Dear Sayekti, Wuryaningsih Dwi; Zakaria, Wan Abbas; Syafani, Tyas Sekartiara; Mutolib, Abdul:

A manuscript entitled "Dominant Factors on Food Coping Mechanism of Poor Household in Pringsewu District, Indonesia" has been successfully submitted online by Dr. Sayekti and is presently being given full consideration for publication in the Malaysian Journal of Nutrition.

The manuscript ID is mjn.2020.0082.

Please mention the above manuscript ID in all future correspondence. If there are any changes in your personal particulars or e-mail address, please log in to ScholarOne Manuscripts at <https://mc04.manuscriptcentral.com/nutriweb> and edit your user information as appropriate.

You can also view the status of your manuscript at any time by checking your Author Center after logging in to <https://mc04.manuscriptcentral.com/nutriweb>.

If you have any objection on your name being included in this submission, please e-mail to: [mjnadmin@nutriweb.org.my](mailto:mjnadmin@nutriweb.org.my).

Thank you for submitting your manuscript to the Malaysian Journal of Nutrition, an official publication of the Nutrition Society of Malaysia (<http://www.nutriweb.org.my>).

Sincerely,  
Malaysian Journal of Nutrition Editorial Office

## Malaysian Journal of Nutrition - mjn.2020.0082 has been unsubmitted

---

Dari: Malaysian Journal of Nutrition (onbehalf@manuscriptcentral.com)

Kepada: sayekti\_wur@yahoo.co.id

Tanggal: Selasa, 1 September 2020 pukul 15.26 WIB

---

01-Sep-2020

Dear Dr. Sayekti:

Your manuscript, mjn.2020.0082, entitled "Dominant Factors on Food Coping Mechanism of Poor Household in Pringsewu District, Indonesia" has been unsubmitted to the Malaysian Journal of Nutrition. It has been unsubmitted because there are some corrections needed:

1. Main Document: i) Format: Please check the overall format, e.g. in this journal, we use 10-pt Bookman Old Style 1.5 spacing, not 12-pt Times New Roman double spacing. Please see the example main document attached. Your main document should look like the example main document attached. ii) Decimal point: In this journal, we use full stop (.) to indicate the decimal point, not commas (,). Please change all your decimal point from commas (,) to full stop (.). iii) Figures: You have coloured figures, please change your figures into black & white form.

2. Reviewers: Please be informed that reviewers should not come from the same institution as any of the authors. The reviewer, Helvi Yantika, that you suggested is from Lampung University, same university as the authors. Please suggest other reviewers from other university to replace her. Please also suggest 1 reviewer from outside of Indonesia.

Attached is the example main document for your reference. Please make the necessary amendments and re-submit the manuscript for consideration of publication. You may contact the Editorial Office if you have further questions.

Sincerely,  
Malaysian Journal of Nutrition Editorial Office

## 1 **Example of format for an MJN manuscript main document**

### 2 3 **ABSTRACT**

4 **Introduction:** This is an example of how your abstract should look like. The introduction  
5 includes rationale and purpose of the study. For example, the MyBreakfast Study is a  
6 comprehensive nationally representative study on breakfast habits among school children  
7 aged 6 to 17 years. This study aimed to determine breakfast habits among Malaysian school  
8 children. **Methods:** Summary of your methods (study design, analytical methods). Example,  
9 this was a cross-sectional study involving primary and secondary school children aged 6 to  
10 17 years. Socio-demographic background was obtained from parents through a  
11 questionnaire. Breakfast consumption was assessed using a breakfast habits questionnaire  
12 (BHQ). Height and weight were measured. Z-scores for BMI-for-age and height-for-age were  
13 determined and classified using WHO AnthroPlus software. **Results:** Main findings,  
14 example, a total of 8705 children had participated in the study, 5581 from primary school  
15 and 3124 from secondary school. The proportion of children recruited from the urban and  
16 rural area was 68.4% and 31.6% respectively. The overall prevalence of overweight and  
17 obesity was 14.0% and 14.4% respectively. It was found that 24.6% of the children skipped  
18 breakfast at least 3 days per week. **Conclusion:** Key aspects derived from the study.  
19 Example, Overall, 1 in 4 children skipped breakfast at least days a week. Interventions to  
20 promote regular breakfast consumption should be conducted in schools. The abstract  
21 should not be more than 250 words.

## 40 **INTRODUCTION**

41 The Malaysian Journal of Nutrition (MJN) welcomes manuscripts on current and emerging  
42 topics in human nutrition in the form of original articles, review articles, case reports, short  
43 communications and letters to the Editor. MJN is an international peer-reviewed journal.  
44 All materials submitted for publication are assumed to be submitted exclusively to the  
45 Malaysian Journal of Nutrition (MJN) unless the contrary is stated.

46  
47 The manuscript must adhere to the submission guidelines before it is considered eligible for  
48 review. Manuscripts should be typed on 10-point font Bookman Old Style, 1.5 spacing with  
49 a margin of 2.5 cm on all sides. The manuscript should have page number and include line  
50 numbering commencing from Introduction. This is an example of citation in text: in a study  
51 by Moy, Gan & Siti Zaleha (2006) in Kuala Lumpur, breakfast was found to be the most  
52 commonly skipped meal among school children and adolescents, and breakfast skipping  
53 was found to increase with age and was more prevalent in girls than boys (Moy *et al.*, 2006).

54  
55 Tables should be sufficiently labelled so as to be comprehensible and complement  
56 information in the text. Tables should be numbered consecutively in Arabic numerals in the  
57 sequence they are mentioned in the text. For example, Table 1 shows the demographic  
58 characteristics of the children. Tables should be typed on 10-font Times New Roman and  
59 single spaced. Do not use border lines on the right and left side of the table, and vertical  
60 lines within the table body. Use a single top line, a single line below the headings, and a  
61 single bottom line. All illustrations and diagrams should be referred to as Figures and  
62 numbered consecutively in Arabic numerals. Combined total number of tables and figures  
63 should not exceed five with the exception of Review Papers. Place tables and figures after  
64 the References, and not within the main text.

65

## 66 **MATERIALS AND METHODS**

67 In the Methods section, authors should state the authority which provided ethical approval  
68 for the study, along with a statement in regards to the informed consent of participants.  
69 The study or clinical trial registration number should be provided, if applicable.

70

## 71 **RESULTS**

72 After that you should describe your result. Tables should be numbered consecutively in  
73 Arabic numerals in the sequence they are mentioned in the text. Do not put your tables  
74 here. Place tables and figures after the References, and not within the main text. Mention,  
75 for example, Table 1 shows the socio-demographic characteristics of the children, or  
76 majority of the children were of Malay ethnic group (61.1%) (Table 1), or the data collection  
77 flow is shown in Figure 1. Put all your tables and figures after references, not here. All

78 statistical notations should be italics, for example, *t* for *t*-test, *F* for ANOVA, *r* for correlation,  
79 *N* for population number, *n* for sample number, *M* for mean and *SD* for standard deviation.

80

## 81 **DISCUSSION**

82 Then you discuss your findings. Please be careful with the citation style, make sure you  
83 follow the guidelines. In the text, references are cited by surname(s) of the author(s) and  
84 year of publication parenthetically at the appropriate place. Three authors appear in full on  
85 first citation, e.g, Bray, Whipp & Koyal (1994), but subsequently as Bray *et al.* (1994). For  
86 four or more authors, indicate the first author followed by *et al.*

87

## 88 **CONCLUSION**

89 Then you conclude the findings of the study.

90

## 91 **Acknowledgement**

92 You can thank anyone or acknowledge any funding or support here.

93

## 94 **Conflict of interest**

95 Authors need to declare any conflict of interest.

mjn.2020.0099 - Dominant factors on food coping mechanism of poor household in Pringsewu Regency, Indonesia

Dear Dr. Sayekti:

Please be informed that your manuscript has been sent to the Editor for the reviewing process. Please also note that I have made some minor formatting on your main document. Some of your references were incomplete and I have completed them for you.

Attached is your main document that I have formatted. Please download and keep it for future use (eg. when doing revision) as this is the version that the Editor and reviewers will receive.

Thank you.

Sincerely,  
Liyana

1 **Dominant factors on food coping mechanism of poor household in Pringsewu**  
2 **Regency, Indonesia**

3

4 **ABSTRACT**

5 **Introduction:** Poor households do not have sufficient purchasing power to guarantee their  
6 food security. To overcome this inability, food coping efforts were made. This study  
7 addresses to identify the dominant factors that influence the food coping mechanism of  
8 poor households. **Methods:** There were 92 poor households of the targeted household of  
9 prosperous rice (RASTRA) beneficiaries in Pringsewu regency, which were selected by simple  
10 random sampling. The research used the survey method, and the data collection technique  
11 was the interview with the questionnaire. There were four villages as a research location,  
12 namely Fajar Baru and Kemilin of North Pagelaran Sub-District and Wargomulyo and  
13 Tanjung Russia of Pardasuka Sub-District. The research purposes are analyzed by  
14 descriptive and factor analysis. **Results:** The results showed that most households had  
15 food coping mechanisms on a scale of 1. Reducing the amount and type of food and buying  
16 cheaper food was food coping mechanism used by all households. Moreover, the result  
17 showed that based on 19 factors analyzed, formed six groups of factors. They were social  
18 conditions, coping activities, economic conditions, assets, head of household's job, and  
19 housewives' job. **Conclusion:** The dominant factor affecting the food coping mechanism in  
20 poor households was social conditions. One of the social conditions, education has the  
21 biggest influence on establishing a survival mechanism in overcoming food insecurity at the  
22 household level.

