ABSTRACT

Current technologies and therapies of hair disorders are not yet satisfying people suffer from hair loss, so that efforts in seeking effective medicine for promoting hair growth are still continues. This study intended to investigate and confirms the effects of crude corms extract of pisang kepok (*Musa balbisiana*) given topically on rabbit hairs growth. Four healthy, male rabbits, aged 4-5 months, weighing 1.5 kg – 2 kg were used for the study. Six areas (2 cm x 2 cm each) on the dorsal aspects of animals were shaved. The first shaved area treated topically with nothing (normal control). The second and third areas treated consecutively with gel without banana corms extract (as negative control) and reference formulations (as positive control). The last three areas treated with gel containing corms extract of pisang kepok with the concentration of 2%, 4% and 8% respectively. All treatments were given once daily for 21 days. The length of hairs were assessed on day 7, 14 and 21, while the hair mass was measured on day 22. The results showed herbal topical gel containing crude corms extract of pisang kepok significantly increase the animal hairs length and mass in comparison to the normal and negative control. Therefore it can be suggested that herbal gel containing corms extract of *M. balbisiana* is potent to be use as the topical formulations for hair growth.

KEYWORDS: Pisang kepok, *Musa balbisiana*, hair loss, hair growth promotion, banana corms extract, androgenetic alopecia.

INTRODUCTION

Although new technologies and hair disorders therapy already widely introduced, many people still suffer from distress condition due to hair loss, thinning and baldness. That is why hair care practitioners all over the world still continues to develop new therapies to stop hair loss and to enhance hair growth, including seeking for alternative or traditional medicine.^[1,2] Traditionally, there are many types of method to treat hair loss (alopecia) in different system of medicine including herbal medicine.^[3]

Referring to pharmacological works in the last five years, there were various herbs reported to show hair growth promoting activities in test animals. Among the examples are as follows. Formulation containing extract of *Hibiscus rosa sinensi*, *Calotropis gigantea* and the combination of both plant extracts showed better hair growth activities in *stressinduced alopecia animal model* by using minoxidil as positive control.^[4] Fresh leaf extracts of *Naringi crenulata* showed hair growth promoting effects in rats.^[5]

The petroleum ether extract of *G. glabra* showed a higher proportion of anagenic hair follicles, *vis-a-vis* telogenic hair follicles, in female rats.^[6] Next, pea sprouts extract^[7], *Eclipta alba* extract^[8], alcoholic and aqueous extract of *Centella asiatica*, *Cyperus rotundus* and *Embllica officinalis*, also showed hair growth promoting activities in laboratory animal.^[9]

In addition to the above mentioned plants, bananas (*Musa* spp.) are also known to be utilized in many folk medicine system for hair care. Among the examples, extract of the trunk's juice can be used to massage scalp to promote healthy growth of hair and preventing hair loss. Other benefits including preventing split ends and breakage, help in softening the hair and protects the hair's natural elasticity and repairing dry and sun-damaged hairs. The benefits allegedly because bananas are rich in potassium, natural oils, carbohydrates and vitamins, mainly vitamin B.^[10]

Despite many herbs and chemicals allegedly may be attributed to the hair growth, many reports relating to the effect of some substances on hair improvement seem to

anecdotal, that in clinical practice, the results obtained are still disappointing when we are confronted to problems.^[11] Moreover, in the context of a banana, there are still many questions need to be verified including the types, plant parts, and substances that actually possess positive activities and affect hair growth. This study was intended to investigate and confirms the effects of crude corms extract of pisang kepok (*Musa balbisiana*) given topically on rabbit hairs growth.

MATERIALS AND METHODS

Plant Sample and Extraction

Banana corms used in the study were collected from a farmer in Gunung Terang, sub-district of Rajabasa, the city of Bandar Lampung, Lampung province, Indonesia. The corms were washed with aquadest, sliced into small pieces, and were shade dried. About 720 gram of the symplicia were macerated using 70% ethanol for 24 hours. After being macerated for four times, the macerate evaporated using rotary evaporator until 720 ml of extract was obtained and labelled as stock solution.

Animals and Experimental Design

Four healthy, adult, male New Zealand rabbits, aged 4-5 months, weighing 1.5 kg – 2 kg were used for the study. Both during the acclimation period and throughout the treatment, the animals were individually housed in a room with natural light cycle with the temperature range of 25 °C – 30 °C and fed with normal diet and water *ad libitum*.

The dorsal aspects of rabbits were divided into six areas, with a size of 2 cm x 2 cm each, on where the test formulation were applied. The hairs on each area were shaved using a razor. These areas are then marked as depicted in **Fig.1** as follows: NC, C-, C+, F1, F2, F3 and F4. Area NC is the shaved skin given nothing as the normal control. Area C- and C+ are the shaved skin treated consecutively with gel without banana extracts (as negative control) and reference formulations (as positive control). Area F1, F2 and F3 are the shaved skin

treated with gel containing corms extract of pisang kepok 2% (v/v), 4% (v/v) and 8% (v/v) respectively.

