondents have a significant difference in their opinion about preferences for different service delivery channels.

As Table 6 shows ATM was the most preferred delivery channel and internet banking came atthe second position after that Mobile banking was the third preference of respondents. Face to Face banking was the fourth preference of consumers which shows that consumers are more inclined towards the technology enabled banking services. Respondents found telephone banking and PC banking as the least preferred mode of accessing their bank account.

Table 6: Mean ranks of customers' preferences for financial services delivery channels

Delivery channels	Mean Rank
ATM	1.72
Telephone banking	4.77
PC banking	4.60
Face to face banking	3.83
Internet banking	2.57
Mobile banking	3.51

Factors that encourage and discourage the respondents' use of technology enabled banking services

With the purpose to get a clearer insight into the customers' attitude towards different financial services delivery channels, the factors that encourage and discourage the customers' use of technology enabled banking services were further investigated. The responses were analysed using Kendall's coefficient of concordance (W), to trace out that whether there is a significant difference in the frequencies.

Table 7: Mean ranks of the frequency of factors encouraging customers to use technology enabled banking.

Statements	Mean Rank
Lower fee	3.36
7days & 24 hours banking is possible through technology	3.54
Easy to get instant feedback of transactions	3.24
Friends and relatives encourage to use electronic banking channels	2.09
Using ATM, Internet banking improves social esteem	2.77

While analysing the factors encouraging the use of technology enabled banking services, the value of χ^2 came out to be 244.08 (p=0.000) and Kendall's statistic (W) was 0.181. This shows a very low degree of association. It means customers perceived that all the factors are not equally important in encouraging the use of technology enabled banking services. Table 7 shows the mean ranks of the factors which encourage the use of technology enabled banking. 24 hours availability of banking services and lower fees were reported as the most encouraging factors closely followed by instant feedback of transactions. The least important factor that encourages the use was influence of family and friends (Howcroft et al., 2003).

Table 8: Mean ranks of the frequency of factors discouraging customers to use technology enabled banking.

Statements	Mean Rank
Security issue	4.29
Chances of occurring an error	3.03
Lack of internet facility and other essential technical equipment	3.38
Difficult to understand new technologies and procedures	2.78
Absence of face to face contact	3.48

Statements	Mean Rank
Security issue	4.29
Chances of occurring an error	3.03
Lack of internet facility and other essential technical equipment	3.38
Difficult to understand new technologies and procedures	2.78
Absence of face to face contact	3.48
Lack of training programs to educate the people	4.05

The Kendall's statistic (W) came out to be very low (0.130) and the value of χ^2 was 219.75 (p=0.000). Put it simply, there is significant differences in the opinion of customers regarding the different sort of problems being faced while using technology enabled banking. As Table 8 shows security issue and absence of face to face contact were reported as the most important concerns by the respondents closely followed by lack of internet facility and other essential equipment. However, more chances of occurring an error and difficulty in understanding new technologies and procedures were reported as the least important discouraging factors.

Table 9: Suggestions to build trust towards technology-enabled banking services

Suggestions	Mean Rank
Banks should improve the quality of its website	4.52
Money refund guarantee should be provided in case of fraud	4.49
Security system must be more strengthened	4.42
More transparency in transactions conducted with online traders must be provided	4.26
Special training should be provided to the customers about precautions while conducting a transaction through modern delivery channels	4.37

The above findings clearly depict the significance of technology in banking industry. The high inclination of customers towards technology enabled financial services makes it clear that the future of banking industry is strongly associated with technology. However, the developing trust of consumers towards the technology based banking system is the major concern. In the present study an effort was made to trace out the major concerns while adopting technology enabled services. The findings clearly show that consumers suggested improving the quality of the website and providing money refund guarantee in case of any fraud (Table 9).

Figure 1: Building trust towards technology enabled bank services
Consumers strongly believe in strengthening the security system of the banks. However, various efforts have been already done by the banking industry in India but still there is a need to strengthen the security system to reduce the frequency of frauds. Banks in India should impart regular special training sessions to encourage the use of technology enabled banking services. It was observed during study that most of the people felt hesitated to use the modern delivery channels due to the lack of knowledge and lack of prior experience with the technology.

Managerial implications of the study

The results of the study will be extremely useful to the banks while framing policies and understanding the opinion of customers about technology enabled banking services. The study provides clear insights on the factors that matter for customers in India while using modern financial services delivery channels. The bank account penetration in India is increased from 35% to 53% during last four years but at the same time the dormancy rate is also very high with 43%(Global Findex Database 2014). This figure brings light to the fact that there is a great scope for making use of technology-enabled banking services to connect the unbanked section with the mainstream banking system.

Further, three main factors are identified in the study explaining that whether technology has made it easy or complicate the procedures for customers. The findings provide evidence that the perception of the consumers regarding the use of modern financial service delivery channels is not identical. The study highlights the need for understanding the different requirements of customers as per their demographic profile i.e. age, income and education. In the present study a significant relationship is observed between the demographic profile and perception of respondents regarding the use of modern financial service delivery channels. The study reported that the consumers, who are young, educated, and having high income find it easier to operate the account electronically. The old age and less educated consumers with low income find it hard to understand and operate the account electronically due to the lack of prior experience with the technology.

Ease of use is the most important factor that matters to the customers while using electronic banking. The bank managers and IT managers should focus on simplifying the procedures and improving the quality of the website so that, the customers with least or no prior experience can deal with the procedures confidently. The operating process should be more user-friendly and easy to understand. As the present study reports that 92.2% of the respondents owned mobile phones, banks should work in collaboration with mobile and telecommunication companies to connect the unbanked masses with the mainstream banking system.

Conclusion

The outcomes of the study provide strong evidence to support the notion that banks should strengthen the security system to build the trust of customers towards technology-enabled banking services. Special training programmes should be initiated to educate the people about how to make use of these services. Majority of less educated and low income bank customers in India have pre- conceived notion that technology enabled banking services are difficult to understand (internet banking, mobile banking etc.) and less secure. In most of the cases the use of modern delivery channels is confined to the ATM only. There is a need to inculcate the confidence among people to use other technology enabled banking services also like internet banking, mobile banking and personal computer banking etc. IT managers in the banking sector should concentrate on simplifying the procedures and designing the websites keeping in view the requirement of different segments of customers.

EXPLORATION OF FACTORS HINDERING THE GROWTH OF 3PL MARKET IN SRI LANKA

M.A. Asoka Malkanthie, University of Sri Jayewardenepura, Sri Lanka
J.M.D.J.N. Jayamanna, General Sir John Kotelawala Defence University, Sri Lanka

Abstract

With the globalization of businesses and the consequent competitive pressures, all the companies are trying to deliver customized products all over the world quickly and on time. This has placed a number of demands on the logistics systems. While today world logistic industry is practicing up to 7PL, within a short span of time, Sri Lanka is still grappling with 3PL activities. Therefore, the intention of this research is to identify the challengers, barriers / factors hindering the growth of 3PL market in Sri Lanka to facilitate the growth of the industry to meet the world competition. According to the findings, customers are quite happy about their 3PL providers, but they are not highly satisfied as well as any high trust to the 3PL providers. Costs, lack of control, lack of coordination, lack of corporation are the main issues respectively that affect the growth of 3PL market in Sri Lanka. Inadequate capabilities are also a one of the problems. Lack of control and lack of coordination are the significant factors that diminish the satisfaction of customers and lack of control is the only significant factor that diminishes the trust of customers. Minimizing lead time between deliveries, adoption of new technology, handling no. of order channels multiplied by the number of delivery options and handling overstocks due to online sales, and adoption of new technology are considered as the future challengers in 3PL market in Sri Lanka.
Key Words: *logistics, 3PL, satisfaction, trust, hindering issues*

Introduction

Over the last decades, the activity of logistics has tremendously evolved (Aldebert and Hudziak, 2012). Logistics is defined as: "a part of supply chain management that plans, implements, and controls the efficient, effective forward and reverses flow and storage of goods, services and related information between the point of origin and the point of consumption in order to meet customer's requirements."(CSCMP, 2015). "Logistics management activities typically include inbound and outbound transportation management, fleet management, warehousing, materials handling, order fulfillment, logistics network design, inventory management, supply/demand planning, and management of third party logistics services providers" (CSCMP, 2015). It is widely accepted that the outsourcing of logistics services aims at enabling the creation of strategic and operational value such as inventory and logistics cost reduction, order fill rate and accuracy increase, and order cycle time reduction (Langley and Capgemini, 2010). For these reasons a majority of shippers, 64%, are increasingly using Third Party Logistics (3PLs) (Aldebert and Hudziak, 2012). According to the Council of Supply Chain Management professionals, Third Party Logistics (3PL) is defined as "a firm provides multiple logistics services for use by customers. Preferably, these services are integrated, or bundled together, by the provider. (Manzini et al, 2007). "Lying on a key East-West trade route and set close to India, Sri Lanka possesses the essential location advantage needed for it to develop into a key logistics hub in South Asia. Despite being a small economy, with a total trade amounting to about US$31 billion in 2014

(Only 4% of India's US$778 billion), the island state is an important transshipment hub in the region. It is a site where many shipping companies consolidate and deconsolidate cargo for transshipping to other destinations" (HKTDC, 2015). "World Shipping Council statistics show that the Port of Colombo, Sri Lanka's major container port on the west coast was the busiest port in South Asia in 2013, handling 4.31 million TEUs. This puts it ahead of India's largest container port, Jawaharlal Nehru (4.12 million TEUs in 2013). In the first 11 months of 2014, the Port of Colombo reported a steady growth of 4% in container traffic, according to the Sri Lanka Ports Authority (SLPA). Notably, transshipment volume grew far faster than domestic cargo business during the period, accounting for more than 75% of total container throughput" (HKTDC, 2015). But, while today world logistics industry is practicing 4PL, 5PL, and collaboration up to 7PL, within a short span of time, Sri Lanka is still grappling with 3PL, JIT (Just in Time), and VMI (Vendor Managed Inventory). Therefore, it is an essential requirement to identify the challengers, barriers / factors hindering the growth of 3PL market in Sri Lanka to facilitate the growth of the industry to meet the world competition. Further the objectives of the research are as follows:

a. To measure the satisfaction, and trust levels of 3PL customers and suppliers in Sri Lanka.
b. To identify existing hindering issues of 3PL market in Sri Lanka.
c. To understand the most significant hindering issues and its' impact that diminish the satisfaction and trust of customers in 3PL market in Sri Lanka.
d. To identify the future challengers faced by 3PL market in Sri Lanka.

Literature review

Customer Satisfaction

Customer satisfaction is defined as customer's overall or global judgment regarding the extent to which product or service performance matches expectations (Stank et al. 1999; Anderson and Sullivan, 1993). Customer satisfaction should be develop and maintain because customer satisfaction helps to reduce perceived risk, reduce transactions costs, increase customer loyalty and customer retention and thus impact on organizational performance (Bejou et al. 1996).

A global logistics study conducted by CGEY (2003), found that customers are satisfy with their 3PL providers and responded positively when questioned as to their intended use of 3PLs over the next 3 to 5 years(Langley, 2003). Chinese customers also showed high level of satisfaction on their logistics outsourced services (Huang, 2003). In a survey conducted in the Singaporean logistics industry found that over three-quarters (76.3%), of the users indicated that their firm's commitment to the contract services concept was moderate or extensive, while the remaining users indicated that their firms' commitment was limited or very limited. (Bhatnagar et.al.1999).

According to Gattorna, Ogulin, Selen (2004), customer satisfaction with LSPs is statistically significantly influenced by; having a signed contract with the LSP (negatively impacted on customer satisfaction), concerns of customer quality provided by the LSP, and uncertainty about cultural fit of the organization with the LSP. Further according to their findings the most important explanatory variables were obstacles rated as important in implementing LSP services, such as coordination and integration between the company and the LSP, and LSP having insufficient understanding about the company's operations. Both factors rated negatively in terms of customer satisfaction.

Trust

"Trust is a set of specific beliefs dealing mainly with the integrity (Trustee honesty and promise keeping), benevolence (trustee caring and motivation to act in the truster's interest), competence (trustee's ability to do what the truster needs) and predictability (trustee's behavioral consistency) of a particular vendor" (Gefen et al. (1999, 2003)). According to Chenet et al. (2000), trust can be developed by having a good internal service quality within organizations and it plays a key role within service provision and is considered important in building relationships. Trust is considered to be of significant importance, not only for building relationships but also to maintain the relationships (Lagace 1991, Morgan and Hunt 1994, Oakes 1990). Termination of relationships is a loss for both parties. Hence, organizations purposely give attention and invest resources in building trust Ghijsen, Semeijn, and Wang, (2009).

Hindering Issues

The design and implementation of 3PL relations appears to be problematic. Often-cited difficulties include lack of understanding of client's supply chain needs (lack of coordination), lack of adequate expertise in specific products and markets, unrealistic customer expectations (lack of cooperation), inadequate description of services and service levels (lack of coordination), lack of logistics cost awareness by the client (cost) and lack of 3PL innovation (Ackerman, 1996; Ellram and Cooper, 1990; Wilding and Juriado, 2004).

The most often-cited problems are associated with 3PL partnerships are loss of control over the logistics function and loss of in-house capability and customer contact (Ellram and Cooper, 1990). Lack of responsiveness to customer needs is also cited as a problem of outsourcing (van, and Van, 1996).Further, many authors cite problems with respect to service performance, disruption to inbound flows, inadequate provider expertise, inadequate employee quality, sustained time and effort spent on logistics, loss of customer feedback and inability of 3PL providers to deal with special product needs and emergency circumstances (Ellram and Cooper, 1990; Gibson and Cook, 2001;Sink and Langley, 1997; Svensson, 2001; Van L., et al., 2000). Despite gaining access to logistics information systems (Rao et al., 1993), shippers appear to be dissatisfied with service provider's IT capabilities and prefer to rely on in-house systems instead (Van L., et al., 2000).

Future Challengers

Gupta, Singh and Suri, (2015) identified challenges faced by 3PL market in India as; Non industry status, The infrastructural bottlenecks, Behavioral complexities, Poor quality of logistics operations, Inefficient inspection Strategies, Increasing globalization, Low rate of technology adoption, and Skill Shortages. Zhang (2006) identified Poor infrastructure, Regulation issues and Finding qualified staff are as challenges in 3PL market in China. Further, Langley et. al. (2015), in the 19th annual third-party logistics study identified handling no. of order channels multiplied by the number of delivery options due to online sales, handling overstocks due to returned goods in online sales, minimizing lead time between deliveries, adoption of new technology are as future challenges in 3PL market.

Methodology

The population of the study is considered as organizations those who are taking 3PL services in Sri Lanka. Sampling unit was taken as the respective managers of 3PL customer organizations. In order to select the respondents of Customers, Snowball sampling technique was used in this research study. In snowball sampling, 3PL companies were asked to identify their customers belong to the target population of interest. Fifty customers were taken as the

sample since, similar studies has used somewhat similar sample size in their studies. For an example; Ghijsen, Semeijn, and Wang, (2009) has used 76 valid questionnaires for their study. For the purpose of measuring satisfaction level, trust level, and to identifying hindering factors affecting the growth of 3PL market in Sri Lanka (In collecting quantitative primary data.), a standard questionnaire was used as the instrument. Before collecting data from the sample, a pre test was conducted using 10 respondents. This pre test was developed to discover any possible weaknesses in the questionnaire.

Consequently, in the final questionnaire, the researcher tried to eliminate the drawbacks identified in the pretest. The researcher conducted face to face interviews for the purpose of collecting qualitative primary data. Qualitative data was noted down and later the common wordings were listed by the researcher to interpret the explanations given by the respondents. In order to measure satisfaction, and trust measurements used by Ghijsen, Semeijn and Wang (2009) were used in this research. Lack of coordination was measured according to Gattorna, Ogulin and Selen (2004), Lack of cooperation was measured according to Lau and Zhang (2006), Cost of outsourcing was measured according to Jennings (2002), Inadequate capabilities of 3PL companies was measured according to Lau & Zhang (2006) Loss of control was measured according to Blumberg (1998), Lonsdale and Cox (2000), Embleton and Wright (1998) and Beaumont and Sohal (2004).

All the above dimensions of the study were measured in a 5-point Likert scale (1=strongly agree, 5=strongly disagree). As well as an open ended question was included to identify the specific factors hindering the growth of 3PL market in Sri Lankan context and to look into the factors in detail, in-depth interviews were conducted. The challengers identified in the literature review were given to respondents and asked to identify the challenges relevant to the Sri Lankan context and an open ended question was included in the questionnaire to identify any other challengers face by 3PL market in Sri Lanka. In addition to that, in order to explore the factors in detail, in-depth interviews were conducted. Further validity and reliability tests were conducted and removed the items which factor loading values are lower than 0.7.

Analysis and results

In order to identify the levels of satisfaction, trust and hindering issues, mean values of the constructs were calculated. Then stepwise liner regression test was conducted to know the impact of hindering factors affecting the growth of 3PL market in Sri Lanka on satisfaction and trust. According to the Table 4.1, customers are quite happy about their 3PL providers because mean values are above the average. But they are not highly satisfied as well as no high trust and loyalty to the 3PL providers.

Table 4.1 - Mean Values of Satisfaction and Trust

	Satisfaction	**Trust**	
Mean	3.5946	3.390	
	50	50	
Std. Deviation	.35233	.5234	

Table 4.2 explains the mean values of the hindering issues that affect the growth of 3PL market in Sri Lanka. Mean values of Cost (X3), Lack of control (X5), Lack of coordination (X1), Lack of cooperation (X2) are above the average and therefore, these factors are the main issues respectively that affect the growth of 3PL market in Sri Lanka. The mean value of the inadequate capabilities (X4) is also at an average level.

Table 4.2- Mean values of the hindering issues

	X1	X2	X3	X4	X5
Mean	2.82	2.69	3.07	2.47	2.82
N	50	50	50	50	50
Std. Devi.	.69	.70	1.09	.826	.69

Further, according to the in depth interviews conducted with the customers, High labor turnover and high training cost, Lack of skills and knowledge, Lack of Industrial knowledge. Labor Unions (Trade union activities) and Political influences were identified as hindering issues that affect the growth of 3PL market in Sri Lanka. To identify the impact of hindering issues on satisfaction and Trust, step wise Liner regression analysis was conducted. According to Table 4.3 two models were extracted and the adjusted R square is strong in both models. Further, according to Table 4.4, both models are significant. Therefore, second model was considered as it has the highest adjusted R square.

Table 4.3- Model Summary (Customers satisfaction)

Model	R	R^2	Adjusted R^2	Std. Error
1	.824[a]	.679	.672	.20
2	.842[b]	.709	.696	.19

a. Predictors: (Constant), lack. Control

b. Predictors: (Constant), lack. Control, lack. cooperation

According to the analysis lack of control and lack of cooperation are the significant factors ($p < 0.05$) that diminish the satisfaction of customers in 3PL market in Sri Lanka. Lack of coordination, cost and inadequate capabilities have been excluded from the model since those variables are not significant ($p > 0.05$).

Table 4.4 Significance of the models- customers' satisfaction

	Model	df	Mean Square	F	Sig.
	Regression	1	4.12	101.31	.000[b]
1	Residual	48	.04		
	Total	49			
	Regression	2	2.15	57.17	.000[c]
2	Residual	47	.03		
	Total	49			
a. Dependent Variable: satisfaction					
b. Predictors: (Constant), lack. Control					

Therefore following equation can be derived;
Satisfaction = 5.194- 0.470 LC- 0.101 LCO
LC= Lack of Control
LCO= Lack of Corporation

According to the above equation of satisfaction, 5.194 is the constant of the equation. While holding lack of cooperation as constant, when lack of control increases by one unit, satisfaction will decrease by 0.47 units on average. As well as, while holding lack of control constant, when lack of cooperation increases by one unit, satisfaction will decrease by 0.101units on average. Lack of control and lack of corporation are the two main reasons affecting the satisfaction and both factors negatively affect the satisfaction.

Next, in order to identify the impact of hindering issues on customers trust, step wise regression analysis was conducted.

Table 4. 5 Model summary- Trust

Model	R	R^2	Adj.R^2	Std. Error
1	.895[a]	.802	.797	.23
a. Predictors: (Constant), lack. control				

According to Table 4.5, adjusted R square is strong in the extracted model . Further, the model is significant.

According to the analysis, lack of control is the only significant factors ($p < 0.05$) that diminish the trust of customers in 3PL market in Sri Lanka. Lack of coordination, lack of cooperation, cost and inadequate capabilities have been excluded from the model since those factors are not significant ($p > 0.05$).

Therefore following equation can be derived;

Trust = 5.295- 0.674 LC

LC= Lack of Control

According to the above equation of trust, 5.295 is the constant of the equation. When, lack of control increases by one unit, trust will be decreased by 0.67 units on average. Lack of control is the main reason affecting the trust and there is a negative impact from lack of control on trust.

According to the qualitative and quantitative data of the study, future challengers of the 3PL market in Sri Lanka was identified as; minimizing lead time between deliveries, adoption of new technology, handling number of order channels multiplied by the number of delivery options due to online sales according to the customers' point of view.

Conclusion

Key findings

In Sri Lanka, Customers of the 3PL companies are also quite happy about 3PL service providers. But the level of satisfaction, and trust towards the service providers are not considerably high. Further, Cost, lack of Control, Lack of coordination and lack of cooperation respectively were identified as main issues in 3PL market in Sri Lanka according to the customers' point of view. These findings are supported by the findings of previous research studies such as Ackerman, 1996; Ellram and Cooper, 1990; Wilding and Juriado, 2004. In addition to that, inadequate capabilities are also an area has to be considered and to pay attention. Ellram and Cooper, 1990; Gibson and Cook, 2001; Sink and Langley, 1997; Svensson, 2001; van Laarhoven et al., 2000 also identified this as one of the main issues in 3PL industy. High labour turnover and high training cost, Lack of skills and knowledge, Lack of industrial knowledge, Labour unions (Trade union activities) and Political influences also identified as problematic areas according to the qualitative study.

Apart from that, Lack of control and lack of coordination are the significant factors affecting the customer satisfaction. Lack of control is the only significant factor that diminishes the trust of customers in 3PL market in Sri Lanka. Minimize lead time between delivers, adaptation of new technology, handling number of order channels multiplied by the number of delivery options due to online sales are considered by the customers as the future challenges in 3PL market in Sri Lanka. The similar future challengers were identified in the 19th annual third-party logistics study as well.

Theoretical Implications

The hindering factors for the growth of 3PL markets are somewhat common across the globe. But, according to the qualitative study of this research, it was able to identify few exceptional factors that hinder the growth of 3PL market in Sri Lanka. High labour turnover and high training cost, lack of skills and knowledge, lack of industrial knowledge, labour unions (Trade union activities) and political influences also identified as main problematic areas in addition to the general hindering issues common to the globe.

Managerial Implications

The findings of the research are highly important to the decision makers in the industry. Especially providers of 3PL companies can implement necessary changes to provide a better service in order to make customers satisfy. High labour turnover and high training cost, lack of skills and knowledge, lack of industrial knowledge are few issues that providers can manage. According to the discussions had with customers, many trainees are hired for the jobs at less payment by the suppliers and they are not given proper training about the overall business performances of the organization. Therefore, by recruiting permanent employees to the companies and developing them and keeping them in the organization while rotating their jobs will help to enhance the level of business performances as well as to make customers satisfy about their services. Lack of coordination, lack of cooperation, lack of control can be addressed by employing well trained customer relationship managers both in customer organizations and provider organizations.

Further Research

The rise of e-commerce has been impressive in the past decade. Its influence as a driving force of change in logistics is undeniable both within companies and within supply chains. It is therefore surprising that little attention has been paid to investigate and assess direct as well as indirect implications of e-commerce for Third party logistics industry. Hence, the influence of e-commerce and related information and communication technology (ICT) developments on third party logistics industry can take other paths that deserve further exploration. In addition to that lack of control was identified as one of the problems in 3PL industry. Therefore, further research could also address how managerial and balance of power issues are handled where both a 3PL and an in-house department manage logistics.

MODERATING EFFECT OF COMPETITIVE INTENSITY ON THE RELATIONSHIP BETWEEN KNOWLEDGE MANAGEMENT AND CUSTOMER SATISFACTION AMONG SELECTED HOTELS

Wambui E. Karanja Ng'ang'a, Moi University, Kenya
Charles Lagat, Moi University, Kenya
Julie Makomere, Moi University, Kenya

Abstract

Customer satisfaction is deemed to be critical for all businesses. Knowledge Management (KM) has been regarded as an antecedent of customer satisfaction. The main objective of this study was to empirically test the moderating effect of competitive intensity on the relationship between KM and customer satisfaction among selected hotels in Kenya. The study employed explanatory research design and sampled 330 respondents. Respondents were selected using cluster sampling combined with simple random. Primary data was collected using a structured questionnaire. Hierarchical linear regression was used to test the research hypotheses. The results revealed a positive and significant effect on the relationship between KM and customer satisfaction. Additionally, competitive intensity had a significant moderating effect on the same relationship albeit negative. The study concludes that KM is an important determinant of customer satisfaction. The study recommends that hotel management should pursue to incorporate diverse KM practices in a competitive environment to enhance customer satisfaction.

Key words: *Customer Satisfaction, Knowledge Management, Competitive Intensity, Hotels*

Introduction

Customer satisfaction is one of the most important factors affecting service management, due to the influence of customer satisfaction on repeat purchases and word-of-mouth recommendations, customer satisfaction is deemed to be critical for all businesses (Yuksel and Yuksel, 2002). In this fast and dynamic environment, service providers can maintain their competitive advantage by delivering high quality services to their customers (Hu *et al*., 2009). Satisfied customers can bring plenty of other advantages for the service providers as a ripple effect including loyalty to service provider, engagement in positive word-of-mouth promotion and paying premium prices (Amin *et al*., 2013; Dominici and Guzzo, 2010; Kim and Lee, 2010; Ryu and Han, 2010). Therefore, customer satisfaction has caught considerable attention from the academicians and the practitioners (Hu *et al*., 2009).The importance of customer satisfaction has been highlighted by many researchers and academicians all around the world. Satisfaction is an overall customer attitude or behavior towards a service provider or an emotional reaction towards the difference between what customers expect and what they receive regarding the fulfillment of some desire and goal (Hansemark and Albinson, 2004; Hoyer and MacInnis, 2001). The importance of customer satisfaction is paramount as it greatly influences customers' repurchases whereas dissatisfaction is seen as a primary reason for customers' intention to switch. Satisfied customers more likely share their experiences with other people around them.

KM has been regarded an antecedent of customer satisfaction (Emadzade *et al*., 2012), which in turn results in customer retention (Zack *et al*., 2009). Many firms consider that to act with efficacy in today's economy, it is imperative for them to become a knowledge-based organization. In this global economy, knowledge is the "king" (Garud and Kumaraswamy, 2002), and maybe that is the biggest competitive advantage of them all (Davenport and

Prusak, 2000). Organizations recognize KM as one of the major contributors of increase in their value and therefore they review their Customer Relationship Management (CRM) initiatives (Croteau and Li, 2003) to use in-depth and integrated KM for creating collective relationships with their customers (Boulding *et al.*, 2005; Croteau and Li, 2003; Parvatiyar and Sheth, 2001).With arrival of knowledge-based economy those organizations which successfully recognize, build and enhance their KM will be more successful and are considered as knowledge-enabled organizations (Rowley, 1999). These organizations segment their markets not only based on their products and services but also based on the amount of knowledge they can acquire from their customers (Zack, 2003).

KM is a great mechanism to customer support (Roy, 2013). It is a major driving force behind knowledge creation, development and growth for the benefits of quality improvement as well as a fundamental factor for an enterprise's success (Wiig, 2006). Boljanovic and Stankovic (2012) implied that KM is about acquiring knowledge with aim of achieving business goals and guarantee on the knowledge accessibility in the future. Ragab and Arisha (2013) and O'Dell *et al.* (1998) stated that KM is a strategy where the right knowledge is transferred to the right people at the right time which can help in putting up and sharing of the information for the purpose of enhancing customer satisfaction leading to improved performance. However studies on KM and customer satisfaction are limited in hotel industry.

To extend the literature further, this study tested the moderating effect of competitive intensity on KM and customer satisfaction relationship. Under conditions of increasing competition, predictability and certainty of an organization's performance diminishes. Therefore, amidst today's highly competitive environment, for a firm to achieve enhanced performance (customer satisfaction), it must continuously scan the environment in which it operates (Punpugdee, 2005). Porter (2004) noted that industries where the market has been largely saturated, companies realize they must compete intensely for those customers that are in the market. This means that firms must work to enhance loyalty as competitors work hard to "steal" customers. A firm's performance and survival are determined by the speed at which the firm develops knowledge-based competencies. Knowledge and intellectual capital are considered among the firm's knowledge-based competencies and, according to Nonaka (1994), the major competitive advantage of a firm lies in its knowledge. Firms competing in the knowledge-based economy can sustain their competitive advantage by harnessing their own unique knowledge and building their capability to learn faster than their competitors (Grant, 1996; Prusak, 2001). KM was conceptualized using the information reciprocity, information capture and information use as defined by Jayachandran (2005).

As Kenya focuses to be industrialized by 2030, research foresees the hotel industry as one of the sectors that will contribute greatly to the industrialization (Schulz and Omweri, 2012), the hotel industry has seen customer satisfaction as a key marketing tactic in differentiating itself from its competitors and therefore a heightened understanding of a guest preference and total worth will enhance a guest experience and maximize hotel revenue. The decline in world tourism has grossly affected hotel sales and posed a threat to hotel operators because Kenyan hotels largely depend on the International Tourism Market (Oketch *et al.*, 2010). Akama (2007) argues that in Kenya, there has been a declining income from agriculture and manufacturing sectors. As a result, Kenya has turned her attention to tourism as an intervention to the numerous economic problems, hence the need to improve on organization changes in hospitality industry. However, little attention has been paid to investigating how to improve customer satisfaction by enhancing KM, thus increasing customer retention in the hotel industry. Despite extensive research on KM and its consequences, there seem to lack empirical research examining these variables in the context of star rated hotels. In filling the gap, this study hypothesized that;

$Ho_{1a:}$ Information reciprocity does not significantly affect customer satisfaction of selected hotels in Kenya

$Ho_{1b:}$ Information capture does not significantly affect customer satisfaction of selected hotels in Kenya

$Ho_{1c:}$ Information use does not significantly affect customer satisfaction of selected hotels in Kenya

$Ho_{2:}$ Competitive intensity does not significantly moderate the relationship between KM and customer satisfaction of selected hotels in Kenya

Theoretical Framework

The study will be guided by Resource- Based View (RBV) developed by Barney (1991). Since Knowledge based resource is "the essence of resource based perspective", (Conner and Prahalad 1996). According to RBV, firms perform well and create value when they implement strategies that exploit their internal resources and capabilities. The theory suggests that knowledge is an organizational asset that enables sustainable competitive advantage in hyper-competitive environments. Resource-based theorists consider intellectual capital to be a firm's strategic resource. KM processes, including knowledge acquisition, knowledge conversion and knowledge application, were used in the study to enhance firm performance through customer satisfaction and to sustain competitive advantages. KM in firms is considered as the most strategically significant resource of the firm (Desouza and Awazu, 2006). This view considers a firm to be a "distributed knowledge system" composed of knowledge-holding employees, and this view holds that the firm's role is to coordinate the work of those employees so that they can create knowledge and value for the firm (Thorburn, 2000). Thus, resource based theory is deemed suitable in studying on KM on customer satisfaction moderated by competitive intensity.

Literature Review

1. Knowledge Management and Customer Satisfaction

The current century is the era of knowledge economy, in which most firms possess knowledge that allows them to enhance customer satisfaction leading to firm performance. The Business Directory defines Knowledge Management (KM) as strategies and processes designed to identify, capture, structure, value, leverage and share an organization's intellectual assets to enhance its performance and competitiveness. It is based on capturing and documentation of individual explicit and tacit knowledge and its dissemination within the organization. Additionally, (Ngai *et al.*, 2009; Greve and Albers, 2006; Reinartz *et al.*, 2004) define KM as the study of the lifetime stages of customer relationship namely; initiation, maintenance, retention and termination. Further, Filemon and Uriarte (2008) defined KM as the broad process of locating, organizing, transferring, and using the information and expertise within an organization. These valuable information can be gathered through interactions with customers or from different touch points within the organization (Brohman *et al.*, 2003).

Growth and globalization, together with recent advances in information technology, have led to many firms to introduce sophisticated KM systems in order to create sustainable competitive advantage and thus enhance performance (Ofek and Sarvary, 2001). Furthermore, a rising number of management academicians and practitioners have asserted that KM now constitutes a key source of competitive advantage for organizations (Nahapiet and Ghosha, 1998; Teece, 1998). Brown and Duguid, (1998) and Grant, (1996) posits that this knowledge-based view of the firm of generating, establishing and using knowledge assets are the principles of firm activities. The efficiency in what they do in relation to competition determines their performance. Adhering to this advice, many organizations have launched key

KM programs. Needless to say that KM has become a significant subject (Dyer, 2000). Additionally, Zaied *et al*. (2012) investigated the role of KM in enhancing performance of some Egyptian organizations and found a significant relationship. Conversely, Kuo-Chung and Chin-Shan (2012) empirical study on the impact of CRM on firm performance in the context freight forwarder services results revealed that KM application on firms' financial performance was not supported. However, few studies have investigated the impact of KM dimension in the context of CRM (Jayachandran *et al*., 2005; Lo, *et al*., 2010) and more specifically its role in the hospitality context (Hallin and Marnburg, 2008; Shaw and William, 2009). This study seeks to examine how KM dimensions are likely to influence customer satisfaction coupled with the moderating effect of competitive intensity on that relationship.

2. Competitive Intensity

As competitiveness intensifies, Auh and Menguc (2005) proposes that the outcomes of a firm's performance will no longer be deterministic but stochastic as the performance is greatly influenced by the actions assumed by competitors. Consequently, predictability and certainty lessens as conditions of competitive intensity increases. When competition is minimal, firms can operate with their existing systems to fully capitalize on predictability of their own performance (Zuniga-Vicente and Vicente-Lorente, 2006). Further, Jaworski and Kohli (1993) indicate that when competition is low, companies can perform well without being market-oriented since customers do not have several alternatives to please their requirement. A company that is not market-oriented may loss its customers to competitors. Therefore, when competitive intensity increases, firms will have to adjust accordingly. In retaliation to competition, firms will have to employ risk-taking and proactive activities of bold learning and assessment to break out of price or promotion wars. This is corroborated by Zahra (1993), "when rivalry is fierce, companies must innovate both products and processes, explore new markets, find novel ways to compete and examine how they will differentiate themselves from competitor."

The hotel industry like any business sector, has to be highly competitive to be able to do well in the business environment. Subsequently, hotels use different methods to differentiate themselves from their competitors. The lower classified hotels identify themselves as offering "value for money" to their guests. The medium classified hotels focus more on the quality of products for example guest rooms, restaurants and location of the hotel. The high classified hotels differentiate themselves by offering superior products and customized services (Lo *et al.,* 2010). Largely, the moderating effect of competitive intensity is still unclear. On one hand, it may have a positive impact as it provides companies with creativeness and opportunities (Jermias, 2006). While on the other hand, it may reduce the positive impact of the innovative practices on performance due to the associated risk of failure (Garcia-Zamora *et al*., 2013). Competitive intensity was measured using the six items scale adopted from Khandwalla (1972) and Jaworski and Kohli (1993) measures. Managers were asked to respond to the six items of: competition is cut-throat; there are many service promotion wars; competition for market share is intense; price competition is intense; there is a new competitor every day; competitors are relatively weak on a five-point scale.

3. Material and Methods

The survey was conducted among hotels in selected regions in Kenya with the main justification being that most classified hotel enterprises are well established. This study in line with positivism approach, which seeks to use existing theory to develop hypotheses that are tested and confirmed wholly, in part, or otherwise refuted leading to further development of theory to be tested with further research. This study employed an explanatory survey research design as it sought to describe and establish associations among key study variables. The target population was hotels listed as members of Kenya Association of Hotelkeepers and

Caterers (KAHC Directory 2014). Cluster and simple random sampling technique was used to select 136 hotels from the target population of 210 hotels in Kenya. Additionally, the study used multiple informants where three managers from each hotel were picked. The study mostly used primary data collected using questionnaire. For the purpose of determining the reliability of this study, Cronbach's alpha test was conducted on all the scales, using a 0.70 cut-off point. The study results indicated that the minimum required Alpha values of 0.70 were exceeded in all the cases, signifying that the instrument used was reliable. Data analysis was conducted using both descriptive and inferential statistics. Descriptive analysis was done using mean and standard deviation. The study hypotheses were tested in two stages using multiple regression analysis as modeled by Barron and Kenny (1986) where the significant level was set at 0.05. The null hypotheses were either rejected at $p<0.05$ level, or fail to reject at $p>0.05$ level.

Analysis and Findings

The study assessed the distribution of KM along the various control variables (firm characteristics) which included; firm size, age, star rating, and ownership. The study used ANOVA to show the statistical differences of means among the firms' categories. This preliminary assessment was used to show the relevance of the demographic information (in categorical form) by comparing with the study variables, that is, KM. Managing knowledge effectively can greatly help an organization to have success in building better customer relationship leading to customer satisfaction which ultimately improves firm performance. The highest mean was evident with firms having between 301-400 employees (mean=4.57) and the lowest was that of firms having over 400 employees (mean=4.15). The relationship between KM and firm size was significant (F=6.007; $\rho<0.05$). This infers that large firms are likely to have higher level of KM as compared to smaller firms. In relation to KM and firm age, the findings are statistically significant at $p<0.05$ level. The highest mean (mean=4.38) was realized by hotels that have operated for over 20 years. Such hotels have gathered useful information about their customers overtime hence they are able to satisfy their customers more effectively. Further, findings on KM and star rating showed that there was higher KM in 4 Star hotels (mean=4.3; S.D=0.49) and low KM in three star hotel (mean=3.96; S.D=0.47). There was significant difference of KM among different hotel classifications as supported by F value 14.01; $p<0.05$). This infers that the high star rated hotels possess higher level of KM. Consequently, the study can argues that levels of KM in hotels will depend on star rating. Further, findings in Table 1 revealed that the different levels of KM in hotels depends on hotel ownership (foreign ownership mean = 4.46; S.D=0.45, local ownership mean=4.20; S.D=0.49, family ownership mean = 4.04, S.D=0.05). The difference was statistically significant (F value=14.63; $p< 0.05$). See Table I below.

Table I Knowledge Management against Control Variables

		N	M	SD	ANOVA (F value)	Sig.
Firm Size	1-100	164	4.19	0.45	6.007	0.000
	101-200	82	4.31	0.43		
	201-300	42	4.36	0.44		
	301-400	35	4.57	0.4		
	Above 400	7	4.15	0.43		
	Total	330	4.28	0.45		
Firm Age	1-5 years	82	4.33	0.43	4.015	0.003
	6-10 years	62	4.26	0.45		

	11-15 years	46	4.19	0.44		
	16-20 years	36	4.07	0.45		
	Over 20 years	104	4.38	0.45		
	Total	330	4.28	0.45

	Family	85	4.03	0.489		
	Total	330	4.21	0.502		

1. Descriptive Statistics of Study Constructs

KM consisted of seventeen items reflecting on KM practices. Managers were asked to provide information concerning their view towards KM practices in their hotels. Mean scale for the above items ranges from 4.59 – 4.09. This implies that KM is highly valued by hotels as they emphasize on developing strategies and processes designed to identify, capture, structure, value, leverage and share a firm's intellectual assets to enhance customer satisfaction and competitiveness. The mean score for customer satisfaction ranges from 4.26 – 4.15 (Table 2). This infers that majority of the hotels experience better customers satisfaction each succeeding year, over the previous three years as compared to rivalry. Additionally, findings revealed that hotel competitors do not appear relatively weak (M=3.95; SD=0.53). This implies that competitive intensity was high among firms, that is, the business competitive environment that hotels are operating in is hostile. Exploratory Factor Analysis (EFA) was carried out to confirm the constructs underlying the data. Sample adequacy for each scale was tested using Kaiser-Meyer- Olkin (KMO). KMO of sampling adequacy value was calculated to predict if the data would likely factor well and if the sample was adequate for factor analysis. According to Hair *et al*. (2006) values >0.5 are considered adequate for good factor analysis. The results revealed that all scales had values greater than the recommended 0.5 expect two items that provided blank spaces and were therefore excluded. (KMO for KM – 0.891; CI – 0.664; CS – 0.679) (Table II).

Table II Descriptive Analysis Results for variables

N=330	Mean	S.D	Loading	KMO	Cumu %
KM	4.21	0.5		0.891	52.626
We use customer information to customize our offers	4.54	0.539	0.646

Guests levels of complains are manageable	4.26	0.631	0.786		

| Customers are satisfied with the services offered to them | 4.22 | 0.628 | 0.74 | | |

2. Correlation Analysis

   Pearson correlation examined the relationship between variables. All the associated sets of variables were significant at level 0.01. Similarly, all the hypothesized relationships developed were found to be statistically significant at level $p \leq 0.01$, suggesting satisfactory external validity of the measures. Specifically, significant and positive correlation exists between information reciprocity and customer satisfaction ($r=0.401$; $p \leq 0.01$), information capture and customer satisfaction ($r=0.421$; $p \leq 0.01$), information use and customer satisfaction ($r=0.382$; $p \leq 0.01$) and competitive intensity and customer satisfaction ($r = 0.278$; $p \leq 0.01$). See Table III below.

Table III Correlation Analysis

	Customer satisfaction	Information reciprocity	Information capture	Information use	Competitive intensity
Customer satisfaction	1				
Information reciprocity	.401**	1			
Information capture	.421**	.574**	1		
Information use	.382**	.445**	.601**	1	
Competitive intensity	.278**	.231**	.226**	.312**	1
** Correlation is significant at the 0.01 level (2-tailed).					

3. Effect of KM Dimensions on Customer Satisfaction

   Hypothesis H_01_a postulated that information reciprocity has no significant effect on customer satisfaction. This results found a positive and significant effect of information reciprocity on customer satisfaction ($\beta=0.213$; $p<0.05$). Thus, the researcher rejects the hypothesis H_01_a. This infers that customer satisfaction will increase by 0.213 when information reciprocity increases by one unit, suggesting that a rise in information reciprocity will lead to increase in customer satisfaction. Hypothesis H_01_b postulated that information capture has no significant effect on customer satisfaction. This results found a positive and significant effect of information capture on customer satisfaction ($\beta=0.196$; $p<0.05$). Hypothesis H_01_b was rejected. This supposes that customer satisfaction increases by 0.196 when information capture increases by one unit, inferring that a rise in information capture will lead to increase in customer satisfaction. Hypothesis H_01_c postulated that information use has no significant effect on customer satisfaction. This research finding indicated a positive and significant effect of information use on customer satisfaction ($\beta=0.17$; $p<0.05$). This lead to hypothesis H_01_c being rejected. This assumes that customer satisfaction increases by 0.17 when information use increases by one unit, inferring that a rise in information use will lead to increase in customer satisfaction. See Table IV below.

Table IV Regression Analysis Results for direct effects

	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	T	Sig.
(Constant)	1.796	0.253		7.098	0.000

Information reciprocity	0.229	0.064	0.213	3.555	0.000
Information capture	0.197	0.067	0.196	2.924	0.004

Adjusted R Square	0.226				
F	33.006				
Sig.	.000				
Dependent Variable: Customer satisfaction					

4. Moderating effect of competitive intensity on relationship between KM and customer satisfaction

The adjusted R^2 value of 0.385 indicate that KM can account for 38.5% of the total variance in customer satisfaction. This infers that customer satisfaction in hotels is likely to be predicted by KM by 38.5%. The difference of 61.5% of the variance in customer satisfaction is probably explained by other variables. Hypothesis $H_0 2$ proposed that competitive intensity does not significantly moderate the relationship between KM and customer satisfaction in hotels. The results indicated a negative and significant moderating effect of competitive intensity on the relationship between KM and customer satisfaction (β=-0.18; $\rho<0.05$). Hence, the hypothesis $H_0 2$ was rejected. Nevertheless, the relationship between KM and customer satisfaction was weakened by competitive intensity. With every unit increase in competitive intensity, customer satisfaction is reduced by -0.18. This infers that effect of current KM practices on customer satisfaction will be less where there is high competition in the industry. This might be explained by the fact that most of the firms are likely to employ KM strategies such as using customer information to measure the lifetime worth of the client and customized offers when competition is intense. Hence, the firms will have a less competitive advantage (Table V).

Table V Regression Results for Moderation

	Beta (Std. Error)	Beta Std. Error	Beta Std. Error	Beta Std. Error
(Constant)	0.147 (0.291)*	0.254 (0411)**	0.268(0.109)**	0.34(0.04)*

Discussion, Conclusion and Recommendations

Sub-Hypotheses $H_0 1_{a, b, c}$ postulated that information reciprocity, information capture and information use has no significant effect on customer satisfaction respectively. The study

found a positive and significant effect of information reciprocity ($\beta=0.213$; $p<0.05$), information capture ($\beta=0.196$; $p<0.05$) and information use ($\beta=0.17$; $p<0.05$) on customer satisfaction individually. The three coefficients implies that with every unit increase in information reciprocity, information capture and information use, customer satisfaction will increase by 0.213, 0.196 and 0.17 respectively. KM constitutes a key source of customer satisfaction for organizations (Nahapiet and Ghosha, 1998; Teece, 1998). Additionally, this study results contend with those of Zaied *et al*. (2012), in that KM has a role in enhancing performance of firms. Related to the results, Ofek and Sarvary, (2001) echo that advancement in information technology has led to the advent of sophisticated KM systems that have enhanced customer satisfaction. Further, KM dimensions provide direction that assist manage customer information and interaction with clients in ways that enhance customer relationships performance (Jayachandran, 2005) as a result of achieving customer satisfaction and retaining current customers.

Hypothesis H_02 stated that competitive intensity does not significantly moderate the relationship between KM and customer satisfaction in hotels. The study findings indicated a negative and significant moderating effect of competitive intensity on the relationship between KM and customer satisfaction ($\beta=-0.18$; $\rho<0.05$). This infers that the presence of competitive intensity creates pressure for firms to enhance their KM practices, that is, most of the firms will likely adopt similar KM approaches hence affecting customer satisfaction in a similar manner. Since KM provides the critical issues of organizational variation, existence and competence in the face of increasingly competitiveness, there is need of managing it effectively (Hussain *et al*., 2004). The negative results achieved in this study could imply that the appropriate KM practices (best practices) are not being implemented in the hotels in an intense competitive environment.

KM is acknowledged as an important tool for sustaining competitive advantage and improving customer satisfaction. Mostly, KM constitutes a key source of enhanced performance for hotels. Thus, managing knowledge effectively can greatly help hotels to build better customer relationships which will heighten customer satisfaction. Therefore, KM is one of the ways hotels can have a competitive edge over competitors. Particularly, the multiplicity of ways to communicate with customers provides the hotels with a wide selection of information which makes them remain competitive. Additionally, hotels can use customer information to identify best customers and assess their lifetime value.

The findings of this study further contribute to the understanding of KM and customer satisfaction in firms' by providing empirical evidence on how competitive intensity significantly moderates that relationship. In addition, the study findings revealed that the moderating effect of competitive intensity weakened the relationship between KM and customer satisfaction. This is a situation where there is intense price and market share competition in the industry. Since KM provides the critical issues of organizational variation, existence and competence in the face of an increasingly competitive environment, there is need of managing it effectively (Hussain *et al*., 2004).

Based on the study findings that the current KM practices are less effective when there is high competitive intensity, firm management should come up with new or more advanced policies and practices of KM respectively in order to increase customer satisfaction in a competitive environment. Hotel management should explore the use of KM best practices that enables hotels to enjoy wide knowledge about their customers and market. It is therefore necessary for firms to enhance KM in order to explore and make use of new and existing knowledge about customers. Also, the firms should use customer information to assess the lifetime value of their customers. This information will also help the firms identify the best customers and to avoid unprofitable relationships.

With regard to areas of further research, this study recommends that work should be done in examining the moderating effect of other environmental factors such as market turbulence on the relationship between KM and customer satisfaction. Additionally, this study collected data from hotel managers which is self-reported and may be subject to bias. Therefore, to overcome this limitation, future studies could collect data from hotel guests or other stakeholders in the hotel industry in order to generate more reliable conclusions.

HEAD-HUNTER'S PERSPECTIVE: A MULTIDIMENSIONAL VIEW OF INTELLECTUAL CAPITAL

Sri Sarjana, Padjadjaran University, Bandung, Indonesia
Dwi Kartini,Padjadjaran University, Bandung,Indonesia
Popy Rufaidah, Padjadjaran University, Bandung,Indonesia
Yunizar, Padjadjaran University, Bandung,Indonesia.

Abstract

Head-hunter developed human resources through improved intellectual capital. Intellectual capital is needed for head-hunters to achieve job satisfaction. The purpose of this study is to explore the relationships of trust, self-efficacy, intellectual capital and job satisfaction in head-hunter firms at Indonesia. There are 253 candidates for head-hunters services were selected for investigating the potential linkage among trust and self-efficacy aspects to contribute for intellectual capital in head-hunter processes. A structural equation model is used to analyze this model. A new conceptual model for intellectual capital is developed based on previous models in the literature. Trust and self-efficacy are the important antecedent of perception of intellectual capital for head-hunter processes. Findings from this study support that trust and self-efficacy have significant effect on intellectual capital. Intellectual capital has significant effect on job satisfaction. This finding integrates insights in intellectual capital framework into a generalization of the stakeholder satisfaction in head-hunter firms. Furthermore, this study suggest to head- hunter firms in order to develop human resources through improved intellectual capital to bring between candidates and clients that suit their needs.

Keywords: *head-hunter, intellectual capital, job satisfaction, self-efficacy, trust*

Introduction

Executive search or called "head-hunter" becomes a profession respected by job seekers. Head- hunters generally provide job opportunities for "white collar" with criteria in the management level or above. The uniqueness of the head-hunters are in the habit of "piracy" of workers in a particular company by offering jobs that are considered to have a better chance at another company. The new position in companies that offered by head-hunters should be "tempting" or provide better value in the improvement of career or salary increase. Head-hunter firms generally have a database that contains a list and specifications of candidates who are the partners. Candidates have high quality and competence as a core business. Client as companies that need workers also become the main core business. Database candidates are become business asset is valuable for head-hunter firms. The more the database of candidates who have a high quality and competence of the opportunity in filling the needs of workers in client companies are also getting bigger. Head-hunter main task is to provide and give candidates as required by the client. Value criteria for candidates to be "appropriate" is not only the quality and competence, but also monitored the background, track record and its potential.

Head-hunter is a specialist company for executive job seekers to get qualified candidates and has the best credibility in the field that was involved. Head-hunter is an expert from the field of candidates looking for a job. Head-hunters will choose a candidate who has the advantages and decent offer to its clients. Through the power of its network,

head-hunters can bring potential employees with a company that is needed. Not just anyone who would be a candidate by hunter executives. When a person contacted by a head-hunter it means that toil in the works for this attention and interest to the head-hunter (Setiani, 2013). Economic growth is important but knowing exactly how the process of innovative grows the intellectual capital of a nation is just as important because the underlying theoretical basis may reveal deeper insights and has larger implications than the concrete outcome (Chew & Sharma, 2014). Intellectual capital uses and transforms resources in market outputs, drawing the line between success and failure. Success is achieved when the three intellectual capital's components work together that is the human capital, the structural or organizational capital and the customer capital (Izvercian et al., 2013). The culture of development is heavily reliant upon adaptability and the readiness to realize grow innovation, and creativity. The culture of a group is reflective of cohesion, teamwork, and morale as conduits that are meant to foster development, empowerment, and unwavering commitment to human resources (Asiaei & Jusoh, 2015). Intangible resources which are embedded in know-how and knowledge of manpower, databases, information technology, operating processes, customer relationship, brand, trust, and cultures (Andriessen, 2004). Management's focus on customer satisfaction is as a source of competitive advantage (Keiningham et al., 2014).

Intellectual Capital In Global Perspective

Sullivan (2000) describes intellectual capital as profit derived from knowledge. Intellectual capital as the totality of knowledge, translated into trademarks, processes and also brands (Roos et al., 1998). Intellectual capital as intellectual material consists of knowledge, information, intellectual property, experience that can be put to use to create wealth (Stewart, 1997). Bontis & Fitz-Enz (2002) explained intellectual capital is a vital resource for strategic marketing and business management and its quantification has great benefit as an internal management tool rather than an external communication to investors. Intellectual capital is intangible resources exist in the minds of men and embedded in organizational skills, corporate culture and behavior, there is no trading market, cannot be obtained through the market (Yongjun, 2013).

The aforesaid intellectual capital elements highlight the fact that there are distinctive knowledge- based assets which organizations could accumulate and exploit via human resources, structures, cultures, and external partners (Berry, 2004). Intellectual capital encourages value creation, which in turn leads to superior performance in today's knowledge-based economy (Tayles et al., 2007). Intellectual capital must behave as an active, performing living mechanism for the creation of innovation (Izvercian et al., 2013). Intellectual capital is a kind of enterprise resource build on the knowledge base, prominent features that can creative intelligence, enables enterprises to obtain sustainable competitive advantage mainly for the knowledge, technology, skills and experience (Yongjun, 2013).

Intellectual capital has able to create value (Yongjun, 2013). The development of intellectual capital is in line with strengthened ethics (Su, 2014). Intellectual capital as the holistic or meta-level capability of an enterprise to harmonize, orchestrate and deploy its knowledge resources to create value in pursuit of its future vision (Zigan et al., 2008). Intellectual capital can be classified into two major categories of human capital and structural capital, and structural capital can be further divided into two subcategories of organizational capital and customer capital (Edvinsson & Malone, 1997). Intellectual capital is difficult to imitate because form a unique and complex path (Yongjun, 2013).

Structural Capital in Organization Development

Structural capital refers to the particular knowledge possessed by an organization

including information system, processes, and data (Bontis, 1999). Izversian et al. (2013) described of structural capital consists of corporate culture (values or behavior criteria), organizational structure (responsibilities and control, operational process and organizational knowledge assets) and information system (support for cooperation and collaboration, availability and transmission of information). Structural capital deals with all kinds of knowledge deposits i.e. business intellects that derive from structure and information. Human capital develops structural capital. Although influenced by human capital, structural capital dependent on human capital exists objectively and independent of human capital (Roos et al., 1998).

Structural capital needs human capital for enabling enterprises to develop customer capital (Izvercian et al., 2013). Structural capital deals with the mechanism and structure of an enterprise that can help support employee in their quest for optimum intellectual performance, and the overall business performance can thereupon be achieved (Chen et al., 2004). Structural capital represented by the electronic network that transports information at a light speed through a company, so that it can react to the market faster than its rivals comprises knowledge assets that are company property: patents, copyrights and trademarks; processes, methodologies, models; documents and other knowledge artefacts, computer networks and software; administrative systems; and so forth (Stewart, 2003). This involves the people of the national embedding their knowledge into the structural capital of the nation through value creating activities such as innovation, and thereby improving this structural capital for future use (Chew & Sharma, 2014). Structural capital describes the codified knowledge bases that do not exist within the minds of Employees e.g. databases, filing cabinets, organizational routines (Bontis & Fitz-Enz, 2002).

Relational Capital Development

Relational capital is the concept of a living learning organization (Dewhurst, 2004). Relational capital refers to the knowledge and competencies available to organizations through the relational structure with external parties such as customers, suppliers, partners, and business affiliations (Cricelli & Grimaldi, 2010). Relational capital represents the relationships with relevant stakeholders (Izvercian et al., 2013). Customer capital considered relational capital represents the knowledge embedded in the organizational value chain, that is, the knowledge embedded in the relationships that the firm has with suppliers, customers and any entity outside the boundaries of the firm (Bontis & Fitz-Enz, 2002). Relational capital is external structure capital or external social capital (Youndt & Snell, 2004) Relational capital comprises of knowledge entrenched within the relationships an organization develops with its customers, suppliers, competitors, government bodies and trade associations (Bontis, 1999).

Dynamic of Innovation Capital

Innovation capital is the knowledge resources concerning business renewal and development such as intangible assets for developing new products or services and intellectual property (Edvinsson & Malone 1997). Innovation capital refers to any intangible part of anything, or anything that can create value by improving financial capital or intellectual capital (Roos et al., 1998). Innovation as the application of intellectual capital for the purpose of growth, and is hence the key process dimension in determining the wealth of nations (Chew & Sharma, 2014). Innovation can be described to as a process that combines tangible and intangible capabilities of a nation to generate desired outcomes. The innovative capability of an organization will is closely tied with the capabilities of these raw materials (Delgado-Verde et al., 2011). The role of innovation in the growth of the intellectual capital of the nation may lead to further initiatives such as useful frameworks,

analytical models or policy instruments to better estimate, create value, showcase or protect the intangible raw materials of innovation (Chew & Sharma, 2014).

The innovation capital includes primarily intellectual properties (Huang et al., 2007). This interplay of resources and processes sets the research impetus to investigate the role of innovation in the intellectual capital of a nation (Chew & Sharma, 2014). There are many ways to measure the intellectual capital of a nation such as a human development focus through educational and hygiene indicators but this research focuses on the innovation aspect (Bontis, 2004). The economic growth and the first two objectives seek to investigate and codify the roles of innovation in the growth of intellectual capital of a nation, which in turn drives economic growth (Chew & Sharma, 2014). It is necessary to have sufficient amounts of intellectual capital in a nation to drive innovation, learning, productivity and economic growth while also functioning as the bedrock and indicator in claiming its future national wealth (Lin & Edvinsson, 2011).

Trust In Complexity

Trust is defined as the expectation that another individual or group will make a good faith effort to behave in accordance with commitments, both of explicit or implicit, be honest in whatever negotiations preceded those commitments, and not take excessive advantage of others even when the opportunity exists (Mangundjaya, 2015). Trust is deeply connected to successful team performance and has been declared a key component of successful and effective teams (Berry, 2011; Driskell & Salas, 1992). Trust is expected to be linked to the evolution of team structures and capable of bridging team developmental barriers (Rickards & Moger, 2000). Trust is a necessary asset for the successful performance of virtual teams (Morita & Burns, 2014). Trust is a psychological state that exists when you agree to make yourself vulnerable to another because you have positive expectations about how things are going to turn out (Rousseau et al., 1998). Trust is also one of the significant considerations that are taken into account in the context of a learning organization (Ferguson-Amores et al., 2005). Trust is a vital component of collaboration (Morita & Burns, 2014).

The identified trust building behaviors will be later converted into design features and interface design objects to be used in communication and collaboration systems that support the work of virtual teams (Morita & Burns, 2014). Trust has dimensions that are predictability, integrity, and benevolence (Darrough, 2006). Indicators of trust included of repository functions, transparency, structural assurance to include guarantees of preservation and sustainability, and the effects of discipline and level of expertise (Yoon, 2014). Identified three dimension of trust consist of integrity, benevolence, and ability. Integrity refers to honesty and truthfulness. Benevolence means the trusted person has your interests at heart, even if yours aren't necessarily in line with theirs. Ability encompasses an individual's technical and interpersonal knowledge and skills (Robbin & Judge, 2013). The relationships, communities, cooperation, and mutual commitment that characterize social capital could not exist without a reasonable level of trust (Asiaei & Jusoh, 2015)

Trust creates an opportunity to deal with the complexity of the world by unloading parts of our responsibilities (Luhmann, 1979). Trust acts as a network that binds a team together, providing mechanisms for knowledge integration that move teams into effective collective minds (Weick & Roberts, 1993). The lack of trust between coworkers will curtail the sharing of private knowledge, which is indicative of the fact that the creation and subsequent development of intellectual capital is incumbent upon great levels of trust (Asiaei & Jusoh, 2015). Mayer et al. (1995) suggested three attributes of perceived trustworthiness: ability, benevolence, and integrity. Ability refers to the skills, competence, and characteristics of a trustee that are influential in a specific domain; benevolence is the belief of a trustor that a trustee wants to do good work for a trustor; and integrity is a trustor's perception that a trustee will adhere to principles acceptable to the trustor.

Trust is a key component of teamwork (Salas et al., 2008). Trust represents how much risk we are willing to accept in exchange for benefits from an interpersonal interaction (Luhmann, 1979; Mayer et al., 1995). Management should identify what kind of variables that can develop organizational trust, as organizational trust play important role in developing commitment to change (Mangundjaya, 2015). If the organization loses the trust of its personnel, they would consequently become less loyal, less motivated, and less productive (Pirson and Malhotra, 2008). Developing trust is still critical for virtual teams and represents one of the keystones of successful collaborations (Gibson & Cohen, 2003).

Self-Efficacy Is a Key Concept

Special self-efficacy refers to Bandura's conception on believing in performing specialized tasks successfully (Tai, 2006). A person's self-efficacy is that person's belief about his or her capabilities to perform a task. People with high self-efficacy believe that they can perform well on a specific task, whereas people with low self-efficacy tend to doubt their ability to perform a specific task (Griffin & Moorhead, 2013). Self-efficacy refers to an individual's belief that he or she is capable of performing a task (Robbins & Judge, 2013). Self-efficacy is defined as individuals' beliefs about their capabilities to produce designated levels of performance that affect their lives directly or indirectly (Bandura, 1986, 1995). Self-efficacy is a central construct in health interventions because of its ability to link belief, attitude, and behavior. Empirically, self-efficacy has been frequently documented as a most significant predictor of behavioral intentions and actual health behaviors (DiClemente et al., 1995).

Self-efficacy refers to an individual's conviction about his or her abilities to mobilize the motivation, cognitive resources, and courses of action needed to successfully execute a specific task within a given context (Stajkovic & Luthans, 1998). The self-efficacy process affects human functioning not only directly, but has an indirect impact on other determinants as well. The self-efficacy process starts before individuals select their choices and initiate their effort. First, people tend to weigh, evaluate, and integrate information about their perceived capabilities (Brown et al., 2001). Self-efficacy, the belief in one's ability to perform a certain task, is a key concept in explaining health-related behaviors (Bandura, 1986, 1995). Bandura argues that self-efficacy perceptions consist of three dimensions: magnitude, strength, and generality. Magnitude refers to the ordering of tasks by difficulty level. Individuals expecting a low magnitude task often feel more capable of performing the task than do those expecting a high-magnitude task. Strength refers to the probabilistic judgment of how certain one is of his/her ability to perform a specific task. Generality concerns the extent to which efficacy expectations about a specific situation can be generalized to other situations.

Self-efficacy is the belief that one can succeed even in the face of challenges and refers to one's judgments as to how effective one is likely to be in a particular situation

(Gibson, 2004). Individual employee's involvement in knowledge sharing is determined by their level of self-efficacy (Olowodunoye, 2015). Self-efficacy is an important motivational construct that influences individual choices, goals, emotional reactions, effort, coping and persistence. It refers to individuals' convictions about their abilities, and consequently an important set of cognitions is self-efficacy or beliefs about one's capacity to perform at designated levels (Stajkovic & Luthans, 1998).

Self-efficacy deals with employee's judgement of ability to organize and implement a certain course of action, which also determines the involvement of an individual employee in knowledge sharing behavior (Bandura, 1997). People with higher self-efficacy exert greater efforts to master skills and workplace challenges (Chovwen, 2012). Employees with high level of self-efficacy may be more prone and useful to the organization in sharing knowledge and this may assists in overcoming hoarding of knowledge in any organization (Olowodunoye, 2015). Higher self-efficacy tends to demonstrate higher level skill attainments, fostering increased self-efficacy in practitioners should result in stronger procedural skills and clinical reasoning (Bandura, 1986).

Job Satisfaction In Human Resources Management

Job satisfaction is an important prerequisite for an effective performance, and given that the organizational climate arises from mutual efforts and relations of groups within the organization, manager and employees, it impresses the employee's behavior and their satisfaction level effectively (Hashemi & Sadeqi, 2016). Job satisfaction reflects the extent to which people find gratification or fulfillment in their work (Griffin & Moorhead, 2013). Job satisfaction is a key concept in management and organization that has an important role in motivation of employees and consequently increased efficiency (Hashemi & Sadeqi, 2016). Job satisfaction is the basic requirement of individual's attendance and work with the organization because it plays the critical role in increasing productivity, commitment to the organization, guaranteeing the physical and psychological health, boosting the morale of the individual (Mrugank & Ashwin, 2005). Kotler (2000) has defined consumer satisfaction as a consumer's feelings of either pleasure or disappointment resulting from a comparison between the perceived performance of a specific product or service and his or her expectations.

Job satisfaction is a key element when it comes to employee turnover (Griffeth et al., 2000). Employees with higher levels of job satisfaction are more committed to their organizations (Froese & Xiao, 2012). Employers to what they can to make sure their employees have a high enough level of job satisfaction (Thompson & Lane, 2014). Employee satisfaction represent the main principles of contemporary human resources management, since only through quality motivation systems can a company increase its competitive advantage and value (Hashemi & Sadeqi, 2016). Job satisfaction is important to employers is that overall job satisfaction tends to be one of the best predictors of employee turnover (Griffeth et al., 2000). Voluntary turnover of desirable employees is generally considered detrimental to an organization in terms of replacement costs and work disruption (Hellman, 1997).

Theoretical Framework & Hypotheses

The most important of head-hunter services is candidates and clients. The success of head-hunter services is the most important factor which determines the success and survival of the business. Head- hunter requires internal capabilities in improving the competence including by strengthening intellectual capital. Intellectual capital can be tailored to the

needs of work involving candidates and clients. Head- hunter requires trust from both candidates and clients. Candidates entrust to a head-hunter to find a better job. Clients entrust head-hunters to find the employee in accordance with the required qualifications. Both are candidates and client would be satisfied if they can need each other and in accordance with qualification. Job satisfaction is not just for candidates and clients but also for head-hunters that already provide services in bringing together and facilitating both so get appropriate rewards.

Companies that use the services of head-hunters will spend a considerable cost to pay for search services qualified employees and related to the expectations of service users. Given the sizeable recruitment costs, most companies will use the services of a head-hunter if need employees with managerial level upwards or positions that are considered quite hard to come by and take a long time if you follow a regular recruitment process (Setiani, 2013).

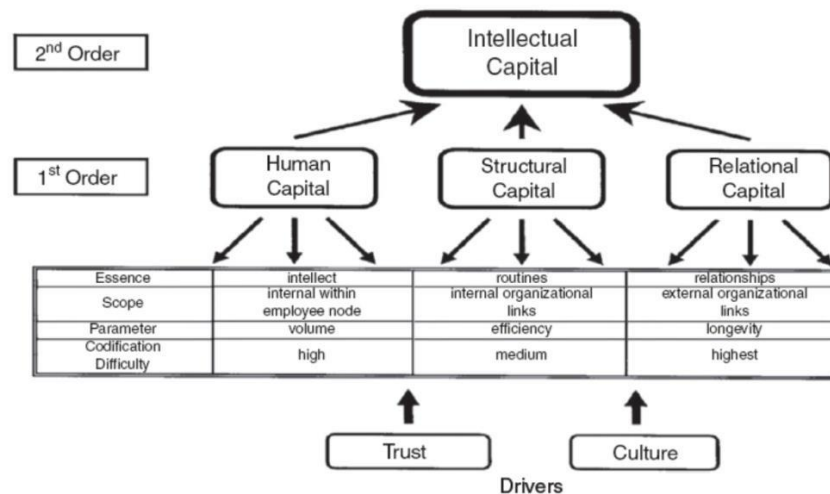
The first base model for creating the conceptual model in this study is Bontis intellectual capital conceptualization (Bontis, 1999). In order to satisfy the desire for exploring a multidimensional view of intellectual capital, this study largely barrows the conceptualization introduced. In his model, two antecedent constructs, i.e. trust and culture, play a leading role as two supporting drivers behind the other intellectual capital dimensions. According to Bontis, the phenomenon of intellectual capital could be fallen into three components. As illustrated in Figure 1, each is reflected based on its essence, scope,
parameter, and codification difficulty. Moreover, Bontis refers to the role of two drivers, namely trust and culture which can be considered for their influence on intellectual capital development.


Figure 1 Intellectual capital conceptualization (Bontis, 1999).

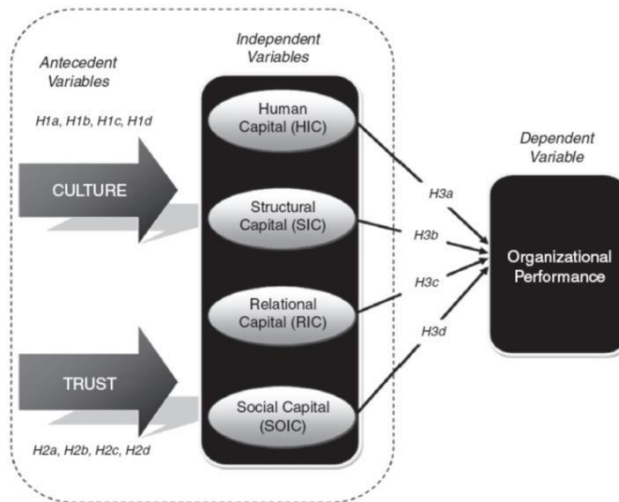
Asiaei & Jusoh (2015) explained at intellectual capital theoretical model are created with added social capital indicator in independent variable and added organizational performance variable at dependent variable. They have suggested four fundamental dimensions which determine success of Iranian public listed companies as it is shown in figure 2. They study particularly employs contingency theory and tries to explicate the association between two contextual factors, namely organizational culture and trust as the two antecedent drivers and intellectual capital (Asiaei & Jusoh, 2015).


Figure 2 Intellectual capital theoretical models (Asiaei & Jusoh, 2015)

Izvercian et al. (2013) present the process of transforming customers into prosumers and integrating them into a successful innovation model and its show at figure 3. This model stipulates a win- win relationship. The company is innovating alongside its customers in a time and cost saving manner with a positive impact on its global image and the consumer has the satisfaction of being listened at, important for the society, contributing to the community and growing in personal value.
Figure 3 Prosumer transformasion model for innovation (Izvercian et al., 2013)

The management of intellectual capital is heavily reliant upon trust (Isaac et al., 2010). Trust is imperative toward the promotion and creation of intellectual capital, due to the fact that the act of sharing tacit knowledge is critical toward the development of intellectual capital (Asiaei & Jusoh, 2015). Trust, whether between business and customers, business and supplier, between customers or internal trust, is deemed crucial to the expansion of a business's intellectual capital (Isaac et al., 2010). Trust is a major determinant of all the intellectual capital components, namely human, structural, relational, and social capital (Asiaei & Jusoh, 2015).

H1: Trust has positive effect on intellectual capital

Self-efficacy is the central construct of social cognitive theory by Bandura and points to conceived capability of a person to perform a given action (Muris, 2003). Self-efficacy is emerged as an important motivational construct in human behavior study

especially at workplace (Shahrzad & Alavi, 2009). Self-efficacy is dependent on the individuals' sense of self control over the environment and their behavior (Zarbakhsh, 2015). Self-efficacy is the beliefs people hold of their own competency in order to exercise control over events affecting their lives (Shams-Esfandabad, 2011).

H2: Self-efficacy has positive effect on intellectual capital

Intellectual capital measurement covers important non-financial contents such as customer satisfaction, innovation and human capital (Shamsudin & Yian, 2013). Managing people based on their human capital will allow an organization to optimize knowledge creation, whether of new product, ideas and services or of improvements in business processes (Jyotirmayee & Mishra, 2010). The resource- based-view accredits human capital as the most important type of resources a firm has (Pfeffer, 1994). Intellectual capital is considered as the combination of human, structural, innovation and cultural capital (Piri et al., 2013). Enterprise's intellectual capital has all the characteristics of the heterogeneity of resources consist of valuable, scarce and difficult to imitate, difficult to substitute (Yongjun, 2013). The significant roles of innovation in the intellectual capital of a nation, their impact on the growth of intellectual capital and identifying useful measures (Chew & Sharma, 2014).

H3: Intellectual capital has positive effect on job satisfaction

Research Method

The main research questions are determining effect of trust and self-efficacy toward intellectual capital and have implication on job satisfaction in head-hunter firms. This research which is a descriptive cross-sectional research analyzing quantitative data collected by using a five point Likert scale. The final questionnaire comprised four variables included trust, self-efficacy, intellectual capital and job satisfaction. We decided to conduct our research more specifically in the job recruitment sectors especially in executive search. It's a sector in which job recruitments responsible initiatives are developed
and second, this research field helps us avoid the limitation of executive search experiments, since data are obtained in real condition of use.

Structural equation model is used to analyze the data and test the hypotheses of the theoretical model which has a multi-variable statistical method. Structural equation model is a statistical method which has been widely used due to measuring direct and indirect relationships between variables in a single model (Meydan & Şeşen, 2011). According to structural equation model, traditional methods are insufficient for correcting measurement errors (Byrne, 2010). Hair et al. (2010) has said that the size of the sample has to be large enough to be used in the data analysis by the application of the model equations with the structure and the distribution of data. The research model which is created by deriving the models in the literature is explained in conceptual framework section and seen in Figure 4.

Data was collected from 253 candidates in head-hunter firms. Simple random sampling was applied to the data collected from the surveyed population. Population consists of all of candidates in executive level at head-hunter firms in Indonesia. The data was collected from candidate in executive search through mailed questionnaires distributed through email. From the target sample of questioners, 275 questioners were completed, 22 were discarded as incomplete. Hence, the final response rate for sample was 84 percent. The sample of this study is 253 people who utilizing the services of company head-hunter in Indonesia. Data were gathered during the month of May 2016. To test the above hypotheses, we used the scales adopted from prior studies for the measurement of dimensions. We measured four dimensions by using 5 point Likert scales ranging from

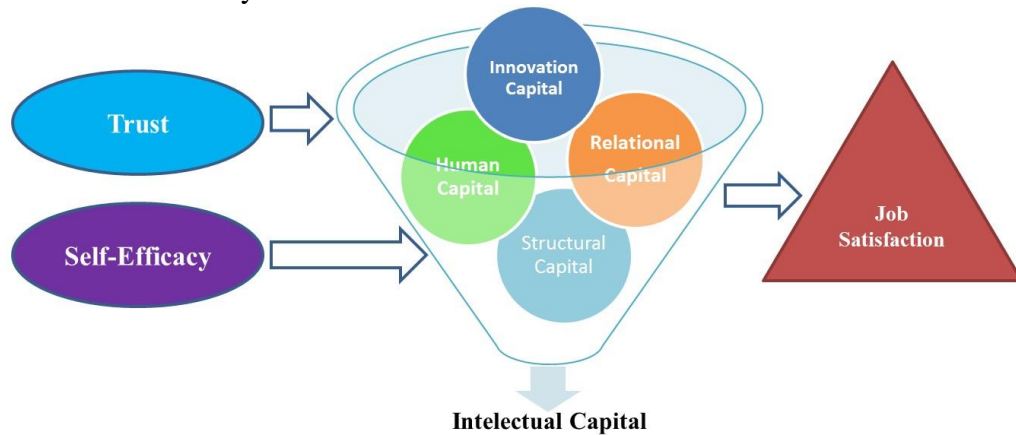
strongly disagree to strongly agree. Structural equation modeling is used to analyze the data and test the hypotheses of the theoretical model which has a multi-variable statistical method. It tests whether the hypotheses of the model are statistically significant or not after determining the reliability and validity of Likert type ordinal scales. SPSS and Lisrel programs are used for analyzes.


Figure 4 Head-hunter models in intellectual capital perspective

Analysis and Result

Frequency distributions were obtained for all the personal data or classification variables. As presented in detail at table 1, respondents' profiles are based on the organizations' characteristics which consist of the type of gender, age, level of education and employment with the company (working experience). According to frequency distribution in head-hunter firm results, 66 % of the respondents are male, 74.7 % of them have university degree and 53 % of them are between 41-50 years old. This test shows the compatibility of the anticipated model and acquired a model. As shown in Table 1, demographic respondents which describes the condition of the respondents in this study.

Table 1 Demographic respondents

Profile	Category	Frequency	%	Cumulative %
Gender	Male	167	66	66
	Female	86	34	100
Age	Below 30 years	2	0.8	0.8
	31 – 40 years old	83	32.8	33.6
	41 – 50 years old	134	53	86.6
	Over 50 years old	34	13.4	100
Level of Education	Diploma	23	9.1	9.1
	Bachelor	189	74.7	83.8
	Masters	41	16.2	100
Years of working experience	< 1 year	24	9.5	9.5

(Employment with this	1 – 3 year	91		36	45.5
	3 – 5 year	77	30.4		75.9
	5 – 10 year	49	19.4		95.3
	Over 10 year	12	4.7		100

All the scales adopted by this study are from the literature. This study used the intellectual scales developed by Bontis (1999) and Asiaei & Jusoh (2015) to measure trust, human capital, structural capital and relational capital and the scales of innovation capital value developed by Izvercian et al. (2013) to measure innovation capital. Factor analysis was applied to four scale items of trust, self-efficacy, intellectual capital and two scales items of job satisfaction converged on their hypothesized with Eigenvalues all great than one and factor loading all greater than 0.5. The scale had a high degree of validity. Scale reliability was analyzed through computing the coefficients of Cronbach's alpha of the scales. As shown in the Table 2, all coefficients were greater than 0.7.

Table 2 Scale Reliability

Indicators	Mean	SD	Total Correlation	Cronbach's Alpha
Integrity	10.435	1.337	0.379	0.811
Benevolence	13.233	1.706	0.442	0.806
Ability	13.972	1.737	0.583	0.796
Relationships	14.506	1.931	0.475	0.803
Belief	13.783	1.939	0.365	0.812
Attitude	16.968	2.370	0.296	0.821
Behavior	16.755	1.977	0.481	0.803
Persistence	14.047	1.724	0.363	0.811
Human capital	13.763	1.980	0.475	0.803
Structural capital	11.146	1.797	0.414	0.808
Relational capital	9.265	1.647	0.634	0.793
Innovation capital	9.514	1.941	0.439	0.806
Performance	9.470	1.639	0.431	0.807
Productivity	9.684	1.612	0.526	0.801

The compatibility of the model and the data are evaluated according to fit indices. CMIN/DF, CFI (the comparative fit index), IFI (the incremental fit index), RMSEA (the root-mean-square error of approximation) are the recognized scales in the literature (Akgün et al., 2014). Correlations among the variables should be verified to test mediator roles of the mediating variables (Baron & Kenny, 1986). First of all, CFA and reliability analysis were conducted in order to assess validity and reliability of the measures. CFA results indicated the model fits adequately: CMIN/DF =3.848 ($\chi2$= 280.96, DF= 73), CFI=0.89, AGFI= 0.80, GFI= 0.86, IFI=0.89, RMSEA= 0.106.
Figure 5 Structural Equations Modeling in Estimates

Effect of trust on intellectual capital is 0.31 and the value of t for this hypothesis is 3.70. Since the value of t is larger than 1.96, the null hypothesis is rejected, opposite hypothesis is accepted. The trust has significant and direct effect on intellectual capital. Therefore, whatever the trust is more attractive in terms of candidates and client, their intellectual capital, has the highest influence.

Effect of self-efficacy on intellectual capital is 0.58 and the value of t for this hypothesis is 5.52. Since the value of t is larger than 1.96, the null hypothesis is rejected, opposite hypothesis is accepted. The self-efficacy has significant and direct effect on intellectual capital. Therefore, whatever the self- efficacy is more attractive in terms of candidates and client, their intellectual capital, has the highest influence.

Effect of intellectual capital on job satisfaction is 0.64 and the value of t for this hypothesis is 5.65. Since the value of t is larger than 1.96, the null hypothesis is rejected, opposite hypothesis is accepted. The intellectual capital has significant and direct effect on job satisfaction. Therefore, whatever the intellectual capital is more attractive in terms of head-hunter, their job satisfaction, has the highest influence.