23

## 40 INTRODUCTION

41 Poverty and hunger are some of the most basic humanitarian problems (Iserson, 2014;  
42 Schrecker & Milne, 2018). In 2015, the Food and Agriculture Organization (FAO) reported  
43 that hunger affects 795 million people worldwide, and 780 million live in developing  
44 countries, including Indonesia (FAO, IFAD & WFP 2015; Glazebrook, Noll & Opoku, 2020).  
45 An effort globally to overcome hunger was formed to continue Millennium Development  
46 Goals (MDGs) called the Sustainable Development Goals (SDGs). SDGs is a sustainable  
47 development agenda that agreed by various countries in the United Nations (UN) based on  
48 human rights and equality to encourage social, economic, and environment (Singh 2016;  
49 Jones *et al.*, 2017; García-Feijoo, Eizaguirre & Rica-Aspiunza, 2020). In 2015, FAO  
50 reported that hunger affects 795 million people worldwide, and 780 million live in  
51 developing countries, including Indonesia. mental development (FAO, IFAD & WFP, 2015).  
52 Several indicators to achieve SDG's goals are ending poverty and hunger, achieving good  
53 food and nutrition security, and increasing sustainable agriculture (Alisjahbana &  
54 Murniningtyas, 2018; Gil *et al.*, 2018; Bilali *et al.*, 2018)

55

56 The purpose of the SDGs, to overcome poverty and hunger are the same with the national  
57 priority agenda of human development in the Medium-Term Development Plan 2015-2019  
58 (RPJMN) and Nawacita Program (president program) in Indonesia (Ramadhani & Prihantoro,  
59 2020). The state has the responsibility to complete the food needs of the population because  
60 it is mandated in the Law of Food Number 12, 2012 (Undang-Undang Pangan) as part of  
61 Human Rights (HAM). As a basic necessity and strategic commodity, food has an essential  
62 role in maintaining human survival to stay healthy and productive (Ma, 2025; Childs,  
63 Calder & Miles, 2019).

64

65 One of the Indonesian government's efforts in tackling hunger and food insecurity  
66 conditions is through a food security program. In the regulation of the Minister of  
67 Agriculture No. 14 /Permentan/Ot.140/3/2012 stated that the food security program is a  
68 national development priority. One of the efforts to achieve food security, BULOG as a  
69 State-Owned Enterprise (BUMN), is tasked with supporting the food affordability sub-  
70 system through the supply and distribution of subsidized rice to poor groups called the  
71 prosperous rice program (RASTRA). RASTRA has opened economic and physical access to  
72 food, so it is expected to protect food insecure households from malnutrition, especially  
73 energy and protein. In addition to maintaining the food security of low-income families,  
74 RASTRA also supports improving the quality of human resources and indirectly also plays a  
75 role in maintaining economic stability (BULOG, 2014).

76

77 Food insufficiency can threaten household food security and the nutritional status of food  
78 insecure groups. One factor influencing food security is household income, which impacts

79 the people's low purchasing power (Yousauf *et al.*, 2018a, 2018b; Ume *et al.*, 2018; Grobler  
80 & Dunga, 2017; Dunga, 2017; Mekonen & Birhanu, 2019). Therefore, food insecurity is  
81 related to the level of household poverty affected by income (Grobler & Dunga, 2017).  
82 Various efforts have been made by the community in their efforts to provide sufficient food  
83 for their members. Apart from the assistance of RASTRA, households will usually carry out  
84 a food coping mechanism to overcome food shortages and economic limitations (Anggrayni,  
85 Andrias & Adriani, 2015). The results of Kisi *et al.* (2018) show that food insecurity is a  
86 factor driving households to do food coping mechanisms. Coping mechanisms can reduce  
87 food insecurity that occurs in households (Wabwoba *et al.*, 2015). Food coping mechanisms  
88 are carried out when households experience difficulties in meeting food needs, or the  
89 availability of food is almost insufficient for all household members' consumption needs.

90

91 Food coping mechanism adopted by every household depends on the situation of food  
92 shortages and the ability of households to cope (Abdulla, 2015). Households that have  
93 unemployment and unstable income problems have higher coping scores (Usfar, 2002). The  
94 more food insecure, the food coping mechanism has taken by households is also getting  
95 closer to the extreme. Then, regions with better food security have adaptive food coping  
96 mechanisms (Ghimire, 2014). Grobler & Dunga (2017), shows that the more insecure food a  
97 household has, the more food coping mechanism is carried out. Indirectly, the  
98 characteristics of food-insecure households play a role in influencing household food coping  
99 mechanisms (household sociodemography) (Alam, 2018).

100

101 One of the Food Development Goals in Indonesia is the realization of food security at the  
102 household level. Lampung Province is an area in Indonesia Country, which classified as  
103 food security. However, food-insecure households are still found quite high. Indirectly, food  
104 insecurity at the household level can affect the nutritional status of children. Regionally,  
105 Pringsewu Regency is one of the regions in Lampung Province that still faces the  
106 malnutrition case of children under five years (Food Security Agency/BKP Pringsewu  
107 Regency, 2015). Malnutrition is closely related to poverty (Ministry of Agriculture's Food  
108 Security Agency, 2019). Pringsewu Regency still faces chronic food insecurity due to poverty  
109 caused by unequal distribution of income and expenditure per capita per month. The  
110 population is still dominated by food expenditure (BKP Pringsewu Regency, 2015; BPS  
111 Pringsewu Regency, 2015). Even though Pringsewu Regency has a surplus in the  
112 availability of staple food, the finding of malnutrition cases still indicates problems in food  
113 security. One crucial problem in food security is low access to food. The RASTRA program is  
114 intended to overcome this problem. The study of food coping conducted by RASTRA  
115 recipient households is important to find social capital owned by households that can help  
116 them from the food problems they face.

117

118 This study addresses to determine the food coping mechanism and identify the dominant  
119 factors in food coping mechanism of poor households. This research is expected to provide  
120 recommendations in developing and formulating appropriate policies to solve food  
121 insecurity by understanding the strategies for overcoming food insecurity adopted by poor  
122 households.

123

## 124 **MATERIAL AND METHODS**

### 125 **Location and Research Time**

126 This research was conducted in Pringsewu Regency using the survey method. The research  
127 area is determined purposively considering that, according to Badan Ketahanan Pangan  
128 (BKP) or Food Security Agency (2015), Pringsewu Regency has a surplus in the aspect of  
129 food availability, but still faces food insecurity issues. Besides, there are still toddlers  
130 suffering from malnutrition, and the percentage of expenditure per capita per month is  
131 dominated by food expenditure. Pardasuka Sub-District and North Pagelaran were selected  
132 as research locations based on poverty and composite indicators on the Food Security and  
133 Vulnerability Atlas (FSVA), BKP Pringsewu Regency in 2015. Based on poverty indicators,  
134 Pardasuka Subdistrict and North Pagelaran are areas with a population below the poverty  
135 line at priority one, while based on a composite index, namely food insecurity of an area  
136 caused by various indicators based on aspects of food availability, food access, and food  
137 and nutrition utilization. Pardasuka and North Pagelaran Districts were categorized as  
138 areas with priority food insecurity status, one with a composite index value of 3 in  
139 December 2015. Based on the highest number of RASTRA beneficiary households, there  
140 were two villages as research locations, namely Fajar Baru and Kemilin in North Pagelaran  
141 Sub-District, while in Pagelaran Sub-District are Tanjung Rusia and Wargo Mulyo. The data  
142 is collected in July - August 2018.

143

### 144 **Sampling Techniques**

145 The sample of this study was poor households receiving RASTRA in 2015 with a population  
146 of 1,132 households. The number of samples is determined based on the Slovin's formula  
147 with an estimated error rate of 10 percent (Siregar, 2016) so that a sample of 92 households  
148 is obtained. The samples from each village were determined by proportional sampling, so  
149 samples were obtained consecutively at Baru Dajar, Kemilin, Tanjung Russia, Margo Mulyo,  
150 13, 19, 26, and 34 households. Sampling was used by simple random sampling.

151

### 152 **Data Collection and Data Analysis Techniques**

153 The type of data used is primary data and secondary data. Primary data collection  
154 techniques are direct observation and interviews using a structured questionnaire.  
155 Secondary data was obtained through recording methods from agencies/institutions related  
156 to the study, such as data on the number of poor households receiving RASTRA, Food

157 Security Vulnerability Atlas (FSVA), malnutrition sufferers, food availability, and food  
158 expenditure of the population in Pringsewu Regency. To find out household food coping  
159 mechanisms, the analytical method used is descriptive analysis. Food coping mechanism is  
160 identified based on the type of activity, frequency, and perpetrators of food coping  
161 mechanism in a household. The food coping mechanism is divided into three scales. Scale 1  
162 includes actions to increase income, change eating habits, and increase immediate access  
163 to food. Scale 2 includes measures to increase immediate access to food, change  
164 distribution and frequency of food, and go through days without food. In contrast, scale 3 is  
165 a drastic step, such as migration, giving children to relatives, and divorcing. The larger the  
166 scale, the more severe the food problems faced so that the behavior of the food coping  
167 mechanism is also drastically approaching. The data analysis method used is quantitative  
168 descriptive and factor analysis using the Principal Component Analysis (PCA) extraction  
169 model.

170

## 171 **RESULTS AND DISCUSSION**

### 172 **Characteristics of Poor Households**

173 Food coping mechanism behavior performed by each household will be different and  
174 depends on the food problem. Besides, household socio-economic factors can also influence  
175 various food coping alternatives that households choose as a survival mechanism.  
176 Household characteristics significantly affect household access to food needs, so household  
177 characteristics can also affect food coping mechanisms. The majority of the age of  
178 household heads are 52-60 years old, while wives are in the 45-51 year age group. Thirteen  
179 widows receive RASTRA assistance and become household heads in the household. The  
180 RASTRA recipients in each village were generally prioritized by old widows based on the  
181 results of the village head's meetings with the village officials. The last level of formal  
182 education undertaken by the majority of household heads and wives is an elementary  
183 school (SD) with the nutrition knowledge of homemakers in the low category.

