### ABSTRACT

The characteristics of mutually distinct companies will certainly also make a difference in the characteristics and role of cash holding components that need to be explored, exploited and optimized. At present, exploration of cash holding and its components has been carried out thoroughly and produces different factors. The empirical study of cash holding is still limited to the elements of vigilance and transaction. Speculation aspects have not been much discussed in determining the company's cash holding. The purpose of this study was to determine the religious influence of the company's cash holding. The method used to test the model is using panel data regression, using a sample of 193 companies on the Indonesia Stock Exchange. This research was carried out by separating between shari'ah and non-shari'ah companies. The results of the research are Religiosity (Islam Discotomic) showing a positive and significant coefficient of cash holdings. Islamic companies have a large amount of cash compared to non-Sharia companies. This is done by Sharia companies to reduce risk by reducing debt financing.

.

**Keywords : Religious and Cash Holding.**