Table 3   SEM Interpretation

Hypothesis	Structural Relationship	Standard Coefficient		t-statistic	Contrast
H1	Trust → Intellectual capital	0.31	3.70		Accepted
H2	Self-efficacy → Intellectual capital	0.56	5.52		Accepted
H3	Intellectual capital → Job	0.64	5.65		Accepted

Significant at $p < 0.05$

Discussions and Conclusions

Models which were previously tested in the literature were utilized to create a new conceptual model to examine the effect of trust and self-efficacy toward intellectual capital and its impact on job satisfaction in head-hunter firms at Indonesia. A new conceptual model for intellectual capital is developed by including dimensions of the tested previous models. Trust and self-efficacy are the important antecedent of perception of intellectual capital for head-hunter processes. Thus, this paper focused on the effect of intellectual capital on head-hunter firms. The effect of intellectual capital has been modeled through

job satisfaction in the literature. Some models included trust and self-efficacy toward intellectual capital as mediator to examine this effect. Therefore, the research model suggests that trust and self-efficacy toward intellectual capital and its impact on job satisfaction play mediator roles on the effect of head-hunter firms in this paper. Job satisfaction affects the health of staff, their efficiencies, labor relationships in the organization and the organization's overall efficiency (Getahun et al., 2016). No company can last for long without satisfied customers (Keiningham et al., 2014).

The findings significantly the fact that trust and self-efficacy plays a leading part in relation to intellectual capital development within head-hunter firm in Indonesia. It is statistically proved that trust, self-efficacy and intellectual capital play mediator roles on the effect of job satisfaction as a result of the analysis. This result shows that trust and self-efficacy have significant effect on intellectual capital. Intellectual capital has significant effect on job satisfaction. Trust is imperative toward the promotion and creation of intellectual capital, due to the fact that the act of sharing tacit knowledge is critical toward the development of intellectual capital (Asiaei & Jusoh, 2015). The creation and subsequent development of intellectual capital is incumbent upon great levels of trust (Asiaei & Jusoh, 2015). An individual with high levels of self-efficacy not only have a greater commitment to the organization, but also a higher level of job satisfaction (Luthans et al., 2006). Employees had higher self-efficacy which was found to be a predictor of future performance and skill development (Harrison et al., 1997). The right amount of self-efficacy is said to instigate sufficient effort which in turn will produce desirable health and satisfaction outcomes (Stajkovic & Luthans, 1998).

This study suggests to head-hunter firms in order to develop human resources through improved intellectual capital. Intellectual capital is needed for head-hunters to achieve job satisfaction for clients as well as for candidates. Job satisfaction for clients means that clients get satisfaction by getting workers as required by candidates. Job satisfaction for the candidates is part of its success in getting a new job as needed. Finally, the main function of head-hunter is to bring between candidates and clients that suit their needs. This finding integrates insights in intellectual capital framework into a generalization of the stakeholder satisfaction in head-hunter firms. Identifying behaviors that lead to increased trust will have significant impact on team management and team design (Gibson & Cohen, 2003; Salas et al., 2008). Play the function of intellectual capital that value creation and drive business growth (Yongjun, 2013).

CILOLOHAN EDUTOWN TOWNHOUSE FINANCIAL FEASIBILITY STUDY USING DISCOUNTED CASH FLOW AND REAL OPTION METHODS

Dwiki Harnawadi Ahmad, Institut Teknologi Bandung
dwiki.harnawadi@sbm-itb.ac.id

Abstract

In the city of Tasikmalaya, where the population is around 700 thousand people, and the annual growth of 1.4% and a backlog of housing around 6000 houses. Tasikmalaya has the capability and potential to have a real estate development.This research is aimed to assist PT. XYZ to make a feasibility study of the intended project by giving options of alternate numbers and types of unit constructed, and the timing of the project started. The feasibility study is going to be analyzing using DCF analysis, with the criteria of Net Present Value (NPV), Internal Rate of Return (IRR), and Payback Period (PBP). ,- Return of Equity (ROE) and Return of Investment (ROI) and the methods of Real Option of delaying the project as a method to be compared with. The result shows that option 4 is the most suitable and profitable. Option 4 (delay) composition type of unit is 34 small units and 17 big units, and expected to be built in the year 2019, thus delaying the project 3 years. Another recommendation is to fund the project by the help of a loan so that the WACC or discount rate for the project is reduced, thus giving the NPV of IDR 5.326.929.851,-, IRR of 97.8%, and PBP of 0.81 year (9 months 26 days). This result is also supported by the real option analysis using Black-Scholes formulation, in which the call value the option 4 (delay) give is 2.381.841.983 which have a higher call value than option 3 (delay).

Keywords: *Indonesia - Tasikmalaya, Real Estate Development, Feasibility Study, Risk Management*

Introduction

Even though the residential business has good prospect, in order to justify the benefit, a feasibility study must be conducted because large sums are at stake in order for this project to run. The primary motivation for investing in the company is the responsibility to make sure that the company is able to achieve expectation of returning the investors original capital plus the desired return on their invested capital (Bierman, 2007).

Feasibility study function to analyze the project whether it is technically feasible and economically beneficial in the future, is feasible within the estimated cost, and will be profitable, to evaluate the value of capital resulting from investment performance within a specified period. Feasibility study measures some values that will be determined to indicate whether or not a project should be undertaken.

The city of Tasikmalaya with the population of 700 thousand lives, an annual growth of 1.4% each year, and a backlog of 6000 housing in 2015 means that the location is very suitable as a investment in real estate development. The area projected for this feasibility study is located in the main street of Cilolohan in the city of Tasikmalaya with an area of 4550 sqm, where the plan to build the public facility is 1820 sqm. With the projected housing will be divided into common living houses, or dorm-houses. This paper is to evaluate the feasibility of the project, and to make sure that the company gets the best strategy to take. This research also broadens a suggestion about the concept of the townhouse based on other ideas. In order to evaluate the project, this research also suggests the idea of delaying the project, the main reason for this is because the government project of a highway that connect Bandung – Cileunyi – Tasikmalaya that will be implemented later. In summary this paper is made to assess which option is the best one that could give the optimal benefit and payback period. Below is the option that the company currently has:

Option 1: 34 Big Units and start at the year mid – 2016

Research Methodology

To analyze Cilolohan Edutown Townhouse study case, the method that will be used is Discounted Cash Flow and Real Option Methods. The necessary data used in this research is qualitative and quantitative data in the form of primary data and secondary data. In accordance with the method of study in-depth case study, the primary data performed with the variety of ways: interviews, historical, and observation. Secondary data were obtained by collecting documents and literature.

Business Issue Exploration

The idea behind this project is that, with the current increase of middle class economy in Indonesia, this could be the sign for bigger potential customers. To confirm that this idea is a right and attractive project, we need to first assess the current condition, choose the right business strategy, set correct targets, and understand the strength and weaknesses of all that have connection with this project. After we analyze these, we need to analyze its financial, this is in order to provide the optimal revenue to the owner, and also get the certainty of the project. In analyzing this project, the author will employ both Discounted Cash Flow (DCF) and Real Option valuation methods.

Changing circumstances and their timings are best appraised using discounted cash flow (DCF) analysis with discounting and compounding. Real option valuation theory also extensively employs DCF modeling with discounting and compounding. The major difference for real option is to explicitly address the uncertainty in decision making after the valuation date. Conversely, conventional appraisal using direct capitalization or traditional DCF analysis does not explicitly address the uncertainty of possible scenario and result, and it also

assumes the decision makers are passive after the appraisal, and throughout the analysis period. Conventional appraisal does not analyze the probability of, and the cash flow from, each option. Thus traditional DCF analysis is said to be deterministic, while real option analysis is said to be probabilistic. (Pomykacz, MAI, and Olmstead, 2013)

Overall, in doing the feasibility study, the methods will be calculated and considered are as follows:

1. Net Present Value (NPV)
2. Internal Rate of Return (IRR)
3. Payback Period (PBP)
4. Return on Investment (ROI)
5. Return on Equity (ROE)

In analysing the the strategy, this research will identify business issue, identify industry analysis using Porter's Five Forces, and identify external and internal factor using SWOT analysis. Industry analysis the research help informed the research about the condition of industry the project is going to take, and which forces out of five that stated have the biggest impact.

By looking at the previous analysis, the research can estimate the condition and risk the project is facing, thus the research can help company choose the best strategy for the project. The project itself is expected to start at the mid of 2016, but the company is willing to hear the suggestion of delaying the project, with the terms that the increase of value in project is higher than previous.

Knowing this, the research has compile numerous strategy, those are:

1. The first plan is to build a townhouse with 34 units with the type of 90/78, priced at IDR 550.000.000,- this strategy relied on fewer unit but with larger units. (Option 1)
2. The second plan is to build 34 smaller units (type 45/39) that price around IDR 275.000.000,- this strategy relied on the terms of anchor, where the idea is to make a community before the development target its profit. (Option 2)
3. The third plan is to delay the project until 2019, but the composition of the project is the same as Option 1. (Option 3)
4. The fourth plan is to delay the project until 2019, but the composition of the project is the same as Option 2. (Option 4)

By comparing the strategies above, this research can give an overview of the project to the company, the research will be conduct using 2 method, the first is using DCF analysis, while the other is using Black Scholes Formulation. the overview of DCF analysis will be shown in the form of NPV, IRR, PBP, and ROE/ROI, while the real option analysis to delay is using the conventional DCF analysis and Black Scholes Formulation as a comparison, which will show us the value of the option of delaying the project.

Result and Discussion

4.1 DCF and Real Option Analysis

In order the company can choose the right strategy, the research for the business solution will be split into 3 parts, the first one is conducting the calculation for the current DCF analysis for Option 1 and Option 2, the data will of the calculation is given from the company, and that the estimated sales and growth is based on interview with the competitors. After conducting the current DCF analysis, further analysis is conducted, which is calculating the project with the delay option, in this case option 1 and 2 will be delayed until year 2019. Where again the estimated growth will be based on news and interview with competitor of the same industry. And also the delay is conducted also using Black – Scholes - Merton Formula as a comparison to see the result of which option gives the best value.

The second part is to compare the result of all option using DCF analysis, where the result of these option are:

Table 4.1 Discounted Cash Flow Comparison Table

Description		NPV	IRR	PBP	ROI	ROE
OPTION 1	OPTIMISTIC	1,052,589,614	30.0%	2.02	22.2%	22.2%
	MOST LIKELY	(1,382,800,270)	10.9%	5.15	16.5%	16.5%
	PESSIMISTIC	(3,561,117,059)	2.4%	8.55	4.7%	4.7%
OPTION 2	OPTIMISTIC	2,035,234,979	47.5%	1.29	27.6%	27.6%
	MOST LIKELY	(634,205,880)	14.1%	3.60	16.5%	16.5%
	PESSIMISTIC	(2,738,404,860)	1.8%	8.65	2.3%	2.3%
OPTION 3	OPTIMISTIC	4,038,309,907	73.5%	1.38	62.0%	62.0%
	MOST LIKELY	1,758,474,817	30.1%	4.40	57.2%	57.2%
	PESSIMISTIC	(1,123,866,393)	12.7%	7.13	30.7%	30.7%
OPTION 4	OPTIMISTIC	4,260,350,793	97.8%	0.81	62.3%	62.3%
	MOST LIKELY	2,115,772,712	36.3%	1.87	55.0%	55.0%
	PESSIMISTIC	(435,998,862)	15.7%	4.90	29.9%	29.9%

The acceptable project is the one with the positive NPV, and if the condition of all the strategy is positive, then the company should choose the highest NPV (Damodaran, 2015). From the result compile in table 4.1 we can see that the highest NPV is given by option 4, where the strategy is to make the composition of the project with 34 small units and 17 big units, and delay the project till 2019, to wait for the highway project to complete.

The other method in finding the best decision for the strategy is by using black scholes merton formula, the formula is put into the option 1 and 2 with the negative NPV of the intended project, in this case option 1 and 2 that gives the first negative NPV is in the most likely scenario, thus we try to delay the project with black scholes merton to see whether the result of the option changes if the options are delay.

Table 4.2 Black Scholes Comparison Table

Comparison of Black Scholes Result		
Description	Option 3	Option 4
Value of Call	2,075,794,800	2,381,841,983
Value of Put	3,748,230,576	3,401,369,260

The result of option 1 and 2 that is delayed by using black scholes merton, show the value of call of 2.075.794.800 for the option 1 and 2.381.841.983 for option 2. This means that delaying the project by 3 years and make the composition the same as option 2 makes a bigger value, thus option 4 is more recommended.

The research also try to see if theres a change in the beta could it affect the WACC which in the end affect the feasibility of a project. Table 4.3 show the result:

Table 4.3 Net Present Value (Comparison of Different Capital Structure)

Net Present Value			
DESCRIPTION		Without Loan	With Loan
		18.63%	14.42%
OPTION 1	OPTIMISTIC	1,052,589,614	1,535,857,259
	MOST LIKELY	(1,382,800,270)	(697,709,385)
	PESSIMISTIC	(3,561,117,059)	(2,983,903,903)
OPTION 2	OPTIMISTIC	2,035,234,979	2,471,150,742
	MOST LIKELY	(634,205,880)	(53,830,670)
	PESSIMISTIC	(2,738,404,860)	(2,281,925,025)
OPTION 3	OPTIMISTIC	4,038,309,907	5,185,960,819
	MOST LIKELY	1,758,474,817	2,986,542,017
	PESSIMISTIC	(1,123,866,393)	(422,163,240)
OPTION 4	OPTIMISTIC	4,260,350,793	5,326,929,851
	MOST LIKELY	2,115,772,712	3,226,329,442
	PESSIMISTIC	(435,998,862)	241,114,305

As seen in the Table 4.3 we can see that that by decreasing the WACC from 18.63% to 14.42% we can increase the NPV of the project, this means that the project is recommended to be funded not only from private investment, but also loan from the bank. While the equity is fixed for the nominal of Rp. 4.550.000.000,- or 65% of the capital, the research suggest to loan for the rest of the investment which is 35% or Rp. 2.450.000.000,- Which will give us the new NPV of Rp. 5.326.929.851,- on option 4 optimistic.

4.2 Sensitivity Analysis

There are also several variables that influences the sensitivity of NPV and IRR of this options. These variables are Price, Cost, WACC, and Inflation. Looking at the Figure 4.1, Figure 4.2, Figure 4.3, and Figure 4.4,where in order to see whether which one is the most sensitive the data is changed by 20%/-20%. Looking at the result, the cost increase is the most sensitive and most influencing towards the NPV and IRR of the project. While the second variables that influences the NPV is the discount rate of the project and the variable that affect IRR is in its price. The Figure 4.1, Figure 4.2, Figure 4.3 and Figure 4.4 also show that by decreasing the inflation, WACC, and the cost for the project, it could inrease its NPV and IRR, this mean that these three variables show negative correlation with NPV and IRR
Figure 4.1 NPV Sensitivity Analysis – Tornado Chart (IDR)
Figure 4.2 NPV Sensitivity Analysis – Spider Chart (IDR)
Figure 4.3 IRR Sensitivity Analysis –
Tornado Chart (%)
Figure 4.4 IRR Sensitivity Analysis – Spider
Chart (%)

4.3 Risk Analysis
The last part is to explore and mitigate the risk that surrounding the project, with the minimum amount of risk management, the company should more or less aware of the risk that may or may not affect the project, thus by doing this risk management the company can choose the right action for the risks.
These are the risks that have been identified in the project:

Political Risk
The risk of politic includes the risk in the legal caused by the politic. There are two main risks in the political risk, those are:

Regulations of Housing (Risk 1)
With the current change in the regulation of KPR, the development of many developers is having big changes, such as the way they built the unit, and their financing. In the last couple of years, financing by KPR can be done even when the unit is still a concept, but now according to Surat Edaran Ekstern Nomor 15/40/DKMP, the bank cannot give KPR/loan to consumer to buy unit that is not tangible, this means that now the unit of the house must first be built by the developer before they can be sold to the consumer. Because of this if the company found out that the project is not within the regulation then that means the license for the project wil be provoked.

The Highway project is Halted (Risk 2)
The main idea for option 3 and 4 is the fact, that the highway project in Tasikmalaya is going to be completed in 2019 (estimated), by default the assumption of growth increase in the year 2019 and above will be demolished if the project is halted.
Mitigation:

Risk 1
The company should succumb to the regulation, by doing this, even though the cost is higher, the risk of halting the project because of legal reason will be avoided.(Avoid)

Risk 2
Even when the highway project is halted, the continuation project of this town house is unaffected, because the project's feasibility doesn't necessarily need the highway project to run. (Retain)

Market Risk
The market risk is the risk that occurs because of macro factors, these mean that these factors are out of reach of the company. This type of risk is uncontrollable by default.

Decreasing buying power (Risk 3)
The decrease buying power of consumer can affect the project very high because a house is commodities that have a quite high price, the buying power of a consumer greatly affect the project.

Mitigation:
Risk 3
Because the risk is influence factor is the macro economy of Indonesia in which affecting the business activities in this country, this mean that this is not only affecting this project specific, instead it affect all other competitor even industry

Competition Risk (Risk 4)

The risk of competition is highly related to the strategy development of a company, because the threat of the competitor is affected by the way the strategy of a company facing the other competitors. The fact about the new highway in Tasikmalaya, will surely attract many competitor that try to make the same development (Risk 4). The main point the company currently have is, that they have already acquired the best position for the development, thus the project is within reach, and thy have already acquired the land in minimal value.

Mitigation:

Risk 4

The increase number of competitor is thing that will happen whether the company like it or not, thus by looking at this the only thing the company can do is by control the probability, this mean instead do anything extreme, a company can only compete healthily or because they have already a lot of experience in Tasikmalaya, the company can secure best location in Tasikmalaya

Operational Risk

Operation risk is a risk that occurs because of a failure in the internal process of the company, these process can be relate to their process itself, people, technology, and even its system. To identify the risk in the operational, these are the main risk in operational risks.

Delay in construction process (Risk 5)

The delay of a unit to be built in the process of the project can occur, these risk usually happen because of the people behind the project is failing or not catching up to the target.

Lack of quality in the unit (Risk 6)

The quality of a unit sometimes deteriorate because of many variables, some of these are people, or force majeure.

Mitigation:

Risk 5

The delay of the construction can heavily influence the project this is because the company's operational cost and reputation is heavily affected by the time of the project. The longer the construction the bigger cost the company must pay, thus the best way to mitigate the risk is by transferring it. Transferring this risk can be done by making a contract with the local contractor and set the deadline of the project in the contract, thus the delay of the project become the responsibility of the local contractor.

Risk 6

The bad quality of each unit can only affect the reputation of the company, this because the impact cannot be seen within period of project, instead this risk can only be seen in 4-10 years of the unit build. Thus the risk is recommended to be only retained.

Financial Risk

Increase cost of unit because of inflation. This risk is one of the risks that may help or jeopardize the profit margin of the project the cost of unit in the project is highly affected by the cost or price of material to build each unit. This mean that a unit can be expensive or cheaper based on the cost of each unit.

Over budget in the operating cost (Risk 7)
The projected cost each year is assumed increase annually, but the increase rate of the cost is hardly forecast, the main variables that affect the cost is related to inflation and gas price. The main cost of each unit is based on material used in the building, thus by the increase of inflation and gas price, the price of a material will change accordingly.
Mitigation:

Risk 7
One of the risk that the company worries is the over budget of cost, this risk can be mitigate by transferring it to local contractor, the condition is the same as risk 5, thus this risk can be mitigate properly.

Conclusion
According to the feasibility study using DCF analysis, and Black-Scholes-Merton analysis, the research conclude that option 4 with 35% of the initial investment by loan, is the best strategy to choose. The result of the strategy give the highest NPV of Rp. 5.326.929.851,- IRR of 97.8%. and Payback Period of 9 Months and 26 Days, even though it is delayed by 3 years.

Abstract

This study aims to provide empirical evidence about the influence of ownership structure on financial performance of sharia banks in Indonesia. Ownership structure in this study consisted of ownership concentration and type of ownership. Ownership concentration is proxied by the largest number of shareholders and three largest number of shareholders, while the type of ownership is proxied by government ownership, institutional ownership, family ownership, foreign ownership. Financial performance in this study was measured by Return on Assets (ROA) and Return on Equity (ROE).This study uses multiple linear regression analysis. Number of samples were used in the study are 56 Sharia Commercial Banks in observation period 2009-2014. Samples were obtained by using purposive sampling method.The results of this study showed positive influence of ownership concentration on bank's financial performance. The results also show that there are positive influence between institutional ownership and family ownership on bank's financial performance, while government ownership negatively affect bank's financial performance. On the other hand, there is no influence of foreign ownership on bank's financial performance.
Keywords: ownership structure, financial performance, return on asset, return on equity.

Introduction

The system of capitalism and socialism are the economic systems that are evolving today (Triyanti, 2008). The nature of the system since the beginning has been unfair or discriminatory, because it tends to side the owners of capital alone (Farihah, 2014).It is certainly contrary to the principles of Islam. Economy in Islam should be able to provide welfare for the whole community, providing a sense of justice, solidarity and kinship and able to provide the widest opportunity for every business (Apipudin, 2015).In response, it would require the financial institution that adheres to Islamic economic system that is able to achieve these goals. One of the financial institutions in question are Islamic banks.

The development of Islamic bank in Indonesia has begun over 15 years ago. The high enthusiasm of the people to use the Islamic bank services causes the founding of many more Islamic banks. Even many conventional banks expand their businesses by opening sharia division.Up to 2015 there have been 12 Public Islamic Banks or Bank Umum Syariah (BUS) founded.The flourishing Islamic Banks makes the competition among Islamic Banks inevitable. The positive impact of this, it motivates banks to race to be the best, while the negative impact is that if they lose the competition, it will hamper the development of the banks themselves (Safitri, 2015).Efforts which can be done by Islamic banks to survive in the high competition among others is to improve their financial performance.

In the research of Wahyudi dan Pawesti (2006) it is explained that the ownership structure can affect the running of the company which in the end takes effect on the company's performance. The same thing is stated by Hastuti (2005) that the financial performance can be affected by ownership structure, that is, whether the ownership is

concentrated or not.Issues regarding ownership structure which affect company performance has been widely studied. Some researchers who conductedconcentrated ownership and company performance among others: Zouari dan Taktak (2014); Arouri, Hossain, Muttakin (2014); Douma, George, and Kabin (2006);Prabowo dan Simpson (2011); Zeitun and Tian (2007).

Zouari dan Taktak (2014) conducted a research about the effect of ownership concentration on Islamic bank financial performance, the result showed that there was no effect of concentrated ownership on the financial performance of Islamic bank.The Islamic bank performance precisely depends on the type of ownership concentration. Government and family owned banks showed positive and significant impacts on the performance of the banks for the research model.However, there is a negative relationship between institutional ownership and bank performance as well as foreign ownership.

The different result was shown by research of Zeitun and Tian (2007). They found a positive effect of ownership concentration on corporate performance as measured by ROA and ROE. They also found a negative effect of government ownership on company's performance. The result was supported by the statement of Kautsar and Fajar (2012) that the corporate performance could be improved by reducing the proportion of government ownership.

Research of Arouri et al (2014), which uses 58 banks in the GCC countries (Gulf Co-Operation Council) during the period of 2010 as a sample in the study also showed different results.The study found that the structure of institutional ownership has a positive effect on company performance.

Different results were indicated by Douma et al (2006) who studied the effect of foreign ownership on corporate performance in India. The study showed positive effect of foreign ownership on firm performance.

Research conducted by Prabowo and Simpson (2011) showed that there was a negative effect on the performance of family ownership of companies in Indonesia. Family ownership is actually detrimental to the performance of the company when the family is involved in management decisions.

Literature review

Financial Performance

According to Mustafa and Handayani (2014) financial performance is a picture of the condition of a company that is analyzed through financial analysis tools that can be used to determine good or poor financial condition of a company which can then describe the performance of a company within a certain period.Ratio analysis is done to conduct an assessment of the financial performance and the potential or ability of a company (Muqorobin dan Nasir, 2009). Fred (in Lahonda, Ilat, Tirayoh, 2014) suggested that financial ratios are often used in measuring the financial performance of companies one of which is a profitability ratio.Profitability is the company's ability to generate profits of several ratios as follows (Faisol, 2007):
a. *Return on Asset* (ROA), is the ratio used to measure the ability of a bank's management in the gain (profit) as a whole.
b. *Return on Equity* (ROE), is the ratio between net income with their own capital.
c. *Net Profit Margin* (NPM), is the ratio of the use of bank profit rate compared to income received from operations.

Agency Theory

Agency theory was first popularized by Jensen and Meckling in 1976.The theory holds that an agency relationship arises when there is one or more persons, called the principal, hires someone else, which is referred to as agent, to perform services and delegate decision-making authority to the agent.Separation of ownership and control in large companies causing problems inalignment of interests between shareholders with management, which leads to agency problems (Jensen and Meckling, 1976). Conflicts of interest may affect the future performance of the company (Setiawan, in Wiranata and Nugrahanti, 2013).The ownership structure is often regarded as an important instrument for corporate governance to resolve conflicts of interest between shareholders and managers (Hu and Izumida, 2008). Further more Hu and Izumida (2008) states that the concentration of ownership has the potential to limit the agency problem, and then it can result in improved performance of the company.

Islamic Bank

According to Regulation No. 21 of 2008 concerning Islamic Banking Article 1, Bank Syariah is a bank running their business based on Sharia principles and based on the type,it consists of Islamic Banks (BUS) and Bank Rakyat Syariah Financing (BPRS).BUS is an Islamic bank whose activities provide services in payment traffic, while the BPRS is an Islamic bank whose activities do not provide services in payment traffic (Act No. 21 of 2008). Under article 2 of Regulation No. 21 In 2008, Islamic banking should be based on Islamic principles, economic democracy, and the principle of prudence. Islamic principles are the principles of Islamic law in banking activities by the fatwa issued by the agency that has the authority in setting the fatwa in the field of Sharia (Regulation No. 21 of 2008).

Company Size

Company size is a value that indicates the size of the company (Butar dan Sudarsi, 2012).The size of the company is divided into three categories: large companies (large firm), medium companies (medium size) and small companies (small firm) (Machfoedz, in Suwito and Herawaty, 2005).Indriani (in Daniati and Suhairi, 2006) explains that the company which has big total asset shows the company has already reached maturity, where cash flows and business prospects are good.

Leverage

Leverageis the ratio between debt and assets which indicates what portion of the assets is used to secure the loan(Butar dan Sudarsi, 2012). Leveragedescribes the company's ability to pay for all long-term and short-term liabilities or if it continues to rise in liquidation (Schipper, in Marwata, 2001). The lower the leverage ratio will increase profits, so the greater the creditors guarantee for repayment of loans given by the company (Fahmi, in Hendri, 2015).

Capital Adequacy Ratio

Capital Adequacy Ratio (CAR)as an indicator of the ability of banks to offset a decline in its assets as a result of bank losses caused by risky assets with its capital adequacy (Margaretha and Zai, 2013).The greater CAR the bank has, the bigger the bank's profits is, or in other words, the smaller the risk of a bank, the greater profits will be obtained by the bank (Kuncoro and Suhardjono, 2002).

Ownership Structure

According to Wu (2003), the ownership structure can be defined as the ratio of shares owned by different shareholders.The ownership structure falls into two forms, namely

concentrated or mixed.The ownership structure is said to be concentrated if a majority of shares are owned by several major shareholders, while the structure of the mixture involves diffusion of ownership among the different shareholders such as governments, businesses, individuals, foreign companies and others (Parveen and Siddique, 2014).Corporate ownership structure in East Asia, including Indonesia, are found tend to be concentrated (Claessens et al, 2000).

Concentration of ownership can improve performance by reducing monitoring costs (Shleifer and Vishny, in Zeitun and Tian, 2007). Ownershipconcentrated by the institutions will facilitate control that will enhance the performance of the company (Hastuti, 2005). Research conducted by the Zeitun and Tian (2007) found a positive effect of ownership concentration on corporate performance as measured using accounting measures ROA and ROE.Similar results were shown by Musnadi (in Yendrawati and Nugroho, 2012) which conducts research on corporate ownership structure as a corporate mechanism govenrnance, and its impact on financial performance.The results showed that the largest concentrated holdings has a positive effect on the company's financial performance.

H$_1$: Concentration of ownership has positive influence on the financial performance of Islamic Banks.

Ownership Types

Thomsen and Pedersen (2000) divides into four different types of ownership, ie the government, institutions, family, and foreigns.

a. Government Ownership

  Government(state) ownership is the shares held directly by the government or by a government agency (Zeitun dan Tian, 2007). Winata (2012) explains that the banking company in Indonesia, the government's stake in the bank whose shares are partly or wholly owned by the government, namely the category of state-owned banks (SOEs) and local government-owned bank (BPD).

b. Institutional Ownership

  Ownership by the institution is the proportion of the company's shares owned by the institution or institutions such as insurance companies, banks, investment companies and other institutional ownership (Tarjo, 2008). According to Veronica and Bachtiar (2005) institutional ownership is ownership of company shares by financial institutions, such as insurance companies, banks, pension funds, and asset management.

c. Family Ownership

  La Porta et al (in Rebecca and Siregar, 2013) defines family ownership as ownership of individual and the ownership of the closed companies (above 5%), which is not a public company, state, or financial institutions.Anderson, Satta, and David (2003) states that the family represents a group of large shareholders who could potentially have a unique incentive structure, great strength of the company, and a strong motive to manage certain companies.

d. Foreign Ownership

  Machmud and Djakman (2008) states that foreign ownership is the ownership of the shares owned by multinational companies. According to Wiranata and Nugrahanti (2013) foreign ownership is a proportion of the company's common stock owned by an individual, corporation, government as well as the status of its parts abroad or individuals, legal entities, governments that do not originate from Indonesia.

Thomsen and Pedersen (2000) states that the effect of the concentration of ownership varies by type of ownershipconcentration, specifically the type of government ownership, foreigners, families, and institutions.Research conducted by Zori and Taktak

(2014) and Zeitun and Tian (2007) found that each type of ownership had a different effect on the bank's financial performance.

H₂ : Type of ownership affects the financial performance of Islamic Banks.

According to Kauthar and Fajar (2012) a reduction in the proportion of state ownership can improve the performance of the company.The statement was supported by Zeitun and Tian (2007) who found a negative influence on the financial performance of government ownership.That's because the government's focus is more on social benefits rather than on profit.

H₂ₐ : Government ownership negatively affects the financial performance of Islamic Banks.

Institutional shareholders are more profit oriented and may have more incentive to monitor the company (Zeitun and Tian, 2007).Results of research conducted by Arouri et al (2014) proved that institusioanl ownership had a positive effect on company performance.

H₂ᵦ : Institutional ownership have a positive influence on the financial performance of Islamic Banks.

Family relationships can improve supervision, which in turn will generate better corporate performance (Arouri et al, 2014).Zouari and Taktak study (2014) showed that family ownership had a positive impact on the performance of banks.

H₂c : Family ownership has positive influence on the financial performance of Islamic Banks.

The increasing number of foreigners who invest their shares in the company will increase the performance of these companies, for foreigners who have invested their shares have the management systems, technology and innovation, expertise and good marketing can bring a positive influence for the company (Wiranata and Nugrahanti, 2013).The results of the study Douma et al (2006) showed that foreign ownership has positive effect on financial performance.

H₂d : Foreign ownership has a positive influence on the financial performance of Islamic Banks.

Research methods

The population used for this study are all Islamic Banks listed on the Financial Services Authority (FSA) in 2009-2014.Selection of the samples for research is done using purposive sampling technique.Purposive sampling technique sampling methods tailored to the specific criteria (Sekaran and Bougie, 2010).The criteria used in determining the sample is as follows:

Islamic Banks listed on the Financial Services Authority 2009-2014.

1. Islamic Banks which published its annual report in the range 2009-2014.
2. Islamic Banks that did not experience a loss in the period.

The data used in this research is secondary data, in the form of annual reports of Islamic Banks, published in the official website of each bank.In addition, the official website of the Financial Services Authority (FSA) is also used to determine Islamic Banks which were registered during 2009-2014.

Operational Definition and Measurement of Variables

1. Financial Performance

With reference to research conducted by Taktak and Zouari (2014), the measurement of financial performance is proxied by two indicators of the bank's financial performance, the ROA and ROE.

1. *Return on Asset* (ROA)

ROA is the ratio of earnings before interest and taxes (EBIT) to total assets of the company, calculated using the following formula (Safitri, 2015):

$$\text{ROA} = \frac{\text{Profit before tax}}{\text{average total asset}} \times 100\%$$

2. *Return on Equity* (ROE)

ROE is a profitability ratio that indicates the ratio between profit with bank capital, this ratio shows the percentage rate that can be generated (Riyadi, in Thamrin, wiyati, Oemar, 2015).ROE is calculated using the formula :

$$\text{ROE} = \frac{\text{profit after tax}}{\text{average equity}} \times 100\%$$

2. Ownership Concentration

Measurement of concentration of ownership followed Zouari and Taktak (2014) in their study, namely:

1. C1, the percentage of shares owned by the largest shareholder.
2. C3, the percentage of shares owned by the three largest shareholders

3. Ownership Type

Measurement of ownership types is described by using dummy variables. To categorize the largest shareholder (controlling owner), four dummy variables are used,like in the research conducted by Taktak and Zouari (2014).

1. GOV,given the value of 1 if the largest shareholder is the government, and 0 otherwise.
2. INST, given the value of 1 if the largest shareholders were financial institutioninvestors, and 0 otherwise.
3. FAM,given the value of 1 if the largest shareholder is familyinvestor and 0 otherwise.
4. FORG, given the value of 1 if there are foreign shareholders, although not the majority, and 0 otherwise.

4. Company Size

This study uses the size of the company according to Crutchley and Hansen (in Nuringsih, 2005) by using the natural log of total assets.

$$\text{Size} = \text{Ln (Total Asset)}$$

5. *Leverage*

Leverage indicates what portion of the assets used to secure the loan, obtained from the ratio between debt and assets (Butar and Sudarsi, 2012).

$$\text{Leverage} = \frac{\text{total liabilities}}{\text{total assets}}$$

6. *Capital Adequacy Ratio* (*CAR*)

CAR is the ratio of the amount of capital and the amount Weighted Assets Ratio (RWA) are formulated with (Safitri, 2015):

$$CAR = \frac{BANK\ CAPITAL}{TOTAL\ RWA} \times 100\%$$

Hypothesis testing

Hypothesis testing is done by using multiple regression analysis. Multiple regression equation to test the hypothesis in this study are:

$$ROA = \alpha + \beta_1 C1 + \beta_2 C3 + \beta_3 GOV + \beta_4 INST + \beta_5 FAM + \beta_6 FORG + \beta_7 SIZE + \beta_8 LEV + \beta_9 CAR + \varepsilon$$

$$ROE = \alpha + \beta_1 C1 + \beta_2 C3 + \beta_3 GOV + \beta_4 INST + \beta_5 FAM + \beta_6 FORG + \beta_7 SIZE + \beta_8 LEV + \beta_9 CAR + \varepsilon$$

Information:

ROA   = *Return on Asset*
ROE   = *Return on Equity*
C1   = Largest Number of Shareholders
C3   = Number of Three Largest Shareholder
GOV   = Government ownership
INST   = Institutional ownership
FAM   = Family Ownership
FORG   = Foreign Ownership
SIZE   = Company Size
LEV   = *Leverage*

Data analysis and discussion

Data Description

The population used in this study are all Islamic Banks (BUS) registered with the Financial Services Authority (FSA) in 2009-2014.The sample selection for the study is based on predetermined criteria in the previous chapter.Based on these criteria, there are as many as 56 BUS during 2009-2014 were selected as the study sample.

Descriptive statistics

Based on Table in the attachment, the financial performance as measured by ROA has the lowest value of 0.08 with the highest value is 5.49.BUS which has the lowest ROA is BRI Syariah in 2014, while BUS with the highest ROA is Victoria Islamic Bank in 2011.The average value of ROA at 1.402 with a standard deviation of 1.124.Measurement of performance through ROE has the lowest value of 0.39, which is experienced by BRI Syariah 2014. The highest ROE owned by Bank Syariah Mega Indonesia in 2012 is 35.01.The average value of ROE amounted to 8.525 and the value of the standard deviation is equal to 7.457.

The average value for C1 is 43.044 with a standard deviation of 14.793. BUS which has the highest score largest shareholder is Bank Syariah Mandiri in 2009 amounted to 66.76% ,while the lowest value of 22.17% owned by BCA Syariah in 2010.C3 has an average value of 65.951 and 18.458 standard deviation value. Bank Syariah Bukopin in 2012 had a value of the three largest shareholders other than the most minor, ie 42.01%.For the highest number three largest shareholders is owned by BRI Syariah in 2011 amounted to 98.95%.

GOV average value of 0.3750 means that the BUS is 37.5% owned by the government.GOV standard deviation is 0.48850. Variable INST has the highest average value compared to other dummy variables, namely 0.4286, means BUS 42.86% is owned by institutions, with a standard deviation value of 0.49935.Furthermore, to the variable FAM has an average value of 0.1964 means BUS 19.64% is owned by the family. FAM standard deviation value of 0.40089.Recently, variable FORG has an average value of 0.6786 means that 67.86% BUS in Indonesia are foreign investors in the composition of its shareholders. Standard deviation value for FORG is 0.471. From these results it can be seen that the majority of BUS in Indonesia are owned by the institution.

This study uses three control variables, namely size, leverage, and CAR. The size of the company is measured by the total assets of the bank has an average value of Rp 13,657,371,450,000.00 while the standard deviation value is Rp 18,139,659,430,000.00.BUS which has the biggest size is Bank Syariah Mandiri in 2014 with total assets of USD 66,942,422,000,000.00. Victoria Islamic Bank in the year 2011 is the smallest BUS with total assets of Rp 642,026,000,000.00.The lowest value for leverage was 2.78, which is owned by Bank Panin Syariah in 2011. For a record high of 41.19 was held by Bank Syariah Bukopin in 2009. The average value of leverage is 19.0972 with the standard deviation value of 7.56544. Last control variables, CAR had an average value of 23.7041 and a standard deviation value of 16.63916.Bank Syariah Mandiri in 2010 had the lowest value of CAR of 10.6. Highest valueCAR of 76.39 was held by BCA Syariah in the same year.

Classic assumption test

Normality test

In Table 3 and Table 4 in the appendix shows that the two values Asymp. Sig. more than 0.05. The results show that the data are normally distributed, both for ROA and ROE.

Multicollinearity test

According to Table 5 and Table 6 in the appendix, all the variables have the tolerance value above 0.10 and VIF not more than 10 so that all of the variables used in the regression model do not contain multicollinearity.

Heteroskidastity test

Figure 1 and Figure 2 in the appendix show that the dots randomly and evenly spread above and below the number 0 on the Y axis and do not form a particular pattern. This indicates that the data did not experience heteroscedasticity.

Autocollinearity test

According to Table 7 and Table 8, it can be seen that both the value Asymp. Sig. is more than 0.05. The results showed that the regression model is free from autocorrelation.

Hypothesis testing

Table 9 and Table 10 shows the results of hypothesis testing with multiple linear regression analysis in nine different models. All models is a summary or the final result of the model one to eight. Thus, the model for one to eight is the explanation of all models. Based on the table above, the regression equation can be written in this study as follows:

ROA = - 0,029 + 0,047C1 + 0,004C3 - 1,173GOV + 1,454INST + 1,173FAM + 0,399FORG - 0,149SIZE – 0,009LEV + 0,022CAR

ROE = -27,204 + 0,317C1 + 0,081C3 - 9,218GOV + 9,050INST + 9,218FAM - 2,765 + 1,124SIZE – 0,153LEV – 0,076CAR

Coefficient of DeterminationTest

In all models in Table 9 it is stated adjusted R Square of 0.335. It shows that 33.5% of financial performance variables proxied by the ROA can be explained by the six variables that exist (C1, C3, GOV, INST, FAM, and FORG). While the balance of 66.5% is explained by

other variables that are outside the regression model.For Table 4.10, adjusted R Square value is stated at 0.334. It shows that 33.4% of financial performance variables that proxy with ROE can be explained by the six variables that exist (C1, C3, GOV, INST, FAM, and FORG). While the balance of 66.6% is explained by other variables that are outside the regression model.

Significant Simultaneous Test (Test F)

Simultaneous Significant test results in Table 9 is expressed by F value of 4.460 with a significance value is below the 0.01 confidence level. Based on these results it can be concluded that the regression model used in the study is fit and it can be said that the concentration of ownership (C1 and C3) and the type of ownership (GOV, INST, FAM, FORG) jointly have a significant impact on the financial performance proxied by ROA.For Table 10, simultaneous significant test results isexpressed by F value of 4.460 with a significance value below the 0.01 confidence level. Based on these results it can be concluded that the regression model used in the study is fit and it can be said that the concentration of ownership (C1 and C3) and the type of ownership (GOV, INST, FAM, forg) jointly have a significant impact on the financial performance proxied by ROE.

1. Partial Significant test (t test)
1. Hypotesis 1

   The hypothesis 1 states that the concentration of ownership has a positive effect on the financial performance of Islamic Banks. According to Table 9, the variable C1 has a regression coefficient of 0.047 with a significance value below 0.01.

2. For Table 10, variable C1 has a regression coefficient of 0.317 with a significance value below 0.01. From the two results we can conclude that the hypothesis (H1) is supported. Although variable C3 on both tables have a significance value above 0.05, the concentration of ownership has been fairly represented by the variable C1 so that H1 can be supported.

3. Hypotesis 2a

   Hypothesis two a states that government ownership has a negative effect on the financial performance of Islamic Banks. According to Table 4.9, GOV variable has a regression coefficient of -1.173 with a significance value below 0.05. For Table 10, GOV variable has a regression coefficient of -9.218 with a significance value below 0.05. From both results it can be concluded that the hypothesis of 2a (H2a) is supported.

4. Hypotesis 2b

   Hypothesis two b states that institutional ownership has positive influence on the financial performance of Islamic Banks. According to Table 9, variable INST has a regression coefficient of 1.454 with a significance value below 0.01. For Table 10, variable INST has a regression coefficient of 9.050 with a significance value below 0.01. From both results it can be concluded that the hypothesis of 2b (H2b) is supported.

5. Hypotesis 2c

   Hypothesis two c states that family ownership has positive influence on the financial performance of Islamic Banks. According to Table 9, variable FAM has a regression coefficient of 1.173 with a significance value below 0.05. For Table 4.10, variable FAM has a regression coefficient of 9.218 with a significance value below 0.05. From both results it can be concluded that the hypothesis of 2c (H2C) is supported.

6. Hypotesis 2d

   Hypothesis two d states that foreign ownership has positive influence on the financial performance of Islamic Banks. According to Table 9, FORG variable has a regression coefficient of 0.399 with a significance value above 0.05. For Table 10, FORG variable has a regression coefficient of -2.765 with a significance value above 0.05. From both results it can be concluded that the hypothesis of two d (H2d) is not supported.

Discussion

Effect of Ownership Concentration against Islamic Banks Financial Performance

Based on the results of hypothesis testing showed that the significant value for the variable C1, both the ROA and ROE, is under 0.01, but the significance value for the variable C3 is above 0.05. The results reveal that the concentration of ownership (especially C1) has positive effect on the financial performance of Islamic Banks. This finding is consistent with the results of Zeitun and Tian (2007) who found a positive effect of the concentration of ownership of the company's financial performance. According to Shleifer and Vishny (in Zeitun and Tian, 2007) concentrated ownership can improve performance by lowering the cost of monitoring and provide better management control. So, the more concentratedthe ownership of a bank, the better the performance will be.

The effect of OwnershipTypeon Financial Performance of Islamic Banks

Based on the results of hypothesis testing showed that significant value to a variable type of GOV, INST, and FAM ownership are under 0.05. The results reveals that a type of ownership has an influence on the financial performance of Islamic Banks.

Effect of Government Ownership type against Islamic Banks Financial Performance

Based on the results of hypothesis testing showed that the value of the variable GOV significance for both the ROA and ROE, was under 0.05. GOV has a regression coefficient -of -1.173 on the ROA and -9.218 on the ROE. The results reveals that the type of government ownership has a negative influence on the financial performance of Islamic Banks. These findings concur with those of Zeitun and Tian (2007) who found a negative influence on the financial performance of government ownership. These results are reinforced by the statement Kauthar and Fajar (2012) which states that a reduction in the proportion of state ownership can improve the performance of the company. Marciano (2008) stated that the government corporation controlled by bureaucrats have goals that are based on political interests and not for the welfare of society and the company itself. The government or the bureaucrats have an interest in social and political, rather than think of to improve the performance of the company (Shen and Lin, 2009). Therefore, the performance of the bank owned by the government tend to be lower than that of the bank which is not a government ownership.

Effect of Ownership Type of Financial Institutions on the Performance of the Islamic Banks

Based on the results of hypothesis testing showed that the value of the variable INST significance for both the ROA and ROE, was under 0.01. INST has a regression coefficient 1.454 in ROA and9.050 in ROE. The results reveals that a type of ownership institusioanl have a positive influence on the financial performance of Islamic Banks. These findings concur with those of Arouri et al (2014) who found that institutional ownership positively affects financial performance. That's because institutional shareholders are more profit oriented (Zeitun and Tian, 2007). Hastuti (2005) states that the ownership which is concentrated by the institutions will facilitate control that will increase the company's performance.

Effect of Family Ownership type against Islamic Banks Financial Performance

Based on the results of hypothesis testing showed that the significant value for the variable FAM, both the ROA and ROE, was under 0.05. FAM has a regression coefficient 9.218 on ROA and 1.173 on the ROE. The results reveals that the type of family ownership has a positive influence on the financial performance of Islamic Banks. These findings concur with those of Arouri et al (2014) as well as Zouari and Taktak (2014) who found a positive influence on the financial performance of family ownership. According Arouri et al (2014), family relations can improve supervision, which in turn will generate better corporate performance.On the other hand, these results do not correspond with the research Prabowo

and Simpson (2011) who found that family ownership negatively affect the company's performance.

Effects of Foreign Ownership type against Islamic Banks Financial Performance

Based on the results of hypothesis testing showed that the value of the variable FORG significance for both the ROA and ROE, was above 0.05. Of the nine existing models in each performance measurement, FORG significant only in one model, the modeltwoon the ROA and modelthree on ROE. The results reveals that foreign ownership does not affect the financial performance of Islamic Banks.This finding is consistent with research of Zeitun and Tian (2007)which found no effect of foreign ownership on the company's performance. These results could be due to foreign owners have not been able to encourage the adoption of good corporate governence and strict supervision of all activities of the company.Besides, the foreign investors merely voicing their interests only, and have not been able to be a good influence in operational terms (Atmaja and Wibowo, 2015).

Conclusion

This study aims to determine the effect of ownership structure proxied by the concentration of ownership and the type of ownership of the financial performance of Islamic Banks.Measurement of concentration of ownership using a number of the largest shareholders (C1) and the three largest shareholders (C3), while the type of ownership is measured by four dummy variables, namely: government ownership (GOV), institutional ownership (INST), family ownership (FAM) and foreign ownership (FORG).Financial performance is measured by ROA and ROE. In addition, this study uses three variables: firm size, leverage, and CAR.

Based on the results of multiple linear regression analysis that has been done, it can be concluded that the first, variable concentrations of ownership (C1) has positive effect on financial performance BUS. In other words, the more concentratedthe ownership of a bank, it will bring a good impact on the performance of the bank, meaning that the bank's performance will be better.That's because the concentrated ownership provides better management oversight so as to improve performance.

Second, government ownership variables (GOV) negatively affect the financial performance of BUS. That is, banks whose shares are largely owned by the government,their performance tends to be lower compared with the bank whosegovernment ownership proportion is small.That's because the government has a purpose that is based on social and political interests rather than thinking to improve company performance.

Third, institutional ownership variable (INST) has positive effect on financial performance of BUS. Unlike the government, institutional shareholders are more profit oriented. Therefore, the more the proportion of institusioanl ownership in a bank then the better the performance of the bank is.

Third, family ownership variables (FAM) have positive influence on the financial performance of BUS. Family shareholders usually has enormous power over the company. It can improve the control so that later can produce a better performance of the company.

Fourth, foreign ownership variable (FORG) has no effect on the financial performance of BUS. In other words, whether or not there are foreign shareholders in a bank,it will not give any influence on the performance of the bank.

Limitation

Some of the limitations that can be found in this study are as follows:
1. This study uses only Islamic Banks as the object so that the number of samples used is fairly limited, it is because the number of Islamic Banks in Indonesia is still limited.
2. Measurement of variables government ownership, institutional ownership, family ownership and foreign ownership in this research is simply by using dummy variables

that the influence of the type of ownership and financial performance less than the maximum.

As for suggestions that may be submitted for further consideration for subsequent research are as follows:

1. For their next study, it is suggested to take the object of research not only Islamic Banks, but also coupled with other Islamic financial institutions, such as Sharia Business Unit.
2. Measurement of variables government ownership, institutional ownership, family ownership and foreign ownership is suggested using the percentage of ownership so that the influence of the type of ownership and financial performance can be known to the fullest.

BUSINESS STRATEGY FORMULATION FOR HOTEL TAMAN MANGKUBUMI INDAH TASIKMALAYA

Muhamad Bilawa Putra, School of Business and Management Institut Teknologi Bandung, Indonesia
Bilawa.Putra@sbm-itb.ac.id

Abstract

Hotel Taman Mangkubumi Indah is a company that has been established since 1978. Theoretical approach taken to solve business issues is to use industry external porter 5 force, pest analysis, analysis of competitors, and internal exploration capability (capabilities), resources (resources), the value (value), the ability of the core (core competencies), value chain analysis and business modeling canvas from internal sources. Then collected SWOT approach.

The process begins with the search for solutions TOWS analysis. Then strengthened with internal-external evaluation matrix with the corporate directional strategy, then business strategy is differentiation and functional strategy in the field of marketing, operational, human resource development, financial and on the field of information technology. Then the solution shown on business canvas model.

The implementation section, included the cost and financial projection, timeline for 4 years until 2019. To achieve the projected targets the management given a balance scorecard from the consumer perspective, internal business learning and growth and financial perspective.

Introduction

Hotel Taman Mangkubumi Indah (HTMI) is located in Tasikmalaya, West Java. It is established in 1978. At that time, HTMI is the first Tasikmalaya's resort hotel and own the Olympic size swimming pool with natural spring water resource as well. The area including the recreational site are up to 10 hectare. At the earlier day, the main segment of HTMI is leisure tourism especially international tourist who usually have a road trip from Jakarta to Yogyakarta and spend a night in HTMI. This segment is potential because of its location within Garut – Tasikmalaya road which offers beautiful scenery of rice field. In addition, it is located in the same road which passes Kampung Naga, a traditional and cultural village tourism destination. HTMI also targets the nearby tourists, who seek for vacation such as culinary enjoyment, karaoke or simply a natural resort enjoyment. Regular tourist is characterized by number of room they rent, short term stay and the meal preference outside the hotel. While MICE customer is characterized by the number of person, preference to buy catering package 3 to 5 times a day, preference in renting convention hall, and the length of stay in a long period.

	2008	2009	2010	2011	2012	2013	2014	2015
INDONESIA	49.73	48. 78	50.61	52.80	53.08	52.69	51.73	53.00
WEST JAVA	41.08	45.84	49.26	49.08	49.68	45.99	46.60	48.94
Figure 2 Occupancy rate of Hotel Taman Mangkubumi Indah

The main MICE customers are government agencies who annually conduct a training or meeting for a long time. The agency comes from local Tasikmalaya government or several divisions of the West Java Provincial Government. Because this occasion is considered as government related project, a tender procedure must be conducted. Winning this tender during this phase is very crucial to ensure they pick HTMI service to conduct event. Luckily, HTMI have cost advantage and its location is not in the centre of the city. Thus, the price offered is considerably lower than its rival. In addition, HTMI offers joyful resort atmosphere and adequate meeting hall for training. HTMI keeps targeting this segment for more than 10 years. This targeting has proved to be profitable, especially in Tasikmalaya's tourism circumstance. By 2011, HTMI built new hall to increase its capacity and thus increase the number of training class rooms within the new hall. More over HTMI have SPJP (Surat Pertanggung Jawaban ke Pemerintahan) that ensure the administration for government internal audit is clear and wont be problem on upcoming year. This license is rare and only few hotel in the City of Tasikmalaya own it.

Customer segment in hospitality industry is divided into 4 segments:
1. Traveler Segment: this is the customer who have a road trip and need a place to take a break and rest during the trip.
2. Tourist Segment: this is the customer who search for entertainment and leisure the City of Tasikmalaya and nearby city. They are on vacation and look for a place to spend the night or to rest. This segment also looks for entertainment within the hotel environment itself.
3. Business Segment: this is the customer who is on business trip, usually need resting place, and a meeting place.
4. Special interest: this segment come to Tasikmalaya for special need, such as seeking healthcare, visiting their relative, visiting their child on nearby boarding school / *pesantren.*
5. Meeting Incentive Convention and Exhibition segment: this segment rents a convention hall to conduct an event or big event. The rent period can be short term (hourly) or long term (monthly).
HTMI have run its business since 1978. Now, HTMI faces some challenges to sustain their business. There are 5 businesses issues in HTMI that need to be resolved Declining Net Income in the past 5 years. Declining of HTMI occupancy rate, HTMI is too

dependent to MICE customer segment, New and existing competitors in the same industry and Old building and facility and a least optimal asset utilization

Business Exploration

Conceptual Framework is an analytical tool to organize the ideas to solve the problem encountered in the company. The conceptual framework of Hotel Taman Mangkubumi Indah Strategy formulation is described as follows

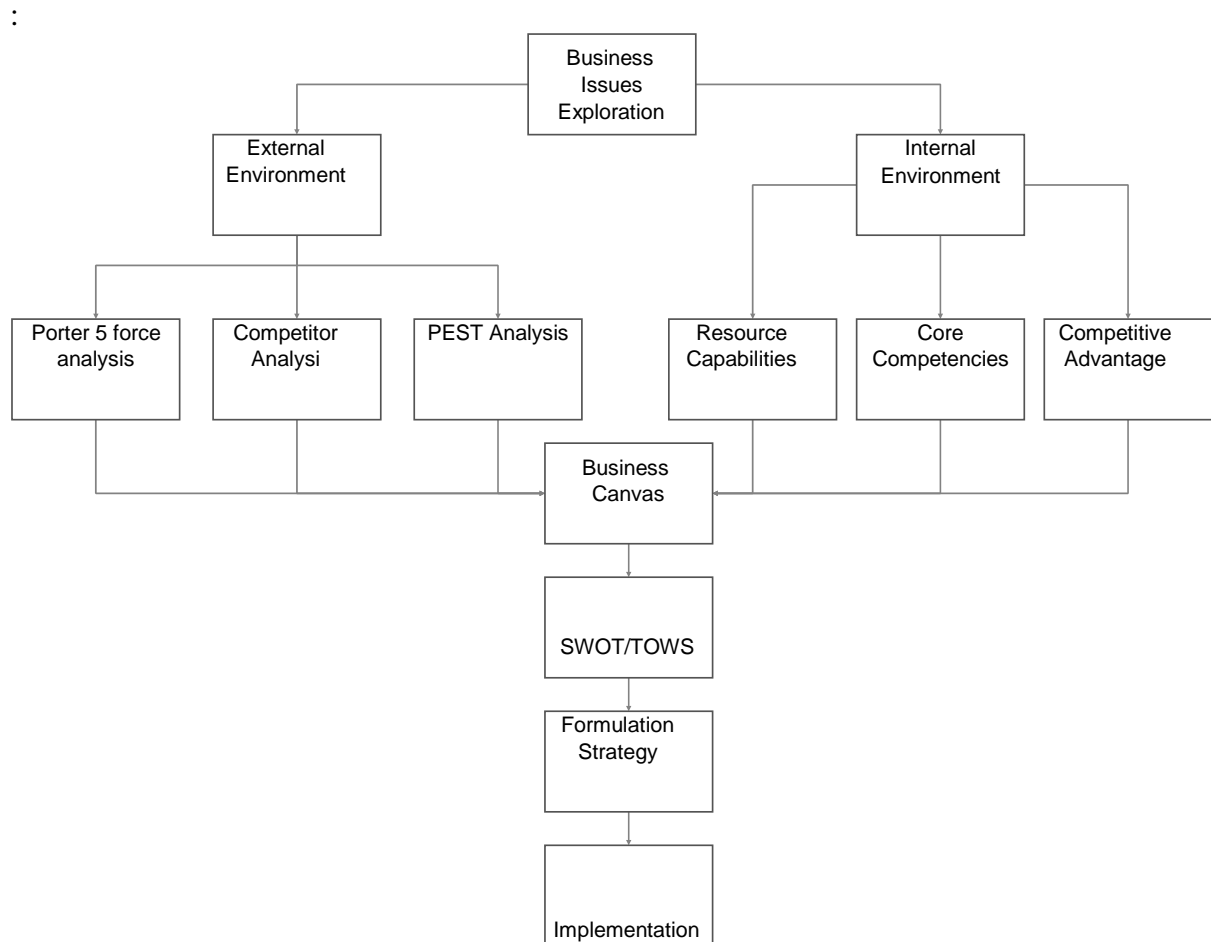
:


Figure 3 Conceptual Frame Work

The business explorations are started by finding the external environment issues using, porter 5 forces, competitor analysis, and Political, Economic, Social and Technology analysis. Then the internal business issues are found by analysing the core competencies, resource capabilities, and competitive advantage. After the External and Internal Analysis have completed, then the findings are implemented into business canvas model to show the overview of business process.

The formulation strategy of chapter 3 begins from SWOT and TOWS, then followed by formulation of the strategy using corporate strategy, Functional Strategy and Business Strategy analysis and the implementation plan begin in chapter 4.

External Environment

The External Environment view objective is to find the current condition of the industry. Therefore, Porter 5 Forces, PEST Analysis and Competitor analysis are used.

Industry Analysis

Using the Porter 5 Forces, (Hitt, 2011) this step analyses the five aspects of the Hotel industry in Tasikmalaya. Those aspects are Threat of Substitutes, Threat of New Entrants, Bargaining Power from Suppliers, Bargaining power of Buyer and Industry Rival.

1. **Threat of Substitutes** In Hotel Industry in Tasikmalaya, the substitutes for Hotel with 2-star rank are Losmen/Motel, Hostel, "Melati" grade hotel and 1-star hotel. Those are cheaper alternatives but with lower quality compared to 2-star hotel. The 3-star hotels are the direct substitutes that threaten 2-star hotel. Although they are more expensive, these hotels offer better service quality and capability.

   Threat of new entrants or barrier to entry for new entrant need to overcome few factor. Incumbent and Large chain hotel may have economic of scale advantage that need to overcome by new entrants, product differentiation such as location, facility target segment that hard to replicated. The capital needed to build hotel facility and its license also high, especially for high-end hotel. The real switching cost is cost for looking new hotel, extra cost for transportation if necessary and loss of loyalty program. The access to distribution channel often controlled by incumbent, yet many online channel offer easier access for new comer. Government have power to control the new hotel license, yet until 2016 in the city of Tasikmalaya still no moratorium for opening hotel.

2. **Industry Rivalry** means the intensity of competition among the competitors in the industry. The competitor in 2 star and above hotel is unbalance, newer or recently renovated incumbent hotel dominated the market. Incumbent with strategic location can still gain market share. Hotel industry in the City of Tasikmalaya is growing, yet the tourism industry growth slower. The accomondation demands are come from business, traveler and special interest especially from nearby city that doesn't have good hotel. The ideal occupancy rate for a hotel is higher than 60%. Each rival with 2 star and above, differentiate from its facility, price, service and location. The lower segment hotel have weaker differentiation. Higher grade hotel cannot lower their price to the lower segment hotel, to protect the competition, yet unofficial deal may still happen especially on mice segment. The exit barrier come from its high capital to build and its license, its cost for terminate employee, high quality hotel industry may attract business man to choose the city as based operational. Without it, may reduce the city business activity. Hotel with large chain or operate on other industry may fear the termination will impact its other business. Government may not interference on bankruptcy because hotel industry not a labor intensive industry.

3. **Bargaining power of suppliers** Hotel industry suppliers are: Food ingredient supplier mainly from local market, the seller is plenty and have low bargaining power. The supplier is less concentrated than the Hotel industry. Hotel can easily switch to other supplier. Hotel appliances such as soap, shampoo, toothpaste, etc. the supplier are also plenty. Every year they propose their product, so hotel can pick the best offer. The sole supplier for Water is supplied by PT PDAM, Electricity by PT PLN and communication and internet by PT Telkom, there is still no substitute for this commodity.

4. Bargaining power of Buyers the bargaining power of buyer is medium to high. MICE segment has high bargaining position since they are booked on large volume. Regular customer has low bargaining power, yet from the increase use of internet, they can become opinion leader spreading positive or negative reputation towards the business. They also can switch to competitor easily

Competitor Analysis

In 2015, there are 2197 hotels in Indonesia. West Java has the biggest number of hotel in Indonesia that are 283 hotels, followed by Bali with 281 hotels available.

The average growth of West Java Hotel Industry is 9.46%. In 2009, there are 165 hotels and grown to 283 hotels in 2015. West Java is the third largest tourism industry in Indonesia, just below DKI Jakarta and Bali. The Hotel industry is a complement industry for tourism. Therefore, the market in West Java is very huge.
Figure 4 Hotel industry in Tasikmalaya

Hotel Taman Mangkubumi Indah is classified as two-star hotel. HTMI's direct competitors are those with 1 to 3-star hotels, which have roughly same room, facility and similar target segment. Yet none of the competitor can classified themselves as resort hotel as HTMI. The competitor are : The Santika Hotel, Mahkota Graha Hotel, Harmoni Hotel, Ramayana Hotel

Political, Economic, Social, and Technology analysis

PEST Analysis is used to describe the four aspects of external environment. Those aspects can directly or indirectly affect Hotel Industry.

1. Political condition is important for business, in 2014 was the period of presidential election in Indonesia. This situation brought uncertainty for business regulation and safety affecting tourism and investment. Government institution also had to reduce their activity affecting hotel industry occupancy. At the end of 2014, Surat Edaran (SE) Nomor 10/2011 and SE Nomor 13/2014 tentang Gerakan Hidup Sederhana by Mentri Pendayagunaan Aparatur Negara dan Reformasi Birokrasi Yuddy Chrisnandi commanded government institution to skimp and forbid a meeting in private hotel. This regulation hit the MICE segment of hotel industry followed by major protest held by hotel association

2. Economical Indonesian macro-economic conditions have major role to the customer spending behavior. US dollar to Rupiah enhanced rates, Bank Indonesia Rate and Indonesian Economic Growth rate Since 2012 Indonesian rupiah value to US$ has decreased from below Rp 10.000 to over Rp14.000 at its peak in 2015. This number was the weakest value since Indonesia national crisis in 1998. Fortunately, starting from the end of 2015 to 2016, the Rupiah grew stronger and reached just over Rp 13.100. This should positively affects the customer spending decision.

3. Social Demographic Indonesia consists of 237.641.326 people which then considered as the fourth highest population in the World. 3.5% of the earth population is Indonesian

4. Technology As the information technology rise, nowadays customer can find and book hotel in the other region right only using their fingertip. They can read the hotel description, location, facility, price, booked and review through website or social media. They can compare few destination hotels to decide which one is the best to choose. This

technology brings huge benefit to the customer in deciding their hotel preferences. They also can deliver complement or complain in the review board available in the websites or social media.

1.2   Internal Environment Analysis

The internal analysis explores the resources, capabilities and core competencies of Hotel Taman Mangkubumi Indah. Resources and capabilities are not inherently valuable, but they create value when the firm can use them to perform certain activities resulting in competitive advantage. Resources are bundled to create organizational capabilities. In turn, capabilities are the source of a firm's core competencies, which are the basis of competitive advantages
Figure 5 Net income of Hotel Taman Mangkubumi Indah

The net income is Rp 442.386.670 then decreasing to minus (231.055.662) at 2012 due building of a new class room. At that time the revenue still stable at Rp 2.878.581.593. At the end 2014 *Surat Edaran* (SE) Nomor 10/2011 and SE Nomor 13/2014 about *Gerakan Hidup Sederhana* by *Mentri Pendayagunaan Aparatur Negara dan Reformasi Birokrasi* Yuddy Chrisnandi, that forbid government instution to conduct an event in hotel decrease the revenue of HTMI to Rp 2.250.374.650 and the net income to the lowest point at minus Rp 296.103.979. In the early 2015 the regulation have been repealed yet most institution already exclude conduct an event in hotel on their yearly spending plan.
Figure 6 Occupancy Rate of Hotel Taman Mangkubumi Indah Tasikmalaya

In the case of Hotel Taman Mangkubumi Indah Tasikmalaya (HTMI), generally, its occupancy rate is declining along 2012 until 2015. Compared to 2013 in the same month, the rate in September 2014 has shown a declining rate and getting worse in November when government decided to forbid government conducting an event in hotel. Even the law has been repealed though most institution already created a 2015 spending budget plan which exclude holding events in hotel. Therefore, the effect felt through 2015 which become lowest occupancy in the last 4 years.

Table 1 SWOT analysis

Strengths	Weakness
Have a total of 10 Hectares and only 30% area has been developed One of the oldest incumbent since 1978 Have 35 room, 4 classrooms and 1 convention room Have 5 Swimming pool Natural Environment as the main differentiation to rival Fresh water spring Located on the main road between City of Tasikmalaya to the Capital of Kabupaten Tasikmalaya, Singaparna Hotel Taman Mangkubumi Indah has SPJP (Surat pertanggung Jawaban kePemerintahan) to ensure safe transaction with government institution	Old Building and facility Weak supervising and control to the employee Lack of innovation and ability to generate idea Far from city center and commercial area Low utilization of modern technology Low Marketing effort for walk-in, tourist or regular guest. Out of total 10actre of area, less than 10% is a rent to PT KAI Decline of financial performance
Opportunities	**Threats**
West Java is number three of the highest tourist destination in Indonesia after DKI Jakarta and Bali. There is no big hotel on Neighbor city such as Singaparna, Ciamis, Banjar	Many big chain hotel entering Tasikmalaya hotel industry. Several incumbents renovated their facility. Higher grade hotel 3 star and higher lower their price to 2-star hotel territory to increase their occupancy.
Tasikmalaya remains the center of business activity on east priangan, make it have high potential market Highway that connect Tasikmalaya and Bandung targeted to be done on 2020, it is predicted will increase the economic, business and tourism in Tasikmalaya Transportation, and Dry port industry in Tasikmalaya growth exponentially. High traffic on jalan Tasikmalaya - Singaparna City of Tasikmalaya hotel occupancy in average is higher than 80% per month, dominated on MICE and business segment.	West Java has the most hotel with star rank in Indonesia. Bali is close second

SWOT analysis is the overall evaluation of a company's strengths, weaknesses, opportunities, and threats. SWOT analysis can identify not only an organization's distinctive competencies

from particular capabilities and resources possessed by the organization but also the superior way to identify the opportunities that an organization is not currently able to take advantage due to lack of appropriate resources.

Business Solution

Based on the Internal and External environment, the directional strategies are created. The tool used for the analyze is an internal-external matrix. This matrix is based on two dimensions, the IFE (internal Factor Evaluation) for the X - Axis and EFE (External Factor Evaluation for the Y-Axis. IFE and EFE factor will be counted as weight and rating. The weight column filled with a score from 0.0 to
1.0 (most important) based on a factor that impacts the Hotel Taman Mangkubumi Indah. The weight determined by AHP (analytical Hierarchy Process) to aid in complex decision making to set a correct priority and consistency on decision maker evaluation.

Table 2 Internal Factor Evaluation

	Internal Factor	Weight	Rating	Weighted Score
Strengths

4	West java has the most hotel with star rank in Indonesia. Bali is close second	0.084	2	0.168
Total		**1**		**2.035**

Hotel Taman Mangkubumi indah currently have 2.511 IFE score and 2.035 on EFE score. Therefore the company IE Matrix position is on cell V. The best Directional strategy is to hold and maintain by using market penetration and product development.
Figure 7 IE matrix

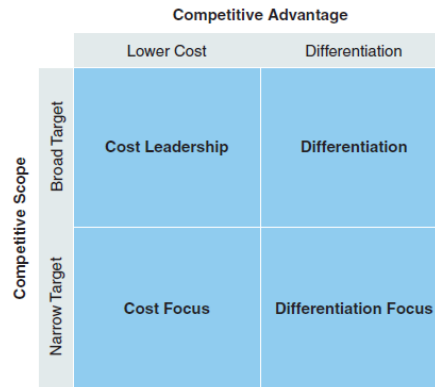
Hotel Taman Mangkubumi Indah can provide a unique and superior value to the customer using **differentiation strategy**. Natural environment and Recreational Park are the main weapons of Hotel Taman Mangkubumi Indah. Then HTMI must position themselves as a resort hotel to boost its unique differentiation. Resort Hotel term, mean that the hotel can provide an array of amenities and typically includes entertainment and recreational activities. This is can serve as a barrier to entry since it's hard to imitate by competitor because of the limited natural land in Tasikmalaya


Figure 8 Porters Generic Competitive Strategie

Functional Strategy

Functional Strategy is the approach a functional area takes to achieve corporate and business unit objectives and strategies by maximizing resource productivity. It is concerned with developing and nurturing a distinctive competence to provide a company or business unit with a competitive advantage

- **Marketing Strategy** Create dedicate marketing division, New STP target Traveler, Tourist, Business and special interest segment as well as retain mice segment, new Marketing Mix 7p of Hotel Taman Mangkubumi Indah, utilize modern channel such online booking and advertising.

- **Financial Strategy** Modernization of financial reporting document, converting an asset to correct value and providing tools for invoice reporting and finance reporting, hire an independent auditor to ensure the integrity of the income statement.

- **Operation Strategy** step by step renovation and facelift of Hotel Taman Mangkubumi Indah, Increase productivity on the PT KAI land, Park redesign with new modern concept, New entertainment and leisure facility, Build 46 new room to increase hotel capacity,

- **Human Resource Strategy** increase the Human resource quality by training and recruiting a new employee, The training for a select HTMI employees are financial accounting, marketing especially internet marketing and communication. Supervisor, such as security and quality control are preferred for those with a short-term contract and replaced regularly. . An employee on the strategic position that prone of stealing, such as front office, cashier gatekeeper, need to be rotated regularly. Rule and punishment for offender need to be strict and uphold to make sure the offender won't repeated again

- **Information Technology Strategy** investment on Hotel Management software to tidy up the transaction report and minimalize loss. Each room must be equipped with RFID card electronic lock. The gate barrier needs to be replaced with electronic barrier counter. Television and WIFI Internet need more improvement

Business implementation

Business Strategy implementation shows the total of activities and choices required for the execution of a strategic plan. Hotel Taman Mangkubumi Indah needs to invest in implementing some action plant. Some of the activities are free and can be implemented easily. The other require a relatively big investment. Some of the activities also need a yearly or monthly budget, other only need once for several years such as for renovation or new facility

Activities	Function	2016	2017	2018	2019

The income projection of Hotel Taman Mangkubumi until 2019. In the first year the operation strategy which focused on how to minimize the leak made by employee, which include invest on room access door, room power switch, gate barrier and software management, plus the marketing strategy should increase the hotel occupancy rate to 50%, at the next year it will increase to 60% then 80% at 2019. The recreation park also increases by 30% by 2016 and goes to 65% by 2019. The other business unit such as restaurant and joglo restaurant also gain proporsional increase.
Figure 9 Projected Net Profit 2015 – 2019

Balance score card perspective

Balance Scorecard concept developed by Robert S Kaplan and David P. Norton, which star from 1990. Balance Scorecard is a management system to manage strategy implementation and evaluate performance, the strategic objective for hotel taman mangkubumi indah is as follow

Strategic Objective	Key Performance Indicator	Strategic Action Plan	Person in charge
Customer perspective			
Improving Customer Value Ensure Customer Satisfaction	Average Occupancy >60% per month Online rating 85%> positive Customer satisfaction average 85%> positive	Marketing strategy, Online Advertising, Online customer service via web service, physical advertising	Owner & Manager in charge.
Internal Business Process Perspective			
Operational Efficiency	Product Service Quality Less than 1% error on reporting accuracy 1%> transaction loss 95% employee average	Innovation Process (create product) Operation Process (Delivery product) After Sales Process	Front Office, Room Boy, House keeper, Marketing.
Learning and Growth Capability			
Capability and competency	95% Employee training attendance. 20% growth of employee productivity	Training Program (Marketing and Finance)	Owner and Manager in- charge.
Financial			

Net profit growth	Net profit Growth 10% per year Margin 24%> Return on Equity 22%> Return on Asset 22%>	Financial Audit, develop new revenue source, Cost control, Cost optimization	Owner and Manager in- charge.

Table 5 Strategic Objective for Hotel Taman Mangkubumi Indah

Conclusion
Conclusion of the research are:
1. The best corporate directional strategy is to hold and maintain by using market penetration and product development.
2. Hotel Taman Mangkubumi Indah best use Differentiation Business Strategy because it has natural resort environment as strong point of difference that hard to imitate by competitor.
3. Hotel Taman Mangkubumi Indah need to consider to do strategic alliance with other hotel in the shape of mutual service consortium (tourism point of interest), Licensing agreement (Franchising) or for alternative plan a Joint venture (Joint hotel operation) with big chain hotel.
4. Functional Strategy of Hotel Taman Mangkubumi Indah need to improve marketing, operational, finance, human resource and technological aspect of the company
5. The balance scorecard is used to evaluate performance and the strategic objective of HTMI. from the consumer perspective with occupancy rates above 60% and a satisfaction rating of over 85%, internal business with error and loss less than 1%, learning and growth by 20% increase in employee performance, and financial perspective with net profit growth of 10% per year
6. The projected occupancy rate should increase to 50% at first year (2016) and 80% at fort year (2019). The net margin increase to 21.9% at 2016 and 27% at 2019.

IMPACT OF REVERSE LOGISTICS ON PERCEIVED CUSTOMER VALUE IN MOBILE SMART PHONE INDUSTRY SRI LANKA

Aluthgamage Hasintha S. Pemerathna, Edulink International Campus, Sri Lanka

Abstract

Purpose of this study was to examine the nature of relationship between reverse logistics efforts of the smart phone industry and its impact on perceived customer value in Sri Lanka. Research design was based on positivism ontology with the deduction framework. Literature review was done to find out a conceptual framework comprising two dimensions reverse logistics and perceived customer value. Hypotheses were developed consequently to prove correlation among main dimensions. Statistical analysis was based on P value and T-test done through SPSS. Findings of the Study concluded the main form of reverse logistics activities practiced in industry as repairing and refurbishing while recycling and remanufacturing was recorded less than 10 % of total reverse logistics efforts. Study also found out that there is a strong relationship between some reverse logistic activities and perceived customer value. Main limitation was the scope as the mobile penetration is very high in Sri Lanka. Therefore the time and resources were not sufficient to probe all the subcultures across the island . The study was able to prove a conceptual framework on reverse logistics and customer satisfaction. Further, critical success factors on reverse logistics were also diagnosed from the research findings..

Keywords - *Mobile phone industry, Repair, perceived value, reverse scheduling, distribution management, Advertising value, consumer behavior*

Introduction

Global mobile penetration would reach 70% in 2019, making this industry one of the largest in the world. China along has more than 1.2 Billion mobile users while India is expecting to hit billion users mark in 2019. Euro region remains to be the area with highest mobile penetration outreaching North American continent by greater margins. However, Asia pacific region would record the highest number of mobile users in 2017 with an estimated value of 2.9 Billion users (Statista, 2013, para.1).According to the World Bank data Sri Lanka has surpassed 100% penetration limit as per 2015.

Figure 01: Mobile penetration in Sri Lanka
Source: World development indicator 2016

According to United Nations, ICT is one of the basic needs in the contemporary society. Hence every government should facilitate the mobile communication industry. Kenyan E-PESA case is a classic example that shows how mobile phones can improve financial markets of an economy with just simple adjustments in the business process. Today more than 17% of the Kenyan population use this facility to remit money with lower cost (UNDP: HDR, 2009, p.74). According to an industrial magazine more than 1.9 Billion people are now actively using mobile money services, while the number of users from developing countries continue to increase. Many non-banking and underbanked population from these developing countries are now using financial platforms in their day today life paving the way to improvement in financial markets and economic conditions. The report further points out that total value addition from mobile ecosystem was 3.1 trillion in 2015.Industry attractiveness also appears to be high as the net investment on this sector is on a growing trend with US Dollars 900 is expected to flow in 2020(Association GSM,2016,p.4). Despite the larger market size and increasing investments, phone industry has reached its maturity consequently. According to International Data Corporation the expected growth rate would reduce to 3.1% in 2016 from 10.5% in 2015. A significant drop in the sales value of the mobile phones. Further the report claims that traditional logistic methods will be replaced with new online based channeling system paving the way to create high level of competition among Original Equipment Manufacturers. Further the report claims that due to market saturation and the increased bargaining power of the customers competition in the industry would increase (IDC,2016,para.1-10).Similar Ideas was shared by Kenney & Pon(2009) were they argued that industry competitive levels are increasing despite the growth potential, and the customer satisfaction would be a difficult thing to accomplish. According to an industrial research more than 1.2 Billion phones were sold every year. In year 2010 return rate of the phones where 8% or 96 million phones. Average market value of those phones would be ranging from 35%-75% of the original value. If the original value of a phone is $150 average resell value of the defective phones would be $82.5. Report further explains that for a million returned phones there would be reclaimable metal value of $2.8 Million (Greve &Davis, 2011, p.8). Hence it can be argued that the phone industry product returns represents high percentage of the original manufactured amount and also the recycle efforts of original equipment manufacturers are high due to the high scrap value of the phones.

The Role of Customer Perception on smart phone industry

A research finding explains that perception meltdown of Nokia brand in Smart phone industry among high tech community had the irrevocable impact on their brand name, also paved the way to the success of Apple brand that was praised by the same community(Gray, Gonzalez & Darling,2011,pp.240-255). According to Bahn et al., (2007) the product color features and functionality plays a critical role in satisfying a mobile phone customers. Further, in another research researcher it was found that the perception is one of the main reason for customer satisfaction in phone business. However, the products attributes and its functionality is said to have a major impact on creating a positive brand perception in the minds of the consumers (p.305-313). Kotler & Armstrong has identified that quality attributes will create a positive perception on the consumers' mind which will be converted in to a purchase decision (Armstrong, 2005, p.581). According to Suki (2007) the light features of the phone like quality of the pictures and the sound will be a determinant factor for the brand perception (pp.350-365).In another research it was found out that perception of customers on the product attributes will increase the purchase behavior of the consumers (Zhang, Zhou & Rau , 2010,pp.1-8). Hence, analyzing the previous research data it is proved that customer perception on mobile & smart phones bares a greater impact on the revenue in this industry.

Significance of the study

Logistic activities represents 7%-10% of the United State economy. However, the total cost of reverse logistics was around 35 Billion US Dollars. Further, this research claims that exact figure cannot be derived as the companies do not want to reveal their cost of failure (Rogers &Tibben-Lembke, 1998, p.20). While product quality and attributes are considered as the main reason, many phone manufacturers try to maintain those qualitative aspects with high after sale services and efficient reverse logistics practices. According to Suppiah (2015) aftermarket repair services are provided by most of the phone manufacturers. Also their supply chain management systems are design to include such reverse logistic activities in their respective processors (p.8).According to Shuang Li et.al. (2012) efficient reverse logistic practices would reduce the total cost, minimize the cycle time and maximize the customer satisfaction (p.2).Despite these efforts smart phone industry remains to be an industry with high defect rates. Industrial research acknowledge that iPhone 4 had an initial rejection rate of 2.1% without counting accidental malfunctions which represents 75% of the product failures during the first 12 months. Total smart phone failure rate is average of 16.9% of total products (Squaretrade, 2010, para.1). According to a logistic company in Canada smartphone has the highest return rate among fast moving electrical items. Based on their data more than 18million smart phones were returned last year. Further source claims that it was an additional burden on the supply chain system of those companies (genco, 2016, para.4).Hence it can be argued that due to high return rate importance on efficient reverse logistics practices has increased in smart phone industry. Further, many research findings claimed that customer perceived value has a direct impact on customer satisfaction and repurchase intention of the products. Therefore it is important to see the relationship between effectiveness of reverse logistics and the   perceived customer value.