184

185 The majority of household income ranges from Rp. 1,000,000.00 to Rp. 1,500,000.00 per  
186 month, with several 3-4 home members. The average income is Rp1,321,576.00 per month.  
187 The type of work of the head of the household is divided into the fields on-farm, off-farm,  
188 and non-farm. As many as 44.57 percent of household heads work on farms, namely  
189 farmers and 29.35 percent work off-farm as farm laborers. The farming work carried out by  
190 most of the household heads in Pardasuka District is farmers and farm laborers. In  
191 contrast, the farmers and farm laborers in Pagelaran Utara District mostly work in oil palm  
192 and cocoa plantations. 34.78 percent of household heads have side jobs, and the majority  
193 work as artisans. Besides, 30 percent of homemakers have side jobs. Households can spend  
194 an average of Rp. 561,639.00/month for food consumption, which is in a row primarily  
195 spent on buying grains, animal food, vegetables, and beans.

**196 Poor Household Coping Mechanism**

197 Every food coping mechanism behavior indicates a problem of household food insecurity,  
198 but it does not necessarily determine the same severity. Therefore, each behavior is grouped  
199 and given scale value. The results showed that all households/respondents did food coping  
200 mechanisms on a scale of 1 and 2. However, scale 1 of food coping was done more by  
201 households. According to Martianto (2006), actions on scales 1 and 2 are the stage of  
202 household adaptation in doing food coping mechanisms. The adaptation phase is carried  
203 out when household food insecurity conditions are at low and moderate levels. This  
204 adaptation stage is related to changing habits in how to obtain and consume food.

205

206 In the past year, the average household took 7 - 8 food coping mechanism actions on a  
207 scale of 1 and 4 food coping actions on a scale 2 with different frequencies and periods. In  
208 this case, only two households take food coping measures on a scale of 3, namely,  
209 migration to the city for work. Overall, from 92 respondent households, only two  
210 households (2.17 percent) carried out a food coping strategy on a scale of 1, 2, and 3 in the  
211 past year. Food coping mechanism on scale 1 includes activities related to increasing  
212 income, changing eating habits, adding immediate access to food. The percentage of various  
213 food coping mechanism actions carried out by households on a scale of 1 displayed in  
214 Figure 1.

215

216 Based on Figure 1, a scale one food coping action taken by all households is to buy cheaper  
217 food reducing the amount of food consumed. For example, they are changing the purchase  
218 of fish or chicken side dishes into tempeh or tofu whose price is much lower. Reducing the  
219 amount and type of food, households usually consume rice with side dishes and vegetables,  
220 but change their consumption to only rice and side dishes or rice and vegetables.  
221 Household food coping mechanism efforts by buying food at lower prices and reducing the  
222 amount of food consumed is done on average two times a week. This fact is following  
223 Maxwell and Caldwell's (2008) opinion, the first step in the strategy to overcome food  
224 consumption used by food-insecure households is to change their diet. For example,  
225 households might divert food consumption from preferred foods to cheaper and less  
226 preferred substitutes.

227

228 Other food coping mechanisms undertaken by the majority of households are collecting wild  
229 food/leaves that can be taken at the edge of rice fields/gardens and can be eaten. Besides,  
230 70.65 percent of households use garden or yard yards for gardening, such as growing  
231 vegetables and tubers. This action is in line with the Sustainable Food Home Area Program  
232 (In Indonesia: Kawasan Rumah Pangan Lestari/KRPL), which is promoted by the Food  
233 Security Agency. Utilization of the yard as a source of fulfillment of household food  
234 availability can reduce food expenditure, improve Desirable Dietary Pattern (DDP), and

235 support the achievement of household food security, especially in food-insecure areas.  
236 KRPL activities are also carried out to support government programs for handling stunting  
237 areas, poverty alleviation, handling vulnerable food insecure areas, and developing border  
238 areas.

239

240 Scale 2 food coping is the next mechanism chosen by households when efforts to address  
241 the lack of household food are entirely unresolved. The next addition of access to purchase  
242 food, changes in the distribution and frequency of meals, to go through days without eating  
243 is a scale two food coping activity group. The percentage of food coping mechanism actions  
244 carried out by households can be seen in Figure 2.

245

246 On scale 2, housewives' most common action in the effort of food coping is to buy food by  
247 way of debt at the stall. These activities are usually carried out 2-3 times/month. Other  
248 actions taken are taking savings to buy food and change food distribution. Changes in food  
249 distribution are actions to reduce the portion of food that is usually consumed by one  
250 household member for other members. Mothers usually do this for their children. For  
251 example, a mother used to eat one rice plate with a size of 2 rice ladles, then change the  
252 distribution of food to just one rice ladle. A mother usually eats the latest after all the  
253 family members have eaten or she ate from the food left at the dinner table.

254

255 The last action taken by the food coping mechanism on scale 2 is to pawn the assets to buy  
256 food needs and be done by the head of the household. The types of assets owned by  
257 households are nonproductive assets and productive assets. Nonproductive assets in the  
258 form of electronic equipment, vehicles, savings, jewelry, household appliances. Productive  
259 assets in the form of houses, land, livestock, and rice fields/fields. In this case, households  
260 in the study area tend to sell productive assets, such as livestock, rather than selling  
261 nonproductive assets. That is because the money from the sale of nonproductive assets is  
262 far less so that the money can only be used to meet a few needs and a short time. Also, the  
263 lack of parties or traders who will buy nonproductive assets in the study area is why the  
264 households prefer to sell their productive assets.

265

266 Beside selling assets, households in the study area also do asset pledging. In this case,  
267 households in Pringsewu Regency often pawned assets to relatives or neighbors compared  
268 to the pawnshop. Administrative conditions and far enough distance are why they prefer to  
269 pawn the assets to relatives or neighbors than to the pawnshop. Adepoju and Oyegoke  
270 (2018) show that households with one form of asset or another have a higher likelihood of  
271 food security, especially if they are liquid. Asset sales serve as a means of generating  
272 income in reducing food-related shocks. Jabo *et al.* (2017) research results show that farm  
273 households that have access to credit are more likely to expand and diversify farming

274 activities, adopt new agricultural technologies, and buy agricultural inputs. Borrowing  
275 money for productive purposes is very important for farm households to increase  
276 productivity.

277

278 The executor of the food coping action includes the head of the household, wife/housewife,  
279 child, head of household and wife, head of household and child, wife, and child. However,  
280 the study results showed that most of the food coping actions were carried out by  
281 housewives/wives. Homemakers play a role in almost all types of food coping behavior.  
282 Homemakers become the dominant actor in food coping mechanisms, especially in the  
283 actions of food coping mechanisms related to financial control for food. According to  
284 Maxwell and Caldwell (2008), usually, household decision-makers are women. Women  
285 arrange resources to limit the short-term effects of not having enough food in the  
286 household.

287

### 288 **Dominant Factors in Poor Household Food Coping Mechanism**

289 Food coping mechanism is carried out by households when there is a lack of food  
290 availability or access to food decreases. Household characteristics influence household  
291 access in meeting needs, including food needs, so it can be said that household  
292 characteristics can reflect the ability of households to access food. The factor analysis  
293 results show that there are two variables with an anti-image correlation value below 0.5,  
294 namely the variable age of housewives and the status of rice staple food availability  
295 (sufficient or less). An according to Santosa (2012), if there is a Measure of Sampling  
296 Adequacy (MSA) variable value less than 0.5, then the variable cannot be predicted and  
297 cannot be analyzed further, so it is excluded from the analysis model. A variable will group  
298 into a factor if the variable is correlated with several other variables that fall into one  
299 particular factor. The correlation between variables in a factor must be strong enough,  
300 which is above 0.5. Because the variables of the age of homemakers and the status of food  
301 availability do not meet statistical requirements, the two variables are reduced and retested.

302

303 The results showed that almost all food coping actions were carried out by housewives at  
304 various age ranges, so basically, the age of homemakers did not affect the food coping  
305 mechanism performed by poor households in Pringsewu Regency. Besides, the availability  
306 of staple food in poor households is also a reduced variable. Most of the poor households  
307 are in the staple food category. In general, the majority of RASTRA recipient households in  
308 the Pringsewu Regency do not rely solely on the availability and consumption of households  
309 from government-subsidized rice (RASTRA). Rice in the household comes from the purchase  
310 of RASTRA and non-RASTRA, gifts from other people/relatives, and the results of the  
311 production of rice fields themselves / arable. Households cannot depend on RASTRA as  
312 their only source of rice supply, because the RASTRA distribution schedule is irregular.

313 Some households classified as less are caused by some of these households selling rice  
314 obtained from government assistance to meet non-food needs. Such as paying for  
315 electricity, paying off debt, and buying kitchen needs, such as buying vegetables and side  
316 dishes.

317

318 In the secondary analysis, there are 19 variables with anti-image correlation values above  
319 0.5, so that further analysis can be done. The results of the KMO-MSA value of 0.672.  
320 Bartlett's Test of Sphericity with a significance of 0.000. This value indicates that there is a  
321 correlation between variables, and data can be further factor analysis. The results of the  
322 analysis can be seen in Table 1.

323

324 Based on the factor analysis test results, six factors were formed with an eigenvalue of each  
325 factor greater than 1, so the total variance of the six factors was 65.584. This value  
326 indicates that 65.584 percent of poor households' food coping mechanism can be explained  
327 by the factors formed. Factor 1 contributed 21.034 percent in forming household food  
328 coping strategies. Eigenvalue and variance on each factor can be seen in Table 2.

329

330 Based on 19 factors analyzed, six groups of factors were formed: social conditions, coping  
331 activities, economic conditions, assets, occupation of the head of the household, and the  
332 housewife's work. The dominant factor affecting the mechanism of food coping in poor  
333 households is social conditions. These social conditions include the age of the head of the  
334 household, the length of formal education of the head and housewife, the nutritional  
335 knowledge of housewives, and the number of actors involved in the action of food coping  
336 mechanisms on a scale 1. The variables in the formed factor correlate. Factors that shape  
337 the mechanism of food coping in poor households can be seen in Table 3.