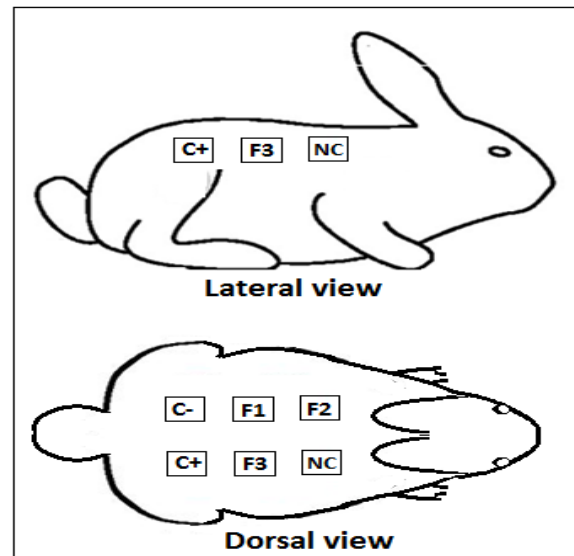

Fig.1 The dorsal aspect of rabbits where the position of treatment area are depicted. NC (normal control): untreated shaved area; C- (negative control): shaved area treated with gel without plant extracts; C+ (positive control): shaved skin given reference formulations; F1, F2 and F3 are the shaved area treated with gel containing extracts 2%, 4% and 8% respectively.

Formulations Ingredients of Topical Gel

The topical herbal gel was prepared using crude corms extracts of *M. balbisiana*, ethanol (96 %), carbopol-934 (1%), butylated hydroxytoluene, triethanol amine (q.s), methyl paraben (0.5%), propylene glycol 400 (5%), and distilled water in a quantity sufficient to prepare 100 g of gel in the case of blank gel. The amounts of ingredients (plant extract and gelling agents) used in the formulations are presented in Table 1.

Table 1. Amounts of ingredients per 100 ml of solution used in topical gel formulations

Ingredients	C-	F1	F2	F3
Banana Corms Extract	0	2 ml	4 ml	8 ml
Ethanol (96 %)	0,5 ml	0,5 ml	0,5 ml	0,5 ml
Carbopol 934 (1%)	0,5 g	0,5 g	0,5 g	0,5 g
Butylated hydroxytoluene	0,01g	0,01g	0,01g	0,01g
Triethanol Amine (q.s)	0,3 ml	0,3 ml	0,3 ml	0,3 ml
Methyl Paraben (0.5%)	0,1 g	0,1 g	0,1 g	0,1 g
Propylene glycol 400 (5%)	5 ml	5 ml	5 ml	5 ml
Aquadest (up to)	100 ml	100 ml	100 ml	100 ml

Formulations Ingredients of Reference

The hair growth promoting gel used as positive control in the study was a product that has been widely marketed in Indonesia. The formulations was containing *Aloe barbadensis* leaf extract (92%), alcohol, glyceryl polyacrylate, dipropylene glycol, butylene glycol, glycerin, propylene glycol, 1,2-hexanediol, polyglutamic

acid, betaine, sodium hyaluronate, calendula officinalis flower extract, mentha viridis (spearmint) extract, *Melissa officinalis* extract, carbomer, peg-60 hydrogenated castor oil, triethanolamin, phenoxyethanol water parfum, and disodium EDTA.

Gel Administrations and Observation

The gel (0.1 g/shaved area) was administered topically on the animal shaved skin, once daily, for 21 days. On day 7, 14, and 21 from each treated area was taken randomly 10 hairs and the length of each hair was measured using caliper and expressed in centimeter. On day 22 all hairs in treated area were taken and weighed using a digital microbalance and expressed as milligram.

Statistical Analysis

The data were described as mean \pm standard error (SE). One-way ANOVA and Least Significant Difference (LSD) test was used to determine the statistical significance ($p < 0.05$) of the differences between values of various experimental and control groups.

RESULTS

The descriptive and analytical data of the effects of six different topical gel on rabbit hairs growth after daily treatments on day 7, 14 and 21 are presented, respectively, in Table 2, 3 and 4. The results of one-way Anova for the data in Table 2 are $F = 3801.251$ and $P < 0.001$; for the data in Table 3 are $F = 526.482$ and $P < 0.001$; and for the data in Table 3 are $F = 64839.600$, and $P < 0.001$. Referring the results of LSD test on the mean values between the treatments which were shown in Table 2, 3 and 4, it is clear that herbal topical gel containing crude corms extract of pisang kepok (*Musa balbisiana*) significantly increase the animal hairs length in comparison to the normal and negative control. When compared to the positive control, the effect of the gel containing crude corms extracts of the plants, even at the highest concentration (8%), statistically lower.