Objectives
01. To identify the reverse logistic practices utilized by the smartphone industry Sri Lanka.
02. To measure the effectiveness of reverse logistic practices utilized by smartphone industry Sri Lanka.
03. To identify the relationship between customers perceived value and the reverse logistic practices of the smart phone industry Sri Lanka.
04. To recommend suitable strategies for developing a proper reverse logistic system for smart phone industry in Sri Lanka.

Literiture review

Reverse logistics is defined by Zuluaga (2005) as the process of planning, implementing and controlling the transfer of information and products from point of consumption to the point of origin (p.11). Another industry analysis explains that average reverse logistic cost of a manufacturer is 9%-15% of the total revenue (Greve &Davis, 2011, p.8).

Reverse Logistics, Forward Logistics and Design For Disassembly

Among many strategies used in the logistic management field reverse logistics and forward logistics are the main strategies that are used by many companies. Reverse logistics defer from the forward logistic practices in many ways. One of the differences is that the push strategy of forward logistics, while reverse logistic focuses on both push and pull both strategies. Also the forward logistic system would only concern about the end consumer while reverse logistics concern about the suppliers and intermediaries at the same time. Further one of the main success factor for reverse logistics is that the design for Disassembly,

were the product design process concerns about possible repair or replacement (Zuluaga, 2005, p.21).In another similar research done on phone industry it was found out that the Design for Disassembly can be effectively used to reduce the defects rate and also the strategies like using durable material and using proper QR coding system for product components (Long et al. 2016).Hence it can be argued that the Design for Disassembly can improve the efficiency of the reverse logistics practices.

Return Lead-Time Management

Das & Chowdhury (2012) explained that a reverse logistic system of the company should be designed to minimize the lead time of re-production process by standardizing the production tasks and reducing the skill requirement of the process. Lieckens & Vandaele (2007) argues that increase in lead time of reverse logistics process would increase the uncertainty of the process. Research findings further prove that the product lead time is a direct function of the efficiency of that process (pp.395-414). Further in another research it is argued that lead time on reverse logistics would increase the consumer lead time and estimated pipeline time resulting in an increase in the total cost (Cannella, Bruccoleri & Framinan ,2016,pp.35-49).In another research it was found out that supply chain of production oriented businesses are directly influenced by the return lead time. Further study claims that the reverse logistic lead time would have a direct impact on the environmental cost (Bogataj & Grubbström, 2011,pp.395-402).The literature implies that lead time of reverse logistics would directly influence the efficiency of the reverse logistic system.

Design For Disassembly.

Design for disassembly is a strategy used by specialist in life cycle engineering. Moreover the research data proves that this tool can be mainly used in the recycle process of the products. This would enhance the serviceability of those products and the end of life objectives such as recycling & reuse (Desai & Mital, 2003, pp.265-281).However Sodhi & Knight argues that longer the disassembly process takes lessor the profits. Further, study highlights the importance of involving in bulk recycling to get maximum advantage from such recycling practices (Sodhi & Knight, 1998, pp.115-118). According to Güngör (2005) Design for disassembly practices would make the products more maintenance friendly and easy to recycle. Further the report highlights the importance of doing disassembling in a nondestructive manner saving the cost and minimizing the environmental impact. Most of the literature suggest that the remanufacturing and recycling process can be enhanced and efficient with proper utility of design for disassembly practices.

Infrastructure and The Top Management Commitment For Reverse Logistics

Chines study claims that lack of infrastructure is one of the main barriers in the reverse logistics efforts of chines manufacturing sector. Further the report claims that chines lack of investment on recycling techniques, non-availability of cost effective methods are the main course of this issue (Abdulrahman, Gunasekaran & Subramaniana, 2012,pp.460-471). Assavapokee & Wongthatsanekorn (2011) explained that product recovery system should render the support from all the logistic resources and chains of the organization. Further the study reveals that government pressure on waste management has increased the significance of effective product recovery system. Moreover, the study has identified statistical coexistence among the infrastructure availability and the and the efficiency of product recovery process of the organizations(pp.129-140).In a study conducted in Brazil it was identified that most parts of the developing world suffers from the condition of "deficient logistic infrastructure" hence the efficient use of infrastructure is far from reality.

As a result, the recycling effort and the remanufacturing efforts would be significantly mitigated, undervalued and underperformed. The study further reveals that part of the problem is that manufacturers resistance to improve the proper product recovery system (Bouzon et.al, 2016, pp.182-197). However Konga et al. (2015) argues that by improving IT infrastructure recycling efforts and product recovery process can be enhanced. Further the study reveals that this improvements will bring about benefits like reduction in remanufacturing time and the lead time with reduction of total cost of the remanufacturing process (pp.51-65). Hazen et.al, (2015) claims that committed management practices would increase the information and knowledge flow to various parties in the organization and would improve the controllability through goal setting and motivation(pp.160-170).Another related study on electrical battery manufacturing industry, reveals that by creating accurate reporting system the top management focus and commitment can be attracted towards reverse logistic management. According to the study with amalgamation of balance score card to improve and analyze the reverse logistic system would improve the overall management effort on further improving the recycling process hence making the process accurate(Bansia, Jayson & Agrawal,2014,pp.1419-1427).According to the literature reviewed most of the research findings claim the notion that proper use of infrastructure would benefit the organizations operation process, recycling and product recovery process while not having such infrastructural benefits was said to have a mitigating impact on the reverse logistics practices. Further, management attitude and commitment is said to have a positive impact on the recycling and product recovery process, as it would improve the resource allocation, information flow and guidance on achieving the reverse logistics goals. However the all the reviewed studies had the gap of not relating the infrastructure improvement and management commitment impact on the customer perceived value.

Customer Expected Lead-Time.

According to Altendorfer & Minner (2015) with proper communication at the sales point or service contact point it is possible to influence the customer expectation of the service. Further the study reveals that any production process should be designed based on the expected customer lead time and those standards need to be communicated to the consumer directly. Moreover the study argues that probability of acceptance is correlated with the lead time required (pp.555-565).Another study found out that the expected lead time is related with the customers cost benefit analysis on the brand (Sohn, Jeon & Han, 2015,pp.2015). Hsieh & Liu (2010) argues that if the expected lead time is higher the total cost of recycling and reprocessing is high. However the study reveals that reducing the quality parameters would increase the sales hence total benefit would increase despite the increase in the cost of penalty (pp.517-527).Further most of the studies were not linking the customer expected lead time on the reverse logistic practices although findings related to cost minimization ,increase in sales were highlighted . Therefore it can be argued that there is a literature GAP in identifying the correlation between reverse logistic practices and customer expected value. Hence the study would focus on identifying and fill that gap through research findings.

Customer Perceived Value

Customer perceived value is a different concept to the customer satisfaction, the main difference being pre and post purchase occurrence, where satisfaction is universally agreed to happen post purchase and post evaluated manner, perception can happen in many stages of the purchasing cycle including the pre purchase stage as a result. Moreover, it can be concluded that a perception about a product would be generated without any consumption experience (Sweeney &Soutar ,2001,pp.203-220). Another related study argues that the

perceived value of the customers are heterogeneous and need to be addressed in crafting a better strategy (Floh et, 2010, 974-982). Another study conducted in Australia on you mobile phone users has confirmed that perception of the mobile phone brand among peers and the public has a direct impact on their preference and selection of mobile phone brand. Further the study argues that this perception has direct influence on the group behavior (Walsh .et, 2010, pp.333-342). Floh et. Has tested the multidimensional scale including fictional, loyal, economic, social and emotional value that are identified as the components of the customer perceived value (pp.974-982).In another research the use of quality is used to map the components of perceived value (Miao,2014,pp.4820-4834). According to Sweeneya & Soutarb (2001) multidimensional scale is a useful scale to determine factor analysis and in-depth analysis. However a narrow analysis on a concept or a behavior pattern can be measured with single scale or likert scale (203,220). However the study is focused on identifying a relationship between customer perceived value and reverse logistics. Therefore there is no need to analyze and comprehend the customer perception in this study. Instead the concept is used to identify the relationship between another set of variables.

Overall Conclusion On Literature

Despite many efforts to identify the cost effectiveness, sales and other benefits there was no clear literature linking the customer perception with the reverse logistic efforts of organizations. However the efficiency of reverse logistics will be dependent upon commonly discussed factors like top management commitment, infrastructure, return lead-time and design for disassembly.

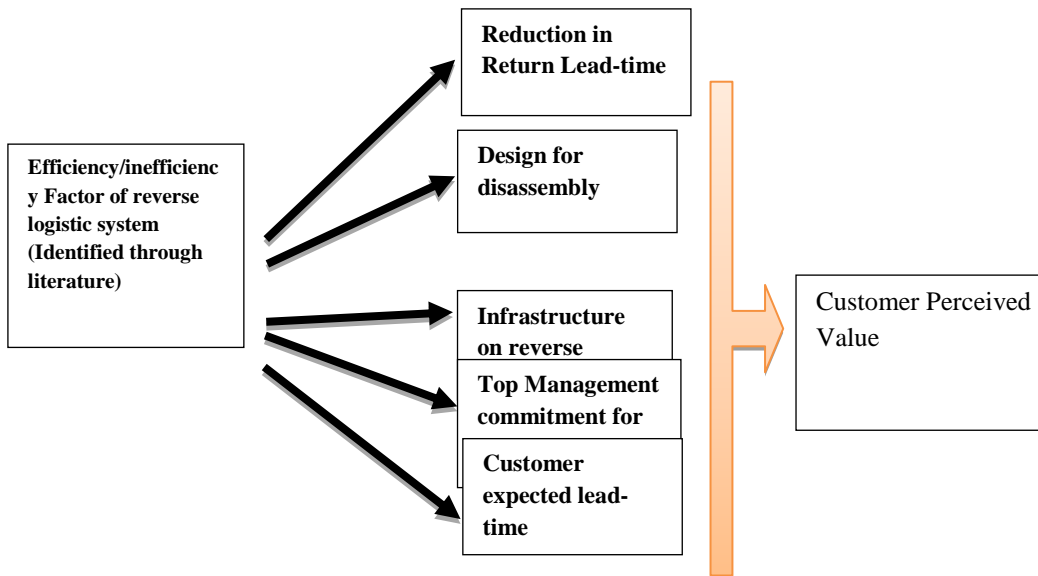
Methodology

Research methodology is dependent upon the intention of the research and the ontology of the research, however the positive ontology is always catered with quantitative approach while the data gathered would be quantifiable. Further it enables the study to develop and measure a possible correlation among some variables(Wang,2010.pp.2-4).According to Boynton, Greenhalgh (2004) quantitative research process requires tools like survey questions that would generate numerical data, where those data would be tested mathematically with hypothesizes ultimately (pp.1312-1315). However the process of this research would be the same as suggested since the intention of the study is to show a relationship between reverse logistics and the customer perceived value to prove that relationship statistical information need to be gathered hence the study approach is qualitative approach with set of hypothesizes created to identify the relationship as mentioned.

Sampling Method & Sample Size

Sample size should be significant enough to represent the target population of the research. Hence the accuracy of the smaller sample size is lesser compared to that of a larger sample. Further, bigger the sample higher accuracy in generalizing the findings on the target population (Yuan et. al, 2012, pp. 1206–1219). However in a study done on meta-experiment stream has found out that many researches use the sample size of 100 and frequently to generalize a larger population despite the theoretical methods to tally the actual population with sample size. Further the report claimed that the all of the studies have accurately proven the research objectives (Tavernier et, al, pp.1371-1382). However the study focuses on companies reverse logistic efforts verses the customer perceived value. Mainly two different samples were collected 500 customers from 50 different phone dealers and franchises in Colombo region. Each customers corresponding dealers/franchises reverse logistic efficiency will be mapped. Therefore the correlation is mapped with customer and the reverse logistic variables identified in the literature review, not the individual service provider. Therefore two

samples can have tallying output. According to Cochran, (1977) when the homogeneity of the total population is high it is easy to use random sampling. However when the subgroup characters are vivid among each other, then a clear strata is required to collect data from those distinct groups (pp.01-442). Further the pilot survey done for twenty customers have revealed that the perception towards recycled product and the expected service do not change from age, gender, and region. Therefore a heterogeneous assumption can be utilized to form the random sampling method for the study.

Figure 1. Conceptual Framework of the study


Source: Literature review

This conceptual framework is tested in the study, while following hypothesis were tested to prove the created conceptual framework.

H1: There is a positive relationship between reduction in return lead time and customer perceived value.

H2: There is a positive relationship between Design for disassembly and customer perceived value.

H3: There is a positive relationship between Infrastructure on reverse logistics and customer perceived value.

H4: There is a positive relationship between top management commitment on reverse logistics and the customer perceived value.

H5: There is a positive relationship between customer expected lead time and the customer perceived value.

Above variables will be tested in the following regression

$$CP = \beta_{0} + \beta_{1}R + \beta_{2}D + \beta_{3}I + \beta_{4}T + \beta_{5}C + E_{1}$$

CP= Perceived customer value.
R= Reduction in Return Lead-time
D= Design for disassembly
I= Infrastructure on reverse logistics
T= Top Management commitment for reverse logistics
C= Customer expected lead-time
E_1 =Standard error

Findings of the study

Initial analysis of the study involved identifying Bivariate Correlation of individual independent variable with the dependent variable. In the second step the proven variables will be tested for the regression.

Table 01:Correlation of Customer Perceived value & Reduction In lead time

		Customer Perceived value	Reduction in Return Lead-time
Customer perceived value	Pearson Correlation	1	.845**
	Sig. (2-tailed)		.000
	N	500	500
Reduction in Return Lead-time	Pearson Correlation	.845**	1
	Sig. (2-tailed)	.000	
	N	500	500

**. Correlation is significant at the 0.01 level (2-tailed) - Source: Research Data

As indicated in the table there is a strong relationship between reduction in lead time of recycled products and the Customer perceived value. With the high significance level the relationship can be interpreted as valid. Therefore it can be concluded that the Hypothesis H1 is proven beyond reasonable doubt with statistical prove.

Table 02:Correlation of Infrastructure on reverse logistics & Customer Perceived Value

		Customer Perceived value	Infrastructure on reverse logistics
Customer perceived value	Pearson Correlation	1	.937**
	Sig. (2-tailed)		.000
	N	500	500
Infrastructure on reverse logistics	Pearson Correlation	.937**	1
	Sig. (2-tailed)	.000	
	N	500	500

**. Correlation is significant at the 0.01 level (2-tailed).   Source: Research Data

According to this table when the reverse logistics system is highly enabled with required infrastructure system the perceived customer value will increase. Hence it can be concluded that the H3 is proven with evidence.

Table 03: Relationship between Top Management commitment & Customer perceived value

		Customer Perceived value	Top Management commitment
Customer perceived value	Pearson Correlation	1	.798**
	Sig. (2-tailed)		.000
	N	500	500
Top Management commitment	Pearson Correlation	.798**	1
	Sig. (2-tailed)	.000	
	N	500	500

**. Correlation is significant at the 0.01 level (2-tailed).   Source: Research Data

Although the significance is not high as other two variables there is a strong positive correlation with top management commitment and customer perceived value. Further the significance is validated with high value proving the validity of the relationship. Moreover, according to this analysis hypothesis H4 is proven with statistical confidence.

Table 04: Relationship Between Customer expected Lead time & Customer perceived value

		Customer Perceived value	Customer expected lead-time
Customer Perceived value	Pearson Correlation	1	.816**
	Sig. (2-tailed)		.000
	N	500	500
Customer expected lead-time	Pearson Correlation	.816**	1
	Sig. (2-tailed)	.000	
	N	500	500

**. Correlation is significant at the 0.01 level (2-tailed).
Source: Research Data

When expected lead times of customers are high delays in replacing products will be tolerated paving the way for the company to maintain the high customer perceived value position. Further the Hypothesis H5 is therefore proven with this statistic.

Table 05: Relationship between Design for Disassembly and customer perceived value

		Customer Perceived value	Design for disassembly
Customer Perceived value	Pearson Correlation	1	.530**
	Sig. (2-tailed)		.064
	N	500	50
Design for disassembly	Pearson Correlation	.530**	1
	Sig. (2-tailed)	.064	
	N	500	500

**. Correlation is significant at the 0.01 level (2-tailed).
Source: Research Data

In the relationship the significance level is high the person correlation value is below the expected reliable level. Hence this variable cannot be considered as independent variable in this equation. And the hypothesis H2 is disproved and the null hypothesis is proved.

The Model Test
Table 06: Regression Results

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.189	.184		1.028	.000
	Customer expected lead-time	.412	.241	.275	1.709	.000
	Reduction in Return Lead-time	.400	.277	.269	1.742	.000
	Infrastructure on reverse logistics	.523	.375	.363	1.995	.000
	Top Management commitment	.084	.228	.056	1.368	.000

Dependent Variable: Customer Perceived value
Source: Research Data

According to this analysis the regression values represents acceptable significance level and the t values are tallying with the P values significance identified. Therefore the regression can be written as

$$CP= \beta_{0+} \beta_1 R+ \beta_2 D+ \beta_3 I + \beta_4 T+ \beta_5 C+E_1$$

New regression
$$CP= \beta_{0+} \beta_1 R+ \beta_2 D+ \beta_3 I + \beta_4 T+ \beta_5 C+E_1$$
$$CP= 0.189_+ 0.4R+ 0.52I + 0.8T+ 0.4C+E_1$$

Discussion
The study has proven four hypothesizes out of the total five hypothesizes. And the model is successful with a minor amendment. However the rejected hypothesize namely the "Design for disassembly" remained to be a prominent consideration factor in the production engineering community despite the research result. When analyzing the qualitative feedback given by the interviewees on the subject matter most of the customers are not concerned about the internal process of disassembling even though they had prior knowledge on it. Especially the phones like iPhones takes lot of time to disassemble vs another budget smart phone. Customers are more concerned on the lead-time, and their delivery, further it is possible to find a relationship between lead time and the Design for dissemble in future researches. Further according to direct agents and franchise the top management commitment is under focused area for the reverse logistics practices.

Most of the Original Equipment Manufacturers response is considered to be slow although the local partners processing speed is high. Most of the technical experts reveals that this is due to their heavy R&D focus on quality assurance, where the R&D try to minimize the product failures while the technological advancement on recycling and product replacing technology is less prioritized. Further the customer expected lead-time is also a unique variable in this study. According to the study results higher the customer expected lead time lower the chances for customer dissatisfaction. Allowing the businesses to increase their possibility to improve or sustain the customer perceived value. Moreover, in a detailed analysis on the same matter has revealed that most of the customers who had long and lengthy expected lead time were using branded phones. Most consumer justified it by relating the complexity, genuinity and the uniqueness of the product. Respondent mentioned that their tolerance level is high due to those reasons and they expect it to be little time consuming than other phone brands. However another factor that would contribute the "customer expected lead time" is the perception on the Culprit of phone failure. If consumers believe the phone failure is due to their misuse then the customer expected lead-time is high. However these qualitative facts were not included in this model to be tested statistically.

Conclusion

The study was able to successfully identify a relationship between reverse logistics and the customer perceived value. Further, based on the data analyzed the customer perceived value can is a function of main four elements of efficient reverse logistics system, namely Customer expected lead-time, Reduction in Return Lead-time, Infrastructure on reverse logistics, Top Management commitment. Moreover study has disproved Hypothesis H2 by proving the null hypothesis. Moreover, most of the literature findings and the research findings are parallel.

EXPROPRIATION BY THE CONTROLLING SHAREHOLDERS ON FIRM VALUE IN THE CONTEXT OF INDONESIA: CORPORATE GOVERNANCE AS MODERATING VARIABLE

Ika Utami Widyaningsih, Universitas Sultan Ageng Tirtayasa, Indonesia
Ardi Gunardi, Universitas Pasundan, Indonesia
Rahmawati, Universitas Sebelas Maret, Indonesia

Abstract

This research discusses the influence of cash flow right, control right and cash flow right leverage on firm value. This research also discusses the influence of independent commissioners and independent directors as moderating variables of cash flow right leverage on firm value. Firm size and profitability are also included in this study as control variables. The research has 83 public corporations as research sample. All of the firms kept on the list during observation period that is from 2007 until 2010. Cash flow right and control right of the controlling shareholders can be shown by investigating ownership structure of public corporations by using ultimate ownership. The result of statistical test indicates that cash flow right is the dominant variable influencing firm value. The result shows that cash flow right has a positive effect on firm value, indicating that firm value increases as cash flow right of the controlling shareholder increases. Other variables are inconsistent when tested by using moderating variable or by adding control variables. Firm size has negative effect on firm value, and profitability has positive effect on firm value.

Keywords: *cash flow right, control right, cash flow right leverage, expropriation, firm value, Indonesia.*

Introduction

This study examines three issues related to the cash flow right, control right, and the deviation of the cash flow right from the control right on the firm value. The first issue in this study is the concentration of cash flow right and the implication on firm value. Cash flow right is incentive for controlling shareholders to avoid expropriation action. The controlling shareholders have strong incentive to monitor managers in maximizing firm value if they have significant cash flow right. The effect of increasing and decreasing in firm value would also affect the controlling shareholders. In line with this, La Porta et al. (1999) suggest that the incentive and ability of the controlling shareholders to expropriate are limited by financial incentive. The source of financial incentive here is the cash flow right of the controlling shareholders. This cash flow right is emphasized by Jensen dan Meckling (1976) by stating that the concentration of ownership has positive impact on firm value (La Porta et al., 2002).

The second issue in this study is the effect of control right on firm value. The concentration of high control right in the hands of controlling shareholders reflects the strong influence of the controlling shareholders on the policies and decisions that will be taken by the company. High control right will negatively effect firm value. Fan dan Wong (2002) confirm that the credibility of financial information decreases when the controlling shareholders exercise control right. The decreasing credibility or quality of financial information will reduce firm value. La Porta et al. (2002) state that this control right has been stressed by Shleifer dan Vishny (1997), focusing on the negative effect of ownership concentration on firm value. Shleifer dan Vishny (1997) state that when the private benefit

over the control exerted is high, the majority of shareholders will endeavor to allocate company's resources to generate the benefits.

The third issue of this study is the cash flow right leverage and the implication on firm value. In a concentrated ownership, the controlling shareholders make several efforts to improve the control right beyond the cash flow right. The separation between these two rights raises the possibility of expropriation on the minority shareholders. Agency conflict will be higher when the cash flow right leverage is in the hands of the controlling shareholders. However, the ability of the controlling shareholders to expropriate is expected to decrease if there is corporate governance in the company. The practice of corporate governance is characterized either by the presence of independent commissioners or independent directors who will give pressure to the controlling shareholders for not doing expropriation because there are many parties oversee their actions. Mitton (2002) examines 398 companies from Indonesia, Korea, Malaysia, Philippines, and Thailand, with various levels of company and ownership structure. This study states that corporate governance is a means to protect minority shareholders from expropriation (takeover) done by the controlling shareholders. Juniarti (2015) finds that the majority shareholder entrenchment causes negative effects which utilizes a large capacity to undertake actions for personal gain at the expense of minority shareholders.

The empirical evidence shows that ownership concentration of public companies prevails in nearly all countries (Jensen dan Meckling, 1976; Shleifer dan Vishny, 1997; La Porta et al., 1999; Claessens et al., 2000; Faccio dan Lang, 2002; Lemmons dan Lins 2003; Yeh et al., 2003; Yurtoglu, 2003; Khrisnamurti et al., 2005; Siregar, 2008).The controlling shareholders have control right beyond cash flow right, so the controlling shareholders are able to effectively influence management policies even to determine management policies. One of these research results is found by Claessens et al. (2000) examining 2980 companies in 9 countries in East and Southeast Asia, including Indonesia. They conclude that most of the sample is the companies concentrated by family ownership and the cash flow right acquired by the controlling shareholders is able to improve firm performance. However, the conflicting research result is found by Siregar (2008) stating that control right of the controlling shareholders and cash flow right leverage do not negatively affect firm value. This is because the layer and ownership chain of public companies are deep and complex. The deep layer of ownership makes investors difficult to know the controlling shareholders of a public company, so the possibility of control right concentration is higher. The worst is the expropriation might not be detected by investors.

Because there is inconsistency of the results in the previous studies, the results of this study are expected to provide a better picture of the phenomenon of expropriation by the controlling shareholders. Indonesian public companies are the right setting because the ownership concentration is high and the protection on minority shareholders is still weak. Agency problem encountered in the concentrated ownership firm is a conflict between the controlling shareholders with minority shareholders. The agency conflict arises when the controlling shareholders have excessive control over company's policy to do expropriation for their own benefit. Involving the practice of corporate governance to moderate the relationship between cash flow right leverage and firm value, this research seeks empirical evidence regarding the existence of expropriation action carried out by the controlling shareholders.

Literature review and hypotheses development

The effect of the cash flow on firm value

Financial incentives may limit the willingness of controlling shareholders to obtain private benefits over control through expropriation. An important source of financial incentive for the controlling shareholders is cash flow right. Expropriation is expensive to do, therefore, the high cash flow right should minimize the expropriation action. This cash flow right is emphasized by Jensen dan Meckling (1976) and evidenced by La Porta et al. (1999), stating that the ownership concentration has a positive influence on firm value.

Based on the argument of positive incentive effect (PIE), the effect of cash flow right on firm value is based on the size of financial impact that will be felt by the controlling shareholders for the expropriation action done to the company. If the negative impact of declining firm value is large for the controlling shareholders, the controlling shareholders will not be motivated to do expropriation. Therefore, the controlling shareholders who have a high cash flow right are more motivated to not to expropriate. The controlling shareholders will monitor the performance of management in order to increase firm value and avoid expropriation action. Because expropriation has a bigger impact on the controlling shareholders, it is too expensive for them to expropriate (Claessens et al., 2000). The cash flow right is a financial incentive for the controlling shareholders, motivating them to maximize firm value by monitoring managers' actions so that the agency problem can be reduced. Based on the description above, it can be hypothesized as follows:

Hypothesis 1: Cash flow right of the controlling shareholders positively affects firm value.

The effect of control right on firm value

The effect of control right on firm value is based on the argument of negative entrenchment effect (NEE), stating that the control right concentration of the controlling shareholders negatively affects firm value. With a high control right, the controlling shareholders have power to influence and participate in determining management policies that will benefit their position so that the controlling shareholders can obtain private benefits over the control. If private benefits over the control is large, the controlling shareholders will seek to allocate company's resources to generate private benefits. If the controlling shareholders are able to effectively control the company, the policy they take tends to result in the expropriation on the minority shareholders.

Claessens et al. (2000) and Claessens et al. (2002) find that the controlling shareholders of Asian public companies tend to use control right for personal interests. The greater the control right is, the lower the firm value becomes. This is because the act of expropriation to obtain private benefits over control unconsciously tends to decrease firm value. If outside investors believe that expropriation has been done by the controlling shareholders, they will value company's stock price lower. Based on the above explanation, the alternative hypothesis is hypothesized as follows:

Hypothesis 2: Control right of the controlling shareholders negatively affects firm value.

The effect of cash flow right leverage on firm value

The effect of cash flow right leverage on firm value is based on NEE argument stating that ownership concentration negatively affects firm value. Cash flow right leverage describes the agency problem that occurs in the company between the controlling shareholders and the minority shareholders. The high cash flow right shows the high agency

problem. The excessive control right over the cash flow indicates the power of controlling shareholders to control the company and perform expropriation.

La Porta et al. (1999) and Claessens et al. (2000) show that there is conflict of interest between the controlling shareholders and the minority shareholders. When the controlling shareholders control the company through their control right, they tend to generate expropriation policy on the minority shareholders. This kind of business is not attractive to the minority shareholders so they undervalue the company. Yeh et al. (2003) state that the deviation of cash flow right from the control right (cash flow right leverage) and stock collateralization by the controlling shareholders are two important variables in measuring expropriation on the minority shareholders. This conclusion is supported by empirical evidence saying that the two measures negatively affect firm value, consistent with the NEE argument. However, Siregar (2008) proves that despite the high ownership concentration, cash flow right leverage does not negatively affect firm value. This is because the layer of ownership and chain of ownership in Indonesian public companies are very deep and complex. So, it is difficult to know the controlling shareholders in the company. As a result, investors are not aware of the possibility of the increasing control right by the controlling shareholders to perform expropriation. Besides, they also keep valuing the company high. Based on this explanation, the alternative hypothesis is hypothesized as follows:

Hypothesis 3: cash flow right leverage of the controlling shareholders negatively affect firm value.

The effect of cash flow right leverage on firm value with corporate governance as a moderating variable

Claessens et al. (2000) state that the weak legal protection to minority shareholders (investors) makes the controlling shareholder increase their control right beyond their ownership in the company. Legal protection and weak corporate governance make the controlling shareholders more interested in expropriating in order to obtain private benefit over control. This is in line with the research of Yurtoglu (2003) stating that with better protection on the minority shareholders will result in higher firm value. The protection here is corporate governance. In their study, Khrisnamurti et al. (2005) state that creating legal environment requires government involvement. Legal environment supports the creation of corporate governance so the expropriation action on minority shareholders may be reduced. Corporate governance has been absolutely necessary for the company because this role is so important in detecting and preventing the counter-productive action of any individual. Corporate governance practice applied in a company is generally characterized by the presence of independent commissioners and independent directors. The existence of independent directors or independent directors within the company provides objectivity effect in doing execution and making decision. This will limit the movement of controlling shareholders to exercise control right in setting company's policy. The monitoring carried out by independent directors will provide effective management for the company so the company's goal can be attained, that is to maximize shareholders' wealth. The shareholders here are not only the controlling shareholders but also minority shareholders. The presence of independent parties in company's management will be able to balance condition, making every management's policy not only beneficial for one party but also for all. Based on the description above, the alternative hypotheses are hypothesized as follows:

Hypothesis 4: the presence of independent commissioners in the company tends to decrease the effect of cash flow right leverage on firm value.

Hypothesis 5: the presence of independent directors in the company tends to decrease the effect of cash flow right leverage on firm value.

Methods

The sample in this research is public companies listed in Indonesia Stock Exchange (BEI) for period of four years, i.e. from 2007 to 2010. Public companies used here are not limited by specific industry group so it is easy to explore every chain of ownership. Sampling technique used is purposive sampling, i.e. sampling based on certain criteria so that data analysis results can be used to answer research questions.

The criteria that must be met are as follows: 1) public companies/issuers were registered in BEI and kept in the list during the observation period that is from 2007 to 2010, they must not experience delisting either, 2) public companies/issuers published their full annual financial statements for the period ending December 31, 2007 and 2010, 3) public companies/issuers applied good governance characterized by the presence of independent commissioners and independent directors, 4) public companies had a complete ultimate ownership structure and can be traced by the controlling shareholders, 5) public companies had a complete data with respect to the variables needed in this research. Based on these criteria, the sample taken is 83 companies.

The dependent variable in this study is firm value. It is the amount that investors are willing to pay for the company, or this also means the investors' perception on the company associated by the stock price. The proxy of firm value used in this study is the ratio of price to book value. The share price meant here is public company's stock price at end of period (closing price). And the book value of company is the total book value available in Balance Sheet. The use of firm value proxy refers to La Porta et al. (2002).

The independent variables in this study consist of: cash flow right, control right, and cash flow right leverage. Cash flow right is financial claim of the controlling shareholders on the company (La Porta et al., 1999; Claessens et al., 2002).The cash flow right consists of direct cash flow right and indirect cash flow right. Control right is voting right to participate in making firm's important decision (La Porta et al., 1999). Control right includes direct control right and indirect control right. Cash flow right leverage is a deviation/ difference in cash flow right from control right owned by the controlling shareholders by using various increasing mechanisms (Siregar, 2008). The bigger the difference between cash flow right and control right is, the higher the increase of shareholder control beyond the cash flow becomes. The cash flow right leverage indicates the possibility of expropriation by the controlling shareholders on minority shareholders. In this study, cash flow right leverage describes the reduction of cash flow right from control right (La Porta et al., 2002).

Moderating variable in this research is corporate governance consisting the presence of independent commissioners and independent directors. The presence of independent commissioners within the company indicates objectivity of company's policy so expropriation can be avoided. The existence of an independent commissioner is indicated by calculating the composition of independent directors compared to the total number of board of commissioners in the company. The second moderating variable is independent directors. The presence of independent director in board of director will make the management become objective and effective. The presence of independent director variable is indicated by finding the composition of the independent director compared to the total number of board members in the company.

The control variable in this study is firm size and profitability. As the scale is quite large, the probability of agency conflict in larger companies is relatively higher than smaller ones. Claessens et al. (2002) find that the size of company negatively affects firm value. In this study, firm size is proxied by the logarithm of total assets. Profitability variable is one of the important variables in evaluating company's performance. The better the performance of company is, the better the firm's value in the eyes of investors becomes. Profitability shows

the availability of internal funds in the company. The proxy of profitability variable used in this study is the ratio return on assets. This measurement refers to Siregar (2008).

According to the research issues elaborated in problem formulation, namely cash flow right, control right, and cash flow right leverage on firm value, the hypothesis testing can be done by estimating full model and partial model. The full model in this study consists of the following equations:

$FV_{it} = \alpha_0 + \beta_1 CFR_{it} + \beta_2 CR_{it} + \beta_3 CFRL_{it} + \beta_4 CFRL_{it}*KOM_{it} + \beta_5 CFRL_{it}*DIR_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} (Model\ 1)$

$FV_{it} = \alpha_0 + \beta_1 CFR_{it} + \beta_2 CR_{it} + \beta_3 CFRL_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} (Model\ 2)$

$FV_{it} = \alpha_0 + \beta_1 CFR_{it} + \beta_2 CR_{it} + \beta_3 CFRL_{it} + \beta_4 CFRL_{it}*KOM_{it} + \beta_5 CFRL_{it}*DIR_{it} (Model\ 3)$

$FV_{it} = \alpha_0 + \beta_1 CFR_{it} + \beta_2 CR_{it} + \beta_3 CFRL_{it} (Model\ 4)$

While for the partial model, the hypothesis testing is done by estimating the following equations:

$FV_{it} = \alpha_0 + \beta_1 CFR_{it} (Model\ 5)$

$FV_{it} = \alpha_0 + \beta_1 CFR_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} (Model\ 6)$

$FV_{it} = \alpha_0 + \beta_2 CR_{it} (Model\ 7)$

$FV_{it} = \alpha_0 + \beta_2 CR_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} (Model\ 8)$

$FV_{it} = \alpha_0 + \beta_3 CFRL_{it} (Model\ 9)$

$FV_{it} = \alpha_0 + \beta_3 CFRL_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} (Model\ 10)$

$FV_{it} = \alpha_0 + \beta_3 CFRL_{it} + \beta_4 CFRL_{it}*KOM_{it} + \beta_5 CFRL_{it}*DIR_{it} (Model\ 11)$

$FV_{it} = \alpha_0 + \beta_3 CFRL_{it} + \beta_4 CFRL_{it}*KOM_{it} (Model\ 12)$

$FV_{it} = \alpha_0 + \beta_3 CFRL_{it} + \beta_5 CFRL_{it}*DIR_{it} (Model\ 13)$

Where:
FV   =   firm value proxied by price to book value
CFR =   cash flow received by the controlling shareholders
CR   =   control right owned by the controlling shareholders
CFRL=   indicator of expropriation by the controlling shareholders
KOM =   composition of independent commissioners of public companies indicating corporate governance
DIR   =   composition of independent directors of public companies indicating corporate governance
SIZE =   firm size
ROA =   company's ability to manage assets held in generating net income

Results and discussion

The estimation result of the full model testing is shown in Table 1 as follows:

Cash flow right of the controlling shareholders is financial claim received by the controlling shareholders on the company. Based on the PIE (positive incentive effect) argument, the controlling shareholders will not take expropriation action on the minority shareholders because they are the party who will suffer the most from the firm value decrease resulted from expropriation action. The bigger the concentration of cash flow right held by the controlling shareholders is, the more financial claim (financial incentive) received by the controlling shareholders becomes. The amount of financial claim received by the controlling shareholders requires them to avoid expropriation action which tends to lower firm value. In fact, they should take decision which will improve firm value. This study is in line with the PIE argument. Besides, there are also some other studies that support this PIE argument, among them are Claessens et al. (2002), Mitton (2002), Yurtoglu (2003), dan Siregar (2008).

In the condition where the concentration of cash flow right owned by the controlling shareholders is high, the impact of an increase or decrease in firm value on the company's controlling shareholders is also high. So, the controlling shareholders are motivated to not expropriate, because without even doing it they still get many benefits from the high cash flow right held. Such condition is the implication of a positive influence of cash flow right on firm value. The concentration of high cash flow right is used by the controlling shareholders to align the interests between the controlling shareholders and minority shareholders. If the right of minority shareholders is protected from the possibility of expropriation action by the

controlling shareholders, they would be willing to hand over their funds to public companies. This will push up the price of securities, especially the stock prices of public companies which subsequently have a positive impact on the increasing firm value. Besides, foreign investors will believe that there is no expropriation action within the company so they will value company's stock higher.

The research data show that the concentration of control right owned by the controlling shareholders is quite high. There are two common mechanisms used to improve the control right, namely the pyramid ownership and cross ownership. Through these mechanisms, the controlling shareholders may increase their ownership in public companies without knowing of investors and public in general. According to the assumption of the NEE theory (negative entrenchment effect), the high concentration of control right will make the control of company's policy-makers fully in the hands of controlling shareholders. So, the controlling shareholders have the discretion to determine the company's policies that might only benefit them alone, or in other words, the controlling shareholders are free to expropriate on the minority shareholders. As a result, foreign investors will undervalue the shares of public companies causing a decline in firm value.

However, the prediction of NEE theory is supported in this study. The research result proves that in Indonesia, control right of the controlling shareholders positively affects firm value. This indicates that, in Indonesia, although the control right owned by the controlling shareholders is high, the firm value still can be increased. There is possibility that the controlling shareholders act professionally so that with their control right, they prefer to keep increasing firm value. The findings in this study are in line with research of Siregar (2008). If the research data were investigated further, some indications were found making hypothesis 2 not supported. First, the structural pattern of public companies' ownership in Indonesia is profound and complex, forming many layers of ownership, chains of ownership and paths of ownership. The pattern of ownership structure of public companies tends to have branches. Between a public company and other public companies there is stock ownership's binding.

The second reason is investors do not know for sure the possibility of increasing control right by the controlling shareholders. This is because investors only know company's ownership structure based on the concept of immediate ownership as listed in annual report of public companies. Based on the concept of immediate ownership, investors will only know the size of the cash flow received by shareholders, without knowing the amount of control right owned by shareholders. So, investors do not have knowledge to assess whether there has been expropriation action or not in the company. This is in line with that expressed by Siregar (2008) stating that investors do not have information about the possibility of expropriation and investors do not know at all who the ultimate owners of public companies are. The third reason is the secrecy of the controlling shareholders who are very well preserved. It is based on the difficulty to obtain overall data of the controlling shareholders of public companies. This happens simply because public companies do not want their secret known by society, especially regarding the ultimate owners of the companies. Besides, they want to always maintain the image.

The high control right held by the controlling shareholders allows expropriation action on the minority shareholders. Expropriation action is indicated by cash flow right leverage, showing the potential use of private benefits over control. By obtaining private benefits over company's resources, the controlling shareholders have opportunity to increase their wealth without worrying that it has a direct impact for them. This condition does not correspond to the real situation, where the findings in this study indicate that the cash flow right leverage does not affect firm value. The findings of this study are consistent with Siregar (2008). The presence of cash flow right leverage is an indicator of expropriation action done by the controlling shareholders on minority shareholders. The high control right

leads the controlling shareholders have opportunity to acquire a large private benefits on public companies. Expropriation tends to encourage controlling shareholders to adopt policies that only benefit them. However, this condition does not occur in Indonesia. Although there has been indication of expropriation by the controlling shareholders, the firm value is not affected. The results of this study are not in line with the prediction of NEE (negative entrenchment effects) theory stating that the high control right by the controlling shareholders trigger them to expropriate though it would affect firm value. The value of public companies in Indonesia remains high although there is any indication of expropriation action done by the controlling shareholders.

According to applicable legislation, a public company is obliged to apply good corporate governance (GCG). The concept of good corporate governance emphasizes that GCG may hinder the possibility of agency conflict, prevent expropriation and increase firm value. The roles of independent commissioners and independent directors are needed to perform supervise and assessment objectively. This paper reveals that independent commissioners were proven to be unable in increasing firm value and decreasing the effect of expropriation, indicated by the presence of cash flow right leverage. This result is in line with Bozec dan Bozec (2007) proving that when the company ownership is concentrated, the role of GCG becomes not effective. The indicator of public firm applying GCG is the presence of audit committee, independent commissioners and independent directors. Even though the presence of independent directors in Indonesia has met GCG regulation, the role of independent directors has not been able to influence expropriation action and change firm value.

The similar condition happens to the role of independent directors in moderating the relationship between cash flow right leverage on firm value. Empirical evidence proves that the presence of independent directors statistically has no influence on cash flow right leverage and firm value. This result is in line with Bozec dan Bozec (2007) stating that when the company ownership is more concentrated, the role of corporate governance becomes not effective. The presence of independent directors indicates that there is corporate governance, but this has no significant influence on firm value. The board of directors as policy makers are deemed not optimum in increasing firm value. It can be said that the application of GCG in Indonesian public firms has not been optimal. This result also indicates that investors or business practitioners tend to be now aware of the importance of corporate governance and how this can minimize the possibility of agency conflict, expropriation, and fraud which may decrease firm value.

In the test involving control variable, either firm size or profitability, it is found that these two control variables influence firm value. When tested with full model, control variable of firm size affects firm value negatively. The negative effect of firm size on firm value is based on the assumption that the larger the company is, the larger the agency conflict becomes. Investors or business practitioners tend to be careful, keeping eyes on the possibility of agency conflict and tend to value the firm value low. This result is in line with Claessens et al. (2002) and Siregar (2008) finding negative effect of firm size on firm value. The control variable of profitability proxied by ROA has empirically positive and significant influence on firm value. The larger the firm's profitability is, the better the performance becomes. Investors and business practitioners observing the profitability growth tend to give high value to the high-profitability firms. Yeh et al. (2003) and Siregar (2008) are in line with finding in this research proving the similar evidence regarding the positive influence of profitability on firm value.

Conclusion

The high cash flow right shown by the financial claim received by the controlling shareholders has positive and significant influence on firm value. This means that the larger the cash flow right is, the larger the firm value will be. The empirical result in this research has proven to support PIE (positive incentive effect) theory stating that the high cash flow right tends to make controlling shareholders keep and maintain firm value. This is because they are the party who will suffer the most if firm value decreases and will benefit the most if the firm value increases. When interacted with other independent variables (control right and cash flow right leverage), control variable and moderating variable, the variable of cash flow right still shows positive influence on firm value, or it can be said that the variable of cash flow right is the most dominant variable in explaining the variable of firm value.

The control right owned by the controlling shareholders in Indonesia is quite high. Empirical results show that partially, the variable of control right has negative and significant influence on firm value and so hypothesis 2 is supported. Thus, the theory of NEE (negative entrenchment effect) can be proven, i.e. the large control right owned by the controlling shareholders gives them opportunity to make decisions that benefit themselves. This will in turn decrease firm value. Other empirical results show that when the variable of control right is interacted with other independent variables (cash flow right and cash flow right leverage), moderating variable and control variable, the variable of control right has positive influence but not significant statistically. This indicates that when there is cash flow right, corporate governance and control variable, the negative influence and control right decrease and tend to be dominated by cash flow right.

Cash flow right leverage indicates that expropriation happens to a public firm, done by the controlling shareholders. Partially, empirical results show that cash flow right leverage has no influence on firm value. In other words, hypothesis 3 stating cash flow right leverage has positive influence on firm value, is not supported. When the variable of cash flow right leverage is interacted with other independent variables, moderating variable and control variable, it has no influence on firm value.

The presence of independent commissioners is predicted to decrease the influence of cash flow right leverage on firm value. Empirical result in this study proves that the presence of independent commissioners has not been able to fully minimize the chance of expropriation. Thus the presence of independent commissioners is not able to push cash flow right leverage and influence firm value. It is because the performance of independent commissioners in Indonesian public firms is not optimum, implying that the chance to do expropriation still exists. Therefore, this research does not support hypothesis 4.

The presence of independent directors is predicted to lower the influence of cash flow right on firm value. Empirical result in this study shows that the presence of independent directors has not been able to fully minimize the chance of expropriation. The presence of independent directors has not been able to push cash flow right leverage and influence firm value. Even in some equations, the variable of independent directors tends to increase the variable of cash flow right leverage. This is because the performance of independent directors in Indonesian public firms is not optimum, implying the opportunity to practice expropriation also still exists. Independent directors are voted not based on regulation or constitution but based the relationship closeness with the company's owners. Thus, this research does not support hypothesis 5.

DETERMINANTS OF ENTERPRISE RISK MANAGEMENT (ERM) AND THE IMPACT OF ERM ON FIRMS' PERFORMANCE: AN EMPIRICAL ANALYSIS OF INDONESIA'S PUBLIC LISTED BANKING FIRMS

Fiany Pryscillia, Petra Christian University, Indonesia
Mariana Ing Malelak, Petra Christian University, Indonesia

Abstract

Objectives: This paper examines the influential factors of potential adoption of ERM and the impact of ERM adoption on the public listed banking firms' performances in Indonesia during 2009-2015.*Methodology*: We use logistic regression to test four potential factors as the driving forces behind the potential adoption of ERM and linear regression to test the impact of ERM on firms' performances.*Findings*: Our result suggests that firms with greater size, having more institutional ownership, and being part of Multinational Company are more likely to adopt ERM, while the implementation of ERM has no significant impact on the firms' performance. *Novelty*: Little empirical research has been conducted on the topic, especially in developing economies like Indonesia. This study will broaden the scope of literature by providing novel empirical evidence.

Keywords - *Enterprise Risk Management (ERM), Public Listed Banking Firms, Firms' Perform*

ntroduction

Liberalization has made the economics becoming more complex and volatile, so that the risk faced by economic agents arising (Adiningsih, 2012). Reliable risk management is one of the core competencies that should be conducted by management to create value of a company. Unlike the traditional "silo-based" approach, the Enterprise Risk Management (ERM) enables firms to manage risk through anintegrated approach.Despite the heightened interest in ERM by academics and practitioners, empirical evidence regarding the determinants of these programs is lacking, especially in the emerging country like Indonesia. Previous study regarding this topichas been conducted by Liebenberg & Hoyt (2003) which found that firms with high financial leverage tends to implement ERM in their risk oversight. The research was supported by Golshan&Rasid (2012) who concluded that firms with higher financial leverage and with a BigFour auditors are more likely to have a form of an ERM framework in place.This research study focuses on one of the quickest developing economies, namely Indonesia, as known as Southeast Asia's largest economy (World Bank, 2016). Throughout this study, the determinants of potential adoption of ERM will be identified.The effectiveness of risk management is crucial in the banking companies to supportdecision-making by balancing the tradeoff between risk and expected return in a more precise way in order to improve the company's performance (Mohammed & Knapkova, 2016). Beasley & Frigo (2010) explains one of the ERM framework, namely The Return Driven Strategy, which is an effective tool in integrating strategic objectives and risk management which facilitate firms to be able to respond risk more effectively and increase potential return, hence it may create value of a company. The second model was built to test the impact of the ERMadoption on public listed banking firms' financial performance in Indonesia.

Literature review and hypotheses

Risk is an integral part of the business. Risk management is a continuous, forward-looking process that is an important part of business and technical management processes.If traditional risk management enabled managers to manage risk separately and was oriented only at protection against the risk of negative impacts, now under the ERM system, all the risks are managed as a single strategic enterprise-wide integrated systemsand further it may improve the decision process with respect to strategic and operational developments(Fraser & Simkins, 2010).Enterprise Risk Management (ERM) is defined as the process, effected by an entity's board of directors,management and other personnel, applied in strategy setting and across theenterprise, designed to identify potential events that may affect the entity, andmanagerisk to be within its risk appetite, to provide reasonable assurance regarding the achievement of entity objectives (COSO, 2004).

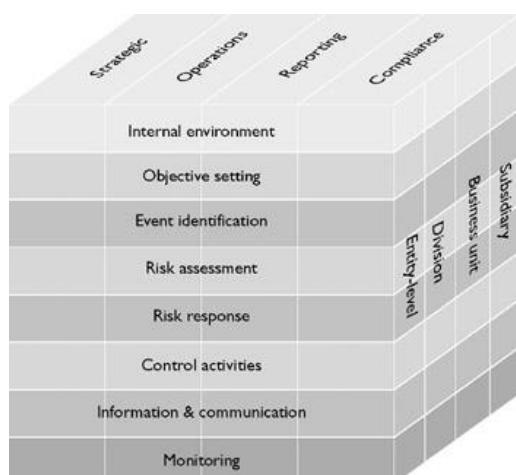
ERM framework is integrated into the parent organization's strategy, operational policies, as well as practical applications, as shown in the picture below :


Figure 1 - ERM Integrated Framework (COSO, 2014)
The influencing factors in ERM adoption used in this research are discussed below :

Stock price volatility

Volatility of stock price, which is the fluctuations in a company's stock price movement, regarded as a form of uncertainty in the company's performance. High volatility made investors leave the market to sell assets to minimize investment risk (Situmeang, 2015). Conversely, a low stock price volatility illustrates the relatively stable company's financial performance,hence gives a positive signal to investors (Nair, Rustambekov, McShane, & Fainshmidt, 2014).Therefore, the company management sees the need to implement ERM in order to stabilize the company's stock price movements. Nevertheless, the research of Liebenberg & Hoyt (2003) and Golshan & Rasid (2012) have not found the significant influence of stock price volatility on the potential adoption of ERM.
H1: Firms with higher stock price volatility are more likelyto adopt ERM

Firm size

Large companies' business activities as well as the types of transactions are more diverse and more complex than the smaller size company. Risks faced by large enterprises are also more diverse than the possibility of the risk borne by small firms (Wasis, 1992). Additionally, larger firms are able to dedicate greater resources on more diversified alternative investments (Beasley, Clune, & Hermanson, 2005 in Golshan & Rasid, 2012). Consistent with these theories, Hoyt, Moore, & Liebenberg (2008) found that firm size has a positive significant influence on the implementation of ERM in US Insurers.
H2: Larger firms are more likely to implement ERM

Institutional Ownership

As today's business are becoming more complex, the demands of shareholders on corporate disclosure are also increasingly intense, especially about the nature and level of risks faced by the company. Institutional shareholders, with the magnitude of the portion of ownership of shares owned, relatively has a greater influence than the individual shareholders and can give more impetus in the implementation of ERM in the company to ensure that the risks remain within tolerable limits of owners (Liebenberg & Hoyt, 2003). This factor has been investigated by Hoyt, Moore, & Liebenberg (2008) and Golshan & Rasid (2012). Only the first has concluded the significant influence of this factor.

H3: Firms with higher percentage of institutionalownership are more likely to adopt ERM

Firm as part of The Multinational Company

Multinational companies (MNC) faced the risk arising from changes in exchange rates since there are differences in currency used in each country where the unit of the company operates, as well as country risk due to thediverse government regulations in each country (Huo, 2013). The risk will potentially reduce the income which will affect the company's profitability as well as the overall condition ofthe company. Therefore, ERM is needed to anticipate the risks associated with the economic policy differences between countries and the risk of exchange rate movements.

H4: Firms as part of the Multinational Company are more likely to adopt ERM

The ultimate purpose of the ERM's implementation is to maximize the shareholders' wealth in an ethical manner. The Return Driven Strategy, one of the ERM framework, is an effective tool in integrating the company's strategic objectives with risk management objectives(Beasley & Frigo, 2010). The method enables the management to respond to the risk more effectively, thus increasing potential return of the firm. Toneguzzo (2010) adds that the company's resource allocation based on risk can maximize the probability of gainingthe return and achieve the business objectives. Therefore, effective implementation of ERM can increase the company's financial performance, hence it can increase firms' ROA (*Return on Assets*), as the measurement of how efficient management of the company utilizes assets to generate income (Ross, Westerfield, & Jordan, 2013).

H5: Firms which implement ERM under their risk management have a higher ROA

Anderson (2008) in Mohammed and Knapkova (2016) states that the application of ERM can stabilize earnings. The stability of earnings indicates the firms have good performance thus creating demand for the company's stock. Resources in the form of such investments can be allocated to develop operational and technologies, hence will improve the company's performance. Liebenberg and Hoyt (2003) also noted thatgood risk management will enable the management of the company to improve the efficiency of capital, therefore firms are expected to operate more optimally and at the end will increase the profit. Therefore, the implementation of ERM will enhance the company's ROE, which indicate how the stockholders fared during the year (Ross, Westerfield, & Jordan, 2013).

H6: Firms which implement ERM under their risk management have a higher ROE

Methodology

In this research, the sample was derived from the banking firms which listed in Bursa Efek Indonesia (BEI) during 2009-2015. By the time this study was conducted, there are totally 26 banking firms listed in BEI. Then the samples will be eliminated using 2 criteria as mentioned below:

a. Firms must publish their annual report and financial report regularly during the period 2008-2015

b. The company's stock price data is fully available during the period 2008-2015

By following the above criteria, the final sample resulted in totally 16 firms.

The necessary data are collected from several relevant information providers.The company's annual report and financial statementare collected from idx.co.id, icamels.id, financial data from Bloomberg Terminal, closing stock price from yahoofinance.com.

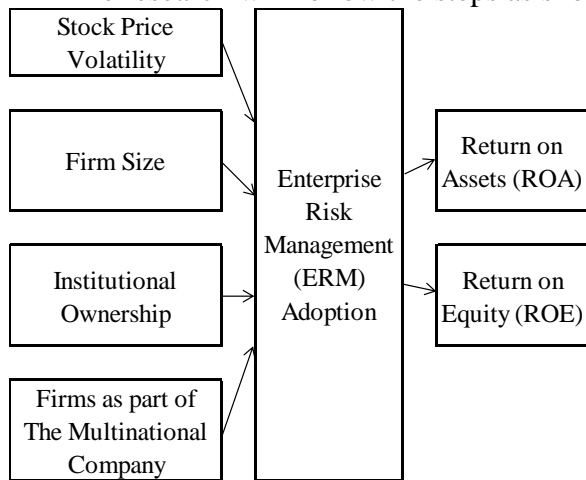
The research will follow the steps as shown in the figure below:


Figure 2 – Conceptual Framework

As for the logistic regression equation for the research model 1 is :

$$Ln \frac{P(ERMt)}{1-P(ERMt)} = \beta_0 + \beta_1 \, vol_{t-1} + \beta_2 size_{t-1} + \beta_3 inst_{t-1} + \beta_4 \, mnc_{t-1}$$

and the linear regression equations for the second and third models are :

$ROA_t = \beta_0 + \beta_1 ERM_t$

$ROE_t = \beta_0 + \beta_1 ERM_t$

The measurements used for the variables included in this research are presented in table 1:

Table 1 – Variables Definition and Measurement

Variables	Definition	Measurement
Stock Price Volatility (Vol)	movement of stock prices measured by the root of the difference of squares weekly stock price with the average price of the stock divided by the number of observations	$S = \sqrt{\dfrac{\sum_{i=1}^{n} (Xi - \bar{X})^2}{n-1}}$

Firm Size (Size)	logarithm of the total assets of the company	Firm Size = Log Total Assets
Institutional Ownership (Inst)	the percentage of shares owned by institutions and	Inst = (number of shares owned by institutions / number of outstanding
Firms as part of the Multinational Company (MNC)	whether or not the company's operating business units located in other countries	0 = firm has no business unit located in other country, 1 = firm has business unit located in other country
Enterprise Risk Management (ERM)	ERM implementation in a banking services firm	0 = firms didn't mention "Enterprise Risk Management" in their annual report, 1 = firms mentioned "Enterprise Risk Management" in their annual report
Return on Assets (ROA)	the ratio between net income and total assets of the company in the same period	ROA = net income / total assets
Return on Equity (ROE)	the ratio between net profit and total equity of companies in the same period	ROE = net income / total equity

Findings and discussion

Table 2 presents the result of the descriptive statistics of model 1.

Table 2 - Descriptive Statistics of Logistic Regression Model

Variables	Mean	Max	Min	St. Dev.	N
ERM	0.5238	1	0	0.50183	105
VOL	203.5473	1495.55	0	306.746	105
SIZE	13.4512	14.93	12.13	0.82252	105
INST	0.7142	0.98	0.06	0.25127	105
MNC	0.3143	1	0	0.46646	105

The number of data is 105 in accordance with the total observations firms (15 sample firms) times number of periods (2009-2015). The mean, maximum value, minimum value, and standard deviation of variables used in the first model, are presented in table 2.

The model was first tested whether it has fitted or not using Hosmer and Lemeshow Test. The result of Goodness of Fit (GOF) test along with Nagelke R Square are shown in table 3:

Table 3 – Hosmer & Lemeshow and Nagelkerke R Square Test

Sig. Value of Hosmer and Lemeshow Test	0.279*
Nagelkerke R Square	0.358

Significant difference of means at 5% level

The p-value of Hosmer and Lemeshow test results in 0.279, which exceed the confidence of interval (α) of 5%. It can be concluded that the model was feasible according to the GOF

criteria. The independent variables are able to explain their influence to the probability of the dependent variable as big as 35.8%.

Omnibus test was conducted in order to test the influence of all independent variables simultaneously to the dependent variable. The result is attached in table 4:

Table 4 – Result of Omnibus Test of Model Coefficients

Sig. Value of Omnibus Test of Model Coefficients	0.000*

Significant difference of means at 5% level

The significant value of the Omnibus test is less than the significance level of 5%. It can be inferred that at least one variable of stock price volatility, firm size, institutional ownership, and firm as part of the Multinational Company is having a significant influence in the adoption of ERM, therefore the logistic regression model is feasible.

The result of the logistic regression test is presented in table 5:

Table 5 – Result of Logistic Regression

Variables	Coefficient (β)	Wald	Sig.	Exp (β)
Constant	-21.797			
Vol	-0.001	1.445	0.229	0.999
Size	1.193	8.845	0.003*	3.298
Inst	6.148	12.268	0.000*	467.859
MNC	2.412	10.521	0.001*	11.156

Significant difference of means at 5% level

Based on the result in the table above, there are three contributing factors to ERM implementation, which are the firm size, institutional ownership, and firm as part of the Multinational Company. For each significant contributing factor, the relationship to potential ERM adoption is positive. It can be concluded that potential adoption of ERM is positively associated with being larger firms, having more institutional ownership proportions in the composition of firm's shareholder, and being part of the Multinational Company. In fact, as the size of the firm increased, the more complex the business activity run by the firm, hence the risk associated with it will be more diverse and threatening as well. Therefore, the implementation of good risk management through the ERM framework can be seen as the effort of the company to mitigate the risk and also show the commitment to the existing debtholders and shareholders.

Meanwhile, the influence of institutions in the adoption of ERM is consistent with the research of Hoyt, Moore, & Liebenberg (2008) which concluded that institutions, with the huge proportions of the firm's ownership, are relatively more influential than individual shareholders and are able to exert greater pressure for the adoption of an ERM. This statement is suitable with the data from public listed banking firms in Indonesia, where the average percentage of institutional ownership in Indonesia is around 64.67-71.82%. ERM is applied to help managers control risk to be within the risk appetite of this dominant shareholders.

Lastly, the adoption of ERM is driven by the characteristic of the firm as the part of Multinational Company. Such firms must consider many financial factors that do not directly affect purely domestic firms. These include foreign exchange rates, differing interest rates from country to country, complex accounting methods for foreign operations, foreign tax

rates, and foreign government intervention(Ross, Westerfield, & Jaffe, 2010). Therefore, ERM is needed to help managers to encounter the risk and transform it into the opportunity to gain.

Table 6 presents the descriptive statistics of linear regression model (second and third models):

Table 6 – Descriptive Statistics of Linear Regression Model

Variables	Mean	Max	Min	St. Dev.	N
ERM	0.5238	1	0	0.50183	105
ROA	0.0128	0.03	-0.01	0.00968	105
ROE	0.1174	0.28	-0.14	0.08516	105

The number of data is 105 in accordance with the total observations firms (15 sample firms) times number of periods (2009-2015).

Table 7 contains the data processing result of the classical assumption test for the second and third model. Since both models are using the simple linear regression, there are only 3 classical assumptions to be fulfilled, which are normality test, heteroscedasticity test, and autocollinearity test.

Table 7 – Classical Assumption Test Result

Test	ROA Model	ROE Model
Asymp. Sig. (2-tailed) One-Sample Kolmogorov-Smirnov Test	0.743	0.911
Sig. Value of Glejser Test	0.653	0.660
Durbin-Watson Statistics	0.541	0.567

The result of classical assumption tests are:
a. Data included in both ROA model and ROE model are normally distributed, since the significant value is more than confidence interval of 5%.
b. There is not a heteroscedasticity problem in both models (significant values are greater than confidence interval of 5%).
c. Statistic value of Durbin-Watson for both models have positive autocorrelation.

According to Gujarati (2004), the data having inconsistencies with the characteristics of the classical assumptions can still be used in the calculation, considering the OLS also produces a bias value. Therefore, no treatment is applied in the data.

Table 8 discussed about the t-test result of linear regression for the second and third model.

Table 8 – Result of Second and Third Model using Linear Regression

ROA MODEL

Variables	Coefficients	t	Sig.
Constant	0.013	9.282	0.000
ERM	0.000	0.064	0.949

Dependent Variable: ROA

ROE MODEL

Variables	Coefficients	t	Sig.
Constant	0.120	9.954	0.000

| ERM | -0.006 | -0.339 | 0.735 |

Dependent Variable: ROE

The p-values of ERM are 0.949 and 0.735 for each dependent variable, ROA and ROE consecutively. Both are greater than the confidence interval (5%) therefore the result suggests that implementation of ERM does not have significant influence on banking firms' performance in Indonesia, measured by ROA and ROE.

There are at least 2 reasons to explain this insignificancy. First, the impact of ERM implementation can be observed in the long term, when firms have implemented ERM thoroughly within the firms' internal environment and communicated to all lines of management. In that case, we assume that firms are able to mitigate and adjust the risk, according to be within its risk appetite. This will lead firms to increase its cash flow and create competitive advantage in the long term. Since many banking firms had just applied ERM between 2014-2015, the expected results can not be observed in the period of observation.

Secondly, we can conclude that investors pay less attention to the ERM implementation as one of the considerable factors in making investment. Investors are more likely to consider other factors, such as the firm size and *leverage*(Sanjaya & Linawati, 2015).

The third reason is because firms that implement ERM in Indonesia is still very limited. Moreover, the level of implementation of risk management by companies in Indonesia is still low compared to other countries. Of the five levels of risk management level according to AON(2010), Indonesia is still at level 1 and 2, which is the level of initiation and involving. Association of Risk Management Practitioner(ARMP) stated that the high cost of obtaining the certificate of risk management processes, constrain the implementation of comprehensive risk management in a company(Bangun, 2011). These facts indicate that risk management has not been considered as a fundamental requirement companies in Indonesia. The managers of the firms have not maximized the potency in ERM to increase the value of the firm for the stakeholders' sake. Therefore, there is no significant influence of ERM implementation on the public listed banking firms' performance in Indonesia.

Conclusion

The main objective of this study was to identify the influential factors that encourage the implementation of ERM among banking firms in Indonesia. The result suggests that firm size, institutional ownership, and firm as part of the multinational company are the driven factors of ERM adoption. On the other hand, the result of this study also concluded that implementation of ERM has no significant impact on banking firms' performance, measured by ROA and ROE.

This study indicates that firms should consider to improve governance of their risk management, especially in the implementation of ERM, in order to maximize the potential of ERM that will increase firms' performance simultaneously and achieve itsobjectives.

It is recommended that the future research can use more specific measurements for ERM variables, such as how well firms implement elements of ERM in its risk management, to gain more insight into ERM implementation in firms. Moreover, the future research should consider including other variables that have an impact on the firm's performance and also extend the period of observation.

Abstract

Sterculia foetida L. capable of generating 40% oil, but to produce a high yield oil production needs to be done the selection process. The selection process of this plant with the data analysis techniques that include an analysis of the correlation of Pearson, yout traffic analysis against a variable is bound (the weight of seeds/plant and yield in oil) and analysis of the coefficient of determination to determine the degree of influence on the variables. The results show that the character of the result components are very effective as the selection criteria directly to suspect heavy seeds/trees in a row is the nature of the number of secondary branches (37.211%), the character of the amount of fruit/rungs (14.756%), number of seeds/locus (14.284%) and weight of 100 seeds (11.009%), so oil yield can produce 4.893 – 22.716 litres oil/ha/season, that can enhancement economy production..
Keywords: Sterculia foetida L., Analysis technique, bio-oil

Introduction

Indonesia is one of the countries with a dense population, so the demand for energy is high enough from year to year. It (Sugiyono, 2015) led to final energy consumption increased from 221.33 million (SBM) in 1990 into a 489.01 million SBM in 2003 or increased by 6.3% per year. Based on the type of energy, the largest consumption of fuel (BBM). Circumstances encourage man looking for new sources of energy as an alternative energy renewable nature to meet the needs.

The alternative energy that renewable can be derived from plants that have relatively high oil content. One of them is *Sterculia foetida* L. These plants have an oil content of 40% of the seeds, but if performed purification again can reach 75%. So the potential oil yield far more than the fruit of the *Ricinus communis* only 35-45%. So, *Sterculia foetida* L seed becomed alternative materials as biofuels (BBN), because in addition to produce lubricating oil can also be used as biodiesel (solar oil substitute). But it has not been balanced with the strategy of getting a *Sterculia foetida* L have high productivity and high oil yield.

Therefore, these problems can be obtained by performing a selection to find out the degree of keeratan the nature of each correlation, with results that can contribute to the improvement of the nature component of the results. The results of the exploration of what research shows that plants have high genetic diversity seen from the appearance of the phenotype. High phenotype distinction makes it possible to do the selection towards the improvement of the nature.

The purpose of this research is to know the nature of the relationships between the components of the result so that it can be determined as the selection criteria directly or indirectly in order to repair the component nature of billowing crops potentially high-yield and results. The benefits of the research is to know the nature of the relationships between

keeratan/characters component results and direct influence as well as the influence of direct which will not be used as selection criteria appropriate to get potentially billowing plants results and high oil yield.

Materials and Methods
Plant Materials:

    Sterculia foetida L. plants are collected from five province at Central Java and then placed at plant breeding laboratorium

As for the location of research and observations set out samples presented on Table 1.

Table 1. Location research and Sample

City	Region	Village
Karang Anyar	Tasik Madu, Karang Anyar, Jaten	Karangmojo, Karangwuni, Derman, Kodokan, Ngaliyan, Biblis, Lalung, Jati, Ngetal , Jetak
Boyolali	Sawit, Kebon Bimo, Banyudono, Nogosari	Tegalmuncal, Klabang, Kendal Gede, Tlatar, Jagoan, Gatak Malangan, Tagung, Mbadan, Pojok, Bulu
Sukoharjo	Mojolaban, Sukoharjo, Grgol, Bendosari	Pancuran, Cangkol, Ngambak, Lipuro, Nderso, Palur, Triyangan, Macanan, Temulus, Pondok, Minggiran

Jerukan,	
Sabrang	

Design research

The main approach used in this study is to see the relationship between the nature of the functional components of the results against the results and yield in oil. This type of research is a research survey.

Primary data is taken from the sample to be *Sterculia foetida* L. accession, while secondary data taken through direct interview to the elders of the village and gatekeeper of the Tomb, while data agroekology information from relevant agencies in this Department of agriculture and the Office of your local city irrigation.

The population of the research was that plants accession which grows naturally obtained from results of exploration. The technique of sampling done in a proportional cluster random sampling techniques. Sampling is chosen based on the plant's habitat group and done randomly (random). The grouping based on the spread of accession its relic research. To minimize the diversity, then the sample observations set 10 accessions each region sehinggga retrieved 50 sample accession set out as the sample observations.

Variable observation

The variables observed in this study are:

- The Number of Primary Branches
  Counting the number of primary branches did to know a large number of primary branches. The number of primary branches who observed as the sample is 40%.
- The Number of Secondary Branches
  Counting the number of secondary branches carried out to know a large number of secondary branches. The number of secondary branches who observed as the sample is 20%
- The Number of Fruits/rungs
  Counting the number of fruit/rungs do to know a large number of fruit/rungs. While the amount of fruit that is calculated from the branch which provided the sample observations
- The Number of Locus/fruits
  Counting the number of locus/fruit performed to know a large number of locus/fruit. While the number of locus that counted was the branch of the sample observations
- Weight /Fruits
  Calculating weight/fruit did to know the weight/fruit
- The Number of Seeds/Locus
  Counting the number of seeds/locus performed to find out the number of seeds/locus
- Weight 100 seeds
  Weighing the weight of seeds is done by taking a billowing seeds has matured as much perfect 100 seeds by using digital scales
- Weight Seeds/trees
  Calculating the weight of seeds/plant based on a comparison of mathematical determination of sample to produce accurate data. The weight of the seed/tree can be calculated/predicted by knowing the number of primary branches, secondary branches, the total number of fruit/rungs, number of seeds/locus and the weight of 100 seeds
- Oil Yield

The oil yield is knowable by doing the extraction of the seeds of billowing and performed in the laboratory of Soil Biology Faculty of Agriculture University Sebelas Maret Surakarta.

Research Data Analysis

Statistical analysis used in this study are:

- Analysis of the Correlation
- Analysis of Fingerprints Cross/Path Analysis
- Coefficient Analysis

while the software that is used to analyze the data was SPSS version 16.

Results and Discussion

From the results of observations made concerning in the yield potential and yield analysis of oil, *Sterculia foetida* L. plants have a high potential to be developed as a source of energy-producing biofuel crops.

The results of the observation and calculation of the fruit that was conducted in november 2009, billowing plants productivity ranged from 179 – 831 kg dried seed/tree/season. According to sources from the elders of the village and the tomb of the gatekeeper where the plant was located, billowing plants bear fruit throughout the year and the harvest could be 2-3 times/year. Assuming the planting distance 10 x 15 m, plant population among the 66-67 trees/ha, then the crop productivity ranged between 11.993-55.677 kg of dry seeds/ha/season. While the yield in oil among 55 – 80%. If the average oil yield in 68% and core levels of 60%, then every hectare of land can produce 4.893 – 22.716 litres oil/ha/season. Besides the resulting oil plants geared to its economic value so that the lubricating oil is higher.

Correlation Between Character

Correlation Between Character of The Result Components

The results of the research data analysis with pearson correlation analysis technique is retrieved the value of the correlation between the character of the components of the results is presented in Table 2.

Table 2. Phenotypic correlation between character of the result components

Character	X_1	X_2	X_3	X_4	X_5	X_6	X_7
X_1	.	0.777**	0.156	-0.064	0.167	0.011	-0.173
X_2	0.777**	.	0.222	-0.181	0.164	-0.100	-0.152
X_3	0.156	0.222	.	-0.573**	0.173	-0.296*	0.201
X_4	-0.064	-0.181	-0.573**	.	-0.070	0.178	-0.155
X_5	0.167	0.164	0.173	-0.070	.	0.020	-0.135
X_6	0.011	-0.100	-0.296*	0.178	0.020	.	-0.100
X_7	-0.173	-0.152	0.201	-0.155	-0.135	-0.100	.

Notes:

*	=	Correlation significant on $\alpha = 0.05$
**	=	Correlation significant on $\alpha = 0.01$
X_1	=	Number of Primary Branches
X_2	=	Number of Secondary Branches
X_3	=	Number of fruits/rungs
X_4	=	Number of locus/fruits

X_5 = Number of Seeds/locus
X_6 = Weight Fruit
X_7 = Weight 100 seeds

From 7 character of the result components observed show that properties that have the strongest correlation is the character of the number of primary branches with the nature of the number of secondary branches (r_{12} = 0.777 **). Allegedly an increasing number of primary branches will increase the number of secondary branches. The nature of the amount of fruit/rungs with number of loci/fruit has a very strong correlation (r_{34} =-0.573**) that indicates that an increasing number of fruit/rungs will lower the number of locus/fruit. The characte of the amount of fruit/rungs with a heavy fruit has a pretty strong correlation (r_{36} =-0.296*) who showing that an increasing number of fruit/rungs will lose weight/fruit. Whereas on other traits showed a strong correlation.

Correlation Between Character of The Result Components Toward Weight Seeds/trees

The results of the research data analysis with pearson correlation analysis technique is retrieved the value of the correlation between the components of the results against the weight of seeds/trees are presented in Table 3.

Table 3. Correlationn phenotypic between the result components toward weight seeds/trees

Observed properties	Coefisien corelasi
Number of Primary Branches	0.342*
Number of Secondary Branches	0.563**
Number of Fruit/Rungs	0.543**
Number of Lucos/Fruits	-0.407**
Number of Seed/Locus	0.419**
Weight/fruits	-0.132 ^{tn}
Weight 100 seeds	0.308*

Notes:
* = Correlation significant on α = 0.05
** = Correlation significant on α = 0.01

Table 3 shows that the correlation phenotypic between character of the result components of the against the weight of the seed/tree is positive and negative. Results of correlation that indicates a positive correlation coefficient value is significant is the nature of the number of secondary branches (r_2y_1 = 0.563**), the nature of the amount of fruit/rungs (r_3y_1 = 0.543**) and the number of seeds/locus (r_5y_1 = 1.806**) and the correlation of the correlation coefficients that indicate the real positive is the nature of the number of primary branches (r_1y_1 = 0.342*) and the weight of 100 seeds (r_{7Y1} = 0.308*). While the results of correlation coefficients that indicate the negative correlation is significant is the nature of the number of loci/fruit (r_4y_1 =-0.475**), whereas the nature of weight/negative correlation indicates the fruit is not real (r_6y_1 = 0. 132tn).

Correlation Between Character of the Results Components Against Oil Yield

From the results of the research data analysis with pearson correlation analysis technique is retrieved the value of the correlation between the nature of the components of the results against the oil yield is presented in Table 4.

Table 4. Correlation between character of the result components against the oil yield

Observed properties	Coefisien corelasi
Number of Primary Branches	0.383*
Number of Secondary Branches	0.329**
Number of Fruit/Rungs	0.124 ^{tn}
Number of Lucos/Fruits	-0.037 ^{tn}
Number of Seed/Locus	0.039 ^{tn}
Weight/fruits	0.175 *
Weight 100 seeds	-0.458*
Weight Seed/tree	-0.027 ^{tn}

Notes:
*   = Correlation significant on $\alpha = 0.05$
** = Correlation significant on $\alpha = 0.01$

Table 4 shows that the correlation phenotypic between character of the components of the results against the oil yield is positive and negative. From some of the properties of the components of the observed results that have a positive correlation with yield in oil is significant is character of the number of primary branches ($r_1y_2 = 0.383**$) and the correlation with the number of secondary branches correlated positive real ($r_2y_2 = 0.329*$), whereas the correlation with the character of the amount of fruit/rungs ($r_3y_2 = 0.124^{tn}$), number of seeds/locus ($r_5y_2 = 0.039^{tn}$) and the nature of weight/fruit ($r_6y_2 = 0.175^{tn}$) is positively unreal.

The character of the result components are very real negative correlated with yield in oil is heavy character of 100 seeds ($r_7y_2 = -0.458**$). While on the nature of the number of locus/fruit and seed weight of nature/trees correlated negatively with no real yield in oil is indicated by the value of the coefficient of korelasinya ($r_5y = 0.037^{tn}$; $r_8y_2 = -0.027^{tn}$). The correlation indicates that both the nature of no relation to the size and weight of seeds/plant does not affect the yield of oil.

Big nothingness of values correlation between seed yield components with a weight/tree and yield above is indicated by the coefficient of phenotypic correlations between the observed properties is simply to know the degree of keeratan relations, which actually is still influenced by other properties/variables so that the real cause is not yet known. According to Dewey and Lu (1959) is the difference between correlation coefficient analysis and analysis of traffic going from the fact that in a simple method of measuring the correlation keeratan reciprocal relations regardless of the cause, whereas with cross-analysis method of direct influence of the independent variables are not against non-free can be known, not its direct influence as well. While according to Sastrosupadi (2003), the question of the correlation of the degree of keeratan would like to find relations 2 or more variables, whereas in the analysis of cross-correlation coefficient, the total can be broken down into the influence of direct and indirect influence.

The Analysis of Fingerprints Cross
The Analysis of Fingerprints Cross Between The Result Components Against The Weight Seed/Tree

Table 5. Direct and indirect influence for the character number of the primary branch (X_1), the number of secondary branches (X_2), the amount of fruit/rungs (X_3), the number of

locus/fruit (X_4), number of seeds/locus (X_5), the weight of the fruit (X_6), and the weight of 100 seeds (X_7) against the weight of the seed/tree

Free Variables	Direct Influence	Indirect Influence Variables							Coeffisient Correlation
		X_1	X_2	X_3	X_4	X_5	X_6	X_7	
X_1	-0.2140	.	0.5128	0.0424	0.0049	0.0569	0.0006	-0.0618	0.3420
X_2	0.6600	-0.1663	.	0.0604	0.0139	0.0559	-0.0059	-0.0543	0.5638
X_3	0.2720	-0.0334	0.1465	.	0.0441	0.0590	-0.0175	0.0718	0.5425
X_4	-0.0770	0.0137	-0.1195	-0.1559	.	-0.0239	0.0105	-0.0553	-0.4073
X_5	0.3410	-0.0357	0.1082	0.0471	0.0054	.	0.0012	-0.0482	0.4189
X_6	0.0590	-0.0024	-0.0660	-0.0805	-0.0137	0.0068	.	-0.0357	-0.1325
X_7	0.3570	0.0370	-0.1003	0.0547	0.0119	-0.0460	-0.0059	.	0.3084

Based on the analysis in table 5 can be seen that the direct influence of the largest components of the nature of positive results against the weight of the seed/tree row indicated by the direct influence of the nature of the number of secondary branches ($P_2y_1 = 0.6600$), the character of the weight of 100 seeds ($P_7y_1 = 0.3570$), number of seeds/trait locus ($P_5y_1 = 0.3410$), the character of the amount of fruit/rungs ($P_3y_1 = 0.2720$), and the weight of the fruit ($P_6y_1 = 0.0590$), but its influence is very small. Direct influence is shown by the negative nature of the number of primary branches ($0.2140 = -P_1y_1$), and the nature of the number of locus/fruit ($P_2y_1 = -0.0770$).

To know his little big donations variable character of the components of the results against the weight of the seed/tree, then with yout traffic analysis can be determined by determining the coefficients of each of the components against the weight of the seed/tree will be more profitable and retrieved a picture more precisely to the instructions of the selection. The magnitude of the total donations to each of the variables are free through all tracks against the weight of the seed/tree can be seen in Table 6.

Table 6. Total donations to each of the variables are free through all tracks against the weight of the seed/tree

No	The Observed Properties		R^2 (%)
1.	Number of Primary Branches	($P_1y_1r_1y_1$)	7.3188
2.	Number of Secondary Branches	($P_2y_1r_2y_1$)	37.2108
3.	Number Fruit/Rungs	($P_3y_1r_3y_1$)	14.7560
4.	Number locus/fruit	($P_4y_1r_4y_1$)	3.1362

5.	Number Seed/Locus	$(P_5y_1r_5y_1)$	14.2840
6.	Weight/Fruit	$(P_6y_1r_6y_1)$	0.7817
7.	Weight 100 seeds	$(P_7y_1r_7y_1)$	11.0090
	Residual	$(ry_1{}^2)$	11.5035
	The total range of the weight of the seed/tree		100.000

From the results of the analysis of fingerprints and the analysis of the coefficient of determination to find out the magnitude of the total donations (R_2) of each component of the results against the weight of the seed/tree, which had a direct influence of the most powerful in a row is the nature of the amount of the secondary branch, the nature of the amount of fruit/seed amount of properties, rungs/locus, the nature of the weight of 100 seeds and number of primary branches. While the nature of the number of loci/fruit/fruit weight and total donations through the direct influence of these small properties.