338

339 The length of the formal education variable of household heads has the highest loading  
340 factor value on the dominant factor formed, which is 0.836. This value indicates that the  
341 head of the household's length of formal education has a high correlation with the social  
342 condition factor in establishing the mechanism of coping with mediocre household food.  
343 The higher level of education of a head of household can play a role in determining the type  
344 of work and income earned so that household purchasing power increases. According to  
345 FAO (2012), the education of heads of households can understand new information more  
346 quickly, can utilize available resources effectively and efficiently, and are more likely to  
347 adopt innovations to improve food security. Therefore, the level of education can increase  
348 the chances of households becoming more food resistant, so that food coping mechanism is  
349 less. This result is in line with the research results by Onunka, IHEMEZIE, and OLUMBA  
350 (2018), which shows that the higher the education level of farmers, the less likely farmers  
351 are to adopt several strategies in overcoming food insecurity.

352

353 In the dominant factor that was formed (factor 1), housewives' formal education period also  
354 formed the food coping mechanism. Housewife education influences work to increase  
355 household income and nutritional knowledge level. According to Damanik, Ekayanti &  
356 Hariyadi (2010), wife education can improve household welfare. Besides, the level of  
357 education of a wife positively can also influence homemakers' behavior in managing the  
358 household, especially in the selection of daily food that plays an essential role in  
359 determining the nutritional status of toddlers and families. A mother with higher nutrition  
360 education and knowledge will play a role in improving household food security and  
361 choosing appropriate food coping actions. Homemakers become the dominant actor of food  
362 coping mechanisms, especially in the actions of food coping mechanisms related to financial  
363 control for food. Food coping mechanism actions, such as the use of yards for gardening  
364 and gathering edible wild plants, can reduce food expenditure and increase household food  
365 consumption diversity.

366

367 The head of the household is also one of the variables that form the food coping mechanism  
368 of impoverished households—the majority of respondents in the age of 52-60 and more  
369 than 60 years. Age affects one's physical endurance in doing work and decision making.  
370 According to the Indonesian Ministry of Health (2009), the age range includes the elderly,  
371 meaning that at this stage, there will be a decrease in endurance/health and various  
372 psychological pressures so that the ability to adapt is decreased due to decreased organ  
373 function in the body. According to Grobler & Dunga's (2017), older and less educated heads  
374 of households are more likely to be food insecure.

375

376 Besides, the number of food coping actors on a scale of 1 is one of the variables in factor 1  
377 that forms the food coping mechanism in poor households. Scale 1 food coping is the first  
378 group of food coping activities carried out by households when food shortages occur. The  
379 food coping activity group on a scale of 1 includes activities to increase income, change in  
380 eating habits, and immediate access to food. Activities that generate income and food are  
381 negatively related to food insecurity (Gazuma, 2018).

382

383 Households tend to do food coping mechanisms on a scale of 1 and 2, but most households  
384 do food coping mechanisms on a scale of 1. The average food coping on a scale of 1 is 2-3  
385 people and 2 as many as 1-2 people. This shows that the more actors involved in food  
386 coping actions, the more opportunities for household food availability. Maxwell and  
387 Caldwell's (2008) state that the more people participate in overcoming food problems, the  
388 less food insecurity.

389

390 Based on these findings, it is known that education is a determinant that affects food  
391 coping strategy in poor households. Not only for the husband but also a wife. Education  
392 can affect nutrition knowledge and types of work so that it has an impact on the level of  
393 income earned by households. Besides food aid (RASTRA), poverty alleviation programs  
394 through increasing access to education in poor rural households can be a viable solution to  
395 reduce food insecurity at the household level.

396

### 397 **CONCLUSION**

398 Based on research that has been done, most households take food coping measures on a  
399 scale of 1. All households buy cheaper food and reduce the amount of food consumed as  
400 the first action taken by households when food shortages occur. Factors that make up the  
401 food coping mechanism of poor households are social conditions, coping activities,  
402 economic conditions, assets, the head of the household, and the housewife's work. The  
403 dominant factor affecting the mechanism of food coping in poor households is social  
404 conditions. These social conditions include the age of the head of the household, the length  
405 of formal education of the head and housewife, knowledge of housewife nutrition, and the  
406 number of actors involved in the action of food coping mechanisms on a scale 1. Formal  
407 education has the most significant influence on establishing a survival mechanism in  
408 overcoming food insecurity at the household level.

Dear Dr. Sayekti:

Your manuscript entitled "Dominant Factors on Food Coping Mechanism of Poor Household in Pringsewu District, Indonesia" has been successfully submitted online and is presently being given full consideration for publication in the Malaysian Journal of Nutrition.

Your manuscript ID is mjn.2020.0082.

Please mention the above manuscript ID in all future correspondence. If there are any changes in your personal particulars or e-mail address, please log in to ScholarOne Manuscripts at <https://mc04.manuscriptcentral.com/nutriweb> and edit your user information as appropriate.

You can also view the status of your manuscript at any time by checking your Author Center after logging in to <https://mc04.manuscriptcentral.com/nutriweb>.

Thank you for submitting your manuscript to the Malaysian Journal of Nutrition, an official publication of the Nutrition Society of Malaysia (<http://www.nutriweb.org.my>).

Sincerely,  
Malaysian Journal of Nutrition Editorial Office

## Malaysian Journal of Nutrition - mjn.2020.0082 has been unsubmitted

---

05-Jan-2021

Dear Dr. Sayekti:

Your manuscript, mjn.2020.0082, entitled "Dominant Factors on Food Coping Mechanism of Poor Household in Pringsewu District, Indonesia" has been unsubmitted to the Malaysian Journal of Nutrition. It has been unsubmitted because there are some corrections needed:

1. Font type, size & spacing: Please use 10-pt Bookman Old Style, 1.5 spacing.
2. Decimal places: In this journal, we use full stop (.) to indicate decimal point, not comma (,). Please change all your decimal points from comma (,) to full stop (.).
3. References: The maximum number of references allowed in this journal is 30. You have a total of 40 references. Please delete some of your references, so that the total does not exceed 30. When you delete the references, please also remember to delete the citations.
4. Reviewers: Please be informed that reviewers should not come from the same institution as any of the authors, and there should be 1 reviewer from outside of the author's country. The reviewer, Dr Helvi Yanfika, that you suggested, is also from Lampung University Faculty of Agriculture, same university as the authors. Please suggest other reviewer from other university to replace her. Please also suggest 1 reviewer from outside of Indonesia.

Please make the necessary amendments and re-submit the manuscript for consideration of publication. You may contact the Editorial Office if you have further questions.

Sincerely,  
Malaysian Journal of Nutrition Editorial Office

## Malaysian Journal of Nutrition - Decision on Manuscript ID mjn.2020.0099

---

Dari: Malaysian Journal of Nutrition (onbehalf@manuscriptcentral.com)

Kepada: sayekti\_wur@yahoo.co.id

21-Feb-2021

Dear Dr. Sayekti:

Manuscript ID mjn.2020.0099 entitled "Dominant factors on food coping mechanism of poor household in Pringsewu Regency, Indonesia" which you submitted to the Malaysian Journal of Nutrition, has been reviewed. The comments of the reviewer(s) are included at the bottom of this letter.

The reviewer(s) have recommended publication, but also suggest some minor revisions to your manuscript. Therefore, we invite you to respond to the reviewer(s)' comments and revise your manuscript.

To revise your manuscript, log into <https://mc04.manuscriptcentral.com/nutriweb> and enter your Author Center, where you will find your manuscript title listed under "Manuscripts with Decisions." Under "Actions," click on "Create a Revision." Your manuscript number has been appended to denote a revision.

You may also click the below link to start the revision process (or continue the process if you have already started your revision) for your manuscript. If you use the below link you will not be required to login to ScholarOne Manuscripts.

\*\*\* PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm. \*\*\*

[https://mc04.manuscriptcentral.com/nutriweb?URL\\_MASK=06cfbc8538b84a30bfc3dc3546f2e2c8](https://mc04.manuscriptcentral.com/nutriweb?URL_MASK=06cfbc8538b84a30bfc3dc3546f2e2c8)

You will be unable to make your revisions on the originally submitted version of the manuscript. Instead, revise your manuscript using a word processing program and save it on your computer. Please also highlight the changes to your manuscript within the document by using the track changes mode in MS Word or by using bold or colored text.

Once the revised manuscript is prepared, you can upload it and submit it through your Author Center.

When submitting your revised manuscript, you will be able to respond to the comments made by the reviewer(s) in the space provided. You can use this space to document any changes you make to the original manuscript. In order to expedite the processing of the revised manuscript, please be as specific as possible in your response to the reviewer(s).

**IMPORTANT:** Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission.

Because we are trying to facilitate timely publication of manuscripts submitted to the Malaysian Journal of Nutrition, your revised manuscript should be submitted by 24-Mar-2021. If it is not possible for you to submit your revision by this date, we may have to consider your paper as a new submission.

Once again, thank you for submitting your manuscript to the Malaysian Journal of Nutrition and we look forward to receiving your revision.

Sincerely,  
Prof. Bee Koon Poh  
Editor-in-Chief, Malaysian Journal of Nutrition  
[mjneditor@nutriweb.org.my](mailto:mjneditor@nutriweb.org.my)

## Editor Comments to Author:

- Please state whether Ethical Approval and Informed Consent was obtained prior to conduct of study.
- Please read and follow the Instructions for Authors carefully before re-submission:(<https://nutriweb.org.my/mjn/guidelines.php>)
- Take note that the number of references need to be limited to 30 or less.
- Provide point-by-point response to Reviewers' comments.

## Associate Editor Comments to Author:

Comments to the Author

The research topic is interesting and useful for further food coping mechanism, which plays a key role in food security.

There are some linguistic errors. Present tense is usually used in the introduction and other places where the author is describing facts/setting the scene. Past tense is normally used in result part. The authors should check the grammatical in writing correctly. It would be better if the authors try to write in a simple and clear English. I would suggest that it will be useful to engage a professional English language editor.

Some literature reviews in the text should be cited. The year in the in-text citation should also match the year in the reference list. In addition, the authors should make sure that all citations do appear in the reference list and the list is in alphabetical order. Please see the original file for these specific errors.