Table 2 The description of rabbit hairs growth on day 7 after daily topical treatments

Treatments	Hair length of rabbits (mm)				Mean \pm SE
	1	2	3	4	
NC	5.11	5.19	5.21	5.20	5.180 \pm 0.024 ^a
C-	5.08	5.12	5.12	5.17	5.118 \pm 0.019 ^a
F1	6.84	6.76	6.77	6.76	6.793 \pm 0.018 ^b
F2	7.52	7.50	7.44	7.57	7.508 \pm 0.027 ^c
F3	8.38	8.24	8.21	8.33	8.280 \pm 0.045 ^d
C+	9.03	9.00	8.99	8.99	9.003 \pm 0.010 ^e

Mean \pm SE values that shared the same superscript are not significantly different at $\alpha = 0.05$. NC (normal control): untreated shaved area; C- (negative control): shaved skin treated with gel without plant extracts; C+ (positive control): skin given reference formulations; F1, F2 and F3 are the shaved skin treated with gel containing banana corms extracts 2%, 4% and 8% respectively.

Table 3 The description of rabbit hairs growth on day 14 after daily topical treatments

Treatments	Hair length of rabbits (mm)				Mean \pm SE
	1	2	3	4	
NC	9.53	9.52	9.30	9.31	9.415 \pm 0.061 ^a
C-	9.47	9.27	9.37	9.45	9.390 \pm 0.039 ^a
F1	13.88	13.82	13.81	13.82	13.833 \pm 0.018 ^b
F2	15.05	14.92	15.07	15.04	15.020 \pm 0.039 ^c
F3	16.29	16.46	16.52	16.51	16.445 \pm 0.055 ^d
C+	17.87	17.86	17.90	17.88	17.878 \pm 0.008 ^e

Mean \pm SE values that shared the same superscript are not significantly different at $\alpha = 0.05$. NC (normal control): untreated shaved area; C- (negative control): shaved skin treated with gel without plant extracts; C+ (positive control): skin given reference formulations; F1, F2 and F3 are the shaved area treated with gel containing banana corms extracts 2%, 4% and 8% respectively.

Table 4 The description of rabbit hairs growth on day 21 after daily topical treatments

Treatments	Hair length of rabbits (mm)				Mean \pm SE
	1	2	3	4	
NC	14.38	14.33	14.33	14.32	14.340 \pm 0.017 ^a
C-	14.31	14.29	14.44	14.38	14.355 \pm 0.033 ^a
F1	20.80	20.82	20.79	20.81	20.805 \pm 0.004 ^b
F2	22.89	22.95	22.93	22.88	22.913 \pm 0.027 ^c
F3	24.95	24.97	24.91	24.93	24.940 \pm 0.019 ^d
C+	26.94	26.91	26.93	26.89	26.918 \pm 0.012 ^e

Mean \pm SE values that shared the same superscript are not significantly different at $\alpha = 0.05$. NC (normal control): untreated shaved area; C- (negative control): shaved skin treated with gel without plant extracts; C+ (positive control): skin given reference formulations; F1, F2 and F3 are the shaved area treated with gel containing banana corms extracts 2%, 4% and 8% respectively.

Table 5 presents effects of topical gel on the rabbit hair mass after 21 days of treatment. The one-way Anova results in $F = 415.621$ and $P < 0.001$. Based on the results of LSD test it is markedly that herbal topical gel

containing crude corms extract of pisang kepok (*Musa balbisiana*) significantly increase the animal hair mass in comparison to the normal and negative control, although still lower than the positive control.

Table 5: The description of rabbit hairs mass in shaved skin area after 21 days treatments

Treatments	Hair mass of rabbits (mg)				Mean \pm SE
	1	2	3	4	
NC	39.8	39.1	38.8	39.5	39.30 \pm 0.22 ^a
C-	39.4	39.0	39.2	39.8	39.35 \pm 0.17 ^a
F1	42.7	42.4	42.9	42.0	42.50 \pm 0.20 ^b
F2	45.9	45.6	46.5	46.2	46.05 \pm 0.19 ^c
F3	48.5	48.0	48.1	48.3	48.23 \pm 0.11 ^d
C+	51.7	51.0	49.8	51.3	50.95 \pm 0.41 ^e

Mean \pm SE values that shared the same superscript are not significantly different at $\alpha = 0.05$. NC (normal control): untreated shaved area; C- (negative control): shaved skin treated with gel without plant extracts; C+ (positive control): skin given reference formulations; F1, F2 and F3 are the shaved skin treated with gel containing banana corms extracts 2%, 4% and 8% respectively.