The Analysis of Fingerprints Cross Between Components Against Oil Yield Results

Table 7. Direct and indirect influence for the character number of the primary branch (X_1), the number of secondary branches (X_2), the amount of fruit/rungs (X_3), the number of locus/fruit (X_4), number of seeds/locus (X_5), the weight of the fruit (X_6), and the weight of 100 seeds (X_7) against the oil yield

Fre Variable	Direct Influence	Indirect Influence Variable							Coffesient Correlation
		X_1	X_2	X_3	X_4	X_5	X_6	X_7	
X_1	0.2310	.	0.0521	0.0407	-0.0015	-0.0199	0.0023	0.0782	0.3829
X_2	0.0670	0.1795	.	0.0579	-0.0043	-0.0195	-0.0210	0.0687	0.3283
X_3	0.2610	0.0360	0.0149	.	-0.0138	-0.0206	-0.0622	-0.0909	0.1246
X_4	0.0240	-0.0148	-0.0121	-0.1496	.	0.0083	0.0374	0.0701	-0.0367
X_5	-0.1190	0.0386	0.0110	0.0452	-0.0017	.	0.0042	0.0610	0.0393
X_6	0.2100	0.0025	-0.0067	-0.0773	0.0043	-0.0024	.	-0.100	0.0452
X_7	-0.4520	-0.0400	-0.0102	0.0525	-0.0037	0.0161	-0.0210	.	-0.4583

Based on the analysis in table 7 can be seen that the direct influence of the largest components of nature negative results against the weight of the seed/tree row indicated by the direct influence of the nature of the weight of 100 seeds (P_7y_2 =-0.4520), and the number of seeds/locus (P_5y_2 =-0.1190). Direct positive influence then successively shown by direct influence the nature of the amount of fruit/rungs (P_3y_2 = 0.2610), the number of primary

branches ($P_1y_2 = 0.2310$), the nature of the weight of the fruit ($P_6y_2 = 0.2100$), the nature of the number of secondary branches ($P_2y_2 = 0.0670$), and the nature of the number of loci/fruit (P_4y_2 $=$ 0.0240).

Table 8. Total donations to each of the variables are free through all tracks against yield oil

No	The Observed Properties		R^2 (%)
1.	Number of Primary Branches	$(P_1y_1r_1y_1)$	8.8449

7.	Weight 100 seeds	$(P_7y_1r_7y_1)$	20.7151
	Residual	(ry_1^2)	63.4835
	The total range of the weight of the seed/tree		100.000

From the results of the analysis of fingerprints and the analysis of the coefficient determination to find out the magnitude of the total donations (R_2) of each component of the results against yield oil, which has the most powerful direct influence in a row is a weight of 100 seeds, the nature and properties of the number of primary branches number of fruit/rungs. While the nature of the amount of the secondary branch, the nature of weight/fruit, nature of the number of seeds/locus and number of loci/large fruit contribution total through the direct influence of the nature of such small value.

By studying the coefficient of correlation between multiple properties on plants, can be used for examining keeratan relationships between complex traits with specific properties. But it can not be used to make the conclusion effectively because the information is limited, regardless of the complex dependencies among the attributes (Board, et al., 1997). Analysis of the relationship between a trait with other properties using the correlation coefficient analysis can be efficiently used if there are no other variables mempengaruhnya. The use of analysis in solving the coefficients of correlation can know how the direct and indirect influences and shows the relative importance of a component against the character.

In the *Sterculia foetida* L plants information and references about the genetic, morphological, agronomic, cultivation system is still very limited and results of research like this has not been done, so much to get a comparison get the difficulty.

Conclusion
In this research, conclude that:
- Character of the result components are very effective as the selection criteria directly to suspect heavy seeds/trees in a row is the character of the number of secondary branches (37.211%), the nature of the amount of fruit/rungs (14.756%), number of seeds/locus (14.284%) and weight of 100 seeds (11.009%).
- Character of the components of the result are very effective as the selection criteria directly to suspect the oil yield in a row is a weight of 100 seeds (20,715%) and primary branches number of properties (8.845%), whereas the selection criteria not properties directly on a number of secondary branches through the properties of the number of primary branches (2.199%).

- Oil yield can produce 4.893 – 22.716 litres oil/ha/season, so can enhancement economi production.

THE FACTORS AFFECTING CAPITAL ADEQUACY RATIO IN INDONESIA ISLAMIC BANKS

Kusiyaha, Padjadjaran University Indonesia
Mts. Arief,Kusuma Negara Business School Indonesia

Abstract

The banking industry as other business units need to be managed properly to be able to make a profit and sustainable, however, the banking industry still refers to the rules from the regulators. One of them is in term of Capital Adequacy Ratio. Indonesia is one country with a population predominantly Moslem, thus this research will be conducted on the Islamic bank in Indonesia. Previous studies on Capital Adequacy Ratio is usually done by analyzing the internal factors that influence it, but in this study will be coupled with macro factors. The dependent variables of this research is Capital Adequacy Ratio while independent variables consist of Internal factors, Profitability/ROA, Deposit Structure/DEP, Asset Quality/ NPF, Liquidity/FDR, and Operational Efficiency/OEOI, Size Bank/SIZE and External Factors (Inflation Rate/IR). This conceptual paper is to investigate the factors influence the CAR, both factors internal and external and what factors are the most dominant influence.
Keywords :_Capital Adequacy Ratio (CAR), Internal factors, external factors_

Introduction

The banking industry is one of the business units that need to be managed properly and yet still refers to the rules set by the regulator. At the end of the estuary of the banking business, both conventional and Islamic banks must perform well as a company, and the important thing in this industry is the management of capital adequacy ratio (CAR) in the risk sector of banking industry. Capital is a mean to finance income-producing assets and the protector of stability. From the point of view of efficiency and return, capital are part of bank funding sources that can be used directly to purchase assets and also to raise other funds. From the viewpoint of stability, the bank's capital act as a protector to absorb the shock of the loss of business and maintain solvency, to the benefits received by customers and other stakeholders.

Capital Adequacy Ratio is one of the important concept in banking which measures the amount of a bank's capital in relation to the amount of its risk weighted credit exposures. With this study the authors wanted to fill the void in the context of the present study is to see Islamic banking strategy in the management of the fulfillment of capital (CAR) not only from the internal side but also includes influences from the external side.

The ability of banks to maintain liquidity affected the efficiency of the bank's risk management in creating a foundation in business activities as well as bank must choose the level of risk and profit ratios the best. The bank's risk can impact effect on operational costs and ultimately impact the Capital Adequacy Ratio (CAR) of a bank (Jasiene, M., 2012). Kweme (2003), noted the importance of capital adequacy for banking business activities. This means that banks will be able to absorb the liquidity risk in the market, if it has a capital adequacy ratio (CAR).

To encourage the prudent management of the risks associated with the structure of the balance sheet, the authorities in most countries introduce specific capital adequacy requirements. At the end of year 1980, Basel Committee on Banking Supervision lead in developing capital adequacy standards-based risks that will lead to international convergence regulatory oversight governing the capital adequacy of international banks are active, with

the aim to strengthen the health and stability of the banking system, which then developed further by the Islamic Financial Standards Board (IFSB), which in turn set standards of capital adequacy for Islamic banks is not lower than 8%.

In 2004, Basel II proposes a tightening of the rules of CAR. Meanwhile, Basel III is no improvement associated with increasing risk-weighted capital requirements (divided into Tier 1 and Tier 2) and non-risk-weighted leverage ratio. Polat and Al-Khalaf (2014) in his research to analyze the relationship specific variables banks, including CAR (dependent variable), profitability (ROA), non-performing loan (NPL), loan-to-deposit (LTD), leverage (LEV), the dividend payout ratio (DPO), loans (LOA), bank size (Size). This indicates that the ability to maintain the CAR is very important for the health of a bank.

Interesting study also done bySitiRochmah et al (2011) regarding the financial performance of Islamic banks and conventional banks. Now, the conditions are different. The financial performance of Islamic banks are not better than commercial banks. This is reflected in the measurement of the CAR, ROA, ROA, and LDR or FDR as follows:

Table 1
Financial Performance Comparison between commercial bank & Islamic bank in Indonesia, 2014

Indicator	Commercial Bank *			Islamic Bank**				
	2012	2013	2014	2012	2013	2014		
CAR	17,43	18,13	19.57	14,14	14,42	15,74		
ROA	3,11	3,08	2,85	1,94	1,58	0,41

* Commercial Bank covers Conventional Bank and Islamic Bank(BUS)								
**Islamic Bank covers Islamic Commercial Bank (BUS) dan Business Unit Conventional Bank (UUS)								

From several studies including that conducted by Erico and Partners Farahbaksh (1998) states that the rules of economic authority for sharia bank can basically use the same size with the bank, although in some cases the management of Islamic banks and conventional is similar.

Said (2012) conducted a study on how the application of the system of Islamic banking ranging from the establishment of the beginning of the establishment of the Dubai Islamic Bank in the United Arab Emirates, then continues in Jidda, Saudi Arabia, Egypt, Sudan, Kuwait, Bahrain and other countries. The need to put forward that are relevant to my research is put forward a study conducted in Indonesia are carried out by Umar, Majid and Rulindo during 2002 to 2004 at 21 private banks with DEA method. With a sample consisting of two Islamic banks and conventional banks remaining.

Likewise research done by Saifullah, on 2004-2008 found that Islamic banks are better in business development, profitability, liquidity and solvency compared with conventional banks. This was stated in the Journal of Literature Review, that on variety of studies both conventional banks and Islamic banks is mainly related to the bank's financial performance, especially in terms of efficiency between Islamic banks, including a variety of discourse, controversy and inconsistency of various studies. In this study the approach to measure efficiency was still simple.

The purpose of this paper is to present conceptual framework to see what factors are affecting the Capital Adequacy Ratio, which include internal factors which consists of some financial ratios, then Size banks and external factors, namely inflation rate.

Many studies, linking the effect of achieving the CAR management, attributed to internal factors and financial ratios. But, not many who   measure CAR, from internal and external at the same time, the macroeconomic factors in this study is the inflation rate.

Lia Amaliawati and Lasmanah(2014) addressed the issue of Capital Adequacy Ratio and some other financial ratio bu there, CAR is not as dependent variables but parallel with the other variables acts an antecedent and also was associated with bank management efficiency.

Many studies, linking the effect of achieving the CAR management, associated with its financial ratios. But, from the reference study, there has been no or not much that incorporate elements of management initiatives, namely the management of measurement of the size of CAR in the bank. In one article(Cohen, 2014), the author fill the research gap on this side. Also Schaffer(2011) delivered on banking studies which incorporate at least the macro element in the management of his CAR, has been a differentiator with previous studies, the researchers conducted answers to the current debate between the management of CAR.

Research conducted Dreca Nada (2013) and Ahmet and HasanBuyuksalvarciAbdioglu (2011) convey the determinant factors affecting capital adequacy / CAR, but seen from internal factors. The dynamics of the market risk in theIndonesia banking structure requires to be able to manage capital adequacy ratio (CAR) which is able to adapt to external shocks. As also stated by Nnanna (2003), a common indicator of macro factors developed by the IMF in assessing the health of the Bank with the acronym CAMELS which include Capital (adequacy), Assets, Quality, Management, Earnings, Liquidity, and Sensitivity to market risks.

Research on the CAR, especially in Islamic banking has been done by several researchers, although not much compared to conventional banks, but in this study the researchers wanted to know CAR associated with the external dynamics that inflation rate. Empirical studies on the determinants of banking Saudi Arabia against CAR (Polat and Al-khalaf, 2014) as well as the idea to include macro policies factor into it (Cohen and Scatigna, 2014), an interesting topic for research on Islamic Banking in Indonesia. Because not much research, especially for Islamic banking which combines internal factor by factors external / macro against Capital Adequacy. Some studies usually do so partially, this is where the researchers want to find a gap theory that has never been done by other researchers.

Many studies, linking the effect of achieving the CAR management of both conventional and Islamic banking more just through its financial ratios or internal factors. But there has been no or perhaps rare that CAR management for Islamic banks that combined with external factors.

The purpose of this study is to propose a more comprehensive research model to complete some previous research that can be developed more fully and comprehensively to determine the determinant factors on the capital adequacy of Islamic banks.

Capital adequacy

The bank as a business unit requires "blood" of the business, namely capital. In other words, the bank's capital is an important aspect for a business unit of the bank. Because operates whether or reliability of a bank, one of which is strongly influenced by the condition of capital adequacy.

LiaAmaliawati and Lasmanah (2014) addressed the issue of Capital Adequacy Ratio and some other financial ratio but here, CAR is not as dependent variables but parallel with the other variables as antecedent and also was associated with bank management efficiency.

Bank capital has three functions (Johnson and Johnson, 1985) which are:

  a. As a buffer to absorb operational losses and other losses. In this function of capital provides protection against failures or bank losses and the protection of depositors.
  b. As a basis for the set lending limit. This is an operational consideration for the central bank, as the regulator to limit the amount of lending to each individual bank

customers. Through this restriction the central bank forced banks to diversify their credit in order to protect themselves against credit failure of one individual debtor.

c. Forms the basis for market participants to evaluate the relative levels of the bank's ability to generate profits were. The rate of return for investors is estimated by comparing net profit with equity. Market participants to compare the return on investment among the existing banks.

While Hempel, Coleman and Simonson (1986) in relation to the function of the bank's capital, stressing there are four things, namely:

a. To protect the depositors , when in a state bank and liquidation insolvency
b. To absorb unexpected losses in order to maintain public confidence that the bank can continuously operate.
c. To obtain the physical facilities and other basic necessities needed to offer bank services.
d. As a means of implementing regulations controlling improper asset expansion.

See capital above functions, it can be seen that the position of capital is an important thing that must be met primarily by the founder of the bank and the bank's management for the bank operation.

Capital resources of banks according to Hempel, Coleman and Simonson (1986) is divided into three main forms of subordinated debt, preferred stock and common stock. Some types of subordinated loans and preferred stock convertible into common stock, and common stock can be developed, either external or internal.

Sources of capital above is the concept of capital theory in conventional banks. For Islamic banks, loan capital (subordinates loan) including greetings qard categories, namely loans refundable price. In fiqh literature Ash SalafSalih, qard categorized in aqadtathawwu, or contract mutual help and not a commercial transaction (Muhammad, 1999).

The main sources of Islamic bank capital is core capital (core capital) and quasi-equity. Core capital is capital from the owners of the bank, which consists of the capital subscribed by the shareholders, reserves and retained earnings. While quasi equity funds recorded in the accounts for the results (mudarabah). This is the core capital that serves as a buffer and absorbing failures or bank losses and protect the interests of account holders deposit (wadiah) or loans (qard), mainly on assets funded by its own capital and funds wadiah or qard.

The capital adequacy is important in the banking business. Banks that have a good level of capital adequacy shows indicators as healthy banks. For capital adequacy of banks shows that the situation is expressed by the so-called act a certain ratio of capital adequacy ratio or the Capital Adequacy Ratio (CAR). The capital adequacy level can be measured by (ZainulArifin, 2002):\

a. Comparing capital with third-party funds

Viewed from the angle of the protection of the interests of the depositors, the ratio between capital and liability items is an indication of the level of security in bank deposits by the masses. The calculation is the ratio of capital associated with third party deposits (current accounts and savings accounts) as follows:

$$\frac{\text{Capital and Reserves}}{\text{Demand Deposits} + \text{Savings}} = 12\%$$

From these calculations it can be seen that the capital ratio on deposits simply by 10% and the ratio of bank capital that is considered healthy. Ratio between capital and public deposits should be integrated with asset and should take account of the risk. Therefore, the capital

must be supplemented by various capital reserves as a buffer, so in general the bank's capital consists of core capital and supplementary capital.

b.   Comparing capital to risk assets

The second measure is today into an agreement BIS (Bank for International Settlements), namely the organization of central banks of developed countries sponsored by the US, Canada, the countries of Western Europe and Japan. The agreement on capital requirements was achieved in 1988, by setting the minimum CAR ratio is the ratio between capital base with risky assets.

$$\frac{\text{Capital and Reserves}}{\text{Risk Weighted Assets}} = 12\%$$

This agreement was motivated by the observation banking experts developed countries, including the experts of the IMF and the World Bank, of the existence of structural inequality and the international banking system. This is supported by a number of indications as follows:

a) Loan crisis countries of Latin America were speculative disrupt the smooth flow of international money circulation.
b) Which is considered unfair competition among Japanese banks with banks of America and Europe in the International Money Market. Japanese banks lend very soft (low interest) because of the provisions of CAR in the country is very soft, which is between 2 to 3 percent.
c) Disruption of international lending situation which result in disruption of international trade.

Based on the indications mentioned above, the BIS establishes protection provisions of the Capital Adequacy Ratio (CAR) to be followed by banks worldwide as a rule in a fair competition in the global financial markets, the ratio of minimum 8% capital against risky assets (Muchdarsyah, 1994).

Internal factors
Internal factors affecting capital adequacy in this study uses several financial ratios and size of the bank.

1. Financial Ratios

Financial ratio analysis as a measurement of financial performance in the financial statements could be used as a basis for predicting the financial condition, business operations, earnings and dividends in the future. Financial ratio analysis combines the financial relationship between the components of the other financial components. In general, the relationship is seen from the ratio between the financial components with one another. Ratio analysis is also useful to compare the company's performance with each other or compare the performance of the company this year with another year
The ratio of accounting / financial ratios to minimize differences in the size of the bank and make them in average (Samad, 2004). The use of accounting ratios common in the literature (Samad and Hassan, 2000; Samad, 2004). Financial ratios have 13 financial ratios and can be grouped into four broad categories, namely the profitability ratios, liquidity ratios, the ratio of risk and solvency and efficiency ratios.

Mahmud and Halim (2003), Hanafi (2003) measure of performance includes the following ratios:

a. Liquidity ratio measures the ability of the company's short-term liquidity to see the company's current assets relative to current debt (debt in this case is the obligation of the company) that serves to determine the company's ability to meet its short term obligations or the company's ability to meet its financial obligations at the time billed. Normally the ratio used is the current ratio, cash ratio and net working capital to total assets ratio.

b. Solvency Ratio / Leverage ratios measure the extent the company meets its long-term obligations. Companies that are not solvable is a company whose total debt is greater dibadingkan total assets. Ratios include debt to total assets ratio, total debt to total capital assets ratio, total debt to equity ratio, long-term debt to equity ratio, etc.

c. Profitability ratios measure a company's ability to generate profit/ loss on the level of sales, assets and certain share capital at a certain period. Some frequently used ratio is the gross profit margin, net profit margin, return on total equity, and so on.

2. Size Bank

Company size is an idea of the size of the companies that appear in the value of total assets at year-end balance sheet. In terms of obtaining funds, large companies have the flexibility and ability to obtain funding because of the easier access to capital markets.

Measurements size companies conducted by the natural logarithm that transforms heteroscedaticity namely to reduce the presence of enlarged variance or spread on each errorthat will produce biased estimated coefficients (Gujarati, 1995). The formula company size is as follows:

Firm size = The Natural Logarithm of Total Asset (LnTA)

Titman and Wessels (1988) suggested that the relatively large companies are generally more diversified as it can optimize the use of debt ratio targets, so it is not easy for bankruptcy. Therefore, large companies tend to use higher debt. This is consistent with the theory that trade off the higher rate of profit, the company will ramp to obtain greater profits by reducing taxes and when debt levels are too high, it will be reduced to the optimum targets.

The argument is different from Myer and Majluf (1984), that the size of the company-related negative leverage due to asymmetric information between the internal and external parties that tend to be larger on the smaller company than in large companies, in other words big companies are more transparent and more accessible to the parties so companies tend to fund external financial sources sensitive internal information, which will use equity through the capital market, thus inversely proportional to the size of the company's corporate leverage. This argument is consistent with the theory of pecking order that obtaining external funds by issuing shares when they cost less than the issuing of debt due to the small degree of asymmetric information, and in this regard large companies are generally more transparent. In contrast to small companies with a large degree of asymmetry would choose a debt due to its lower cost rather than issuing shares.

External factors

Macro-economic linkages with the business / businesses be interesting to be explored, especially banking financial sector. Monetary policy (and abroad) affect economic activity in the banking financial sector, such as open market operations, the establishment of statutory reserves, the determination of interest rates.

Relations macroeconomic (monetary) and micro, is not a new thing in the world. However, it becomes interesting when studying the implications of the macro sector into the base or

foundation of building resilience micro enterprises / businesses. Global economic uncertainty and increasingly demanding national micro sector (bank) must be prepared as such to strongly build the foundation of business.

Banking financial sector has basically been set as an indicator for the security of a financial institution bank and non-bank, that is facing the uncertainty of the macro sector (monetary). Indonesia's role in the supervision of financial institutions and non-bank banks conducted by the Financial Services Authority (FSA). Prudential regulations set by the FSA include twenty provisions, some of which are core capital of commercial banks, the capital adequacy ratio, net foreign exchange position, lending limits, asset quality, allowance for uncollectible assets, restructuring of credit, restructuring financing for Islamic banks and UUS, statutory reserves, the transparency of the financial condition of the bank, bank product information transparency and use of personal data, and more. Meanwhile, the provisions of the rating of the bank by the FSA, including the risk profile (risk profile), good corporate governance (GCG), profitability (earnings) and capital (capital).

The ability of banks to maintain the soundness of the business / her business cannot be separated from management capabilities that has set the level of risk faced. The fourth factor which the provision of health assessment has covered various components that must be maintained and enhanced by the bank. Bank performance (ROA, NPL, ROE, etc.) who either need the support of macro policies to maintain the stability of the banking financial sector. Thus, synchronization between macro policies (monetary) to the micro sector (bank) becomes the main thing in maintaining the health of the banks to face global economic fluctuations which occur in the last decade.

Said (2012) conducted a study on how the application of the system of Islamic banking ranging from the establishment of the beginning of the establishment of the Dubai Islamic Bank in the United Arab Emirates, then continues in Jidda, Saudi Arabia, Egypt, Sudan, Kuwait, Bahrain and other countries. Likewise to be stated that this study is relevant to put forward a study conducted in Indonesia are carried out by Umar, Majid and Rulindo during 2002 to 2004 at 21 private banks with DEA method. With a sample consisting of two Islamic banks and conventional banks remaining. Here in the can that Islamic banks to operate above the average cost and profit efficiency compared to conventional banks.

Likewise research done by Saifullah, on 2004-2008 found that Islamic banks are better in business development, profitability, liquidity and solvency compared with conventional banks. This was stated in the Journal of Literature Review, that on variety of studies both conventional banks and Islamic banks is mainly related to the bank's financial performance, especially in terms of efficiency between Islamic banks, including a variety of discourse, controversy and inconsistency of various studies.

The research to wanted to see what factors are affecting the Capital Adequacy Ratio, some of them with through the analysis of Financial Ratio, Size banks and of macroeconomic factors.

Dreca (2013) discusses the CAR affected by the capital structure, the size of the bank, an indicator of profitability, participation of deposits and loans on total assets and leverage. Results of the research that Size, DEP, LOA, ROA, ROE and LEV has significant influence, while LLR and NIM does not have a significant impact on CAR.

Bohari, Ali and Sultan (2012), conducted a study on the banking sector in Pakistan. Results of the study found that Average Capital Ratio, capital requirements and portfolio risk ratio showed a weak correlation, while the share of deposits, and ROE has shown strong but negative correlation.

Variable and hypotheses

1. *Return on Asset (ROA) on Capital Adequacy Ratio (CAR)*

The profitability ratio describes the ability of a company to make a profit with a given amount of capital (Melissa, 2012). The profitability ratio in this study was measured using financial ratios, including ROA, ROA and NIM. Polat and Al-khalaf (2014) describes factors that affect the Bank's CAR in Turkey 2006-2010, ie loan, ROA, leverage, NIM, deposits, and the liquidity and the Bank Size. Buyuksalvarcy and Abdioglu (2011) using ROA as a proxy for profitability, and stated that the tendency to increase the profitability of capital. Sundarajan and Errico (2002) held that the high NPF will reduce the quality of assets and the expected effect on capital adequacy in Islamic banks.

H1: Return on Assets (ROA) has significant effect on Capital Adequacy

2. *Structure of Deposits (DEP) on Capital Adequacy Ratio (CAR)*

Research on the link structure of the deposit to the capital adequacy has been done by Ismal (2011), as well as carried out by Sharpe (1977), Dowd (1999), as well as Harold (1999), which states the importance of deposits for capital adequacy.

H2: Structure of deposits (DEP) has significant effect onCapital Adequacy Ratio

3. *Liquidity (FDR) on Capital Adequacy Ratio (CAR)*

Bank said liquid if it has the ability to meet its obligations, it can repay all its depositors, and meet credit demand submitted. Liquidity ratio illustrates the company's ability to meet its short term obligations (Melissa, 2012). Melissa (2012) was a component of liquidity ratios that include financial indicators such as loan-to-deposit ratio (LDR) / financing to total deposits (FDR).

H3: FDRhas significant effect on Capital Adequacy Ratio

4. *Operational Efficiency (OEOI) on Capital Adequacy Ratio (CAR)*

Operating efficiency of research has been done by Sahajwala and Bergh (2000) and Sarker (2006). Stating that OEOI / Operating expense on operating income can be used as an indicator to evaluate the quality of bank management, particularly in operational efficiency.

H4: Operational Efficiency / OEOI has significant effect on Capital Adequacy Ratio

5. *Leverage (LEV) on Capital Adequacy Ratio (CAR)*

Leverage is the ratio of equity to liabilities in a company. The magnitude of the leverage ratio of the company describes the level of liabilities to equity gets smaller.

Büyükşalvarcı and Abdioğlu in Polat and Al-khalaf (2014) found that leverage negatively affecting the CAR. This is in contrast with Ho and Hsu (2010) analyzed the relationship between leverage, performance and CAR in Taiwan during the study period 2001-2006, indicates that company size, leverage, and financial costs positively affects the performance of the company. Polat and Al-khalaf (2014) in his study of a number of banks in Saudi Arabia, suggesting that leverage positive effect on the bank's CAR.

H5: Leverage (LEV) has significant effect onCapital Adequacy Ratio

6. *Bank Size (SIZE) on Capital Adequacy Ratio (CAR)*

Al-Sabbagh in Polat and Al-khalaf (2014), as well as research Goddard (2000) in European banks, and Smirlock (2001) in Liu and Wilson, 2010, stating the effect of bank size on CAR

H6: Bank size (SIZE) has significant effect onCapital Adequacy Ratio

7. Inflation Rate (IR) on Capital Adequacy Ratio (CAR) Bank

Variables associated with the influence of external / macro-economics of the capital, William (2011) conducted a study in the banking industry in Nigeria, which are: inflation rate, exchange rate is a predictor of the CAR. Likewise, linking macroeconomic research conducted by JA &AdegbiteOjo (2010) and Newman L (2010).

H7: Inflation Rate has significant effect on Adequacy Ratio

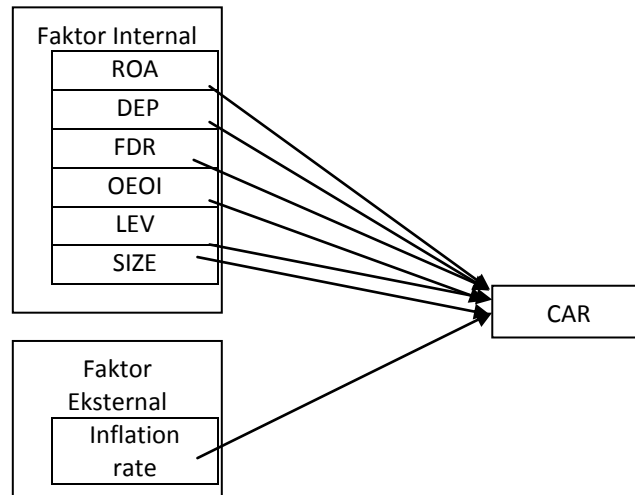
Based on the framework above, the Proposed model of research :


Figure 1
Conceptual Framework

Proposed hypothesis

Based on the identification problem, research objectives and framework, the authors formulate the research related to the tests that will be carried out as follows:

H1 = rate of return on assets (ROA) has significant effect on capital adequacy ratio (CAR) of banks

H2 = Deposit Structure (DEP) has significant effect on(CAR) of banks

H3 = financing to total deposits (FDR) has significant effect on capital adequacy ratio (CAR) of banks

H4 = OEOI (ratio of operating expenses to operating income) has significant effect oncapital adequacy ratio (CAR) of banks

H5 = leverage (LEV) has significant effect oncapital adequacy ratio (CAR) of banks

H6 = Size Bank (SIZE) has significant effect oncapital adequacy ratio (CAR) of banks

H7 = inflation rate (IR) has significant effect oncapital adequacy ratio (CAR) of bank

Conclusion

The purpose of this conceptual paper is to investigate the factors that influence the CAR/ Capital Adequacy Ratio, both factors internal, and external micro and what factors are the most dominant influence. Thus it will be utilized for the banking industry and regulators in making decisions.

This type of research is verification, which aims to determine the relationship between variables through a hypothesis testing and other research method which aims to clarify the relationship variables.

Object of this research is the capital adequacy of Islamic banking in Indonesia, which is influenced by internal factors (ROA, DEP, FDR, OEOI, LEV, Size Bank) as well as external factors (IR). Then study the test empris detection accuracy and validation of the model is formed.

In this study the researcher have not entered some other external factor.The factor that affect Capital Adequacy Ratio/CAR, such as Interest Rate, Demand Deposit, Money Supply, and other external factors.

BUSINESS STRATEGY DEVELOPMENT USING SCENARIO PLANNING FOR TELKOMSEL T-CASH

Henry Ganda, Institut Teknologi Bandung, Indonesia

Abstract

Massive growth of the Internet along with the growth of mobile Internet access affects the lifestyle of people in the transaction. Based on the results of the world market research, there was a shift from the global trend towards non-cash cash. Transactions occurs with a volume of 357.9 billion in 2013, with steady growth of 7.6% in 2013 and 8.9% in 2014. The Asian continent is the fastest growing with 21.6%, led by China. More than 10% of transactions are digital and electronic payments (Lees and King, 2015). However, from the 250 million population of Indonesia there are 60 million people who have a bank account which is still relatively low when compared to the mobile phone penetration which has reached 123.1% in 2014. There are 70 million people in the city and 100 million people in villages that do not have a bank account (Wirjoatmodjo, 2016). This conditions can occur mainly due to: Minimum balance requirement is high for some people in Indonesia, especially for the poor people, additional costs for administration, card manufacturing and others, remote areas quite far from the bank.

The purpose of this research is to develop business strategy using scenario planning approach. Data collection method used is a combination of data collection through literature and collecting data through interviews with management, customers, and competitors T-Cash. Based on current conditions there is uncertainty in terms of regulation governing the company is allowed to do business micropayment. Aside from the regulatory uncertainties that may change the strategy map is a global player on the market penetration in the country. From these two things will produce four scenarios that will change the strategy of T-Cash. As the implementation of the recommendations of planning scenarios have been compiled in this research, planning scenarios that had been developed in this research needs to be synergized with the existing company's strategy. This research also analyzes the company's business conditions in T-Cash in 2015 and gave suggestions that scenario planning should be started within the next five years.
Keywords: *Scenario Planning, Business Micro Payment, T-Cash, Corporate Strategy*

Introduction

Robert Reich (2012), argued: "There will be a time – I don't know when, I can't give you a date – when physical money is just going to cease to exist"

The volume and value of electronic money transactions in Indonesia climbed significantly, amounting to a total of 535.6 million transactions and IDR 5.3 trillion respectively. The positive growth reflected in these figures represented an increase in the volume and value of electronic money transactions of 163.4% and 59.1% respectively from the previous period's figures of 203.4 million transactions and IDR 3.3 trillion (Bank Indonesia, 2015). The cash circulating in Indonesia is around IDR 450 T in normal days. In peak seasons, for example in Eid Al-Fitr (lebaran) the cash circulated is around IDR 550 T. The retail transactions are about IDR 7500 T and 31% are using non-cash. Indonesia is the lowest cash less transaction in ASEAN, where other countries are using cash less more than 51% (Martowardojo, 2014). However, out of 250 millions people in

Indonesia, only 60 millions of them own bank account which is relatively low compared to cellular phone penetration that reached 123,1% in 2014. There are 70 millions people in the cities and 100 millions people in the villages do not have bank account (Wirjoatmodjo, 2016).

Telkomsel launch T-Cash in 27th November 2007 as the first mobile wallet and mobile e-money to facilitate financial transactions through mobile. In the mid of 2011, Telkomsel launched contactless payment via mobile phone. This innovation is the first and the only one in Indonesia called Tap-Izy. In October 2015, PT. Telkomsel launched a new development of mobile services of e-money by introducing the use of technology sticker NFC (Near Field Communication) to replace the SIM card with RFID technology. It use very short range of radio transmission, only few centimeters. The customers will pairing its MSISDN number (card identity) to the seller or shop that has a mobile e-money accounts. In addition, transactions are also very secure because customers must use PIN (Personal Identification Number) as a verification. TCASH Tap itself is already widely accepted in more than 2,500 merchants within the Jabodetabek area and an expansion plan is underway to cater to more cities in Indonesia. TCASH Tap features TCASH mobile money services, i.e. quick payment using tap, online shopping, buy and pay through mobile phone, and money transfer. Telkomsel also sealed partnership with communities and organizations, such as schools and Islamic boarding schools (Pesantren), to introduce e-money transactions to rural communities, representing Telkomsel's commitment to support Government's National Cashless Movement.

In 2015 program, one of the masterpieces of Telkomsel is "great digital payment experience". Marketing activities and Sales activities also are created to support masterpiece in digital payments. The main product of this masterpiece is T-Cash considering the big opportunity in Indonesia as stated by Wiryoatmodjo (2016) where 170 millions of people (about 70% of the population) do not have banks account. Even the opportunity is enormous, but the competition in this segment is very tight. Telkomsel as a Telco Company is not only competing with other Telco Company, but also with banking industry as well. Payment is a new business for Telkomsel and it is not a core business of Telkomsel. There are already big players in this segment, E-Money Mandiri and Flazz BCA followed by four new comers to penetrate the market such as Brizzi BRI, Tapcash BNI and BTN Blink, JakCard Bank DKI. In the Telco industry, XL comes with XLTunai and Indosat with Dompetku and Smartfren with Uangku. Telkomsel also must pay attention also to the growth and penetration of Apple with Apple Pay and Google with Android Pay and also PayPal. In the existing market, there is Doku Wallet as an Over The Top Payment Application. In the other hand, some of the business which are not banks or Telco operators also creates a micropayment to support their business, such as Digicash for online gamers, Dimopay using QR which enables cross-platform transaction, Mimopay, Starbucks card and Go Pay from Gojek. Telkomsel face a tough strategic decision making in this tough competitions. This choice will define and impact to the investment strategy. The potential market is enormous, a lot of citizens do not have bank account and also much more does not use electronic micropayment. In the other hand, there are stiff competitions from existing companies and it will be more tough competitions if any new competitors with new business model from OTT or global player enter the market. The game in this business very dynamic and government are catching up regulations to secure the industry make benefit for the citizens and also for the country.

Scenario planning is an effective strategic planning tool for medium to long-term planning under uncertain conditions. This research is using scenario planning to manage the uncertainty and the rapid changing environment in the micropayment industry. This limitation for 5 years is based on the best practice in the Telco Industry. Telco industry

is the fast technology roadmap and triggered by the handset manufacturer and application developer.

Business issues exploration

Conceptual Framework

In current conditions, revenue stream for all operators mostly comes from voice traffic. Voice traffic trends is degrade day by day due to the increment users of the OTT like WhatsApp, Line, WeChat, Telegram, etc. Telkomsel have a strategy to broader the capability in digital business and one of the strategies is to grab the opportunity in the micropayment business. Telkomsel use T-Cash as an enabler in this business. In the micropayment business, there are a lot of players and the biggest player in Indonesia comes from banking sector like BCA with Flazz and Mandiri with e-money. In this mobile micropayment business, there are uncertainty that must be aware and be managed that possible happen in the future.

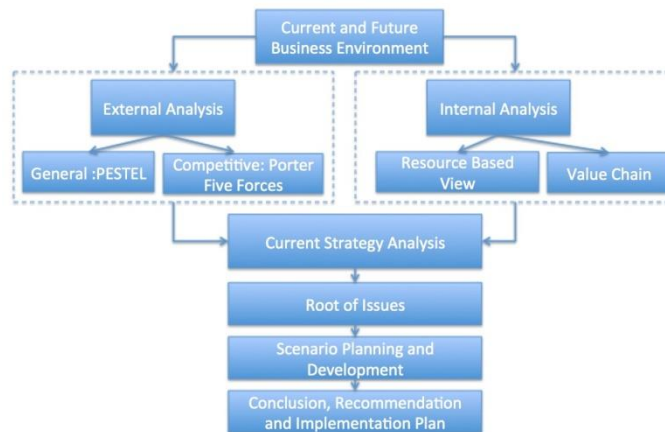
T-Cash needs a scenario planning to manage sustainability of this product. In order to create the scenario planning, the current and future business trends understanding and assessment is required to broader the knowledge of the business context. Internal analysis and external analysis are used to explore the T-Cash strength, weakness, opportunity and threat in micropayment business. This current strategy analysis will define the root of issues. Based on the issues, we finally develop the scenario planning and implementation. Below is the conceptual framework that is used in this project.


Figure 1. Conceptual Framework

External Environment

PESTEL Analysis

From the PESTEL analysis, the conclusion that can be gather:

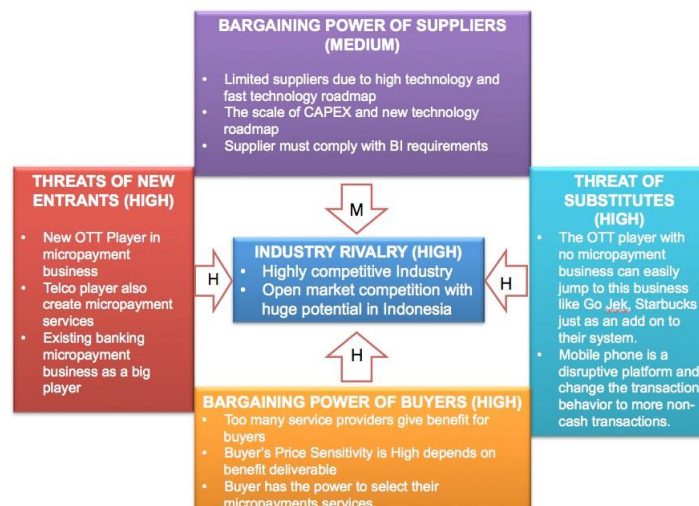
1. Competition is very high even today with the open market in the region with ASEAN Market Community (AEC). In the other hand, the opportunity lies ahead due to the movement of the government to accelerate the non-cash transaction.
2. The growth of non-cash transaction very high and it is inline also with the growth of

electronic money.
Table 1. Region Mobile Penetration versus Financial (Ernst and Young, 2014)

     Economic of Indonesia are still in good shape even the global countries tend stagnant

3.   and even worse. In the specific service sector, the GDP even grow higher.

4.   Indonesia demography with younger people makes the market easily adopt new product with new technology. The lifestyle change more digital in the social activities, transaction and also spread to most of activities and environment. More people are using smartphone, non--cash transaction and NFC capable handset.

Table 2. Indonesia Pyramid Population (CIA World Factbook, 2015)


Porter Five Forces

Figure 2. Porter Five Forces Payment Industry

From the Porter Forces analysis, five forces that must compete and win competition are the fierce battleground. The conclusion from the Porter Forces as follows:

1. Entry barrier is very low but the competition is very high. A lot of big players are already in the market
2. It is easy to enter the business but it is not easy to get out due to the huge investment in this business.

Internal Environment

Resources Based Analysis

This analysis usually is called VRIO (Valuable, Rare, Difficult to Imitate and Organized). Based on this analysis, T-Cash VRIO can be describes as follows:

- T-Cash is the micropayment product from Telkomsel, Telkomsel is leading operator in Indonesia.
- T-Cash is the pioneer of the mobile micropayment in Indonesia. It started since 2007 and has an advance technology to support T-Cash.
- T-Cash payment system is supported by the advance mobile technology in Telkomsel. T- Cash can use all of the resources to make a differentiation to other product.
- Telkomsel have expertises in the mobile business but lack of resources in micropayment.

Value Chain Analysis

This framework is used to views the organization as a sequential process of value creating activities.
Figure 0‑1 T‑Cash Value Chain

The conclusion from the value chain analysis as follows:

- In the primary activities, there are some areas need to be strengthen. The operations of this business are different from the existing capabilities. Strengthen the core business competencies and core capabilities. Improve the operations business process, competencies and capabilities also impact the service deliverable. Service quality is the characteristic of the financial services and it measures from the accountable SLA (service level agreement) and MTTR (mean time to repair) ratio.
- In the support activities, there are some areas some focus area. Human Resources management is the key area to support and produce great resources with high capabilities and competencies. Telkomsel must aware of rapid updated of technology roadmap and ensure the investment in technology will support the business needs and the improve the customers experiences

Porter's Generic Strategy

Based on Porter's Generic strategy, T‑Cash is using **Differentiation** as their competitive advantage. Innovation is the key to keep the company has the competitive advantage from other company. T‑Cash using approach to fulfill the area that existing financial system that cannot deliver using their existing resources. The differentiation that T‑Cash give to the customers:
- T‑Cash as the lifestyle to the banked customers. It provides the fast and convenient transaction just "tap and go", fast and safe transaction with H+1 settlement, great customer experience as the easiest payment method.
- T‑Cash as enabler to the non‑banked customers. It provide the easiest way to do transaction by USSD for the feature/low segment phone, reduce the theft issues, ensure targeted transfers and reception of the government aids which is called "bantuan langsung tunai".
- Telkomsel coverage that spread across Indonesia and more than thousands agent that cover rural areas can use as the "mini bank" for the cash out and cash in.

Business solution

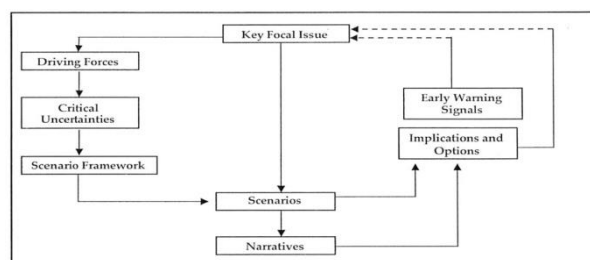
In order to deal with the uncertainties, T‑Cash required scenario planning. According to Garvin, there are several components of the scenario planning that together create the view of the future (Garvin and Levesque, 2006).


Figure 0‑2 Scenario Planning Components

This research is using data collection that was conducted through two methods;

there are literature review, electronic micropayment customer's qualitative survey and interview with expert. Literature review to get the insight related the theory, internal and external environment,   the business sustainability and competitiveness. The respondent profiles in this research project are management team, customers of other electronic micropayment and customers of T‑Cash. The goal from interview with T‑Cash management are to get the insight related to the industry and trend in the future, the challenge and opportunity in the electronic micropayment industry. This interview session want to get the focal issues, driver and early warning regarding the T‑Cash strategy and the industry behavior   itself.

Scenario Planning Development

1. T‑Cash Business Key focal Issues and Driving Forces

The key focal issues that have been identified based on the internal and external analysis, semi structural interviews and customers survey were:

a. How T‑Cash increases market share and revenue in the tight micropayment competitive market?
b. How T‑Cash increases competitiveness with the banking, OTT and telecommunication operator micropayment and competes the service deliverable to competitor?
c. How T‑Cash reaches the superiority in an Integrated Mobile Financial Services Eco‑‑system?
d. How T‑Cash dealt with the regulation that set the rule of the game?

The driving forces will be mapped and grouped based on the degree of uncertainties and the level of the impact. Degree uncertainty and the level of impact from driving forces can be seen at below table.

		Degree Of Uncertainty		
		LOW	MEDIUM	HIGH
Level of Impact	HIGH	Human Resources Capability Telkomsel Financial and Support Fee of Services	Economic Climate Customer Lifestyle Trend Innovation	Government Regulation Market Competition
	MEDIUM	Telkomsel Subscriber Growth	TECHNOLOGY PUSH	Product Substitution
	LOW	Supplier Push	POLITICAL SITUATION	Security Issues

The critical uncertainties ranked by the highest degree of uncertainty and the highest levels of impact are:

Government Regulation
      Regulation in the electronic money is dynamic because it is quite new payment method and   the market behavior is still keep changing and market penetration is still low. Based on the interview from the customers, the low penetration is happen due to the customers did not see any benefit from using the electronic money. They used electronic money because they have to use it for the e‑toll card and some of them use it for cinema discount, for example: 21 Cineplex discount for T‑Cash customers. There is a time when the electronic money is the primary payment method in the micropayment transaction. When it happens, regulation already mature and the micropayment player also

already consolidate in term of services, customers and companies.

Market Competition

The potential market in this business is very huge because there are 70% of the Indonesian citizens did transactions with cash and only 30% with non-cash. Even the market potential is very huge; the competition also is very tight. The competition is happen in cross industry, start form telecommunication provider, banking and OTT player. New OTT player with the huge customers will use their own electronic micropayment with attractive discount of their product. Starbucks and GoJek already have their own electronic micropayment.

2. Establishing Scenario Planning for T-Cash in Electronic Micropayment Business

The scenario is built based on the combination of the highest rank of uncertainties and impact. The uncertainties spectrum will create the 2x2 matrix with four quadrants. Four quadrants create four scenarios with the description that highlight risks and opportunities will be faced in the future.
Figure 2-1 T-Cash Scenario

Scenario Narratives

Scenario Title: **T-Cash The Conqueror**
Narratives:

Politics in Indonesia are stable and support industries to keep moving in the right track. More policies and regulations are produced to improve the existing environment condition to be more transparent and more accountable. In the mobile services, all of the users are using smartphone as their mobile and digital lifestyle. People are using their mobile as their primary need, not only for legacy communication (voice and chat), but also for non-human communication (internet of things). Penetration of the electronic micropayment transactions spread rapidly across the nation. The players invest hugely in this business and accelerate the penetration just to win the competition and lead the market share as fast as possible. Who lead the market first will continuously dominate the market. Cash transaction decrease hugely year by year and become a very minor transaction due to the consolidation and   interoperability of non-cash micropayment gateway. Government gives incentives for existing player to penetrate the market as fast as possible and reduce the cash transaction. Global player try to invest in micropayment business indirectly by acquisition or by joint venture with the existing

player because government tighten the regulation for the new global player.

Scenario Title: **T‑Cash The Innovator**

Narratives:

Politics in Indonesia are stable and support industries to keep moving in the right track. More policies and regulations are produced to improve the existing environment condition to be more transparent and more accountable. In the mobile services, all of the users are using smartphone as their mobile and digital lifestyle. People are using their mobile as their primary need, not   only   for   legacy   communication   (voice   and chat),   but   also   for   non‑human communication (internet of things). Potential market in this business is huge and a lot of players in electronic micropayment business want to enter and involve in the game. Electronic micropayment transaction increases steady linearly not exponential due to the stiff competition between all of the players. The competitions are not only from the global player and the existing players; it is also with the new OTT (over the top) players that have lot of customers. The focus of the game is to beat others and kill others because lots of players enter this business. Some of the players with huge resources attack aggressively the   market, some of the players struggle and battle for life in this business with their limited resources. The differentiator in this business is in the resources. The resources can be the capital and also talents to create innovations. The stiff competition can be winning only with the innovation by the great talent. The scarcities of the talents are the big questions to be solved by the organizations.

Scenario Title: **T‑Cash The Fighter**

Narratives:

Politics are playing dominantly in their interest in the government economic package decision. More policies and regulations are produced to create benefit to more sectorial and not comprehensive directly to the nation. Telecommunications sector suffer in this business because the regulation did not favor to the telecommunication sector. In term of   competition, government invites more investors to invest in the electronic micropayment. The   stiff   competitions   and   also   not   favored‑competitions   make telecommunication sector are struggling and battle for life in this business. They are using all of their resources to keep   them alive. There is a certain time, for the telecommunication player to consolidate and did partnership, horizontal integration and/or vertical integration between player to slim the cost and keep sustain. Electronic micropayment transaction still increases but not as expected due to the stiff competition between all of the players. The competitions are not only from the global player and the existing player; it is also with the new OTT (over the top) players that have lot of customers. Telecommunication sector are using their power in the mobile business to fight with the OTT player and mobile apps banking sector. The telecommunication sectors keep influence government to make fair competition. The focus of the game for telecommunication player is to keep alive. It can be by horizontal and/or vertical integration or by influencing government to create regulation fit for all.

Scenario Title: **T-Cash The Transformer**

Narratives:

Politics are playing dominantly in their interest in the government economic package decision. More policies and regulations are produced to create benefit to more sectorial and not comprehensive directly to the nation. Telecommunications sector suffer in this business because the regulation did not favor to the telecommunication sector. In the mobile services, all of the users are using smartphone as their mobile and digital lifestyle. People are using their mobile as their primary need, not only for legacy communication (voice and chat), but also for non-human communication (internet of things). The electronic micropayment transactions keep growing across the nation. Telecommunication sector are using their power in the mobile business to fight with the OTT player and mobile apps banking sector. The telecommunication sectors keep influence government to make fair competition. The potential market is bigger than the regulation limitation. The players invest hugely in this business and accelerate the penetration just to win the competition and lead the market share as fast as possible. Telecommunication sector optimizes all of the resources and emphasizes all of the regulation to maximize its profit. In the other hand, to fit with the regulation, some option must be taken. The transformation is an option needed to change the existing business behavior from Telecommunication Company to financial company. The transformation can be done by spin off the business from the existing company. Partnership, vertical and/or horizontal Integrations are also the possible way out in the unfavorable regulation.

Global player try to invest in micropayment business indirectly by acquisition or by joint venture with the existing player because government tighten the regulation for the new global player.

Option and Consideration

In this stage, we will develop implications and options for each of the alternate futures. Every scenario has implication to the strategy and option to consider in decision-making. This will impact on how management to make their strategic decision in order to react, action or anticipate current condition in every scenario to ensure the organization sustainability.

Scenario	Implications	Options
T-Cash The Conqueror (Good regulation for non-banking sector and low market competition)	Huge potential market with limited player	Invest effectively to increase market share
	Fast market penetration and increase market share	Get benefit from the wide coverage network and services of Telkomsel
	Push technology awareness to non-bank customers	Manage suppliers and vendors to deliver effective technology to every segments of customers
	Push great services for the digital lifestyle customers	Using data analytics to get customers behavior from mobile technology
	Grab the customers as fast as possible	Manage and increase core competencies and capabilities
T-Cash The Innovator (Good regulation for non-banking sector and high market competition)	Many player to play in the same ground	Innovate to gain the benefit from convergence of the mobile technology and electronic micropayment technology
	Capital resources and Talent resources play important role to win the competition	Prioritization of investment to obtain the maximum gain
	High gimmick cost to maintain and grab new customers	Using mobile data analytics to maintain and deliver premium services for the high value customers
	Lower profit margin for same services deliverable	Manage cost of services by manage the supplier and vendors selectively and cost effectively
	Slow market penetration due to the stiff competition Scarcity of the talent to deliver innovation	Built knowledge management system within organization
T-Cash The Fighter (Bad regulation for non-banking sector and high market competition)	Limited arena to penetrate the market	Find new stream and business model to inline with existing regulation
	Many player to play in the same ground	Partnership, vertical and/or horizontal integration with existing players
	Stagnant market penetration	Influence government to create favorable regulation
	Stiff competition and unfavorable regulation are the complex situation for the non-banking sectors	Cost efficiency and effectively in investment and operational
T-Cash The Transformer (Bad regulation for non-banking sector and low market competition)	Limited arena to penetrate the market	Create new business model to inline with existing regulation. It can be also partnership, vertical and/or horizontal integration
	Huge potential market with limited player	Invest effectively to enlarge the coverage and services
	Compete to fast penetrate the market and gain significant market share	Get benefit from the wide coverage network and services of Telkomsel
	Telecommunication sector must be agile to compete in this business	Influence government to create favorable regulation
	Huge potential market with unfavorable regulation regulation	

Building Early Warning Signal

This stage identifies early warning signals that could point to possible future directions and likely emergence of new scenario rather than others. This early warning signals are leading indicator to make organizations aware and prepare the changing of the scenario. Below are the early warning signals for every possible scenario.

EWS for The Conqueror

Forces	Indicators	Measurement	SignPost
Political and Regulatory	Regulation	Regulation to support mobile micro payment	Government support all instrument from mobile business
		Regulation to keep mobile micro payment to sustain	Government creates tight rules for global company
	Government support	Good environment in non-cash transaction	Government push all transaction using non-cash transaction
		Investment rate in mobile micro payment	High investment in mobile micro payment
Competitiveness	Governmet Policy for fair competiton Number of player in electronic micro payment	No monopoly business	Open market for all existing electronic micro payment (unprotected)
		No Protected market	Open interoperability
		Number of player in the electronic micropayment	Government roadmap to consolidate existing and limit the new player in electronic micropayment
		Global Player involvement	No direct global player involvement
		New OTT Player involvement	Limited new OTT player
Socio Cultural	Digital Lifestyle trend	Smartphone users trend	Smartphone users increase significantly
		internet and mobile usage	Internet and mobile usage penetration increase significantly
		Non-cash transaction trend	Non-Cash transaction trend increase
		mobile lifestyle trend	More social interaction via mobile
Technological	New Technology and business model	New Advance mobile technology	New advance change of the mobile technology that support connectivity
		New mobile micro payment technology	New innovation in micro payment that change the micropament behavior
Economical	GDP Ratio	Growth of GDP	Stable growth of GDP
	GINI Ratio	Increment of GINI ratio	Good GINI ratio
	NFC Growth	NFC growth users	High users of NFC enabled phone

EWS for The Transformer

Forces	Indicators	Measurement	SignPost
Political and Regulatory	Regulation	Regulation to support mobile micro payment	Government limit the Telco Company involvement in mobile micro payment
			Government push banking company to use mobile technology
			Government push Telco Company to support banking customers mobility
			Government push the Telco Company as support system for Banking Micro Payment
		Regulation to keep mobile micro payment to sustain	Government creates tight rules for global company
	Government support	Good environment in non-cash transaction	Government push all transaction using non-cash transaction
		Investment rate in mobile micro payment	Limited investment in mobile micro payment from Telco Company
Competitiveness	Governmet Policy for fair competiton Number of player in electronic micro payment	No monopoly business	Open market for all existing electronic micro payment (unprotected)
		No Protected market	Open interoperability
		Number of player in the electronic micropayment	Government roadmap to consolidate existing and limit the new player in electronic micropayment
		Global Player involvement	No direct global player involvement
		New OTT Player involvement	Limited new OTT player
Socio Cultural	Digital Lifestyle trend	Smartphone users trend	Smartphone users increase significantly
		internet and mobile usage	Internet and mobile usage penetration increase significantly
		Non-cash transaction trend	Non-Cash transaction trend increase
		mobile lifestyle trend	More social interaction via mobile
Technological	New Technology and business model	New Advance mobile technology	New advance change of the mobile technology that support connectivity
		New mobile micro payment technology	New innovation in micro payment that change the micropament behavior
Economical	GDP Ratio	Growth of GDP	Stable growth of GDP
	GINI Ratio	Increment of GINI ratio	Good GINI ratio
	NFC Growth	NFC growth users	High users of NFC enabled phone

EWS for The Fighter

Forces	Indicators	Measurement	SignPost
Political and Regulatory	Regulation	Regulation to support mobile micro payment	Government limit the Telco Company involvement in mobile micro payment
			Government push banking company to use mobile technology
			Government push Telco Company to support banking customers mobility
			Government push the Telco Company as support system for Banking Micro Payment
		Regulation to keep mobile micro payment to sustain	Government creates tight rules for global company
	Government support	Good environment in non-cash transaction	Government push all transaction using non-cash transaction
		Investment rate in mobile micro payment	Limited investment in mobile micro payment from Telco Company
Competitiveness	Governmet Policy for fair competiton	No monopoly business	Closed market for all existing electronic micro payment (protected)
		No Protected market	Selective interoperability
	Number of player in electronic micro payment	Global Player involvement	Global Player with huge capital enter the market
		New OTT Player involvement	Most of big retailer introduce new electronic micro payment
			New start up company in mobile micro payment enter the market
Socio Cultural	Digital Lifestyle trend	Smartphone users trend	Smartphone users increase significantly
		internet and mobile usage	Internet and mobile usage penetration increase significantly
		Non-cash transaction trend	Non-Cash transaction trend increase
		mobile lifestyle trend	More social interaction via mobile
Technological	New Technology and business model	New Advance mobile technology	New advance change of the mobile technology that support connectivity
		New mobile micro payment technology	New innovation in micro payment that change the micropament behavior
Economical	GDP Ratio	Growth of GDP	Stable growth of GDP
	GINI Ratio	Increment of GINI ratio	Good GINI ratio
	NFC Growth	NFC growth users	High users of NFC enabled phone

Strategic Roadmap

In this section, there are strategies that possible to choose that suitable for the scenarios:

Grab it all (Applicable for T∙∙ Cash The Conqueror and T∙∙ Cash The Innovator)

This option focuses on how company reacts to the huge potential market. In this condition the player of the electronic micropayment is limited but the market is so huge. Electronic micropayment is increasing continuously. There are two types of customers in this arena; lifestyle play and enablement play.

There are some of the characteristics of lifestyle play. The characteristics are: medium to high class which are digital minded persons, most of the targeted customers in the cities, services is the key of the product: easy, simple, more merchant, have a brand reputation (feel secure). The service must deliver to this class are: deliver broaden services to marketplace via T∙∙ Cash, fast and convenience services, safe payment method, great customer experience

The characteristics of the enablement play are: lower class segments with non digital minded persons, rural area targeted customers, low banking acceptance due to low education persons, have a high risk savings (mostly in house), no access to the ATM. The service must deliver to this class are: safe micropayment services, can be a vehicle for the government aids (ensure the aids 100% to the targeted persons), broad services to marketplace via T∙∙ Cash, easy to use for non digital lifestyle persons

Differentiation strategy is the most suitable strategy to do aggressive market penetration.

Every segment has different needs to fulfill. Brand image, technology, innovation, customer intimacy and T-Cash network is the key that customers choose T-Cash as their primary product.

Share to Grow (Applicable to T-Cash The Fighter and T-Cash The Transformer)

This option focuses on how company reacts to the hard time in the business. Most of regulations are unfavorable to the telecommunication business. Telco Company tries to protect their market from other micropayment company. There are time for the company to get consolidate and grab the business opportunity ahead. In this strategy, partnlership is the option can be taken.

T-Cash can make a partnership with existing Micropayment Company from banking sector.

T-Cash has competitive advantage to run the micropayment business which are: wide coverage and wide service point and kiosk across Indonesia, mobile technology to support mobile micropayment with data analytics, product of Telkomsel as the premium brand image of Telco player, great knowledge in the mobile technology.

Banking sector also has advantage compare to the T-Cash, which are: expert in the financial services, wide services in financial services, cover most of the cities across Indonesia, have a good trust from customers in financial services.

The Partnership in this section can be done in some scenarios:
- Horizontal Integration
  T-Cash did a merger or acquisition the micropayment banking sector, which is complying with all regulation from government. This strategy will make T-Cash more agile to compete with other micropayment company.
- Vertical Integration
  T-Cash support the mobile technology and Banking Micropayment support the financial system
- Strategic Partnership
  T-Cash and other banking micropayment join together and set agreed objectives to create mutual objective from both parties. The expertise and resources from both parties can be used to create greater opportunity

Overall Cost Leadership strategy is the most suitable strategy to do in this unfavorable regulation. The arena is limited for the Telco Company to penetrate the market. In order to sustain and compete to other competitor, cost leadership is the option for these scenarios.

Conclusion and implementation plan

Conclusion
In this research project, there are some points can be concluded:

1. There are current issues that identified in this research:
   a. Low trust of the customers in the T-Cash micropayment
   b. Huge potential market but low T-Cash penetration

   c. Unfavorable regulation from government to Telecommunication Company

   d. High competitiveness in the electronic micropayment business

2. The existing T-Cash Strategic plan that has been made by the Telkomsel:

   a. Address lifestyle play and enablement play. 25 cities focus on the banked customers and 50 cities focus on non-banked customers.

   b. Scale-up the revamped "T-Cash TAP" solution across key cities and segments

   c. Be first to market and replicate to other cities

   d. Look to extend T-Cash offerings to other areas of mobile payments like mobile ticketing (parking, transportation), merchant/retailers (in-store shopping, online\shopping).

3. The key focal issues of T-Cash are:

   a. How T-Cash increases market share and revenue in the tight micropayment competitive market?

   b. How T-Cash increases competitiveness with the banking, OTT and telecommunication operator micropayment and competes the service deliverable to competitor?

   c. How T-Cash reaches the superiority in an Integrated Mobile Financial Services Eco-system?

d. How T-Cash dealt with the regulation that set the rule of the game?

4. The research have been identified the driving forces that have the most uncertainty and most impact to the T-Cash sustainability:

   a. Government regulation to support mobile electronic micropayment business

   b. Stiff competition in the electronic micropayment business

5. The research already identified that there are 4(four) scenarios that impact to the T-Cash strategy in the next five years: T-Cash The Conqueror, T-Cash The Innovator, T-Cash The Fighter and T-Cash The Transformer.

6. The possible strategies roadmap to choose in the scenarios:

a. Grab It All Strategy

This strategy is using differentiation strategy to penetrate the market as fast as possible. The differentiation strategy also to ensure the customers gets the best services compare to other competitor.

b. Share To Grow Strategy

This strategy is using overall cost leadership to keep sustain in the market. In this scenario, the business environment is not favorable to the existing Telco Company.

Implementation Plan

      Implementation plan of this project is derived from the defined scenarios of the T-Cash. Every scenario has a clear time plan for action to be taken. The four scenarios also are using two strategies in this research, Grab It All strategy and the Share To Grow Strategy.

Share To Grow Strategy

Scenarios	Task		Year 1	Year 2	Year 3	Year 4	Year 5
T-Cash The Fighter	Reduce any cost that is not correlate with the business strategy		blue	blue

INTEGRATED MARKETING COMMUNICATION; A CONCEPTUAL APPROACH

Arfendo Propetho, Padjadjaran University Indonesia
Irzanita Wathan, Kader Bangsa University, Palembang

Abstract
This article aims to provide the clarity of integrated marketing Communication concept by analyzing and comparing the existing concepts or definitions from books, articles, journals and other sources. The implication of the finding of integrated marketing communication is a concept that integrates variety of communication disciplines, approaches and company resources to maximize the impact on customer that leads to maximum profit and low cost. The original contribution of this paper is to redefine the concept of integrated marketing communication. The approach taken by this paper is to compare the development of IMC, from their early years until today. From many literature review, we could see some approaches as a response to the emerging technology, but the roots remain on classic marketing, but all IMC concepts agrees that IMC related to how an organization communicates with its customer, whether by direct communication, or by branding, or by other indirect communication.
Keywords :*Integrated marketing communication, promotional, brand*

Introduction

Integrated marketing communication has become a powerful idea in the marketing field (Christensen, Torp and firat 2005). since 1990, integrated marketing communication has been a hot topic in the realm of marketing (schultz, 1993). Integrated marketing communication can help a company to promote the business and to set a position of the product in the market. Many Scholars have defined the concept of Integrated marketing communication, but on the contrary of that, many scholars also argued that Integrated marketing communication lacks a theory base. It is also argued by (Cornelissen and lock cited in kitchen et al 2004) "on the basis of the observation that Integrated Marketing Communication as a theory is quite shallow through its lack of definition, formal theory construction, and research, the hypothesis emerges that Integrated Marketing Communication is a management fashion". The previous argument shows that "because there is no established academic or professional definition of IMC, or recognized measurement system in place to gauge the influence and bearing of the various IMC concepts, it must be a managerial fad" according to (kitchen et al., 2004).

According to Edminston (2009) researchers have been inconsistent as to whether IMC represents 'integrated marketing communication' or 'integrated marketing communications' While a simple letter 's' may seem to be a minor difference, there are major implied differences between the two terms. The term ' communication ' is defined as ' the act of communicating; transmission '(Communication, n.d.) while the term ' communications ' is defined as ' the technology employed in transmitting messages ' (Communications, n.d.). Sometimes the 'communication' and 'communications' used interchangeably.

Integrated marketing communication concept

The integrated marketing concept is not a novel concept, as it is researched on the 1980s by the economic researchers (Hutton, 1996). The discussion surrounding IMC stems from a lack of consensus whether the IMC is just regular marketing communication given new buzz words but without addition of novel and newer things, or IMC is a type of marketing communication that are vastly different with its legacy marketing communication. (Beard, 1996) . Hutton (1996) though opinioned that finding differences between IMC (integrated marketing communication) and MC (marketing communication) is not easy, and even impossible, because integrated marketing communication itself will not be separated and cannot be separated with the "spirit" of the marketing communication, thus calling the attempt to separate IMC and MC are pure philosophical debate that will have no strategic management impact whatsoever.

Moharam and Shawky stated that "integrated marketing communication concept highlights the need to maintain a clear and consistent message throughout all marketing media channels and across all marketing communications messages". According to brunello(2013) "The eventual role of the Integrated Marketing Communication is to convey a consistent message to customers. Effective Integrated Marketing Communication approaches foster companies to effective usage of promotional resource and to build longer term sustainable consumer relationships". Schultz (1993) stated that "Integrated Marketing communications is the process of developing and implementing various forms of persuasive communication programs with customers and prospect over time". (American Association of Advertising Agencies) claimed that integrated marketing communication "a concept that recognizes the added value of a comprehensive plan that evaluates the strategic roles of a variety of communication disciplines, and combines these disciplines to provide clarity,consistency and maximum impact. Furthermore (Jones and schee as cited in brunello 2013) explained that "integrated marketing communication represents a combination of direct marketing, general advertising, sales promotion and public relations".

According to Pauwels (2013) integrated marketing communication must fulfill three basic functions : increase the awareness of product and services, change customer buying behavior, or increase the awareness of current or future marketing communication attempts to the customer regarding the said product and services. Increasing the awareness of the product and services will allow the customer to re-calculate the purchasing habits, hopefully allows switching of product from other product to current organization product. Pauwels (2013) also notes that it is important that customer expects further marketing communication, as this will allow the customer to make a "proper" response from the customer. IMC must made as such to get a "proper" response from customer (Erdogmus&Cicek, 2012).

Sisodia and Telrandhe stated that "Integrated marketing communication is integration of all marketing tools, approaches, and resources within a company which maximizes impact on consumer mind and which results into maximum profit at minimum cost". Schultz as cited in Peltier et al., (2003) stated that "Integrated marketing communication is the result of a natural evolution from the use of mass-market advertising to more targeted message strategies". Moreover (Rehman and Ibrahim 2011) explained that integrated marketing communication can build a positive image and brand awareness of a company, as they stated that "Integrated marketing communication is thus the voice of marketing creating brand awareness, deliver information, educate the market and make a positive image of the company. " Mongkol (2014) clearly stated that Integrated marketing communication is a tool to convey the message of the brand, Mongkol stated that integrated marketing communication "is the marketing tool of consistent brand messaging across both traditional and non-traditional marketing channels and using different methods to reinforce each other".

Katrandjiev (2000) stated that "this concept of Integrated marketing communication enables adequate tendencies accompaniment in the modern business conditions, which deal with internet application in business activities, globalization and brand image importance". he also said that "The way to reach considerable sales volume and to build a strong brand image' is called integrated marketing communication" katrandijev(2000). Katrandjiev (2000) said that "combining the marketing communication tools and a solid campaign can be an effective impact, also integrated marketing comunnication programs give chance to low-budget campaign". Furthermore from Katrandjiev (2000) "while Technology can gives power to competitors and consumers the same technology also enables to operate new levels. Mechanisms for two-way communication are more efficient and fluid than ever. by using technology to support Integrated Marketing Communucation concepts, Companies can go beyond customer expectations and also the competition". More from Katrandjiev (2000) he said that "IMC is planned, developed, executed, and evaluated with affecting one specific consumer behavior in mind, the process of making purchase now or in future". He also said "the concept of integrated marketing communication means a long-term synchronization of messages and campaigns" Katrandjiev (2000).

The idea of Katrandijev about Integrated marketing communication and technology is supported by (Kucukosmanoglu et al., 2010) which stated "Integrated Marketing Communications (IMC) is considered as one of the most prominent benefits of technology in the marketing communications field since the early 1990s". (Kucukosmanoglu et al., 2010) said that "IMC is recognized as beneficial to the accomplishment of business objectives on one hand, and the key of competitive advantage on the other". Kliatchko (2008) considered that "Integrated marketing communication is an audience-driven business process of strategically managing stakeholders, content, channels, and results of brand communication programs." According to Luck and Moffat (2009) "IMC's emphasis is on communication and its core concepts of nourishing profitable relationships and building brand equity are equally important to services marketers."

Integrated marketing communications (IMC) "has become a popular approach with both clients and communication agencies Vel and Sharma" (2010). According to Vel and Sharma (2010) "Integrated Marketing Communication concerns the use of three main elements; tools, media and messages". Vel and Sharma (2010) stated that integrated marketing communication requires that organisations coordinate their various strategies, resources and messages in order that it engages coherently and meaningfully with target audiences. Integrated marketing communication to deliver its desired output, it should in the first place be a strategic combination of the relevant communication mix tools including Advertising, Personal Selling, Sales promotion, Direct Marketing and Public relations, carefully selected message and the choice of right media mix Vel and Sharma (2010).

"Integrated marketing communication is a strategic business process used to plan, develop, execute, and evaluate coordinated, measurable, persuasive brand communication programs over time with consumers, customers, prospects, and other targeted, relevant external and internal audiences" Schultz and Schultz (2004). According to the Schultz and Schultz (2004) "Integrated marketing communication,however, uses multiple communication methods to focus on the customer with the overall objectives of acquiring, maintaining, growing, or migrating customers in order to generate greater and most consistent income flows over time. Schultz and Schultz also (2004) claimed that Integrated requires evaluating these activities not only as separate events but as part of an overall and ongoing program that continues to contribute to results and to build longterm relationships with customers over time. Schultz and Schultz (2004) "Integrated marketing communication process is to gain meaningful insights into the needs, wants, and wishes of those individuals or companies the firm wishes to serve". According to Schultz and Schultz (2004) "IMC is about 5 R which are

Relevance, receptivity, response recognition, and relationship". For IMC to succeed, all communication systems must be interconnected and interactive so the customer is served and not impeded Schultz and Schultz (2004).

According to Belch and belch (2003) "integrated marketing communications (IMC) perspective, which calls for a "big picture" approach to planning marketing and promotion programs and coordinating the various communication functions". "Process of integrated marketing communications (IMC), which involves coordinating the various promotional elements and other marketing activities that communicate with a firm's customers. Belch and belch (2003).Belch and belch (2003) stated that "Each element of the promotional mix is viewed as an integrated marketing communications tool that plays a distinctive role in an IMC program" the promotional mix which are; advertising, direct marketing, interactive or internet marketing, sales promotion publicity/ public relations, and personal selling. Belch and belch (2003) stated that the "integrated marketing communications program can be designed to influence the response process in favor of the company's product or service".

Brunello (2013) stated that "Integrated marketing communication strategy plays a majorrole in persuading customers to buy the products or services of a particular firm". "IMC has a much more significant value: it contributes to the development of a company's brand equity" (Brunello 2013). Brunello (2013) considered that "the eventual role of the IMC is to convey a consistent message to customers". According to Brunello (2013) "effective IMC approaches foster companies to effective usage of promotional resource and to build longer term sustainable consumer relationships". Integrated marketing communication refers to speaking with one voice, eliciting a response Brunello (2013). Brunello stated that "integrated marketing communication strategy is essential to the firm's strategic brand development and that it strengthens the interface between the company' s brand identity strategy and its customer-based brand equity, that is, brand awareness and brand image.

Furthermore according to Brunello (2013) "Integrated marketing communication represents the reunion of all marketing tools, approaches, and resources within a company which maximizes the impact on the consumer's mind and which leads to maximum profit at minimum cost". Brunello (2013) declared that "the integration of all these promotional tools along with other components of the marketing mix to gain edge over competitors is referred to as Integrated Marketing Communication". Integrated marketing communication has been advanced as a strategic business process that could contribute to building brand value (Brunello 2013).

According to Carlson et al., (2003) "Integrated marketing communications (IMC) potentially can create synergy and produce a consistent front among communication tools and to help generate customer databases that can lead to effective target marketing". "Such outcomes are desirable goals for service organizations who struggle with promoting intangible offerings Carlson et al., (2003). Carlson et al., (2003) stated that "well-devised program of integrated marketing communications has the capability of producing this end by heightening the tangibility of the service product and generating consumer information that leads to more effective communication". Carlson et al., (2003) considered that "Integrated Marketing Communication is an attempt to accomplish one or all of three goals: build brand equity, provide product or feature information, or communicate or differentiate a product position. Integrated marketing communication is embraced by service organizations and how it is manifested in their advertising efforts (Carlson et al., (2003). According to eagle et al., (2006) Integrated Marketing Communication "is developed as a practice and philosophy in response to changing business environments, concomitant with heightened expectations of greater effectiveness and efficiency in all marketing communication activity. Elliot and boshoff (2008) stated that "An IMC approach to marketing communication ensures that a firm's messages, positioning and use of communication tools are coordinated and consistent".

According to Fitzpatrick (2005)"Integrated marketing communication involves the merging of distinct communication functions in a way that allows an organization to speak with one voice, one look"

Šerić, Gil-Saura, & Ruiz-Molina (2014) stated that IMC is a response by the marketers to respond to current change in how marketing is communicated, and how buying and selling patterns are evolving in the market. The goal of the IMC is similar, is to increase the awareness of the brand, product, and services, erodes the loyalty of the customer on other products and services, increase the switch factors to the current product and services, and change buying habits of the customer.

Hartley and Pickton (2001) have a quite different approach with IMC, that stated that IMC is defined as an integration of various marketing communication that embraces the elements of marketing mix, the 4Ps, which are the price, product, promotion, and place.

Kitchen and Burgman (2010) stated that "integrated marketing communication can help in creating coordinated and consistent messages across various channels of communication". Most managers perceive IMC as a process which encourages message integration and consistency, thus facilitating the interpretation of information for customers. IMC " helps to create a consistent marketing communication approach focusing on the long-term brand value of both corporate and product brand, which should lead to significant synergy effects" Kitchen and Burgman (2010). Kitchen and Burgman (2010) declared that "IMC, as a strategic business process, should therefore be implemented and applied throughout the organization.

Kliatchko (2005) Defined that Integrated Marketing Communication is the concept and process of strategically managing audience-focused, channel-centred, and results-driven brand communication programmes overtime. According to Rehman and Ibrahim (2011) the various steps in an integrated marketing communication process are:

- Identify the audience to be targeted.
- Determine objectives of your communication.
- Design the message of communication.
- Select your media channel.
- Decide the budget.
- Decide the marketing communication mix.
- Measuring your results.
- Managing and coordinating IMC.

Concepts and the development of integrated marketing communications

Below I will convey some of the concept and the development of Integrated Marketing Communications :

Table 1
Concepts and the development of Integrated Marketing Communications

Researchers	Concepts introduced
(American Association of Advertising Agencies	a concept that recognizes the added value of a comprehensive plan that evaluates the strategic roles of a variety of communication disciplines, and combines these disciplines to provide clarity, consistency and maximum communication impact.
Jones and Schee, 2008 as cited in Brunello (2013)	"integrated marketing communication represents a combination of direct

Researchers	Concepts introduced
	marketing, general advertising, sales promotion and public relations" represents a combination of direct marketing, general advertising, sales promotion and public relations
Schultz 1993 as cited in Kitchen, Brignell, Li, Jones (2004)	IMC is the process of developing and implementing various forms of persuasive communications programs with customers and prospects over time process of developing and implementing various forms of persuasive communications programs with customers and prospects over time
Percy, Rossiter and Elliot (2001) as cited in Kitchen et.al (2004)	planning and execution of all types of marketing communication needed for a brand, service, or company to satisfy a common set of communication objectives, or put more specifically, to support a single positioning.
Duncan (2002, p.8) as cited in Dewhirst and Davis (2005:81)	"a cross-functional process creating and nourishing profitable relationship with customers and other stakeholder by strategically controlling and influencing all messages sent to these group and encouraging data driven, purposeful dialogue with them".
Smith 1999 as cited in holm 2006 pg.24.	Ensuring the brand positioning, personality and messages are delivered sinergitistically across every element of communication and are delivered from a single consistent strategy. -a concept of marketing -communications planning that recognizes the added value of a comprehensive plan that evaluates the strategic roles of a variety of communications disciplines (for example general advertising, direct response, sales promotion, and public relations)
Phelps et al. (1996) as cited in (2003)et al. pg. 94	as a solution for achieving synergy in advertising planning and execution, with the end result being enhanced efficiency, productivity and performance -natural evolution of traditional mass-media advertising, which has been changed, adjusted and refined as a result of new technology."
Kotler and Armstrong, (1999) as cited in Elliot and Boshoff (2008)	a concept of marketing communications planning that recognizes the added value of a comprehensive plan that evaluates the strategic roles of a variety of communications disciplines (for example general advertising, direct response,

Researchers	Concepts introduced
	sales promotion, and public relations) -the strategic coordination of all messages and media used by an organization to influence its perceived brand value."
Sisodia and Telrandhe (2010:135)	Integrated marketing communication is integration of all marketing tools, approaches, and resources within a company which maximizes impact on consumer mind and which results into maximum profit at minimum cost - powerful tool in reaching target audiences with persuasive messages
Schultz (1999) as cited in Gabrielli and Balboni (2010)	IMC ". . . appears to be the natural evolution of traditional mass-media advertising, which has been changed, adjusted and refined as a result of new technology." -marketing tools -approaches -resources -maximizes impact on consumer mind -results into maximum profit at minimum cost
Duncan and Everett (1993) as cited in Gabrielli and Balboni (2010)	"the strategic coordination of all messages and media used by an organization to influence its perceived brand value." -The strategic analysis -Choice - Implementation - Control of all elements of marketing communications that efficiently (best use of resources), economically (minimum costs) and effectively (maximum results) influence transactions between an organization and its existing and potential customers, consumers and clients.
Pitta, Weisgal, and Lynagh (2006 p. 156)	IMC is a powerful tool in reaching target audiences with persuasive messages. -A planning process -evaluates the strategic and synergistic role of a variety of communication disciplines -integrate them across the firm
Vargas 2005 as cited in kajianSaeed, Naeem, Bilal, and Naz 2013 pg 127	"IMC process is concerned with the identifications of target audience, determination of the communication objectives, designing of the message content, selecting the means for communication, defining the media mix, budget & priorities and measuring the effectiveness of

Researchers	Concepts introduced
	effort." -identifications of target audience - determination of the communication objectives - designing of the message content -selecting the means for communication -defining the media mix budget Priorities - measuring the effectiveness of effort
Menurut Smith et al., (1999) as cited in Herstein, Mitki, and Jaffe (2008 p. 361)	The IMC concept has been formulated as: the strategic analysis, choice, implementation and control of all elements of marketing communications that efficiently (best use of resources), economically (minimum costs) and effectively (maximum results) influence transactions between an organization and its existing and potential customers, consumers and clients. -a solution for achieving synergy in advertising planning and execution. -Enhanced efficiency -productivity - performance
Schultz 1999	"IMC is the result of a natural evolution from the use of mass-market advertising to more targeted message strategies." -natural evolution from the use of mass-market advertising -to more targeted message strategies
Kitchen et al., (2004) as cited in Madhavaram, Vishag and Mcdonald (2005:71)	IMC is no longer just a communication process, but a process associated with management and brands.
(Gronroos, 2004; Kitchen, 1993; Baines et al., 2008 as cited in Vel and Sharma 2010 p. 372)	IMC is as a strategic approach to the planned management of an organisation's communications -Brand positioning -personality -messages
Zahay (2004) as cited in Reid (2005) pg.42	As a planning process that evaluates the strategic and synergistic role of a variety of communication disciplines and considers how best to integrate them across the firm -strategic approach to the planned management -an organization's communications
Rehmann and Ibrahim 2011 p. 189.	Integrated marketing communication is thus the voice of marketing creating brand awareness, deliver information, educate the market and make a positive image of the company. -the voice of marketing -creating brand awareness,

Researchers	Concepts introduced
	-deliver information - educate the market and make a positive image of the company.
Mongkol (2014 p. 445-446)	"is the marketing tool of consistent brand messaging across both traditional and non-traditional marketing channels and using different methods to reinforce each other" -marketing tool -consistent brand messaging -traditional -non-traditional -Advertising -promotion -event marketing - public relations - direct marketing Personal selling - word of mouth - marketing - interactive marketing

Basically what Rehman and Ibrahim stated about IMC is about the comprehensive plan of integrated marketing communication. Similar to the Rehman and Ibrahim's steps, Vargas (2005) also propose that "an effective integrated marketing communication compromises the following steps which are identify the target audiences, determine the communications objectives, design the messaging content, select the means for communications define the mix of media, budget and priorities , measure the effectiveness and efforts". According to Vargas (2005) "Execution of Integrated marketing association needs evaluation process to ensure the effectiveness of the effort". Further Vargas (2005) stated that "integrated marketing communication is a way of looking at the whole marketing process from the viewpoint of the customer". Further according to (schultz & schultz, 2004) (1993) " the goal of integrated marketing communication is to influence or directly affect the behavior of the selected communications audience. Schultz (1993) stated that "Integrated Marketing Communication makes use of all forms of communication which are relevant to the customer and prospects, and which they might be receptive". Percy, Rossiter and Elliot as cited in Kitchen et.al (2004) stated that Integrated marketing communication "planning and execution of all types of marketing communication needed for a brand, service, or company to satisfy a common set of communication objectives,or put more specifically, to support a single positioning".