Studied area should be consistent in all parts of the article. For example, Wargomulyo was mentioned in abstract (Line no 12) whereas Wargo Mulyo and Margo Mulyo were mentioned in the material and method section (Line no 141, 149). In the abstract, Wargo Mulyo and Tanjung Russia are identified in Pardasuka Sub-District. While in Material and Method section, they are identified in the other sub-district, Pagelaran. Slovins formular with 10% error was used for sample size calculation resulting in a small number of samples. It should be noted and cited that this value provided enough sample size for factor analysis study to validate reliability.

"Overall, from 92 respondent households, only two households (2.17 percent) carried out a food coping strategy on a scale of 1, 2, and 3 in the past year." (Line 209-211). It's interesting compared to the current results. The paper would be significantly improved with the addition of more discussion details about it.

Reviewer: 2

Comments to the Author

Abstract: In result, which one is the result of the interview? In method, how do you analyse the interviews?

Line 47 : that is agreed..

Line 51: mistake...suddenly there is mental development.

Line 54: put full stop at the end of sentence.

Line 62: reference: Ma, 2025????

Line 66-68: In the regulation of the Ministry of Agriculture No. 14 /Permentan/Ot.140/3/2012,the food security program is stated as a national development priority.

Check English throughout. Line 142, 148, 153, 159, 161: was, not is.

Line 150: (13, ....and 34 households).

Please explain in detail for line 150: how is simple random sampling done? As earlier you mentioned you used

proportional sampling.

Line 154: Was the questionnaire validated? If adapted, please cite the reference. Similar to Line 161 on food coping mechanism, what type of questionnaire was used? validated?reference?

Line 173: will be change to were

Line 179: received, became, line 182, 187, 190: was

208: took, instead of take.

236:was also carried out. From here onwards, I will not correct each of the grammatical mistakes, I suggest a proofreader is taken to proofread the manuscript before resubmission.

Line 372: Explain 'adapt' to what in this food security context?

Reviewer: 3

#### Comments to the Author

1. The author needs to explain the meaning of food coping in the preliminary research and how food coping can increase food security in cases in other regions.
2. Provide an explanation / reason for using a scale of 1-3 in the research method (Line 161-165).
3. Please more specific on farm, off farm, dan non farm (Line 187-188)
4. Line 383-185: "Households tend to do food coping mechanisms on a scale of 1 and 2, but most households do food coping mechanisms on a scale of 1. The average food coping on a scale of 1 is 2-3 people and 2 as many as 1-2 people". This sentence is difficult to understand and a little ambiguous. explain in simple sentence.
5. What are the implications of the findings of this study on household food security in the study area? What is the strategy to increase food security? Add the questions above to the discussion/conclusions/recommendations section.
6. Please improve the english

7 4 **ABSTRACT**

9 5 **Introduction:** Poor households do not have sufficient purchasing power to guarantee their  
10 6 food security. To overcome this inability, food coping efforts were made. This study  
11 7 addresses to identify the dominant factors that influence the food coping mechanism of  
12 8 poor households. **Methods:** There were 92 poor households of the targeted household of  
13 9 prosperous rice (RASTRA) beneficiaries in Pringsewu regency, which were selected by simple  
14 10 random sampling. The research used the survey method, and the data collection technique  
15 11 was the interview with the questionnaire. There were four villages as a research location,  
16 12 namely Fajar Baru and Kemilin of North Pagelaran Sub-District and Wargomulyo  
17 13 Tanjung Russia of Pardasuka Sub-District. The research purposes are analyzed by  
18 14 descriptive and factor analysis. **Results:** The results showed that most households had  
19 15 food coping mechanisms on a scale of 1. Reducing the amount and type of food and buying  
20 16 cheaper food was food coping mechanism used by all households. Moreover, the result  
21 17 showed that based on 19 factors analyzed, formed six groups of factors. They were social  
22 18 conditions, coping activities, economic conditions, assets, head of household's job, and  
23 19 housewives' job. **Conclusion:** The dominant factor affecting the food coping mechanism in  
24 20 poor households was social conditions. One of the social conditions, education has the  
25 21 biggest influence on establishing a survival mechanism in overcoming food insecurity at the  
26 22 household level.

## 40 INTRODUCTION

41 Poverty and hunger are some of the most basic humanitarian problems (Iserson, 2014;  
42 Schrecker & Milne, 2018). In 2015, the Food and Agriculture Organization (FAO) reported  
43 that hunger affects 795 million people worldwide, and 780 million live in developing  
44 countries, including Indonesia (FAO, IFAD & WFP 2015; Glazebrook, Noll & Opoku, 2020).  
45 An effort globally to overcome hunger was formed to continue Millennium Development  
46 Goals (MDGs) called the Sustainable Development Goals (SDGs). SDGs is a sustainable  
47 development agenda that agreed by various countries in the United Nations (UN) based on  
48 human rights and equality to encourage social, economic, and environment (Singh 2016;  
49 Jones *et al.*, 2017; García-Feijoo, Eizaguirre & Rica-Aspiunza, 2020). In 2015, FAO  
50 reported that hunger affects 795 million people worldwide, and 780 million live in  
51 developing countries, including Indonesia. mental development (FAO, IFAD & WFP, 2015).  
52 Several indicators to achieve SDG's goals are ending poverty and hunger, achieving good  
53 food and nutrition security, and increasing sustainable agriculture (Alisjahbana &  
54 Murniningtyas, 2018; Gil *et al.*, 2018; Bilali *et al.*, 2018)

56 The purpose of the SDGs, to overcome poverty and hunger are the same with the national  
57 priority agenda of human development in the Medium-Term Development Plan 2015-2019  
58 (RPJMN) and Nawacita Program (president program) in Indonesia (Ramadhani & Prihantoro,  
59 2020). The state has the responsibility to complete the food needs of the population because  
60 it is mandated in the Law of Food Number 12, 2012 (Undang-Undang Pangan) as part of  
61 Human Rights (HAM). As a basic necessity and strategic commodity, food has an essential  
62 role in maintaining human survival to stay healthy and productive (Ma, 2025; Childs,  
63 Calder & Miles, 2019).

65 One of the Indonesian government's efforts in tackling hunger and food insecurity  
66 conditions is through a food security program. In the regulation of the Minister of  
67 Agriculture No. 14 /Permentan/Ot.140/3/2012 stated that the food security program is a  
68 national development priority. One of the efforts to achieve food security, BULOG as a  
69 State-Owned Enterprise (BUMN), is tasked with supporting the food affordability sub-  
70 system through the supply and distribution of subsidized rice to poor groups called the  
71 prosperous rice program (RASTRA). RASTRA has opened economic and physical access to  
72 food, so it is expected to protect food insecure households from malnutrition, especially  
73 energy and protein. In addition to maintaining the food security of low-income families,  
74 RASTRA also supports improving the quality of human resources and indirectly also plays a  
75 role in maintaining economic stability (BULOG, 2014).

77 Food insufficiency can threaten household food security and the nutritional status of food  
78 insecure groups. One factor influencing food security is household income, which impacts

1  
2  
3 79 the people's low purchasing power (Yousauf *et al.*, 2018a, 2018b; Ume *et al.*, 2018; Grobler  
4 80 & Dunga, 2017; Dunga, 2017; Mekonen & Birhanu, 2019). Therefore, food insecurity is  
5  
6 81 related to the level of household poverty affected by income (Grobler & Dunga, 2017).  
7  
8 82 Various efforts have been made by the community in their efforts to provide sufficient food  
9  
10 83 for their members. Apart from the assistance of RASTRA, households will usually carry out  
11  
12 84 a food coping mechanism to overcome food shortages and economic limitations (Anggrayni,  
13  
14 85 Andrias & Adriani, 2015). The results of Kisi *et al.* (2018) show that food insecurity is a  
15  
16 86 factor driving households to do food coping mechanisms. Coping mechanisms can reduce  
17  
18 87 food insecurity that occurs in households (Wabwoba *et al.*, 2015). Food coping mechanisms  
19  
20 88 are carried out when households experience difficulties in meeting food needs, or the  
21  
22 89 availability of food is almost insufficient for all household members' consumption needs.

23  
24 91 Food coping mechanism adopted by every household depends on the situation of food  
25  
26 92 shortages and the ability of households to cope (Abdulla, 2015). Households that have  
27  
28 93 unemployment and unstable income problems have higher coping scores (Usfar, 2002). The  
29  
30 94 more food insecure, the food coping mechanism has taken by households is also getting  
31  
32 95 closer to the extreme. Then, regions with better food security have adaptive food coping  
33  
34 96 mechanisms (Ghimire, 2014). Grobler & Dunga (2017), shows that the more insecure food a  
35  
36 97 household has, the more food coping mechanism is carried out. Indirectly, the  
37  
38 98 characteristics of food-insecure households play a role in influencing household food coping  
39  
40 99 mechanisms (household sociodemography) (Alam, 2018).

41  
42 101 One of the Food Development Goals in Indonesia is the realization of food security at the  
43  
44 102 household level. Lampung Province is an area in Indonesia Country, which classified as  
45  
46 103 food security. However, food-insecure households are still found quite high. Indirectly, food  
47  
48 104 insecurity at the household level can affect the nutritional status of children. Regionally,  
49  
50 105 Pringsewu Regency is one of the regions in Lampung Province that still faces the  
51  
52 106 malnutrition case of children under five years (Food Security Agency/BKP Pringsewu  
53  
54 107 Regency, 2015). Malnutrition is closely related to poverty (Ministry of Agriculture's Food  
55  
56 108 Security Agency, 2019). Pringsewu Regency still faces chronic food insecurity due to poverty  
57  
58 109 caused by unequal distribution of income and expenditure per capita per month. The  
59  
60 110 population is still dominated by food expenditure (BKP Pringsewu Regency, 2015; BPS  
111  
112 111 Pringsewu Regency, 2015). Even though Pringsewu Regency has a surplus in the  
113  
114 112 availability of staple food, the finding of malnutrition cases still indicates problems in food  
115  
116 113 security. One crucial problem in food security is low access to food. The RASTRA program is  
117  
118 114 intended to overcome this problem. The study of food coping conducted by RASTRA  
119  
120 115 recipient households is important to find social capital owned by households that can help  
121  
122 116 them from the food problems they face.