DISCUSSION

In spite of the efficacy of the crude corms extract of pisang kepok (*M. balbisiana*) does not exceed the reference formulations (positive control), but the data of the study provide a significant contribution to the pharmaceutical science, particularly in the field of hair care. First, the study opens the insight that in nature there are too many plants which could potentially be used as alternative ingredients for enhancing hair growth, including bananas. Second, the results of this study make clear that the banana is a versatile crop^[12], even the parts (the corms) that are considered waste by the farmers, still have economic and health values.

The most common type of hair loss both in men and women is androgenetic alopecia (AGA). The cause of one of the dermatological disorders is rather complicated, involving a series of mechanisms that are not fully understood. Currently AGA is believed associated with the abnormality of androgens such as testosterone (T) and its derivative dihydrotestosterone (DHT). However, recently, authors have argued against the use of the term AGA in women, as the role of androgens in female pattern hair loss is debatable.^[13]

Beyond the debate on the cause of the androgenetic-related hair loss between male and female, researches on seeking the effective medicine for promoting hair growth either *in vitro* or *in vivo* using animal models still continues. Among the result of the studies suggested that hair loss can be prevented by eating foods rich in biotin and cystein.^[11] or using certain topical plant extracts or herbal oils.^[14,15,16]

By using 5% mixture of local Myrtus, Galls and Oak extracts to treat rats *in vivo*, Khidhir and Mahmood^[17], suggested that the effect of the extracts on hair growth may be mediated through the regulation of growth factors in dermal papilla cells. Such plants, Myrtus for example, containing citric acid, malic acid, resin, tannin,

sugar1, flavonoids, anthocyanin arabinosides, anthocyanin glucosides, kaempferol, quercetin, myricetin 3-o-glucoside, myricetin 3, 3-di-o-galactoside, myricetin 3 rutinoside, aesculin, scopoletin, caffeic acid, myricetin 3-o-rhamnoside or myricitrin, esculetin-6-oglucoiside or esculin, hesperetin 7-o-rhamnoglucoside or hesperidin, hesperetin-2-o-methylchalcone-4-orhamnoglucoside.

The essential oil content including 1, 8-cineole, α -pinene, methyl eugenol, terpineole, trans-carveole, cis-carveole, geraniol, methyl geranate, α -terpinyl acetate, neryl acetate, β -caryophyllene, myrcene, sabinene, myrcene, p-cymene, c-terpinene, linalyl acetate, car-3-ene, phellandrene, methyl eugenol, methyl butyrate, methyl benzoate, benzyl alcohol, isobutyl butyrate, myrtenylacetate, limonene, α -terpineol, linalool, eucalyptol, p-cymol, β -pinene, geraniol, camphene, butyl butyrate and myrtenol.^[18]

This study evidently showed positive promotion effects of crude extract of the banana corms on the hair growth in rabbits. Banana plant extracts, as indicated by many authors, contained majority or at least some of the phytochemicals that were found to show hair growth promoting activities. The extracted substances were β -carotene and α -carotene, lutein, stigmasterol, campesterol, cycloeucaalenol, cycloartenol, and 24-methylene cycloartanol and many types of vitamins including vitamin A, vitamin B, vitamin C, and vitamin E.^[19,20,21,22]

Other specific research to address the androgenetic-related hair loss indicated that hair growth can be promoted by treating the subject with substances, including herbal extracts, that potent inhibitory effect on the activity of 5 α -reductase, an enzyme responsible for transformation of testosterone into dihydrotestosterone.^[23,24] The octaphloretol A, an isolated component from the *Ishige sinicola* extract, inhibited the activity of 5 α -reductase and increased the

proliferation of dermal papilla cells (DPCs).^[25] Other botanicals that commonly used for treatment of AGA, that allegedly able to reduce free testosterone are lauric and myristic acid.^[26] Overall, from a variety of literature review, Semwal *et al.*^[3] stated there are dozens of substances suspected effect on hair growth, including saponin, alkaloids, ecliptine, wedelic acid, luteolin, triterpine, glycosides, β - sitosterol, hentriacontanol, vitamin A, vitamin C, iron calcium oxalic, malic acid, α pinene, β pinene, fatty acid, sterol compounds, polyphenols, steroids, volatile oil and essential oil.

Again, plant extract of banana revealed to contain almost of all the substances which were reported to possess promotion activities against the hair growth.^[27] The last and most important is it has already reported that the ethanol extract of banana peel can inhibit 5 α -reductase in mice.^[28]

CONCLUSION

Given the topical herbal gel containing ethanolic corms extract of *M.balbisiana* of all concentration levels, showed higher length of rabbit growing hair, it can be concluded that crude corms extract of pisang kepok is potent to be used as alternative herbal for the hair growth promotion.