Duncan as cited in Dewhirst and Davis (2005:81) stated that "a cross-functional process creating and nourishing profitable relationship with customers and other stakeholder by strategically controlling and influencing all messages sent to these group and encouraging data driven, proposeful dialogue with them". Smith 1999 as cited in holm 2006 Ensuring the brand positioning, personality and messages are delivered sinergitistically across every element of communication and are delivered from a single consistent strategy. AMA stated that integrated marketing communication as "a planning process designed to assure that all brand contacts received by a customer or prospect for a product, service, or organization are relevant to that person and consistent over time Kotler and Keller marketing communications planning that recognizes the added value of a comprehensive plan to evaluate the strategic

roles of a variety of communications disciplines, and that combines these disciplines to provide clarity, consistency, and maximum impact through the seamless integration of discrete messages. Integrated marketing communication ". . . appears to be the natural evolution of traditional mass-media advertising, which has been changed, adjusted and refined as a result of new technology" Schultz (1999) as cited in Gabrielli and Balboni (2010)

Duncan and Everett (1993) as cited in Gabrielli and Balboni (2010) claimed that "the strategic coordination of all messages and media used by an organization to influence its perceived brand value." Pitta et al., (2006 p. 156) stated that "integrated marketing communication is a powerful tool in reaching target audiences with persuasive messages. Smith et al., (1999) as cited in Herstein et al., (2008) The Integrated marketing communication concept has been formulated as: the strategic analysis, choice, implementation and control of all elements of marketing communications that efficiently (best use of resources), economically (minimum costs) and effectively (maximum results) influence transactions between an organization and its existing and potential customers, consumersand clients. (Gronroos, Kitchen, Baines et al., as cited in Vel and Sharma 2010) IMC is as a strategic approach to the planned management of an organisation's communications. Zahay as cited in Reid (2005) claimed that integrated marketing communication as "a planning process that evaluates the strategic and synergistic role of a variety of communication disciplines and considers how best to integrate them across the firm

Discussion

In this section we will summarized the essence, role, function and what the Integrated marketing communication concept is about.

Moharam and Shawky (2012) : concept- maintain a clear consistent message through all marketing media channels- accross all marketing communication message. Brunello (2013): consistent message-Promotional resources- build long term relationship. Schultz (1993): added value of comprehensive plan-variety of communication discipline- general advertising-direct response-sales promotion- public relation- to provide clarity, consistency and maximum impact-influence and affect behaviour-selected communication audience- receptive customer. American association of advertising agencies: concept-comprehensive plan-communication disciplines-provide clarity and maximum impact. Jones and Schee as cited in Brunello (2013): Promotional mix. Sisodia and Telhandre: integration of marketing tools-resources of company-maximize impact-consumer's mind- minimum cost. Rehman and Ibrahim: built positive image-brand awareness-educate the market-deliver information-comprehensive plan. Mongkol: Marketing tool-consistent brand message- traditional and non-traditional marketing channels. Katrandjiev: internet application in business activities-globalization-brand image-increase sales volume-marketing communication tools-solid campaign-low budget campaign-technology-planned-developed-evaluated-affecting-consumer behavior in mind-long term synchronization of messages. Kucukosmanoglu: technology –competitive advantage. Kliatchko: Audience-driven business process-strategically managing stakeholder content, channels and result brand communication program-overtime. Luck and Moffat: Nourishing profitable relationship and building brand equity. Vel and Sharma:clients and communication agencies with three main elements: tools, media and messages-strategies-resources-meaningful messages-targeted audiences-deliver desires output-combination mix of tools-selected messages-choice of media mix. Schultz and Schultz: strategic business process used to plan, develop, execute, evaluate coordinated-measurable - persuasive brand communication programs over time- multiple communication method-focus on customer-overall objectives acquairing, maintaining, growing, customers in order to get greater and most consistent income flows-contribute result-long term relationship-meaningful insight-relevance-receptivity-response-recognition and relationship. Belch and

Belch: Promotional mix-influence the response process in favor of the company product or services. Brunello: marketing tools approaches-resources-maximize the impact on consumers' mind and profit at minimum cost-promotional tools-marketing mix-business strategic process-build brand value. Carlson : Create synergy-communication tools-generate customer database- Heightening the tangibility of the service product-Generating consumer information-effective communication-build brand equity-Provide product or feature information-communicate or differentiate product position. Eagle et al.,: practice-philosophy hightening expectation throguh effectiveness and efficiency in all marketing communication activity. Eliott and Boshoff: ensure a firm's message- positioning-communication tools-coordinated and consistent messages. Kitchen and Burgman: creating coordinated and consistent message- various channels of communication-facilitating the interpretation of information for customer-focusing on long term brand value. Vargas: comprehensive planning and marketing process from customer point of view. Percy et al., as cited in Kitchen et al.,: Planning and execution- all types of marketing communication- brand positioning. Duncan as cited in dewhirst and davis: Process creating and nourishing profitable relationship-control and influencing all messages. Smith as cited in Holm: Brand positioning-personality-messages delivered sinergitistically - delivered from single consistent strategy. AMA :planning process –brand contacts- consistent over time. Kotler And Keller: Marketing communication planning -recognizes added value to evaluate strategic roles- variety communication disciplines-provide clarity- consistency-maximum impact-seamless integration of discrete messages. Duncan and Evered as cited in Gabrielli and balboni: Strategic coordination of all messages -media -perceived brand value. Pitta et al: tool to reach target audiences persuasively. Smith et al., Herstein: the strategic analysis, choice-implementation - control-elements of marketing communications-efficient (best use of resources) - economical (minimum costs) - effective (maximum results) influence.

There are some similarities of points of the concepts that have been presented in the table which are American Association of Advertising Agencies, Kotler and Armstrong as cited in Elliot and Boshoff, Percy et al., as cited in Kitchen et al., Smith et al., as cited in Hersteiner al., Jones and Schee as as cited in BrunelloGronroos, 2004; Kitchen, 1993; Baines et al., as cited in Vel and Sharma also Mongkol which are a comprehensive plan/planning, added value, marketing tools, advertising, promotion etc.

American Association of Advertising Agencies as cited in Brunello, 2013 and Smith et al., (1999) as cited in Herstein, Mitki, dan Jaffe (2008 p. 361) SisodiadanTelrandhe (2010:135) Integrated marketing communication needs to get a maximum impact on consumer's mind and maximum result. Pitta et al., and Schultz as cited in Kitchen et., al can be a powerful tool to reach audience persuasively.

Based on the studies that have been presented so this paper proposes that IMC is the act of a strategic and synergistic planning and implementing which involving all forms of marketing communication tools and technology continously and persuasively, in order to get the maximum impact on consumers and also to create and maintain the company's relationship with its customers and stakeholders over time.

Conclusion

This article aims to provide the clarity of integrated marketing Communication concept by analyzing and comparing the existing concepts or definitions from books, articles, journals and other sources. The implication of the finding that integrated marketing communication is a concept that integrates variety of communication disciplines, approaches and company resources to maximize the impact on customer that leads to maximum profit and low cost. The original contribution of this paper is to redefine the concept of integrated

marketing communication. But there is still wide open for scholars to conduct in-depth studies of Integrated MaketingCommuncation (IMC) considering the very breadth of its scope.

VALIDITY OF PFEFFER MODEL TO SRI LANKAN MANUFACTURING SMALL AND MEDIUM ENTERPRISES

WWAN Sujeewa, Rajarata University of Sri Lanka
Email: nasutwin@gmail.com

Abstract

The purpose of this study is to examine the effectiveness of human resource management(HRM) practice and operational performance in manufacturing small and medium enterprises (SMEs) in Sri Lanka. Researcher used the Pfeffers' model from marketing research to explain and examine how HRM practices impact to operational performance of the SMEs. The study was conducted relating to 448 manufacturing SMEs in Sri Lanka. The structured questionnaire was administrated to cover 428 Human Resource Managers/Executives or responsible authorities in various SEMs in Sri Lanka; however data were possible to be collected from 135 only, making a responded rate of 30.1 per cent. The results of the study showed significant and positive relationship with seven HRM practices: employment security; selective hiring; use of self-managed teams and decentralization; use of compensation contingent on organizational performance; the extent of training; reduced status distinctions and sharing of information with manufacturing SMEs performance in Sri Lanka. Regression analysis was to examine the impact of the variables and it was found that 32.4 percent of the variance in the dependent variable is jointly and significantly explained by the collective variance in all the independent variables considered in the study Findings of the study will be important on the practical ground.

Introduction

Given contemporary financial market constraints and limited growth in demand, smaller firms refocusing increasingly on how to utilize existing resources more efficiently and effectively (Gallego et al., 2012). Given their resource limitations, small and medium-sized firms have fewer options than their larger counterparts to improve performance. However, one resource that is common to all organisations, which has been the focus of increasing theoretical, empirical and practical attention in small and medium sized enterprises (SMEs), is that of human resources. Pfeffer (1998), Wimbush (2005) noted that most valuable asset that an organization can possess is its human resource.Subsequently, human resources in the organization can vitally contribute to the success (or failure) of the organization. Hence, scholars have suggested that adopting specific human resource management (HRM) practices can improve small firm performance and sustain competitiveness (e.g. Michie and Sheehan, 2008; Patel and Cardon,2010; Razouk, 2011; Williamson et al., 2002).

Most of Western based studies (Delaney & Huselid 1996; Delery & Dot 1996; Huselid 1995; MacDuffi 1995; Pfeffer 1998; Wimbush 2005; Vlachos 2008;Michie and Sheehan, 2008; Patel and Cardon,2010; Razouk, 2011, Sheehan, 2013) have revealed that human resource practices can enhance organizational performance. In addition, prior empirical studies have indicated that some human resource practices positively association with organizational performance. Researchers in the field of human resource management suggest that more future empirical investigations need to be carried out to ascertain and validity these findings (Brewest 2004; Givord&Mauri 2004). This is important consideration

as human resource practices are found to vary across countriesand these variations are postulated to cultural values a country possesses (Ngo, Turban, Lau &Lui 1998), and also organizational size (Heneman, Tansk& Camp 2000).Majority of findings from human resource management – performance research in large firms points in the direction of a positive relationship (Combs et al., 2006). There are reasons to assume that these are not necessarily applicable to small and medium enterprises (SME). In comparison with large organizations, SMEs lack of economic of scale, less number of employees, and HR decisions in SMEs are usually taken by owners/managers in an informal and personalized manner (De Winne&Sels, 2013).

Over the years, researchers have suggested many HRM practices that have the potential to improve and sustain organizational performance. These practices include emphasis on employee selection based on fit with the company's culture, behavior, attitude and necessary technical skill (Ahmad & Schroeder, 2003). Same time growing number of empirical studies have confirmed that not every HR practice can impact on organizational performance or organizational sustainability (Ahmad &Schrorede 2003; cardon& Stevens 2004; Barring, Jones &Neubaum 2005, Boxall, 2013).Pfeffer (1998) has proposed seven HRM practices that are expected to enhance organizational performance. The practices proposed by Pfeffer (1998) are; employee security, selective hiring of new personnel, self-manage teams of decision making as the basic principles of organizational design, comparatively high compensation contingent on organizational performance, extensive training, reduced status distinctions and barriers, including dress, language, office arrangements, and wage differences across levels and extensive sharing of financial and performance information throughout the organization. Few empirical examinations have been carried out this model to understand the effect of HR practices on organizational performance (Vlachos 2008; Subramaniam, Shamsudin& Ibrahim 2011). These prior studies in HRM practices and performance by using Pfeffer model were mainly focusing large scale firms. With exception to Subramaniam, Shamsudin& Ibrahim (2011), the above studies were oversea based. Thus, HRM practices and performance in SMEs sector amongst Sri Lanka is still understudied.

There are two objectives of the present study based on these practices. First, to understand whether manufacturing SMEs' in Sri Lanka use of these seven practices. Second, whether these seven practices are impact to performance of manufacturing SMEs in Sri Lanka and check the usefulness of this model to Sri Lanka context.

Theoretical background and hypotheses

In order for firms sustain competitive advantage, resource-based view (RBV) of the organization postulates that better performance is the result of mix of human resource practices (Barney 1991; Sheehan 2013).Razouk (2011) said that organization can develop a sustainable competitive advantage only by creating value through internal resource and RBV emphasizes the internal characteristics of the firm (Sheehan 2013), Barney (1991) noted that resource that are rare, valuable, inimitable, and non-substitutable can provide sources of sustainable competitive advantages. In contrast with other resources that are easier to imitate, the management of human resources is complex, ambiguous and dynamic, and thus a potential source of significant competitive advantage (Barney &Wright, 1998; Backer & Huselid, 1998, Razouk, 2011, Sheehan 2013). Several researchers (Cappelli& Singh 1992; Wright et al 2001) showed the relationship between the RBV and the HRM is widely and finally it effect on the firm performance (Ahmad &Schrorede 2003; Cardon& Stevens 2004; Barring, Jones &Neubaum 2005, Razouk 2011; Boxall, 2013; Sheehan 2013). In addition to that human resources is regarded as a crucial input to the resource base of the firm (Barney & Wright, 1998; Backer & Huselid, 1998; Huselid 1995) because better management of human

resources contributes to sustained competitive advantage. But the management of human resources is differently in SMEs and larger firms. But several researchers have called for more research on HRM in SMEs, especially give the role and pervasiveness of SMEs in the economy (Cassell el al, 2002).

There is a little agreement as to which HRM best practices can be consider as strategic in an organization (Paauwa, 2004). Much of the prior research on the relationship between HRM practices and organizational performance has concentrated on a single HR practice (Wattanasupachoke, 2009; Tessema & Soeters, 2006)however, a growing number of researchers have argued for instituting complementary bundles of HRM practices to enhance organizational performance (Osterman 1994;Sheehan, 2013).The first works on HRM in SMEs have claimed for a long time that these last invest less inhuman capital and that their HRM practices remain informal (Mayson and Barrett 2006). One reason of this fact is the concentration on the financial aspects in SMEs. Marlow and Patton (1993) argue that the concentration on financial criteria for SME success has led to an imbalance in research towards financial investigation and away from human capital and reinforced the argument that HRM within SMEs may not be real. However, as SMEs control their own fate and involve everyone in the business, they are the best image for the involvement-oriented approach (Lawler 1992).A further issue complicating analyses of the HRM–performance relationship is the potential for the difference between rhetoric and reality regarding policy presence and implementation (Legge,2005). Specifically, a human resource practice may formally be in place, but it may be delivered only sparingly, especially when delivery has been devolved to line managers and/or is not consistently applied to all employees (Legge, 2005; Bowen and Ostroff, 2004; Guest and Conway, 2011).In the small firm context, given the importance of informal practices, any survey about whether aformal practice is in place or not has the potential to underestimate, and possibly misrepresent, theextent to which human resources are managed in practice, since the use and effectiveness of informal management will not be captured in a survey.

Pfeffer's seven HRM practices are internally consistent with one another. The seven practicesare expected to foster such inimitable attributes in human resources and, thereby help an organization attain competitive advantage. Several researchers (Delery and Doty, 1996; Huselid, 1995; Arthur, 1994; Osterman, 1994) including Pfeffer (1998) have argued why these practices are expected to enhance organizational performance. . However, Ahmad & Schroeder (2002) noted, empirical validation of the findings in operations across countries and/or industries is nearly non-existent and very limited at best. But, the impact of HRM practices on organizational performance as proposed by Pfeffer (1998) can be generalized across manufacturing plants operating in different industries and countries. Therefore,present study set of hypothesis below.

H1. *Each of the following seven HRM practices: employment security; selective hiring; use of self-managed teams and decentralization; use of compensation contingent on organizational performance; the extent of training; reduced status distinctions and sharing of information will be positively related to manufacturing SMEs performance in Sri Lanka.*

Methodology

Sample and Data collection

To achieve the research objective, a survey was carried out amongst SMEs in Western Province of Sri Lanka only because more than 46 percent of manufacturing SMEs are located in this area. According to Chelliah, Sulaiman, and Yusoff (2010), SMEs are usually define by socioeconomic development of each country. For example, in the US, Carusgil, Knight and Riesenberger (2008) defined SMEs as a company with 500 or fewer employees while in

Taiwan SMEs it is 650 employees or less (Lin & Chane, 2007). However, in Sri Lanka, does not have a nationally accepted definition for small and medium enterprises. For example, the Department of Small Industries defines SMEs as those with a capital investment of less than Rs. 5 Million, and which employ less than 50 employees; Export Development Board defines SMEs as those with a capital investment of less than Rs. 20 Million in plant, machinery and equipment excluding land and buildings and an annual export turnover not exceeding Rs. 40 Million and total annual turnover not exceeding Rs. 100 million (www.srilankabusiness.com); Department of Census and Statistics has defined an establishment with less than 10 persons engaged was considered as a small establishment and an establishment with 10 or more persons engaged was considered as a large establishment (Census of Industry 2010). Therefore, researcher, adapted definition given by World Bank in 1997 for this study. According to them, a small enterprise was defined to include 1-49 workers, and a medium enterprise with 50-99 (Ayyagari*et al*, 2003). At the initial stage, six hundred manufacturing SMEs were selected to the sample by applying random sampling procedure. After the cross checking with particular firms researcher was identified that hundred and fifty two SMEs are not come under the World Bank definition. Hence, these SMEs were dropped from the sample.

The questionnaire was prepared to be in line with the research objectives and variables. Basically closed questions are used since the research outcome is mostly quantitative study than qualitative. Structural questionnaires were sent out to selected four hundred forty eight firms namely to human resource manager and in some instances the owner or proprietor of the organization. The questionnaire was pilot tested with randomly selected organizations first before final distribution and several changers were incorporated based on the feedback received. The participants were given three weeks to respond to the questionnaire and a follow-up call was made to remind them also. After the stipulated time period given to them, only hundred and thirty five questionnaire were returned and used for analysis, making a responded rate of thirty per cent.

Measurements

The items used to measure seven HRM practices were adapted from Pfeffer (1998) and Ahmad & Schroeder(2003) respectively. A set of Likert scales was used to measure pertinentconstructs. Each item of a constructwas answered usingthe following five-point scale: strongly agree (5),agree (4), neutral (3), disagree (2), and strongly disagree(1). Organizational performance was measured using Vlachos's (2008) instrument, which tapped the categories of self –reported measures on organization specific, market specific and overall organization. Past empirical research has mostly investigated the effects of HRM practices on financial performance (Delery and Doty, 1996) and some on efficiency and employee turnover (Huselid, 1995). However, very few studies have examined the impact of HRM practices on operational performance measures, such as quality, cost or delivery (MacDuffie, 1995) or intangible performance measures, such as organizational commitment (Kalleberg and Moody, 1994). Backer and Gerhart (1996) said that *"The appropriate dependent variable will varywith the level of analysis, but in each case the focusshould be on variables that have inherent meaningfor a particular context"*. Because the unit of analysis for this study is amanufacturing SMEs, Hence, HRM practiceswill impact the operational performance measuresat the organizational level. Therefore, this study investigate theimpact of HRM practices on operational performancemeasures. The content validity of a construct was ensured through pre-testing of the questionnaires and structured interviews with the managers in the field. Each scale was evaluated for its reliability and uni-dimensionality. A value of Cronbach's alpha of 0.7 or more was used as a criterion for a reliable scale (Nunnally, 1978).

Results

The data has been analyzed in Statistical Package for Social Sciences (SPSS). Correlation analysis technique is used to find out the relationship among the variables and their relative strength. The results are given in table 1.

Table 1: Mean and Correlation of HRM practices and organization performance

HRM Practices	Mean	1	2	3	4	5	6	7	8
employment security	3.35	1							
selective hiring	4.32	0.31*	1						
self-managed teams	4.08	*	0.38*	1					
decentralization	3.32	0.24*	0.33*	0.28*	1				
compensation	4.58	0.27*	0.42*	0.39*	0.32*	1			
training	4.19	0.39*	*	0.47*	0.35*	0.37	1		
sharing of information	3.40	0.40*	0.53*	0.32*	*	*	0.41	1	
Organization performance	4.21	*	0.27*	0.36*	0.43*	0.42	*	0.39	1
		0.29*	0.47*		0.34*	*	0.47	*	
		0.38*				0.56	*		
						*			

significant at *P < 0.05; **P < 0.01

Table 1 presents the means and correlation values of the variables. High mean values indicated that most of organizations agreed the HRM practices are important. The correlations show low to moderate correlation between organization performances. It obtained for the values were employee security 0.38, selective hiring 0.47, self – management teams 0.36, decentralization 0.34, compensation 0.56, training 0.47 and sharing information 0.39.

Multiple regression analysis applied to test the hypothesis which is set in this study. Multiple regression analysis is used to determine what proportion of the variance in the dependent variable is explained by the independent variables are entered into the regression analysis (Cramer, 2003).

Table 2:Result ofMultiple Regression Analysis

Model	R	R Square	Adjusted Square	RStd. Error of the Estimate
1	0.395	0.324	0.297	0.0382

a) Predictors: (Constant), employment security, selective hiring, self-managed teams, decentralization, compensation, training, sharing of information

According to the table 2, a reliability test of the regression line was conducted and R = 0.395. It indicate that there is a reliability of the line. That means the multiple correlation (R) is 0.395 an indication of high multiple correlation between effectiveness of applicant attraction(dependent variable) and set of independent variables. The coefficient of multiple determination (R^2) indicated that $R^2 = 0.324$. This suggests that 32.4 percent of the variance in the dependent variable is jointly and significantly explained by the collective variance in all the independent variables considered in the study. Hence, HRM practice have positive impact on organization performance in manufacturing SMEs thus supporting hypothesis 1.

Discussion and Conclution

Previously, a limited number of studies have found a positive relationship between a greater number of human resource practices and SME performance in both a cross-sectional context (Messersmith and Wales, 2011; Michie and Sheehan, 2008; Nguyen and Bryant, 2004; Verreynne et al., 2011) and longitudinally (Razouk, 2011). In this study, investigated the relationship of specific HRM practices which was introduce by Pfeffer (1998) and organization performance among the SMEs in Western Province of Sri Lanka. It was discovered that HRM best practices enhance firm performance. The study found that employment security, selective hiring, self-managed teams, decentralization, compensation, training, sharing of informationhave positive relationship on firm performance. The results found in this analysis are consistent with the previous studies, (Ahmad & Schroeder, 2003; Wright et al., 2005; Cho et al., 2006; Khan, 2010; Quresh et al., 2010; Arumugam&Mojtahedzadeh, 2011; Boohene&Asuinura, 2011,). Compare with other HRM practices compensation is influencing organization performance. Further, it also confirmed by Chew and Chan (2008), they said that compensation plays an important role in maintaining their employment and enhancing work commitment. The present study has shown that compensation practiced by manufacturing SMEs in Sri Lanka has an impact on organization performance. This finding is also consistent with Subramaniam, Shamsudin and Ibrahim (2011).Nevertheless, less present study also found that training could influence significantly organization performance. Pfeffer (1998) noted, training is an investment in the organization's staff and in the current business environment. Successful firms that emphasize training do so almost as a matter of faith and because of their belief in the connection between people and profits. Present study also confirmed it because training of the manufacturing SMEs in Sri Lanka has a positive impact to organization performance. This finding is also consistent with Ahmad and Schroeder (2003). In addition, organizations serious about obtaining profit through people, for the purpose of that organization needed large pool of applicants, able to identify critical skills and attributes needed in its applicants and job requirements (Pfeffer, 1998) subsequently it leads to enhance the performance. Present study has shown that selective hiring also impact to employee performance and subsequently organization performance.Present study also revealed that sharing information, employment security, self – management teams and decentralization have weak moderated but positive relationship with organization performance.In conclusion, the present study has provided additional insight into the effects of HRM practices which was introduce by Pfeffer especially amongst the manufacturing SMEs in Sri Lanka. According to the findings of present study have manage to provide empirical Pfeffer model still valid to test the relationship between HRM practices and organization performance not in the large scale organizations but also in SMEs.

PREDICTORS OF STUDENT SPIN-OFF INTENTIONS: PERSONALITY

Abdul Rahman Zahari, University,Bandar Muadzam Shah,Malaysia
Noor Azlinna Azizan, Universiti Malaysia Pahang, Kuantan,Malaysia

Abstract

Student spin-off has captured the attention of policymakers, educators and researchers because of its contribution in achieving university's vision and mission, regional economic growth, knowledge commercialization, and employment generation. This study is design to examine the role of personality traits in shaping students spin-off intention in higher learning institutions. A systematic literature review search is conducted and several scientific articles and reports have been examined. The results of this study indicate that many previous studies had mentioned the students' personality traits like needs for achievement, innovativeness, propensity for risk-taking, locus of control, and self-efficacy shows the positive relationship with entrepreneurial intentions. This study will serve as a base for future studies and will have valuable implications for policymakers and universities.
Keywords: Student spin-offs, Personality

Introduction

The field of new business start-ups among university students has been the subject of increasing interest among scholars (Boh, De-Haan and Strom, 2015; and Hayter, Lubynsky and Maroulis, 2016). Bailetti (2011), student spin-off firms can be originated by students attending programs in any faculty at a university. These companies are operating independently from the university; they have their own legal, technical, and commercial structures. Student spin-offs are important at least for five reasons: (i) They offer a concrete proof the university is relevant, up-to-date, and competitive; (ii) They significantly contribute to the economic development of the region where the university is located; (iii) They commercialize knowledge that may otherwise go undeveloped within the university; (iv) They help universities accomplish their core missions of research, teaching, and community development; and (v) They increase the return on government investment in university research and development (Bailetti, 2011). More importantly, the realities of today manifest that; no government in this world can assure to provide jobs to all graduates, thus student spin-offs also could be the possible solution of shifting the job seekers to job creators. With numerous benefits offered, the process of investigating the key motivation of setting up student spin-offs is important to be executed. In this context, many different expectations have been articulated which functionally aim for the macro level goal growth of student spin-offs: the primary concern is to increase the potential number of students interested in starting new businesses (spin-offs intentions), to stimulate as many student spin-offs as possible (start-up realization) and finally to secure the survival and or growth of these start-ups (spin-off success).

Opening up a new company is reflect much with an individual decision, which is why the individual's qualities as an entrepreneur are central in the examination of entrepreneurship field (Littunen, 2000). Personality trait is the individuals' consistent reaction caused by stimulation of external environment. Past studies (e.g. Shaver and Scott, 1991; Crant, 1996; Rauch and Frese, 2000; Veciana, Aponte and Urbano, 2005; Aghazamani and Roozikhah, 2010; Hosseini and Ahmadi, 2011; and Kautonen, Van Gelderen and Tornikoski, 2013)

identified the personality traits have proven as predictors of many aspects of entrepreneurship including intending to start a business, starting a business, succeeding in running a business, and corporate intrapreneurship. Students possess certain personality traits, and the value of these characteristics in decisions related to the spin-off intentions is the focus of interest in this paper. Early notification of these characteristics will help the university to train them to become an entrepreneur. Perhaps the universities also can increase the commercialization of technology and getting good rating of graduates' employability rate through this activity. Then, the stakeholders will heavily recognize the contributions of university to the society. The reminder of this paper is organized as follow. The following section describes the methodology. Section 3 presents the key results and discussion. The last section concludes the study.

Methodology

To study the types of personality that influencing student spin-offs intention, an organized literature review was conducted. The investigation was limited to the entrepreneurial intentions using web based search engines. Topic search was used to identify publications that refer to perception of barriers in setting up a business among students in title, abstract, and author keywords. The search then was further narrowed down to English language articles. The search included only journal articles without considering books and press papers publications. Major online databases such as Science Direct, Academic Search Complete, Wiley Online Library, Business Source Complete, and Emerald, were used.

Analysis and results

The characteristics of individuals, the behavior of individuals, the nature or type of business start-up and characteristics of the environment in which a newly created company operates are decisive factors for the firm's performance (Gartner, 1985). As they are supposed to be leaders, their personality traits affect their firm vision and strategy (Peterson, Smith, Martorana and Owens, 2003). Besides, if the entrepreneurs possess certain traits, this enables them to perform their roles well (Judge, Piccolo and Kosalka, 2009). Thus, identifying the right personality of students that motivate them to establish the spin-offs is vital. Table 1 indicates some studies dealing with entrepreneurial traits among university students. Among the traits are needs for achievement, innovativeness, propensity for risk-taking, locus of control, and self-efficacy.

In view of entrepreneurial intention, Fishbein and Ajzen, (1975) identified it was a significant predictor of one becoming an entrepreneur. Intentions in general influence the engagement in actual behavior. Due to that, a number of scholars have viewed entrepreneurial intention as a motivating force of entrepreneurial activity and therefore have defined the construct to reflect this position. For instance, Katz and Gartner (1988) defined entrepreneurial intention as the search for information that can be used to help fulfil the goal of venture creation. It has also been defined as the perceptions of desirability and feasibility and the propensity to act upon opportunities (Peterman and Kennedy, 2003). Following from these definitions, this study define entrepreneurial intention as student's willingness, desire and ability to engage in entrepreneurial behaviors or establish a spin-off that is of relevance to the students, university, and society at large. Moreover, Krueger and Brazeal (1994) postulated that entrepreneurial intention is central to understanding the entrepreneurial process because it is the foundation and the first step to know the process of entrepreneurship. Furthermore, Segal, Borgia and Schoenfeld (2005) pointed two questions to predict an individual's intention to become an entrepreneur in which also can be used to test with university students: (i) is entrepreneurship desirable to me?; and (ii) is entrepreneurship feasible for me? Against these questions, this study concludes that a proactive individual

(student) has the attributes that mirror someone with high desire and motivation to venture into business. Therefore, the present study sought to literary investigates the students' personality to become an entrepreneur.

The relationship between personality traits and entrepreneurial intentions (spin-off intentions) has been established in literature (Table 1). During the start-up or pre-founding phase of a new venture, entrepreneurial intention model has confirmed that individual characteristics include achievement motivation, innovativeness, propensity for risk-taking, and self-efficacy were significantly associated with entrepreneurial intention. With regard to need for achievement, past studies (e.g. Tibbits 1979; Birds 1989; Davidsson, 1989; Boyd and Bozikis, 1994; Beverland and Lockshin, 2001; Papadakis, 2006; Gurol and Atsan, 2006; Manolova, Brush and Edelman, 2008; Benzing, Chu and Kara, 2009; Tong, Kin Tong and Loy, 2011; Ghazali, Ibrahim and Zainol 2012; Peng, Lu and Kang, 2012; Estay, Durrieu and Akhter, 2013; Amir, Mohamad and Abdullah, 2013; Bigliardi, Galati and Verbano, 2013; Olakitan, 2014; Rofa, Ngah and Ab. Wahab, 2015; Pinho and de Sa, 2014; and Karabulut, 2016) found the relationship between the needs for achievement and entrepreneurial behavior. Thus, university students who have a high need to achieve will show more entrepreneurial behavior and leading them to become an entrepreneur. McClelland (1961) introduces this concept to rather revealing empirical evidence (obtained through several kinds of methods) on the existence of a connection between the need for achievement and (business) development. The concept was empirically tested and shows the positive link of needs for achievement and entrepreneurial intentions among university students.

Evidence from a review of the literature discloses how entrepreneurs are significantly more innovative than non-entrepreneurs (Robinson, Stimpson, Huefner and Hunt, 1991). Schumpeter (1934) stressed the innovativeness is the most fundamental aspect of entrepreneurship and an essential entrepreneurial characteristic. Ghazali et al., (2012) added that innovativeness as crafting new products or new quality, generating new methods of production, attainment into a new market, creating a new source of supply or building new organization or structure in business. It is suggested as a behavior that characterizes entrepreneurial intention. Some previous studies (e.g. Carter, Gartner, Shaver and Gatewood, 2003; Gerry, Marques and Nogueira, 2008; Fatoki, 2010; Peng, Lu and Kang, 2012; Dinis, do Paco, Ferreira, Raposo and Ricardo, 2013; Estay, Durrieu and Akhter, 2013; and Karanja, Ithinji and Nyaboga, 2016) revealed that entrepreneurial intentions is linked with innovative students and thus supported the previous definitions. Other key characteristic to be an entrepreneur is the risk taking propensity. Risk taking propensity has been conceptualized by Sexton and Bowman (1985) as one's orientation toward taking chances in a decision making situation. Caird (1993) mentioned few characteristics of entrepreneurs such as the desire to take risks, the ability to identify business opportunities, the ability to correct errors effectively and the ability to grasp profitable opportunities. In addition, Gurol and Atsan, (2006) defined risk taking as the propensity of an individual to reveal risk taking or risk avoidance when confronted with risk situations. In short, the acceptation of risk in managing the businesses or activities is related the probability of success. Previous studies (e.g. Hisrich and Peters, 1995; Luthje and Franke, 2003; Segal, Borgia and Schoenfeld, 2005; Sanchez, 2011; Ghazali et al., 2012; Peng, Lu and Kang, 2012; Amir, Mohamad and Abdullah, 2013; Bigliardi, Galati and Verbano, 2013; Estay et al., 2013; Gomezelj and Kusce, 2013; Pinho and de Sa, 2014; Karanja, Ithinji and Nyaboga, 2016; Karabulut, 2016) have indicated that students who can manage the risks are linked with high entrepreneurial intentions. Next, the role of individual locus of control has been identified as the influenced factor of entrepreneurial intentions among university students. Altinay et al., (2012) brief mention about the locus of control as the individual's perception of his or her ability to influence events in life. Moreover, an internal control expectation is usually associated with entrepreneurial characteristics

(Littunen, 2000) and entrepreneurial success Brockhaus (1980). Due to that, Ismail, Ahmad, Gadar and Yunus (2012) have described students who have high internal locus of control are expected to become entrepreneurs than those with external locus control. The other past studies (e.g. Gatewood, Shaver and Gartner, 1995; Luthje and Franke, 2003; Gurol and Atsan, 2006; Frank, Lueger and Korunka, 2007; Turker and Selcuk, 2009; Khan, Ahmed, Nawaz and Ramzar, 2011; Gomezelj and Kusce, 2013; Kafi and Hosseini, 2013; Dinis et al., 2013; Karanja, Ithinji and Nyaboga, 2016; and Karabulut, 2016) also have supported the findings.

Finally, self- efficacy has a significant impact on performance in variety tasks and has been related to dynamics around business performance (Hmieleski and Baron, 2008; and Machmud and Sidharta, 2016). As explained by Wood and Bandura, (1989) the self-efficacy is an individual's perception regarding his or her ability to successfully complete a given task. This is essential for entrepreneurs because they must be confident in their abilities to perform in diverse and unanticipated jobs in inexact situations. The self-perceived competence of the founders of entrepreneurial firms is positively related to the entrepreneurial performance (Baum and Locke, 2004) and can be prediction of entrepreneurial intention (Barani, Zarafshani, Del-Angizen and Lorgani, 2010). According to Saleh, (2014) students with high belief in personal capability or self-efficacy will have higher entrepreneurial intentions than with low personal capability. Among the past studies that supported the role of self-efficacy with entrepreneurial intentions are Boyd and Bozikis, (1994), Chen, Greene and Crick, (1998), Krueger, Reilly and Carsrud, (2000), Segal, Borgia and Schoenfeld, (2002), Wang et al., (2002), Ramayah and Harun, (2005), Zhao, Seibert and Hills, (2005), Basu and Virick, (2007), Kickul, Wilson and Marlino, (2009), Sanchez, (2011), Khan, et al., (2011), Akanbi, (2013), Pihie and Bagheri, (2013), Susetyo and Lestari, (2014), Pinho and de Sa, (2014), Olakitan, (2014) and Manik and Sidharta, (2016). To summarize, Altinay, Madanoglu, Daniele and Lashley (2012) claimed that the personality trait is the highest predictor in business set-up intentions. Table 1 below summarized the research findings.

Table 1. Studies of personality and entrepreneurship intentions

Personality	Previous study
Needs for achievement.	Tibbits 1979; Birds 1989; Davidsson, 1989; Boyd and Bozikis, 1994; Beverland and Lockshin, 2001; Papadakis, 2006; Gurol and Atsan, 2006; Manolova et al. 2008; Benzing et al. 2009;Tong, Kin Tong and Loy, 2011; Ghazali, Ibrahim and Zainol 2012; Peng, Lu and Kang, 2012; Estay et al. 2013; Amir, Mohamad and Abdullah, 2013; Bigliardi, Galati and Verbano, 2013; Olakitan, 2014; Rofa, Ngah and Ab. Wahab, 2015; Pinho and de Sa, 2014; and Karabulut, 2016.
Innovativeness	Carter, Gartner, Shaver and Gatewood, 2003; Gerry, Marques and Nogueira, 2008; Fatoki, 2010; Peng, Lu and Kang, 2012; Dinis, do Paco, Ferreira, Raposo and Ricardo, 2013; Estay, Durrieu and Akhter, 2013; and Karanja, Ithinji and Nyaboga, 2016.
Propensity for risk-taking.	Hisrich and Peters, 1995; Luthje and Franke, 2003; Segal, Borgia and Schoenfeld, 2005; Sanchez, 2011; Ghazali et al., 2012; Peng, Lu and Kang, 2012; Amir, Mohamad and Abdullah, 2013; Bigliardi, Galati and Verbano, 2013; Estay et al., 2013; Gomezelj and Kusce, 2013; Pinho and de Sa, 2014; Karanja, Ithinji and Nyaboga, 2016; Karabulut, 2016.
Locus of control.	Gatewood, Shaver and Gartner, 1995; Luthje and Franke, 2003; Gurol and Atsan, 2006; Frank, Lueger and Korunka, 2007; Turker and Selcuk, 2009;

Khan, Ahmed, Nawaz and Ramzar, 2011; Gomezelj and Kusce, 2013; Kafi and Hosseini, 2013; Dinis et al., 2013; Karanja, Ithinji and Nyaboga, 2016; and Karabulut, 2016.

Self-efficacy   Boyd and Bozikis, 1994; Chen, Greene and Crick, 1998; Krueger, Reilly and Carsrud, 2000; Segal, Borgia and Schoenfeld, 2002; Wang et al., 2002; Ramayah and Harun, 2005; Zhao, Seibert and Hills, 2005; Basu and Virick, 2007; Kickul, Wilson and Marlino, 2009; Sanchez, 2011; Khan, et al., 2011; Akanbi, 2013; Pihie and Bagheri, 2013; Susetyo and Lestari, 2014; Pinho and de Sa, 2014; Olakitan, 2014; and Manik and Sidharta, 2016.

The results from the findings are then used to develop the research model. The suggest model is explained in figure 1. The personality traits i.e. needs for achievement, innovativeness, propensity for risk taking, locus of control, and self-efficacy are set to become the predictors of students spin-off intentions.
Figure 1. Proposed research model

Conclusion

According to research findings, need for achievement, innovativeness, propensity for risk taking, locus of control, and self-efficacy affect entrepreneurial intention among university students. This study is designed to make contributions to vast parties such as students (potential entrepreneur), university, and the government. University through the entrepreneurship center can examine the personality traits and other factors which affect entrepreneurial intention by conducting follow-up studies. Potential entrepreneurs (university students) can understand personality traits affecting the entrepreneurial intention much better and improve these traits to become successful entrepreneurs. Given the positive effects of entrepreneurship on a country's economy in the form of the creation of employment opportunities, product innovation, and economic growth, the promotion of entrepreneurship inside university is a national priority for many governments around the world and particularly those in developing countries.

Since entrepreneurship and entrepreneurial attitude are not totally inborn and they can be stimulated by education. Therefore, it is suggested that the faculties or schools can provide complete entrepreneurial education, and allow university students to have the opportunity to learn organizations of firms, market analysis, product development, fund raising and corporate operation before they enter the society. It might reduce the risk of failure of student

spin-offs. Besides learning in classes, the faculties can construct the institutes by business competition, industry-academy cooperation center, innovation incubation center, skill transfer or authority center, and industry-academy cooperation in order to enhance the graduates' entrepreneurial intention and skills.

GROWTH STRATEGY DEVELOPMENT OF START-UP COMPANIES: EVIDENCE: INDONESIA

Senna Gumilar, Universitas Indonesia Depok, Indonesia
Dr. Budi W Soetjipto, Universitas Indonesia Depok, Indonesia

Abstract

The interest over entrepreneurship is manifested in start-ups or new-small businesses, but the number of startup entrepreneur is still low. One of many reasons for that is the risk of failures. People tend to adverse risk and come to more stability profession. These failures then become motivational factors and the need of management capability that role as internal barrier (Cooney, 2012) for being an entrepreneur. These failure often affected by their incapability of creating sustainable growth, making strong direction, and formulating strategies in order to continue being relevant.

This study emphasize on how newly-business would be able to encompass their strategies to grow, iterate them into business targets and activities, and what the essential logic and values that enable them to do so . Thus it will create an interpretation on how growth strategies are incorporated in start-up context.

Qualitative approach is selected in order to study how growth strategies affecting how start-up/small-new business perform. The approach is performed in multiple case studies including 27 startup/new-small businesses in semi-structured interviews supported by complement data from various secondary sources. Classification of Start-up by Start-up Genome Report (2014) and Blank-Marmer Phase are implemented in order to understanding more deeply behavior between one company to the other in incorporate growth strategies.

The study indicates that some of the firms in the strategy positively use emergent approach in strategy formulation, while the other combined between planning and emergent approach. All of the firms adapt the high-level of flexibility over implementation and formal strategies. This approach help some of the firms to made clear into steps taken by them to explore their entrepreneurial behavior in opportunity seeking behavior while maintained their sustainable source of advantages.

Through the interview, it is found that different elements affected the fabrication of growth strategies. External environment, access to financial, human and social resources is quite affected on how firms formulate strategies. Other factors that proposed internally affected the process such as entrepreneurial orientation and the owner-manager orientation towards growth are also affected the process of growth strategies manufacturing.

There also findings that Ansoff strategy map able to classify growth strategy taken by the participant.
Another finding is that strategic experience does give the firms more consideration in selecting strategies. It also will be a positive consideration for new-small business should consider collaboration in order to expand their own capabilities and cooperate with externals as strategic steps to obtained more sustainable growth..

Keywords : *Startup, Growth Strategy, Strategy Map, New-Small Business, Entrepreneurial Action*

Introduction

According to Global Entrepreneurship Monitor Report 2015-2016, SME had its contribution to Indonesia's GDP for 57% (2013). That condition ratified Indonesia to have score 4.5/7 of World Economic Forum Global Competitiveness Rating. Slightly 0.5 points below Israel, known as a country with the most outstanding performance in developing entrepreneurship, that indicated with 3 times more (423 dollars per capita, Zirra Start-up Report 2015) investment dollars than USA.

Entrepreneurship, especially in Indonesia, had contributed to economic performance of a country. Unfortunately, potentials had by Indonesia couldn't be supported with the few numbers of entrepreneurs that still below 2%.

The interest over entrepreneurship is manifested in start-ups or new-small businesses. This study emphasize on how newly-business would be able to encompass their strategies to grow, iterate them into business targets and activities, and what the essential logic and values that enable them to do so . Thus it will create an interpretation on how growth strategies are incorporated in start-up context.

One of the problems occurs when we studied startup is, that they had problem in sustaining their growth and becomes a more established companies. The focus they made to create most viable product over time get their focus blurry. Thus, they should maintain their goals clear and they ought to formulate their strategies better in order to continue to grow (Rasmussen, 2009).

Strategies however take central aspect in how an organization run and process. It works by setting directions then formulating the way an organization achieve their goals (Gibcus& Kemp, 2003). In another way, the terms and the implementation of strategy rather are very well known in a more established companies. Ireland R et al (2003) conclude that small businesses, phrased specifically in terms of small and medium sized enterprises, are lacking their attention on formulating strategy also the definition of strategy in general.

Among other things, small medium business, especially the ones called start ups, are still lacking in efforts of researches and academic studies. People who embraced themselves in the world of startup business always try to find many alternative sources in implementing their ways to run the business. It is also justified with a little interest in small firms, data availabilities, and believes among entrepreneur. It lead to a conclusion that start ups, and small businesses roll the strategies in order only to survive. There are findings that say there are positive connections between the performances as results of strategy used in small business (Fletcher & Harris, 2002).

In recent phenomenon, start-ups, that have shifted its meaning over time, are also considered as small businesses. It is become popular as the way young people doing their business nowadays. It becomes so rapid that not many studies have been found regarding this topic.

In many studies, great emphasis of strategic management puts its focus on larger and more established businesses. There are less studies that gives a clear framework that capable of illustrate the use of Strategic management in specific definition in small business paradigm (Gilinsky et al., 2001). Young and small businesses are considered more effective in finding solution over problems compared to largerand more established one, thus made them more abilities in identifying opportunities (Ireland et al., 2003). Moreover, even if they able to find more problem/solution fit products, it is argued that Start-ups we mentioned before are quite hard to maintain sustainable competitive advantages over competitor based on the solution they implement (Ireland et al., 2003). This is happened when the founder/key-person of the business fail to think in more strategic manner, so that they fail in made above average performance and developing a more sustainable competitive advantages.

The process of altering invention to innovation is mentioned as creative destruction in

the entrepreneurial activity as Schumpeter (1934) in Rasmussen (2009). He also said that entrepreneurship contribute to the dynamism of industries and development of economic growth. Nowadays, the opinion stated start-ups and small business does give contribution on economic growth become more popular. That way, it emphasizes that growth performances of the industry become the measures for entrepreneurial success in the real practice.

But, the developing of firms success factors need to be done in the terms of start-up companies as well as the established ones. Specifically, Start-ups in need to be bigger and sustainable had to face dynamics and ill-threaten environment. The success rate of Start-ups Company is determined on how well they adapt to the conditions.

Adaptability of the company is can be seen in how a company could grow. But when we talked about growth, Paul graham (2012) said that start-up is a company engineered to grow fast (http://www.paulgraham.com/growth.html). The focus of growth that not limited by geographical variables is the factor that differentiates startups from small businesses.

How they anticipated the environment and pursue the growth of the company, is the one that interesting to discussed. Growth also became goals for start-up company in doing their activities. Strategy in doing so, to prevent common mistakes that lead the firms fail, should become the focus the firm had paid their attention to.

By those condition, this paper would like to take a closer look on how Startup making their strategy in order to grow and survive their business. This studies hope the results will confirm the subject relevances. It also will increase awareness among researcher and practicioner to further develop field of study of start-up industry and develop tools that will provide start-ups as well as small firms with direction and frameworks for strategy development for them to grow to more established companies.

Theoretical background

Start-Up

What is considered to be a small business/Start-ups? According to academic review, it is really hard to match a clear explanation of start-ups. The information comes in a wide range in accordance of one researcher/article to another. Such aspects like industries, geo-locations, and other operational variable such as revenue, number of employee and so on. Some researcher like Storey (1994) and Deakins & Freel (2003) did also manage to define it.

Blank (2013) mentioned that startup is the "temporary organization in search of scalable, repeatable, profitable business model". Nowadays, start-up terms are correllated as the high growth business. Pieper (2013) stated that high growth new ventures are came from the terms "gazelles" that first introduced by Birch (1995) which define gazelles as a new firms that double its sales every four year. Saßmannshausen and Volkmann (2012) in Pieper (2013) elaborates the terms gazelles that shifted in ten years as below:

Table : Definitions of Gazelles based on Saßmannshausen and Volkmann (2012) on Pieper (2013).

Table 15 Start-up/Small Business Definition Compilation

Year	Author/Research/ Institute	Definition
1995	Birch, Haggerty, Parson	Enterprises that doubled their sales every four years
2000	Moreno & Casillas	SME according to definition of the EU grew their performance at least

Year	Author/Research/ Institute	Definition
		doubled in the last 3 – 4 years
2001	National Comission on Entrepreneurship	a firms that has employee growth at least 15% in 5 consecutives years /100% in 5 years.
2003	Littunen and Tohmo	a firms that at least doubled the size in 4 years
2007	Global Entrepreneurship Monitor, Autio	a venture that employe at least 20 employees in 5 years operations
2007	Acs and Mueller	a firms taht founded without subsidiaries of existing firms and employ at the start of 20 – 499 employees
2007	Lesonsky	a firm that managed by owner generate 233.757 USD revenue per employee
2010	Daunfeldt	a firms that belong to top 1% in terms of revenue, productivity, or employee growth on one population
2010	Stangler	a firms that has thirty percent renue growth and 20% employee growth
2010	Davila, Foster and Jia	a firm that exist for no more than 10 years and have, 20 – 150 employees.
2011	Ries, Eric	a human institution designed to deliver a new product or service under conditions of extreme uncertainty

In his works, Birch et al (1995) also mentioned other two terms regarding the typology, which mice and elephant. Later on ther terminology of mice and gazelles that will be differentiate on what the Pieper (2013) as a High growth new firms and a mere new firms. Elephant obviously refer to big-established companies that will be discussed later in terms of usual strategy implementation of a firm.

Categorization of start-ups and small businesses that divided by the number of people worked on it; by the size of market they operate, and/or by whether the owner manage it in a more personalized way are proposed by Deakin & Freel (2003). They also add information from European Commission where small medium enterprise is categorized by the number of workforces, its turnover or financial performances.

Different with Start-ups, although the number of employee are small, the market they ought to seize is numerous and wide. They focus themselves creating goods and services that accepted as general and can be enjoyed by wide variety of market. The main product they focusing on is called most viable product (MVP).

Start-up, a part of being small, it has to be new. It consists zero to ten years of existence. Startups need to be small companies determined to grow quickly in the hopes of becoming the next passé giant (Tech Crunch, 2016). Start-up business or a new business considered at them when they are less than forty-two months old (Reynolds, Bosma, & Autio, 2005).

Another defintion of Startup is came from Wikipedia that state it as an early stage company in the life cycle of an enterprise where the entrepreneur moves from the idea stage to securing financing, laying down the basis structure of the business, and initiating operations or trading (Wikipedia, 2016). It also has to be an organization formed to search for a repeatable and scalable business model (Blank, 2011)

A more technical classification came from Alex Wilhelm (2015) that stated start up as an organization that not exceed $50 million revenue run rate (forward 12 months); 100 or more employees; Worth more than $500 million, on paper or otherwise. A startup is a young company that is just begins to develop. It usually small, initially financed and operated by a handful of founders or one individual. (Investopedia). A developmental organism that evolves along 5 interdependent dimensions: Customer, Product, Team, Business Model and Financials. How progress is measured varies depending on the stage of the development.(Startup Genome Report 2012)

A startup also are temporary organizations designed to scale into large companies (Ries, 2011). Early stage startups are designed to search for product/market fit under conditions of extreme uncertainty. Late stage startups are designed to search for a repeatable and scalable business model and then scale into large companies designed to execute under conditions of high certainty. (Blank, 2011);

The quality of start-ups becomes a decisive factor in determining the impact of entrepreneurial activity (Anokhin; Wincent,2012). They mentioned to have innovativeness that later on, innovative firms will create new products and technology that can generate extraordinary economic performances (McGrath, Tsai, Venkataraman & MacMillan ,1996).

The definition of start-up should differ from SMEs since not every newly founded company is a startup (Graham, 2014). Thus this paper will state that Start-up is a firms that undergone small time of operational (up to 60 months top), that not exceed $50 million revenue run rate a year; and have 499 or less employees as in Autio (2007) and Arcs & Mueller (2007) in Pieper (2013).\

Start-Up Phase Typology

Pieper (2013) said that even a high growth firms are started as a results of a start-up phase. As mentioned by Thomson (2006) in Pieper (2013) preparation phase are become preliminary requirement for high growth companies. It shows on the map of high growth firms are started from start-up.
Figure 14 Nature Performance of Startup

Graph 2: Performance graph for high-growth ventures (Thomson, 2006) on Pieper (2013)

The pictures strengthen the argument on what is called of start-up, where a company had to have an enormous hockey-stick figure of the performances. The high risk- high return also applied here where the condition of start-up industry are very unstable that uncertainties often leads to failure.

Start up Business Typology

The graph above also more or less visualizes of how a good startup should meet the fit the success stories such company as Google, eBay & Cisco. Many scholars argued that business plan would ensure that a company will be formed (Heriot and Campbel, 2014 in Pieper (2013). Business plans (BP) also have good effects on company performances as Carland (2003) in Pieper (2013).

Apparently Ripsas and Zumholtz (2011) in Pieper (2013) mentioned that BP considered more likely a failure prevention-factor than a success factor of firms. This is due to findings that state BP is being used as way to get funding a not a strategic and planning tools to operate.

The failure of BP is that it often based on up-front known assumption. Thus it conclude to the point that the more details of business will run in BP the more biased and the more it will become out of the target. Then the new terms of communicating a way pf doing business well known more in terms of business model (BM).

The terms of BM according to Osterwalder (2005) in Pieper (2013) is already well known in 2000ish that firstly started at 1997. BM is known as the means of capturing the value of innovation (Chesbrough, 2010) in Pieper (2013). BM as a structural template of how an organization confirms values to their customer, partners, and vendors (Zott and Amit, 2004). BM also defined as Biakman (2014) said in his lecture as revenue-generator machine of the business that communicate well for the future investor.

Swifts that happened from BP to BM then will made it more clear to categorize the means of start-up business. There are many typologies of the start-up that being used. Steve Samartino (2010) define the typology of start-up from the means of Trophy Idea, Idea Borrowing and Renovation (https://startupblog.wordpress.com/2010/08/23/startup-typologies/). the classification based on the means of innovativeness of the idea that combined with the rate of success, the most innovative is "Trophy Idea" that will creat market demand and let the firms taste the first mover advantages to the least innovative of "Idea Borrowing".

One of the way to classify the business is the concept of Industry Classification

Benchmark (ICB). ICB is an industry classification taxonomy launched by Dow Jones and FTSE in 2005 and now owned solely by FTSE International. It is used to segregate markets into sectors within the macro economy. The ICB is used in a wide application to divide the market into specific categories. It will help this study to compare position of a startup regarding its business. The ICB replaced the legacy FTSE and Dow Jones classification systems on 3 January 2006, and is used today by the NASDAQ, NYSE and several other markets around the globe. All ICB sectors are represented on the New York Stock Exchange except Equity Investment Instruments (8980) and Non equity Investment Instruments (8990).

Steve Blank (2011) also promote the idea of how start-ups should be defined as its BM and other distinctive characteristics into 6 category (http://www.xconomy.com/san-francisco/2011/09/01/why-governments-dont-get-startups-or-why-theres-only-one-silicon-valley/?single_page=true). Lifestyle business who run the business in order to live the passion (ex: surfers and divers who run the business to finance their passion). Small Business that run his/her own business that mentioned with the same hard work level of silicon valley star-ups but most of them barely profitable. Scalable business that has vision to change the world and to made big business, it first needs huge capital to validate business before they grow-or die.

Next, Large companies start-ups that needed by the "elephant''s Birsch type. this companies are in need to made their own disruptive products in order to secure themselves in the wild market. Born to flip (Buyable) business that usually being targeted by company who also made themselves to be more bigger corporation demand. Born-toflip business, as the name says, is founded to be bought. The last of Blank typology is Social start-ups that in focused their job in making the world a better place. Social's one doesn't have market share or wealth creation as a main goals.

Those category of Blank (2011) require different ecosystems, tools, incentives, and other facilities. It already had broad scope of the real condition of nowadays business and very tempting to be taken as a field of study. But then again, typology based on different measurements will be hard to validate.

Others typology is based on Thendayi Viki in April, 2016 (https://medium.com/the-corporate-startup/a-new-typology-for-innovation-that-combines-the-three-horizons-of-framework-and-christensen-s-2155c42bdea#.y9nq3zx43) that mapped the startup companies based the thought from Nagji and Tuff's innovation Ambition Matrix that based itself on Ansoff's Matrix Products-Market that made it through ranges with the combination of three main types of innovation: Core, adjacent and transformational.

Then again, the theory above is still considered new and very debatable. Another approach that would like to suggest next is BM typology in Startup Genome Reports (2012). Typlogy of start-up mainly derived from the means of internet start-ups with the spectrum of Marketing and Sales level based on 3200+ high growth technolgy start-ups around the globe. The highest, mid and low spectrum of marketing and sales then differ into 3 type of business. Then come the fourth type of startup which called 1N that had similarity of Type 1 but with the more of network effects.

Type 1, The Automizer consists of charecteristic of self-service customer acquisition, solution focused, product intensive, fast completion and often automation of manual process. This type needs the smallest capital, bigger market opportunities thatn Type 2 and more likely tackle the existing market. The example of the company is google, dropbox, basecamp, kickstarter, slideshare etc.

Type 1N are The Social Transformers that have characteristic for had critical mass, massive user growth, winner-take-all type, complex UX, network effects and typically creating new means of user's interactions. It completely need longer time compared to Type 1 an type 2, business heavy and balanced team are considered success factor, have a large team and user growth. The example of this business are: Ebay, AirBnB, Uber, Craiglist, Skype,

Facebook, Youtube and LinkedIn.

Type 2 , The Integrator that lead generations with inside sales reps, more likely being succeed with prompt monetization phase. It focused on SMES thus have smaller market. Pivots idea that based on customer insight are happened more frequent rather than other types. The example of this business is: Zendesk, PBworks, Xignite, Code Margonda.

Type 3 are the Challengers that have characteristic of industrial market, high reliance on clients, complex and rigid market, and recurrence sales processes. It has the biggest market size among other three, tackle existing market with better product, become the longest time to achive scale stage than any other types. The example of this company are: Oracle, MySQL, Yammer, Redhat, and Cloudera.

The typology of thoses start-up will be used in this study along with Blank categorization of a startup as for more reliable in terms of data it has mapped also in order to find more clear linkage of growth stratgey and underlying logic that happened among start-ups companies. According to the mapping from the first Startup genome report.

Table 16 Startup Genome Typology

	Avg. Months to Move Through Marmer Stages	Primary Service Providers Hired	Type of Founding Team that is Most Successful	Market size Estimation (Efficiency & Scale Stages)
Type 1 (The Automizer)	21	User Experience, Backend Development	Technical Heavy Team	$11B
Type 1N (The Social Transformer)	32	User Experience, Backend Development	Balanced Team	$13B
Type 2 (The Integrator)	16	Sales, Business Development, PR	Balanced Team	$7B
Type 3 (The Challenger)	64	Sales, Business Development, PR	Business Heavy Team	$65B

Start up Phase Typology

Correlate with the startup definition and typology phases and developmental stages probably one of the important factors to consider. Obviously in what state a start-ups are standing in a time will relate to how big the challenge it has to face. The challenges and the developmental itself has been slightly mentioned before.

Developmental stage model also distributed by Ash Maurya (2012) in Pieper (2013) that mentioned the stages in: (1) Problem/Solution Fit that have key question on product which must have, viable and feasible to be done. (2)Product/Market fit that tested with Sean Ellis Method in order to see the scalability of the start-up. (3) Scale that referring to her, company building goes parallel with customer acquisition.

Stages that being used in this study is genome +3200 startups were used stage map of Blank (2013). Steve Blank's 6 Steps of the Epiphany (2013) that an enhancements of his Four steps of ephihany (Blank, 2013) has mapped the startup lifecycle into 6 stages of development that focused the view on customer. Each stage of development is made up of levels of substages. Those stages include Discovery; Validation, Efficiency, Scale, Profit Maximization, Renewal. Combined with Max Marmer (2011), that focused on the length of operational time, phases of startup combined as five stages of start-up that consists of Discovery, Validation & Traction, Efficiency, Scale and Sustain/Exit (http://www.techinasia.com/startup-stages/).

From : http://www.techinasia.com/startup-stages/ - combined startup models from Marmer Stages & Steve Blank

Figure 15 Blank-Marmer Start-up Developmental Phases (scales) Source: http://www.techinasia.com/startup-stages/

While making their way into the phases, the firms had themselves an evolving mechanism in order to find the best business model. Through the changes and environment realization, it will affected on their former goals and organizational structure.

According to the finding in start-up genome, start-up firm tend to show mishaps in their developmental state by showing many inconsistency. Some inconsistencies are happened as the table below. Then those inconsistencies later on will be treated as Strategic experience to let participant know whether or not they through that phase so they learn to get up from there.

Table 17 Strategic Experience (Inconsistency) seource: Startup Genome Report 2013

Dimension	Examples for inconsistency
Customer	Spending too much on customer acquisition before product/ market fit and a repeatable scalable business model Overcompensating missing product/market fit with marketing and press
Product	Building a product without problem/solution fit Investing into scalability of the product before product/ market fit Adding "nice to have" features
Team	Hiring too many people too early Hiring specialists before they are critical: CFO's, Customer Service Reps, Database specialists, etc. Hiring managers (VPs, product

Dimension	Examples for inconsistency
	managers, etc.) instead of doers Having more than 1 level of hierarch
Financials	Raising too little money to get thru the valley of death Raising too much money. It isn't necessarily bad, but usually makes entrepreneurs undisciplined and gives them the freedom to prematurely scale other dimensions. I.e. overhiring and over-building. Raising too much is also more risky for investors than if they give startups how much they actually needed and waited to see how they progressed.
Business Model	Business Model Focusing too much on profit maximization too early Over-planning, executing without regular feedback loop Not adapting business model to a changing market Failing to focus on the business model and finding out that you can't get costs lower than revenue at scale.

By having those typology, it will represents diverse types and exclusive patterns of characteristic that able to ascertain significant results of phenomenon (Doty,Glick, 1994). It also deliver a mental model that can be noted and explained.

Goal Setting Measurement

When an organization considered working strategically, Firstly they set their goals. In startup business usually called traction, sales, and market size. By doing so, the business able to track their performance, operational and financial. Latham and Lee (1986) in Fletcher et al (2002) found that 97% of studies involving in goal-setting experience showed that by set themselves challenging and clear goals, instead of doing a maximum efforts or not having goals at all, individuals can performed better. Ansoff (1991) approved that planning resulting the organization a better performances than the trial and error learning.

By having some goals, individuals could structure their planning aspect; allocate their resource, and setting more short-terms goals. All of the information then gave birth to what it called strategies. Ansoff (1991) mentioned that procedures in creates those plans produces better performance compared to trial and error mechanism. Then, those realities may look very intuitive.

Since Bhide (2003) said small firms does not implement strategy in the way more established businesses does. In what way does strategy and growth strategy implemented in small business, more exactly a start-up company?

Growth of companies in empirical studies is being used as dependent variable for the performance of young, small companies by Wiklund (1998) and Delmar (2006). It has become a central topic when entrepreneurship being discussed and studied. In many case,

growth measurements has been viewed as the main driver of entrepreneurship activities (Stevenson & Gumpert, 1991).

The framework of how strategy generated will be a basis for measuring how startups interviewed in this paper whether implement the strategy or not. This study will consider revenue, sales, and number of the employee as growth indicators.

Growth has been used to visualized achievement and trated as dependent variables of new firms in empirical studies Delmar (2006) and Wiklund (1998). Because of that, growth is considered as a main measurement for interacting with entrepreneurship studies.

In measure growth, Barkham et al (1996) said that human capital, assets, profits, revenue and some other of financial performances become most common ways to size the organization. In the meantime, Weinzimmer et al., 1998 claimed that multiple metrics will gave better insights than single indicators of the company.

Those variables are considered a good indicator of company size, and development of the start-ups company in term of size from time to time will seen as growth measures of having growth or not. Revenue become one of the measurements for the start-ups in order to maintain their goals on any strategy polar, emergent or deliberately. This multiple measurement are also according to Davidsson (1989) that suggested composite measure using multiple indicator in accordance to fact that no superior growth indicator seems to exist. Using multiple metrics may let the decision maker acquire a lot of underlying process for growth (Delmar, 2003).

Strategy

Definition the terms strategy as a process came from Mintzberg et al. (2003). Process of the strategy presented by Mintzberg the categorized into plan, ploy, pattern, position and perspective. The description will be mentioned below.

Plan: Is a view that see Strategy in process terms that begin with the goal/direction setting process (usually long-terms) then go to formulation of plans. These implementations of plans act as guidelines on how the organization should maintain with different situations they faced with. Risk mitigation and alternative plans are one of the characteristic in employing the strategy as a plang

Ploy: Strategy viewed as an intention of the owner to react to competition.To threat, maneuver, and to outwit a competitor is a more practical way in explaining strategy as a ploy. The definition of ploy, clearly concerns on the competitive aspects of strategic management.

Pattern: Strategy viewed in an array and repetition of neither neither a stream of execution and action taken by the firms that came up without purposeful planning nor background of strategic plan, but show steadiness in the slants taken to deal with condition faced.

Position: Strategy that viewed as a position happened when the organization pursues to locate themselves among its surrounding competition. This lead to Porter's description that matches strategy alongside process of creating a valuable and unique position by choosing to take differently course of actions than competitors do. Maintain position and assess the strategic position of the company will be implementation of strategic as a position.

Perspective: Strategy that viewed as a perspective explore the way of company thinking as a results of collective and/or individual mind that drive organization behave as they were. This is happened due to internalization common and mutual common thinking or behavior in the every individuals thinking.

When it comes to strategy that can be overtook by the startup, there are contrast in terms of planned vs emergent approach of strategy formation (Mintzberg & Waters, 1985). Planned strategies and realized one sometimes called deliberate strategies, while emergent strategy viewed as successful actions that consistent but not to confuse with the concept of

chaos.

People who agree with deliberate strategies believe strategic actions are formulated in more concrete steps. Plan and execution being analyzed before it were coordinated beforehand in order to call them strategies. As De Wit & Meyer (1998) says that "A successful pattern of action that was not intended cannot be called a strategy, but should be seen for what it is – brilliant improvisation or just plain luck" (De Wit & Meyer, 1998:152).

Emergent followers agree on, as said by Mintzberg & Waters (1985), views strategies as activities that show constancy and transpire frequently, rather than intentional at a certain points of period. They see that emergent view is characterized by being malleable and adaptable to responding external condition of the organization. This view has been supported entrepreneurial circumstances as a best suited to unstable and unpredictable environments faced by them (Mintzbeg & Waters, 1985). In that condition, planning is considered to be too bothersome to do since it takes too much procedures and resource to take.

Both of the view can be combined in order to obtain the advantages of the two views. Some firms (Growth one) will integrate the planning process, that usually more formal with the more deliberate approach than and as flexible as the environment and situation (Fletcher & Harris, 2002).

Strategic Entrepreneurship

Entrepreneurship consists of activities that involve the discovery, evaluation and exploitation of opportunities (Ireland, Hitt, Camp, Sexton, 2001). Those activities then convert opportunities to value adding services and product to the market that require strategic act. Thus, a basic premise of this paper is that entrepreneurship is considered a process said Shane and Venkataraman (2000) on Rasmussen (2009). Another researcher describes entrepreneurship as a dynamic process of vision, change, and creation (Kuratko, 2009).

"It requires an application of energy and passion towards the creation and implementation of new ideas and creative solutions. Essential ingredients include the willingness to take calculated risks, formulate an effective venture team, marshal the needed resources, build a solid business plan, and, finally, the vision to recognize opportunity where others see chaos, contradiction, and confusion" (Kuratko, 2009, p. 5).

Adding to the definition, entrepreneurship is the process of altering invention into innovation (Schumpeter, 1934). Schumpeter (1934) also said thath entrepreneurial activities are things that really affected the dynamism of industries and economic growth in the long run.

In the later work, Ireland, Hitt and Sirmon (2003) define strategic entreprenurship as activities that involved behaviours of opportuniy seeking and advantage seeking behaviour that run concurrently. They also developed model of it that integrate Entrepreneurial mindset collaborated with entrepreneurial cultire and leadership in order to manage resource strategically. The capability of managing resources then amplified by creating creativity and innovativeness will create competitive advantages and wealth creation.

Biakman (2014) mentioned that strategic entrepreneurship is a process that creates changes with the opportunities seeking in transfer challenge to opportunities, creativity to innovation, and scalable business to sustainable business in terms of wealth creation.

When we talk about small business and/or start-ups as per viewed in strategic perspectives, we can't deny that strategic entrepreneurship (SE) play an important role. The underlying logic of SE that it combined how strategic management is being used in entrepreneurial activeities. Ireland et al (2003) define it as a combination of opportunity seeking behavior of entrepreneurial goals and the advantage-seeking framework of strategic management goals.

In other words, SE is a concept where individual/organization determines action of

entrepreneurship, to identify and exploit the opportunities, along with concerns to create and sustain their competitive advantages, with a goal to create above average performance compared to their competitor.

Different studies reveal that SE is needed to create wealth and to maintain growth, the goals are to optimize the combination of advantage-seeking and opportunity-seeking behavior and complement each other (McGrath & MacMillan, 2000; and Ireland et al., 2003).

McGrath (2013) in his book describing on how competitive advantage considered hard to achieved (see The end of competitive advantage, Mc Grath) and get replaced by transient advantage that much more dynamic than a competitive advantages. In doing so startups should try harder to get and maintain this advantages beside to keep their track on SE. This concept is implementable to both entrepreneurs in terms of strategic views and goals, and intra-preneur of established business/organization to think more entrepreneurial. SE is also sets as a discipline that happened when a founder decided to switch from emergence of operational decision making Lasch in Kuratko et al (2009).

Small business tend to focus themselves on short-term goals to survive frameworks, to focus on the strategic development, further goals and market orientation of his business. Stephan Heblich expresses Strategic Entrepreneurship to be an alternative way of running business that specifies the way of meticulous planning and unsystematic trial and error for being called running strategically (Kuraktko & Audretsch, 2009: 14).

Ireland et al (2003) get the sense and impression of Strategic Entrepreneurships as a perspective of Growth orientation of a small business. The growth-oriented perspective show how growths in the entrepreneurial firms are influenced. Those elements, together with strategic managemet framework resource allocation, are channeled to the final goals of entrepreneurial activities, growth and wealth creation.

The paper basically tries to implement the concept of Strategic Entrepreneurship in the entrepreneur's perspective. It done by seeing start-ups forming strategy process in their business. This is because strategic thinking/process is not only exploiting and allocating resources and capabilities of the firm, but also creating more sustainable value chains. By this strategical thinking, it will also enable workforce to stay on their target, as they know where the company they work for ahead to.

Growth Strategy

Strategy beside Mintzberg (2003) had mentioned earlier is also considered as an act to choose to be different (Hammond, 2001). By taking option, trade-offs, well directed in a more sustainable way, the firm would regain a distinctive and sustainable competitive advantage.

Growth in another way, is one of the focuses that have been defined in visualizing the sustainability's of a company. It became goals, a general purpose of a company to operate. The same level applies also in Start-up companies.

Growth strategy, as the mean stated on the combination of the word, is strategy that aimed at acquiring bigger state on the company performances. As stated by Hammond (2001) on strategy, deliberateness in expense internal and external resources in order to create sustainable competitive advantages.

Ansoff (1957) however find growth strategy as a mean of effort that enable an organization getting bigger market share over competitor, that later visualize in a 2x2 matrix that also become fundamentals theory in this theses.

Mcfarland (interviewed by Mike Hofman, Jan 1st 2008) stated that growth strategies is a series of actions that enable organization get themselves from one point to another with the most results and the least efforts and results. The results in this study concerns on how start-up company gaining more on their performances.

This phase will divide into how we define start-up growth, how the growth strategy

emerge, and what kind of growth strategy typologies used in this study.

Start-Up Growth and the Emergence of Growth Strategy

There is a common belief and unwritten standards of growth level of a Start-up. It has to be a Hockey-stick figure with the high achievement in the short of time. Academic approach of this phenomenon will distinct the characteristic of Start-up Companies with the small business growth. There should be many factors that influence the growth. Business context also more likely facilitating one's growth than any others.

A better perception of the factors will be relevant for a start-up, as the firms will able to grasp the context and articulate it into strategy for them to over and grow.
In terms of academic review, it's considered to be still insufficient for the practical use. The limitation of academic study making this trend an attractive area to be studied (Deakins & Freel, 1998). Since there's a few source to exploit, the shortcoming study will be disperse and the related connection between them will not be focus on the same interpretation (Davidson &Wiklund, 2000).

In accordance to what we mentioned, there are a lot of factors, internal and external, that affect willingness and ability to grow (Davidson, 1989). Evenmore, the decision of small firms to adopt specific strategy will also depend on the different factors affecting the firm's growth (Roper, 1999). By putting a better perception, of factors that affect growth in small business, it will affect the better comprehension in factors, whether internal or external affecting firm's motivation of growth.

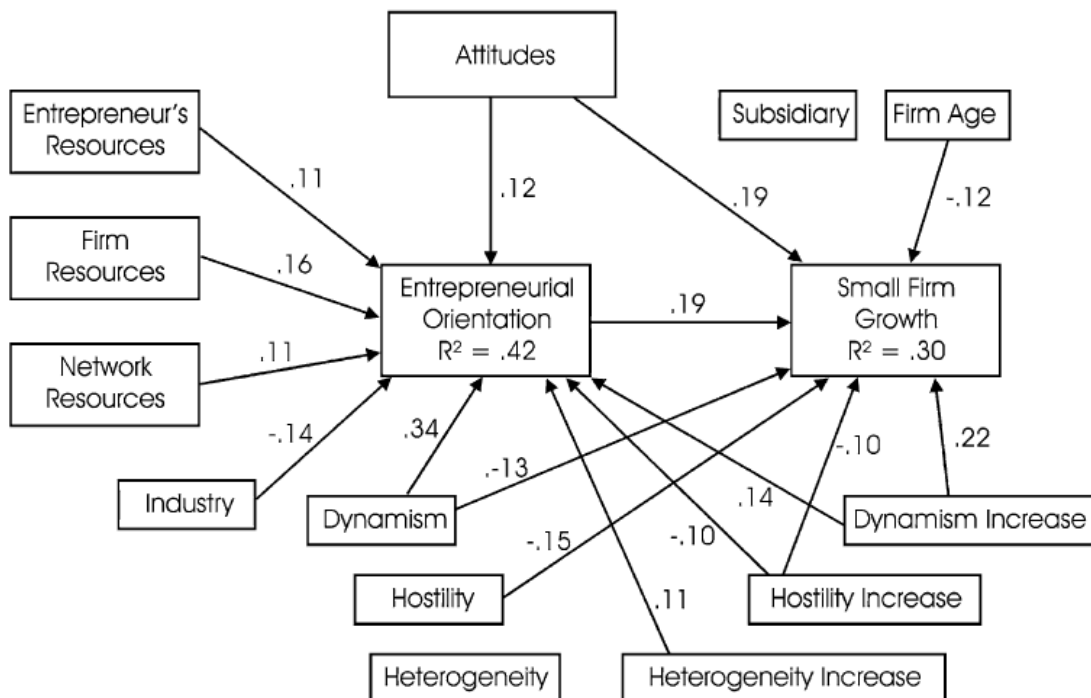
Furthermore, the decision to adopt a particular strategy will also depend on the different factors affecting the firm's growth (Roper, 1999). Wiklund et al (2009) already map some aspects affecting firm growth, as they, statistically considered relevant to growths in small businesses.


Figure 16 Wiklund Small Business Growth Integrative Model

By analyzing 413 small businesses, he developed an integrative model that allows him

to measure dominant perspectives that affecting firms growth. The model also able to assess some of the construct such as entrepreneurial orientation (clear), environmental characteristic (a set of dynamism, hostility and heterogeneity as affected by industry), Resources (entrepreneurs resources, firm resources, and network resources), and manager orientation toward growth (visualized by attitude). Subsidiary and Firm age are taken out since it focuses on Start-up companies that rarely built with experience and time.

Entrepreneurial Orientation (EO)

Entrepreneurship comes from dynamic processes of vision and changes that projected implementation and creation on new ideas as well as creative solutions (Kuratko, 2009). Altogether with the combination of visionary profile that able to seize the opportunities in others saw as chaos, contradiction and confusion (Kuratko, 2009).

Along with the heroic terms of entrepreneurship, it has valued as the main factor of economic growth as Schumpeter (1934) and Covin & Sleving (1991). Entrepreneurship activities hold importance in how they perceived as motor, job creator, enhanced technology and wealth generation.

Then, EO has derived from entrepreneurship and specifically established in strategic management field as strategic orientation that, as Miller (1983) stated, concerns entrepreneurial practice and method that visualized in terms of decision making process.

Differences between entrepreneurship and EO is distinguished by the content and the process perspective of strategic management (Lumpkin and Dess, 1996). Content means how a firms address basic entrepreneurial questions of business entry and how they able to distinguish between opportunities in wealth creation. Process means necessary logic, practices and methods of key persons in a firm that able to behave entrepreneurially.

A start-up is considered having strong EO as their actively engages in product or market innovation, practice risky activities in uncertain areas, and having a better proactive approach relative to their competitor as it implies in Miller (1983) and Lumpkin & Dess (1996). This study believes that innovations, risk engagement and proactive approaches has constructive/positive effects on startup performance, either financially or growth.

Innovation: as Kimberly (1934) found, innovativeness is an advancement of current technologies, practices and products. It also become one of the main elements of EO/process (Schumpeter, 1934). An organization considered innovative as they able to engages in new ways resulting in new market, or technology, services and products (Lumpkin &Dess, 1996)

Weak and strong consideration of innovativeness is indicated on whether they able to: design products; produce effectively; penetrate or enhance ther market; manage business; getting technical knowledge; or able to overcome hurdles they faced in between processes.

Proactiveness: is a property that enables firms to execute innovation as product earlier than competitor does. Initiating action in order to gaining relative or competitive advantages over competitor is what categorized proactive.

Lumpkin & Dess (1996) argue that proactiveness emerge when there are asymmetric information exposing opportunities in the market which enable players gaining advantages over the others. Thus, this study will define proactiveness by initiatives taken by the firms to act and anticipate market condition as the pursuit of opportunities.