1  
2  
3 118 This study addresses to determine the food coping mechanism and identify the dominant  
4 119 factors in food coping mechanism of poor households. This research is expected to provide  
5 120 recommendations in developing and formulating appropriate policies to solve food  
6 121 insecurity by understanding the strategies for overcoming food insecurity adopted by poor  
7 122 households.  
8  
9

## 10 123

### 11 124 **MATERIAL AND METHODS**

#### 12 125 **Location and Research Time**

13 126 This research was conducted in Pringsewu Regency using the survey method. The research  
14 127 area is determined purposively considering that, according to Badan Ketahanan Pangan  
15 128 (BKP) or Food Security Agency (15), Pringsewu Regency has a surplus in the aspect of  
16 129 food availability, but still faces food insecurity issues. Besides, there are still toddlers  
17 130 suffering from malnutrition, and the percentage of expenditure per capita per month is  
18 131 dominated by food expenditure. Pardasuka Sub-District and North Pagelaran were selected  
19 132 as research locations based on poverty and composite indicators on the Food Security and  
20 133 Vulnerability Atlas (FSVA), BKP Pringsewu Regency in 2015. Based on poverty indicators,  
21 134 Pardasuka Subdistrict and North Pagelaran are areas with a population below the poverty  
22 135 line at priority one, while based on a composite index, namely food insecurity of an area  
23 136 caused by various indicators based on aspects of food availability, food access, and food  
24 137 and nutrition utilization. Pardasuka and North Pagelaran Districts are categorized as  
25 138 areas with priority food insecurity status, one with a composite index value of 3 in  
26 139 December 2015. Based on the highest number of RASTRA beneficiary households, there  
27 140 were two villages as research locations, namely Fajar Baru and Kemilin in North Pagelaran  
28 141 Sub-District, while in Pagelaran Sub-District are Tanjung Rusia and Wargo Mulyo. The data  
29 142 is collected in July - August 2018.  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39

#### 40 143

#### 41 144 **Sampling Techniques**

42 145 The sample of this study was poor households receiving RASTRA in 2015 with a population  
43 146 of 1,132 households. The number of samples is determined based on the Slovin's formula  
44 147 with an estimated error rate of 10 percent (Siregar, 2016) so that a sample of 92 households  
45 148 is obtained. The samples from each village were determined by proportional sampling, so  
46 149 samples were obtained consecutively at Baru Dajar, Kemilin, Tanjung Russia, Margo Mulyo,  
47 150 13, 19, 26, and 34 households. Sampling was used by simple random sampling.  
48  
49  
50  
51

#### 52 151

#### 53 152 **Data Collection and Data Analysis Techniques**

54 153 The type of data used is primary data and secondary data. Primary data collection  
55 154 techniques are direct observation and interviews using a structured questionnaire.  
56 155 Secondary data was obtained through recording methods from agencies/institutions related  
57 156 to the study, such as data on the number of poor households receiving RASTRA, Food  
58  
59  
60

1  
2  
3 157 Security Vulnerability Atlas (FSVA), malnutrition sufferers, food availability, and food  
4 158 expenditure of the population in Pringsewu Regency. To find out household food coping  
5 159 mechanisms, the analytical method used is descriptive analysis. Food coping mechanism is  
6 160 identified based on the type of activity, frequency, and perpetrators of food coping  
7 161 mechanism in a household. The food coping mechanism is divided into three scales. Scale 1  
8 162 includes actions to increase income, change eating habits, and increase immediate access  
9 163 to food. Scale 2 includes measures to increase immediate access to food, change  
10 164 distribution and frequency of food, and go through days without food. In contrast, scale 3 is  
11 165 a drastic step, such as migration, giving children to relatives, and divorcing. The larger the  
12 166 scale, the more severe the food problems faced so that the behavior of the food coping  
13 167 mechanism is also drastically approaching. The data analysis method used is quantitative  
14 168 descriptive and factor analysis using the Principal Component Analysis (PCA) extraction  
15 169 model.

## 24 171 **RESULTS AND DISCUSSION**

### 25 172 **Characteristics of Poor Households**

26 173 Food coping mechanism behavior performed by each household will be different and  
27 174 depends on the food problem. Besides, household socio-economic factors can also influence  
28 175 various food coping alternatives that households choose as a survival mechanism.  
29 176 Household characteristics significantly affect household access to food needs, so household  
30 177 characteristics can also affect food coping mechanisms. The majority of the age of  
31 178 household heads are 52-60 years old, while wives are in the 45-51 year age group. Thirteen  
32 179 widows receive RASTRA assistance and become household heads in the household. The  
33 180 RASTRA recipients in each village were generally prioritized by old widows based on the  
34 181 results of the village head's meetings with the village officials. The last level of formal  
35 182 education undertaken by the majority of household heads and wives is an elementary  
36 183 school (SD) with the nutrition knowledge of homemakers in the low category.  
37  
38  
39  
40  
41  
42  
43

44 185 The majority of household income ranges from Rp. 1,000,000.00 to Rp. 1,500,000.00 per  
45 186 month, with several 3-4 home members. The average income is Rp1,321,576.00 per month.  
46 187 The type of work of the head of the household is divided into the fields on-farm, off-farm,  
47 188 and non-farm. As many as 44.57 percent of household heads work on farms, namely  
48 189 farmers and 29.35 percent work off-farm as farm laborers. The farming work carried out by  
49 190 most of the household heads in Pardasuka District is farmers and farm laborers. In  
50 191 contrast, the farmers and farm laborers in Pagelaran Utara District mostly work in oil palm  
51 192 and cocoa plantations. 34.78 percent of household heads have side jobs, and the majority  
52 193 work as artisans. Besides, 30 percent of homemakers have side jobs. Households can spend  
53 194 an average of Rp. 561,639.00/month for food consumption, which is in a row primarily  
54 195 spent on buying grains, animal food, vegetables, and beans.

### 196 **Poor Household Coping Mechanism**

197 Every food coping mechanism behavior indicates a problem of household food insecurity,  
198 but it does not necessarily determine the same severity. Therefore, each behavior is grouped  
199 and given scale value. The results showed that all households/respondents did food coping  
200 mechanisms on a scale of 1 and 2. However, scale 1 of food coping was done more by  
201 households. According to Martianto (2006), actions on scales 1 and 2 are the stage of  
202 household adaptation in doing food coping mechanisms. The adaptation phase is carried  
203 out when household food insecurity conditions are at low and moderate levels. This  
204 adaptation stage is related to changing habits in how to obtain and consume food.

205  
206 In the past year, the average household took 7 - 8 food coping mechanism actions on a  
207 scale of 1 and 4 food coping actions on a scale 2 with different frequencies and periods.  
208 this case, only two households take food coping measures on a scale of 3, namely,  
209 migration to the city for work. Overall, from 92 respondent households, only two  
210 households (2.17 percent) carried out a food coping strategy on a scale of 1, 2, and 3 in the  
211 past year. Food coping mechanism on scale 1 includes activities related to increasing  
212 income, changing eating habits, adding immediate access to food. The percentage of various  
213 food coping mechanism actions carried out by households on a scale of 1 displayed in  
214 Figure 1.

215  
216 Based on Figure 1, a scale one food coping action taken by all households is to buy cheaper  
217 food reducing the amount of food consumed. For example, they are changing the purchase  
218 of fish or chicken side dishes into tempeh or tofu whose price is much lower. Reducing the  
219 amount and type of food, households usually consume rice with side dishes and vegetables,  
220 but change their consumption to only rice and side dishes or rice and vegetables.  
221 Household food coping mechanism efforts by buying food at lower prices and reducing the  
222 amount of food consumed is done on average two times a week. This fact is following  
223 Maxwell and Caldwell's (2008) opinion, the first step in the strategy to overcome food  
224 consumption used by food-insecure households is to change their diet. For example,  
225 households might divert food consumption from preferred foods to cheaper and less  
226 preferred substitutes.

227  
228 Other food coping mechanisms undertaken by the majority of households are collecting wild  
229 food/leaves that can be taken at the edge of rice fields/gardens and can be eaten. Besides,  
230 70.65 percent of households use garden or yard yards for gardening, such as growing  
231 vegetables and tubers. This action is in line with the Sustainable Food Home Area Program  
232 (In Indonesia: Kawasan Rumah Pangan Lestari/KRPL), which is promoted by the Food  
233 Security Agency. Utilization of the yard as a source of fulfillment of household food  
234 availability can reduce food expenditure, improve Desirable Dietary Pattern (DDP), and

235 support the achievement of household food security, especially in food-insecure areas.  
236 KRPL activities are also carried out to support government programs for handling stunting  
237 areas, poverty alleviation, handling vulnerable food insecure areas, and developing border  
238 areas

239  
240 Scale 2 food coping is the next mechanism chosen by households when efforts to address  
241 the lack of household food are entirely unresolved. The next addition of access to purchase  
242 food, changes in the distribution and frequency of meals, to go through days without eating  
243 is a scale two food coping activity group. The percentage of food coping mechanism actions  
244 carried out by households can be seen in Figure 2.

245  
246 On scale 2, housewives' most common action in the effort of food coping is to buy food by  
247 way of debt at the stall. These activities are usually carried out 2-3 times/month. Other  
248 actions taken are taking savings to buy food and change food distribution. Changes in food  
249 distribution are actions to reduce the portion of food that is usually consumed by one  
250 household member for other members. Mothers usually do this for their children. For  
251 example, a mother used to eat one rice plate with a size of 2 rice ladles, then change the  
252 distribution of food to just one rice ladle. A mother usually eats the latest after all the  
253 family members have eaten or she ate from the food left at the dinner table.