Risk Taking: Before Schumpeter, Cantillon (1734) as mentioned by Swedberg (2000) proposed entrepreneurship as the self-employed person who faced the absent of profit assurances rather than to work for somebody else for the assurance of wages. Repeating Ries (2011) A startup is a human institution designed to deliver a new product or service under conditions of extreme uncertainty. Thus, the handling of risk and uncertainty become one of the entrepreneurship features and what it means as EO in this study.

Risk as Miller & Friesen (1978) is a means of manager actions on making huge

commitment on resources in order for high returns. Even though not all the return paid back, in the long run, risk willingness create more growth to the firm (McGrath, 2001). In categorization, there are different level of individual and firm's risk attitude (Begley& Boyd, 1987 in Rasmussen 2009). In practical, to reval firms risk taking attitude is asking managers whether firm is willing to engage in risky projects in order to reach the firm's goal.

Manager orientation towards growth (MO)

Davidson (1989) argue that economic science assume that owner-manager motivation in the firms is profit-maximizing and growth. But we aware that motivation on one person among another has differ. Along with Wiklund et al (2009), many researchers believe that reciprocal motivation of owner-manager has a key aspect in determining growth of a firm.

In other perspective, people begin their own business with vary motives than just to maximize their profit. Deakins & Freel (2003) distinct one group of self-employment person who pursue their own interest to another group who has ambition in making bigger firms. Later on, it projected with their action in terms of firm's growth.

Attitude of owner-manager towards growth has varied regarding situation they faced. Some authors claim that positive orientation towards growth came after the team has went through a successful growth period. Differently, Wiklund et al (2003) claim that changes that result from firm's growth became a hindrance for a firm to do so. This comfort zone that visualized in term of stabilities in terms of employee number, power distribution, and the need to adapt to harsh environment appear more interesting for managers to let every aspect in the firm remain unchanged.

Manager orientation towards growth has huge influence to direct and visualize strategies of the firm (Naffziger et al, 1994). Positive effect on owner attitude towards growth are shown in many studies that shown in relation of high degree control of owner-manager towards operation that responsible for strategic decisions in the firms that led to better performances to develop the firm.

Resources (Re)

Resources are the inputs or the factors available to a company which helps to perform its operations or carry out its activities. Also, these authors state that resources, if considered as isolated factors do not result in productivity; hence, coordination of resources is important. Resources are needed for firms to exploit new opportunities, apply new strategies, and implement projects in accordance to firm strategic goals. Financial, social and human capitals are respected to be three main resources necessary to develop and grow the company (Neergard et al, 2003, Wiklund et al (2009). Resource-based view (RBV) are considered to be basis for competitive advantage that rest the base application of a bundle of valuable tangible or intangible resources at the firm's disposal (Penrose, 1959).

Financial capital: financial capital level is correlate positively to firm growth. Alsos et al (2006) state that finance are the most basic yet supple to be formed to another type of resources. It also represents one of the vital resources to achieve firm's growth. It even could lead a firm's strategy at the very early stage of firm organization Boeker (1989).

Financial led a firm to implement more capital intensive strategies where at the same time, it provides buffer for experiment and early implementation to test Cooper (1994). Later, the implementation of it would gained advantages over competitor in terms of imitability and more barrier to compete by the ability of firm to mitigate unfavorable outcomes.

Human capital: This capital indicates the ability of the firm to retain manager's knowledge and attributes (hard or soft) that assist them in manage the firm (Koeller and Lechler, 2006). It also means of the sum of workforce that enable management of organization business process.

Human capital considered as an intangible asset that considered as a firm's competitive advantages that will help the firm to identify and attain new opportunities in order to grow the firm in a more effective way (Alvarez & Busenitz, 2001).

It already gain popularity in current research that stated as the firm competitive advantages that hard to replicate compared to others such as technology, scalability and natural resources. RBV accentuates human capital as inimitable resources and correlated positively with the firm performances (Guthrie, 2009). It also considered as a decisive factor in current market condition.

Social capital: Social capital represented by the significance of firm's connection, in numbers and worthiness (Borgatti & Forster, 2003). Freel & Harrison (2008) argue that those connection are commonly stated as relation between one's firm to other entities. Usual words regarding the network connection is to perform collaboration that not limited to: developing new products, combining complementary skills, regain new opportunities and many more. Scholars assess that relationship had an active role in the firm's growth (Barringer & Greening, 1998) since it overcome the problem of small-new firm and create collaborative relationships that can be beneficial in the early-phase of the firm. This capital attained through inter and intra-organizational networks. In managerial this capital provide necessities for firm to grow as; important information, new opportunities and other type of resources necessary to achieve growth.

Since those three caused specific change of challenge to the firm when restrained, this study tries to explore the source of the resources. Both of the analysis will be mapped with the source of the resource, from/to internal and external comparison in the firms.

Internal means that all the resources mentioned before are able to be fulfilled by internal condition of the firms. Whereas external means, whether asked or voluntarily, are the one that came from a means of networks from a firm to another. As Choonwoo et al, (2001) had summarize, internal capabilities were operationalized by entrepreneurial orientation, technological capabilities, and financial resources invested during the development period. External networks were captured by partnership- and sponsorship-based linkages. Partnership-based linkages were measured by strategic alliances with other enterprises and venture capitalists, collaboration with universities or research institutes, and participation in venture associations. Sponsorship-based linkages consisted of financial and nonfinancial support from commercial banks and governmental agencies.

Some scholars mentioned that networks play important role for small business growth. This networks denotes both founder-manager with the rest of the employee and from one firm to another that enable firm with the access to: capital; human resource and managerial advices.

This research will try to divide resources based on original sources. Internal resources will be categorized into initial financial and human resources. Whilst external resources will be denoted as external source of funding and social capital as definition mentioned before.

Environmental Characteristic (EC)

Pfeffer (1970) on Rasmussen (2009) has mentioned that environment influence growth of the firms. In term of opportunities, a specific environment may interfere managerial action. It also stated that the smaller firms established the more likely it being altered by environment (Dyer & Ross, 2008 on Rasmussen, 2009).

It is important for managers and founder to perceive their business environment nature being faced by the firm in order to associate their action respectfully to the condition. Hambrick (1982) on Rasmussen (2009) had researched the crucial role of the ability to perceive strategy to environment condition as the successful implementation of those strategies relies on the nature of its competitive environment (Murray, 1988)

From different views, the number of studies were established on how vary environment affected firm performances. Industries, demography, geographical area, worker union, maturity of the market are areas between those numbers (Baldwin & Gellatly, 2003). Those researches corroborate the firm's advantages regarding certain environments. There are variables to concern in order to perceive environment.

Since it too complex, Wiklund (2009) suggested that environment should be seen in small business perspective. They summarized in three levels in order to distinct characteristic of the environment; dynamic, hostile and heterogeneous environments.

Dynamic environment is an environment where demand changes continuously, volatility of the aspects of business environment and certain turbulences (Pelham, 1999 on Rasmussen 2009). Customer's need changes, volatility and other changes create opportunities to establish innovation, and deliberate strategies that later associated with higher growth. Dynamism claimed to have positive impact on firm performances that orient their goal to pursue new opportunities (Wiklund, 2009). Adaptability and flexibility of small startup enable them to cope up with that changes and pursue their opportunities through innovation process.

Khandwalla (1977) defined hostile environments as a risky, dominating and stressful condition faced by the firm. It described as an intense rivalry and risky industriousness condition. In hostiles, firms with limited resources have to considered their managerial decision as it will resulting higher cost and loss of competitive advantages when it's wrong. Otherwise, supported with enough resources, Mieller & Friesen (1982) said that startups would pursue benefits of this environment thorough their opportunity seeking behavior through aggressive and innovative products.

The other environment condition, heterogeneous, described as complex with multiple segments of customers (Pelham, 1999 on Rasmussen 2009). Those different market segments needs to be gained as it creates more opportunities for startup ploy in niche markets. Wiklund (2009) argue that this type of environment might provide startups growth opportunities as it able to explore specific niche segments. As long as the firm able to perceive and exploit those segments, then growth relation among the forms is inevitable.

As stated, environment might gave opportunities for firms to grow, but not as related directly as the other aspects. When founder had already attained strong growth orientation, pressures created through environmental changes only would have role as strong facilitators for achieving those objectives. Differ with conventional firms combined with low attention on innovation will prefer to compete in a stable environments. Stable environments later adhere firms to continue play safe with a rare occasion to rethink their strategies. Otherwise, the harder the setting, the more likely will the firm is to devise actions with the intention of surviving, growing and stay relevant.

This study then will try to distinguished startup firms environment and whether, as data provide, related to growth strategies and later to it's performances.

Growth Strategy Typologies

The definition of strategy as a thoughtful unique choice came from Hammonds (2001). By making course of actions, trade-off choices, and leading with direction and continuousness, a firm can create sustainable competitive advantage and gain its uniqueness. Other word, Typology came from a value to translate more complex situations into more simple portrayals that enable to explain causality of outcomes and action based.

In terms growth strategy typologies, we used product-market model proposed by Ansoff (1965) as it holds variables that consider relevant to growth strategies (Moreno & Castilla, 2008). Besides, this typology usually taken place in corporate level of decision so it will be more solid to explain the strategy held together by the subject of this study.

Ansoff's (1965) model proposes different corporate-level strategies that aim towards

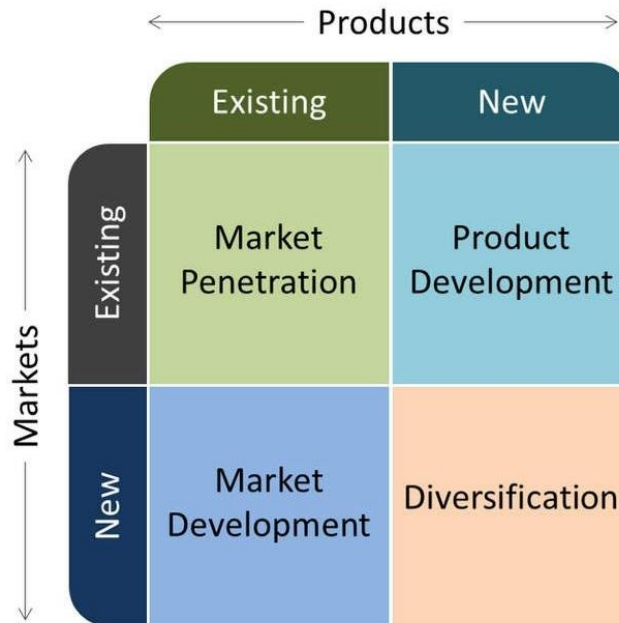
the growth of the firm. This typology is concerned with the strategic decision that a firm faces, when considering in widening the range of products or entering new markets. Based on two dimensions, product and market, four strategies are formed.


Figure 17 Ansoff's product-market matrix (Source:
https://i.ytimg.com/vi/6NGehyOPF_k/maxresdefault.jpg)

To be brief, Market penetration is a growth strategy based on increasing the firm's existing share of products and markets. It happened through; sells the product to existing customer, attract customer from competitor, and provide better product than the competitor.

Market development is a strategy where firm responds to the market by introducing existing products to new markets or customer groups. Internalization concept as a key area for growth could be recognized as the visualization of this strategy.

Product development is a strategy where firms Develop a new product for customers that already loyal to the brand. This entails additional product development costs, but eliminates the cost of acquiring new customers. Keogh & Evans (1998) in Rasmussen (2009) said that this strategy is compulsory in order to keep the firm competitive and grow (Keogh & Evans, 1998).

Diversification guides the firms to introduce new products to new markets. It Enter a new market with a completely new offering. Doing this entails significant costs and risk, but can be extremely rewarding.

In terms of parameters, Mascarenas et al., (2002) state that growth visualized in expansion on what is currently a firm doing.

Even Watts et al (1998) in Rasmussen (2009) stated that most suitable strategy to grow are those vis-à-vis to product development or market development, but this study will explore how firms adapted to any strategy classified in Ansoff's (1965) product-market matrix. As the model taken as a guide during the case study, any flexibility regarding the exact strategy implemented by the startups are still put on consideration and documented.

Growth Strategy Development on Startup Companies
Based on the academic literature that had been mentioned from 2.1 to 2.6 then this study propose some of the causal models that later represent this logical think on how a

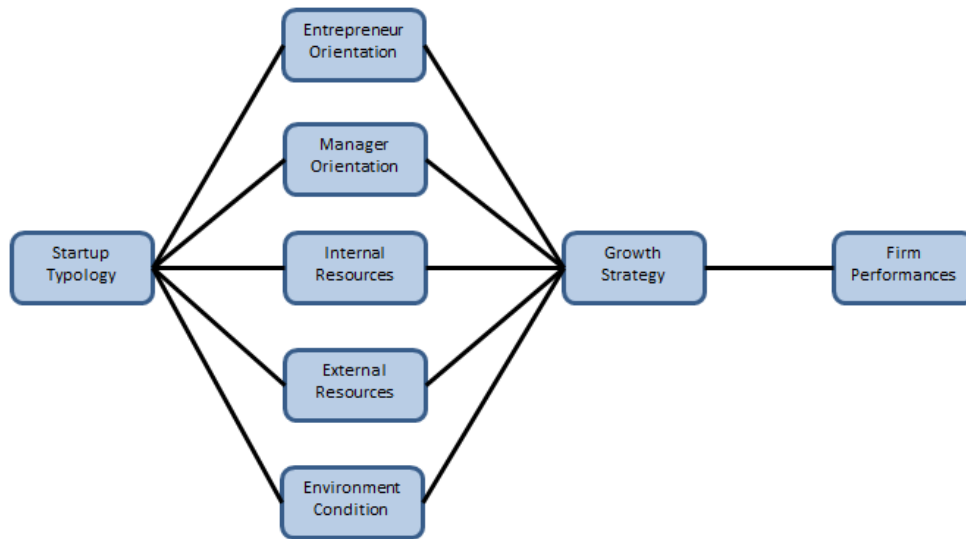
startup companies develop their growth strategy. We derived the models from Wiklund (2009) along with typologies that been declared by the Marmer-Blanks and Startup genomes. Those classification will later compared with the strategy they taken to grow that based on Ansoff (1991) Product-market matrix as representation of growth strategy option available.


Figure 18 Proposed Research Model in Growth Strategies in Startup

Those models then will be used as this study's framework of analysis. Any direction of question, interview and exploration on the research subject later on will be done through this framework. Validation of data will be cross-analyzed with the performances of the firms.

Problem statement

Start-up rate of success is considered low and most of the start-up/nascent entrepreneurs are failed to run business, most of them fails because they failed in setting strategic goals (Hechavarria, Renko, 2011).

The study about creating strategy for small business vis a vis a startup company are very well known in popular article, but very little the theme arise in academic research. By knowing on how strategies are made, it should inspired start-up founder to formulate the strategies in order to increase the survivability rate of the startup. This thesis will also creating more insight in how strategies are made in startups business.

The first phase to working strategically, means to set the well-defined goals. This process of vision and goal setting coherency that very important for the organization (Rasmussen, 2009)

Study apprehend by Latham & Lee (1986) show that 97% of goal-setting experience that having the challenging and clear goals one can performed better rather that the one that done their best' or not having goals at all. Planning process also resulting in better results rather than emergent actions (Ansoff, 1991). In term of strategy implementation, there is a different way to implement between small and established firms (Bhide, 2003).

Then, all the argument should conclude our first problem statement to:
1.   What is a strategy and growth strategy in a Start-up company?

While maintaining its Most Viable Products (MVPs) to launch to the market, Growth Strategies in startups often defined as a strategic step that whether the company stay with the current product or pivoting (Blank, 2014). Some of the start-up in the same type of business characteristic had similarities in the way they behave in accordance on how they

react to their challenges (Startup Genome, 2012).

In the terms of business classification, Steve Blank's 6 Steps of the Epiphany (2013) that an enhancements of his Four steps of ephihany (Blank, 2013) has mapped the startup lifecycle into 6 stages of development that focused the view on customer. Each stage of development is made up of levels of substages. Those stages include Discovery; Validation, Efficiency, Scale, Profit Maximization, Renewal. Combined with Max Marmer (2011), that   focused on the length of operational time, phases of startup combined as five stages of start-up that consists of Discovery, Validation & Traction, Efficiency, Scale and Sustain/Exit (http://www.techinasia.com/startup-stages/).

In every stage, there should be a certain condition that a company should fulfil in terms of resources, maturity, and market power/traction/customer. The availability of resources and capability will be faced differently between one start-up phases to another, thus it will be a challenge for a company in each phase to accomplish to move to the next phase, or to grow. It concludes us to the second problem statement:

2. What are the Challenges over Start ups in each Phase of Start up?

A start-up business that classified in taxonomy should have the similar pattern in the strategy they taken to grow. But it is still a black box, considering what triggering them using strategy? We hope that, by understand the context or pre-requisite of a start-up firms that enables them to implement growth strategy, founders would able to measure external condition of the firms matched with the resources in order to come up with the best-fit growth strategies.

It concludes us to the third problem statement:

3. Under What Condition does Start-up Emerge Strategy?

Strategy is emerged as an output of a company in responding external-internal condition; it is moved by either performance (Marmer, Hermann, 2011), Personal motives (Birley, 1994), or as a result for benchmark that considered the best practices of one companies with the underlying logic and revealed direction.

Balaji Viswanathan (2016) said that strategy is considered in some criteria and its goal is to not fail. In order to simplify the comprehension, also by analysis in many best practices, the growth strategies should be architect into a simple model. The model should self-descriptive to findings in the real condition. Thus, the model might be used for practical guidance by many company to follow.

Ansoff (1991) had mapped the strategy in every mattrix that considered as strategy, it shows some direction on how a company would accomplish its goal to. Whether the company choose to (i) Decrease its price; (ii) Increase in promotion and distribution support; (iii) Acquire of a rival in the same market; (iv) Refine product to be modest to penetrate the market and so on in order to gain competitive advantage over its competitor.

It concludes us to the fourth problem statement:

4. What is the underlying logic and strategic direction of the growth strategies of Start-up Company?

Research object and methodology
Research Purpose

As stated from previous chapter, the purpose of the whole study is to answer some of the question that I consider important in order to find out all aspects that affected survivability in startup by the clear understanding of growth strategy. Those lead questions then followed with problem statements mentioned earlier.

Existing researches about growth strategies, especially in start-up company is consider

limited. One of the issues of that scarcity is there are still unexplored area in strategic development process. Later, Deakins and Freel (1998) consider the growth strategies emergence factors are still lacked cultivation among management school. Moreover, there is a need for summarizing long research papers into model that could gave overview and applied to business practice.

Yin (2003) as in Wahyuni (2012) categorized the research purpose of a study into three categories: exploratory, descriptive and explanatory. Exploratory research is taken when the main issues are not yet known and the available info is not yet complete. It helps the researcher to explain and comprehend those issues by gathering a lot of information about a specific matter (Zikmund, 2003; Yin, 2003). Descriptive research is used to find the answer of specific matter as how, where, what, and who.

When the intention is to identify causal relationships among variables, one can conduct an explanatory research (Zikmund, 2000). Yin (2003) claims that an explanatory research could also be used when the objective of the study is to explain specific procedures from different perspectives or situations with a given set of events.

Qualitative Research

The research conducted in qualitative way which intend to develops and discover the new aspects of growth strategy, specifically in start-ups environment.

It is started from the subjective research and definitions of main concepts of the research. The down-side of this research is that subjectivity of research object and the role of the researcher becomes stronger in the quality of the process. Besides, the researcher himself becomes a collecting data tool and in certain areas has the suppleness to make fine-tuning in the process in order to gain better understanding of the data collected.

There are three kinds of approaches in qualitative research selected. There approaches to subjective view points; Description of the making of social situations; and Hermeneutic analysis of underlying structures. These approaches had differences in terms of objective of the research, theoretical conjectures and methods applied.

The first approach highlights the view point of the subject. The second approach attempts to describe the processes in the production of existing situations, and the last approach, is distinguished by the analysis of deep structures that generate action and meaning. This paper will employ the first approach, which focuses on the approaches to subjective viewpoints, by making use of, for instance, semi-structured interviews.

The goal is to gain a comprehensive view of the phenomena under study with detailed information about how   the strategies adopted. Thus, this paper concentrates in answering how start-ups adopt sustainable growth strategies, a question that is not subject to behavioral events but deals with contemporary, present-day events. Case study is chosen as the research strategy of this study.

The research strategy adopted in this study characterized as explorative, which allows a case study approach. Case study is the investigation of a contemporary, empirical phenomenon within its real life context; when the boundaries between a phenomenon and its context are not really clear.

Hartley (1994) stressed that the key feature of the case study approach is not method or datam but an understanding of the process as they occur in the context. This type of case study research

There are two ways to conduct a case study, by analyzing a single case or multiple cases. Yin (2003) mentions that a single case study is suitable when the case is critical, extreme or revelatory. Multiple case studies, on the other side, are not dependent on one unique case and because they are based on diversified cases, it is considered that the pattern matching (validity) and robustness of the results are enhanced compared to a single case

study. The downside of a multiple case study might be a lack of depth, and the fact that they are more time consuming and expensive to conduct.

This paper chooses a multiple case study because it will be incomplete to study only one firm and its growth strategy/strategies. It is needed to study a selection of cases in order to get a more broad perspective of the actual practice of start-ups, and also to provide more robust and valid information concerning growth strategies in start-ups.

Research Strategy

This study aim to understand the condition on how startups interact with growth strategy process along with the classification on actual categorization on startup typology by examining the decision and actions taken. We hope to create simple models that could illustrate actual practice, also to provide idea for start-up firms when dealing with growth strategies.

By the purpose, this study is considered exploratory in terms of exploring and gaining insight about the current issues, in order to contribute to current research. In the other side, this study also considered being descriptive in a way to find how exactly startup able to develop sustainable growth strategy.

Broadly speaking, the research carried out by the method of literature study, and deep interview for startups in Indonesia that closely varied to meet all population of startup Genome. Yet, the sample is selected among companies that considered a start-up in the various phases in order to get a better understanding about the issues.

Case studies are selected in order to gain more insight about start-up by describe in detail of the issue and by analyzed in diverse view of the subject. We hope that case study will allow the researcher to acquire richer information and deeper observation on the related subject.

In order to reach the goal of this study, this research will gain knowledge on startup companies as unit analysis. Selection of start-up firms are based on the business that established below 5 years regardless of the size of the company, founded by three or less people, and relatively targeting big market segmentation. Size of the firms doesn't become concerns since one of the variables that will be studied is startup typologies by steve-blank's that vary on term of firm sizes. Non-limitation in terms of main business process is also not become a concern, since by descriptively analyze business characteristic of the startup we hope that we will able to validate start-up typology by startup genome's.

After we able to define each of our respondent then we move to our next investigation on how they deal with growth strategy. Descriptive process on how startup formulates their growth strategies in a way that has constructed in the previous chapter. To enrich the observation, multiple case studies are selected. That way, it provide the study a more broad standpoints on how different startup reacts and ploy on different strategies one and another.

Collections of data are selected in the form of recording audio of the interview that later on Tran scripted into verbatim articles. Some of the complementary data are made through secondary research over internet, and some of the participant employees.

In the interview, we chose to use guided interview methods with questionnaires as a guide to every interview. All of interview questions are derived from every research questions that mentioned in problem statements before. All phases in order to answer every question are backed with literature review, terms of data collections and early data analysis among one informant to another. The process then replicated in order to answer the questions. The list of questions is illustrated in table below.

As Reynolds (1979) stated in Wahyuni (2011) that the informants in start-up's participants should dissect four principles of informed consent: competence; voluntarism; full-information; and comprehensive. In some times before interview schedule, those

questions above then compiled into one questionnaire then being informed to every participants.

As in participants, at first we want to use quota sampling in order to fulfil every aspect of Marmer-blank typology cross-sect with startup genome's typology then pre-determined either the participants use growth strategy in terms of either product development or market development. That way it calculated that we should get as many as 32 startups with each of main characteristics.

Research Question	Interview Guide	Source of Data
Research Question one What is a strategy and growth strategy in a Start-up company?	o Could you describe what is your view towards strategy? o According to you, would you rank from 1(the most) to 8 (the least) your main competitive advantage over your rival/ ather business? *; 1 Regulation Advantage; 2 Technology; 3 Partnership/Supplier; 4 Strong Infromation; 5 Sources; 6 User Engagement; 7 Barriers to Entry; 8 Substitutes Product *Strategy Implementation* 0 Does your company make use of the strategies? o Do you hold meetings to discuss strategic issue? o Do you write down plan and had a written plan as a guide? o Do you set objectives and review the realization? o Do You Review Strategies vs Objectives o How Flexible are your strategies?	Literature Review Data Collection Secondary data regarding participant's firm Semi Structured Interview with research participant Participant observation and informal interview Early data analysis further semi-structured interview Continuation of data anlaysis through and through
Research Question Two What are the Challenges over Start ups in each Phase of Start up?	o What is your main challenges in order to keep operational and grow? And why? Check all that apply option as: Acquiring More User/Customer; Maintain service/production level to meet the needs; Creating Product/market fit or Problem/Solution Fit; Building a solid group of team; Getting More Capital; Other (open ended) *Strategic Experience* o regarding to Customer are you:... Spending too much on customer acquisition before product/ market fit and a repeatable scalable business model; Overcompensating missing product/market fit with marketing and press; Other: o Regarding to building your Product are you: ...Building a product without problem/solution fit; Investing into scalability of the product before product/market fit; Adding "nice to have" features; Other: o Regarding to building Internal Team are you:... Hiring too many people too early; Hiring specialists before they are critical; CFO's, Customer Service Reps, Database specialists, etc.; Hiring managers (VP product managers, etc.) instead of doers; Having more than 1 level of hierarch; Other: o Regarding getting Financials for grow are you...: Raising too little money to get thru the valley of death; Raising too much money; Other:	Literature Review Data Collection Secondary data regarding participant's firm Semi Structured Interview with research participant Participant observation and informal interview Early data analysis further semi-structured interview Continuation of data anlaysis through and through
Research Question Three Under What Condition does Start-up Emerge Strategy?	*Growth Strategies* o In the last 3 months, how many average hours your worker spent their time working per week? o For teams that in-touch in technical and operational problems, how many years they had experience in their field? o For teams that in-touch in Business and Strategic matters, how many business they did help so far? o In your opinion, how can the firm achieve growth? o Can you describe the growth strategies employed by the firm? o How does the company go about developing new products? o How does the company go about expanding its markets?	Literature Review Data Collection Secondary data regarding participant's firm Semi Structured Interview with research participant Participant observation and informal interview Early data analysis further semi-structured interview Continuation of data anlaysis through and through
Research Question Four What is the underlying logic and strategic direction of the growth strategies of Start-up Company?	*Entrepreneurial Orientation* o To what extent can the firm be described as having an entrepreneuria orientation? That is, its proclivity for risky projects, emphasis on invation, and tendency to introduce products before competitors. o In your opinion, does the entrepreneurial orientation of the firm affect its growth strategies? If , how? o Owner Manager Growth Orientation o What is the main goal of the owner manager with the firm? For instance, focus on survival of the firm, maintenance of lifestyle or achieve growth. o What is the attitude of the manager toward growth? o In your opinion, does the manager's attitude toward growth affect the firm's growth strategies? If , how? Firm Resources o Do you believe the firm has the adequate internal resources to grow? Such as human capital, intraorganizational networks o Do you believe the firm has the adequate external resources to grow? Such as financial capital, inter-organizational networks o In your opinion, do internal and external resources affect the growth strategies of the firm? If , how? Environment o How can you characterize the environment of the firm in your particular industry, market or location? For instance, dynamic: instability and continuously changing hostile: high rivalry or decreased demand of the firm's products, heterogeneous: different market segments with varied characteristics and needs or stabile o In your opinion, does this environment affect the growth strategies of the firm? If, how?	Literature Review Data Collection Secondary data regarding participant's firm Semi Structured Interview with research participant Participant observation and informal interview Early data analysis further semi-structured interview Continuation of data anlaysis through and through
Complementary Data of Participant	o Company Name o Month and The Year The Firms Start o What is the form of legal aspect of your company o Who is your Consumer/Customer/ User? Is there any specific market you target? o What is Product/Service you offered to your customer? o Could you describe Product/Service you offered to your User? o Do you have supplier or external service to support your business? Could you describe it? o Would you describe this business as: 1. An independent start-up, created by an individual or team working on their own; 2. A purchase or takeover of an existing business; 3. A franchise or multi-level marketing initiative; 4. A start-up sponsored by an existing business; 5. Something else. How would you describe the location where this new business is being developed? o Average Sales of the company o Average Sales Growth per months o Number of the Employees o Average Growth of User/Customer per month o Is the startup receive any financing/funding from external sources?	Data analysis and Synthesis

But along the way, we find that there are not enough types of startups with that kind of characteristics. So we moved to chain referral sampling (snow ball) that meet what Castillo (2009) mentioned would overcome problems such as subjects that hard to locate (Wahyuni,

2011). Snowball sampling is a non-probability sampling technique to cover a very small subgroup of the population (Wahyuni, 2011). This type of sampling techniqueis used in terms maximum variation sampling, where in the implementation, previous participants will refer the next participant with the most divergent forms of the experience.

Assurance in Quality of this Study

In order to ensure quality of this study, we decide on using Yin's (2003) in Wahyuni (2011) assessment criteria. Yin (2003) refer four design tests to assess quality of the research; construct validity, internal validity, external validity and reliability.

Construct validity is made sure by acquiring numerous foundations of info regarding academic statements of every argument from many scholars. Internal validity gained from performing triangulation or cross analysis between participants, theories and literature. This process also gained from patterns matching regarding one participants and another regain specific issues. External validities are gained from documentations based on in-depth interviews. Triangulation process also consider in helped with confirmation from various sources of literature as well as from experts.

Reliability denotes to the similar discoveries and deductions when a researcher runs the same case study in various frequencies (Saunders et al., 2000). Implementation of the reliability of the findings and analysis is to minimize errors and biases in this study. Yin (2003) in Rasmussen (2009) stated that by construct the most operational procedures as possible and conduct the research as being monitored, the research could improve the reliability of the study. In this study some of the participants interview are done through outsource help (Cozora, TemanJalan, and Bagi Kata) in order to see if the procedure will be as reliable as it hoped when designed

For the record, some company reluctant to reveal their performance measurements and their figure. One of the firm also doesn't want their name revealed as participants. In order to include that participant in this report then we rename all the details into alias (Company A). Some of the data that failed to obtained directly, are complemented through various sources.

Case Studies

As stated from methodology, startups are selected from snowballing samples. One of the first participant being interviewed is Tosha Telecommunication that founded by Tommy Herdyansyah in 2012. This start-up work in creating digital solutions (websites, company internet in branding, smartphone applications) for companies as solution in optimize work process, branding and IT Solution. Later, he introduced the study to No Limit, a company specialized in analyzing social media contents for brand activation and optimizing actions regarding activities or testing the market.

Example above are pattern that happened in the study. With snowballing sample we proceed in interviewing 27 start-up firms with varied type of business (startup genome) and phases (blank-marmer's). One of the firms chose not to be mentioned in this study, which later on we called Company A.

Some information like sales and revenue are not quite easy to obtained. Some of the firms gave the information, most of them reluctant to do so. This is quite burdening to the study and for the firms is not an obligation to reveal sales and revenue since most of the

startups here. Even the big player such Gojek and Bukalapak are not required to open their information to public due to their status that still not listed in the stock market.

Since the goal of this research was to describe and to explore empirical data of the selected firms. Case studies are collected among 27 cases represented each of start-up firms. In this paper, will be shown 3 cases as representatives. Then all the findings will be summarized along with analysis.

Case Study 1: Go-Jek (PT Asli Karya Anak Bangsa)

Name of the Participant: Dayu Dara Permata, Vice President Non-Transportation Business

Go-Jek is a company that first started from 2011 with Nadiem Makariem as its founder. At first they maintain their main business by connecting the demand for Ojek (Motorcycle) Transportation manually. Even though started as a side project as for the Founder academic task in Harvard Business School back in 2010, the sole purpose of GoJek is to solve traffic Problem in Jakarta. Our respondent, Dayu Dara Permata, a Vice President in Non-Transportation Business Line stated that traffic problem responsible for 30 trillion Rupiah of unproductivity from 10 million people due to 1200 hr/year roughly from stuck in the traffic only.

Matches made for informal demands of transportation that started from the lowest transaction of 5 informal motorcycle drivers a day. In 2014, collaborated with his programmer friends, Nadiem created the apps for automatically match-make the process. Nostra, a Company of the friend of his, helped built his first app. From that moment, it is remembered his first Gojek pivot from Transportation Company into application based company. In 2015 it was launched as Go Jek and maintained its growth up until nowadays. The huge growth that claimed to be 200% incremental rose of performance per month (April, 2016).

The hockey-stick performances allow them to attract many venture capitalists that willing to help Gojek to scale up. It allows Gojek to scale up his line of business from 1 line, Go Ride (January, 2015) to 4 (March, 2015), to 5 (June, 2015), to 10 services (October, 2015) finally 11 Services (February, 2016) that Consist of 7 Transportation line (Go Ride, Go Car, Go Food, Go Send, Go Mart, Go-Box and Go Busway) and 4 of non-transportation business (Go-Life: Go Massage, Go Clean, Go Glam, Go Tix). Now, the company held under PT Asli Karya Anak Bangsa (AKAB) now has 1700 workers that claimed to be a just-now best fit with the business process needs.

Go jek Typology

According to our analysis, the work length of Go-Jek is being classified as Efficiency with Avg Months Working of 16 Months but already got the funding, the Average growth of user, and number of employees within <u>Scale</u> classification of Marmer-Blank's Classification.

From that analysis we can assume that Go-Jek has already on its Scale startup business classification.

According to the business model and characteristic of the growth, Go Jek is classified as Type 1N (The social Transformer) while according to the interview, the focus they had is in their internal processes. The business heavy and balanced teams perform excel compared to their performance on technology heavy teams. They able to give births to new business line as fast as 1 business line per months they operated. The main purposes of the company to give society alternatives of transportation means strengthen the argument of this classification.

Challenge that faced by Gojek according to our respondent is in order to keep themselves growing they had to Maintain Service Level in order to meet market needs. This issue is came up as Go-Jek face some challenges to keep all of their services performed well even though they had some backend problem. It happened due to high level of demand of the recent product they introduce to the market, suddenly all of Go-Jek apps need to be updated in order to give maximum experience to their customer. More problems arise due to a huge number of users they had so far, automatically update the app would be burdened more the server they had. Consequently if the problem had to rose, it will give bad publication and it is hard to afford them right now.

Another challenge that becomes their focus is they had to create more product/market fit that answered recent problems. They had to do it fast in order to keep them having first mover advantages. It reflected on how much they launched 6 new products within the second year they had operated. Become the first mover is also become they main competitive at the start, within the first year they excel in transportation business, they become the first company which differentiate their product more than their rivals.

Strategy Aspect

According to our respondent, strategies are the means to achieve their goals or objectives. Go-Jek strategies are managed and being monitored very intense as a serious commitment taken by management line. They are discussed and approved decisions in the annual general meeting. Later they wrote down and followed things up in the whole year.

The Strategy is considered really flexible as they aware that the growth of this company should be exceptionally high in order to becoming a more established company. Action plan and strategy as a whole are monitored in a tight timely manner so that any changes in the market could affect the whole strategy they created. As an illustration, respondent informed that strategy that implemented in go-jek in a year is equal to 4 years-of-strategy that implemented in a more established company.

As of today, go-jek has pivoted two times. First when they started matchmaking demand-motorcycle services by manual process, they collaborated with Nostra to build more

optimized and more automatic way to do so. The Second pivot then visually seen as they moving from a transportation businesses in to more to a backbone application services provider for a number of service Indonesia in 2015.

Factors affecting Go-jek's growth and its growth strategies

Entrepreneurial Orientation: Go-jek saw innovation on operational excellent along with presenting new products and services to the market has become the strong point that indicate the company had strong entrepreneurial orientation. By dedicating their business as a backbone application services, Go-Jek has dedicated into developing new products line in order to making their new market. Approach on non-transportation business, bundled with Go-Life Feature on the app made Go-jek adapt to new market segments in Indonesia allowing them to have first mover advantages.

New line of business are considered high-risk but as the March 2016 results, the demands for the new products still increasing in the point that Go-jek doesn't need to do more marketing activities. By doing so, Go-jek culminated as one of the most productive startup in Indonesia by taking risk, Innovate on process, pioneering new products and opportunity-taking actions from every level of the organization.

Validated to the question, our respondent agreed that without the strong orientation of entrepreneurial that the company has now, it would be hard to implement the growth strategies in Go-Jek. Innovation that emerged from the bottom line of organization has claimed to be setting new bar for the other player and grab the first market and mind share of the customer.

Manager Orientation towards Growth: The Interview session mentioned that there's policy in hiring people in Go-Jek. Go-jek builds a working environment that only people with a combination of hustler-hipster type that would be performed in Go-Jek. The respondent emphasised that only worker who had good spirit to become more salient and entrepreneurial minded are the one who being accepted and will survive in the company.

Our respondent shows her enthusiasm of solving one of the biggest problems in Indonesia big cities, traffic jam. As mentioned before, by solving big problems in the country the company along with awareness that people who work for the company are the one who have possibilities building their own company, The managers there surely try to perform well in achieving company growth and maintain healthy profitability. Until now, full support in order to execute strategies from decision maker are considered supportive for the implementation of the strategy, thus managers have a sturdy attitudes towards Go-jek development.

Firm's resources: Dayu consider have the good amount of internal resources in order to sustain the growth of the company. With 1700 people working on Go-Jek they first considered "too much" in January 2016 but with the extensive growth on product line, it

suddenly become fit as the requirement of operating those business (April 2016). That Human capital along with intra-organizational network of the company that given their own authority for each strategic function to operate does give an adequate numbers on what the company needs to grow.

As in external resources, Series B funding up until 2015 are considered as a big chunk of help. It help the company most on customer acquisition program. Some program like referral fee when a customer referred go-jek to other new user and 10.000 rupiahs service to go anywhere within Ramadhan Month in 2015 are evaluated as programs that never happened without the fund help.

As in their early phases (validation) of start-up, they consider their financial source in bootstrapping state are enough for them to operate the scale of business. In more advance phases (Efficiency), Series A funding series enable them to acquired more customer acquisition having more resources to grow to more scalable company as it is now.

Intangible external resources such as government support did so much help for the company to be able to penetrate many markets. With the vision to provide solution for traffic problem, governmental support for go-jek was welcoming to the point they gave easy access to penetrate new cities.

Environment Condition: Ever since the first Gojek operated, the business environment of mobile application has always been hard and hostile. Players that have similar capabilities in developing the same products are scattered. But, after this company managed to gain current market on their product and services, mostly after tremendous customer acquisition, the environment considered to be dynamic while go-jek claimed to grow in different market segment while other player sees it as hostile yet red-oceanic market.

The changes in social media activities and recent events (conventional taxi companies act against new player in transportation) had put emphasis and pressures on Go-Jek strategy and yet resulting in recent growth opportunities and win the mind share of a broaden existing customer. Another changes such as regulation changes, security of the driver in first quarter 2015, pricing war also play a role in operational strategies held by Go-Jek. Coalition with conventional motorcycle taxis and tight pricing become one of the strategies they launched as business environment adaptation.

Growth Strategies

Market Development: Until the time the interview takes place, Go-Jek has services in big cities in Indonesia, and still focus in expanding to major big cities in Indonesia. They try to focus their services to Indonesia markets since its already big enough to explore. Switching themselves from transportation companies to specialized backbone application service provider enable them to expand their market more freely. The proven business model they had

with their driver partner and other non-transportation partners are so reliable to make them repeatable in almost every generic business condition and environment in the country.

Series B funding also factors that made them enable to enlarge their capacities in doing more customer acquisition in the new market they penetrated. It being said, the funding creating the first mover advantages in their new areas of business relatively to other similar business.

Nadiem Makariem, Go-Jek Founder said plays huge roles in expanding the market. He's being said being eloquent to helping solving traffic problems as the main values to offer to target cities. By being fearless to every situation they're in, this company gaining more markets as they get supported from user and motorcycle taxis in the cities they're operated. This positive attitude being said as the main catalyst of Go-jek in penetrated more markets area along new market segments.

Product Development: Our respondent mentioned about to focus on creating new products, Go-Jek needs to focus themselves to (1) identify white spaces in the market that meet an untapped needs; then (2) go it at first with minimum viable products; with (3) excellent pilot testing. Those steps are undergone to made new products blend well with the market to execute (4) scale –up phase of the product exploitation.

When the respondent being asked about expanding the market she set strategy that closes to product development approach. They should (1) set up team that assigned to that product, they had to have ability to (2) launch that product fast than any other competitor. The last, to meet the needs in their region, they had to (3) tailor fit products as per each region/area needs.

In implementing their strategies, they claimed to be very flexible and agile in the level they set and review their strategy every month. These measures undergone in order to face their dynamic environment.

Some of the experience they had so far is on strategy that related to customer that they had to ensure their quantity and quality of supply to maintain accessibility of their user group to Go-Jek Services to keep their customer satisfied.

In Product building strategy they had experienced a premature scale up before product/market fit. Eventually, to overcome their current status this premature scales up affect their performance and their strategy to become more and more aggressive by taking the first bite of new markets before their competitor.

In terms of Human Capital, Go-Jek believe that they had hired too many people in their early stage and in their recent stage. With 1700-ish people working for running Go-Jek Business, in January 2016 they thought that they over-hire. Our respondent then clarifies that in terms of growing business and demands, the huge number of employee is considered fit to operate the business.

In Financing strategy, that they raising huge funding (the number is classified) they forced to maintain cash flow really care-fully to ensure their financing sustainability.

In order to prevent all those things to happened again they had to introduce new services as soon as they can, expanding into new region. All of it was enhanced with cross sell and up sell the users to every services in Go-Jek App.

Case 2: Company A

Name of the Participant: Mr AS, Vice President on Quality Management

Is a new company raised by Company AA (Holding) as its holding company, in order to overcome the dynamic of lubricant business challenge in Asia Pacific. This company is first started as a function Marketing Directorate of Company AA, where marketing and sales policy is guided directly by head quarter office.

The need to become more agile and dynamic came up after in 4 years, the market segments of lubricants in Indonesia are penetrated by so many local and international players. The main quality of the company that established in 30 October 2013 is the capability of company in making many kind of lubricated solution. This capability is due to, PT. HQ Lubricant (COMPANY A) as the main supplier of base oil in Indonesia. It also claimed to have the biggest Lube Oil Blending Plant (LOBP) in ASEAN. This company also had acknowledgement from Minister of Law and Human Rights on 31Oktober 2013.

According to its main capabilities, COMPANY A now able to fulfill all market segment of lubricates solution, from retail consumer to industrial, from light to heavy lubricated solution. Not only domestic COMPANY A already penetrated 23 countries regional market like Korea, Japan, Thailand, Vietnam, Bangladesh, Myanmar, Italy, UEA, Afghanistan, China, up until Mauritius and South Africa. The brand they sell might be different than the one that being sell in domestic market, but lubricant products are sold based on specification as ins SAE, that OEM approved and API SM based specification. By maintaining this formula, lubricant products that being sell are able to penetrated in many market and able to have 118 variations of OEM Approved Products.

Working condition of the COMPANY A doesn't change much from before it was established as a company. 8 hours a-day working time still applied to this company before and after it become spin-off. With the high demand of target and the need to gain maximum market share of lubricant product in Indonesia, also in order to expand to other countries, the need for the company to be more agile is needed. COMPANY A, after it becomes company, now is able to recruit more experienced workers. Our interview with Mr AS, Head of Quality Management in COMPANY A said that worker that have experienced in technical matter (such as LOBP and Laboratory) had average of 10 years' experience with the maximum experience is 18 years. In business and marketing field, they had average of 7 years' experience with the maximum of 20 years of experience.

By making it into more independent company, COMPANY A would able to excel its performances like customer satisfaction, worker productivity, supply chain performance and other operational performance to meet the criteria of company profitability. Even though the sales and revenue doesn't seems to have increased significantly, but the market share is raising up to 60%. Despite the stagnancy of lubricant market in ASEAN, COMPANY A is the company who still more profitable than any other player in Indonesia. Also by making it more independent, even though the company had a significant amount of communication development , COMPANY A is able to maintain its good-corporate governance level that measured by scores (73 in 2013 to 93 in 2015).

COMPANY A Typology

According to the Marmer-Blank's typology, COMPANY A is already in <u>Scale</u> classification in terms of numbers of employee, funding raised and massive customer expansion. even though the national growth on consumer is still due to discovery level, but due to market share and the fact that it face more harsher environment that it has in 10 years ago (being a sole player of lubricant) it still happened maintain its majority against 32 rival companies in Indonesia.

According to the business model and characteristic of the growth, COMPANY A doesn't belong to any internet business classification since the base of the business is selling products and lubricant solutions as conventional to other business. But, when we used the approach and the concept of how it growth, COMPANY A could classified as Type 2 Integrator for the domestic market and Type 3 the challenger for the new market. Classification of Type 2 Integrator is due to its business that creates lubricant products and integrated lubricant solution for retail and industrial market. COMPANY A made it as they produce all of lubricant products for every consumer needs (118 OEM Approved products). Classification of Type 3 the challenger is due to its ability to build a rival and substitute products in the new market they had in the new countries they penetrated.

The main challenge that faced by COMPANY A according to our respondent is the need of COMPANY A in becoming a company as Indonesia's pride that visualize into company goals, to be a Top 15 World Class Lubricant companies. With the high-setting target, COMPANY A try to accelerate the company excellence with full team work. That's why workers' productivity becomes one of the most important measurements used by the company.

Another challenge that becomes their focus is they had to create more product/market fit that maintain the dominancy as the main player in national and ti penetrate more international market. They had to do it big and comprehensive in order to gain competitive advantages. It reflected on how much effort they create product variations.

Strategy Aspect

According to our participant, strategy is a tool to achieve company means of goals. COMPANY A had their strategies written, managed, and measured it performance very well. So well that KPIs over strategy achievement are cascaded into every function and key persons. Monitoring frequency in the company is mentioned to monitor achievement every quarter, while some are weekly and monthly. The KPIs is cascaded from the vision and long term strategic planning that tailored by the headquarter office and bootstrapped by the frequent performance records of the company.

There's no records and mentions whatsoever about COMPANY A doing pivot experience. They stick their plan in lubricant industries specialized in lubricant solutions for the next ten years. This decision is taken since COMPANY A already had invested in expensive asset that should take more time to enter more economic return time.

According to the information, the flexibility of the strategic implementation of COMPANY A is very rigid. This is due to the environment business and the maturity of the industries. Though, COMPANY A already aware with the disruption era of nowadays business environment. They had functions that have responsibilities to evaluate strategic, business development and risk mitigation in order to detect early warning indicators of business change.

Factors affecting COMPANY A growth and it's growth strategies

Entrepreneurial Orientation: COMPANY A saw innovation as a culture that already maintained before it was spun-off. Innovation culture in terms of Project Control Circles, Quality Control Circles and Suggestion Systems are driven from headquarters as a quality management policies in the headquarter. That makes a means of operational excellence become more efficient in terms of cost and able to increase profit margin for the company that make them as one of profitable companies in 2015.

COMPANY A approach on introducing new lubricant products are made through its will to create as many as new products (OEM approved products) over competitor due to COMPANY A moves to one-step ahead in introducing new products in lubricant market. In the other hand, risk-taking environment is considered low and close to safe player.

However, our respondent agreed that strong entrepreneurial orientation will affect how a company able to grow. Since with the ability of searching for opportunities in terms of customer demands and new product introduction, a company should able to penetrate new market and gain more market share.

Manager Orientation on Growth: Our respondent mentioned that the owner-manager really expresses personal goals within working in the company. Numbers of salary and career safety are the main reason employee working on the company. Driven by target and

experience they had in their field, Employee able to reach and maintain their target set by the company.

With the skill and values that has been transferred from headquarter, COMPANY A had maintain the workforce climate of the company to share a mature value of established company. They aware that bonuses will come a lot when they achieve their company target that visualized how managers are positively support growth of the company. Managerial support is considered having the same aspect as the previous company.

Firm's Resources: Our respondent, Mr AS, consider COMPANY A had more than enough asset to explore national lubricant market segment. They see that they need more resources in order to penetrate new market overseas. One of many important resources that they need is governmental willingness and support for them in doing their business, especially internationally.

For internal resources, COMPANY A is confident in having enough resources to reach the goals set by the headquarters. Both white and blue collar employee has reached a significant level to make them able to operate as they were nowadays and penetrate into new markets. One of the evident that intra organizational resources are beneficial for company benefit is when even the supplier gave feedback and suggestion to the sales performances of one of the main product. When one of the products wants to be changed from SAE 0W-30 to SAE 0W-50, supplier had to research them if it will work or not. After they found out it probably won't work, they tell COMPANY A not to take the action. Later on COMPANY A found out that it was and still the right decision to not to change the specification.

All they now needs is supports from decision maker and more marketing expenses in terms of lubricant sales. Social capital played an important role within the ability of the company to penetrate new market. Accelerated process of these activities is reached through partnership with existing lubricant company or automotive company that affiliate with industry segments in Indonesia.

Environment Condition: Before 2002, when HQ still in charge in Crude and its derivatives products, Lubricant market segments are all covered by HQ. The number of player in the market at that time really segmented and doesn't have significant market segment. 98% of lubricant market segment is what they have at that time. But hen stable environment that they face suddenly changed after more players involved in Indonesia Market and some other player getting stronger to disrupt status quo.

Nowadays, they faced more dynamic environment and according to our respondent it closes to hostile that indicated by: strong market competition, increased churned costumer, changes in top-of-mind paradigm's survey results. Getting introduced by many marketing activities, new products able to gain more share against strictly restrained marketing activity held by HQ at that time.

With the spin-off of COMPANY A, now they able to do more marketing activities. COMPANY A now also able to get more initiatives happened after they now more independent.

Growth strategies.

Market profile & competitive level demand and supply become main characteristic and trends in lubricant market. 40% of world market lubricants are centered on Asia Pacific. Indonesia lubricant market grow at 2.2% that contribute to 3.8% Asian demand and placed the country to be the third biggest market after China and India. 80% passenger car motor oil increase is one of the main reason of the number.

Petrochina and Sinopec considered as two main giants in the market in terms of volume. Sales volume of the both exclusively came from their national sales. Then come Shell and ExxonMobil also other companies made COMPANY A become number 11 to this day. They right now had 2.6% market share, slightly above Total.

Market development: In order to face those market profiles, COMPANY A had to overcome five challenges in market development. Broaden market coverage; Sales increase, production capacity adjustment, quality of the products and competitive price becomes indicators to be concerned in winning lubricant market.

As mentioned earlier, COMPANY A had already doing its international penetration since it still become a function (2007). Now they already had 23 international export targets. In terms of developing overseas market, COMPANY A did brand acquisition, creating awareness and market penetration to gain more acknowledgement as well as other international player. In other activities, in 2014 and 2015 they increased their attempt to penetrate more international market, from 3 (2013) to 5 (2014). They disclosed the number of attempt in 2015 and 2016 in terms of strategic concern.

To gain more market and customer requirement, COMPANY A aware that they had to comply with registration and legal, technical and industrial requirements of the products. They aware that Lubricant market demand is increased 2.3% or become 55.24 Million of KL and slowed about 45% from the previous years. They also aware that base oil trend in the world will shifts from oil group I to base oil group II and III along with the increasing technical specification of machinery and automotive

Product Development: in 2013, they had decreased their International sales since they decide to stop Bulk Export sales. At the same year ownership of Lube Base Oil (main ingredients) are changed to other function in HQ (when COMPANY A still function) since the price of Lube Base Oil considered lower than its transfer rate. In the year of 2013, COMPANY A need to outsourced its lube based oil when it comes to fulfill international/regional market needs, since it's cheaper than had to imported to Indonesia. In 2014, the control of Lube Base Oil taken back to COMPANY A due to operational and efficiency matter.

Beside main ingredients, COMPANY A are really aggressive in terms of product development. It shows on how many they have variant in OEM approved. 217 Products that fulfil NPT recommendation and 118 OEM approved products are one of the example COMPANY A concerns in developing products.

Case Study 3: KIBAR (PT. KIBAR KREASI INDONESIA)

Name of the Participant: Yansen Kamto, Chief Executive Kibar

Kibar Kreasi Indonesia or well known as Kibar is called themselves as a tech-startup ecosystem builder that started its operational from the program Google for Education that focus in Indonesia education quality. Kibar firstly pointed as IT consultant in creating IT infrastructure in Indonesia campus that include in the program. Since 5 years ago it created, Kibar oriented their business on value creating activities that hoped to solve problems in creating the path and the good environment of creative industry in Indonesia. Right now, Yansen defined Kibar that consisted up to three pillars of Ecosystem builder business: Incubator, Start-up Management, and Innovation Hub for every client that become Kibar subsidiaries to attract.

Our respondent stated that the company doesn't need to sell any products, since they have their own idealism that focus on solving problems in the public as general and in the scope of the startups as specific. Most of the projects that run by Kibar are Pro Bono, this due to the idealism that led by Yansen as CEO that affected start-ups that run by Kibar. To build supportive ecosystem for start-up generation Indonesia become their vision that held the team together in working every prjects they own.

According to our respondent, Yansen Kamto believe that funding doesn't have that much influence in creating start-up process. He mentioned that Start-up need more strategic partner rather than a mere financial aid. In the growing phase, the start-up need to up skill the capability of every person in the firms then after that financial partner to scale up. That's why, Kibar focused in how they able to give newly born start-ups any help they need to bring their vision came through. As an ecosystem builder, Kibar also mediate the start-ups to investor, also create opportunities for them to collaborate with other people.

They had 6 – 8 years that consisted from fresh graduated to 25 years of experience employee in the team of technical expertise. The business team that already experienced in having run 3 businesses completed.

Kibar Typology

According to what Kibar had achieved so far with the results of the business, we can correlate business typology of Kibar into scale category. This typology is classified into Kibar by the working experience, number of employees and growth over last period (2015) in terms of financial and employee are more than 300%. Right now it has 30 people that worked solely in Kibar, and 65 others that scattered in startups they currently founded.

It also had competitive advantages that completely in different level over another incubation startup. Networking (traction) over either inter-organizational and clients that know Kibar which potential become future client. A set of startup ecosystem (technology) that exceed any other incubator in Indonesia also become the company's competitive advantages.

Also according to our interview, intention that put in the recruitment process, express how to build a solid team is still become a challenge of the company. In the interview also conceal how projects that entrusted to Kibar is still plenty. So much that they need to hold them out. It is express how Kibar try to fulfil their team readiness become more challenging.

How Kibar run the business, the company are categorized as internet startup of a Type 2 The Integrator. Even though Kibar motivation is seems close to a "change the world" terms, but it implied that they focus to build ecosystem of creative industry. The statement and the actions make them as an integrator that integrates any sources that needed to build ecosystem that support how a creative business could sustained and grow. This typology also confirmed that sales, business development and public relation become activities that they focused on combined with the balanced team of business and technical expert behind their sleeve.

Strategy Aspect

According to our respondent, strategy is the way to get the goals. Moreover, strategy is how we implemented this goals-setting mechanism in the way we live and expected to create value in life to make them more useful and solve more problems. The next thing he said was the importance to know well and righteous goals that want to achieved. Our respondent see the phenomena in start-up that doesn't really know the goals they want to achieved by the business or have been wrong in setting the goals. To show (kibar: raise the flag) how Indonesian start-ups become stars in Indonesia and from Indonesia to the world is the goals that want to achieved by the company and become fundamentals to move as they were now.

All activities that Kibar done are considered still align with Kibar strategy as an ecosystem management. Next strategy that will hold by Kibar is to collaborate with google communities in Google business group and Google development group. Our respondent said that startup is in the need of more community and then academic environment to survive and grow.

Factors affecting Kibar growth and it's growth strategies

After aware with how huge potential that lies in creative industries, and how chaotic standards of everything in this world, they ought to create a sets of new standards of creative industries. Those initiatives taken act in such action as price of the products, fee of creative worker, and quality standards of the products. These standards are sets in order to make the creative industry had their own authority.

Kibar sought this progress to create the better world is a constant vision held by the company in order to make good quality of firm growth and stick to their focus to create more solution and results for the society. Competitive advantages that already mentioned by Yansen.

Entrepreneurial Orientation:According to our respondent, Kibar activities are really focused on problem solving and to achieved values. In terms of more operational and strategically matters, Kibar aware of changes are happened very emergently that needed to be solved. That matters needs immediate solution and without an organization that have strong entrepreneurial orientation, Kibar never be as big as it is now.

Kibar also become the first company that do what they do. From the state of become the first person introducing startup environment, to become one of the first start-up incubator in Indonesia, Kibar had proven to be the organization that really have a strong entrepreneurial orientation.

Kibar made themselves as a place where, designer, programmer, cartoonist and other creative industry create together and create integrative community that able to not to just create products but also solving problem in the society. As the side effect they make a sustainable business out of it. There are neither records nor statement whatsoever that mentioned pivot event in Kibar core business. They basically move and actuate themselves in projects that in the end have the impact in achieving the main goals of Kibar.

They believe visionary aspect, and problem solving attitude of entrepreneurial orientation are very important for a company and Kibar especially to grow as it is now. As the results of having good entrepreneurial orientation, Kibar able to collaborate with regional government (Start Surabaya), Academic institution (UGM Business Incubator) and governmental bodies (National 1000 Startup Program).

Manager-Orientation towards Growth: According to Yansen, people hired in Kibar are required to have the same crystal clear goals as Kibar did. To become agents of changes. This changes means literally of a new world order that create values that worth more than money, but he good changes within the internal country's changes.

Our respondent also mentioned that he always remind their employee to resign on their own, literally every day. This mechanism trusted to build working and workplace environment that guaranteed in accordance to company vision and values. This condition also allow turnover employee very high, In the meantime, the employee believe that Kibar has to grow in order to made the employee feel that they left a legacy on mile stones of Kibar growth.

That mentioned in the interview that Kibar doesn't in need for people with superb skill. They believe that skill can be taught along the process employee work at Kibar. They choose the employee based on the good attitude personality the employee had. In this interview, Yansen also mentioned recruitment process in Kibar. Consensus with many former employee are required whenever any new worker like to be employed. This process

implemented due to select really carefully people that needed to fulfil their values in the employee, energy, intelligent and purpose. Those values are needed in order to apprehend the changes to Indonesia business climate as the sole purpose of Kibar.

This phenomenon supported by one of its worker, Andi Martin, that also CEO of Kratoon. He said that Kibar gave him the opportunity to create a startup there with that base of similar value and vision that his company and kibar shared. Kratoon wants to create intellectual property business in Indonesia to be more have values than it is now. Even though this is the 4th company that started by him, Kibar still willing to incubate the business as it is now. He also mentioned that he get incentives by being CEO that paid more than enough his bill and his employee's.

Manager orientations is believe to be important matter for the company to grow, since without awareness and supports from the operational and managerial level, a company will get a hardship in getting their goal achieved.

Firm's Resources: For the purpose that they had right now, internal resources that already acquired by Kibar are mentioned enough for them to grow. Thanks to the a strict recruitment process, they able to choose employee that required to run the business and the projects they had very well and efficiently.

Intra-organizational and working condition that they build till nowadays also able to naturally select star employees to stay, and the bad one to go. Collaboration with other functioned can be easily generated since they stated that they implement horizontally-collaborative-open organizational structure of the company. Personally, we found that Kibar actually implement more of a matrix organizational structure.

As for external resources such as finance, the rest of the projects they done that are not Pro Bono (as mentioned earlier) stated that able to aid their operational level. As for the salary, Yansen later on mentioned (after the interview session over) there are no employee that quit because the salary was not enough for them.

In the social capital point of view, collaboration with other external organization is one of the strong aspects for Kibar to grow. Many of the projects they had are the results of collaborative action between Kibar and other organization. They also mentioned that access and networking for business and social purposes frequently intertwined and supported each other in the organization growth.

As an addition, Yansen mentioned that financial aid is not the one that becomes primary factors in growth process of Kibar. To invest more in people, whether internal or externally is the main reasons Kibar could keep growing at an exponential level.

Environment Condition: Yansen aware that business environment in Indonesia for startup still not ideal for the start-ups to grow. It also applied to Kibar as well. With the absence of regulation and people awareness regarding start-ups industries, Yansen argue that environment for Kibar is rather dynamic than heterogeneous. Even though Kibar business is

one of a kind in Indonesia, but they saw changes is frequently happened in the environment that push them to challenge more and more activities in order to adapt with the market.

Kibar believe that environment really does affect the way they operate, and as the results really affect the way they grow and the growths results itself. It also valid for any other start-up company, since the way they managed strategy for start-up they incubated is based on the business environment that they has to face.

Growth Strategies

Kibar started as a consultant in order to gain financially independent to make the company operational secured. At the first time they didn't start looking for funding in order to keep their value encore. After a while they intend their strategy a little bit different than any other companies. But according to Yansen, it seemed take them to where they belong now. In the process, they admit that in the mean time they have been compromising quality of the employee when they want to build internal team, in order to do that right now they focusing themselves into more selective recruitment process. Another strategic experience they had is they feel they raise too little money to get operational secured. But, it confirmed later that they took the risk over control of values that still hold by them till this day.

In his opinion, if they stay true to our course true to our purpose is the main reason of startup to grow. They believe that Kibar achievement so far basically doesn't planned on in terms of written document. They flow naturally but supported with the backend operation that really effective.

Kibar aware that to grow, a company should maintain their product and how they need to expand their market coverage. But then again, Kibar doesn't focus on the need to develop their product and/or market. They focused on what kind of social problem or collaboration projects that needed to be solved. Regardless it will impact on their product refinements (in Incubator, Start-Up Management, and Innovation Hub) or broaden their market coverage is considered as a results for them.

Compilation of Participants

As stated earlier, all of participants are interviewed in snowballing sample with the sequence as seen in Appendix A. All of participants are being asked with the same interview questions as stated in Appendix C. This paper try to make the visualization of this study to more compact as the details of the rest case studies will be compiled in a series of data.

The compilation of participants divided by the nature of business by ICB are mentioned as table below:

Table 18 List of Participant Main Business Compilation

No	Name	Subsector (ICB)	Specific Business
1	Aksi Insan Nusantara	0587 Alternative Fuels	Trash/Garbage-Electricity

No	Name	Subsector (ICB)	Specific Business
			generator
2	Langgar Nanotech indonesia	1357 Specialty Chemicals	Toner producer for paint industry
3	Multi Karya Cipta Loka	2357 Heavy Construction	construction site service provider
4	Ramesia Mesin	2723 Containers & Packaging	Food and culinary business machinery distributor
5	Nanotech Indonesia	2791 Business Support Services	Consultant in material testing and Implementation of nano technology
6	Transinov	2791 Business Support Services	Event organizaer on academic environment
7	No Limit	2791 Business Support Services	Social Media Analytics
8	Tosha Telecommunication	2791 Business Support Services	Digital Business Consultant
9	Startup Legal Clinic	2791 Business Support Services	Content creator and Legal service provider
10	Kibar	2793 Business Training & Employment Agencies	Startup Incubator and Environment
11	Nano Center Indonesia	2793 Business Training & Employment Agencies	Startup Incubator in Technology Startup
12	Ruang Reka	2793 Business Training & Employment Agencies	Coworking Space and Business Incubator
13	Flip ID	2795 Financial Administration	Alternative inter-bank transaction provider
14	Company A	2797 Industrial Suppliers	Spin-off of lubricant producer
15	Nanotech Herbal Indonesia	3577 Food Products	Food Manufacturers specialized in

No	Name	Subsector (ICB)	Specific Business
			nanotechnology implementation
16	Atirupa	3726 Furnishings	Interior Designer and Furnishing Specialist
17	Kratoon	5555 Media Agencies	Digital hub for Intellectiual Property character
18	Big Evo	5555 Media Agencies	Digital Marketing Specialist
19	Solusi Kolam	5755 Recreational Services	Hobby/Leisure on fishery tools provider
20	Travass	5759 Travel & Tourism	Travel and Leisure event organizer
21	Bukalapak	9535 Internet	Digital marketplace specialized in Small and Micro Enterprises
22	Go-Jek	9535 Internet	Backbone application on transportation services
23	Bagi Kata	9535 Internet	Portal of specific information
24	Cozora	9535 Internet	Internet content provider and webinar event organizer
25	Teman Jalan	9535 Internet	Transportation service application
26	Autonet Magz	9535 Internet	Youtube Content Creator and car trading
27	Center for Robotics and Intelligent Machines	9572 Computer Hardware	Academic-institution on Drone and Intelligent Machine

More specific visual presentation of the participants are put on Appendix B Categorization of Start-ups based on ICB. By classify them into main business we hope that we can be easier to analyze nature of the business of those startup business.

More deep into factors that had been analyzed through this study focus, all the participants then mapped from the business typology from Startup genome and Marmer-Blank's Scale. Red color indicated Type 1, Yellow indicated Type 1N, Blue indicating Type 2 and Green is indicate that participants are considered as Type 3 of start-ups.

Much further we also try to explore the intensity of the factors affecting growth such as; strength of EO, strength of MO, level of internal resources and external resources and categorization of their Environment Condition (EC). Special case for EC, we classify heterogenic as 1, dynamism as 2 and hostile as 3. The interval had given due to arguments in 2.6.1.4 that infer more hostile and uncertain condition will tend to made the firms take initiatives to grow rather than stable and safe environment.

As inferred from the interview, we also try to map strategic grow action based on ansoff's matrix. From information inferred we classify them either their strategy considered as Product Development, Market Development, Market Penetration or Differentiation.

Assessment of each participant later being validated with the current performance of the firms. A firms is considered as grow as their basic and known variables that shows so indicated growing significantly in the last of six months. Fair performance are assessed from the number of general 5 – 20% growth per year. They considered collapsed when they indicating a hiatus condition in transaction, sales, or activities in the last 6 months. Apparently not all the voice recording able to grasp these information. Beside from secondary sources, many of the firms try their best to seclude their firms performances. Some of the data are gained through off-the-record way to obtained.

All the map of the performances and interview session are visualized in Appendix D Start-up Interview Compilation.

Analysis
Analysis of Start-up Typologies with the Actual Challenge Condition

As we relate to actual data analysis, we provide that Startup genome's typology and Blank Marmer's scale quite practical in mapping condition of the startup firms. By making classification, it will make us easier with the justification over firm's actions that based on the company condition.

As can be seen, we try to cross case analysis between business type with scale of the firms to make an analysis about it. We find that 10 firms are still in discovery phase, 4 in validation/traction phase, 7 in efficiency and only 6 startups that well established (scale). By the table above, we also could infer that startups have propensity of time for them to scale quite related with type of startup business they run.

For Type 1-The automizer are shown that most of the solution-focused business doesn't run well in terms of growth. It seems product intensive that comes with the higher needs of R&D initial costs really affecting stated business in growth as fast as the traction comes. Most companies in Type 1 needed bigger support (financially) in order to grow. Other aspects is competition, exclude langgar nanotech that using an absence of rival, most of the firms in Type 1 really does compete with international rivals. Technology like apps (Flip ID,

Nanotech herbal), contents (SLC, AMI) and implemented electronics (Solusi Kolam and CRIM) are something that quite accessible nowadays. Thanks to internet and global spread of knowledge, beside patent, similar product would be easily copied by other firms.

For Type 1N players are quietly as harsh as type 1. With the condition either make it Big or thrive, social transformer business must regain tractions as big as possible in creating user awareness. In order to grow, the differences

Table 19 Type 1 Start-up Participant

Name	Startup Genome	Blank Marmer
Langgar Nanotech indonesia	1	Validation
Startup Legal Clinic	1	Discovery
Flip ID	1	Discovery
Nanotech Herbal Indonesia	1	Efficiency
Solusi Kolam	1	Efficiency
Autonet Magz	1	Validation
Center for Robotics and Intelligent Machines	1	Discovery

between Discovery and Scale firms of the sample are that, more Human Resources in making business heavy and balanced (technical and business) team, better user awareness, and varieties of contents they offered. I assume that time is one of the factors that will bring the smaller firms to go to the bigger phase of the firms.

Table 20 Type 1N Participant

Name	Startup Genome	Blank Marmer
Kratoon	1N	Discovery
Bukalapak	1N	Scale
Go-Jek	1N	Scale
Bagi Kata	1N	Discovery
Teman Jalan	1N	Discovery

For Type 2-Integrator business it is clear that resources and product-market fit become factors that differ scale to discovery an efficiency firms. While Travass and Cozora still new, they already proposed unique product/services as well as the other firms in the market. To listen to customer insights, to read market opportunities and to become the best in their business are some of the insight that made bigger type 2 to succeed to smaller ones.

Table 21 Type 2 Participant

Name	Startup Genome	Blank Marmer
Kibar	2	Scale
Nano Center Indonesia	2	Efficiency
Ruang Reka	2	Efficiency
Big Evo	2	Efficiency
Travass	2	Discovery
Cozora	2	Discovery

For Type 3, Challenger firms have something common to firms as an establish company. By targeting big market, recurrence sales processes, it shows the same characteristic as conventional companies. The need of competitive advantages and dynamic capabilities also become some of their characteristics.

Table 22 Type 3 Participant

Name	Startup Genome	Blank Marmer
Aksi Insan Nusantara	3	Discovery
Multi Karya Cipta Loka	3	Scale
Ramesia Mesin	3	Scale
Nanotech Indonesia	3	Efficiency
Transinov	3	Validation
No Limit	3	Efficiency
Tosha Telecommunication	3	Validation
Company A	3	Scale
Atirupa	3	Discovery

Relatable argument by making cross analysis between Blank-Marmer's Efficiency and Scale firms are came up after researching background of each participants. In terms of revenue, the biggest firms among participants is Company A, Bukalapak and Gojek. Exclude company A that act as a spinoff of existing establish business from big company, Bukalapak and Gojek had tell that time, distinctive product and winner-take-it-all market has placed those two as the main player in their industry. Rivals that against them should have better resources and strategies to win the market.

All the scale companies already through some challenges and strategic experiences as they mentioned in the interview. Human resource management mistakes, financing situation and some of growth related issue as timing and partnership had already made them as big as they are now. Pivoting from one main business process to another also become their experiences that made them perform. Apparently this study unale to find startup that fail after they go through scale phase.

In efficiency, they make clear that main focus and performance measurement by the time they interviewed is that they need to make sure they acquire more customers. All the company in efficiency already monetized their main products, which alredy fit with the description pf Marmer-Blanks phase of efficiency.

Table 23 Efficiency and Scale Participant

Name	Startup Genome	Blank Marmer
Nanotech Herbal Indonesia	1	Efficiency
Solusi Kolam	1	Efficiency
Nano Center Indonesia	2	Efficiency
Ruang Reka	2	Efficiency
Big Evo	2	Efficiency
Nanotech Indonesia	3	Efficiency
No Limit	3	Efficiency
Kibar	2	Scale
Multi Karya Cipta Loka	3	Scale
Ramesia Mesin	3	Scale
Company A	3	Scale
Bukalapak	1N	Scale
Go-Jek	1N	Scale

Strategy from Start-ups Perspective

In the fundamental views of startup firms, strategies are perceived as many things. The table below is the recapitulation of every startups that shows a varied response on strategy. But seeing the result that related with the Mintzberg means of strategies, we can comprehend that strategy in a startup is a coordination and collaboration of plan and ploy.

These arguments really did meet the recent popular article regarding how start-up should plan thoroughly while making validated learning (Ries, 2014) as well as Pivot when necessary as the results of those learning. Changes in plan of startups that show by the gojek from transportation to backbone app, Nano center technology from association to incubator, Autonet Magz from automotive retailer to youtube content maker and Kibar becoming startup environment are examples of relatively scaled start-up that changed their main business into something else as the reason of more validated idea that will work on the market, or just to be their true self.

In terms of Implementation, 12 companies felt that they need to dedicated special times in reviewing strategy implementation, while 15 companies sees strategies are one-time-only planned and keep the rest in gaining their main performances.

Among those numbers, all the scale firms (Appendix D, Column Blank Marmer, Category 4), and most of the Efficiency (Idem, Category 3) are firms that allocated frequent times in incorporating their strategies to their business activities. More deep some big firms as Kibar, Gojek, Bukalapak are making more ladder-like system in decision making process, also with the strategy implementation performances.

They also seems really aware that operational performances are measured with the importance of whether they getting closer to their goals. From the study we also inferred that they aware that strategy plays important role in making a successful firm. The mix between planned and emergent implementation of strategy are shown with huge variety of time span between planned (Go-Jek, Langgar Nanotech Indonesia and Bukalapak) and how reactive emergent should be (Ramesia, Gojek, Bagikata, Travass, Nano Center Indonesia). This huge

variety only show different perception of strategy implementation means as the best practice running business, especially a start-up firms.

Table 24 Participants Percepetion on Strategy

No	Name	Strategy is considered as
1	Aksi Insan Nusantara	Way to achive what we desire as a team, to provide energy
2	Langgar Nanotech indonesia	big picture in order to fulfil company needs
3	Multi Karya Cipta Loka	Procedure of company in making plan and implement those plan
4	Ramesia Mesin	a scheme in order to keep the company profitable
5	Nanotech Indonesia	tactic to fulfill company desired state
6	Transinov	tactic to fulfill company desired state
7	No Limit	course and ploy in order to be better thatn competitor (competitive advantage)
8	Tosha Telecommunication	a means of company efforts to gain more client
9	Startup Legal Clinic	a way of company in getting better performances
10	Kibar	the way to get the goals
11	Nano Center Indonesia	tactic to fulfill company need in order to reach desired state
12	Ruang Reka	a how-to, of how things worked in order to achieve the target
13	Flip ID	a way in getting more user
14	Company A	a tool to achieve company means of goals
15	Nanotech Herbal Indonesia	a way in getting the desired condition
16	Atirupa	how the company able to reach the target
17	Kratoon	the way to get the goals
18	Big Evo	is a way and how people
19	Solusi Kolam	an effort for making the company more profitable
20	Travass	a way to make the company bigger
21	Bukalapak	pattern in making product and to keep the company still relevant
22	Go-Jek	the means to achieve their goals or objectives
23	Bagi Kata	Step by step of achieveing goals
24	Cozora	plan of getting to the required company phase
25	Teman Jalan	plan of means to the required company state
26	Autonet Magz	a way to achieve company revenue
27	Center for Robotics and Intelligent Machines	tactics in order to get many customer in buying our products

In terms of scope, bigger companies also aware that strategy also has its scope. They aware that in bigger companies, decision making must be executed fast. They aware that by delegating decision making and sometimes strategic process making they will boost their performances fast as long as it supported with the same direction over managerial members. Bukalapak, Ramesia, and Gojek are some of the firms that implement delegations so that, the founder could focus their attention on bigger opportunities that will create more impact to their firms.

Growth Strategy

Factors affecting the emergence of growth strategies

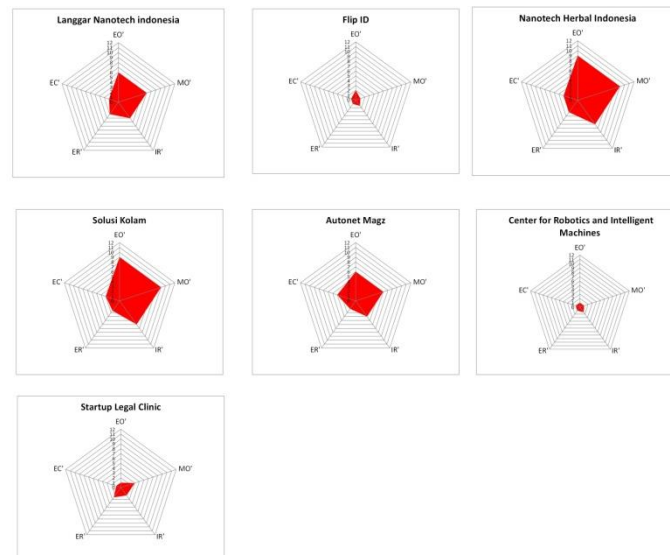
From theoretical background in part 2 of this study, it appears from Wiklund's (2009) integrative model that EO, MO, Re (either internal or external) and EC become elements that affect the small firm to grow. It also infer in analysis part 4.1 startup really consider strategies as their means to achieve the goals. Later on, this strategy to grow is inferred affected by wiklund's (2009) factors for growth of the small firms.

It also inferred that positive levels of the factor will subsequently foster growth strategies, whether it formal or informal one. EC are considered different since there are no

specific kinds of environment that better or lesser for the firm to growth. Most firms will likely pursue a stable and less competition environment, that's why blue ocean strategy becomes hype. But these studies refer to kind of EC that logically will affect firms in having more growth than the other.

We measure the factors by the strength they envision. As pictured in appendix D, we score all the factors with 1 (low), 2 (fair) and 3 (strong/high). Later, according to Marmer-Blank Scale we multiply the score with: 1 (Discovery); 2 (Validation); 3 (Efficiency); or 4 (Scale). That way, we would be able to recognize any pattern to show the firms profile in order to proceed with grow strategies. Exception for EC, we denotes that hostile environment as the most positive factor to grow the firm (score 3), and heterogenic as the least positive factors (score 1).

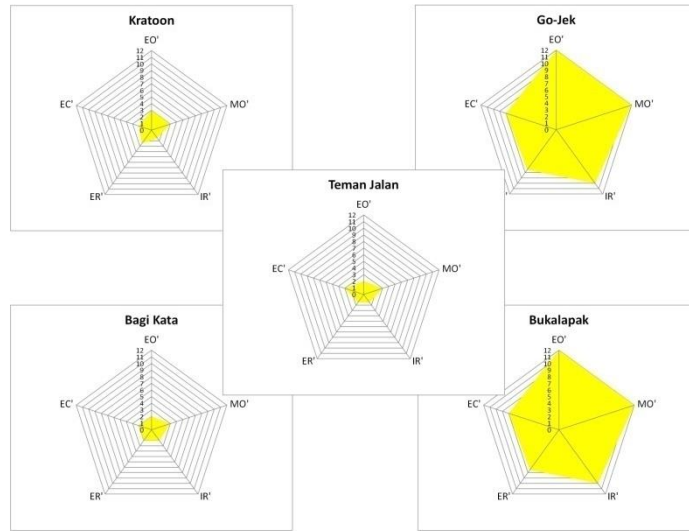
We also try to differ the pattern from its kind of business (startup genome typology) through the color that been mentioned in part 2.

For Type 1


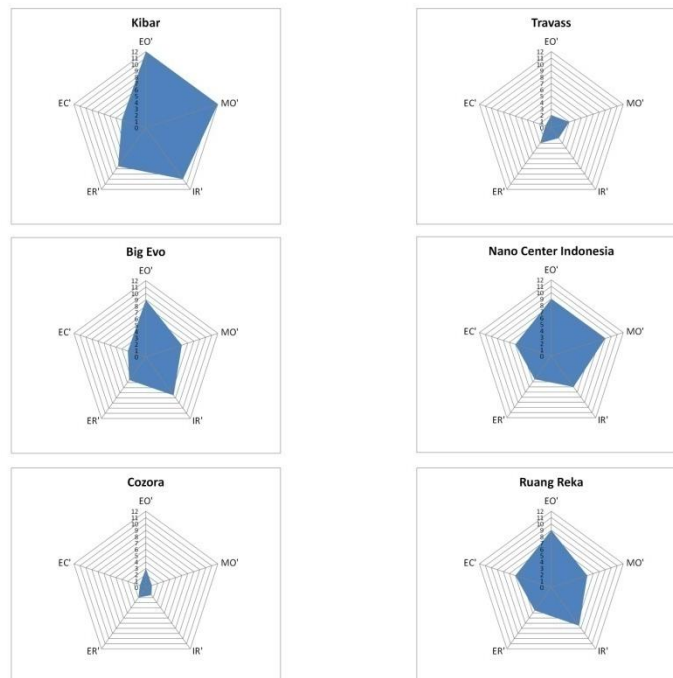
Type 1 – The Automizer

As we can see, EO did give positive impact on how a firm performs. All the "collapse" performance of the firm is reflected from the low level of EO. The high level of EO is also corresponding to the more growth strategy numbers the affected (from 2 to 4). But some cases as Cozora, No Limit, Solusi Kolam still give them fair performances. It brings us to the next factor, MO.

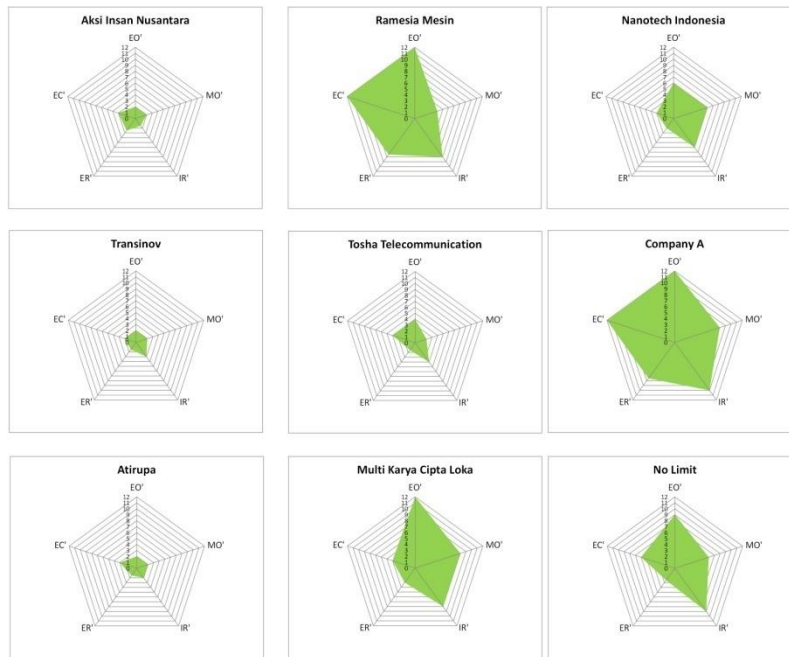
The high level of EO, as mentioned in part 2, are shown in 16 firms that envision innovativeness, proactive towards new opportunities, and enable to taking risks. In terms of innovativeness: Langgar Nanotech Indonesia are succeed in creating new domestic color pigment for paint industry in Indonesia based on waste iron. Multi Karya Cipta Loka enable to creating specialty services in building construction like epoxy mortar, anchoring, and rebar supplies. Ramesia mesin creating joint venture with Chinese distributor to supply food-related machinery and equipment complemented with guarantee.

For Type 1N


Type 1N – The Social Transformer

For Type 2


Type 2 – The Integrator

For Type 3


Type 3 – The Challenger

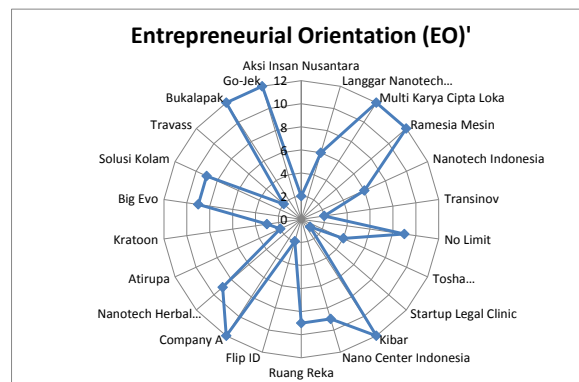
In term on proactiveness, Kibar pursue the hype in Indonesian culture trends in creating startup by providing support system for startup to growth, along with maintain projects with bigger institutions in gaining publication and more strategic collaboration. Big Evo founder, as an ex of international company worker in digital marketing, pursue new business in digital marketing in terms of clientele and training in the same industry. Company A decided to be a spin-off which bears more responsibilities and compliances activities as an independent entity in order to pursue international market.


Figure 19 EO Mapping

In term of risk taking, all of the firms categorized as so are pursue new market or existing market that already owned by stable supply. Company like cozora that supplied by major player like slide share and youtube, Nanotech Herbal Indonesia that risking making their own facilities to provide nano technology implementation of food processing, something that not commonly accepted among Indonesian, and Kratoon that pursue digital remarks and

arts that already captivated by Manga (japan), Comic (USA), and Manhwa (Korea) by making specialty services for intellectual property in Indonesia.

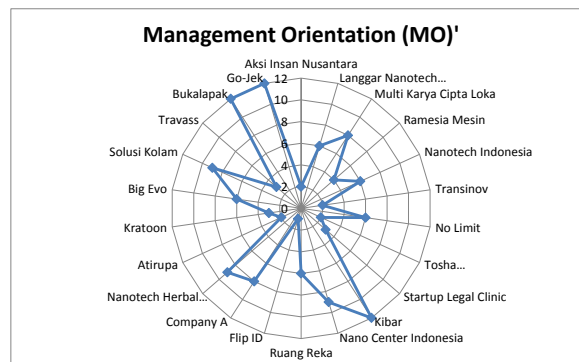
MO or Management Orientation towards growth did also give positive control to Performances and number. Interesting fact of MO is seen that it is affected by EO as well. Exception for Bagi Kata and Startup Legal Clinic are happened where MO are greater than EO. This case happened because in term of business process of those two are based on member generated activities. Bagi Kata is company that provides information regarding user generated answer they need to curate information on their site and gaining support from their content provider. SLC is also providing training and content regarding law issue related to startup business.


Figure 20 MO Mapping

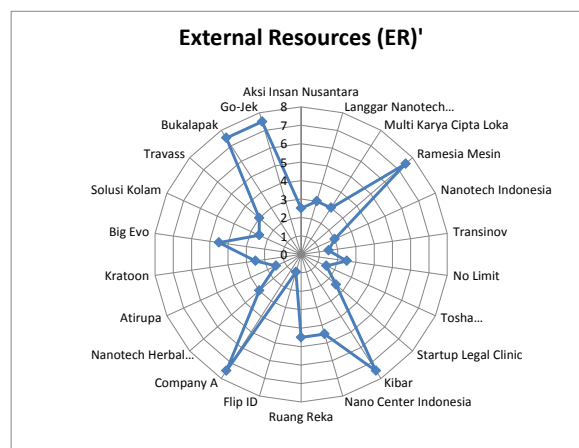
From 27 participants, 5 participants felt their internal Re is not enough to perform growth strategy, among them 2 participants felt that external resources are not enough for them reveal to implement growth strategies. Firms that fulfil their needs regardless their performances, their able to perform more strategies than other firms. Beside Financial, most of the firms confirmed that they prefer good human resource and social capital among any other resources. Since through social capital, they able to grow even more in terms of performances and collaboration of making more action to develop the firms.


Figure 21 External Re Mapping

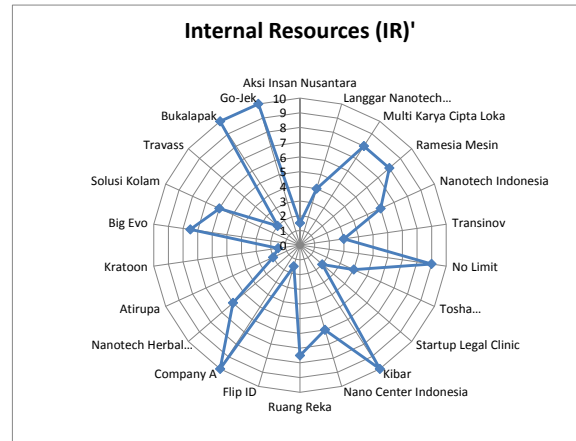
Surprisingly, as stated before regarding numbering of EC status that projected to having more chances for the firms to grow doesn't appear so. Firms in Hostile EC had the same numbers of growth strategies than firms in Dynamism EC (2 strategies), except for Atirupa and Teman Jalan where they still in early developmental phase and with the limited resources they have they tend to focus on single strategies as possible, which still Market Penetration.


Figure 22 Internal Re Mapping
Figure 23 EC Mapping

Analysis of underlying logic of Growth Strategies

The conjectural idea in studying the growth strategies of 27 participants was based on Ansoff's typology of growth strategy. In the interview we inferred that articulation of Apple product when re-describe their strategy in order to explain it to us.

Market Development mean introduce existing product to new market segment or new market geographically, or demographically like apple create Ipod touch for those who can't have Iphone because of market readiness in a country. Product Development means to develop new product for customer who already loyal to the brand with high development cost but they can minimize cost of new customer acquired like Ipod Shuffle for apple. Diversification are visualized as entering new market with completely new offering, with

significant cost and risk like apple introduce Itunes that change the game from computer product to music. Market Penetration mean sell more attract from competitors by providing better products in many ways available like I Phone to conventional phones and smart phones.

By that review, we able to grasp information among firms about what strategy they want to implement in order to achieve their goals. We use all four of typology from ansoff typology.

Form the interview we infer that, most of the firm, focusing on making natural growth by Market Penetration. While other firms choose other strategy beside that to Developing the product and market.

• Tosha Telecommunication • Nano Center Indonesia • Ruang Reka • Bukalapak • Bagi Kata • Langgar Nanotech indonesia • Multi Karya Cipta Loka • Transinov • Kibar	• Flip ID • Big Evo • Solusi Kolam • Cozora • Center for Robotics and Intelligent Machines • Aksi Insan Nusantara • Ramesia Mesin • Company A • Atirupa • Teman Jalan	• No Limit • Nano Center Indonesia • Kratoon • Bukalapak • Go-Jek • Autonet Magz • Langgar Nanotech indonesia • Nanotech Indonesia	• Startup Legal Clinic • Kibar • Nanotech Herbal Indonesia • Solusi Kolam • Ramesia Mesin • Company A

Market Development		**Differsification**	
• No Limit • Go-Jek • Kibar • Travass • Aksi Insan Nusantara • Company A		• Nano Center Indonesia • Ruang Reka • Kratoon • Bagi Kata • Kibar • Cozora	

Figure 24 Growth Strategy Map of 27 Participant

Example of product development is reflected in No Limit. In order to enhance their service, in early 2016 they enable to analyze more data and give more information to future client, they made new tools to extract social media and content data over world wide web. nowadays, they able to give more information including trends and semi linguistic model for activities held by the customer.

Company A as mentioned before able to enrich new products to market in regional and overseas up to 118 Product that approved by OEM. Solusi kolam able to produce their own trickle filter that customize to tropical climate using their own bacteria and make their own company about it. Nanotech Indonesia create services regarding military grade over material testing and material construction.

Example of Market Development in Kibar beside made collaboration with company like google, they also work with academic and gorvermental bodies in order to create more network and social capital over startup ecosystem. They also develop their market to reach not only professional person that want to build startup but more general people through ''gerakan 1000 startup'' that run from august 2016 that supported by many stakeholders.

Aksi Insan Nusantara, even before their first project working, they enable to penetrate new market in Bali and Lombok regarding garbage/waste electricity generator. Company A as mentioned before try to penetrate international market to over 7 countries.

Example of differsification is when kratoon try to made a place for artist and content maker to nurture andmaking intellectual property, making Kratoon as one of the first player of

master IP protector in Indonesia. Bagi kata business by providing relevant and curated information over everything by making strategic partnership with content provider along with their content curator.

Financial capital can allow the firm to pursue more capital-intensive strategies that are also better protected from imitation (Cooper et al, 1994). This buffer may in turn increase the firm's willingness to pursue new opportunities and strategies. On the other hand, firms that are content with their existing operations might not be able to follow with changing demands, and will consequently be negatively affected by this type of environment.

In his publication "The Lean Startup" (2011), Ries incorporates the lean manufacturing principles into the business model generation process. The underlying principle of Lean Management is to avoid waste by optimizing resource expenditure (Womack et al., 1991).

Traditionally, waste is defined as everything that does not add value to the end customer. However, many young businesses do not fail because they are incapable of building a solution or creating value to customers but because they face too many uncertainties and have not found a sufficient number of prospective customers to offset the costs.

Therefore, Ries incorporates a new definition of value for startups which he calls "validated learning". Validated learning is a process that turns leap of faith assumptions into facts through falsifiable hypotheses. This concept is reached with the help of the Build-Measure-Learn-Loop (Ries, 2011).
Figure 25 Build-Measure-Learn-Loop (Ries, 2011)

Startup Genome report stated that similarities exist between firms on different stages. It also appear in validation to discovery, efficiency to validation, even scale to validation had some similarities. The need of more resource, ability to attain more customer and

Inconsistencies of the following the right stages become findings that said the mentioned startups having more problems which premature scaling. The mistakes in premature scaling are following certain areas (Marmer, 2013):

A company named Brickhouse decide to put too many features in their product. It affected the main function and the top-of-mind feels in the user terms. In the end, they had to stripped down some of the feature that considered "too much".

By having more capital a company tends to adding more management overhead such as facilities and a great-expensive team. It will be vulnerable for them if the sales won't come as

high as they spend. After all, it is the money seeds that needed to return as fast as possible. Once they had too many traffic, they tend to have incorrect measurements of the goals. Often they tend to miss between the lead and the lag indicator.

So according to the finding, it is important to watch over the right developmental phases as long as growth strategy of the firms.

Conclusion and future research

Overview

The aim of this study is to find how startups managed and develop growth strategies. From part 3 we already aware that we already asked four questions regarding strategy growth strategy formulation in start-up firm's perspective. We already aware that startup business have common pattern that lead us to find challenges over each phase of the start-up.

After finding pattern and self-definition of strategy in start-up concern, we need to know on what condition does startup emerge their strategy in order to find out more on what factors become the main motor for growth strategy on startup. Later we try to find underlying logic and direction of growth strategy in Startup based on Ansoff's growth strategy classification.

Academic framework and popular articles regarding startip offered pertinent background within definitions of strategies, Startup typology, growth strategies factors and growth strategy typologies as the direction of the research. Case studies are done through exact guidance as shown in Appendix B.

The following four parts of research question and connects it with the findings of each part of the study.

Research Question 1: What is a strategy and growth strategy in a Start-up company?

The study exposed that participant had perceive strategy with the same definition as mintzberg's 'plan' and 'ploy' definition on strategy to achieve the goals and to go to desired condition of the company. However, the complexity, flexibility and formality of those 'plans' and 'ploys' varied in term of span and scope. From bureaucracy to time span, in practice variation of implementation is very wide, as it needed for startup to standardized process of strategic implementation. However, for some firm, strategies in practice were something that emerged according to the situations they faced and their environment.

Consequently, from start-up point of view, one can say that strategies are plans to achieve the firm's objectives and they are often used in practice through a combination of pre-decision analysis and emergent patterns.

Research Question 2: What are the Challenges over Start-ups in each Phase of Start up?
The three main factors such as EO, MO and Resources (Internal and External) positively affecting startup's growth strategies were recognized by the four studied firms. Furthermore, it was possible for the firms to link those factors as being responsible for the emergence of their growth strategies.
EC known to be more informative as they seems doesn't correlate directly to the performances and the emergent of growth strategy.

Research Question 3: Under What Condition does Start-up Emerge Strategy?
The five main factors affecting a firm's growth strategies were recognized by the 21 interview of the participants. Furthermore, it was possible for the firms to link those factors as being responsible for the emergence of their growth strategies.

Startup typology also has made a good pattern in assigning challenges on every phase

of the startup. By knowing challenges supported by strategic experience held by the firm made, it is possible to know certain strategy for startup to work on.

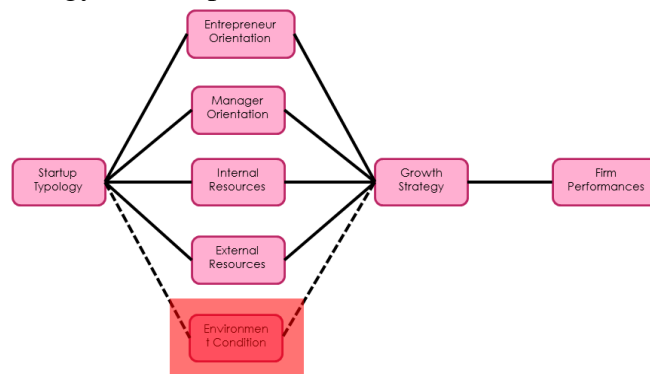
The case study suggests that growth strategies emerge where:

- The Manager Orientation towards growth is positive
- The firm possesses certain degrees of entrepreneurial orientation that vary to firm performances
- The firm has the varied status in financial (internal and external), human and/or social resources
- The environment of the firm creates certain felt pressures resulting in new opportunities whilst not really had directly affected performances and growth strategy.

Research Question 4: What is the underlying logic and strategic direction of the growth strategies of Start-up Company?

The findings suggested that the firms were making use of growth strategies directed to the development of new products while some other also pursue Market Development and Differsification as shown in Figure 11. Furthermore analysis on Market Penetration is not perceived as dist

Furthermore, after an analysis of the employed strategies, it was possible to state an important dimension that was present in those strategies.

Thus, it resulting in rejection in proposed model. That for Indonesia, model representing growth strategy in startup is as follow:


It is where Environment Condition doesn't satisfy the need for underlying logic for startup to employ growth strategy.

Contribution

Topic discussed in this study invites to different path and approaches in order to ensure survivability of startup company. This study focus on five related aspects in term growth strategies in Startup Company. Business typology, Scalability, Factors affecting growth, growth typology and integration between them is focusing in exploring and describing a what and how startup works on strategy.

The contribution of this study is by far all-embracing suggestion and facts in startup company practices. This study suggests that:

- Startup perceives strategies as valuable tool and means to achieve their goals and desired condition of the firm. Participants in this study do incorporate strategies in their business process.
- Could be perceived that typology is a practical mean of firm's predetermination in ploting of following up patterned strategic action for the company growth.
- The pre-decision analysis of strategy formulation along with strategic experience that came

along with scale of the startup could drive the growth strategy and need more improvement in order to make it more practical for the use.

- Start-up could be defined with the typology maps from wiklund integrative models along with scales from Marmer Blank's.
- The different factors affecting the emergence of growth strategies, showed that certain conditions were most likely to foster growth strategies than others.
- Growth strategies in small businesses can be classified by ansoff's growth strategy with the variable actions called pivoting as ries (2011) suggested.
- Inter-organizational cooperation has a key role when developing growth strategies. Firms should therefore consider looking opportunities with collaboration to create sustainable growth strategies.

Appendix C Questionnaire

Growth Strategy on Start up

Entrepreneurial activity has a very central role for economic development (Delmar, 2000). By stimulating growth and innovation, entrepreneurial activity contributes to the creation of new products, production methods, technologies, which challenge existing businesses models, creates jobs and contributes to the general welfare of a society (Iværksætterindeks, 2008). Unfortunately, most of these internet startups eventually went bust due to major oversights in their underlying business plans, such as a lack of sustainable revenue.

Start-up rate of success is considered low and most of the start-up/nascent entrepreneurs are failed to run business, most of them fails because they failed in setting strategic goals (Hechavarria, Renko, 2011). Meanwhile, Strategy plays an important role in a business' management process, as it helps a business to set a direction and to formulate the way they want to achieve their goals (Gibcus & Kemp, 2003). However, earlier research indicates that small and medium sized enterprises (SMEs) pay little attention to strategy formulation and strategy in general (Ireland, R., 2003). The lack of research effort concerning growth strategies in small businesses may be justified with a limited interest in Start-ups, even the definition of it is still ambiguous among its practitioner. The research will be focusing on of how growth strategies are developed by start-up businesses by answering the following problem :
(1) What is a strategy and growth strategy in a Start-up company?
(2) Under What Condition does Start-up Emerge Strategy?
(3) What is the direction and underlying logic of the growth strategies of start up?
(4) What are the Challenges over Start ups in each Phase of Start up?

In order to do that, we would like have insight of company practice from you, an owner/manager of a company that most fit the Unit analysis of this research according to Blank-Marmer Phase and Startup Genome Typology. Some of the question below will be asked to you in forms of interview session that will be held by our researcher.

We would like to hand you final analysis of this research to each company that help this research by getting interviewed and fulfilling some questions in this forms in advance.

We would like to thank you in advance for spend your time in this research.

Best Regards
Senna Gumilar

General Question
Company Name *
Month and The Year The Firms Start *
Startup Typology
<u>Performance</u>
Performance often categorize start-up phase and typology. Company Performance in the Last three years will gave insight about the company outlook, and will shorten the time it needed for interview session. Please do fill in the blanks answer to every question in following format:
2015: ...
2014: ...
2013: ...

1. Average Sales of the company
2. Average Sales Growth per months
3. Number of the Employees
4. Average Growth of User/Customer per month
5. Is the startup receive any financing/funding from external sources?
   <u>Business Profile of Start-up</u>
   Information needed such as Product/Service, Forms, Consumer/User, Legal Aspect and External Sources; you are free to answer those question
1. What is the form of legal aspect of your company
2. Who is your Consumer/Customer/ User? Is there any specific market you target?
3. What is Product/Service you offered to your customer?
4. Could you describe Product/Service you offered to your User?
5. Do you have supplier or external service to support your business? Could you describe it?
6. Would you describe this business as:
   1. An independent start-up, created by an individual or team working on their own;
   2. A purchase or takeover of an existing business;
   3. A franchise or multi-level marketing initiative;
   4. A start-up sponsored by an existing business;
   5. Something else. How would you describe the location where this new business is being developed?
   Other :

<u>Team Capability</u>
Team plays important rule to succeed of business. Commitment, skill and attitude towards growth is an important factors to start-up achievement
1. In the last 3 months, how many average hours your worker spent their time working per week?
2. For teams that in-touch in technical and operational problems, how many years they had experience in their field?
3. For teams that in-touch in Business and Strategic matters, how many business they did help so far?
   Strategic View
1. Could you describe what is your view towards strategy?

2. According to you, would you rank from 1(the most) to 8 (the least) your main competitive advantage over your rival/ ather business? *
   Mark only one oval per row.
   1 Regulation Advantages
   2 Techlogy
   3 Partnership/Supplier
   4 Strong Infromation
   5 Sources
   6 User Engagement
   7 Barriers to Entry
   8 Substitutes Product
   Competition

1. Does your company make use of the strategies?
2. Do you hold meetings to discuss strategic issue?
3. Do you write down plan and had a written plan as a guide?
4. Do you set objectives and review the realization?
5. Do You Review Strategies vs Objectives
6. What is your main challenges in order to keep operational and grow? And why?
   Check all that apply.
   Acquiring More User/Customer
   Maintain service/production level to meet the needs
   Creating Product/market fit or Problem/Solution Fit
   Building a solid group of team
   Getting More Capital
   Other:
7. How Flexible are your strategies?
   Strategic Experience
   Did the following things occurred in your firms?
8. Regarding to Customer...
   Check all that apply.
   Spending too much on customer acquisition before product/ market fit and a repeatable scalable business model
   Overcompensating missing product/market fit with marketing and press
   Other:
9. Regarding to building your Product
   Check all that apply.
   Building a product without problem/solution fit
   Investing into scalability of the product before product/market fit
   Adding "nice to have" features
   Other:
10. Regarding to building Internal Team
    Check all that apply.
    Hiring too many people too early
    Hiring specialists before they are critical: CFO's, Customer Service Reps, Database specialists, etc.
    Hiring managers (VPs, product managers, etc.) instead of doers
    Having more than 1 level of hierarch
    Other:
11. Regarding getting Financials for grow
    Check all that apply.

Raising too little money to get thru the valley of death

Raising too much money. It isn't necessarily bad, but usually makes entrepreneurs undisciplined and gives them the freedom to prematurely scale other dimensions

Other:

StartUp Typology

This section is aimed to categorized the firms you work on. it is based on BlankMarmer and Startup Genome's Internet Startup Typology

1. What is the name of this new business – what do you call it when you talk about it?
2. Why do you expect this new business to be successful? *
3. If you were t starting this business, what would you be doing with your time and money?
4. Have you taken any classes or workshops on starting a business?

Factors That Trigger Strategy A Start Up

This is some questions that will be asked to you as our resource person in our scheduled interview.

Entrepreneurial Orientation

1. To what extent can the firm be described as having an entrepreneurial orientation? That is, its proclivity for risky projects, emphasis on invation, and tendency to introduce products before competitors.
2. In your opinion, does the entrepreneurial orientation of the firm affect its growth strategies? If , how?

Owner Manager Growth Orientation

3. What is the main goal of the ownermanager with the firm? For instance, focus on survival of the firm, maintenance of lifestyle or achieve growth.
4. What is the attitude of the manager toward growth?
5. In your opinion, does the manager's attitude toward growth affect the firm's growth strategies? If , how?

Firm Resources

6. Do you believe the firm has the adequate internal resources to grow? Such as human capital, intraorganizational networks
7. Do you believe the firm has the adequate external resources to grow? Such as financial capital, inter-organizational networks
8. In your opinion, do internal and external resources affect the growth strategies of the firm? If , how?

Environment

9. How can you characterize the environment of the firm in your particular industry, market or location? For instance, dynamic: instability and continuously changing, hostile: high rivalry or decreased demand of the firm's products, heterogeneous: different market segments with varied characteristics and needs or stabile
10. In your opinion, does this environment affect the growth strategies of the firm? If, how?

Challenges and Strategy

Growth Strategies

11. In your opinion, how can the firm achieve growth?
12. Can you describe the growth strategies employed by the firm?
13. How does the company go about developing new products?
14. How does the company go about expanding its markets?

INCREASING THE QUALITY OF TUNA TO FULFILL JAPAN EXPORT MARKET PREFERENCES

Syafruddin Chan, Syiah Kuala University, Indonesia
Mirza Tabrani, Syiah Kuala University, Indonesia
Fauziah Aida Fitri, Syiah Kuala University, Indonesia

Abstract

In Aceh, Tuna is one of marine products commodity that has high economic value. Tuna is catched by fishermen then sold either to Toke Banku (dealer), which is part of the of marketing intermediary chain, before they sold to the wholesalers. Ulee Lheu is one of the port where Tuna fishermen landing its boat. But unfortunately economic value of Tuna has not been utilized properly so there was some economic value that loss beciase the fishermen did not do proper handling of Tuna after they are being caught. Through the program of economic livelihood done by the university of syiah kuala, the fishermen have been trained so they are now able to do tuna handling better and get beeter quality of Tuna. By having good quality of tuna, they also get better price and consequently get better income.

Keywords : *Tuna , Distribution Channel , Product Export , Export Markets , Value Chain, Better Price, Better Income, Fishermen.*

Introduction

Background

In Aceh, Tuna is one commodity of marine products that have high economic value. Tuna is fished by fishermen then it sold to either to Toke Bangku, which is part of the chain of intermediaries marketing, or directly to whole sellers. In Banda Aceh, there are some fishing port where tuna fishermen can landed their boats. Ulee Lheu is one of them. Ulee Lheu fishing port is not the biggest in Banda Aceh, but in term of Tuna, Ulelheu could be said as an important fishing port compare to other fishing port such as Lampulo located 5 km North of Ule Lheu.

Currently not less than 10 tones of tuna per day landed in Ulee Lheu fishing port, produced by dozens of Boat Bak (7-8GT) and Boat Tep Tep (1-2GT) (Nagata, 2014). If the average Tuna weight is 60 kg, then there are more than 166 tuna landed in this fishery port. With a selling price to Toke Bangku at an average of Rp 40,000 / kg, then the economic value generated is Rp 400 million per day, or Rp 12 billion in a month. Although this number is an optimistic estimate, but a market capitalization level of tuna business in Ulee Lheu can not be underestimated. Moreover, if the calculations performed referring to the price set or obtained by exporters of Fresh Tuna, then the economic value even bigger. Fortunately most of tuna landed in this post have lower grade: B or C. While Japan as one of the biigest market for Tuna only accept Grade A Tuna

According Junianto (2007), the characteristics grade A Tuna are:
 • The color of the meat for yellow fin tuna was fresh red as blood, and for the big eye tuna is dark red like a rose, and there was no rainbow
 • The Eye are clean, bright, and stand out - normal skin, the color is clean and bright
 • The texture of the meat for yellow fin Tuna hard, chewy and elastic and for big eye tuna is soft, supple and elastic fish condition (appearance) was nice and intact.

However, this condition could not not be achieved by the fishermen in Ulee Lheu. Most fish they bring ashore usdually in Grade B or C.

Because the quality of Tuna is low, then the selling price received by the provider Tuna in Aceh including fisherman, intermediaries (Toke Bangku) and Exporter Tuna is also low. This means that there are a number of economic value is lost simply because of the ignorance of the

fishermen in treating Tuna well in order to maintain quality of Tuna to stay in Grade A. Why Japan is selected as the market Tuna? Because Japan is the biggest tuna consuming country other than European countries and the United States (Mahmud, 2014).

This activity is supported by the theory of Marketing by Kotler (2007), especially in the subject of Product management. In designing this activities to improve the quality of products, the author also uses the theory of supply chain stated by Michael E Porter (2007) in his book Competitive Strategy

Formulation of the problem

One of the problem to market fresh fish is margin. Marketing margin represents the difference between the final consumer price and the price of product sold by the fishermen. he detailed formulation of the problem is as follows
1. What kind of marketing channels of tuna exist in Banda Aceh and its surrounding area?
2. What factors that influence the margin of fresh tuna?
3. Marketing channels fresh tuna are most efficient in Banda Aceh?

Research purposes

The purpose of this study are:
1. To identify the marketing channels of fresh Tuna in Banda Aceh.
2. To determine the factors that influence the margin of fresh tuna in Banda Aceh.
3. To determine the most efficient marketing channels of fresh tuna

Literature review

Japan Market Overview

The most consuming countries of tuna in the world today apart from the United States and EU is Japan.

Tuna market opportunities in Japan, generally in the form of fresh and frozen products. Japanese tuna market today tend to be decreased from 751.293 tones (2008) to 702.450 tons (2012). This is due to a decrease in the level of fish consumption as a result of the composition of the Japanese population is dominated by adult and elderly (inverted pyramid) as indicated by the level of food intake began to decline. However, Japan is still the world's largest importer of tuna.

Currently, Japan is developing the concept of eco-label in marketing their products. It is very possible to succeed, because apart from being a manufacturer of tuna, Japanese as well as the main market destination, so it has a strong influence in determining the market (market driven).

One of the issues of market access at discussion at the conference labeling and eco-certification is a requirement of the market (market driven). Ecolabel on tuna products is a recognition in conducting fishing practices and good production on an industrial tuna, as well as being one of the market requirements that must be met (Machmud 2014)

Tuna Fish Production in Indonesia.

Tuna is an economically important fish species in Indonesia. Indonesia tuna fish distribution area covers from the Banda Sea, Maluku, Flores Sea, Celebes Sea, Indian Ocean, Halmahera Sea, the waters of the to the Arafura Sea. Volume production of tuna, including skipjack tends to increase every year, where in 2010 and 2011 respectively reached 910.506 tonnes and 974.011 tones.

Distribution Marketing

According to Keegan (2003) Distribution Channel is a channel used by the manufacturer to deliver the goods from producer to consumer or industrial user. Marketing terms according to Keegan (2003), synonymous with business administration or distribution, which is a kind of economic activity that carries or deliver goods from producers to consumers. Marketing is an important link in fishery activities. Marketing efforts can play a role in price formation and absorption of production. Marketing of fishery products according to A.M Hanafi and A.M Saefuddin (1983) have the following characteristics:

1. Fishery products largely absorbed by the final consumer steadily throughout the year, while its bid depends on the production affected by the climate.
2. In general, traders give credit (advanced payment) to producers (fishermen) as collateral in order to obtain the largest share of the fishery.
3. Channel marketing of fishery products generally consist of fishermen, middlemen as collectors, wholesalers (wholesaler), retailers and consumers (industrial processing and end consumers).
4. The movement of fishery products from producers to consumers in general includes the processes of collecting, counterbalancing and deployment, where the collection process is paramount.
5. The most important aspect in the marketing of fishery products traders lies in the area of production that is scattered, small-scale production and seasonally

The smoothness of fish marketing is because of the intermediaries. Fishermenare hardly to sell their fish by themselves. They always use intermediaries to market the product. In Aceh intermediaries in fish marketing called Toke Bangku.

Research Model

Research Model
   This research uses the model as follows:

Figure-2

Research methods

Scope of the Study
   This study used a survey technique. Data was collected from respondent in the same period through interviews by using questionnaires (Surakhmad, 2004). In this study the unit analysis is the fishermen and middlemen. This research was conducted at the Fishing Port of Ulee Lheue, home of the largest population of Tuna fishermen in Banda Aceh.

Types and Sources of Data
   The data used in this study consisted of primary data and secondary data. The primary data obtained from interviews with fishermen and middlemen. To facilitate exercising the interview provided a list of questions to obtain uniformity questions.
   Secondary data were obtained from the agency or institution that has to do with research, among others: the Central Bureau of Statistics of Banda Aceh, the Fisheries and Marine Banda Aceh, Indonesian Fishermen Association of Aceh, PT Nagata Tuna Prima Aceh and ADB TA 8224 program for the improvement of Quality of Tuna in Ulee Lheue

Sampling Methods
   To determine the sample area for the selected districts used cluster random sampling method. In this study the sample area for the selected districts is Ulee Lheue fishing port, with consideration that this port has the largest number of tuna fishermen.
   The respondents consist of 24 fishermen that regularly catch Tuna, both fishermen of Boat Bak and Boat Tep Tep. While sampling of intermediaries were Toke Bangku and Whole Seller.

Discussion
   The activities to improve the performance of the fishermen in handling tuna at Ulee Lheu fishing port started from training activities to teach the fishermen how to handle Tuna well when it was caught. Training activities were divided into two sessions: in class training conducted through face-to-face with the instructor who were Tuna care practitioners. The session was done by using workshops included the practice of doing GG. The second session was practice at sea. The instructors come to sea with the fishermen, when the Tuna successfully captured and landed on the boat, then the hand on session training began over the boat, to maintain the quality of tuna always fresh upon arrival on land.
   With the increasing quality of tuna produced, PT Prima Nagata as collectors and processing of Tuna is also willing to buy at higher prices. The impact is to the increasing of fishermen income.
   Because the training was done not merely maintain the quality of Tuna to remain good, but fishing is also equipped with some basic knowledge about technology such as to see the

coordinates of the location so that it can marked the fishing area more clearly. At the same time they have also been given the understanding of the use of weather application to see the weather forecast, so that they are spared from the storm at the sea.

With a variety approaches, not only the quality of the Tuna increased but also increase the amount of tuna caught.

The following table presents the benefit of fishermen who are members of the community service activities to improve the quality of Tuna.

Table IV-1:CAPITAL

No	INCREASING RANGE	FREQ	PERCENT
1	300.000-400.000	3	13%
2	400.001-500.000	20	83%
3	500.001-600.000	0	0%
4	600.001-700.000	1	4%
	TOTAL	24	100%

The average capital owned by fishermen increased from Rp 300,000 to Rp 400,000 per person. The highest increased was in a range between Rp 400.000 to Rp 500,000 – that was recorded by 83%.

Table IV-2: SALES

No	INCREASING RANGE	FREQ	PERCENT
1	500.000-1.000.000	20	83%
2	1.000.001-1.500.000	2	8%
3	1.500.001-2.000.000	2	8%
	TOTAL	24	100%

In addition to capital, sales turnover Tuna fishermen after joining this program were also increased from Rp 500,000 to Rp 2,000,000 per person per month.

The largest increase was in the range of Rp 500,000, to Rp 1.000.000, - that is 83%. In other words 83% of the fishermen who joint this program experience the increasing of sales turnover between Rp 500,000 to Rp 1,000,000, - per person per month.

Table IV-3: TUNA CAUGHT

No	INCREASING RANGE	FREQ	PERCENT
1	10-20	15	63%
2	21-30	6	25%
3	31-40	1	4%
4	41-50	2	8%
	TOTAL	24	100%

In line with the increasing of fishermen sales turnover, so the catch is also increasing, because fishermen have been equipped with the technical knowledge associated with the use of GPS readings and weather applications such as Accu weather. Added the catch was between 10

and 50 fish of tuna per month. The increase in catches occurred in a range between 10-20 per month is equal to 63%.

TABEL IV-4: NET INCOME

No	INCREASING RANGE	FREQ	PERCENT
1	<=250.000	14	58%
2	250.001-500.000	5	21%
3	500.001-750.000	1	4%
4	750.001-1.000.000	3	13%
5	1.000.001-1.250.000	1	4%
	TOTAL	24	100%

Ultimate goal of these activities actually was to increase fishermen's income. With the increase of the income of fishermen means the objective of the community services conducted in that area is said to be successful. The fact was an increase in income between Rp 250,000 up to 1,250.000 per month. While additional revenue was in the range of Rp less than 250,000. Indeed, the increase was not large enough. But at least there is extra revenue to show gain by fishermen. It is showed visible results that the activities of economic empowerment that starts from downstream up to the marketing as a model of community empowerment that has a higher probability to succeed.

The intervention of the program to also include PT. Nagata Prima Tuna as a buyer was really help full to convince fisherman to produce high quality tuna since they will also get higher price as a consequences.

The use of additional income

Some expenses that are commonly used by fishermen when they get additional revenue are to finance a child's education, increase business capital or pay off their debts. This study also looked at for consumption pattern when they get extra revenue gained from improving the quality of tuna they produced. As for the question that asked to them can be seen in the following table:

TABLE IV-5
THE USE OF ADDITIONAL INCOME

NO	QUESTIONS	YES	NO	% YES	% NO
1	Finance the children's education?	19	5	16%	4%
2	Adding venture capital?	3	21	3%	17%
3	Creating a new business?	0	24	0%	19%
4	Buy food for your family?	24	0	21%	0%
5	Buy clothes or other household items?	22	2	19%	2%
6	Give / lend money to your spouse or someone else?	21	3	18%	2%
7	Keeping them in case there will be unexpected needs?	15	9	13%	7%
8	Paying other debts?	9	15	8%	12%
9	Repair or buy a house or land?	1	23	1%	19%
10	Finance the celebrations (eg weddings, circumcision, etc.)?	2	22	2%	18%
	TOTAL	116	124	100%	100%

From the table above shows that the increasing income they get mostly earmarked as additional funds to buy better food (21%). In the second place additional allocations earmarked income to buy better clothes (19%).

From this fact we can conclude that the fishermen who were respondent of this study were still relatively lacking basic needs of both clothing and food. So the extra income they have, not been spent on luxury goods but on primary needs such as food and clothing.

Conclusion

1. Community service program performed in Ulee Lheu fishing port been able to help improve the welfare of fishermen, in the form of an increase in sales turnover, the catch and also revenue
2. The majority of the additional income generated from the program has been spent to fulfill basic needs such as food and cloths.

EMPOWERING OF SMALL, MICRO ANDCOOPERATIVES BUSINESSENTERPRISE (SMCES) ONBASE AGRIBUSINESS TO FACE ASEAN MARKET: SURVEY AT SMCES CENTRAL OF ACEH, INDONESIA

Ishak Hasan, Syiah Kuala University, Indonesia

Abstract

This study aim to analyze the Empowering of Small, Micro and Cooperatives Business Enterprise(SMCEs) on the base Agribusiness in Facing Asean Economic Community (AEC). Population in research is all SMCEs under develop on Board of Cooperative, Industry and Commerceof three   areas,   North-East, Central, and South-West Acehbeing based on Agribusiness. Sample was done of the trained and developed about management of is effort; administration, accountancy, marketing and exploiting of various facility of is inclusive of information technology that is as much 60 SMCEs.Analyze conducted by regression of variable supporting power of SMCEs. The study result show that variables identified in model to progress of effort SMCEs equal to 0,66%. While if seen from level of influence relative minimize, that is only equal to 0,44%. Its Small cause is the influence possibility of progress variables of effort, with the indicator only mount the advantage and satisfaction in trying to represent the small shares from progress variables of is effort very macro. But that way result of this study represent the step of early good in comprehending by real is condition faced by SMCEs in Aceh. To be obtained by a more result utilize the importance of planning and better future policy needed by research coverage of inclusive of indicator amount as well as amount of sample of larger ones again. Other cause of this research possibility not make classified of stratified random sampling. Because in the fact of SMCEs are differed. The difference of the aspect; (a) scale of business, (b) market share, (c) capital, (d) labor force, and the others. The results of test showed that the level of tolerance significantly by 10% then the variables that affect PE (Progress of Enterprises) are VAR00006 / CTE (Completeness Technology of Enterprises) and VAR00012 / CBA (Condition of Business Administration), and there are 13 other variables were not significant the progress of the business.
Keywords: *SMCEs Agrobusiness, AEC*

Introduction

Small businesses, micro and Cooperative (SMECs) is often used as a sector of economic power which gives support and contribution to public life in many countries. Many facts in many countries that cooperatives, small and micro enterprises have saved the life of the local economy a weak one, and marginalized groups are frozen out of the market competition. Not a few of the executive and the legislature to make SMECs as an important instrument in realizing the kinds of government programs in the field of economic and social welfare, in particular through the empowerment of the economic sectors in the community, such as agribusiness. But on the other hand portrait SMECs unstable, marginal and vulnerable to the onslaught of powerful financiers, it is often overlooked. SMECs often received unfair treatment in many respects compared with large corporations, both state and other private corporations. In fact, much evidence supports the idea that SMECs able to survive in difficult economic conditions.

The data are available on the Department of Cooperatives, Industry and Trade (Diskopindag) Central of Aceh district by March 1st, 2013 shows the number of cooperatives in various kinds reached 376 units, comprised of 182 active and 194 inactive units. The number of inactive this is generally a result of the negative impact of the conflict. While the micro, small

and medium enterprises under the guidance Department of Cooperatives, Industry and Trade Central of Aceh reached 1521 units. Micro, small and medium enterprises are engaged in various fields of business, covering; small industries, handicrafts and trade. Industrial enterprises, handicraft and the trade based on agricultural commodities produced by local people.

In the reality on the ground a lot of SMECs are less able to grow well in spite of its potential is relatively large, especially in the agricultural sector. This is due to many factors that influence the development of theSMECs, therefore, considered to be very important study and understand the problems faced and thus in turn is expected to provide an appropriate solution in developing SMECs in Central of Aceh in particular, and SMECs nationally, and regionally in general.

In addition to the above conditions in Aceh today SMECs soon faced a new era that is facing an economic and free trade area between ASEAN countries and China, known as ACFTA (Asia-China Free Trade Agreement). Based on that in addressing this condition SMECs anywhere including in Aceh require attention was more serious in order to organize further about their performance in the face of this global issue. Otherwise SMECs would lose in global competition, which grew rapidly in the future.

This study aims to: (1) Analyze the factors supporting and hindering business development SMECs Central of Aceh in facing the ASEAN market, (2) Generate SMECs Central of Aceh empowerment strategy in the face of competition.

Literature review

SMECs often characterized by: (1) The structure of simple business, (2) Often without the use of staff, usually the owner serves as the staff, (3) The division of labor is less clear, (4) Having a managerial hierarchy is relatively short, (5) Activities business was relatively less formal, less perform management functions, (6) Less distinguish personal assets from the company's assets, (7) registration of simple financial, some even do not make a recording. There are several reasons why SMECs survive in times of economic crisis: (1) Most SMECs producing consumer goods and services with the income elasticity of demand is low, then the level of the average income of people do not have much effect on the demand for the goods produced. The opposite is also the level of income will not affect the demand, (2) Most SMECs not get capital from banks. Because of the deterioration of the value of money is not dragging SMECs in bankruptcy business, (3) the relative SMECs very dynamic in production and are not bound by a fixed product. SMECs is relatively without any obstacles out into the market. So that they can be continue to survive in the markets.

Quite a lot of facts on the ground convince us how SMECs have a lot to save the rabble of a constellation of a bad economy, greedy, and oppressive. Because that's the reason for E.F. Schumacher author of the book "Small is Beautiful" which has been translated under the title "Small is Beautiful" (1978) believes that "small businesses will increasingly contribute to a strong future for the prosperity of a nation". Likewise, the forecast futurologist John Naisbitt (1999), he believes that the future of the global economy is in the hands of small business, autonomous, yet solid technology. What was predicted by both experts in the above proved to be of small businesses have contributed stabilize the economy of a country, especially when many countries buffeted by a severe economic crisis. There are still many other views of various groups with a similar tone that small and medium enterprises and cooperatives often becomes a symbol of rescue institutions against economic marginalization of the people, little people who are oppressed and bounced out of competition. Especially for institutional cooperation, Endress in Munkner (2000) illustrates that the cooperative also plays a role similar to the rescue of the oppressed economically, "the agency proved to be able to help the farmers, artisans and small traders survive and strive in difficult times, which is caused by the reforms, agriculture, industry

and liberal economic policy. Cooperatives become an appropriate alternative, not only in times of scarcity, but also in the all-round prosperous future".

On the other hand, although admittedly, in reality SMECs considered relatively immune to survive and face the crises, there is no doubt there are also some small businesses are also caught in a difficult economic situation. As a result of the impact of a prolonged crisis, rising fuel prices and other energy, rigid government regulations, causing many small business units were forced out of business. But it will not be easy dampen our courage even heighten our spirit to be able to give full support to a healthy business climate for the development of SMECs amidst global competition. As the opening of the market with ASEAN. By strengthening SMECs in various aspects, both aspects of business management and is expected to survive in any condition as part of economic actors in a market increasingly competitive and cooperative.

Research methods

This study used survey method, which takes a sample of part of the population to represent the population as a representative (Masri Singarimbun and Sofian Effendi, 1995). The target population in this study are all SMECs which is the responsibility of coachingthe Department of Cooperatives, Industry and Trade in Central of Aceh district. Keeping in population SMECs the relatively large reach 376 cooperative units and 1521 units of SMECs, and of the number of SMECs are some who are not active and the types of businesses that are very diverse, this research has only sampled SMECs is still active and has received coaching by the Department of Cooperatives, Industry and Trade on the period July 2013 is 80 units. Although it acknowledged the type and scale of business of each SMECs are different from one another, but in terms of criteria, typical, and the problems encountered in the field are relatively the same. The coaching has been done include; management training, institutional, entrepreneurial, accounting, and information technology ofSMECs.

The data collection is done by direct observation in the field in a participatory manner. It also created guidelines for interviews with key informants, such as with the leadership in the Department of Cooperatives, Industry and Trade in charge SMECs and business leaders from SMECs studied. The data collection took place in July 2014. The data were analyzed qualitatively and quantitatively. Quantitatively used regression model as follows:

$$PE = a + \beta_1 AIM + \beta_2 SG + \beta_3 CB + \beta_4 CT + \beta_5 SL + \beta_6 CTB + \beta_7 TFI + \beta_8 CAI + \beta_9 BR + \beta_{10} CP + \beta_{11} C + \beta_{12} CBA + \beta_{13} BW + \beta_{14} BV + e$$

Informations:
AIM = Ability of Individual Managing Business (X1)
SG = Supporting of Government (X2)
CB = Competition of Business (X3)
CT = Customer Trust (X4)
SL = Strategic of Location (X5)
CTB = Completeness Technology Business (X6)
TFI = Trust of Financial Institutions (X7)
CAI = Application of AbilityInformation Technology of Business (X8)
BR = Business Relations (X9)
CP = Cost of Production (X10)
C = Capital (X11)
CBA = Conditions of Business Administration (X12)
QW = Quantity Workers (X13)
BV = Business Volume (X14)
PE = Progress of Business (Y)

The research variables, indicators and measurement can be seen in the matrix below:

Table No. 1.1 Variable Matrix Research

No.	Variable	Indicator	Measurement
1	AIM = Ability of Individual Managing Business (X1)	The individual's ability to lead / manage a business	(5) Very Capable (4) Able (3) Average (2) Underprivileged (1) Not Able
2	SG= Supporting of Government (X2)	The intensity of the government guidance for SMECs	(5) Very Often (4) Often (3) Average (2) Less (1) Very Less
3	CB = Competition of Business (X3)	The conditions of competition (many similar businesses)	(5) Very Much (4) Many (3) Average (2) Less (1) Very Less
4	CT = Customer Trust (X4)	The conditions of customer confidence levels on SMECs	(5) Very Strong (4) Strong (3) Average (2) Less (1) Very Less
5	SL = Strategic of Location (X5)	The conditions of business strategic location both in terms of consumer reach and access to production inputs	(5) Very Strategic (4) Strategic (3) Average (2) Less Strategic (1) Not Strategic
6	CTB = Completeness Technology Business (X6)	The conditions of production equipment (technology) owned in trying	(5) Very Complete (4) Complete (3) Average (2) Deficient (1) Not Complete
7	TFI = Trust of Financial Institutions (X7)	The condition of confidence in financial institutions (banks, donors, etc.) of the business carried	(5) Very Strong (4) Strong (3) Average (2) Less (1) Very Less
8	CAI = Application of Ability Information Technology of Business (X8)	The ability of technology companies in applying existing businesses	(5) Very Capable (4) Able (3) Average (2) Underprivileged

			(1) Not Able
9	BR = Business Relations (X9)	Ability to establish a business relationship (partnership) with other enterprises (in marketing, financing, procurement of inputs, etc.)	(5) Very Strong (4) Strong (3) Average (2) Less (1) Very Less
10	CP = Cost of Production (X10)	The conditions production costs borne by companies in production in comparison with the cost of production outside of the Central of Aceh	(5) Very High (4) High (3) Average (2) Low (1) Very Low
11	C = Capital (X11)	The conditions ability of capital companies today	(5) Very Strong (4) Strong (3) Average (2) Less (1) Very Less
12	CBA = Conditions of Business Administration (X12)	The condition of administration of the company nowadays	(5) Very Good (4) Good (3) Average (2) Less Good (1) Not Good
13	QW = Quantity Workers (X13)	The conditions of use of manpower in running business activities	(5) Very Supports (4) Supports (3) Average (2) Less Support (1) Not Support
14	BV = Business Volume (X14)	The conditions volume of business generated by companies nowadays	(5) Very Large (4) Large (3) Average (2) Small (1) Very Small
15	PE = Progress of Business (Y)	The conditions advances in benefit and satisfaction in business	(5) Very High (4) High (3) Average (2) Low (1) Very Low

Result and discussion

Central of Aceh district is rich in various natural resources, particularly agricultural and forestry resources and supported by most of the territory that the cool air has made it as one of the center area of coffee production and horticulture are important in Aceh. The potential of the rich natural resources has become a major business base and the potential for SMECs. These resources include plantations, agricultural crops, livestock, processing results of the plantation and agriculture, as well as the marketing of agricultural products.

Based on the report of Department of Cooperatives, Industry and Trade of Central of Aceh by March 31st, 2013 amounted to 367 units the number of cooperatives. Of these active are as much as 171. Cooperative inactive are generally stuck with funds Farmer Business Credit (KUT) and the fuel compensation amounting to Rp.35 billion which has not been able to be repaid to the donors. Another problem facing cooperatives is due to the low quality of management, as well as member participation is also low. As a result of cooperative business activities is running in place there that has not run the business again.

The result of the calculation using the regression formula shows that the relationship between the variables identified in the model of the business progress SMECs in Central of Aceh district with the indicator is the achievement of progress in obtaining benefits and satisfaction in business is not too strong only by 0.66%. Meanwhile, when seen from the magnitude of the effect is relatively small, at only 0.44%. Thus there are many other variables that affect the business progress SMECs in Central of Aceh. Because the variable progress of the business is very macro variables. It also estimated the size of the samples taken are only 80 units that are in accordance with the predetermined criteria of the hundreds of units SMECs in Central of Aceh can be a cause of small effect of these variables. Therefore, in the interests of future planning and policy better is needed expansion of the scope of research with larger samples, in order to know more clearly about the dominant factors affecting the business progress SMECs in Central of Aceh.

By understanding the possibility of the dominant factors that influence of the factors exist, then the following steps can be found much more appropriate solutions in the empowerment of SMECs in Central of Aceh district. Another cause is that the study also did not classify the samples by strata.Even thoughin reality, the SMECs is relatively different from each other. Such differences include aspects; (A) the scale of business, (b) the extent of marketing, (c) the power of capital, (d) the number of workers employed, and many others if you want to stratify. The small sample is taken due to the limited funds available for research on the larger samples. Likewise SMECs limitations in meeting the desired criteria are also still limited to SMECs who has followed guidance from the government of a few things. Whereas it is most SMECs in Central of Aceh is still very limited receiving guidance from the government. As a result, the determined sample less representative and is also relatively limited.

Further details of the results of regression to the above variables can be traced to the regression output below.

Table: The Results of Regression Calculation

Model Summary

a. Dependent Variable: VAR00015

The results of test showed that the level of tolerance significantly by 10% then the variables that affect PE (Progress of Enterprises) are VAR00006 / CTE (Completeness Technology of Enterprises) and VAR00012 / CBA (Condition of Business Administration), and there are 13 other variables were not significant the progress of the business.

Empowerment Strategy

Based on the results of field research in 80 units SMECs in Central of Aceh can be given some recommendations as an empowerment strategy. The strategy includes: (1) Improvement Performance Management and Institutional, (2) ImprovedBusiness Performance, (3) Strengtheningthe Partnership, (4) Strengthening the Access to Information and Production Technology, (5) Strengthening Network Marketing, (6) Assistance Capital, (7) Mentoring Program, and (8) Strengthening competitiveness by studying each change and global consumer taste, especially looking at the strategy launched by competitors other ASEAN countries including China who are members of the ACFTA.

1. Improved Performance and Institutional Management

In connection with the management and institutional performance improvement in the near future need to do the continuous training in the field of management information systems based on information technology. Likewise, more in-depth training on the basic tasks and management functions ranging from mid-level to the top, especially medium-sized enterprises and cooperatives. Especially in the areas of planning, financing and supervision.
Ability of management to make the right business planning will help SMECs to achieve the expected level of progress. With reference to the plan that has been outlined it will be able to understand the target achievement of the activities performed. Theplanning have to assessed through monitoring of what has been realized or which ones have not.
In addition to performance-related management also needs to be improved the quality of institutions, for example in the case of institutional business licensing in order to have a solid legal foundation in their daily activities. Similarly, in terms of self-image agencies, such patents from SMECs, however little it may be very useful for SMECs in the midst of a very strong competition. Imaging company through branding (trademark) is very important in order to have

a place in public memory. Strong branding in the minds of consumers is a very valuable asset for the company's progress. The actually is many products SMECs in Central of Aceh who need to get proper legal protection from the government. But until now there is still very limited obtain such protection. So that the products ofSMECs routinely ignored, while they do have advantages if get serious attention, both from the business community and from the government itself.

2. ImprovedBusiness Performance

Central of Aceh government needs to continuously provide knowledge and expertise in advancing theoretical and technical effort. Internally the company, SMECsin Central of Aceh is still need to improve efficiency in the attempt. The efficiency include; (A) Low-cost strategy, and (b) Utilizing human resources with knowledge and expertise in the field.

In addition, strong efforts are needed from SMECs with the administration and accounting in accordance with the provisions of Accounting Standard Indonesia (SAI). Indicators of business as business volume, profit margins, liquidity, Return on Investment (ROI) and other financial indicators going to be understood in depth by the SMECs. Because by understanding these indicators management has a strong effort in the achievement.

3. Strengthening theBusiness Relations

The business relations also a factor that needs special attention especially in an increasingly competitive world. TheSMECs will be able to exist if an intense relationship with various circles. The partnerships can be done with similar businesses, financial institutions, government agencies, and other institutions that put a strong interest in the field of SMECs.
It is impossible to ignore the importance of partnerships with various parties at this time for SMECs. Because the business world is dynamic and competitive demands all parties to mutually advantageous cooperation in various fields. If the partnership ranging from downstream to upstream can be knitted then SMECs will get the benefits that must have as strength in various business activities in the future.

4. Strengthening Access to Information and Production Technology

The application of information technology and the production of appropriate technology would be very helpful in developing a business SMECs. Almost no longer possible today ifSMECs apart from both of the above. Because one of characteristics of the progressive and modern business nowadaysare characterized by ability to utilize existing technology to improve the productivity (Soekartawi, 1990). Further Cobia (1989) emphasized the importance of procurement in marketing information networks in order to reach a comprehensive marketing area. "Mastery of a strong information network supports businesses to develop properly, due to a variety of information in quick time and the right has a value that is very valuable in terms of production and marketing of their products". Even more than the production of information technology and provide its own power for SMECs in the transformation of local businesses that are becoming more global. Moreover, with the opening of free trade between Indonesia and other Asean countries and China is certainly strengthening access informationand production technology is crucial. Given the global and local customers require products that are more qualified.

5. Strengthening Network Marketing

Strong marketing network is very helpful SMECs in profit. Therefore we need a strong effort from SMECs to create a chain to the marketing of various circles. For example mastery transport networks, promotion agency, to the various layers of the consumer is very important. TheProducts ofSMECs need to get a room and a more easily accessible by consumers, for example by opening promotion centers at various strategic places, such as airports, shopping

centers, ports, terminals, tourist sites, and various other places are more easily accessible by consumers , The network can be done locally, nationally, and internationally. Especially for those who have a value SMECs reliable products for export purposes. Thus the level of the profits are also expected to be increased.

6. Supporting Funds

The adequate capital base to do business is needed, but the immediate need to do is facilitate them to able to deal with financial institutions, including microfinance institutions (MFIs). The capital aid in question can be done in two models; (A) providing capital that is able to turn the business from upstream to downstream, especially SMECs which has the potential to export market orientation, (b) providing capital only as a stimulus for business development. The both models can be operated in a more real in the field, and thus clearly known anywhere SMECs are included in that category in order to carry out policy is not misplaced.

7. Mentoring Program

Although the implementation of assistance programs in the field are often less satisfying results yet to SMECs still needed. Mentoring programs can be done by setting up personnel more appropriate and in accordance with the character of the local SMECs. Because if the Human Resources (HR) companion character is poorly understood by the public and also the character SMECs the assistance efforts often fail. In addition to mentoring programs in the form of assistance in terms of human resources are also other very necessary soft skills such as; facilitate comparative studies and others who are able to change the mindset and culture of effort toward more efficient.

8. Strengthening the Competitiveness

Strengthening the competitiveness is meant here is doing a careful arrangement of the imaging product (quality, branding, service, and price), and also a deep understanding of the global consumer tastes by observing the consumer behavior of each country. This can be done in producing various agro-based products, such as Gayo'scoffee that as long as it is well known in foreign countries. The Gayo'scoffee is marketed now only with one sense, but in the future can be better engineered with a rich flavor that global consumers can enjoy according to their taste. Similarly, other export commodities, such as horticultural products can better adjust to the conditions that exist in order SMECs engaged in agribusiness is more able to exist in the global competition that is already in sight.

Specifically about the cooperative development, Syahza (2010: 1) so that the cooperative can function properly, then the government needs to develop a supporting factor of regional economic development through cooperative development, namely: (1) The potential of the community, (2) Employers, (3) Institute of crediting, (4) Relevant agencies; and (5) Cooperative as a business entity.

Conclusions

In the face of intra-ASEAN competition today is expected SMECs again should further adjust its performance to better withstand and still be able to contribute for many people to meet various needs. Thelearningof the spirit of vitality SMECs during this despite the onslaught of the harsh global economic proven that many parties gave a high appreciation of the importance of developing a wider range SMECs effort to bridge the economic gaps that exist. This can be done as long as the government together with the wider community in developing SMECs synergy together.

SMECs development efforts should be done in an integrated and continuous in order SMECs can develop in line with expectations. There are still many SMECs in Indonesia,

including in Central of Aceh require special attention and touch in many aspects, so that their efforts have stalled in the middle of the road. The government needs to encourage continuous tireless order SMECs more independent in all respects, including the strengthening of management, financing and marketing. Considering there are still some SMECs is in need of protection from the government because of the scale of operations and marketing reach is still limited. With the development of the SMECs income levels will increase and thus will have positive implications for economic growth. Therefore, in promoting SMECs should be synergized with the other cross-cutting in order toobtain protection and force of law in carrying out activities. Otherwise it will be difficult to develop SMECs in the constellation of the business world is increasingly competing today.

Reflecting on the conditions and the potential SMECs in Central of Aceh should increasingly read an important opportunity to expand its business, for example, so far only focus production efforts on the local market, but now should be oriented to export markets (Asean regional market and China) and even other countries in world. It is not impossible given the magnitude of the potential possessed by the region. Moreover, nowadays Central of Aceh has become the center of production of some export commodities and also to local market needs in Aceh. Its strategic location as the gateway to the northern coast of Central of Aceh has made very favorable as the hinterland, a supplier of horticultural products needs to parts of Aceh, Indonesia, and also for the neighboring countries that are members of the ACFTA.

MAQASHID AL-SHARIAH INDEXAS A BASED OF ISLAMIC BANKING PERFORMANCE MEASUREMENT OF INDONESIA AND MALAYSIA

Evi Mutia, Syiah Kuala University, Indonesia
Riky Ramadhani, Syiah Kuala University, Indonesia
Rahmawaty, Syiah Kuala University, Indonesia

Abstract

A review of the Islamic Banking performance in Indonesia and Malaysia can be applied by using Maqashid al-Shariah Index approachment. This research is a descriptive quantitative type where eight Islamic Banks in Indonesia and nine Islamic Banks in Malaysia are the objects of this research because these Islamic Banks fulfil the criteria to be the research objects. The secondary data which are financial statements/annual reports were obtained from the official website of each banks. To conclude the result, this research used Maqashid al-Shariah Index approachment with SAW (The Simple Additive Weighting) method. The result showed that Islamic banking peformace in Indonesia is still under the peformance of Islamic Banking in Malaysia as much 1%. It showedthat Malaysia has better performance of its Islamic Banking compared to Indonesia Islamic Banking Performance.

Key words : *Islamic Banking, Maqashid al-Shariah Index, Performance, Simple Additive Weighting,*

Introduction

The interesting phenomenon today as alternative banking service is the presence of Islamic banks which have given new variation in the business world. Islamic banks have influenced the economic development of a country, especially in Indonesia and Malaysia, in provide the working capital or as a place to invest.

Generaly, the peformance of banking is measured by using financial ratios such as CAMELS *(Capital, Assets, Management, Earnings, Liquidity, Sensitivity of Market Risk),* including Islamic banks. According to Antonio et al., (2012), CAMELS are too weak in measuring the performance of Islamic banking. Thera are many reasons why CAMELS become weak. Among others are, first, financial ratios as the main determinant of the performance make managers will act in the short term and ignore the long-term plan. Second, ignoring the non-financial aspects and fixed assets will give an erroneous view of the manager in the present and the future. The last one is the financial performance which is based on past performance will unable to the company in organize the plan in the next period.

Islamic banking has many criterias that requires a measurement in terms of objectives of sharia.

Maqashid al-Shariah is one of performance measurement to assess the extent to which performance has been achieved, which should be in accordance with Islamic principles in its operations, especially the objective of Islamic banks itself. The objectives of Islamic banks are not only limited to the financial aspects, but also to other aspects such as social and environmental. Based on the Law of the Republic of Indonesia No. 21 of 2008 concerning about Islamic Banking, The objective of Islamic banks is to support the implementation of national development in order to improve justice, solidarity and equal welfare of the people".Bedoui and

Mansour (2013) stated that ethics is the view Islamic performance and it is not only about the financial dimension, but also about the additional dimension that makes the company has not oriented to the owners but widely, to all stakeholders and society as a whole. This is the main idea for performance based on the concept of Maqashid al-Shariah.

Many researches were conducted before. The result stated that the Islamic banking performance measurement can not only be measured by conventional measurement, but as an Islamic institution, Islamic banking can be measured in terms of Maqashid al-Shariah as well to see the extent of Islamic bank in carrying out the objectives of sharia well. Based on this phenomenon, the purpose of this study was to analyze the performance of Islamic banking based on Maqashid al-Shariah, a comparison between Indonesia and Malaysia.

This research will assess the performance of Islamic banking using Maqashid al-Shariah with The Simple Additive Weighting Method (SAW) and Maqashid al-Shariah Index (MSI) to describe the comparison of the performance of Islamic banking in Indonesia and Malaysia the year of 2012-2014. Both countries were selected as the object places because these countries consist of mostly Muslim. Moreover, among ASEAN members, Indonesia and Malaysia are countries that have the big numbers of Islamic banks.Based on the background, the problem in this research is howis the comparison of the performance of Islamic banking in Indonesia and Malaysia based on Maqashid al-Shariahindex.

Literature

The Principles of Islamic Banking

Islamic banks are commonly called Islamic banking or interest free banking, because the banking system in the operational implementation do not use the system of interest (riba), speculation (gambling), andthe uncertainty or vagueness(gharar) (Zainuddin, 2010:1).

The products of Islamic bank have their own specifications which conduct in form contract (aqad) and divided into two types of profit contract they are the contract sale and purchase agreement (Murabaha, Salam, and Istishna) and the contract of revenue sharing (Mudaraba, Musharaka, Ijarah and Ijarahmuntahiya bit Tamlik). The non profit Islamic banking contracts consist of tabarru contract for products of Qard, Qardhul hasan, Wakalah, Kafalah, and Rahn (Karim, 2006:97).

The principle of Islamic banking is stipulated in the Al-Quran and As-Sunnah whisch state the prohibition of usury, the division of risk, considering money as capital potential, a ban on speculative activities, the sanctity of contracts, and sharia-compliant activities. Thus, the principle of Islamic banking also refers to the principles of willing-to-willing (antaraddim minkum), no oppressing and oppressed party (la tazhlimuna wa la tuzhlamun), result-cost display (al kharaj bi al Dhaman), and benefit-risk shows (al ghunmu bi al ghurmi).

Islamic Banking Performance

The bank's performance is anachievements of the bank in its operations and also in the banks' financial condition of the given period in both aspects of fund raising and distributing. Performance indicates to the strengths and weaknesses of an Islamic bank.Maqashid al-Shariah Index now is a trending methods to measure the peformance of Islamic Banking. It consists of two words*maqashid* and *sharia*. Maqashid is the plural form of maqashad, the word means purpose. Maqashid al-Shariah framework can be an instrument to improve the capabilities and quality of community intellectual reform and reform of civilization (Elahi, 2010).

The term Maqashid al-Shariah of was popularized by Imam Syatibi. Syatibi explained that the ultimate goal of lawmakers is *tahqiq* (realizing the benefit) and the law has to maintain Maqashid al-Shariah. al-Raisuni in his study argued that maqashid of Syaitibi is

formed on two principles, enumeration of sharia by and as induction into basic products ijtihad in cases that have not been touched by nas and qiyas.The concept of Maslahah as the core of maqashid is the best alternative for the development of ijtihad methods. Al-Zuhaily also explained that the law was made in order to realize human maslahah. Based on the research of ushul fiqh, there are five principals to be maintained and realized. The five principles are to preserve religion, life, intellect, lineage, and property.

Qaradhawi had put forward views on how to give understanding about Maqashid al-Shariah. First, examine every illah in the text of the Qur'an and hadith. Second, examine and analyze the particular laws, then deduce the meaning of the ideal integration of particular laws. Meanwhile, to know more about Maqashid al-Shariah, Asyur mentioned at least three methods can be used:

TABLE I. Istiqra, reviewing all aspects of the law. This can be done in two ways. Reviewing and researching the illat of the law, so maqashid can be seen easily. Then, examine the arguments of the illat, until it is certain that the illat is the maqashad.

TABLE II. The dalalah of the Quranic arguments are clear and unequivocal. It must be Zahir.

TABLE III. The arguments of sunnah are mutawatir, both ma 'Nawi and' Amali.

Knowing and understanding Maqashid al-Shariah can be used as an aid in understanding the editorial Qur'an and Sunnah, helping to settle the argument of conflicting, and establishing a legal a case that the provisions of the law are not listed in Qur'an and Sunnah if using semantics assessment (Anshori, 2009). Maqashid is the nature of the concept as part of the texts that must be applied as in the direction of the Shari'a which is clear and real (Al-Ghazali in Hurayra, 2015).

Al-Ghazali utilized maqashid concept as the basis for some of the rules in Islam. Maqashid al-Shariah was developed based on three main factors; the education of individuals, the creation of justice, and the achievement of prosperity, in which three of these factors in accordance with Maqashid al-Shariah goal of achieving prosperity and avoid evil. In the books of Ushulul Fiqh by Zahrah, there are three goals or objectives of Islamic law are as follows:

1. Educate individuals (Tahdhib al-Fard)
   Educate individuals could be a source of good for associations and not for the worse for the society. Educating people is a worship that is prescribed by Islam. It is intended to cleanse the soul and strengthen social solidarity. This service can cleanse the soul from impurities (disease) malice that inherent in the human heart. Thus, it will create an atmosphere of mutual love, not mutual unjust and cruel among fellow Muslims.

2. Establishing justice (Iqamah al-Adl)
   It must uphold justice in society, both related to fair dealings among fellow Muslims and in relations other party (non-Muslims).

3. Prosper (Jalb al-Maslahah)
   The ultimate goal to be achieved by Islamic law is maslahat. According to Zahrah, all matter will contained maslahat essential. Although, the beneficiaries was disguised by some people covered by their own will, while the beneficiaries are required by law. However, the ultimate beneficiaries are for public society, they are not for the interests of certain individuals or groups.

Theoretical Framework

The measurement of performance of Islamic banking is important and necessary. The researchers wanted to describe the comparison of the performance of Islamic banking by using Maqashid al-Shariah Index between Islamic banking in Indonesia and Malaysia. The comparison is to know which Islamic banks between Indonesia and Malaysia have better performance by Maqashid al-Shariah.

This study uses three concepts of Maqashid al-Shariah in measuring performance, which is to educate people (Tahzibul Fardi), justice (Iqamah al Adl), and achieve the prosperity or welfare (Maslahah).

Research Methodology

The type of this research is descriptive quantitative research. The unit of analysis of this study is a group of Islamic banksregistered in Bank Indonesia and Bank Negara Malaysia in 2012-2014. The data used in this research are financial statement (annual report) of Islamic banks registered in Bank Indonesia and Bank Negara Malaysia over the years 2012-2014.

The objects in this study are all the 27 Islamic banks, which are divided into two groups, 11 Islamic banks registered in Bank Indonesia and 16 Islamic banks registered in Bank Negara Malaysia during 2012-2014. Based on the criteria that have been determined, the number of objects used this research are 27 Islamic Banks.

This study uses a quantitative method called SAW (The Simple Additive Weighting), which requires a decision to determine weights for each attribute. The total value for each variable is obtained from the total results of the comparison between the attribute ranks in a variable with the weight of each attribute (Antonio, Sanrego, An Taufiq) 2012). The calculation of the performance of Islamic banks is conduct from various aspects by using the approachment of MADM (Multiple Attribute Decision Making). The performance measurement with Maqashid al-Shariah index was determined from the performance ratio as well assign weights to each component of the ratio. When using Maqashid al-Shariah index, there are several steps in the measurements that determine performance indicators and rank of Islamic banks by using Maqashid al-Shariah index (Mohammed, Dzuljastri and Taib, 2008). Some of the steps are:

1. Determine the performance indicators:
   a. Education grants / total revenue ($R1^1$)
   b. Education costs / total cost ($R1^2$)
   c. Training costs / total cost ($R1^3$)
   d. Publicity costs / total cost ($R1^4$)
   e. TheAmount of financing and loss /total investment ($R2^2$)
   f. Non-interest income / total revenue ($R2^3$)
   g. Income / total assets ($R3^1$)
   h. Zakat / net income ($R3^2$)
   i. Investment in the real sector / total investment ($R3^3$)
2. Calculate the performance of Islamic banks on their respective Performance Indicators (PI). The next step is to perform a multiplication of the weight of each variable with the weight-performance ratio for each attribute. Mathematically, the calculation model of performance indicators which was then called the Performance Index (PI) is described as follows:

1. Education (O1)

$$PI(O1) = W1^1(E1^1 xR1^1 + E1^2 xR1^2 + E1^3 xR1^3 + E1^4 xR1^4)$$

Description:

$W1^1$ is the weight for education

$E1^1$ is the weight to the first element in O1 (education grants)

$E1^2$ is the weight to the second element in O1 (Research)

$E1^3$ is the weight to the third element for the O1 (Training)

$E1^4$ is the weight to the fourth element in O1 (Publicity)

$R1^1$is the ratio of performance to the first element in O1

$R1^2$ is the ratio of performance to the second element in O1

$R1^3$ is the ratio of performance to the third element in O1

$R1^4$ is the ratio of performance to the fourth element in O1

2. Justice (O2)

$$PI(O2) = W2^2(E2^2 \, xR2^2 + E2^3 \, xR2^3)$$

Description:

$W2^2$ is the weight for justice

$E2^2$ is the weight to the second element on O2

$E2^3$ is the weight to the third element on O2

$R2^2$ is the ratio of performance to the second element on O2

$R2^3$ is the ratio of performance to the third element on O2

3. Welfare (O3)

$$PI(O3) = W3^3(E3^1 \, xR3^1 + E3^2 \, xR3^2 + E3^3 \, xR3^3)$$

Description:

$W3^3$ is the weight for welfare

$E3^1$ is the weight to the first element in O3

$E3^2$ is the weight to the second element in O3

$E3^3$ is the weight to the third element in O3

$R3^1$ is the ratio of performance to the first element in O3

$R3^2$ is the ratio of performance to the second element in O3

$R3^3$ is the ratio of performance to the third element in O3

Determination of Islamic bank ratings is obtained from the total of all the performance indicators of the three variables Maqashid al-Shariah that can be formulated as follows:

Maqashid al-Shariah Index (STI) = PI (O1) + PI (O2) + PI (O3)

Description:

PI is a Performance Index

O1 is the first of Maqashid al-Shariah index of education

O2 is the second of Maqashid al-Shariah index of justice

O3 is the third of Maqashid al-Shariah index that welfare.

Results and Discussion

The first Index Maqashid al-Shariah (Education)

Education index has four items in measure the performance of islamic bank which are consist of education grant, research, training, and publicity/promotion. Out of the 17 banks that became the research objects, only three Islamic banks in Indonesia and two Islamic banks in Malaysia provide the details of the education grant which is distributed to the public, either in the form of scholarships or assistance to educational institutions. In Indonesia, the Islamic bank that has the largest distribution for education is Shariah Mandiri Bank with a total grant of Rp12 billion in 2012-2014 with a percentage of 0.29% of the total expenses. The next ones are Muamalat Indonesia Bank and Bank Negara Indonesia Shariah with the ratio of 0.11% and 0.03%.

Meanwhile in Malaysia, the contribution for education is still very far behind Indonesia. It can be seen from two Islamic banks that show the education contribution detail. The largest contribution in the field of education in Malaysia only reached 1 billion RM (Ringgit Malaysia) by AIBB. The BIB was the second with numbers that are not much different. Thus, the distribution of funds for education contribution from Islamic banking in Indonesia is still better than Malaysia.Education is very important and vital.The cost of education given by Islamic banking is expected to develop the education for generations and to accelerate the growth of Islamic-based economy as a whole so that the existence of Islamic banks can continue and grow from time to time.

The second ratio of educationdescribes the expenditure of funds used for the purposes of research and development, especially in the development of the banks. This research is expected

to help the development of new products that conform to Islamic principles and to strengthen the position of Islamic banking.

Muamalat Indonesia Bank (BMI)is at the first in a field of research with a percentage of 0.22%, while the second place is occupied by Mandiri Shariah Bank (BSM). The fund allocated to the research field between BMI and BSM is not quite different, as much Rp10.7 and Rp10.2 billion from the year of 2012-2014. In contrast to the two banks, based on the results of the analysis, six other banks do not allocate funds in the field of research and development. Supposedly, other Islamic banking can also provide special funds in the field of research which is expected to assist in advancing the sharia-based economy and to strengthen the Islamic banking industry in Indonesia. Nevertheless, the ratio of the two maqashid index, Indonesia is better when compared to Malaysia.

Based on the analysis, none of the banks in Malaysia disburse funds for research and development. Although Malaysia applies dual banking system, Islamic economy in Malaysia is already growing better than conventional systems. However, it is good for Islamic banks in Malaysia to allocate funds for research in order to create new innovations so that the sharia-based economy system can continue to show the strength.

The third ratio of the first maqashid index is the amount of funds spent by Islamic banks for training and education to employees. The training is conducted to improve the understanding as well as soft skills and hard skills of the employees so that banks can operate optimally. However, Islamic banks also provide the opportunity for employees to get further education so the future employees can be more readily perform the duties and has more responsibilities.

The bank which is in the first rank for this ratio is Bank Negara Indonesia Shriah (BNIS) with a percentage of 3.28%. BNIS gives considerable attention to the training. The amount of funds allocated to research and development in the period of the study more than Rp30 billion. The trainings that was conducted by BNIS included technical training and soft skills with more than 100 types of training related to leadership, risk awareness, and effective internal controls. For a relatively new bank like BNIS, this ranking is a remarkable achievement. This should be an example for other banks to improve the skills of employees.

In the second place, BMI and Permata Shariah Bank (BPS) have the same percentage of 1.57%, and then followed by Bank Rakyat Iindonesia Shariah and Bank Central Asia Shariah (BCAS) at the same percentage of 1.23%. Percentage of 1.05% is owned by BSM, which made this bank is far behind than that of other Islamic banks in Indonesia in terms of training and development. However, it is still better than BBS and BMI that just have a percentage of 0.6% and 0.3% of the total expenses and enable them to be at last in this ratio.

Trainings are very useful for the progress of the banking industry itself to face the economic change that moves so quickly. Therefore, Islamic banks must be able to act fastly and be responsive to face any situation, including crisis that suddenly hits.

Islamic banking in Malaysia seems ignore this research ratio. Out of the nine research objects of Islamic banking in Malaysia, only AFB clearly states the allocation of funds for training purposes. AFB with a percentage of 2.13% is worthy to be an example for other banks in Malaysia that training and development is indispensable for the sustainability of Islamic banking industry. The training is expected by the employees to continue in maximizing their performance for the advancement of Islamic banks. The conclusion is Indonesia outperforms training ratio over Malaysia.

The fourth ratio of the first maqashid index is publicity or promotion. Publication is expected to attract the interest of investors. The hallmark of effective publication is reliable and appropriate. That is, the message should directly lead to the consumer so that Islamic banks can also be expected to respond to consumer concerns that Islamic banks completely are different from conventional banks which apply the system of interest (usury).

Out of all the Islamic banking in Indonesia, only BMI did not allocate funds for publication. This means that, Islamic banking aware of the importance of a publication that could affect consumers in making decisions.The highest publicity of 5.87% is owned by BNIS. In 2014, the fund allocated by BNIS was more than Rp50 billion, equivalent to 0.5% of the total expenses. This publication is expected to improve the competitiveness of BNIS in the Islamic banking industry. The second rank is occupied by BMI with a percentage of 4.33%. Others are BMI, BRIS, and BSM with each percentage of 2.53%, 2.33% and 2.22%, while the smallest percentage of the allocation of funds is owned by BBS with the percentage of 1.06%. This figure is quite good compared with BMI that does not issue the allocation of funds for publicity ratio.

In line with Indonesia, the percentage for this ratio on Islamic banking in Malaysia also showed sizable numbers. ARBB has the highest percentage of 6.20%, followed KFHB by 5.69%. ABB also has a percentage that is not much different from the KFHB of 5.29%, followed by BMB, BIB, and ABIB with the percentage of 2.71%, 2.18%, and 2.13%, while the AFB and AIBB have the smallest percentage in terms of allocation of funds for the publication that is equal to 0.18% and 0.13%.

At this ratio, Islamic banks in Malaysia are better compared to Indonesia. The difference was not significant. This percentage can be said that Islamic banks are already promoting optimally.

The Second Maqashid al-Shariah (Justice)

The second goal on Maqashid al-Shariah index is justice. There are three ratios that measure the extent to which Islamic banks have been instrumental in upholdingjusticeisPER (profit equalizationreserve),mudaraba andmusyarakahfinancing, and the ratio dealing with usury. On the purpose of this second Maqashid al-Shariah, only two ratios are used, they are mudaraba and musyarakah financing and income without interest. The ratio of PER is not used because the Islamic banks are not yet fully implemented PER and there is no Islamic banks to report the level of PER in the annual report.