254  
255 The last action taken by the food coping mechanism on scale 2 is to pawn the assets to buy  
256 food needs and be done by the head of the household. The types of assets owned by  
257 households are nonproductive assets and productive assets. Nonproductive assets in the  
258 form of electronic equipment, vehicles, savings, jewelry, household appliances. Productive  
259 assets in the form of houses, land, livestock, and rice fields/fields. In this case, households  
260 in the study area tend to sell productive assets, such as livestock, rather than selling  
261 nonproductive assets. That is because the money from the sale of nonproductive assets is  
262 far less so that the money can only be used to meet a few needs and a short time. Also, the  
263 lack of parties or traders who will buy nonproductive assets in the study area is why the  
264 households prefer to sell their productive assets.

265  
266 Beside selling assets, households in the study area also do asset pledging. In this case,  
267 households in Pringsewu Regency often pawned assets to relatives or neighbors compared  
268 to the pawnshop. Administrative conditions and far enough distance are why they prefer to  
269 pawn the assets to relatives or neighbors than to the pawnshop. Adepoju and Oyegoke  
270 (2018) show that households with one form of asset or another have a higher likelihood of  
271 food security, especially if they are liquid. Asset sales serve as a means of generating  
272 income in reducing food-related shocks. Jabo *et al.* (2017) research results show that farm  
273 households that have access to credit are more likely to expand and diversify farming

1  
2  
3 274 activities, adopt new agricultural technologies, and buy agricultural inputs. Borrowing  
4 275 money for productive purposes is very important for farm households to increase  
5 276 productivity.  
6  
7  
8

9 277  
10 278 The executor of the food coping action includes the head of the household, wife/housewife,  
11 279 child, head of household and wife, head of household and child, wife, and child. However,  
12 280 the study results showed that most of the food coping actions were carried out by  
13 281 housewives/wives. Homemakers play a role in almost all types of food coping behavior.  
14 282 Homemakers become the dominant actor in food coping mechanisms, especially in the  
15 283 actions of food coping mechanisms related to financial control for food. According to  
16 284 Maxwell and Caldwell (2008), usually, household decision-makers are women. Women  
17 285 arrange resources to limit the short-term effects of not having enough food in the  
18 286 household.  
19  
20  
21  
22

23 287

### 24 288 **Dominant Factors in Poor Household Food Coping Mechanism**

25 289 Food coping mechanism is carried out by households when there is a lack of food  
26 290 availability or access to food decreases. Household characteristics influence household  
27 291 access in meeting needs, including food needs, so it can be said that household  
28 292 characteristics can reflect the ability of households to access food. The factor analysis  
29 293 results show that there are two variables with an anti-image correlation value below 0.5,  
30 294 namely the variable age of housewives and the status of rice staple food availability  
31 295 (sufficient or less). An according to Santosa (2012), if there is a Measure of Sampling  
32 296 Adequacy (MSA) variable value less than 0.5, then the variable cannot be predicted and  
33 297 cannot be analyzed further, so it is excluded from the analysis model. A variable will group  
34 298 into a factor if the variable is correlated with several other variables that fall into one  
35 299 particular factor. The correlation between variables in a factor must be strong enough,  
36 300 which is above 0.5. Because the variables of the age of homemakers and the status of food  
37 301 availability do not meet statistical requirements, the two variables are reduced and retested.  
38  
39  
40  
41  
42  
43  
44

45 302

46 303 The results showed that almost all food coping actions were carried out by housewives at  
47 304 various age ranges, so basically, the age of homemakers did not affect the food coping  
48 305 mechanism performed by poor households in Pringsewu Regency. Besides, the availability  
49 306 of staple food in poor households is also a reduced variable. Most of the poor households  
50 307 are in the staple food category. In general, the majority of RASTRA recipient households in  
51 308 the Pringsewu Regency do not rely solely on the availability and consumption of households  
52 309 from government-subsidized rice (RASTRA). Rice in the household comes from the purchase  
53 310 of RASTRA and non-RASTRA, gifts from other people/relatives, and the results of the  
54 311 production of rice fields themselves / arable. Households cannot depend on RASTRA as  
55 312 their only source of rice supply, because the RASTRA distribution schedule is irregular.  
56  
57  
58  
59  
60

1  
2  
3 313 Some households classified as less are caused by some of these households selling rice  
4 314 obtained from government assistance to meet non-food needs. Such as paying for  
5 315 electricity, paying off debt, and buying kitchen needs, such as buying vegetables and side  
6 316 dishes.  
7  
8

9 317  
10 318 In the secondary analysis, there are 19 variables with anti-image correlation values above  
11 319 0.5, so that further analysis can be done. The results of the KMO-MSA value of 0.672.  
12 320 Bartlett's Test of Sphericity with a significance of 0.000. This value indicates that there is a  
13 321 correlation between variables, and data can be further factor analysis. The results of the  
14 322 analysis can be seen in Table 1.  
15  
16  
17

18 323  
19 324 Based on the factor analysis test results, six factors were formed with an eigenvalue of each  
20 325 factor greater than 1, so the total variance of the six factors was 65.584. This value  
21 326 indicates that 65.584 percent of poor households' food coping mechanism can be explained  
22 327 by the factors formed. Factor 1 contributed 21.034 percent in forming household food  
23 328 coping strategies. Eigenvalue and variance on each factor can be seen in Table 2.  
24  
25  
26

27 329  
28 330 Based on 19 factors analyzed, six groups of factors were formed: social conditions, coping  
29 331 activities, economic conditions, assets, occupation of the head of the household, and the  
30 332 housewife's work. The dominant factor affecting the mechanism of food coping in poor  
31 333 households is social conditions. These social conditions include the age of the head of the  
32 334 household, the length of formal education of the head and housewife, the nutritional  
33 335 knowledge of housewives, and the number of actors involved in the action of food coping  
34 336 mechanisms on a scale 1. The variables in the formed factor correlate factors that shape  
35 337 the mechanism of food coping in poor households can be seen in Table 3.  
36  
37  
38  
39

40 338  
41 339 The length of the formal education variable of household heads has the highest loading  
42 340 factor value on the dominant factor formed, which is 0.836. This value indicates that the  
43 341 head of the household's length of formal education has a high correlation with the social  
44 342 condition factor in establishing the mechanism of coping with mediocre household food.  
45 343 The higher level of education of a head of household can play a role in determining the type  
46 344 of work and income earned so that household purchasing power increases. According to  
47 345 FAO (2012), the education of heads of households can understand new information more  
48 346 quickly, can utilize available resources effectively and efficiently, and are more likely to  
49 347 adopt innovations to improve food security. Therefore, the level of education can increase  
50 348 the chances of households becoming more food resistant, so that food coping mechanism is  
51 349 less. This result is in line with the research results by Onunka, IHEMEZIE, and OLUMBA  
52 350 (2018), which shows that the higher the education level of farmers, the less likely farmers  
53 351 are to adopt several strategies in overcoming food insecurity.  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 352  
4  
5 353 In the dominant factor that was formed (factor 1), housewives' formal education period also  
6 354 formed the food coping mechanism. Housewife education influences work to increase  
7 355 household income and nutritional knowledge level. According to Damanik, Ekayanti &  
8 356 Hariyadi (2010), wife education can improve household welfare. Besides, the level of  
9 357 education of a wife positively can also influence homemakers' behavior in managing the  
10 358 household, especially in the selection of daily food that plays an essential role in  
11 359 determining the nutritional status of toddlers and families. A mother with higher nutrition  
12 360 education and knowledge will play a role in improving household food security and  
13 361 choosing appropriate food coping actions. Homemakers become the dominant actor of food  
14 362 coping mechanisms, especially in the actions of food coping mechanisms related to financial  
15 363 control for food. Food coping mechanism actions, such as the use of yards for gardening  
16 364 and gathering edible wild plants, can reduce food expenditure and increase household food  
17 365 consumption diversity.  
18 366

19 367 The head of the household is also one of the variables that form the food coping mechanism  
20 368 of impoverished households—the majority of respondents in the age of 52-60 and more  
21 369 than 60 years. Age affects one's physical endurance in doing work and decision making.  
22 370 According to the Indonesian Ministry of Health (2018) the age range includes the elderly,  
23 371 meaning that at this stage, there will be a decrease in endurance/health and various  
24 372 psychological pressures so that the ability to adapt is decreased due to decreased organ  
25 373 function in the body. According to Grobler & Dunga's (2017), older and less educated heads  
26 374 of households are more likely to be food insecure.  
27 375

28 376 Besides, the number of food coping actors on a scale of 1 is one of the variables in factor 1  
29 377 that forms the food coping mechanism in poor households. Scale 1 food coping is the first  
30 378 group of food coping activities carried out by households when food shortages occur. The  
31 379 food coping activity group on a scale of 1 includes activities to increase income, change in  
32 380 eating habits, and immediate access to food. Activities that generate income and food are  
33 381 negatively related to food insecurity (Gazuma, 2018).  
34 382

35 383 Households tend to do food coping mechanisms on a scale of 1 and 2, but most households  
36 384 do food coping mechanisms on a scale of 1. The average food coping on a scale of 1 is 2-3  
37 385 people and 2 as many as 1-2 people. This shows that the more actors involved in food  
38 386 coping actions, the more opportunities for household food availability. Maxwell and  
39 387 Caldwell's (2008) state that the more people participate in overcoming food problems, the  
40 388 less food insecurity.  
41 389

1  
2  
3 390 Based on these findings, it is known that education is a determinant that affects food  
4 391 coping strategy in poor households. Not only for the husband but also a wife. Education  
5 392 can affect nutrition knowledge and types of work so that it has an impact on the level of  
6 393 income earned by households. Besides food aid (RASTRA), poverty alleviation programs  
7 394 through increasing access to education in poor rural households can be a viable solution to  
8 395 reduce food insecurity at the household level.

12 396

### 13 397 **CONCLUSION**

14 398 Based on research that has been done, most households take food coping measures on a  
15 399 scale of 1. All households buy cheaper food and reduce the amount of food consumed as  
16 400 the first action taken by households when food shortages occur. Factors that make up the  
17 401 food coping mechanism of poor households are social conditions, coping activities,  
18 402 economic conditions, assets, the head of the household, and the housewife's work. The  
19 403 dominant factor affecting the mechanism of food coping in poor households is social  
20 404 conditions. These social conditions include the age of the head of the household, the length  
21 405 of formal education of the head and housewife, knowledge of housewife nutrition, and the  
22 406 number of actors involved in the action of food coping mechanisms on a scale 1. Formal  
23 407 education has the most significant influence on establishing a survival mechanism in  
24 408 overcoming food insecurity at the household level.