In the comparison between the two countries in this ratio, the Malaysian Islamic banks still superior to 19.38% compared to Indonesia which is only 18.67%. It is indicated that the difference was not significant. This can serve as a motivation for Indonesia to continue to improve and enhance the justice of sharia banking.

The Third Maqashid al-Shariah (welfare)

The third objective of Maqashid al-Shariah index is the benefit or welfare. Welfare is a very important aspect of human life. Each agency that operates a business must make welfare as an objective of the company, so that this aspect deserves attention in maqashid index in the world of Islamic banking.In this Objective, Malaysian Islamic banks are still superior to the value of 30% compared to the Islamic banks in Indonesia which only gained 28.80%. This is because the contribution of Malaysian Islamic banks to finance the real sector is bigger than Indonesians'. The welfare index can be seen from the profitability, zakat, and real sector investment.

Profitability is a picture of a company's success in carrying out its functions. If the expense is greater than the income earned, the company is failed to function properly.In Indonesia, BMI had the highest profitability of 17.90%. This percentage continues to decline in the next year. This could be happen because of the high COF (Cost of Fund) as well as the main business BMIs, namely financing micro and small segments and motor vehicle financing declined significantly. In addition, the ratio of financing problems also increased so BMIs should establish a backup taken on the burden of allowance for uncollectible accounts. It is finally also suppress the amount of profit. Furthermore, BCAS, BSM and BSB have a percentage of 10.97%, 9.80% and 9.26%, while the lowest percentage is in BNI with 7.19%.

For Malaysia, the Islamic bank with the largest percentage of profitability ratio is owned by ARBB by 4.93%. It is followed by KFHB, BIB and ABIB, with a value of 3.54%, 3.36% and

2.72%. The high percentage of profitability is a picture of pretty good asset utilization. When compared with Malaysia, it can be seen that Islamic bank assets in Indonesia is relatively higher than that of Islamic banks in Malaysia. According to Brigham (2001), the higher ROA indicates that a company is more efficient in utilizing its activities to earn profits, and thus the value of the company increases. The high ratio indicates the good efficiency and effectiveness of asset management.

The second ratio at the third maqashid index is spending zakat by Islamic banks themselves. Zakat is something very special because it has standardized requirements and regulations, for allocation, source, amount or number which shall be issued at a specific time. Zakat which is distributed to the right receiver can improve the welfare of society. As an institution that has an income, it would be nice if the bank also issued zakat on income earned.

BMI is an Islamic bank that has the highest value at a ratio of zakat amounting to 4.65%, followed by BSM, BMIs, and BNI with a value of 3.49%, 3.42%, and 3.30%, while the smallest is BRIS by 2.30%. For Malaysia, only 5 Islamic banks pay zakat while four other banks did not. AIBB has the highest value with 11.70%, followed by BMB and BIB with 3.73% and 2.39%. The Malaysian Islamic bank with the smallest ratio of zakat is OCBC with a value of 0.04%.

The higher the level of profits the bank, the greater the zakat to be paid. In addition to paying zakat, Islamic banks also act as the distributor of the zakat. In its function as a distributor of zakat, Islamic bank also cooperates with agencies that manage zakat as LAZNAS (National Zakat Institution) or can form a channeling zakat institution itself that the disbursement of zakat can be run more effectively.

The last ratio is the allocation of funds for investment in the real sector. Based on the analysis, BMI and BMB rank first in their respective countries with the percentage of 65.08% and 68.01%. This proves that the two banks are actually invested in the real sector for the benefit of society in accordance with the objectives of the establishment of Islamic banks. The least investment in the real sector in both countries is BPS and ARBB. BPS Indonesia is an Islamic bank that has no investments in the real sector, whereas in Malaysia ARBB provides investments with a percentage of 0.19% only. This indicates that the two banks are not focusing on the financing the real sector. Basically, the real sector is one of the efforts to improve the welfare of small and medium communities by providing financing for their businesses as in agriculture, animal husbandry and aquaculture. Furthermore, it is expected that Islamic banks has a real contribution to the investment of the real sectors.

As an institution that collects funds from the public, Islamic banking should also focus attention on the real sector. This investment is expected to have a direct impact on the welfare of the community, so that one of the goals of Islamic banks to create wealth to society can be achieved.

The ranking of Islamic Bank in Indonesia and Malaysia Based on Maqashid al-Shariah Index
Maqashid al-Shariah index was developed with three main factors that are universal. The three performance measurements require the banks to be capable of designing education and training programs that include moral values so that the bank is able to improve the skills of employees. The aspects of justice require that the bank must be honest and fair in operation as well as the need to develop an investment that can improve people's welfare.

The best Islamic bank in Indonesia in terms of maqashid index with a value of 0.30261 was BMI, while the AFB has a value maqashid index of 0.27869 and was the bank with the best performance in Malaysia.The lowest performance of Islamic bank in terms of maqashid index in Indonesia was BMIs with a value of 0.17754, whereas the lowest for Malaysia was ARBB with a total value of maqashid index of 0.17237. The overall rank for islamic banking both in Indonesia and Malaysia can be seen in the Tabel I.

Table I.
The rank of Islamic Banks in Indonesia and Malaysia Judging from Maqashid al-Shariah Index

Islamic Bank	T1	T2	TT3	Total	Overall Rank
Islamic Banks in Indonesia					
BMI	0.004492	0.218477	0.079641	0.30261	11
BRIS	0.002714	0.192204	0.033682	0.228601	22
BSM	0.002723	0.185038	0.037008	0.22477	88
BPS	0.002764	0.20653	0.007485	0.216779	13
BBS	0.001263	0.178166	0.021918	0.201348	14
BCAS	0.001787	0.179577	0.017812	0.199177	15
BNIS	0.006644	0.177737	0.009805	0.194187	16
BMIs	0.000308	0.156598	0.020638	0.177544	17
Islamic Banks in Malaysia					
AFB	0.001792	0.268984	0.007914	0.278691	11
KFHB	0.003926	0.234363	0.014122	0.252412	22
BMB	0.001874	0.171414	.0788	0.252088	33
Abib	0.001474	0.193688	0.036497	0.231659	44
AIBB	0.001068	0.211489	0.013184	0.225741	55
ABB	0.003652	0.165631	0.047791	0.217075	66
OCBC	0.002115	0.177241	0.02649	0.205846	17
BIB	0.002115	0.158868	0.040774	0.201756	17
ARBB	0.004279	0.163166	0.004929	0.172374	88

Conclusion

There was no significant differences in both Islamic banks. From the analysis, the difference was 1-3% per bank for both countries.Based on the analysis, none of the Islamic banks in Indonesia and Malaysia showed a significant different on the performance. The difference was only around 1-3 % for each ratio.

Generally, the performance of Islamic banks in Malaysia was better than the Islamic banks in Indonesia. However, the difference was only 1%.

VALUE AT RISK OF SUKUK IJARAH AND MUDHARABAH IN INDONESIA

Evi Mutia, University of Syah Kuala, Indonesia
Rahmawaty, University of Syah Kuala, Indonesia
Cut Afrianandra, University of Syah Kuala, Indonesia

Abstract

Sukuk is one of financial instrument that is compliant with Islamic Sharia law. Sukuk is popularly being used as a funding mechanism by the governments and corporations throughout the Muslim world and other countries. The aim of this study is to investigate risk structure of sukukijarah and mudharabah in Indonesia. This study using Value at Risk (VaR) framework with an independent model analysis of t-test samples. VaR is a method of assessing the risk that uses standard statistical techniques routinely used in other technical fields. Formally, VaR is the maximum loss over a target horizon such that there is a low, prespecified probability that the actual loss will be larger. Samples of this study were 21 companies that issued sukukijarah and mudharabah listed on the Indonesia Stock Exchange. The results indicate that sukukiIjarah have a lower level of risk than sukukmudharabah. By identifying the sukuk risk, it should enable stakeholders to address related funding issues.
Keywords: *Islamic Finance, Sukuk, Ijarah, Mudharabah, Value At Risk*

Introduction

A company has excess funds in the form of cash due to gains or achieving goals. There are several ways to utilize the excess funds at the same time to gain benefit. One of them is investments in bonds or sukuk. As the time runs, there will be a modification of bonds in investment markets. Sukuk is one of the modifications that occur in the investment market. It is a halal investment which avoids usury, gharar, and maysir. According to Sharia Board of Indonesian Ulama Council fatwa No.32/DSN-MUI/IX/2002, sukuk can be interpreted as an Islamic long-term securities which issued by the issuer to the holders and it requires the issuer to pay income to the holders in the form of profit sharing, margin / fee, as well as repayment of the bonds at maturity. The differences between Sukuk bonds and conventional bonds are the concept of reward and profit sharing instead of interest, the existence of underlying transaction in the form of certain assets, and the Islamic- based contract/agreement.

According to AAOFII (Accounting and Auditing Organization for Islamic Financial Institution), there are many types of sukuk known internationally but only four of them are regularly used by the public, namely mudharabah, ijarah, musharaka, and istishna. Mudharabah is one form of cooperation, of which one party provides capital (rabb al-maal) and other parties provide expertise (mudharib). The profit of the cooperation is divided based on the proportion that has been previously approved. Losses incurred will be borne solely by the capital provider. Ijarah is a sukuk in which one party, alone or through a representative, sell or lease an asset to another party based on the rent price and the lease period without transfer of asset ownership. Musharaka is a cooperation between two or more parties to combine capital to build new projects, develop the existing project or fund operations. Gains and losses incurred are shared according to the capital participation. Istishna is a contract in the form of the purchase agreement between the parties for project financing. The process, duration, and prices are determined by the agreement.

State-owned sukuk records a very rapid movement. Until the period of March 3, 2014, 43 sukuks were issued with a total of Rp139.97 trillion. Since the first sukuk issued in 2002 until now, there is 64 cumulative issuance of corporate sukuk with total emissions of Rp11.9 trillion. Based on the data obtained from IDX (Indonesian Stock Exchange), sukuk issued in Indonesia is currently only using two kinds of contract namely mudharabah and ijarah. According to Fatah (2011), sukuk during the period of 2002-2004 was dominated by mudharabah for Rp740 billion (88%) and the remaining Ijarah amounted to Rp100 billion. The 2004-2007 period was dominated by ijarah amounting to Rp2.194 trillion (92%) and the rest was mudharabah amounting to Rp200 billion (8%).

After the SBSN Law of the year 2008 was legalized, the government issued sukuk amounting to Rp15 trillion. This issuance was done as a part of financing the budget deficit on the state budget in 2008. The amount of sukuk in accordance with the underlying assets owned by the government was Rp 15 trillion. The government used the collateral in the form of state-owned assets such as land and buildings. Based on the Islamic capital market statistics per December 31, 2013, Sukuk ijarah is most preferred. This is due to more simple structure than the sukuk mudharabah . The use of underlying assets as a condition of issuing sukuk mudharabah becomes a limiting factor for the issuer because it requires the valuation of assets.

Every investor who invest funds in the capital market both in sukuk ijarah and mudharabah certainly hopes and desires to make a profit or return. However, an expected return can not be separated from the risk of the investment. One of the risks is the market risk. Market risks come from price movements or volatility of market prices. Return and risk have a positive relationship. The greater the risk of an investment, the greater the returns.

Conversely, when the risk of an investment is small, then the return also will be small. Diversification can be done to reduce the risk because each instrument has different risk and return. The rate of return earned by investors in each kind of sukuk is different. Hence, in capital markets, there are important factors that should be used by investors as a material consideration in purchasing sukuk as an investment instrument. That is called as Yield. Fabozzi (2000) suggested there is some measure of yield that can be used by investors, namely Current Yield and YTM (yield to maturity). Tandelilin (2001) stated that YTM is the most frequent tool. YTM is a measuring tool used by investors to make considerations in purchasing sukuk.

Pramono and Setiawan (2008: 8) showed the comparison of both sukuk ijarah and mudharabah that we can see in Table 1

Table 1
Comparison of sukukmudharaba and ijarah

	Ijarah	Mudharabah
Akad (Transaction)	Ijara (lease)	Mudharaba (profit sharing)
Transaction type	Certain contract	Uncertaint contract
Character	Investment	Investment
Bid price	100%	100%
Bond principal at maturity	100%	100%
Coupon	Rewards/Fee	Revenue/Profit Sharing
Return	Predetermined	Indicative based on Revenue /Income
National Sharia Board fatwa	No.41/DSN-MUI/III/2004	No.33/DSN-MUI/IX/2002
Investor type	Sharia / conventional	Sharia / conventional

Source: Datuk (2014)

Based on Table 1 it can be concluded that yield and risk of sukuk was different. In terms of its coupon, the YTM of mudharabah is obtained based on revenue or profit sharing, while the sukuk ijarah is based on rewards. In terms of the return, sukuk mudharabah is determined based on the income generated, while the return of sukuk ijarah is predetermined. So the risk obtained by sukuk ijarah is lower than mudharabah sukuk.

The previous research by Puspitadewi about a comparative analysis of YTM and market risk between bond portfolios and sukuk, the scope of the research as well as the portfolio used in the study were very small, and the research time duration was very short. Since the variables used were very good, yet the objects were still general, I am interested in conducting this research using the same variable but different objects, with a measure of risk using VAR (Value at Risk). VAR is an attempt to quantify the magnitude of the maximum potential losses that may occur at a particular asset position with a certain probability over a certain period. Based on the background, the problems of this research is there any difference between the market risk of corporate sukuk ijarah and mudharabah based on VaR.

Literature Review

The concept of Sukuk

Sukuk is an Arabic word which is the plural for the words akk that means financial certificate. Sukuk in the context of Islamic capital market refers to a process of securitizing and is known as Islamic bond. In sharia standard No.17 about investment of sukuk, AAOIFII defined it as follows: "Sukuk is certificates of equal value representing undivided share in ownership of tangible assets, usufruct, and services or (in the ownership of) the assets of particular projects or special investment activity. However, this is true after receipt of the value of sukuk, the closing of the subscription and the employment of funds received for the purpose for which the sukuk were issued."According to the Sharia Board of the Indonesian Ulema Council fatwa No.32/DSN-MUI/IX/2002, sukuk can be interpreted as Islamic long-term securities issued by the issuer to the holders, which require the issuer to pay income to the holders of Islamic bonds in the form of profit sharing, margin/fee, as well as to pay back the fund at maturity.

Sukuk has different characteristics compared to conventional bonds because the structure is based on tangible assets. It can minimize the possibility of the fund to exceed the value of the underlying sukuk transaction. Sukuk holders own the portion of the revenue generated from the assets in addition to the rights to the sale of assets.Claims on sukuk are not based on cash flow but on asset ownership. According to AAOIFI via the Ministry of Finance (2010), there are many types of sukuk which are known internationally.Sukuk can be divided into two which are sukuk based on debt (Sukuk al-Murabahah, al-Istisna' dan Salam) and based on equity (Sukuk al-Mudharabah, al-Musyarakah dan al-Ijarah). Nevertheless, there are other kinds of sukuk practiced in the activity of financing although it is less popular which are sukuk al-Wakalah, Bay bithaman Ajil, al-Muzaraah, al-Musaqa and many more.

Sukuk Ijarah

The concept of ijarah can be used to mobilize funds for the development of long-term infrastructure projects. Ijarah is an engagement lease which entitles muaajir (the lease) to receive wages from mustajir (tenants) on the benefits. This means that the lessor would entitle the other parties to use the leased object. However, the tenant must give rewards in accordance with the agreement. (Dewi et al. 2006:158).

In ijarah contract, there is a transfer of benefits, temporary, without any transfer of ownership. The rate of rents ini ijarah must be clearly defined for the first rental period. The next

periods, the rent can be updated, whether to keep, increase, or decrease based on a benchmark or a variable such as rate of inflation, price index published periodically, or a defined percentage. Mainstream sharia experts allow the use of a benchmark with reference to interest rate, though for them it is not an ideal practice (Usmani, 2000: 168-171).

Sukukijarah is issued based on the Ijarah contract in which one party through a representative rents an asset to another party based on the price and the agreed period without being followed by the transfer of ownership. Sukukijarah is securities that represent ownership of assets whose existence is clearly attached to a hire purchase contract. For investors, sukukijarah more beneficial because under no circumstances will receive the benefit (return) in the form of rent paid by the issuers of sukuk (Purnawati: 2013)

Mudharabah

Sukuk mudharabah is a partnership contract between the owners of capital (shahibul maal) to the managers (mudharib). Mudharabahh investment transactions are based on trust. Trust is the most important element in mudharabah, that is the belief of shahibul maal to mudharib, where the owner of the funds provide the money of 100% to mudharib. Mudharib as service providers only manage property fully and independently, and also only bear the loss or risk in the form of time , mind, and efforts for administering such project or business, as well as the loss of an opportunity to obtain some of profits in accordance with the agreements.

Sukuk Mudharabahare investment Sukuk used to enhance public partnership in capital intensive projects, for example the development of airport, dams and power generations facilities. For that purpose the SPV will issue Mudaraba Sukuk for raising funds required to develop that project. SPV manage the development of the project on behave of Sukuk holders. Any income or fee generated at liquidation or sale is paid to Sukuk holders as per agreed share (Al Zubi and Maghyereh, 2006, p. 235-248).

Market risk

Market risk is the risk due to changes in market prices, such as exchange rate changes or changes in the value of assets that can be traded or leased.The objective of market risk management is to minimize the possible negative effects as a result of changing market conditions on assets and capital. Market risk consists of foreign exchange risk, commodity risk, and equity risk. Exchange rate risk is the risk due to changes in the value of TB (Trading book) and BB (banking book) caused by changes in foreign currency exchange rates and gold prices. Commodity risk is the risk that occurs as a result of changes in the price of financial instruments from the position of TB and BB which are caused by changes in commodity prices. Equity risk is the risk due to changes in the price of financial instruments of TB caused by changes in stock prices.

The Bank of Indonesia Regulations or PBI No.11/25/PBI/2009 and No.13/23/PBI/2011 state that the risk in the conventional market is different with the shariah one, where the conventional system is based on interest, while sharia system is based on sharing system. In conventional the main activity is trading. Trading is the buying and selling of financial instruments on behalf of the bank for the purpose of short-term gain from the expected changes in market prices to determine the value of a financial instrument. These trading instruments include cash instruments and futures instruments. Cash instruments are foreign exchange spot transactions, forward foreign exchange, bonds, etc. While the futures instrument is interested swaps, currency swaps, options, etc.

Investors should develop a strategy to market risk, including the level of market risk that can be accepted into contractual agreements with providers of funds, the type of risk-taking activities, and target markets to maximize returns. Investors must establish market risk management processes and information systems which are healthy and comprehensive

consisting of The conceptual framework to encourage the identification of the underlying market risk, guidelines for the management of risk-taking activities on different portfolios in limited investment and market risk limits, framework for the right pricing, valuation, and revenue recognition, the strong Management information systems (MIS) for the counting, monitoring, and reporting of market risk exposure and risk management performance.

Historical method is a method that uses past data to calculate the VAR (Value at Risk). The historical method has advantages and disadvantages. The advantage is that it does not assume certain distribution and it is simple. The disadvantage is the assumption that past data can be used to predict the future. In other words, these methods have the assumption that the data patterns of the past are the same as the data pattern in the future.

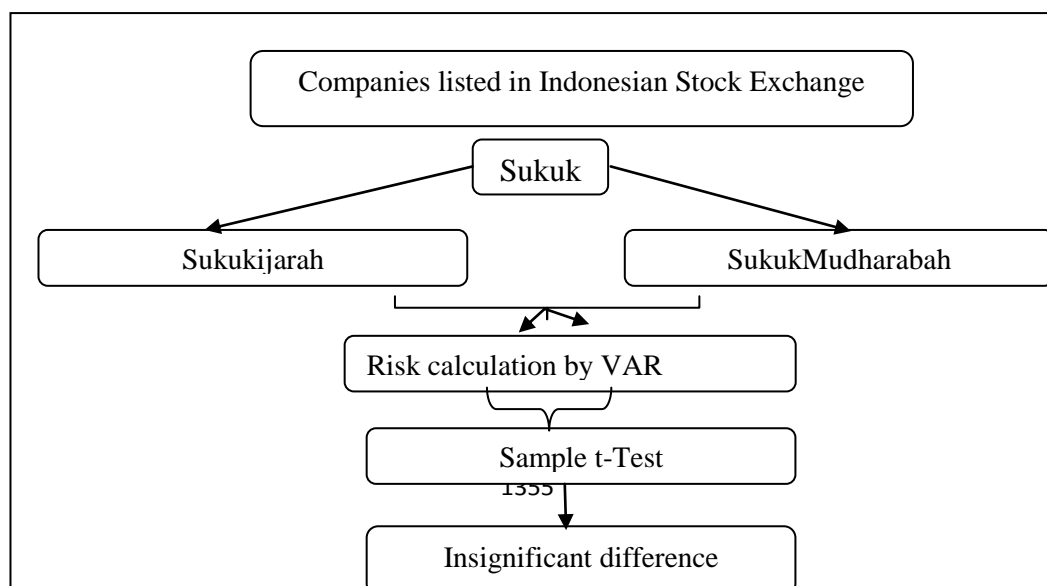
Framework

This study aims to compare the coupon rate and market risk of corporate sukuk ijarah and mudharabah. The yield levels are analyzed using a coupon. Compound rate of return is accepted if the investor buys the bonds at current market prices and holds at maturity which is calculated using the yield to maturity (Tandellin, 2001).

Bonds can be issued by governments, corporations, banking institutions and non-banking financial institutions. Because of forward sales or forward purchases of goods through salam is allowed, there may be forward commodity markets, which would differ from conventional markets (Job, 2009: 319). Sukuk differs in its nature to the common stock of a combined company. The certificate is similar to the values that represent stocks which do not separate the ownership of assets of a specific project or activity, the right of assets and services (AAOIFI, 2004:298-300). The yield and market risk are things that must be watched by any investors because the return on bonds depends on the income derived from underlying assets or projects, so as to minimize risks (Ayub, 2009).

Transactions in ijarah contract have several advantages compared with other types of contract, including:
1. Compared with other types of contract, Ijara contract is more flexible in terms of the transaction object. In murabahah contract, the transaction object must be goods while at the Ijara contract, the transaction object may be services such as health services, education and others that do not contradict sharia.
2. Compared with investment, Ijara contract contains a lower business risk, like the income is relatively fixed (Yahya et al., 2013: 252).

The historical method has advantages and disadvantages. The advantage is that it does not assume certain distribution and it is simple. The disadvantage is the assumption that past data can be used to predict the future. In other words, these methods have the assumption that the data patterns of the past are the same as the data pattern in the future. If the pattern occurred fairly stable, then the data in the past can be used to predict the future (Hanafi, 2009:151).

Scheme of theoretical framework can be seen in Figure 1


Data and Methodology

Data Sample of the Study
This research is a comparative research which is a research that uses T-test analysis tool, has a minimal intervention level, does not set the research condition, hassukukijarah and mudharabah as its analysis units, and its time horizon is longitudinal (period of 2010-2014). This study uses quantitative secondary data derived from the financial statements, the annual ratio (financial highlights), and cash flow statement and income statement. In this study, the data used quantitative secondary data obtained from the Stock Exchange, KSEI, the FSA and the Bond agency.

Thesampling model in this study is nonprobability sampling that the chosen design isjudgment sampling. Judgment sampling is based on certain considerations, including selecting a subject which is in the most favorable place or in the best position to providenecessary information (Sekaran, 2006: 137).The number of observations is 21 observations from the 13 companies, 13 ijarah,and 8 mudharabah. Sugiyono (2009: 263) stated that, if the object of research it has a number of samples (n) which are different (homogeneous variance), then the number of samples can vary by using the pooled variance formula.

Variable Operationalization
This study analyzes one calculation of yield andone VAR (Value at Risk). The yield calculation is Yield to Maturity ratio and the VAR uses the historical method (Back Simulation). VAR historical method (Back Simulation)
The historical method uses past data to calculate VAR, in which the historical method has an advantage and a weakness. The advantage is that, it is simple and does not assume certain distribution. The weakness is that, itassumes that past data canbe used to predict the future. In other words, this method believes that data patterns of the past are the same with the data pattern of the future.

The formula used in the calculation of historical data is:

$$VarT = V.1,65.\sigma\tau$$

$$VarT = V.1,65.\sigma\tau$$

Where:
V = the market value of the asset at time T
$\sigma\tau$ = standard deviation of the portfolio
T = period of time during the standard deviation of returns counted

Data Analysis Methods
T-test is used to determine whether two unrelated objects have different average values. Itis performed by comparing the difference between the average value with a standard error of the two research objects(Ghozali, 2009: 6).

Research result

Data Research Description
This study aims to compare the performancewhich is measured by using two types ofMarket Risk in sukuk ijarah and sukuk mudharabah. Data used in this research is secondary data (the data of sukuk ijarah and sukuk mudharabah are selected based on the criteria during the period 2010-2014). Table 2shows the first analysis to find a picture or a description of the variables.

Table 2
Descriptive Statistics ofMarket Risk of Sukuk Ijarah

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
RisikoPasar	13	2661, 15	7392, 08	4353, 7472	1551, 43714
Valid N (listwise)	13				

Source: Data processed (2015)

Based on Table 2we can see the value of the minimum, maximum, average, and standard deviation for each variable in 2010- 2014 with the research object of13 samples.The minimum value of the market risk of sukuk Ijarah is 2661.15 and the maximum value is 7392.08. The average value of 4353.7472 with a standard deviation of 1551.43714 meansthat there is variations in market risk of sukuk Ijarah . The number 4353.7472 showsa big number because the standard deviation of the market risk of sukuk Ijarah is smaller than 4353.7472 which is 1551.43714. This indicates that the level of risk that will be received by investors when buying sukuk Ijarah at the current market price and hold it until maturity is 4353.7472 in average.

Table 3
Descriptive Statistics Market Risk of Sukuk mudharabah

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
RisikoPasar	8	4227, 10	8454,20	6039, 4720	1320, 43182
Valid N (listwise)	8				

Source: Data processed (2015)

Based on Table 3we can see the value of the minimum value of the market risk of sukuk mudharabah is4227.10 and the maximum value is 8454.20. The average value of 6039.4720 with a standard deviation of 1320.43182 meansthat there is variations in market risk of sukuk mudharabah . The number of 6039.4720showsa big number because the standard deviations of the market risk of sukuk mudharabah is smaller than 6039.4720which is 1320.43182. This indicates that the level of risk that will be received by investors when buying sukuk Ijarah at the current market price and hold it until maturity is 6039.4720 in average.

Table 4
Independent Sample T-Test to Market Risk

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Risiko Pasar	Equal variances assumed	,353	,559	2,551	19	,020	1685,7248	660,80770	302,638	3068,81
	Equal variances not assumed			2,655	16,851	,017	1685,7248	634,89612	345,309	3026,14

Source: Data processed (2015)

Table 4 shows the calculated F value of levene test amounted to 0,353 with a probability of 0.767. Because the probability is greater than 0.05, it can be concluded that both variances of Ijarah and Mudharaba are the same. Thus, the t-test analysis should apply equal variances assumed. Based on SPSS output, it shows that the value of t onequal variances assumed is -2,551 with the significance probability of 0.028 is smaller than 0.05. So it can be concluded that the Yield to Maturity of Ijarah and Mudharabah differ significantly.

Comparative Analysis of Market Risk of Sukuk Ijarah and Sukuk Mudharabah .
The results indicate significant different between ijarah and mudarabah, which Ijarahsukuk have a lower level of risk than mudarabahsukuk.Unfortunately, our predictions that sukukijarah and sukukmudharabah should have similar level of risk were incorrect.As revealed above average VaR of sukukijarah is almost higher than average VaR of sukukmudharabah.

Yahya (2013: 252) arguedthatijara contract has a lower business riskthan investments. The income of ijara is relatively fixed. It is statistically proved that there is a significant difference on the market risk between Sukuk Ijarah with sukuk mudharabah withsignificance value of 0.020 <0.05, with the risk level of 4353.7472 for ijarah and 6039.4720 formudharabah.The results support the research Puspitadewi (2010) who studied the market risk on a portfolio of sukuk bonds.Although this study use different objects, the statistical results show that there is a significant difference between Sukuk ijarah with mudharabahsukuk.

In previous studies, the object used asa comparison is the portfolio of bonds and sukuk, not between one sukuk and another sukuk. The reasons to use one more variable in this study is that to knowthe market value changes that occur in mudharabahsukuk because mudharabah sukuk are issued earlier than Sukuk ijarah which are recently published.So market risk may occur because of the difference. This study shows that sukuk Ijarah can minimize the potential negative impact due to changes in market conditions on assets and capital investment by having a lower investment risk than sukuk mudharabah.

Conclusion
This research has compared the performance of market risk sukuk ijarah and mudharabah using a series of indices in the Indonesia sukuk market. Indeed, we use the indices of the series SukukINDEX reflecting the performance of Sukuk and bonds market in Indonesia for the period from 2010 to 2014. We first addressed that the development of sukuk issuance in Indonesia is not in line with the development of sukuk trading. There are several factors that caused it, they are: the limited issuance of sukuk corporate in Indonesia, the investor has a lack of understanding about the corporate sukuktrading in the secondary market.Secondly, There are differences in sukuk Ijarahand Mudharabahschemes. The scheme adapted to the condition of each issuer. The results also show that Risk of Ijarahsukuk have a lower level than mudarabahsukuk.

THE EFFECT OF SUPPLY CHAIN INTEGRATION, INFORMATION SHARING, AND BUYER-SUPPLIER RELATIONSHIP TO SUPPLY CHAIN PERFORMANCE (STUDY AT PT FREEPORT INDONESIA'SDOMESTIC SUPPLIERS JAKARTA AND SURABAYA AREA)

Adam Putranto Setiawan, Perbanas Institute Jakarta, Indonesia
Selamet Riyadi, Perbanas Institute Jakarta, Indonesia

Abstract

The research examines how supply chain integration, information sharing and buyer-supplier relationships affect supply chain performance. The research problems are came from two main issues, the first is PT Freeport Indonesia's (PTFI) domestic supplier Jakarta and Surabaya area performance which their on-time deliveries were not optimal and wrong specification or damage goods were still commonly found. The second, this research is also based on some inconsistency results found from previous researches such as Sezen (2008), Pinindari (2011), Kocoglu et al (2011), Ibrahim et al (2011). Proportionate stratified random sampling is used for research sampling method. Respondents of research are 64 companies, which all of them are PTFI's domestic supplier Jakarta and Surabaya area. The research requires PLS-SEM analysis with SmartPLS3.0 software. The result of data analysis shows that the research model is valid to meet all the requirements and the result will be well received. The result proves that supply chain integration partially affects supply chain performance. Then information sharing is also proved partially affects supply chain performance. Similarly, buyer-supplier relationship partially has effect on the performance of the supply chain. Finally, supply chain integration, information sharing and buyer-supplier relationship simultaneously affect supply chain performance.
Keywords: *supply chain integration, information sharing, buyer-supplier relationship, supply chain performance*

Background

Supply chain management is one of common strategies for companies and organizations to strengthen their operational and business activities with the main objective to achieve the maximum benefit. Heizer and Render (2014) stated that companies and organizations need to consider supply chain issues to support to their main strategies. Supply chain management represents the flow of materials, products, information, and financial within organization, as well as across businesses from suppliers to manufacturers to customers in the supply chain to improve the long-term performance of organization (Mentzer, 2001; Baofeng Huo, 2012)

Some previous studies examined several factors that influence supply chain performance, they are supply chain integration, information sharing and buyer-supplier relationship. Supply chain integration becomes an important factor for organizations that can improve supply chain performance. Integration is not only performed by organizations with customers or suppliers, but they also need to integrate process and functions in their internal business activities (Huo et al, 2012; Flyn et al, 2010; Wong et al, 2011; Pinindari, 2011). Integration enables organizations to maintain flexibilities in the product specifications, production volume, product customization options and product changes to compete with others (Wong et al, 2011).

Rapid changes in recent technologies, information systems and data processing become valuable elements in supply chain. Information sharing can affect supply chain performance throughwhat type of information to be shared (Lin et al, 2002; Ogunyemi, 2011), potential information varieties that need to be standardized (Yu et al, 2010; Kocoglu et al, 2011) and its

ability to improve the efficiency and effectiveness of the supply chain to provide a competitive advantage to organization in the long term (Arawati Agus, 2011).

Meanwhile, buyer-supplier relationship have crucial roles to reduce uncertainties in business process changes (Patterson et al, 1999; Hsu et al, 2008) that drive organizations to ease dependencies on suppliers, improve demand forecasting and delivery performance and achieve superior performance. Kamau (2013) stated five factors in buyer-supplier relationships: trust, communication, cooperation, mutual goals and commitments are able to improve company performance.

PT Freeport Indonesia (PTFI) is one of the largest copper and gold mine in Indonesia, which operates in Tembagapura, Mimika District, Papua Province. PTFI requires a lot of materials, equipment, machinery, spare parts, logistics and others from its suppliers to ensure business and operational activities work properly. PTFI anticipates good cooperation and coordination with suppliers in providing goods or services to support PTFI that can establish its main activity in mining and processing mineral resources.

Refer to PTFI internal data, suppliers are still indicated to have not optimal performance as expected. Some of supplier performance issues in PTFI supply chain are

a) Late delivery. Suppliers are tend to struggle in fulfilling their commitment to provide on-time delivery as stated in purchase order (PO) due date.
b) Wrong specification. There were still found different or wrong specification, poor quality and defect material.
c) Lack of responsiveness in communication.
d) Lack of flexibility in order changes.

Our study aims to examine the real condition of supply chain integration, information sharing and buyer-supplier relationship in PTFI and build a model to represent the relationships among those aspects and their impactto supplier performance using data collected from PTFI domestic suppliers in Jakarta and Surabaya area.

Literature review

Supply Chain Performance

Measuring supply chain performance is the process of measuring the effectiveness and efficiency of supply chain activities. The effectiveness is the extent to which customer requirements can be met and efficiency measures how company resources are economically utilized in providing customer satisfaction (Neely, 1995; Spepherd and Gunter 2006). Gunasekaran et al (2004) explained supply chain performance as measurement and comparison to standard output of processes that performed in a supply chain to meet the competitive and strategic objectives on quality, speed, reliability, flexibility and cost.

Gunasekaran et al (2004) provides a measurement framework for supply chain performance based on activities of the supply chain such as plan, source, make/assemble and delivery/customer. SCOR model method is also widely used in measuring supply chain performance, there are five key attributes in SCOR performance measurement, and they are supply chain reliability, responsiveness, agility, costs and assets. Chopra and Meindl (2013) assess supply chain performance in terms of responsiveness and efficiency, and stated that it is necessary to study driving factors in logistics and cross functions for improving performance such as facility, inventory, transportation, information, sourcing, and price to understand how the company can improve its supply chain performance.

This study examinesBeamon (1999) performance measurement method in flexibility, resources and output performance which were also used by other previous studies (Pinindari, 2011 and Sezen, 2008). Flexibility can measure the ability of the system to accommodate volume and schedule fluctuations in suppliers, manufacturers and customers. Resource performance is generally measured by its level of efficiency in resources utilization . Efficiency

measures the use of resources to meet the set up goals in the system. Output performance measurement can be represented numericallysuch as number of items produced, time required to produce a particular item or set of items and number of on-time deliveries (orders).

Supply chain integration and supply chain performance

Supply chain integration can be defined as the degree to which an organization strategically able to collaborate with its supply chain partners and cooperatively manage processes inside and outside the organization to achieve effective and efficient flows of products, services, information, finance and decisions to provide maximum value for end customers with low cost and high speed (Flynn et al, 2010; Baofeng Huo, 2011). Supply chain integration allows organization to strengthen the sustainable competitive advantage in the market competition and achieve their goals and objectives to improve organizational performance. (Li et al, 2006; AlSagheer et al, 2011) with lower inventory levels, shorter cash flow, improved labor efficiency and customer satisfaction (Vokurka et al, 2003 in Pinindari, 2011).

There are several dimensions of supply chain integration concept used in previous studies. Zolait et al (2010) examined three-dimensional integration of supply chain their research: financial flow integration, physical flow integration and information flow integration. Gimenez et al (2011) used three different categories in supply chain integration, they are supply chain practices (specific activity), supply chain patterns (communication models) and supply chain attitudes (aspects of relationships, trust). This study will examine three-dimensional of supply chain integration focused in the level of integration with suppliers, integration within organization and integration with customer (Oghazi, 2009; Soo Wook Kim, 2009; Flynn et al, 2010)

Kocoglu et al (2011: 1634) mentioned organizations that committed in supply chain integration will obtain competitive advantage, improve their both business and operational performance, provide efficiencies in their supply chain by increasing flexibility on delivery time and response to customer demand, eliminate bullwhip-effect and reduce transaction costs and provide great attention to information sharing. Integration in the distribution process from upstream to downstream, such as organization commitment in providing quick access to product requirement, more sensitive to customer needs and more responsive than competitors will increase the effectiveness of supply chain (Rosenzweig et al, 2003; Cagliano et al, 2006; Pinindari, 2011).

H1: Supply chain integration positively influences supply chain performance

Information sharing and supply chain performance

Information sharing is to share organization valuable information (Spaho, 2011) related to operations, tactics and strategies to other partners in its supply chain (Qing Hu et al, 2011: 4) to get benefit from the shared information for all parties involved in the supply chain network (Kalyar et al, 2013) and improve supply chain performance in terms of flexibility and reliability (Ibrahim et al, 2011).

This study uses a two-dimensional information sharing: information with suppliers and information sharing with customers (Sezen, 2008; Pinindari, 2011). Information sharing is required to perform with two external partners (customers and suppliers) in supply chain. Sharing information with customers will ensure customers can monitor their orders due to its importance for them to make decisions on their business operations. Meanwhile, sharing information with suppliers is crucial for buyers to obtain proper information about product to minimize wrong specification or material in procurement process.

Information sharing has strong influence to supply chain performance by eliminating the potential for variation in information to achieve standardized information sharing framework (Yu et al, 2010; Kocoglu et al, 2011). It will establish better communication in supply chain

using real-time information shared by all supply chain members that enable more accurate decision-making process to improve inventory control/management and inventory turnover (Moberg et al, 2002; Abdallah et al, 2014) and achieve efficiency in resource utilization to improve organization performance (Graham et al, 2000; Pinindari, 2011).

H2: Information sharing positively influences supply chain performance

Buyer-supplier relationship and supply chain performance

Buyer-supplier relationship is the extent of relationship developed between organization with its partners along supply chain, not limited to the particular partner only, (Hsu et al, 2008) wherein there is a good understanding in their roles and responsibilities (Lemke et al, 2002; Inayatullah et al, 2012), and high level of trust and commitment to establish a long-term relationship as an important factor in achieving competitive advantage for all parties (Aghamohammadi et al, 2014)

There are three key elements of buyer-supplier relationship: trust and commitment, buyer dependency and supplier dependency (De Jong and Nooteboom, 2000; Caniels et al, 2010). Another study states that key attributes such as coordination, collaboration, commitment, communication, trust, flexibility and dependability are widely considered as the center of meaningful relationship (Mburu, 2012). This study uses a two-dimensional of buyer-supplier relationship: trust and commitment.

Buyer-supplier relationship will grow stronger with the development of trust that is facilitated by face-to-face communication between buyer and supplier, buyer fair and proper treatment to its supplier and supplier willing to invest for buyer specific requirement. Robust buyer-supplier relationships will improve the performance of suppliers who also lead to increased organizational performance (buyer) (Inayatullah, 2012). When relationship between buyers and suppliers are established, it will encourage suppliers to provide a better response to buyer needs and drive improvement for buyers and suppliers performance (Rashed et al, 2010).

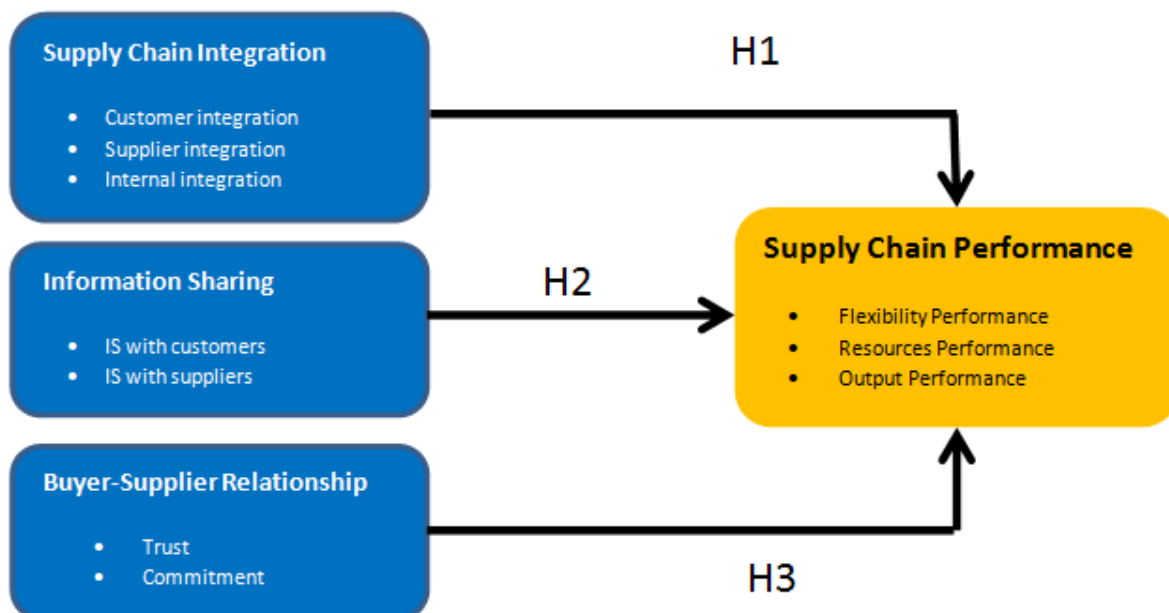
H3: Buyer-supplier relationship positively influences supply chain performance


Figure 2.1 Conceptual framework

The conceptual framework of this research can be illustrated in Figure 2.1 which shows the relationship between supply chain integration, information sharing, buyer-supplier relationship and supply chain performance. Supply chain integration will use three dimensions: customer integration, supplier integration and internal integration. Dimensions of information sharing are represented by information sharing with customers and information sharing with

suppliers. While the buyer-supplier relationships are using two dimensions: trust and commitment. Supply chain performance will be measured by flexibility performance, resources performance and output performance.

Research methodology

Research Variables

This research is a quantitative research with survey approach infive-point Likert scale questionnaires form for respondents as sample of determined population. The obtained data from survey will be processed and analyzed descriptively and quantitatively using PLS (partial least squares) statistical modeling techniques with SmartPLS software.

Statistical analysis in PLS uses second order construct method. There are four latent variables, supply chain integration (SCI), information sharing (IS), buyer-supplier relationship (BSR) and supply chain performance (SCP). SCI is using 3-dimensional variables: customer integration (CI) with measured indicators CI1-4, supplier integration (SI) with indicators SI1-3 and internal integration with indicators II1-3. There are two dimensions of IS, they are information sharing with customers (ISC) with indicator ISC1-5 and information with suppliers (ISS) with indicators ISS1-5. BSR uses a two-dimensional variable trust (TRS) with indicators TRS1-4 and commitment (COM) with indicators COM1-3. The last variable is SCP with three dimensions of flexibility (FLX) with indicators FLX1-3, resources (RES) with dimensions RES1-3 and output (OUT) with indicator OUT1-6.

Population and Sampling

The population in this study is PTFI partner suppliers at Jakarta and Surabaya area with active and recurring transaction with minimum transaction value of USD 50,000 during 2013 period. PTFI internal data recorded 76 qualified suppliers. The study will use a sampling method because not all suppliers returned the questionnaire until the specified. Therefore census method should not be allowed. By using Slovin method, the representative sample is obtained (64 suppliers) as shown in table 3.1.

The sampling technique used in this study is the probability sampling with proportionate stratified random sampling method. Probality sampling method is a selecting sample size method in which each member of the population has an equal chance to be elected as members of the sample (Umar, 2013). While the proportionate stratified random sampling method is used when the population has not homogeneous member and stratified proportional (Sugiyono, 2011).

Transaction value (2013)	Suppliers	Research Sample	
		Slovin Method	Rounding Sample
Above USD 10M	5	4.2105263	4
USD 5M - 10M	5	4.2105263	4
USD 1M - 5M	27	22.736842	23
USD 250K - 1M	27	22.736842	23
USD 50K - 250K	12	10.105263	10
Total	76	64	64

Table 3.1 Research population and sample

Outer Model Evaluation

Evaluation of outer model is used to determine the validity and reliability of indicators relationship with latent variables. Indicators are reflective because the indicators of latent

variables affect its variable. Therefore there will be two stages of measurements: Convergent validity and Discriminant validity (Sofyan Yamin, 2011)

There are three kinds of measurements in convergent validity, they are individual items reliability (standardized loading factor), construct reliability (internal consistency and composite reliability) and average variance extracted (AVE). Only one indicator has loading factor value below 0.5 which is OUT4 indicator with loading factor value -0.093 (from a construct SCP) and -0.096 (from a construct OUT). Thus OUT4 indicator is excluded from the model

The second measurement in convergent validity stage is composite value reliability (CR) and Cronbach's alpha measurement which both first order and second order construct are greater than 0.70. It is implied that all the indicators are consistent in measuring their variables. Then, the third measurement is an AVE measurement. AVE value at least 0.5 indicates convergent validity is good, and this research has AVE values greater than 0.5 as required.

Variables	AVE	Composite Reliability	Cronbach's Alpha
SCI	0.539	0.913	0.891
IS	0.58	0.932	0.919
BSR	0.501	0.875	0.832
SCP	0.58	0.938	0.926

Table 3.1 AVE, Composite Reliability and Cronbach's Alpha values

The next stage measurement is the evaluation of discriminant validity. Model measurement is assessed by cross loading measurement with its variable. If variable correlation with each indicator is larger than its correlation with other variable, then it has better prediction to its indicator than to another variable. Cross loading values in this study indicate that almost all indicators respectively have higher correlation value with their variable compared to their correlation value with another variables except CI1 that have cross loading0.717 with its variable (CI), lower than its cross loading with SI (0.797).It does not meet discriminant validity requirements and CI1 indicator will be excluded from the model.

The outer model evaluation indicates that almost all of the variables/construct and indicators in this study are accepted, except indicators OUT4 and CI1 that do not meet validity and reliability requirements and both indicators are excluded from the model. The new research model without indicators OUT4 and CI1 will recalculate using algorithm and bootstrapping for structural (inner) model evaluation.

Inner Model evaluation

There are several stage of inner model evaluation, start with variable relationship significance represented by path coefficients in accordance with research hypothesis. The next stage is to evaluate the R-square (R^2), effect size f^2 evaluation, Stone-Geisser Q-square test evaluation for predictive relevance and goodness of fit (GoF) evaluation for model validation.

The results of PLS algorithm analysis generated correlation values between the relevant variables. SCI and its first order construct variables have correlation values 0.865, 0.887 and 0.926. Whereas IS to its first order construct have correlation values 0.962 and 0.960. BSR correlation values to its first order construct are 0.920 and 0.904. And SCP has correlation values with its first order construct 0.840, 0.829 and 0.954. All correlation values are significant at the level of 0.05.

PLS algorithm also generated path coefficient values for all research variables. The significance value obtained from the bootstrapping process by using a sub-sample value of 500 and 0.05 level of significance in PLS that resulted t value for each path coefficients in the

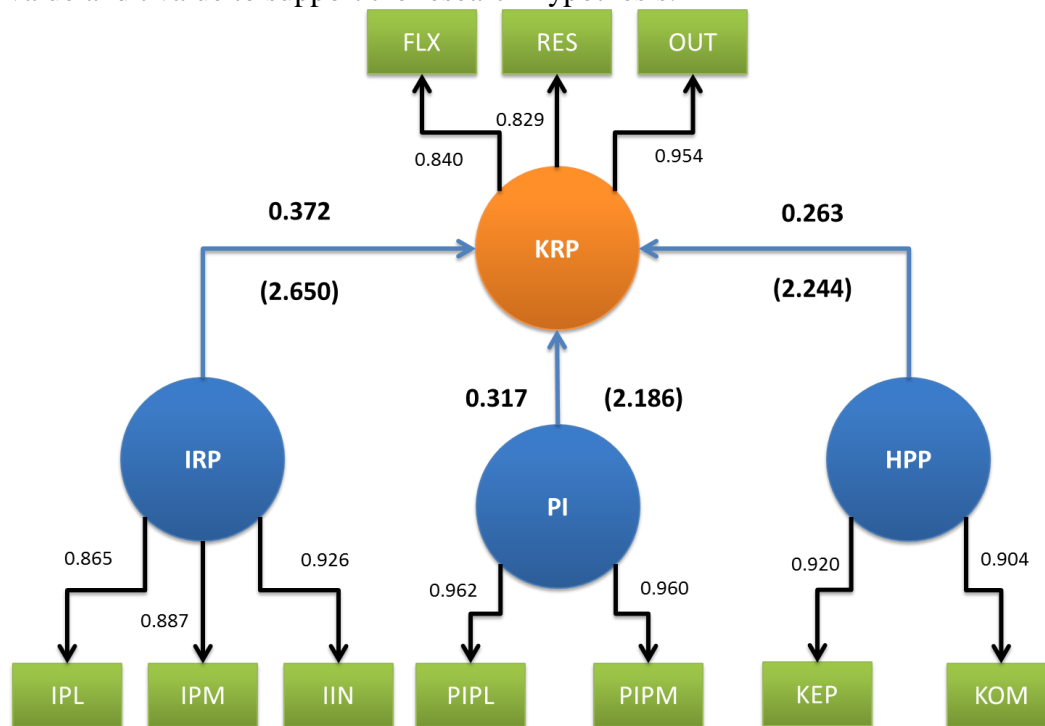
model. PLS analysis results can be seen in Figure 3.1 below which includedpath coefficient value and t value to support the research hypothesis.


Figure 3.1Path coefficient and t value

Figure 3.1 shows the effect of SCI, IS and BSR to SCP. As shown in the figure, SCI has a positive influence to SCP ($\gamma 11 = 0.372$, t = 2.650) supports the hypothesis H1. Then IS also positively influences SCP ($\gamma 21 = 0.317$, t = 2186) supports the hypothesis H2. Hypothesis H3 is also supported that BSR positively influences SCP ($\gamma 31 = 0263$, t = 2,244)

Then R-square (R^2) evaluation was also conducted to determine how much latent exogenous variables (supply chain integration, information sharing and buyer-supplier relationships) influences were able to explain endogenous variables (supply chain performance) variability. R^2 value of supply chain performance is 0.789, which means supply chain integration, information sharing and buyer-supplier relationships together are able to explain the variability of supply chain performance by 78.9%.

The effect size f^2 evaluation will determine the effect of exogenous latent variables (SCI, IS and BSR) on the structural level when they are or not in the research model. f^2 effect size value for SCI is 0.152 (a moderating influence on the structural level) means SCI moderately contribute to the research model. Values f^2 effect size for IS and BSR are 0.123, 0.109. They have little effect on the structural level, both of these variables only make a small contribution to the model.

Stone-Geisser's Q^2 evaluation is used to examine the model predictive ability of exogenous latent variables. This value is obtained through the process of blindfolding in PLS data analysis. Construct cross validated redundancy value of supply chain performance (SCP) is 0.448 greater than 0. Therefore exogenous latent variable SCI, IS and BSR have good predictive ability for endogenous latent variables SCP.

The last evaluation of inner model is goodness of fit (GoF) evaluation that was examined to validate the overall model (inner model and outer model evaluation),the result of GoF index calculation in this study is 0,702 and greater than 0.26. It is categorized as large GoF and indicates overall model both inner model and outer model are met to standard requirement as a good model.

Result and discussion

Supply chain integration have partially the highest influence on supply chain performance with the path coefficient 0.372, t statistic value 2,650> 1,96 and significant at P Value 0.008 <0,01 compared to two other variables. Therefore, organizations with higher degrees supply chain integration are more likely to have better supply chain performance. This finding is consistent with those of Lee et al (2007), Baofeng Huo (2011), Pinindari (2011),Kocoglu (2011) and Abdallah et al (2014). However this study does not support those of Sezen (2008) and Gimenez et al (2011).

PTFI domestic suppliers Jakarta and Surabaya area implemented supply chain integration practices with supply chain partners both their suppliers (sub-suppliers or manufactures) and customer (PTFI) increasingly improve flowof information, materials, products or services and finance in all parties. They have better coordination and communication with their suppliers and manufactures through their information network. PTFI as customer utilizes ERP and web base system to manage its procurement process. Suppliers have significant role to receive and review PTFI order electronically, review PTFI stock item status and their delivery status. It represented the strong integration as there seems no limit or boundaries between all supply chain partners. Meanwhile, internal integration through integrated internal data, periodic department meeting and cross-functional team utilization encourage suppliers to optimize their resources in their effort to support customer and supplier integration.

Information sharing is essential to ensure the seamlessly flow of information among supply chain members to support their supply chain activities. Information sharing has the second greatest influence partially on supply chain performance with the path coefficient 0.317, t statistic value 2,186> 1,96 and significant at P Value 0.029<0.05. When organization is willing to share its information with supply chain partner, it will drive better performance for all parties in supply chain context. It is align with previous studies from Kocoglu (2011), Ibrahim et al (2011), and Abdallah et al (2014). However this study does not support those ofSezen et al (2008), Rashed et al (2010) and Pinindari (2011).

PTFI domestic suppliers Jakarta and Surabaya area closely monitor and communicate their orders to sub-suppliers or manufacturers to ensure the quality and delivery of products. By using supplier portal provided by PTFI, suppliers are able to review and update PTFI orders frequently to provide the real-time order status, better and flexible response to order changes . The distribution of clear and explicit information shared with their sub-suppliers or manufacturers and customer (PTFI) provide great benefits to all supply chain parties by enabling them to take the right decision on their operational and business activities. However, all parties need to guarantee the confidentiality of shared information especially related to intellectual property rights to prevent any information abuse. PTFI as customer also necessarily communicates its standard of procedure related to procurement process for suppliers to ensure their understanding in roles and responsibilities to provide on-time delivery and proper goods or services.

Buyer-supplier relationships have the smallest influence than the two other variables partially on supply chain performance with the path coefficient 0.263, t Statistic value 2.244> 1.96, and significant at P Value 0.025<0.05. This study supports previous studies by Hsu et al (2008), Gozlu (2010), Kamau (2011) and Ibrahim et al (2011).

Although PTFI domestic suppliers Jakarta and Surabaya area generally have performed good buyer-supplier relationship with their sub-suppliers or manufactures and customer (PTFI), there are two indicators of trust dimension are still not optimally performed. Responsible is a key indicator to measure how suppliers will respond customer orders and fulfill their delivery time. It was concerning that suppliers often asked PTFI to modify the order due date as they unable to deliver the order on-time. PTFI expected suppliers to commit with their delivery time as their proposed, but many suppliers are unable to keep their promise. They will give some

reasons just to justify their late delivery. Low score in responsible and keeping promises indicators indicated suppliers still need to reconsider their approach in developing their partner's level of trust. The higher level of trust will lead to better relationship for upstream and downstream supply chain members and improve overall performance.

Conclusion

This study examined PT Freeport Indonesia domestic suppliers Jakarta and Surabaya area to determine the effect of supply chain integration, information sharing and buyer-supplier relationship to supply chain performance based on encountered supplier performance issues. By reviewing literature from previous studies and referring to existing issues, this study stated its research hypothesis and performed statistical analysis to confirm the hypothesis.

While supply chain integration, information sharing, and buyer-supplier relationship are found positively influence supply chain performance, there are some factors that need adequately further action for better result in the future. Supply chain integration trough customer integration, supplier integration and internal integration will improve the coordination of business activities among supply chain members. Information sharing between supply chain members provides the opportunity to obtain valuable information on the right time and the right place for better decision making. Buyer-supplier relationship increase the level of trust and commitment all supply chain members and will establish competitive advantage. All of those aspects will lead to improved supply chain performance in terms of flexibility, resources and output performance.

Abstract

To anticipate declining ginger selling price when the harvest season is over, medicine plant farmers in Karanganyar, Indonesia process fresh gingers into ginger simplisia (dried form). Accordance to SNI 01- 3393-1994, the maximum water content in ginger simplisia should not be more than 12%. To support farmers in producing ginger simplisia, the prototype of solar dryer has been made. The prototype uses a main heat source from solar energy and a heat backup source from biomass stove. Before the solar dryer can be applied by farmers, the prototype needs to be evaluated. The evaluation was done by the experimental method. Experimental method that used in this study was a split-split-plot design. Based on the results, the solar dryer prototype has been able to meet the performance target when using heat source from solar energy (up to 12% water content within 8 -12 hours).
Keywords: *solar dryer, experiment study, water content, split-split-plot design*

Introduction

Simplisia is a dried form of natural substance that is used as raw material medicine (Dirjen POM, 1982). National Standardization Agency of Indonesia (BSN) in the SNI 01-7087-2005 stated that specifications for the ginger rhizome are fresh, no buds, bright cross-sectional, intact, and free from insects or other pests. For the standard product of dried ginger (ginger simplisia), the standard is based on SNI 01-3393-1994. Within these standard, there are some special requirements regulating ginger simplisia that can be categorized to have a good quality, which include 12% maximum water content of ginger simplisia.

Previously, medicine plant farmers in Karanganyar, Central Java, Indonesia used the conventional drying method to dry ginger rhizomes. This method was done by drying the ginger rhizomes that has been cut under direct sunlight. Figure 1 shows the drying process of ginger rhizomes with the open sun drying method.

Figure 1. Direct open sun drying method of ginger simplisia

Open sun drying drying method was less effective and efficient, as it required a wide space, long time, depending on weather conditions, and make ginger simplisia was easily contaminated with dirt or mold spores. Based on research by Fahma et al. (2014), the ginger simplisia was not homogeneous and still had 18-20% water content.

Based on these problems, the technology that can be used to dry the ginger simplisia has been developed. The technology was a solar dryer which has a main heat source from solar energy and a backup heat source from biomass stove (Agassi et al, 2015). The prototype of solar dryer is shown in Figure 2.
Figure 2. Solar Dryer Protoype with A Backup Heat Source from Biomass Stove

The solar dryer prototype used woods as the main frame. It was based on the consideration that the solar dryer can be reproduced independently by farmer groups in the region that the region has the potential sources of wood. The solar dryer prototype had the dimensions of length, width, and height of 2,4 x 1,2 x 2,2 meters. The solar dryer prototype specification are presented in Table 1.

Table 1. Solar Dryer Spesifications

Solar Dryer Parts	Spesifications
Frame Material	Wood Zinc 1,8 m
Solar Collector Material	15°
Solar Collector Size	5 mm
Solar Collector Slope	0,13 m^2
Solar Collector Thickness	
Inlet Size	0,14 m^2
Collector-Drying Chamber Connection Hole Size	1,9 m x 1,2 m x 0,6 m
Collector Dimensions	16
Number of Drying Rack	6°
Drying Rack Slope	8 cm
Distance Between Drying Rack	7 kg
Drying Maximum Capacity	1,2 m x 0,6 m x 1,7 m
Drying Chamber Dimensions	Aluminium
Biomass Stove Material	0,6 m x 0,4 m x 0,3 m
Biomass Stove Dimensions	

Agassi, et al (2015) has conducted evaluation by computer simulation, with the result showed that the solar dryer has been able to meet the performance target both the drying heat

source from sun (solar) energy and the backup heat source from biomass stove. The performance target of 12% water content was achieved within 5-8 hours. Moreover, the drying condition result was uniform for all ginger simplisia.

Before the solar dryer can be used by farmers, in addition to an evaluation by computer simulation, the prototype needs to be evaluated by direct testing. It aims to find out the real perfomans solar dryer based on real environmental conditions. The direct testing was conducted by the experimental mechanism.

Literature Study
Ginger Simplisia and SNI 01-3393-1994

Simplisia is a dried form of natural substance that is used as raw material medicine (Dirjen POM, 1982). Simplisia can be derived from plants or animals. The production process of simplisia consists of several steps: washing, first sorting, slicing, drying, second sorting, packaging, storage. The illustration in Figure 3 shows sample form of fresh rhizomes and various product of simplisia.

Figure 3. Examples Form of Fresh Rhizomes and Simplisia

Indonesia has a standard relating to the characteristics of simplisia used as herbal raw materials or traditional medicine. For ginger, Indonesia through the National Standardization Agency (BSN) has issued a standard product of ginger simplisia in SNI 01-3393-1994. The detail of ginger simplisia quality requirements is listed in Table 2.

Table 1. Ginger Simplisia Requirements in SNI 01-3393-1994

Characteristics	Requirement
Smell and taste	Unique
Maximum water content (%)	12
Minimum il content (ml/100g)	1,5
Maximum ash content (%)	8,0
Fungi and Insect	No
Maximum foreign object/material (%)	2,0

Drying Method

Medicine plant farmers in Karanganyar, Indonesia beside sell rhizomes in fresh form, also process into simplisia (dried form). During the production process of simplisia, drying is the process that takes the longest time. It has been presented in the introduction that farmers drying was done through the conventional (traditional) way, by direct open sun drying. The direct open sun drying process takes 10- 14 days. Previously, farmers in Karanganyar, Indonesia already have a oven for drying rhizomes (Figure 4). The oven dryer was a relief from the Ministry of Research and Technology Indonesia in 2011. Based on its technical specifications, the oven dryer was

capable to drying rhizomes with a production capacity of 100 kg. However, this oven dryer did not benefit the farmers. Because the use of very high power (10,000 watts) and long time drying (24-hour). At the beginning, the farmers were still trying to use this oven in the drying process by hiring power generating units, but this resulted in high production costs (Fahma et al, 2014). So in the end farmers returned to traditional drying method for the production of simplisia.

Figure 4. Oven for Drying Simplisia

To solve these problems, it has been developed a dryer with a heat source from solar energy (solar dryer) and it equipped with a backup heat source from biomass stove. The solar dryer design was based on the needs of farmers that the drying process of simplisia do not require electricity, but still be able to meet the drying target.

According Hii (2012), solar dryer is a drying mechanism by utilizing the heat energy of sunlight that has been used to dry the plants, seeds, fruit, meat, and other agricultural products. The solar dryer with mix heat source (hybrid) has been developed by the Asian Institute of Technology (AIT) for drying agricultural products. The solar dryer used heat energy from the sun by using flat plate solar collector. Kirirat (2006) designed a solar dryer using solar energy with backup from biomass stove as heat sources drying. The biomass stove was used as energy reserves when the heat energy from the sun can not be used, for example at night, cloudy, or rainy. Kirirat (2006) solar dryer design was used as the basis Agassi et al (2015) to make the effective technology for farmers in Karanganyar, Indonesia to drying simplisia. The design and prototype of Agassi solar dryer shown in Figure 5.
Figure 5. Design and Prototype of The Solar Dryer

Experiment

Experiment is an defined action of steps, so the necessary information for the problems can be collected and analyzed to answer the question. Experiment can be use to test/evaluate the performance of tools or equipments for further development.

To assess the performance of solar dyer prototype that has been made, it was necessary to do experiments to find out capabilities of the solar dryer. Before the experiment was conducted, the experiment should be designed so that the objective of the experiment can be achieved. This experiment was designed with reference to the previous studies that have been done before.

In this study, there are three factors used in the experiment. The first factor is the heat source. The decision to make the heat source as one of the factors because there are presumption differences in the response of different heat sources. Additionally, the study about the solar dryer with different heat sources also conducted by Kassem et al (2006). In that study, the systems used are solar dryer drying, direct open sun drying (as a natural drying method) and oven drying (as artificial drying). While on this dryer, heat sources to be compared were solar drying, biomass stove drying, and combination of both.

The second factor in the experiment of this study was the drying time. Comparing to another steps in the drying process from fresh rhizome into simplisia, the drying step takes a long time. However, if too long, it makes the simplisia did not meet the quality. Therefore, it is necessary to find the optimal time to dry the simplisia.

In observing the drying time, Susilo and Okaryanti (2012) conducted a study in a drying machine to dry the Mocaf chips (Modified Cassava Flour) fermented with a thickness of 1-1.5 mm for 9 hours starting from 09:00 am until 18:00 pm. Then, the temperature and humidity on the drying machine were measured every one hour.

However, sometimes the drying time was dependent to the drying rack position. It caused by the temperature difference between top racks and bottom racks position. Therefore, the position of the rack was also used as a factor in this experiment.

Meanwhile, the water content of the simplisia was a response to be measured. The water content was directly affected by temperature, humidity, and wind speed (Yuwana and Silvia, 2012; Rocha et al., 2011). The temperature, humidity, and wind speed were actually also be referred to uncontrolled factors. However, these factors were also influenced by the source of heat, drying time, and rack position. Thus, the temperature, humidity, and wind speed were more accurately described as between responses.

Methodology

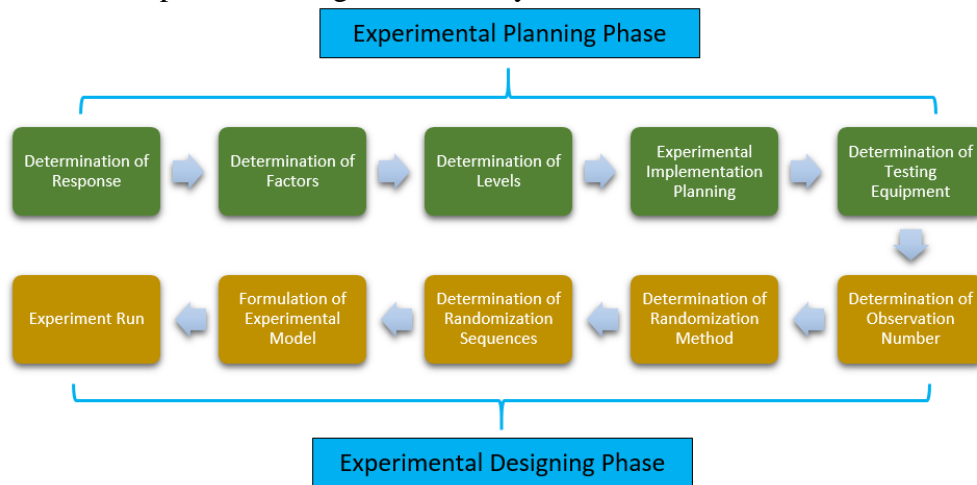
Before the experiment was conducted, the experiment design was need to be developed. Figure 6 shows the experiment design of this study.


Figure 6. Experiment Methodology

1.   **Experiment Planning Phase**

Determination of Response

The water content of ginger simplisia was selected as a respon in this study. In addition, there were selected environmental responses from internal environmental conditions (temperature and humidity of drying chamber) and external environmental conditions (wind speed and outside temperature of the drying chamber).

Determination of Factors

In this study, source of heat, drying time, and rack position were selected as factors. The heat source was expected to have an influence on the drying process according to the research by Kassem, et al (2006). Meanwhile, the difference in drying time ever assessed by Susilo and Okaryanti (2012). The position of the rack was used as a factor because it was expected differences in water content at each rack position. Figure 7 shows the rack position of the solar dryer prototype in this study.

Figure 7. Racks Position in the Solar Dryer Prototype

Determination of Levels

The heat source has three levels: sun (solar), biomass stove, and both combined solar and biomass stove energy. The position of rack has eight levels: rack A, rack B, rack C, rack D, rack E, rack F, rack G, rack H, as shown in Figure 7. The drying time has 8 levels: 1 hour of drying, 2 hours of drying, 3 hours of drying, 4 hours of drying, 5 hours of drying, 6 hours of drying, 7 hours of drying, and 8 hours of drying based on the research by Susilo and Okaryanti (2012).

Experiment Implementation Planning

In this study, the experiment used ginger as a research object. The quality of gingers that were used in this study was considered homogeneous. Before experiment was conducted, fresh gingers were washed, aerated, and sliced crosswise with a size of 3-6 mm. In this study, the experiment used a 2 kg of fresh ginger in each experiment run. The fuel used for biomass stove in this study was a branche of woods.

Determination of Testing Equipment

The measuring instruments used in this experimental study were: thermometer (to measure the temperature inside the drying chamber), thermo-hygrometer (to measure the temperature and humidity inside the drying chamber), anemometer and thermometer (to measure wind speed around and outside the drying chamber, moisture gauge (to measure the water content of ginger simplisia).

Experimental Designing Phase

Determination of Observation Number
In this study, the experiment took 3 times replications at random method.

Determination of Randomization Method

The experiment in this study used split-split-plot randomization method. The heat source factor had three levels contained in one prototype, so the experiment must be run separately (plot). Furthermore, randomization in retrieval data in a split (split-plot) was based on the drying time, where the experimental data taken in consecutive accumulated time. So the experiment was more efficient because the drying time was not be repeated. Then the experiment data was taken in a split-split-plot design according to the rack position.

Determination of Randomization Sequences

According to the experiment design (split-split-plot), ginger simplisia were measured randomized to each rack on each drying time in each heat source.

Formulation of Experimental Model

The experimental model developed in this study is shown in equation 1. $Y_{ijk} = \mu + R_i + S_j + RS_{ij} + W_k + RW_{ik} + SW_{jk} + RSW_{ijk} +$

whole plot   *split-plot*

$P_m + RP_{im} + SP_{jm} + RSP_{ijm} + WP_{km} + RWP_{ikm} + SWP_{jkm}$ (equation 1)
split-split-plot

Where,

Y_{ijk}	:	Decreased levels of ginger simplisia water content
μ	:	Average water content reduction
R_i	:	Replication
S_j	:	Heat source factor
RS_{ij}	:	Interaction between replication and heat source W_k : Drying time

factor

RW_{ik} :   Interaction between replication and drying time SW_{jk} : Interaction between heat source and time

RSW_{ijk} :   Interaction between replication, heat source, and drying time P_m : Rack position factor

RP_{im} :   Interaction between replication and rack position SP_{jm} : Interaction between heat source and rack position

RSP_{ijm} :   Interaction between replication, heat sources, and rack position WP_{km} :   Interaction between drying time and rack position

RWP_{ikm} :   Interaction between replication, drying time and rack position SWP_{jkm} :   Interaction between heat source, drying time and rack position

Result and Discussion

The implementation of the experiment lasted for three days, with the first day of drying condition with solar heat source, the second day was drying with the biomass stove heat source, and the third day was drying with the heat source from both (combined) solar and biomass stove heat source. The experimental procedure used in this study was according to the methodology steps. The overview of the experiment implementation in this study is shown in Table 3.

Table 3. Experiment Steps of The Solar Dryer

No	Steps
1.	Preparing ginger rhizomes (washing and slicing with a thickness of 6 mm / standardized thickness of the herbal industry and traditional medicine)
2.	Arranging gingers into the racks of drying ch
3.	Record the drying temperature inside the drying chamber (under heating conditions fr___ ___t, bi___ stove, and a combination of both)
4.	Measuring water content of ginger simplisia per
5.	Record the weight of dried ginger (ginger simplisia) as the result of the d___ ___s

After the experimental testing, the interaction of three factors experiment: heat source, drying time, and position of the rack was discussed further by the ANOVA test. Based on the ANOVA test for three interaction factor, there was a significant difference at each level of the experimental factors. From the ANOVA and SNK (Student Newman Keuls) test, it can concluded that the best interaction of the three factors that can decreased water content of ginger simplisia are as follows:

The heat source from solar energy on rack D with 8 hours drying time with 61.4% of

average water content reduction.

The heat source from biomass stove energy on rack D with 5 hours drying time with 63.9667% of average water content reduction.

The heat source from combination both solar and biomass stove energy on rack D with 5 hours drying time with 61.2667% of average water content reduction.

From these tests, all heat sources can be used to dry the gingers according to the water content target of 12% (SNI 01-3393-1994). However, if examined from the temperature, the biomass stove drying process resulted in more than 60°C drying temperature. According Fitriani (2013) ginger drying process should be done at a temperature between 40-60°C. This was to maintain the essential ingredients in ginger simplisia. To overcome these problems, it is necessary to do the installation of the thermostat, where this concept has emerged in the solar dryer design concept, but has not been realized in the prototype of this product.

The solar dryer with solar energy heat source can be used during the summer where there is enough sunlight to support the drying process. Meanwhile, the use of biomass stove, both as an primary energy source or in combination with the main heat from solar energy can be used during the rainy season. This ensures the drying process is still ongoing despite at the night or at the cloudy weather.

Conclusions

To evaluate the performance of solar dryer prototype, the experimental method has been conducted. The experiment showed that to achieve the ginger simplisia water content target according to SNI 01-3393-1994, the use of solar energy as heat source took eight hours, while the use of a biomass stove as heat source took 5 hours. Although shorter in achieving the target of 12% water content standard, but the use of biomass stove as heat source of drying needs to be studied further in this solar dryer. This is because the biomass stove can not meet the maximum allowable heat for the drying (40- 60°C). Best rack position to reach the target is on rack D. But in its implementation, all of racks can be used well. This is because the flow of hot air inside the drying chamber is quite homogeneous.

GREEN BUSINESS DESIGN OF COFFEE WASTE THROUGH REVERSE LOGISTIC FOR URBAN FARMING

Poundra Viveka Nanda, Universitas Airlangga, Indonesia
Indrianawati, Universitas Airlangga, Indonesia

Abstract

Coffee is one of the popular beverages, which is currently becoming a trend and part of an urban lifestyle. Based on the data collected from the Association of Indonesian Coffee Exporters (AICE), it was noted that an increase in consumption of coffee by Indonesians began four years ago. And it is predicted that the needs of coffee in 2016 will hit 300 million kilograms or reach the coffee consumption per capita as big as 1.15 per kg / capita / year.

The increasing number of coffee enthusiasts in Indonesia triggers the growth of new small business sectors, such as cafe, with a variety of forms ranging from the cheap prices up to the classy cafe. The interesting things that were examined in this study are the impact of these business processes, namely the coffee grounds. Transforming the negative impact on the environment of coffee grounds waste into beneficial forms that bring positive impacts to the environment.

This research is aimed to create a business plan coffee grounds waste management into something that brings economic value through the concept of reverse logistics. This study aims to describe the design of reverse logistics for the management of coffee grounds waste in order to be utilized as a new product and generate added value for businessmen.

Keywords: *waste*, *reverse logistics*, *economic value*

Background

Coffee is one of the popular beverages, which is currently becoming a trend and part of urban lifestyle. Based on the data collected from the Association of Indonesian Coffee Exporters (AICE), it was noted that the consumption of coffee by Indonesians is increasing rapidly.

Table 1 Data of Coffee Consumption in Indonesia

No.	Year	Number of Population (persons)	Needs of Coffee (kg)	Coffee Consumption (kg/capita/year)
1	2010	237.000.000	190.000.000	0,80
2	2011	241.000.000	210.000.000	0,87
3	2012	245.000.000	230.000.000	0,94
4	2013	249.000.000	250.000.000	1,00
5	2014	253.000.000	260.000.000	1,03
6	2015	257.000.000	280.000.000	1,09
7	2016*	260.000.000	300.000.000	1,15

* estimation

Based on the data presented in Table 1 above, it can be seen that the interest of the Indonesian people for coffee has increased evey year, and predicted that coffee needs in 2016 will reach 300 million kilograms or reach the coffee consumption per capita as big as 1.15 per kg / capita / year. The phenomenon of the increasing number of coffee enthusiasts also occurred in East Java, especially in the City of Surabaya. The number of cafes in Surabaya are growing by 10-15% annually alongside with the acceleration of the infrastructure development in East Java.

Looking at the Table 1.1, it can be seen the number of café / coffee shop located in the city of Surabaya has processed coffee-based beverages for their core products (www.tripadvisor.com, 2016). This chart has been compiled based on data collected by Trip Advisor, the biggest website in the world which contains a lot of reviews related to travel business with over 60 million members in the world and operates in 30 countries around the world as follows:
Figure-1 *Coffee Shop* **in Surabaya**
Source : www.tripadvisor.com,2016 (prcessed)

As seen on Graph 1.1 the number of café / coffee shop in Surabaya, the coverage area of café / coffee shop which are still active until recently listed as follows: there are 4 outlets in North Surabaya, 15 outlets in Central Surabaya, 20 outlets in West Surabaya, 18 outlets in East Surabaya, and 12 outlets in South Surabaya. The growth of the small business sector / café that involve a variety of business operations and production activity are seen as activities that significantly impact the environment changes. In connection with environmental issues, in running the business process employers should think of ways to minimize waste and reduce negative impacts on their surroundings.

One factor needs to be considered is the company's supply chain management. Supply chain management is a set of activities in the form of entities or facilities involved in the process of transformation and distribution of goods ranging from raw materials from the very start to the final consumer. Implementation of supply chain management has now becomes environmental factor which has considered as a global issue in a business. Issues about business concept in regard to environmentally friendly, encourage businessmen to adjust to the concept of green business / industry in their every business process. The concept of green business / industry itself in its development is known as the concept of green 552 procurement (environmentally friendly procurement), green manufacturing, green distribution, and reverse logistics (Ninlawan et al., 2010). It is also in line with the concept of the triple bottom line, as quoted from the article at www.swa.co.id edition in November 2010, the concepts that define the sustainability and growth of the company depends not only on the profit alone, but also the real action of the company the social circumstances (people) and the environment (planet). The three components of the triple bottom line moves dynamically depending on the circumstances and the pressure of social, political, economic, environmental, and due to possible conflicts of interest of certain parties (Elkington, 1998). Besides, it also refers to the concept of blue economy as stated by Pauli (2010), the concept of blue economy aims to provide opportunities for businesses to develop investment and business that brings more profit both economically and environmentally.

One of the interesting issues for further discussion on the topic of supply chain management is the application of reverse logistics in a company. In general, a lot of research only discusses the flow of forward logistics, which only concerns about the flow from suppliers to the final consumer. This shows that there is not much research that fundamentally studies about the flow in the backward or reverse performed from consumers, retailers, and to the company or from within the company itself. Theoretically reverse logistics also has a major influence on the cost for both the companies and the suppliers (Daugherty et al, 2005).

Focusing back on the rapid growth of café / coffee shop business which is booming a trend in Surabaya, waste production in the form of coffee grounds produced during the production process is unavoidable by the manufacturer. This will be discussed by the authors, which is a problem in the supply chain or problems in supply chain management that will ultimately "give birth" to the reverse logistics activities in the supply chain looking at the point of view in waste management or the dregs of coffee production in order to be utilized as a new product. As noted in the article at www.nationalgeographic.co.id in January 2015 edition, production in the form of waste coffee grounds can be utilized as several new products, among others they are: hair care products, skin care, facial scrubs, and complementary ingredients kitchen, briquettes, and manure or fertilizer. The research will focus on the use of coffee grounds that will be processed into fertilizer / fertilizer materials plants so that they will have economic values. This research is intended to design green reverse logistics business through the management of waste. The results of this study are expected to provide benefits, such as for businesses, to determine the design of reverse logistics for the management of waste in the form of coffee grounds in order to create economic value products and to provide a solution in the form of recommendation, and as the study of literature in future studies that focuses on the research of reverse logistics design.

Theoritical Background

Supply Chain Management is defined as a set of methods that collaborate every part of business (supplier, manufacturing, warehousing, and consumers) so that the product can be produced and distributed at the right time, the right place, the right amount, and the conditions according to which desirable, with the aim of minimizing the total cost of the expenses, and be able to improve service needs of the end consumer (Simchi-Levi, 2009).

Logistics is defined by the Council of Supply Chain Management Professionals (CSCMP) as a process of planning, implementing and controlling the efficient flow and effective in the cost of raw materials, in process inventory, finished goods and related information from point of origin to point of consumption for the purpose in accordance with customer requirements (Kenneth and Dwayne, 2008). Include events logistics transportation, warehousing (storage warehouses), inventory, value, and management (Ming-Chih et al, 2008). Logistics is part of the supply chain management; it helps trigger the development of a network or network in supply chain management and supply chain support to the organization. As explained in the advice given by Dischinger et al (2006) which states that the logistics professionals must be able to process various functions of skills, technical skills, leadership skills, global management, experience, and credibility.