Dear Dr. Sayekti:

Your manuscript entitled "Dominant factors on food coping mechanism of poor household in Pringsewu Regency, Indonesia" has been successfully submitted online and is presently being given full consideration for publication in the Malaysian Journal of Nutrition.

Your manuscript ID is mjn.2020.0099.R1.

Please mention the above manuscript ID in all future correspondence. If there are any changes in your personal particulars or e-mail address, please log in to ScholarOne Manuscripts at <https://mc04.manuscriptcentral.com/nutriweb> and edit your user information as appropriate.

You can also view the status of your manuscript at any time by checking your Author Center after logging in to <https://mc04.manuscriptcentral.com/nutriweb>.

Thank you for submitting your manuscript to the Malaysian Journal of Nutrition, an official publication of the Nutrition Society of Malaysia (<http://www.nutriweb.org.my>).

Sincerely,  
Malaysian Journal of Nutrition Editorial Office

16-Aug-2021

Dear Dr. Sayekti:

Manuscript ID mjn.2020.0099.R1 entitled "Dominant factors on food coping mechanism of poor household in Pringsewu Regency, Indonesia" which you submitted to the Malaysian Journal of Nutrition, has been reviewed. The comments of the reviewer(s) are included at the bottom of this letter.

The reviewer(s) have suggested some minor revisions to your manuscript. Therefore, we invite you to respond to the reviewer(s)' comments and revise your manuscript.

Please take note, however, that you have not responded to my earlier request for Ethics approval and participant's consent statement. Do note that MJN does not accept for publication any studies that involve human participants if the study has not obtained prior Ethics approval.

To revise your manuscript, log into <https://mc04.manuscriptcentral.com/nutriweb> and enter your Author Center, where you will find your manuscript title listed under "Manuscripts with Decisions." Under "Actions," click on "Create a Revision." Your manuscript number has been appended to denote a revision.

You may also click the below link to start the revision process (or continue the process if you have already started your revision) for your manuscript. If you use the below link you will not be required to login to ScholarOne Manuscripts.

\*\*\* PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm. \*\*\*

[https://mc04.manuscriptcentral.com/nutriweb?URL\\_MASK=d3141333b622479691326e8b1edf6e5c](https://mc04.manuscriptcentral.com/nutriweb?URL_MASK=d3141333b622479691326e8b1edf6e5c)

You will be unable to make your revisions on the originally submitted version of the manuscript. Instead, revise your manuscript using a word processing program and save it on your computer. Please also highlight the changes to your manuscript within the document by using the track changes mode in MS Word or by using bold or colored text.

Once the revised manuscript is prepared, you can upload it and submit it through your Author Center.

When submitting your revised manuscript, you will be able to respond to the comments made by the reviewer(s) in the space provided. You can use this space to document any changes you make to the original manuscript. In order to expedite the processing of the revised manuscript, please be as specific as possible in your response to the reviewer(s).

**IMPORTANT:** Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission.

Because we are trying to facilitate timely publication of manuscripts submitted to the Malaysian Journal of Nutrition, your revised manuscript should be submitted by 15-Sep-2021. If it is not possible for you to submit your revision by this date, we may have to consider your paper as a new submission.

Once again, thank you for submitting your manuscript to the Malaysian Journal of Nutrition and we look forward to receiving your revision.

Sincerely,  
Prof. Bee Koon Poh  
Editor-in-Chief, Malaysian Journal of Nutrition  
[mjneditor@nutriweb.org.my](mailto:mjneditor@nutriweb.org.my)

Associate Editor Comments to Author:

Associate Editor

Comments to the Author:

The clarity of the manuscript is much improved in the revised version. Please see the minor suggestions from the two reviewers. It is recommended that the manuscript be sent to a better English proofreading service before resubmission.

Reviewer(s)' Comments to Author:

Reviewer: 1

Comments to the Author

The manuscript is better compared to before, but please send the manuscript to a better proofreader.

Line 17 Please rewrite the sentence.

Line 51 check the sentence

Line 150 Each households were selected using simple random sampling.

Line 167 Incorrect usage of approaching-change.

Line 173-whole paragraph: Please check and revised the tenses used. Should be in past tense.

Line 207 Rephrase the sentence, or does it need a comma somewhere as I dont understand.

Line 252 eats last

Line 268 delete far enough

Line 293 Was factor analysis mentioned in data analysis in method section, as I only see it here.

Line 325-327 Put the percentage into 1-2 decimal point?

I'd like to suggest for the author to improve the flow of her overall discussion.

Reviewer: 2

Comments to the Author

The authors have addressed all the comments and suggestions I made in the first review. The quality of the article has significantly improved. I believe the paper is acceptable for publication in the MJN.

Minor revision

P5 line 175, it should be 45-51 YEARS old.

P9 line 325, it may be better to report "FOOD COPING ACTIVITIES" rather than "coping activities"

P14, line 3-8, please correct the Eigen Value and Percentage of Variance in the table 2. It should be "." rather than",". The authors may consider to report the name of factors in the table 2 to make it clearer.

P14 line 25, it should be 0.645 rather than 0,645.

P14 line 57, the title of figure should be "Percentage of household food coping mechanism on scale 1".

P15 line 4, the number should be in the figure.

16-May-2022

Dear Dr. Sayekti:

Manuscript ID mjn.2020.0099.R3 entitled "Dominant factors on food coping mechanism of poor household in Pringsewu Regency, Indonesia" which you submitted to the Malaysian Journal of Nutrition, has been reviewed. The comments of the reviewer(s) are included at the bottom of this letter.

The reviewer(s) have recommended publication, but also suggest some minor revisions to your manuscript. Therefore, we invite you to respond to the reviewer(s)' comments and revise your manuscript.

To revise your manuscript, log into <https://mc04.manuscriptcentral.com/nutriweb> and enter your Author Center, where you will find your manuscript title listed under "Manuscripts with Decisions." Under "Actions," click on "Create a Revision." Your manuscript number has been appended to denote a revision.

You may also click the below link to start the revision process (or continue the process if you have already started your revision) for your manuscript. If you use the below link you will not be required to login to ScholarOne Manuscripts.

\*\*\* PLEASE NOTE: This is a two-step process. After clicking on the link, you will be directed to a webpage to confirm. \*\*\*

[https://mc04.manuscriptcentral.com/nutriweb?URL\\_MASK=3c3bedccb58248df8d00d83c5b711d3a](https://mc04.manuscriptcentral.com/nutriweb?URL_MASK=3c3bedccb58248df8d00d83c5b711d3a)

You will be unable to make your revisions on the originally submitted version of the manuscript. Instead, revise your manuscript using a word processing program and save it on your computer. Please also highlight the changes to your manuscript within the document by using the track changes mode in MS Word or by using bold or colored text.

Once the revised manuscript is prepared, you can upload it and submit it through your Author Center.

When submitting your revised manuscript, you will be able to respond to the comments made by the reviewer(s) in the space provided. You can use this space to document any changes you make to the original manuscript. In order to expedite the processing of the revised manuscript, please be as specific as possible in your response to the reviewer(s).

**IMPORTANT:** Your original files are available to you when you upload your revised manuscript. Please delete any redundant files before completing the submission.

Because we are trying to facilitate timely publication of manuscripts submitted to the Malaysian Journal of Nutrition, your revised manuscript should be submitted by 16-Jun-2022. If it is not possible for you to submit your revision by this date, we may have to consider your paper as a new submission.

Once again, thank you for submitting your manuscript to the Malaysian Journal of Nutrition and we look forward to receiving your revision.

Sincerely,  
Prof. Bee Koon Poh  
Editor-in-Chief, Malaysian Journal of Nutrition

## Editor Comments to Author:

- Please revise and provide point-by-point response to the Reviewers' suggestions.
- Please send for professional English editing prior to re-submission, and attach proof when re-submitting.

## Associate Editor Comments to Author:

## Associate Editor

## Comments to the Author:

Some language edits have been suggested by the Reviewer. Please send the manuscript for English editing to improve its readability and technical accuracy. Do choose qualified native English-speaking editors.

## Reviewer(s)' Comments to Author:

## Reviewer: 1

## Comments to the Author

Comments for the article: Dominant factors on food coping mechanisms of poor household in Pringsewu Regency, Indonesia.

- Thank you for inserting additional information to the paper.
- The authors should send the paper for English proofreading. This would improve the paper and the ability of the reader to understand the message. For example:
  - o Line 11 abstract. .... through survey methods, interviews, and questionnaire. Do you mean ... through the following survey methods: interviews, and questionnaire?
  - o line 53, 'human growth' – should it be 'quality of human resources' instead?
  - o Lines 122-125 can be improved.
  - o Lines 137-141 – the sentences are not complete.
  - o Line 174 – recording methods? – do you mean using records/documents?
  - o Line 191 – do you mean - socio-demographic characteristics ??
  - o Etc.
- Recheck for spelling errors. For example:
  - o Line 192 analyze
  - o Line 257
- Recheck for consistencies, for example:
  - o line 116 – food security problems, not security.
  - o Line 151 – The sample was a total of 1,132 poor households .... This number turns out to be the population of the study, not the sample size. The sample was 92 households.
  - o Etc.
- Line 176. The terminology 'malnutrition sufferers' is not commonly used. Maybe the authors should use the term 'undernutrition'- undernourished/undernourishment - instead of 'malnutrition' – because essentially the paper addresses undernutrition, not overnutrition.
- Suggestion to add Lampung province in the title of the paper.
- Suggestion to add Indonesia in the keywords
- Suggestion to move the explanation about RASTRA written in lines 75-81 to line 69 after introducing the program.
- Lines 425-429 is a bit confusing. The authors mentioned 3 households and the 1-2 people. What happen to the rest of the 92 sample?
- Line 439 – do you mean consumption frequency?
